Chisel Jersey: Bittersweet type. Small to medium-sized, conical fruit; juice well colored, low in acidity, high in tannin, sugar content good. Harvested late October to mid-November; milling period more than 3 weeks. Yields a cider of marked astringency, usually of full body and good flavor and aroma. Tree medium-sized, vigorous, spreading; consistently high yielding. Originated in Somerset, England. WILLIAMS, R.; F88G, F91T{SC}, H90M{SC}, I61M{SC}, M22

Cimitiere: Bittersweet type. Medium-sized, flat to conical fruits; skin greenish-yellow splashed with crimson; flesh sweet with a dash of bitterness, juice highly colored, fairly well perfumed; keeps and ships very well. Useful for blending with cultivars of little color and mucilage. Harvest date October 10 at Geneva, New York. Tree very vigorous and haidy, exceedingly productive. Originated in Blargy, France. U7J{SC}

Dabinett: Bittersweet type. Medium to large, roundish fruit; skin green, blushed with dull red; juice low in acid, tannin medium, sugar content fair; fermentation moderate. Produces a very high quality, soft, full-bodied cider. Harvest date September 25 at Geneva, Nov York. Tree small, spreading; precocious; a regular and heavy bearer; blooms late; pollinates with Michelin. Originated in Somerset, England. WILLIAMS, R.; F88G, L12, M11M{PR}, M22, 081, Q30{SC}

Dymock Red: Sharp type. Small to medium fruit; skin entirely covered with dark mahogany red; flesh soft and tender, slightly sweet with a pleasant acidity; sugar content average, fermentation slow. Yields a high-grade cider that is medium sharp with some astringency. Can be harvested in late September, but will hang on the tree until November. Tree vigorous, upright, productive. Very susceptible to canker and scab. U7J{SC}

**Foxwhelp:** Sharp type. Small to medium fruit; skin yellow streaked with bright red; juice golden, of high specific gravity, aroma and flavor very characteristic; sugar content high, fermentation moderate. Produces a cider of high-vintage quality, containing the correct balance of sugar, acid and tannin. Harvest date October 1 at Geneva, New York. Tree vigorous and productive. Most famous of the older English cider apples. B27M{SC}, C27T{SC}, C30M, E84{OR}, G65M, H90M{SC}, LI, L12, M11M{PR}, M22

**Frequin Rouge:** Bittersweet type. Small to below medium fruit; skin yellow, highly blushed with red; juice very well colored, intensely perfumed, of high flavor; rich in tannin, acidity sufficient; ripens in November, keeps well. Makes an excellent cider of good color. Tree moderately vigorous, upright, very productive. Old French cultivar of unknown origin. U7J{SC}

**Grosse Launette:** Medium to large, roundish fruits; skin greenish-yellow, dotted with russet gray near the stem; juice moderately colored, of good flavor, very bitter and astringent, well perfumed, notably rich in sugar and tannin. Good for blending. Tree vigorous and productive, semi-vertical, excessively fertile. Originated in Bretagne, France. M22

**Harry Masters' Jersey:** Bittersweet type. Small to medium-sized, conical fruit; skin greenish-yellow blushed with dark red; flesh white, dry, sweet and astringent. Harvested in early November; milling period more than 3 weeks. Cider medium to full bittersweet, of very good quality. Tree medium-sized, semi-spreading; bears good crops biennially; pollinates with Yarlington Mill. Originated in Somerset, England. WILLIAMS, R.; H90M{SC}, M22, 081

**Herefordshire Redstreak:** (Redstreak) Bittersharp type. Prominently striped fruit with a sharp culinary flavor. Produces excellent cider. Medium-sized tree with an open spreading habit. Very similar to Foxwhelp. The original Redstreak, introduced in the early 1600's, established the cider growing reputation of Herefordshire, England. MORGAN, J.; A91

**Hughes' Crab:** (Hewe's Virginia Crab) Fruit small, about 1 1/2 inches in diameter, nearly round; skin dull red, dotted with white specks, obscurely streaked with greenish-yellow; flesh fibrous, with an acid, rough, astringent flavor; when ground, runs clear and limpid from the press, and ferments very slowly. Often mixed with rich, pulpy apples, to which it imparts a good deal of its fine quality. BETTS, PROULX; J93, J93{SC}, L90M

**Kingston Black:** Bittersharp type. Medium-sized, conical fruit; skin deep purplish-crimson over yellow-orange ground color; juice moderately sweet, aromatic, pleasantly acidic with an astringent aftertaste. Harvest date September 15 at Geneva, Nov York. Produces a full-bodied, distinctive cider of "vintage" quality without blending. Tree medium-sized, spreading, fairly productive. Difficult to grow. Susceptible to scab and canker. WILLIAMS, R.; A91{SC}, B27M{SC}, C30M, C34, E23Z, E84{OR}, G65M, J61M, LI, L12, M11M{PR}, M22, 081

**Major:** Bittersweet type. Medium-sized, greenish fruit; juice low in acidity, tannin content medium, high in sugar for an early cultivar; ripens in late September and early October. Produces cider that is among the best of the bittersweets of its season. Tree fairly vigorous, spreading, bears well biennially. Highly esteemed in Devon, England. WILLIAMS, R.; C27T{SC}

**Marechal:** Bittersweet type. Large, elongate-conical fruit; skin greenish-yellow, striped with red; flesh creamy white, firm and juicy; juice perfumed, well colored, very bitter and astringent but rich. Good for blending. Harvest date October 5 at Geneva, New York. Tree very vigorous and productive; blooms late. H90M{SC}

**Medaille d'Or:** Bittersweet type. Small to medium-sized, conical fruit; skin golden-yellow, with grayish-brown russeting. Juice very high in sugar, density and tannin; highly perfumed, strongly astringent and bitter, below average in color. Harvest date September 25 at Geneva, New York; milling period more than 3 weeks. Cider full bittersweet, often alcoholic and fruity, of good quality. Tree small

and spreading, haidy, excessively productive. Originated in Normandy, France. One of the principal apples used in the production of *calvados*. WILLIAMS, R.; L12, M11M{PR}, M22

**Morgan Sweet:** Pure sweet type. Very large, greenish-yellow fruit, sweet and juicy. Produces a light, fruity cider ready for drinking before Christmas. Also eaten fresh. Formerly widely grown for early September eatiqg apples supplied to South Wales mining towns. Now reserved for cider making. Apparently originated in Somerset, England in the 18th century. MORGAN, J.; 081, Q30{SC}

**Nehou:** Bittersweet type. Small to medium-sized, conical fruit; skin waxy, butter-yellow, very distinctive; flesh white, soft, easily bruised, juicy, sweet and astringent. Harvest date September 10 at Geneva, New York; ready for pressing up to 3 weeks after harvest. Cider full bittersweet, astringent, fruity, full-bodied, good to excellent in quality. Tree medium-sized, semi-spreading, yields well. Originated in France. WILLIAMS, R.; LI

**Porter's Perfection:** Bittersharp type. Small to medium-sized, conical fruit; skin greenish-yellow blushed with dark red; flesh white, crisp, juicy, sharp with no astringency. Harvested in late November; milling period more than 3 weeks. Cider medium bittersharp, of average to good quality. Tree large, vigorous, spreading, heavy yielding. Originated in Somerset, England. WILLIAMS, R.; F88G, F91T{SC}, I61M{SC}, LI, L1{ES}

**Reine des Hatives:** Bittersweet type. Small to medium-sized, somewhat conical fruit; skin greenish-yellow washed with carmine pink; flesh mild, fairly tender, sugary, highly perfumed, of very agreeable flavor; juice not abundant, fairly colored, slightly bitter. Harvested late September to early October. Tree vigorous, upright; blossoms early; very productive. Originated in Yvetot, France. First fruited in 1872. M22

**Reine des Pommes:** Bittersweet type. Medium to large fruit; skin greenish-yellow, strongly tinted with deep red; juice sugary, well colored, perfumed, very high in density and tannin, low in acidity. Makes a bitter, full-bodied cider of character. Excellent for blending. Harvest date September 25 at Geneva, New York; keeps well. Tree very vigorous, upright, extremely productive. Originated in Bretagne, France. H90M{SC}, N24M

**Stoke Red:** Bittersharp type. Small to medium-sized fruit; skin yellow flushed with red; juice high in tannin and density, acidity moderate, sugar content above average; bitter astringency prominent in after taste. Harvested in late November, ready for milling over a period of more than 3 weeks. Produces a fruity cider of "vintage" quality without blending. Tree medium-sized, spreading, fairly vigorous; precocious; bears heavy crops. Originated in Somerset, England. WILLIAMS, R.; M22

**Sweet Coppin:** Sweet type. Medium to large, conical fruit; flesh white, soft and sweet with no astringency. Harvested late October to mid-November, ready for milling over a period of more than 3 weeks. Yields a pure sweet cider, or occasionally mildly bittersweet. Tree large, semi-spreading; precocious, bears very good crops biennially. Originated in Devon, England. WILLIAMS, R.; H90M{SC}, M22

**Taylor's:** (Taylor's Sweet) Sweet to mild bittersweet type. Greenish-yellow fruit, blushed with red; sweet juice. Harvested early to mid October. Produces sweet or mildly bittersweet cider of fair quality. Mainly used as a pollinator for Tremlett's Bitter. Originated in Somerset, England. MORGAN, J.; H90M{SC}, LI, 081

**Tremlett's Bitter:** Bittersweet type. Medium-sized, conical fruit; skin yellow blushed with red; flesh white, sweet and astringent. Harvest date September 25 at Geneva, New York; ready for milling up to 3 weeks after harvesting. Yields a full bittersweet cider with hard and bitter tannin. Tree medium-sized, spreading; precocious, bears very good crops biennially. Originated in Devon, England. WILLIAMS, R.; C30M, F88G, LI, L12, M11M{PR}, M22, 081

Vilberie: (Villebery) Bittersweet type. Flattened, dark green fruit; full bittersweet juice. Produces cider with a good full-bodied flavor. Harvested early to mid November. Large, spreading tree. Originated near Dinan, Brittany. Introduced into Herefordshire, England in the 19th century. MORGAN, J.; H90M{SC}

Yarlington Mill: Bittersweet type. Medium to large, conical fruits; juice low in acid, sugary, tannin content medium. Produces a medium bittersweet cider of good body, aroma and flavor. Harvest date October 10 at Geneva, Nov York; ready for pressing over a period of more than 3 weeks after harvesting. Tree medium-sized, semi-spreading; precocious, bears excellent and regular crops. A superior all-round cultivar. Originated in Somerset, England. WILLIAMS, R.; A91{SC}, C27T{SC}, C30M, E84{OR}, F88G, F91T{SC}, G65M, H90M{SC}, LI, 081

#### COOKING APPLES

Although the dividing line between cooking and dessert apples is not always sharply defined and there is much overlapping, tart, sharp or sour apples are usually best cooked. Cooking apples which have a high acid content usually become fluffy or frothy when cooked.

#### SUMMER HARVESTING

Arthur Turner: Large, round to conical fruit; skin light green blushed with orange-red, attractive; flesh yellowish-white, coarse, rather dry, pleasantly acid; ripens early, hangs well on the tree and also keeps well. Requires a longer cooking time than other cultivars, bakes well. Tree upright, of moderate to vigorous growth; bears abundant crops regularly; fairly resistant to scab. Originated in Berkshire, England. Introduced in 1915. SANDERS, SIMMONS 1978; M22, 081, Q30{SC}, R83

Cauley: Extremely large fruit, 3 inches or more in diameter, often weighing as much as a pound; skin green with faint red stripes; flesh yellow, crisp, juicy; season early July to the end of August; resembles Yellow Newtown. Excellent for culinary and jelly use. Tree a heavy bearer, averaging 26 bushels per tree. Introduced by the Mississippi Agricultural Experiment Station. BROOKS 1972; C30M

Duchess of Oldenburg: (Duchess) Large, roundish fruit; skin pale greenish-yellow, prominently striped and mottled with bright red and crimson; flesh tinged with yellow, firm, crisp, juicy, sprightly subacid, aromatic; too acid for dessert, good to very good for culinary purposes. Tree medium-sized, upright-spreading becoming roundish. Known in Russia in the 1700's. BEACH; A91, A91{SC}, C58, E84, F53, F88G, G16, G16{DW}, G65M, H65, I49G, LI, L12, L27M, M11M{PR}, etc.

Emneth Early: Medium-sized, conical fruit; skin pale yellow, slightly blushed with red; flesh white, tends to soften quickly, cooks to a froth; ripens very early, during July and August. Tree moderately vigorous, precocious, heavy bearing. Originated in England in 1899. SIMMONS 1978; M22, 081

Gravenstein: Fruit medium-large, oblate to roundish; skin greenish-yellow, blushed with light and dark red; flesh yellowish, firm, crisp, juicy, sprightly subacid, aromatic; dessert quality very good, excellent for cooking; ripens unevenly. Tree large, vigorous; productive; requires a pollinator. A very old European apple of uncertain origin. BEACH; B53, B83, E23Z, E631{PR}, E84, F88G, G79M{DW}, H65, H89M{ES}, I19M{PD}, J61M, LI, L1{ES}, L47, N24M, etc.

Grenadier: Large, flattened globe-shaped fruit; skin pale green, tinged with yellow; flesh white, crisp, acid, cooks to a froth, good for baking; season mid-August to October. Tree moderately vigorous, a regular and heavy bearer; resistant to scab and canker. Of unknown origin, first recorded about 1860. SIMMONS 1978; F88G, M22, 081, Q30{SC}, R83

Hall's Pink:<sup>5</sup> Medium to large, roundish fruit; skin bright red; flesh tinged with red, juicier than Gravenstein; resembles Gravenstein but ripens about 2 weeks earlier. Makes pink apple-

sauce. Tree apparently disease resistant. Originated in Merville, British Columbia, Canada. Introduced in 1980. F88G, M22

Keswick Codlin: Medium to large, roundish heart-shaped fruit; skin pale yellow, slightly blushed on the side exposed to the sun; flesh nearly white, tender, very juicy, brisk subacid, very good for culinary use, too acid for dessert unless very ripe. Makes a delicious soft apple puree. Tree medium to large, moderately vigorous. Originated in northern England, about 1790. BEACH, SIMMONS 1978; E84{OR}, F88G, LI, L12, M11M{PR}, 081, R83

Red Astrachan: Medium to large, roundish fruit; skin yellow or greenish, overspread with light and dark red; flesh white, often strongly tinged with red, crisp, tender, juicy, brisk subacid, aromatic; sometimes slightly astringent; quality good for dessert, excellent for cooking. Tree vigorous, upright-spreading; grows well in hot areas. Originated in Russia. BEACH; A91{SC}, C30M, C58, D69, E84, F88G, G65M, G79M{DW}, H65, I49G, LI, L1{ES}, M11M{PR}, N38M{SC}

White Astrachan: Fruit medium to large, roundish to roundish oblate; skin waxen yellow or whitish, with faint streaks of red, covered with dusky bloom; flesh white, fine-grained, crisp, tender, perfumed, acid; good for culinary use; season August and September. Tree vigorous; productive; does well in hot areas. Originated in Russia about 1748. BEACH; C27T{SC}, LI

#### FALL HARVESTING

Alexander: (Emperor Alexander) Large, uniform, roundish-conic fruit; skin greenish or pale yellow, blushed with bright red; flesh nearly white, firm, coarse, moderately crisp, tender, juicy, mildly subacid; dessert quality fair to good, very good for cooking. Tree vigorous, upright-spreading; hardy; moderately productive. Introduced into England from Russia in 1817. BEACH; A91{SC}, C58, E84, F88G, LI, L12, M11M{PR}, M22, N38M{SC}

Bramley's Seedling: (Bramley) Fruit large; flattened, irregular; skin greenish-yellow, slightly blushed red; flesh yellowish-white, firm, coarse, juicy, acid. Excellent for stewing and baking; best for dumplings and canning. Tree very large and vigorous; productive. Most popular cooking apple in Great Britain. SANDERS, SIMMONS 1978; A39, A53{PR}, A91, A91{SC}, B27M{SC}, C27T{SC}, C58, E84{OR}, F88G, G79M{DW}, J61M, LI, L12, M11M{PR}

Cellini: Medium-sized, round to slightly flattened fruit; skin pale yellowish-green, blushed and streaked with brownish-red; flesh white, tender, sub-acid, with an unusual resinous flavor liked by some; ripens October to November. Tree stocky, very productive. Originated in England. Introduced in 1828. SIMMONS 1978; M22, 081

George Neal: Large, flat-round fruit; skin green changing to whitish-yellow, often slightly blushed red, thin and smooth; flesh greenish-white, crisp, juicy, coarse; flavor excellent, sweet yet somewhat acid; cooks yellow and remains in intact slices; ripens in midseason. Tree of moderate growth, bears freely and regularly. Originated in Kent, England. Introduced in 1923. SANDERS, SIMMONS 1978; M22, 081

Gloria Mundi: Fruit large to very large, roundish; skin greenish-yellow, sometimes with a faint bronze blush; flesh slightly tinged with greenish-yellow, coarse, moderately crisp, rather tender, juicy, mildly subacid; quality fair for dessert, good for culinary purposes or exhibition. Known in New York, New Jersey and Pennsylvania prior to 1804. BEACH; A91{SC}, C30M, E84, 081, Q30{SC}

Golden Noble:<sup>1</sup> Fruit medium to large, round-conical; skin golden-yellow, slightly speckled with grey and brown; flesh creamy-white, slightly soft, juicy, fairly fine-textured; ideal for baking, cooks to a golden rich-flavored froth. Exceeds most other edible apples in vitamin C. Tree small, compact; precocious; bears heavily and regularly. Discovered at Downham, Norfolk, England. Introduced in 1820. SANDERS, SIMMONS 1978; A91{SC}, LI, L12,

M11M{PR}, M22, 081, Q30{SC}

Howgate Wonder: Very large, round-conical fruit; skin greenish-yellow, blushed and striped with orange-brown or red; flesh creamy-white, firm, fine-textured, fairly acid; excellent for culinary use, becoming dirty yellow and cooking to a froth. Tree vigorous; a heavy and regular cropper. Raised in the Isle of Wight about 1915. SANDERS, SIMMONS 1978; F88G, M22, 081, Q30{SC}, R83

Maidenblush: Medium to large, oblate fruit; skin pale waxen yellow, blushed with crimson, very attractive; flesh white, fine-textured, tender, very juicy, subacid; quality good, especially for culinary purposes. Tree medium-sized, vigorous, spreading. Named by Samuel Allinson of Burlington, New Jersey; first described in 1817. BEACH; A91, A91{SC}, B27M{SC}, C27T{SC}, C76M, E84{OR}, F88G, G65M, I49G{SC}, LI, L12, L27M, M11M{PR}, N38M{SC}

Milwaukee: Fruit rather large; distinctly oblate, sides often unequal; skin pale yellow or whitish, more or less blushed with red; flesh whitish tinged with yellow, firm, somewhat coarse, crisp, very tender, very juicy, sprightly, brisk subacid; dessert quality fair to good, well-suited for culinary use. Tree moderately vigorous, upright. BEACH; C58, I49G{SC}, L27M

Peasgood Nonesuch: Fruit large to very large; round, slightly flattened; skin golden yellow, blushed and striped with bright crimson; flesh yellowish, soft, very juicy, subacid; cooks to a froth, also very good for baking. Tree moderately vigorous, spreading; fairly productive. Raised by a Mrs. Peasgood at Stamford, Lincolnshire, England from a seed planted in a pot about 1858. SANDERS, SIMMONS 1978; F88G, M22, 081, Q30{SC}

Pound Sweet: (Pumpkin Sweet) Large to very large, globular fruit; skin clear yellow, marbled with greenish-yellow; flesh tinged with yellow, medium in texture, firmness and juiciness, decidedly sweet with a peculiar flavor; good for culinary use, especially esteemed for baking or stewing with quinces. Tree vigorous, upright-spreading. Originated in Manchester, Connecticut, prior to 1834. BEACH; A91, A91{SC}, B27M{SC}, C27T{SC}, C58, C76M, D69, F88G, G65M, H65, H89M, L12, L27M, M11M{PR}, M99G, etc.

Reverend W. Wilks: Fruit very large; round-conical to conical; skin pale yellowish-green, thinly striped with red; flesh creamy-white, soft, juicy, only slightly acid, cooks to a pale yellow froth. Tree small, compact; prolific, but tends to be biennial, bears fruit on short spurs; disease resistant. Originated in England. Introduced in 1908. SANDERS, SIMMONS 1978; M22, 081, Q30{SC}, R83

Rhode Island Greening: Medium to large, roundish or slightly conical fruit; skin yellowish pale-green; flesh yellowish, firm, crisp, tender, juicy, rich, sprightly subacid, peculiarly flavored; quality very good for dessert, excellent for culinary purposes. Tree vigorous, spreading; moderately productive. Probably originated in Newport, Rhode Island in the 17th century. BEACH; A53{PR}, A91{SC}, C27T{SC}, E84, F88G, G79M{DW}, H65, LI, L12, M11M{PR}, M59M, N38M{SC}

Rome Beauty: Medium to large, roundish fruit; skin yellow or greenish, mottled with bright red; flesh nearly white, very firm, crisp, juicy, slightly aromatic, mildly subacid, fairly good for dessert, excellent for baking; keeps and ships well. Tree medium-sized, moderately vigorous; productive. Originated in Lawrence County, Ohio prior to 1848. BEACH; A91{SC}, C54, D81{P0}, D81M{P0}, E84, G65M, G72{DW}, I23M{PD}, LI, M11M{PR}, M69M

Tolman Sweet: Medium-sized, nearly globular fruit; skin pale clear-yellow; flesh white, firm, moderately juicy, decidedly sweet; dessert quality good to very good, highly esteemed for pickling, boiling and baking. Tree moderately vigorous, very spreading; long-lived; very hardy. BEACH; A53{PR}, A91, A91{SC}, B27M{SC}, E84{OR}, G65M, G79M{DW}, H65, LI, L12, L27M, M11M{PR}, N38M{SC}

Warner's King: Fruit large to very large; flat-round to slightly conical; skin yellow, slightly blushed with pinkish-brown; flesh greenish-white, firm, coarse, crisp, juicy, very acid; excellent for culinary use, cooking to a very fine froth. Tree very vigorous and productive. Known since the end of the 1700's in Great Britain. SANDERS, SIMMONS 1978; 081, Q30{SC}, R83

#### WINTER HARVESTING

Bismark: Large to very large, round-conic fruit; skin pale yellow, prominently blushed and striped with dark-crimson; flesh white, crisp, juicy, subacid, cooks to a greenish-yellow froth. Tree moderately vigorous, spreading; hardy; productive. Probably originated at the old German settlement in Hobart, Tasmania, about 1870. SANDERS, SIMMONS 1978; M22, Q30{SC}, R83

Crawley Beauty:<sup>4</sup> Medium to large, flat-round fruit; skin bright yellow-green blushed with brownish-red, with broken stripes of darker red; flesh greenish-white, firm, not very juicy, tart; flavor fairly good for dessert, improves when cooked; season December to March. Tree vigorous, spreading; resistant to most diseases; blooms late, about the latest flowering of all recorded apple cultivars. Originated in Crawley, England about 1870. SANDERS, SIMMONS 1978; F43M, F88G, M22, 081

Crimson Gold: Small to medium-sized fruit; skin red, covered with a dusky bloom. When quartered or sliced and then boiled, the flesh remains solid and takes on a golden yellow color, stained red on the edges by the skin; the result is a product resembling canned peaches; flavor excellent. Developed by Albert F. Etter of Ettersburg, California. Selected for its outstanding quality for canning. E84

Edward VII: (King Edward) Medium to large, roundish fruit; skin pale yellowish-green, faintly blushed with brownish-red; flesh creamy white, very firm but tender, rather coarse, juicy, acid, cooks to a somewhat red, translucent puree. Tree vigorous, upright; moderately productive; slow to come into bearing. Originated in Worcester, England. Introduced in 1908. SANDERS, SIMMONS 1978; A91{SC}, C27T{SC}, G65M, J61M, J93{SC}, L12, M11M{PR}, M22, 081, Q30{SC}

French Crab: (Easter Pippin, Apple John, Two Year Apple) Fruit medium-sized, round to conical; skin yellowish-green, often blushed with dull brownish-red; flesh greenish-white, very firm, crisp, acid, very astringent; good for culinary use; will keep up to 2 years. Tree vigorous, productive. Of French origin; brought to England in 1700. SIMMONS 1978; 081

Lane's Prince Albert: Medium to large, round-conical fruit; skin greenish-yellow, slightly blushed with orange or red; flesh greenish-white, fine-textured, firm, juicy, acid; excellent for culinary use, remaining fairly intact on cooking. Tree small, weeping, of weak growth; suitable for small gardens. Originated in England. Introduced about 1850. SANDERS, SIMMONS 1978; 081, Q30{SC}, R83

Monarch: Large, roundish fruit; skin pale yellow, blushed and striped with deep-red, attractive; flesh white, soft, acid, good for culinary use. Excellent for grilling. Ripens in November and December, will keep until April with careful storage. Tree vigorous, productive, tends toward biennial bearing; resistant to scab. SIMMONS 1978; M22, 081, Q30{SC}, R83

Newton Wonder: Fruit large to very large, flat-round; skin bright yellow, blushed brownish-red to very bright red; flesh yellowish, firm, crisp, juicy, acid, slightly astringent; excellent for culinary use, cooking to a yellow froth; ripens in November; keeps in natural storage until April. Tree vigorous, somewhat spreading; productive. Raised at Melbourne, Derbyshire, England, about 1887. SANDERS, SIMMONS 1978; I49G{SC}, 081, Q30{SC}, R83

#### CRAB APPLES

Apples which are two inches or less in diameter are generally considered crab apples. They vary in flavor, taste and use. Some are suitable for jelly, others for canning and freezing, and still

others as small dessert apples. Crossing crab apples and standard apples has produced useful hybrids called *apple crabs*, especially in the prairie provinces of Canada. They are large crab apples that taste like dessert apples. F74M{PD}

### COOKING

Almata:<sup>5</sup> Fruit large, 2 1/2 inches in diameter, round to conical; skin solid brilliant red; flesh bright red throughout, juicy, pleasantly subacid, suitable for sauce, jelly and pickling; season early winter. Tree very hardy; susceptible to scab; ornamental, with reddish leaves and blossom. Originated in Brookings, South Dakota by N.E. Hansen. Introduced in 1942. BROOKS 1972; A91, A91{SC}, B27M{SC}, C30M, I49G{SC}, J61M, L12, L27M, M11M{PR}, M11M{PD}, M22

Callaway: Medium-sized, red fruit, about 1 inch in diameter; very pleasing flavor, good for jelly; ripens in September. Vigorous, productive tree with pink flowers. Originated at Callaway Gardens in Pine Mountain, Georgia. B9M, B52, E45, F93, G8, G65M, H4, K37M, M69M

Cranberry:<sup>5</sup> Fruit small; long, conic pointed; skin dark red; flesh red, crisp, acid; excellent quality for jelly; ripens in early September. Tree vigorous, upright when young; productive; hardy; flowers red; useful as an ornamental. Redflesh x Dolgo. Originated in Wyndmere, North Dakota. BROOKS 1972; U7J{SC}

Dartmouth: Medium to large, oblate fruit; skin pale yellow, almost entirely overlaid with bright red; flesh yellowish, tinged with red near the skin, fine-grained, juicy, mildly subacid, flavor and quality good. Tree moderately vigorous, upright-spreading; comes into bearing mther early, yields full crops in alternate years. Originated in New Hampshire prior to 1883. BEACH; I61M{SC}, R83

Dolgo: Fruit large, 1 to 1 1/2 inches in diameter, long-conical; skin brilliant crimson; flesh very juicy, sprightly, somewhat acid, good for dessert when fully ripe, very good for culinary use. Jells easily, producing a rich, ruby-red jelly of beautiful color and excellent flavor. Tree vigorous, upright-spreading; prolific; hardy. Introduced from Russia by N.E. Hansen of South Dakota, in 1897. A91{SC}, B4, E45, K64, LI, L1{ES}, L70, M11M{PR}, M35M, M69M

Florence: Medium-sized, oblate fruit; skin yellowish-white, mostly overspread with brilliant pinkish-red; flesh tinged with yellow, coarse, crisp, rather tender, juicy, very brisk subacid, somewhat astringent; quality good for jelly or pickling; season late August and early September. Tree moderately vigorous; precocious; very prolific. Originated in Excelsior, Minnesota by Peter M. Gideon, prior to 1886. BEACH; N33

Geneva:<sup>5</sup> (Geneva Redflesh) (M. *pumila* 'Niedzwetzyana') Medium to large, attractive fruit; very tart, red flesh; eating quality fair. Excellent for jelly, cider and juice (blended with other juice for color). Tree hardy; resistant to apple scab; red-leaved. Originated in Ottawa, Ontario, Canada by Canada Department of Agriculture Research Station. Introduced in 1930. BROOKS 1972; C30M, F88G, J93{SC}, M22, N24M

Hyslop: Medium to large, roundish-ovate fruit; skin clear pale yellow, prominently blushed with dark red; flesh yellow, very firm, at first juicy but eventually becoming dry and mealy, subacid, astringent, good for culinary purposes; season late September and October. Tree vigorous, upright-spreading; a reliable cropper; bears fruit in clusters; very handy. Origin unknown; first raised sometime prior to 1869. BEACH; B27M{SC}, B45M, F88G, I61M{SC}, J68, M11M{PR}, M22

John Downie: Medium to large, oval fruit; 1 1/4 inches long, 1 inch in diameter; skin orange-yellow, blushed with scarlet, attractive; makes excellent jelly and preserves. Tree very productive; highly ornamental. Originated in Lichfield, England. Introduced into the United States in 1927. BROOKS 1972; I61M{SC}, M22, 081, Q30{SC}, R77, R83

Ralph Shay: (Shay) Fruit about 1 1/4 inches in diameter; brilliant red; makes excellent jelly; retains its color longer than others; never drops. Tree vigorous, sturdy; with unusually dark-green, disease resistant foliage. Introduced by Simpson Nursery Company, Vincennes, Indiana. Wolf River x Zumi Calocarpa. Named for Dr. Ralph Shay, formerly in charge of the fruit breeding program at Purdue University. C27T{SC}, J93, J61M, J93{SC}, K77, M92

Redflesh:<sup>5</sup> Large oblong fruit, 2 inches long; skin deep red; flesh red, makes a clear red jelly, also good for whole preserves. Tree spreading; blooms late; bears biennially; ornamental, with copper colored leaves and red flowers. Originated in Brookings, South Dakota by N.E. Hansen, South Dakota Agricultural Experiment Station. Introduced in 1928. BROOKS 1972; F91T{SC}, J61M

Redflesh Winter:<sup>5</sup> Fruit round; skin solid red; flesh red, very firm, moderately juicy, pleasantly subacid; excellent for sauce and jelly. Tree ornamental, with dark-colored leaves and abundant purple flowers. Originated in Brookings, South Dakota by N.E. Hansen, South Dakota Agricultural Experiment Station. Introduced in 1946. BROOKS 1972; A91, A91{SC}, L27M

Transcendent: Fruit medium to large; roundish-oval, flattened at the ends; skin clear bright yellow with bright red cheek, covered with delicate white bloom; flesh yellow, crisp, juicy, somewhat astringent, subacid, very good for culinary uses; season late August to mid-September. Tree large, very spreading; hardy; bears heavily and annually. Known prior to 1844. BEACH; A88M, B45M, B93M, C54, F88G, I53M, I61M{SC}, J68, K76, LI, N20

Whitney: Large, roundish fruit; skin light yellow, largely shaded and striped with red; flesh yellowish, crisp, juicy, mildly subacid or nearly sweet, with slight crabapple flavor; good for dessert when fully ripe, very good for culinary use; season late August and early September. Tree vigorous, upright; precocious; very productive. Originated in Franklin Grove, Illinois by A.R. Whitney, prior to 1869. BEACH; A74, A91{SC}, B27M{SC}, D65, D76, G4, G16, G16{DW}, H65, LI, L70, M39M

Young America: (Young) Fruit large, one of the largest of the edible crabs; skin bright red; flesh pleasantly acid, flavor distinctive; quality good for dessert, excellent for culinary use. Jelly made from the fruit is clear, beautiful red and of very good flavor; season mid-September. Tree very vigorous and hardy; productive; ornamental. Introduced by the New York Agricultural Experiment Station in 1925. G65M, I49G{SC}

### DESSERT

Centennial: Fruit oval, 1 1/2 to 2 inches in diameter; skin orange-yellow, fully striped with bright scarlet red; flesh yellow, tender, crisp, juicy; flavor mildly acid, pleasant; dessert quality very good, also good for canned sauce and jelly; ripens in early midseason. Tree vigorous; hardy; very productive; tends toward biennial bearing. BROOKS 1972; A74, B4, C34, D37, D69, I49G, I49G{DW}, J61M, J93{SC}, L12, L27M, L70, M35M

Chestnut: Applecrab. Fruit large; skin reddish-yellow, russet; flesh yellow, sweet, flavor pleasant, distinctive; dessert quality good, also very good for cooking; ripens in midseason. Tree vigorous; productive; hardy; resistant to cedar rust; a good pollinator. Originated in Excelsior, Minnesota. Introduced in 1946. BROOKS 1972; A34, A74, A91, B4, D65, D69, F53, G4, H85, I49G, I49G{DW}, L27M, L70, M35M, etc.

Humboldt: (Jumbo Transcendent) Fruit very large, twice as large as Transcendent; conical; skin cream and pink, glos^, transparent; flesh cream-colored, tinted pink near the skin, firm, juicy, quality very good; ripens in late fall, hangs on the tree long after ripening; resembles Transcendent. Tree ornamental, producing masses of large, fragrant, pink-tinted blossoms. Originated in Ettersburg, California ty Albert F. Etter. Introduced in 1944. BROOKS 1972; E84, M22

Kerr: Applegreen. Large, oval fruit, about twice the size of Dolgo; skin bright red; flesh yellow, flecked with dark red, firm, crisp, juicy; flavor sweet, sprightly acid; dessert quality good when mellow, makes good preserves and excellent jelly; season mid-September, keeps well until February. Tree vigorous, very hardy and productive. Originated in Morden, Manitoba. BROOKS 1972; A65, B47, D69, F67, G54, G66, H85, I49G{SC}, I49M, L27M, M22, M35M, N24M

Renown: Applegreen. Small to medium-sized fruit, 1 1/4 to 1 1/2 inches in diameter; skin yellow splashed with dull red; flesh white, flavor pleasing, excellent for dessert purposes; ripens in early September, stores well. Tree moderately hardy. Originated in Indian Head, Saskatchewan, Canada. Introduced in 1936. RONALD; B47, G54

Rescue: Applegreen. Large, round-ovate fruit, 1 1/2 inches or more in diameter; skin greenish-yellow, washed and striped red; flesh yellowish-white, firm, flavor sweet, subacid, pleasant; season late August; quality good. Tree medium tall, rounded; very hardy; adapted to northern areas. Originated in Scott, Saskatchewan, Canada. Introduced in 1933. BROOKS 1972; A16, A65, B47, G54, H42, H85, I49G{SC}, K64, M22, N24M

Rosthern 18: Medium to large fruit, up to 1 3/4 inches in diameter; skin greenish-yellow with red stripes; flesh white, pleasant to eat out of hand; ripens in mid-September; keeps well in cold storage. Tree vigorous, hardy, moderately productive. Originated in Rosthern, Saskatchewan, Canada. Introduced in 1936. BROOKS 1972; A91{SC}, B47, I61M{SC}

Shafer: Applegreen. Medium to large fruit, 1 1/2 to 2 1/4 inches in diameter; skin yellow, blushed with red; flesh yellow, tender, slightly coarse, sweet and pleasant for fresh eating; quality good; ripens in early September. Rescue x Trail. Originated in Poplar Point, Manitoba, Canada. RONALD; B47, H85, K64

Trail: Applegreen. Fruit large, about 1 1/2 inches in diameter; skin yellow, splashed and striped with orange-red; flesh yellow, dessert and processing qualities good. Tree hardy, productive. Northern Queen x Rideau. Originated in Ottawa, Ontario, Canada by Canada Department of Agriculture Research Station. Introduced in the 1920's. BROOKS 1972; A65, B47, H85, K64, M35M

Wickson: Small, oblong fruit, 1 to 2 inches in diameter; skin brilliant red; flesh sweet (up to 25% sugar), with abundant, high-flavored juice; suitable for dessert as well as for pickling, jam and jelly, excellent for cider. Tree vigorous; very prolific, produces fruit on 1 year old branches. Originated in Ettersburg, California by Albert F. Etter. Introduced in 1944. BROOKS 1972; A91, A91{SC}, C27T{SC}, C30M, E84, F88G, LI, L12, M11M{PR}, N24M

## DESSERT APPLES

### SUMMER HARVESTING

Adina:<sup>2</sup> Large, round-conic fruit; skin red to purple-red with an occasional overlying stripe; flesh creamy white, firm, juicy; flavor sweet with a distinctive hint of cinnamon; ripens in mid-June. Tree vigorous and precocious. Low chilling requirement, only 350 hours. Originated in Australia. A63, I68, I83M, L33, L33{DW}

Anna:<sup>2</sup> Large, conical fruit; skin red-cheeked; flesh subacid to sweet, flavor mild; season June and July, sometimes with a second crop in the fall. Tree vigorous; annually productive; requires a pollinator, such as Ein Shemer or Dorsett Golden. Low chilling requirement. Originated in Doar Na Shomron, Israel by Abba Stein. Introduced into the United States in 1965. BROOKS 1972; A82, C75M, E45, F93, G17, G49, H4, I53M, I83M, LI, L1{ES}, L47, L90, M69M, N33, etc.

Anoka: (Champion Supreme) Large, conical fruit; skin yellow, heavily striped and overlaid with red; flesh mild, subacid; dessert quality poor, suitable for culinary use; ripens early. Tree very hardy; productive; bears at a very young age, often the first or second year

after planting. Originated in Brookings, South Dakota by N.E. Hansen. Introduced in 1920. BROOKS 1972; C27T{SC}, D76, F91T{SC}, G65M, K36, L27M, L70

Apple Babe:<sup>3</sup> Medium-sized, conical fruit; skin red, russet-free, waxy, attractive; flesh crisp, sweet, juicy, very flavorful; ripens about 6 weeks before Garden Delicious; resembles Red Delicious. Tree a genetic dwarf, growing only 8 to 10 feet tall when mature; heavy bearing; pollinated by Garden Delicious. Chilling requirement 700 hours. Originated in Modesto, California by Floyd Zaiger. A88M, N20

Beacon: Fruit very large; skin solid red, covering almost the entire surface, tough; flesh juicy, mildly acid; quality good, superior to Maidenblush, Duchess and Wealthy; matures about August 1, 10 to 14 days before Weakly. Tree productive; resistant to fire blight and scab; quite susceptible to cedar rust. BROOKS 1972; A74, A74{Dm}, A91, A91{SC}, C27T{SC}, G4, H89M, I49G, I49G{SC}, L27M, L70, M11M{PR}

Benoni: Small to medium, roundish to conic fruit; skin orange-yellow, partly covered with lively red, striped with deep carmine; flesh yellow, firm, crisp, fine-grained, tender, juicy, pleasantly subacid; quality good to very good; season August and early September. Tree large, vigorous; yields fair to good crops biennially. Originated in Dedham, Massachusetts, where the original tree was still standing in 1848. BEACH; B27M{SC}, C27T{SC}, E84{OR}, G65M, K36, L12, M11M{PR}, N38M{SC}

Beverly Hills:<sup>2</sup> Small to medium-sized, roundish fruit; skin pale yellow with red stripes, splashed with red; flesh white, tender, juicy, somewhat tart; suitable for dessert or cooking; ripens early; resembles McIntosh. Tree medium-sized, vigorous. Low chilling requirement. Originated in Los Angeles, California. Introduced in 1945. BROOKS 1972; C54{ES}, D23M, G65M, I68, I83M, K88T, L47, N20

Carroll: Medium-large fruit; skin light-green, completely striped with red; dessert quality very good, also suitable for cooking; season late August to early September, keeps well into December. Tree semi-dwarf, growing 8 to 10 feet tall and spreading to 15; hardy; moderately productive. Originated in Morden, Manitoba, Canada. BROOKS 1972; A65, C27T{SC}, F88G, H85, I49G, I49G{SC}, K64, L12, L27M, M35M

Cole's Quince: Large, yellow, ribbed fruit; flesh when first ripe firm, juicy, pleasantly acid, excellent for cooking, when very mellow remarkably tender, of a mild, rich, high quince flavor and aroma; ripens in August. An old Maine apple; first described in "Cole's American Fruit Book" published in 1849. A91{SC}, C27T{SC}, F88G, L12, M11M{PR}, N38M{SC}

Dayton:<sup>4</sup> (Coop 23) A new disease resistant apple from the University of Illinois. Medium-sized, roundish fruit; skin cherry red; flesh crisp, juicy, flavor spicy and mildly tart; season late August to early September. Tree vigorous, bears annually. Appears to have good resistance to all major apple diseases. Much more rust-resistant than Prima. A5, A39, B74, C27T{SC}, C30M, J61M, J89M

Devonshire Quarrendon: Small to medium, flat-round fruit; skin yellowish-green, heavily blushed with dark-crimson; flesh greenish-white, crisp, firm, very juicy, with a distinctive vinous flavor; season August to September. Tree moderately vigorous, upright-spreading; susceptible to scab. Very old English apple, mentioned in the "Compleat Planter and Cyderist" published in 1690. SANDERS, SIMMONS 1978; F88G, L12, M11M{PR}, M22, 081

Discovery: Medium-small, flat-round fruit; skin pale greenish-yellow, prominently blushed with brilliant crimson-red; flesh creamy-white tinged with pink, firm, juicy, crisp, fine-textured; flavor good for a summer apple; season mid-August. Tree moderately vigorous, upright-spreading; very productive. Popular commercial cultivar in England. SANDERS, SIMMONS 1978; A91, A91{SC}, G66, F88G, H90M{SC}, I61M{SC}, M22, 081, R83

Dorsett Golden:<sup>2</sup> Medium to large, round-conic fruit; skin golden yellow, sometimes blushed with light-red on the side exposed to the sun; flesh firm, crisp, juicy, sweet; quality good; ripens early. Tree self-fruitful; excellent pollinizer for Anna. Extremely low chilling requirement, less than 100 hours. Originated in Nassau, New Providence Islands, Bahamas. Introduced in 1964. BROOKS 1972; A82, C75M, E45, E99M, F93, G17, G49, I49M, I53M, I83M, L1, L1{ES}, L47, L90, M69M, N33, etc.

Early Dawn:<sup>2</sup> Medium-sized fruit, about 1/2 pound; skin yellow, blushed with red, attractive; flesh crisp, juicy, aromatic, subacid; suitable for dessert or cooking; ripens in August. Tree vigorous; disease resistant; grows well in hot inland climates as well as under coastal conditions. Low chilling requirement, 250 hours or less. Originated in Ontario, California by L.D. Claypool. 183M

Early Harvest: Fruit medium to large; oblate to nearly round; skin clear pale waxen yellow, thin, tender; flesh white, crisp, tender, juicy, at first briskly subacid but eventually becoming milder; suitable for dessert or culinary use; season late July and August. Tree medium-sized, moderately vigorous and productive. Of unknown origin; listed by McMahon in 1806. BEACH; A82, A91, A91{SC}, C27T{SC}, C30M, E84{OR}, F88G, I9M, I49G{SC}, L12, L27M, M11M{PR}, N38M{SC}

Early Joe: Small to medium, oblate-conic fruit; skin pale greenish-yellow, striped and blushed with dull dark-red; flesh tinged with yellow, crisp, very tender, very juicy, mildly subacid; flavor and desert quality excellent; season August and September. Tree moderately vigorous, dwarfish. Originated with Northern Spy in the orchard of Heman Chapin, East Bloomfield, New York. BEACH; A91{SC}, B27M{SC}, C30M, L12, M11M{PR}, N38M{SC}

Early Strawberry: Medium-sized, roundish fruit; skin waxy, entirely red or yellow nearly covered with a rich dark red; flesh whitish-yellow often with streaks of red, crisp, tender, juicy, subacid, aromatic, sprightly; quality very good for dessert or culinary use; season August. Tree hardy; precocious; productive. Originated in New York prior to 1838. BEACH; C27T{SC}, E84{OR}, L12, M11M{PR}, N38M{SC}

Ein Shemer:<sup>2</sup> Fruit medium-sized, conical to roundish; skin greenish-yellow; flesh crisp, melting, tender, moderately juicy, subacid; quality good; season June and July. Tree medium-sized; very precocious; productive; good pollinizer for Anna. Very low chilling requirement. Originated in Doar Na Shomron, Israel. Introduced in 1963. BROOKS 1972; A63, C75M, E45, E99M, G49, H4, I53M, I68, I83M, L90, M83, N20, Q93

Elah:<sup>2</sup> Medium-sized fruit; skin bright canary yellow, 30% covered with a pink blush; flesh crisp, juicy, pleasantly aromatic; season mid-June to late July. Best when eaten slightly before fully ripe, as they tend to become mealy. Tree upright, semi-spreading; very precocious and prolific. Low chilling requirement. Originated in Rehovot, Israel by Chanan Oppenheimer. G17

Garden Delicious:<sup>3</sup> Small to medium-sized, conical fruit; skin yellow-green to golden-yellow, free of striping, lightly blushed with pink in warmer climates, bright red in colder areas; flesh sweet, crisp, flavorful; quality very good; ripens about 2 weeks after Golden Delicious. Tree a genetic dwarf; mature height 6 to 8 feet; slow growing; bears heavily and annually. Ideal for small gardens. Developed by Floyd Zaiger. A88M, C54, D95, I68, N20

Golden Sweet: Medium to large, roundish fruit; skin waxy, clear pale yellow when mature; flesh yellowish-white, firm, fine-grained, moderately tender, juicy, rich, very sweet, aromatic; quality good to very good; season mid-August to late September. Tree large, vigorous, roundish spreading; yields moderate to heavy crops biennially. An old Connecticut cultivar. BEACH; B27M{SC}, C27T{SC}, F88G, L12, M11M{PR}

Heyer 12: Medium-small fruit, 2 1/2 inches in diameter; skin greenish-yellow; flesh juicy, moderately coarse, acid; quality good for dessert or cooking; season mid-August to September. Tree

extremely hardy; productive; late blooming. Valuable as an early apple for northern climates. BROOKS 1972; A16, A65, A74, B47, F67, G54, G66, H85, I49G{SC}, K64, L27M, L70

Honey Sweet: (Honey Cider) Medium-sized, round-flat fruit; skin light green, blushed with light pink, light russeting; flesh crisp, juicy, sweet, translucent, aromatic; dessert quality good; season early August. Originally used as a blending apple to sweeten early apple cider. Tree upright-spreading; precocious; disease resistant. Rediscovered by Elwood Fisher at an abandoned homesite in the Shenandoah Valley of Virginia. A39, B27M{SC}, B53, C30M, E84{OR}, G65M, I49G{SC}, M99G

Horse: (Yellow Horse, Haas) Medium to large, oblate fruit; skin yellow, nearly covered with deep bright-red; flesh white, firm, somewhat tough, sprightly subacid, slightly astringent; quality poor to fair or sometimes nearly good; season October to early winter. Tree precocious; very thrifty; hardy; productive. Originated on the grounds of Gabriel Cerre, St. Louis, Missouri, prior to 1870. BEACH; A91{SC}, A91, B27M{SC}, C30M, E84{OR}, E99M, F88G, F93, G8, G65M, I41P, K76

Iowa Beauty: A high quality apple good for either dessert or culinary use Very large fruit. Yellow skin, blushed with red. Very juicy flesh with a sweet tang; the core becomes pink sugar when overripe. Hardy to about -50° F. Ripens early. Introduced by G.C. Patten. I49G, I49G{SC}, L27M

Irish Peach: Small to medium, flat-round fruit; skin pale yellow, streaked and mottled with light and dark red; flesh greenish-white tinged red, soft, slightly aromatic, fairly juicy, with a rich vinous flavor; quality very good; season early July. Tree moderately vigorous, spreading; an irregular bearer. Of Irish origin; introduced into England in 1820. SANDERS, SIMMONS 1978; A91, A91{SC}, B27M{SC}, C27T{SC}, E84{OR}, F88G, I49G, I49G{SC}, L12, L27M, M11M{PR}, M22

Jerseymac: Medium to large, conical fruit; skin yellow, blushed with red; flesh yellow-white, medium firm, slightly acid; quality good; ripens early; ships well; resembles McIntosh. Tree vigorous, upright-spreading; precocious; bears heavily and annually; blooms with Gravenstein which it pollinizes. A5, A91, A91{SC}, C27T{SC}, F53, G65M, I61M{SC}, J89M, L12, M11M{PR}, M39M, N33

July Tart: Fruit large for an early apple; skin light green shading to light yellow when fully ripe; flesh fine-grained, tender, extremely aromatic; dessert quality very good, excellent for frying and freezing; ripens before Gravenstein. Tree large, vigorous; apparently tolerant to scab and fire blight. Local apple from the mountains of Kentucky. B27M{SC}, C27T{SC}, E84{OR}, J93{SC}, K36, M22

Liveland Raspberry: (Lowland Raspberry) Fruit medium to large; skin clear waxen-white, striped, shaded and marbled with light crimson; flesh white, often stained with red, fine-grained, very tender, mildly subacid to sweet; dessert quality good, also makes a fine sauce; ripens in August, with Yellow Transparent. Tree medium-sized; tends toward biennial bearing. Originated in Russia prior to 1883. BEACH; A91, A91{SC}, B27M{SC}, E84, I49G, I49G{DW}, L27M

Lodi: Medium-sized, round-conical fruit; skin greenish-yellow, thick; flesh firm, crisp, flavor rich, sprightly; suitable for dessert and culinary use; ripens early, later than Yellow Transparent; resembles Yellow Transparent, keeps longer and does not become mealy and soften at center as quickly. Tree large; tends to bear biennially. BROOKS 1972; A5, A91{SC}, B73M{DW}, B74, D69, E45, F53, F88G, G16, G16{DW}, I49G, J83, J83{DW}, M11M{PR}, M39M, etc.

Lord's Seedling: Medium to large, roundish fruit; skin yellow, more or less russet; flesh very aromatic, of excellent flavor; season late August. Tree a heavy and regular bearer. Originated at Linden, New York by James S. Lord about 1892. A91, A91{SC}, C27T{SC}, E84{OR}, L12, M11M{PR}

Lubsk Queen: Medium to large, nearly round fruit; skin very smooth, polished and wax-like, brilliant white, more or less covered with solid light rosy-red, very attractive; flesh snow white, firm, juicy, subacid; quality good; season August and September; keeps well for an early apple. Tree moderately vigorous, upright-spreading; very hardy and productive. Imported from Russia by the USDA in 1870. BEACH; A91, A91{SC}, C27T{SC}, E84{OR}, F88G, I49G{SC}, L12, M11M{PR}, M22

Lyman's Large Summer: Fruit large to very large; skin greenish to pale yellow, smooth; flesh breaking, tender, crisp, juicy, with a pure clean flavor, blending sweet and subacid; suitable for dessert or cooking; season early August. Tree hardy; a tip bearer. Of American origin; first described in 1844. A91{SC}, C27T{SC}, C30M, F88G, LI, L12, M22

Maayan:<sup>2</sup> Round, medium-sized fruit; skin yellow, 50% covered with dark-red, attractive; flesh yellow, juicy, firm, aromatic, flavor sprightly. Ripens from early June to late July, keeps and ships well. Tree vigorous, compact; can be induced to bear in its third year; tends to overproduce. Pollinated with Elah and Michal. Low chilling requirement. Originated in Rehovot, Israel by Chanan Oppenheimer. Introduced in 1967. BROOKS 1972; G17

Mantet: Medium-sized, roundish fruit; skin heavily washed and striped bright red; flesh fine-grained, tender, juicy, aromatic, sweet, very pleasant; dessert quality excellent; season early to late August. Tree upright; very hardy; productive. Originated in Morden, Manitoba, Canada. Introduced in 1929. BROOKS 1972; A74, A91{SC}, B4, B27M{SC}, C27T{SC}, F88G, G66, I49G, I49G{DW}, J93{SC}, K36, L27M, L70

Melba: Attractive, *high* quality, early summer apple. Pale yellow fruit with light-red stripes and shading. Very white, crisp, firm, sweet flesh. Hardy, productive and precocious. Seedling of McIntosh. Originated in Ottawa, Ontario, Canada. Introduced about 1924. Awarded the Silver Wilder Medal by the American Pomological Society. ARMSTRONG [Re], BROOKS 1972; C27T{SC}, F88G, G65M, G79M{DW}, I49G, I49G{SC}, I61M{SC}, L27M

Michal:<sup>2</sup> Medium-sized, roundish fruit; skin light golden-yellow, streaked with light red and orange; flesh juicy, firm, subacid, with good aroma and texture; flavor resembles Jonathan. Ripens mid-June to late July; keeps at room temperature at least 2 weeks, becoming sweeter. Tree precocious, bearing in the third year; very productive. Low chilling requirement. Originated in Rehovot, Israel by Chanan Oppenheimer. BROOKS 1972; G17

Mollie's Delicious: Large to very large, slightly conical fruit; skin light yellow, highly blushed with red, very attractive; flesh crisp, juicy, sprightly, aromatic; quality very good; ripens 3 weeks before Golden Delicious. Tree vigorous, semi-spreading; productive. Originated in New Brunswick, New Jersey. Introduced in 1966. BROOKS 1972; A39, A85M, C75M, E99M, F53, F93, G65M, J93, J93{SC}, L90, M11M{PR}, M39M, N33, N33{DW}

Oriole: Fruit large to very large; roundish, oblate; skin yellow-orange, striped and splashed red; flesh tender, fine-grained, juicy, aromatic, subacid; quality excellent for cooking or dessert; ripens early; similar to Duchess of Oldenbuig in form and appearance. Tree medium tall, rounded; productive; very susceptible to mildew. BROOKS 1972; A91, A91{SC}, C27T{SC}, F88G, I49G, I49G{DW}, L27M, L70

Ozark Gold: Medium to large fruit; skin smooth, golden-yellow blushed with bright red; flesh fine-grained, crisp, juicy, sweet, aromatic; quality above average for its season and locale; ripens about 3 weeks earlier than Golden Delicious, which it resembles. Tree vigorous, spreading; very hardy; disease resistant. Released in 1971 by the Missouri Experiment Station. C27T{SC}, C30M, G65M, J93{SC}, K36, L12, M11M{PR}, M22

Pink Transparent:<sup>5</sup> A pink-fleshed sport of Yellow Transparent. Medium-sized, round to conical fruit; skin clear yellow, thin and

tender, bruises easily; flesh pink, very tender, tart, good for cooking or dessert; ripens early, has a very short shelf life. Tree vigorous, upright, productive. M22

Primate: Medium to large, roundish-conic fruit; skin pale yellow, often blushed but not striped; flesh whitish, crisp, very tender, juicy, subacid, aromatic, sprightly; quality very good to best; season August and September. Tree medium-large, moderately vigorous, upright-spreading; reliably productive. Originated in Onondaga County, New York, about 1840. BEACH; A91, A91{SC}, B27MISC}, C27T{SC}, E84{OR}, F88G, L12, M11M{PR}, N38M{SC}

Quinte: Fruit medium-sized, round to slightly conic; skin attractive yellow, heavily blushed with red; flesh cream-colored, very tender; very suitable for dessert purposes, being equal to Melba and superior to Crimson Beauty; ripens 7 to 10 days before Melba; ships very well. Tree annually bears good crops; as hardy as McIntosh. BROOKS 1972; A91, A91{SC}, C27T{SC}, F88G, I61M{SC}, K36, L27M, M11M{PR}

Red Hackworth: Fruit smaller, firmer, and more solid red than Hackworth; flesh nearly white; quality good when fully ripe; ripens in August. Well adapted to the climate and soils of the Tennessee Valley to the Alabama Coastal Plain and east Texas. A good understock in northern Alabama. BROOKS 1972; C30M, G65M

Red June: (Carolina Red June) Fruit small to medium-sized; skin pale yellow or greenish, nearly overspread with deep purplish-red; flesh white, fine-grained, tender, juicy, briskly subacid; quality good to very good; season late July. Tree moderately vigorous, spreading; a reliable and heavy bearer. An old apple said to have originated in North Carolina. BEACH; A82, A91{SC}, D76, E84, E99M, F88G, I41P, K76, LI, L12, M11M{PR}, N38M{SC}

Redfree:<sup>4</sup> (Co-op 13) Medium-sized, roundish fruit; skin bright glossy red, waxy, attractive; flesh light-colored, crisp, juicy, flavor excellent; ripens 6 weeks before Red Delicious, can be held in storage for up to 2 months. Tree bears annually. Immune to scab and cedar rust. Moderately resistant to fire blight and mildew. A5, A9, A39, C27T{SC}, C30M, C58, D69, F53, G8, G16, J89M, J93, M11M{PR}, M39M, N24M

Reverend Morgan:<sup>2</sup> Seedling of Granny Smith that originated in the Houston, Texas area. Skin green, blushed with pinkish red. Excellent flavor and texture. Ripens in August, keeps well. Tree self-fruitful, disease resistant; requires 400 to 500 hours of chilling. Recommended for trial in California and other warm winter areas. A91{SC}, C30M, G65M, I83M, J59, J93{SC}, N20

Starr: Fruit very large to large; oblate to roundish oblate; skin yellowish-green; flesh tinged with yellow, very tender, crisp, very juicy, sprightly subacid, aromatic; quality very good; season August and September. Tree moderately vigorous, upright-spreading, productive. Originated in Woodbury, New Jersey, sometime prior to 1865. BEACH; A91{SC}, F88G, L12, M11M{PR}

Summer Pearmain: Medium-sized, round-conic fruit; skin greenish-yellow, more or less covered with dull purplish-red, marbled, splashed and striped with brighter red; flesh yellowish, very fine-grained, tender, almost melting, juicy, aromatic, crisp; flavor mild, rich, excellent; season August and September. Tree large, productive. An old American cultivar; first described in 1817. BEACH; B27M{SC}, C27T{SC}, F88G, G65M, L12, L27M, M11M{PR}, N38M{SC}

Summer Rambo: Large to very large, oblate fruit; skin yellowish-green, striped and mottled with lively pinkish-red; flesh yellowish-green, firm, coarse, tender, very juicy, mildly subacid, somewhat aromatic; quality good; season August and September. Tree vigorous, upright-spreading; precocious. Originated in France in the 16th century. BEACH; A5, B27M{SC}, B53, C27T{SC}, E84, F24G{SC}, F88G, G65M, H65, H89M, L12, M11M{PR}, M99G

Summer Red: Medium-large, oblong fruit; skin highly colored with a bright, solid blush; flesh cream-colored, firm, crisp, juicy, flavor very good when fully ripe; ripens 3 to 4 weeks before McIntosh; matures evenly on the tree. Tree vigorous, spreading; blooms relatively early; bears early and fairly regularly. A91, A91{SC}, B27M{SC}, C27T{SC}, I49G{SC}, M11M{PR}, M22

Summer Rose: Small to medium, roundish fruit; skin very pale yellow, distinctly striped and splashed with bright red and carmine on the exposed cheek; flesh white, fine-grained, crisp, very tender, sprightly, juicy, subacid, agreeable but not rich; suitable for either dessert or culinary use; season July and August. Tree haidy, precocious, productive. Originated in New Jersey prior to 1806. BEACH; A91{SC}, B27M{SC}, E84{OR}, F88G, LI, L12, M11M{PR}, N38M{SC}

Sweet Bough: (August Sweet) Medium to large, roundish-conic fruit; skin pale greenish-yellow; flesh white, moderately firm and crisp, very tender, juicy, decidedly sweet, slightly aromatic; quality good to very good; season August and early September. Tree moderately vigorous, upright-spreading; productive. Of unknown origin; first described in 1817. BEACH; C27T{SC}, F88G, I49G{SC}, K36, LI {SC}, L12, M11M{PR}, N38M{SC}

Tetofsky: Small to medium, oblate or roundish fruit; skin uaxy, greenish-yellow, more or less striped and splashed with attractive bright red; flesh white, firm, crisp, tender, juicy, sprightly, slightly aromatic, subacid; quality fair to good; season late July to early September. Tree small to medium, very upright; very hardy; precocious. Of Russian origin; imported into the United States about 1835. BEACH; A91, A91{SC}, I49G, I49G{SC}, L27M

Tropical Beauty:<sup>2</sup> Medium to large, roundish fruit; skin rich carmine red; flesh white, fairly crisp, juicy, with a smooth mild flavor; dessert quality very good; ripens early; resembles Rome Beauty. Tree small to medium; self-fruitful; bears at an early age; low chilling requirement. Adapted to tropical and sub-tropical climates. Originated in Maidstone, South Africa about 1930. BROOKS 1972; G49, G65M, I68, I83M

Tydemans Red: (Tydemans Early Worcester) Medium to large, roundish fruit; skin solid bright red, attractive; flesh yellowish-white, soft, rather coarse, juicy, sweet; quality very good; ripens early, 3 weeks before McIntosh. Tree vigorous, very spreading; productive. Originated in Maidstone, Kent, England. Introduced in 1945. BROOKS 1972; A91{SC}, B53, C27T{SC}, F88G, L12, L27M, M11M{PR}, 081

Vista Bella: Medium-sized, roundish fruit; skin blushed with bright red; flesh creamy-white, very firm for an early summer apple, juicy, subacid, flavor and quality good; ripens in early August, with Yellow Transparent. Tree very vigorous; yields heavy crops annually. Originated in New Brunswick, New Jersey. Introduced in 1974. A5, A91, A91{SC}, B27M{SC}, C27T{SC}, I49G{SC}, L12, M11M{PR}, M22, 081

William's Pride:<sup>4</sup> (Coop 21) A new disease resistant apple named for Purdue apple breeder E.B. Williams. Medium to large, slightly conic fruit; skin red to dark red; flavor mildly acid, rich, slightly spicy; quality excellent; ripens late July to early August. Can be stored for about one month in common refrigeration. In warmer regions of Zone 6 and south, watercore can be a problem in early production years. A9, A39, C27T{SC}, C30M, C34, D37, B74, F53, G8, J61M, J93, N24M

Yellow Transparent: (White Transparent) Medium-sized, roundish fruit; skin thin, tender, waxy, clear yellow; flesh white, moderately firm, fine-grained, crisp, tender, juicy, sprightly subacid; quality good to very good; season late July and August. Tree large, upright, moderately vigorous. Imported from Russia by the USDA in 1870. BEACH; A91, A91{SC}, B53, B73M, C58, E84, F88G, G79M{DW}, H65, //S9M{ES}, J16, L27M, M11M{PR}, N38M{SC}

## FALL HARVESTING

Akane: (Prime Red, Tokyo Rose) Small to medium-sized, flat-round fruit; skin bright solid red; flesh white, firm, crisp, juicy, slightly coarse, flavor slightly acid; quality excellent; ripens in midseason; does not store well but holds well on the tree. Tree semi-dwarf, moderately vigorous; precocious. Originated in Tohoku, Japan. Introduced in 1970. STEBBINS; A39, A91, A91{SC}, C27T{SC}, C34, D28J, E4, F88G, I49M, J61M, M11M{PR}, N20, 081

Apricot:<sup>6</sup> Very unique new apple with distinctive, orange flesh. Medium-sized fruits; skin yellow-orange, striped with red; solid orange-colored flesh. A delicious apple with a distinctive apricot-like aftertaste. Ripens in mid-fall in the Pacific Northwest. I49M, N24M

Arlet: (Swiss Gourmet) Golden Delicious x Idared. Medium to large, round to conic fruits; skin rich yellow, highly blushed with bright red, occasional russet; flesh creamy-white, firm, fine-textured; flavor very good, sprightly subacid. Ripens 10 days before Jonathan. Moderately vigorous, precocious tree. Originated in Wadenswil, Switzerland. BROOKS 1997; A9, A53{PR}, B53M, B71M, B83, C27T{SC}, I61M{SC}, I75, M11M{PR}, M39M

Bill's Red Flesh:<sup>5</sup> Small to medium-sized fruit, resembles Red Delicious in shape; red skin; distinctive, deep red flesh, redder than Hidden Rose Very sweet flavor. Ripens in early fall, does not keep well. Makes a unique applesauce. Also an attractive addition to salads when sliced. Discovered by Bill Schultz of Benton County, Oregon. I49M

Blenheim: (Blenheim Orange) Medium to large, flat-round fruit; skin yellow, striped and blushed with orange-red; flesh creamy-white, firm but tender, crisp, subacid, with a characteristic nutty flavor, sometimes dry; quality very good for dessert or culinary uses. Tree vigorous, spreading; slow to come into bearing. Discovered about 1740 near Blenheim, England. SANDERS, SIMMONS 1978; E84{OR}, F88G, L12, M11M{PR}, M22, 081, R83

Blue Pearmain: Large, roundish fruit; skin blushed with red, splashed and striped with deep purplish-carmine overspread with an abundant blue bloom, very attractive; flesh yellowish, rather coarse, moderately juicy, mildly subacid, decidedly and agreeably aromatic; quality good; ripens in October. Tree large, moderately vigorous, spreading. An American apple of uncertain origin; first recorded in 1833. BEACH; A91, A91{SC}, B27M{SC}, E84{OR}, F88G, G65M, I49G{SC}, L12, L27M, M11M{PR}, M22, N38M{SC}, 081

Blushing Golden: Medium-sized, round-conic fruit; skin waxy, golden yellow, 50% covered with a light red blush, very attractive; flesh very firm, juicy, subacid, quality very good, rated A plus in customer taste tests of Applesource; ripens 2 weeks after Golden Delicious, which it resembles; ripens in October and November; keeps very well; Tree vigorous, spreading; productive; spur-bearing. Introduced in 1968. BROOKS 1972; A9, A53{PR}, C27T{SC}, D81{PO}, L33, L33{DW}

Bonum: (Magnum Bonum) Medium to large, oblate fruit; skin yellow, blushed and striped with crimson and dark red; flesh white, often stained next to the skin, firm but tender, juicy, aromatic, mildly subacid; dessert quality very good; season September to November. Tree moderately vigorous, upright-spreading. Originated in Davidson County, North Carolina prior to 1856. BEACH; B27M{SC}, C30M, L21P

Bottle Greening: Medium to large, round-conic fruit; skin grass-green, thinly blushed with dull pinkish-crimson; flesh nearly white, very tender, very juicy, peculiarly aromatic, pleasantly subacid; quality good to very good; season October to March. Tree moderately vigorous; hardy; productive. Originated on a farm on the dividing line of New York and Vermont, prior to 1866. BEACH; A91{SC}, F88G

Breaker: Medium-sized, round-oblate fruit; skin yellow-green, striped and blushed with red and scarlet; flesh white, fine-textured, melting, juicy, flavor mild, spicy; dessert quality very good, also good for sauce or pies; ripens in early September. Tree vigorous, upright-spreading; very hardy. Originated in Morden, Manitoba, Canada. Introduced in 1935. BROOKS 1972; A91, A91{SC}, F88G, M35M

Champlain: Medium to large, roundish-conical fruit; skin pale yellow, often with a light crimson blush; flesh white, fine-grained, very tender, juicy, sprightly, subacid; dessert quality good to very good, excellent for culinary use; season late August to October. Tree vigorous, upright-spreading; hardy; reliably productive. Of unknown American origin; first described in 1853. BEACH; A91{SC}, L12, M11M{PR}

Chehalis: Medium-sized, conical fruit; skin greenish-yellow, blushed with pink on the side exposed to the sun; flesh cream-colored, medium-fine, crisp, breaking, moderately juicy; flavor pleasantly mild, subacid; ripens 3 to 4 weeks before Golden Delicious, which it resembles. Resistant to scab. Tree upright-spreading, moderately vigorous and productive. BROOKS 1972; B27M{SC}, B74, C27T{SC}, C34, D28J, H89M, I49M, J61M, N20

Chenango Strawberry: Medium to large, oblong-conic fruit; translucent yellowish-white skin, highly blushed with attractive pinkish-red; flesh white, moderately firm, tender, juicy, mildly subacid, very aromatic; dessert quality excellent, also good for culinary use; ripens in September. Tree vigorous, upright-spreading. Originated in Chenango County, New York prior to 1854. BEACH; A91, A91{SC}, B27M{SC}, C27T{SC}, E84{OR}, G65M, H65, L12, L21P, L27M, M11M{PR}, M22, N38M{SC}

Cinnamon Spice: Medium-small fruit; skin predominantly wine-red, slightly blushed with yellow; flesh very rich and sweet, with a sharp aromatic cinnamon-like flavor which lingers for some time; ripens late October. Discovered in an old orchard in the Bolinas-Olema Valley of northern California. Introduced by Living Tree Center. A91, C30M, E23Z, LI

Collet: Fruit medium-sized; oblate to conic oblate; skin attractive, 80% medium red; flesh white, firm, crisp, texture moderately fine; dessert quality fair to good, excellent as sauce or pie. Tree medium to tall, very hardy, annually productive. Originated in Notre Dame de Lourdes, Manitoba, Canada. BROOKS 1972; A65, B47, G66, H85, K64, L12, M35M, N24M

Cortland: Fruit large; roundish-oblate, uniformly ribbed; skin attractive red, darkly and obscurely striped; flesh white, slow to discolor on exposure to air, fine-grained, crisp, tender, juicy, subacid; quality good; season November to February; resembles McIntosh. Tree vigorous, spreading; precocious; annually productive; very hardy; prolific. BROOKS 1972; A5, A53{PR}, A82, A91{SC}, A91, B83, C95M{PR}, D69, F42M{PR}, F53, G16, G79M{DW}, H65, J16, J93, L73{PD}, M39M, etc.

Cox's Orange Pippin: Fruit medium-sized; round-conical; skin clear yellow, blushed with orange-red, striped with brownish-crimson; flesh cream-colored, fine-textured, fairly firm and crisp, juicy, rich, flavor excellent; season October to December. Tree moderately vigorous, upright-spreading; bears fruit on short spurs. Considered the finest flavored apple in Great Britain, but not as highly esteemed elsewhere. SANDERS, SIMMONS 1978; A53{PR}, A91, A91{SC}, C58, E84{OR}, F88G, G79M{DW}, H65, I49M, LI, L1{ES}, L73{PD}, M11M{PR}, N20

Crimson Beauty: (Scarlet Pippin) Very attractive apple of the Fameuse group. Medium-sized, roundish fruit; skin red-striped; flesh white, firm, crisp, tender, melting, juicy, mildly subacid with a pleasant but not high flavor; season fall and early winter. Tree vigorous, upright; very productive. Originated about 1860 at Lynn, Ontario. BEACH; F88G, F91T{SC}, K36, L27M

Dakota: Large, round-oblate fruit; skin yellow, blushed with an attractive deep red; flesh creamy-yellow, crisp, juicy, firm, fine-

grained, sprightly subacid; excellent for dessert and culinary uses; ripens in mid-September; keeps in common storage for several weeks. Tree vigorous, spreading; productive; handy. Originated in Mandan, North Dakota. Introduced in 1965. BROOKS 1972; I49G, I49G{SC}, M35M

Detroit Red: Large, roundish-oblate fruit; skin dark crimson, largely striped and splashed with purplish-carmine eventually becoming almost black; flesh white, rather coarse, tender, juicy, mildly subacid, very aromatic; quality good to very good; season the end of September to December. Tree medium to large; moderately vigorous and productive. Supposedly brought into the Detroit area by early French settlers. BEACH; B27M{SC}, E84{OR}, G8, G65M

Dr. Mathews: Fruit large; skin dull red, striped with darker red; flesh creamy-white, crisp, juicy, fine-grained, with a mild but sprightly aromatic flavor; quality excellent; ripens in September. An obscure 19th century Indiana cultivar. Was for many years grown in the orchards of the Indiana State Agricultural Station and is still a local favorite wherever known. A53{PR}, A91{SC}, L12, M11M{PR}

Egremont Russet: Medium-sized, flat-round fruit; skin golden-yellow, blushed with brownish-orange, with attractive russeting; flesh creamy-colored tinged with yellow, crisp and firm, fairly juicy, sweet, aromatic, with a rich nutty flavor; season October to November. Tree upright, compact; hardy; bears heavily and annually. Considered one of the best dessert apples in Great Britain. Origin unknown; first recorded about 1880. SANDERS, SIMMONS 1978; A91, A91{SC}, B27M{SC}, C27T{SC}, F88G, I49G{SC}, J61M, J93{SC}, L12, L27M, M11M{PR}, M22, N24M, 081

Ellison's Orange: Fruit medium-sized, round, slightly conical; skin golden yellow, blushed brownish-red with stripes of brownish-crimson; flesh creamy-white, tender, crisp, juicy, with a very rich, distinctive, anise-like flavor; season September and October. Tree precocious; spur-bearing; bears moderate crops biennially. Originated in England. Introduced about 1911. SANDERS, SIMMONS 1978; B27M{SC}, F88G, I49G{SC}, J93{SC}, L12, M11M{PR}, M22, 081, R83

Els tar: Golden Delicious x Ingrid Marie. Medium to large, round-conic fruits; skin yellow, attractively striped with orange-red; flesh creamy white, firm, crisp, rather coarse; flavor very good, somewhat tart at harvest. Ripens 3 1/2 weeks before Golden Delicious. Very vigorous and precocious. Originated in Wageningen, the Netherlands. BROOKS 1997; C27T{SC}, C34, I61M{SC}, LI, L73{PD}, M11M{PR}, M39M, N20, 081

Empire: Medium-sized, roundish fruit; skin dark red, distinctly striped, waxy, very attractive; flesh cream-colored, crisp, juicy, subacid to semi-sweet, aromatic; dessert quality excellent; ripens 2 weeks after McIntosh; stores well. Tree large, vigorous, upright-spreading; annually productive. McIntosh x Red Delicious. BROOKS 1972; A5, A34, A39, A53{PR}, A91, B83, D81{PO}, F53, G79M{DW}, H65, L33, L73{PD}, M11M{PR}, M22, A/59M, etc.

Etter's Gold: Fruit medium to large; round, slightly ribbed; skin clear golden yellow, glossy; flesh light yellow, crisp, mildly subacid, sprightly; dessert quality excellent, also good for pies; ripens in October; keeps well; resembles Wagener. Tree very productive; bears annually; produces spurs readily. Wagener x Transcendent crab. Originated in Ettersburg, California by Albert F. Etter. Introduced in 1944. BROOKS 1972; C27T{SC}, E84

Fall Pippin: Large to very large, roundish fruit; skin clear yellow, sometimes faintly blushed; flesh whitish, moderately firm, tender, very juicy, agreeably subacid, somewhat aromatic, rich; quality very good for dessert or culinary uses; season late September to January. Tree large, vigorous; hardy. Of unknown origin; listed by McMahon in 1806. BEACH; A91{SC}, E84{OR}, H65, M99G, N38M{SC}

Fallowater: (Tulpehocken) Large to very large, globular fruit; skin yellow, prominently blushed with deep pinkish-red; flesh tinged with yellow or green, firm, coarse, crisp, juicy, subacid to mildly sweet; quality good or nearly so; season November. Tree large, vigorous, upright; productive. Originated in Bucks county, Pennsylvania, sometime prior to 1845. BEACH; A91{SC}, B27M{SC}, C27T{SC}, C30M, F88G, G65M, K36, L12, M11M{PR}, M99G, N38M{SC}

Fameuse: (Snow Apple) Small to medium, roundish fruit; skin light bright red, very attractive; flesh white, sometimes streaked or stained with red, very tender, juicy, subacid becoming mildly subacid or sweetish, aromatic; dessert quality very good to excellent; ripens in October. Tree vigorous, upright-spreading; hardy; reliably productive. Probably originated in Canada in the early 18th century. BEACH; A53{PR}, A91, A91{SC}, B53, C58, D69, E84, G16{DW}, G79M{DW}, H65, LI, L1{ES}, L27M, N24M

Fortune: Northern Spy x Empire. Large to very large, round to conic fruit; overall maroon red color; crisp, cream-colored flesh, firm, subacid, slightly aromatic; ripens with Empire; keeps 4 to 5 months in common storage. Tree vigorous and very precocious; bears annually. Originated in Geneva, New York. Introduced in 1995. BROOKS 1997; A5, A53{PR}, B83, C41M, C76M, F53, J93, M11M{PR}, M59M

Franklin: Medium to large, conical fruit; skin nearly covered with red, attractive; flesh white, tender, crisp, aromatic, flavor mild; dessert quality high; season late fall and early winter. Tree very susceptible to scab. McIntosh x Delicious. Originated in Wooster, Ohio by the Ohio Agricultural Experiment Station. Introduced in 1937. BROOKS 1972; A53{PR}, J93{SC}, K36, L12, M11M{PR}

Freedom:<sup>4</sup> Large, oblate fruit; skin yellow, blushed and striped with red, attractive; flesh cream-colored, medium-coarse, crisp, tender, juicy, sprightly subacid; quality good for desert, sauce and juice; ripens in early October. Tree vigorous, spreading; precocious; very productive; spur-bearing. Highly resistant to scab; resistant to cedar rust, fire blight and powdery mildew. Originated in Geneva, New York by Robert C. Lamb. Introduced in 1983. A5, A91, B53, B74, C34, C58, D37, D76, E97, F53, F88G, G8, G23, H65, L27M, M22, N24M, etc.

Freyberg: Small to medium-sized, round fruit; skin golden yellow, blushed with mahogany red; flesh yellow, fine-grained, firm, crisp, juicy, sweet, quality excellent; ripens shortly after Cox's Orange Pippin; stores well. Tree small, upright, vigorous; spur-bearing; productive. Connoisseur cultivar for home gardens. Originated in New Zealand by J.H. Kidd. BROOKS 1972; A53{PR}, B27M{SC}, C27T{SC}, E84{OR}, J93{SC}, LI, L12, M11M{PR}

Fuji: Medium to large, round-conical fruit; skin golden-brown, blushed with dull red; flesh creamy-white, very crisp, extremely juicy, very sweet; quality excellent; not very aromatic, susceptible to water core; ships and stores well. Popular specialty market apple. Tree slow to come into bearing; requires a long season. Ralls Janet x Delicious. Originated in Aomori, Japan by the Tohoku Horticultural Research Station. BROOKS 1972; A9, A53{PR}, D81M{PO}, E4, G65M, H49{DW}, H69{PR}, I23M{PD}, I83M, J93{SC}, K73M, LI, L73{PD}, M63M{PR}

Gala: Medium-sized, oblong-conical fruit; skin bright yellow, heavily striped with bright orange-red, glossy; flesh yellow, fine-textured, firm, crisp, very sweet and juicy; dessert quality very good; ripens with Cox's Orange Pippin; keeps well. Tree vigorous; precocious; annually bears heavy crops; produces spurs freely. Originated in Greytown, Wairarapa, New Zealand. BROOKS 1972; A39, A53{PR}, A88M, A91, A91{SC}, C89{PR}, D2{PR}, D81{PO}, D81M{PO}, E4, E97, F88G, I68, L73{PD}, M22, M63M{PR}, etc.

Golden Delicious: (Yellow Delicious) Medium-sized fruit, long and tapering; skin pale yellow, occasionally blushed with pink; flesh yellowish-white, crisp, juicy, sweet and aromatic; ripens midseason to late, does not store well. Originated in Cley County, West Vir-

ginia about 1890. SIMMONS 1978; A34, A82, D81{PO}, D81M{PO}, G72, I9M, I19M{DF}, I23M{PD}, L73{ED}, L97G{DF}, M13M{PD}, M63M{DF}, M63M{PR}

Goodland: Medium to large, roundish-oblate fruit; skin creamy yellow, splashed and streaked with an attractive bright red; flesh crisp, juicy, tender, sweetly subacid, aromatic; quality excellent for dessert or sauce; season mid-September to mid-January. Tree medium tall; very hardy; annually productive. Originated in Morden, Manitoba, Canada. Introduced in 1955. BROOKS 1972; A16, A65, A91, A91{SC}, B47, F88G, G66, H42, H85, I49G, I49G{SC}, K64, L27M, L70, M35M, N24M, etc.

Gordon: Medium to large, nearly globe-shaped fruit; skin green, blushed and striped with red; flesh near white, crisp, juicy, firm; quality good for dessert or cooking; ripens in midseason. Tree vigorous, upright; productive; bears regularly; self-fruitful. Prolonged season of flowering and fruiting. Low chilling requirement, about 400 hours. STEBBINS; A63, A88M, C54, D23M, G49, H4, I68, I83M, K46, N20

Grimes Golden: Medium to large, roundish-conical fruit; clear deep yellow skin with pale yellow or russet dots; flesh yellow, very firm, tender, crisp, moderately juicy, subacid, rich, aromatic, sprightly; quality excellent; season October and November; does not keep well. Tree moderately vigorous, upright-spreading; productive. Originated in West Virginia prior to 1804. BEACH; A5, A53{PR}, A91, A91{SC}, D2{PR}, [D76, E84, G79M{DW}], H65, J93, J93{SC}, L33, M22, M39M, M99G, etc.

Haralson: Medium to large, roundish-conic fruit; skin yellow, striped or nearly covered with an attractive red; flesh white, firm, moderately tender, fine-grained, juicy, mild, pleasant, subacid; suitable for dessert or cooking; stores well. Tree vigorous, upright; hardy; productive; resistant to fire blight. Grown commercially in Minnesota. BROOKS 1972; A91, A91{SC}, D65, D65{DW}, D76{DW}, G16, G16{DW}, H90, I49G, I49G{DW}, K64, L12, L27M, L70, M11M{PR}, etc.

Hawaii: Fruit medium-sized; oblong angular; skin waxy, light golden-yellow; flesh yellow, firm, juicy, pleasantly aromatic, with a strong pineapple-like flavor; ripens in early October; keeps well; resembles Golden Delicious. Tree vigorous, upright; bears fruit on small spurs; biennial, requiring heavy thinning in high-yielding years. Originated in Sebastopol, California. BROOKS 1972; A39, A53{PR}, A91, A91{SC}, B27M{SC}, C27T{SC}, C30M, E23Z, G65M, J93{SC}, L12, M11M{PR}, M22

Herring's Pippin: Large, round-conical fruit; skin pale greenish-yellow, almost completely covered with red blush; flesh creamy-white, soft, juicy, slightly coarse, aromatic, with a spicy flavor; suitable for both dessert and cooking; season early October. Tree moderately vigorous, upright-spreading; adapted to cold, heavy soils. Originated in England about 1908. SANDERS, SIMMONS 1978; C30M, F88G, M22, 081, Q30{SC}

Hibernal: Fruit large; irregular, oblate to roundish-conical; skin greenish-yellow, blushed with red; flesh yellowish, crisp, tender, juicy, acid, somewhat astringent; dessert quality fair, fine for cooking, said to be good for drying; season September to November. Tree vigorous, very spreading; very productive; extremely hardy. Of Russian origin; introduced into the United States prior to 1880. BEACH; A91, A91{SC}, F91T{SC}, I49G{SC}, L27M

Holiday: Medium-sized, flat-round fruit; skin yellow, overspread with deep bright-red; flesh white, crisp, tender, juicy, aromatic; flavor rich, slightly tart; quality very good; ripens in October, keeps well in cold storage; resembles Macoun. Tree moderately vigorous, upright; somewhat difficult to prune. Macoun x Jonathan. A53{PR}, A91{SC}, B27M{SC}, C27T{SC}, K36, L12, M11M{PR}

Holstein: Fruit medium-large; oblong-conical to round-conical; skin golden-yellow, blushed and striped with red; flesh creamy yellow, firm, juicy, sweet, aromatic, somewhat similar to Cox's

Orange Pippin; quality excellent. Tree vigorous, spreading; produces spurs readily; requires pollination. Raised in Schleswig-Holstein, Germany about 1918. SANDERS, SIMMONS 1978; A91, A91{SC}, B27M{SC}, C27T{SC}, E84{OR}, F88G, I49G{SC}, J93{SC}, LI, L12, M11M{PR}, M22, 081

Honeycrisp: Considered the best very hardy cultivar in the world. Medium-sized, roundish fruit; skin lemon yellow, 50 to 70% blushed with scarlet; flesh cream-colored, extremely crisp, juicy, coarse, juicy, mildly aromatic, subacid. Dessert quality excellent. Ripens 5 days after McIntosh. Moderately vigorous, upright-spreading tree. Originated in Excelsior, Minnesota. A5, A53{PR}, B53, B83, D65, D65{DW}, F16, F53, G16, G66, I49G, I49G{DW}, I49M, J61M, J93, L27M, L33, M11M{PR}, M39M, etc.

Honeygold: Medium to large, round-conic fruit; skin yellow, blushed with bronze; flesh yellow, crisp, juicy, sweet; dessert quality excellent, equal to Golden Delicious but keeps better; ripens October 1. Tree medium-sized, moderately vigorous; hardy. Golden Delicious x Haralson. Recommended where Golden Delicious is marginal. BROOKS 1972; A91, A91{SC}, B27M{SC}, C27T{SC}, C58, D69, F53, G16, G66{DW}, G89M, H90{DW}, I49G, I49G{DW}, L27M, L70{DW}, N24M, etc.

Hubbardston Nonesuch: Medium to large, roundish-ovate fruit; skin yellow or greenish, blushed and mottled with bright red; flesh whitish slightly tinged with yellow, tender, juicy, aromatic, rich, at first sprightly but becoming mildly subacid mingled with sweet; quality excellent; season October to January. Tree vigorous; precocious; bears heavy crops annually. Originated in Hubbardston, Massachusetts prior to 1832. BEACH; A53 {PR}, A91, A91 {SC}, B27M{SC}, C27T{SC}, E84{OR}, F88G, I49G{SC}, LI, L12, M11M{PR}, N38M{SC}

James Grieve: Medium to large, round-conical fruit; greenish-yellow skin, blushed and striped with brownish-red; flesh creamy-white, firm and crisp, fine-textured, very juicy, flavor excellent; ripens in September; does not keep well. Excellent for making *cysser*, a type of honey wine. Tree vigorous, upright; readily forms short fruiting spurs; annually produces heavy crops. Originated in Scotland; first recorded in 1893. ACTON, SANDERS, SIMMONS 1978; A91{SC}, B53, C27T{SC}, F88G, L1{SC}, L12, M11M{PR}, M22, 081, R83

Jefferis: Fruit small to medium, roundish oblate; skin pale yellow, blushed and splashed with red; flesh yellowish-white, firm, crisp, tender, very juicy, mildly subacid; quality very good; season September to January. Tree medium-sized, moderately vigorous; hardy; productive. Originated with Isaac Jefferis, Newlin township, Pennsylvania prior to 1848. BEACH; A39, A91, A91{SC}, C27T{SC}, E84{OR}, F88G, G65M, L12, M11M{PR}, M22, N24M, N38M{SC}

Jenner Sweet: Medium-sized fruit; skin yellow, blushed and striped with red; flavor fine, mildly sweet, typically Fameuse; ripens in mid-autumn; resembles Fameuse. Tree extremely hardy. Open-pollinated seedling of Fameuse; discovered in 1924. Introduced in 1964 by Fred L. Ashworth, Heuvelton, New York. BROOKS 1972; L27M

Jonalicious: (Daniels) Large, round fruit; skin thick and tough, yellow blushed a bright, nearly solid red; flesh tinged with yellow, juicy, firm but tender, aroma distinct; flavor rich, slightly less tart than Jonathan, rated A plus in customer taste tests of Applesource; ripens just after Jonathan which it resembles, keeps better. Tree vigorous, upright, hardy and productive. Originated in Abilene, Texas by Anna Morris Daniels. BROOKS 1972; A9, A39, A53{PR}, C27T{SC}, E63I{PR}, L33, M11M{PR}

Jonamac: Medium-sized, roundish fruit; skin greenish-yellow, prominently blushed with dark red; flesh firm, crisp, juicy, somewhat tart, aromatic; quality very good; ripens a few days before McIntosh, which it resembles; does not keep well. Tree medium-sized, moderately vigorous; productive. Jonathan x McIntosh. A5,

A34, A53{PR}, A91, A91{SC}, C76M, F53, J93{SC}, L12, M11M{PR}, M39M, M59M, M99G, N24M

Jonathan: (Philip Rick) Small to medium, roundish-conic fruit; skin pale bright yellow overlaid with lively red, striped with carmine; flesh whitish, firm but tender, crisp, juicy, very aromatic, sprightly subacid; quality excellent for dessert and culinary uses; season November to January. Tree small to medium, moderately vigorous. Originated on the farm of Philip Rick, Woodstock, New York prior to 1826. BEACH; A53{PR}, A91, A91{SC}, C30M, D76, D76{DW}, D81M{PO}, G79M{DW}, J83, J83{DW}, LI, L47, L73{PD}, N38M{SC}

Kandi! Sinap: A novelty cultivar from Turkey. Fruit medium-sized; very tall, narrow, cylindrical; creamy-yellow, porcelain-like skin, washed with a brilliant red blush; flesh crisp, juicy, fine-grained, of excellent flavor; ripens in early October. Tree small, narrow pyramidal; a heavy and regular bearer. A53{PR}, B27M{SC}, C27T{SC}, C30M, E84{OR}, F88G, J93{SC}, K36, LI, L12, M11M{PR}, M22

Karmijn de Sonnaville: Cox's Orange Pippin x Jonathan. Large, oblong-conic fruit; skin yellowish-green, blushed with carmine, russet; flesh yellow, firm, fine-grained; flavor superior, very rich, high in sugar and acid. Ripens with Red Delicious, stores well. Excellent for dessert and juicing. Moderately vigorous, spreading tree, fairly productive. Originated in Wageningen, the Netherlands. C30M, C34, F88G, H90M{SC}, J61M, L12, 081, Q30{SC}

Kerry Pippin: Small, roundish fruit; skin glossy yellow, sometimes striped on the side exposed to the sun; flesh very firm, crisp, crunchy, with a fine, rich spicy flavor; quality excellent. An old Irish apple, first noted in 1802 in a survey of the Royal Dublin Society of County Kilkenny. A91{SC}, J93{SC}, LI, L12, M11M{PR}

Kidd's Orange Red: Medium to large, conical fruit; skin dull yellowish-green, blushed with orange-scarlet, with red stripes and russet patches; flesh light cream, firm but tender, crisp, juicy, sweet, aromatic; quality very good; ripens in October; stores well. Tree vigorous, upright; very productive; resistant to scab; best suited to warm climates. Originated in New Zealand in 1924. SANDERS, SIMMONS 1978; A91, A91{SC}, B27M{SC}, C27T{SC}, E23Z, F88G, G65M, LI, L12, M11M{PR}, M22, 081

King: (Tompkins King) Fruit large to very large; roundish to somewhat oblate; skin yellow, mottled and striped with deep red and bright carmine; flesh yellowish, rather coarse, crisp, tender, aromatic, juicy, subacid; quality excellent for dessert or cooking; season mid-October. Tree vigorous, spreading; hardy; productive. Originated in Washington, New Jersey prior to 1804. BEACH; A91{SC}, B74, E63I{PR}, E84, F88G, H65, J61M, J93{SC}, LI, L12, L73{PD}, M11M{PR}, M22, N38M{SC}

Laxton's Fortune: (Fortune) Fruit medium-sized; round, slightly conical; skin pale yellowish-green, blushed and striped bright red; flesh creamy-white, firm but tender, rather coarse-textured, sweet, flavor rich; quality good; ripens in September. Tree small, compact; precocious; productive; inclined to biennial bearing. Originated in England in 1904. SANDERS, SIMMONS 1978; A91{SC}, J93{SC}, L12, M22, 081

Liberty:<sup>4</sup> Medium-sized, oblate fruit; skin yellow, highly blushed with bright red, attractive; flesh yellowish, slightly coarse, crisp, juicy, sprightly; dessert quality good; ripens just after McIntosh. Tree vigorous, spreading; very productive. Highly resistant to scab, resistant to mildew, cedar rust and fire blight. A39, A53{PR}, A91, A91{SC}, C58, D2{PR}, D76{DW}, E84, F43M, F53, G16, G23, G65M, H65, J61M, J93, LI, L1{ES}, L33, M39M, etc.

Macoun: Small to medium, flat-round fruit; skin pale yellow, almost completely blushed bright red, with very dark red stripes; flesh white, crisp, firm, sweet, aromatic, flavor rich; dessert quality high; ripens 1 month after McIntosh. Tree vigorous, upright; productive. One of the best of the McIntosh type apples. A5, A53{PR},

A91, A91{SC}, C27T{SC}, F42M{PR}, F53, G79M{DW}, H65, LI, L1{ES}, L12, M11M{PR}, M59M

Makepeace: Flattened spherical fruit; skin green with an attractive pink blush on the exposed side when mature; flesh nearly white, crisp, juicy, sweet; dessert quality very good, also very good for cooking if picked slightly immature; keeps well at room temperature for 3 to 4 weeks. Tree bears heavily and at an early age; requires about 450 hours of chilling. Well suited to the warm winters of southern California. Originated in Rancho Santa Fe, California. D57{OR}

Mandan: Fruit medium to large; round conic to oblong conic; skin greenish-yellow overspread with orange-red, with dark red splotches; flesh yellowish, firm, crisp, very juicy, mildly subacid; dessert quality excellent, good for culinary uses; ripens early to mid-September. Tree vigorous, spreading; annually productive; hardy; resistant to fire blight. Originated in Mandan, North Dakota. BROOKS 1972; I49G, I49G{SC}, L27M, M35M

McIntosh: Medium-sized, nearly round fruit; skin yellow with a bright red blush; flesh white, sweet, tender, moderately soft and juicy; ripens in midseason. Tree vigorous, productive, handy. Originated in Ontario, Canada. STEBBINS; A82, A91{SC}, C58, D76, E4, E45, E97, G72{DW}, LI, L1{ES}, L73{PD}, M13M{PD}, M99G

Melrose: Fruit medium to large; flat-round to conical; skin yellowish-green, blushed and streaked with dark brownish-red, very attractive; flesh creamy-white, firm, crisp, juicy, slightly acid, rich; dessert and culinary quality excellent; ripens in October and November. Tree moderately vigorous, upright-spreading; precocious; very productive. BROOKS 1972; A5, A53{PR}, A91, A91{SC}, C30M, C34, F88G, J61M, M11M{PR}, M39M

Monroe: Medium to large, roundish-conic fruit; skin nearly solid red, excellent in appearance; flesh yellow, firm, crisp, juicy, subacid; dessert quality good. Excellent for pies, sauce and baking. Tree vigorous, upright-spreading; bears heavy crops annually; susceptible to powdery mildew. Originated in Geneva, Nov York by U.P. Hedrick. BROOKS 1972; C27T{SC}, J93{SC}

Mother: Medium to large, roundish-oval fruit; skin golden yellow, nearly covered with bright deep-red; flesh creamy-yellow, tender, juicy, very mildly subacid, aromatic, with a rich distinctive flavor; quality excellent; season late September to January. Tree upright-spreading, moderately vigorous and productive. Originated in Bolton, Massachusetts prior to 1844. BEACH; A39, A91{SC}, B27M{SC}, C27T{SC}, E84{OR}, F88G, J93{SC}, LI, L12, L21P, M11M{PR}, M22, N38M{SC}, 081

Muster: Small, flat-round fruit; striking orange-red or pink skin with prominent brown or grey spots; flesh pure-white, coarse but crisp, very sweet; quality excellent; ripens in early September. An old American cultivar of unknown origin; first described in 1869. L12, M11M{PR}

Norda: Medium-sized fruit; skin green to yellow, overlaid with red; quality and flavor good; suitable for dessert or cooking, also dries well with very little discoloration of the clear white flesh; ripens in late September; keeps well. Tree very hardy. Developed at the Beaverlodge Research Station, Alberta, Canada. B47, F67

Nova Easygrow:<sup>4</sup> Large, oblate fruit; skin greenish-yellow, 80% covered with red stripes, moderately attractive; flesh white, crisp, juicy, medium-fine in texture; flavor sweet and sprightly; quality good. Tree moderately vigorous and productive; blooms one day after McIntosh. Strongly resistant to scab; resistant to powdery mildew, cedar rust, and fire blight. A39, A91, A91{SC}, C27T{SC}, I49G{SC}, I61M{SC}, J93{SC}, K36, L27M, M22, N24M

Ohio Nonpareil: Medium to large, roundish-oblate fruit; skin yellow, overspread with bright red, mottled and striped with carmine; flesh tinged with yellow, crisp, tender, juicy, agreeably

subacid, aromatic; quality good to very good; season October and November. Tree medium-sized, spreading, moderately vigorous; hardy. Originated near Massillon, Ohio; first described in 1848. BEACH; A91{SC}, L12, M11M{PR}

Opalescent: Large to very large, roundish-conic fruit; skin glossy, takes a brilliant polish, bright pale yellow overspread with dark red, very attractive; flesh distinctly tinged with yellow, firm, somewhat coarse, juicy, mildly subacid, aromatic; quality good to very good; season November to February. Tree vigorous, roundish. Originated in Barry County, Michigan; introduced about 1899. BEACH; B27M{SC}, E84{OR}, H65, I49G{SC}, L12, M11M{PR}, N38M{SC}

Orengo: Medium to large, roundish fruit; skin nearly solid bright red, attractive; flesh white, tender, juicy, crisp, sweet, mild but piquant; dessert quality high; ripens in mid-September. Tree moderately vigorous, upright-spreading; unproductive; resistant to scab. Introduced by the Oregon Nursery Company of Orengo, Oregon in 1920. BROOKS 1972; C27T{SC}, E84{OR}, F88G, I49G{SC}, LI, L12, M11M{PR}, M22

Orleans Reinette: Medium to large, flat-round fruit; skin dull golden-yellow blushed with dull orange, covered with patches of grey-brown russet; flesh yellow, very crisp, very juicy, sweet, with a distinct rich nutty flavor; ripens in September and October. Tree vigorous, upright-spreading; hardy; prolific; spur-bearing. Probably of French origin; first described in 1776. SANDERS, SIMMONS 1978; C30M, F88G, F91T{SC}, LI, L12, M11M{PR}, M22, 081, R83

Ortley: Fruit medium to large; oblong-conic, flattened at the base; skin waxy, whitish-yellow to rich yellow; flesh whitish tinged with yellow, crisp, tender, juicy, sprightly subacid; quality very good; season October to February. Tree medium to large, upright, moderately vigorous. Originated in New Jersey, prior to 1817. BEACH; A53{PR}, A91{SC}, B27M{SC}, LI, L12, M11M{PR}, N38M{SC}

Palouse: Fruit large; oblong-conic, ribbed or scalloped; bright yellow skin, blushed with crimson, splashed and dotted with darker red; flesh yellowish, crisp, tender, juicy, subacid, very aromatic; quality very good; season October. Tree very productive. Originated in Whitman County, Washington, from seed brought from Illinois in 1879. BEACH; A91{SC}, C27T{SC}, J93{SC}, L12, N38M{SC}

Patterson: Small to medium, slightly oblate fruit; skin greenish-yellow, blushed with red; flesh very mildly subacid, flavor and quality excellent; ripens in midseason; keeps well. Tree extremely hardy. Originated in Saskatoon, Saskatchewan, Canada. Introduced in 1960 for home gardens. BROOKS 1972; B47, F67, G54, I61M{SC}, M35M

Pettingill:<sup>2</sup> Large, round fruit; skin green overlaid with deep-red; flesh nearly white, firm, crisp, moderately acid; suitable for dessert, good for baking, cooking and sauces; ripens early September to mid-October; keeps and ships well. Tree large, upright, vigorous; very productive; a regular bearer. Low chilling requirement. Originated in Seal Beach, California. BROOKS 1972; A63, C54, I83M, N20

Pink Old Lady:<sup>5</sup> Medium-sized, round-conical fruit; skin yellow overlaid with carmine; flesh pink, fading towards the core, very juicy, medium sweet, aromatic, flavor very good; ripens early to mid-October, does not keep well. Tree small, moderately vigorous, spreading; very productive, requires thinning. Pink Pearl x King of the Pippins. Originated in Rockton, Ontario, Canada by Frederic Janson. F88G, LI, M22

Pink Pearl:<sup>5</sup> Medium-sized, roundish-oblong fruit; skin transparent, glowing pink from the flesh beneath, extremely aromatic when broken; flesh bright pink, crisp, juicy, rich and sweet; dessert quality very good, also makes a colorful sauce or pie filling; ripens in September. Originated in Ettersburg, California by Albert F. Etter. Introduced in 1944. BROOKS 1972; A53{PR}, A91, A91{SC}, B27M{SC}, C54, E84, /49P, J93{SC}, LI, L1{ES},

L12, M11M{PR}, N24M

Pink Pearmain:<sup>5</sup> (Pink Sparkle) Fruit larger than Pink Pearl; distinctly shaped; skin translucent cream, striped and splashed with brilliant red when mature; flesh rose pink, somewhat deeper than Pink Pearl, more intense in flavor, with the distinctive aromatic berry-like flavor that characterizes pink-fleshed apples; ripens in late September, about a month after Pink Pearl. Probably a creation of Albert F. Etter. Found growing in an old orchard. Pink Pearmain is a registered trademark of Greenmantle Nuisery. FISHMAN; E84, L12, M11M{PR}

Pitmaston Pineapple: Small, broadly conical fruit; skin golden-yellow, almost covered with a fine fawn russet; flesh yellowish, crisp, very juicy, sweet, subacid, rich, with somewhat of a pineapple-like flavor; ripens in September and October. Tree small, upright, very suitable for small gardens; productive. Originated in England about 1785. SIMMONS 1978; A53{PR}, B27M{SC}, C27T{SC}, C30M, E84{OR}, F88G, J93{SC}, LI, L12, M11M{PR}, 081, R83

Pomme Royal: (Garden Royale, Dyer) Medium to large, roundish fruit; skin clear pale yellow, more or less flecked with thin russet; flesh yellowish-white, fine-grained, very crisp, tender, aromatic, sprightly, mildly subacid, highly flavored; quality excellent; season September and October. Tree yields good crops biennially. Origin uncertain; known in cultivation during the Revolutionary War. BEACH; C27T{SC}, I49G{SC}, L12, M11M{PR}, N38M{SC}

Porter: Medium to large, conical fruit; skin clear bright yellow, with a faint red blush; flesh yellow, crisp, tender, juicy, subacid, agreeably aromatic, sprightly; quality good to very good for dessert or culinary uses; season September to November. Tree medium to large, vigorous; hardy; precocious; productive. Originated about 1800 with Rev. Samuel Porter, Sherburne, Massachusetts. BEACH; A91 {SC}, C27T{SC}, E84{OR}, F88G, L12, M11M{PR}, N38M{SC}

Prima:<sup>4</sup> Medium to large, round fruit; skin bright yellow, 60% covered with dark red blush; flesh white, juicy, mild, subacid; quality good; ripens 10 days ahead of McIntosh. Tree moderately vigorous, spreading; bears annually when properly thinned. Both fruit and foliage are immune to scab and resistant to fire blight, cedar rust, and mildew. B74, C27T{SC}, C58, H90M{SC}, J89M, J93{SC}, L33, M11M{PR}, M22

Priscilla:<sup>4</sup> Medium-sized, slightly conical fruit; skin yellow, 65% covered with bright red blush; flesh white to slightly greenish, crisp, coarse, mildly subacid; quality good; ripens with Jonathan. Tree moderately vigorous, spreading. Immune to scab. Resistant to fire blight, powdery mildew, and cedar rust. Good pollinator for Prima. A39, C27T{SC}, C30M, C58, L12, M11M{PR}

Purple Passion:<sup>5</sup> Large, purplish-red fruit; crimson red flesh and juice; tart flavor. Excellent for pies, sauce, juice and cider. Makes a tasty and colorful dried product. Very ornamental with attractive red blossoms in the spring. Tough, dependable tree\* extremely hardy. Has produced a full crop after a winter of -50° C. temperatures. N24M

Red Delicious: Fruit medium-sized, long and tapering; skin striped, or solid red with yellowing; flesh white, juicy, sweet; ripens in midseason. Tree large, upright and spreading; very susceptible to scab. Most widely grown apple in the world. Originated in Iowa. STEBBINS; A82, D81{PO}, D81M{PO}, E4, E45, F93, G72, I9M, I23M{PD}

Ribston Pippin: Medium-large, round-conical fruit; skin greenish-yellow, blushed and striped with brownish-orange and red; flesh yellow, very firm, crisp, fine-grained, richly sweet, very aromatic; quality excellent; season September and October. Tree vigorous, spreading; bears fruit on short spurs. Originated in England from seed brought from France in about 1688; parent of Cox's Orange Pippin. SANDERS, SIMMONS 1978; A91{SC}, C27T{SC},

E84{OR}, F88G, G65M, G79M{DW}, LI, L12, L21P, M11M{PR}, M22, N38M{SC}, 081, R83

Royal Gala: Medium-sized, conic to round fruit; skin solid orange-red, brighter overall red than Gala; flesh yellow-white, firm, juicy, fine-textured; flavor sweet, slightly tart; ripens with Gala, hangs well on the tree. Vigorous, compact tree; prolific, tends to overbear; pollinates Red Delicious and Granny Smith. A9, B53, B71M, B83, D28J, D37, E4, F15{PR}, F85D{PR}, I83M, K73M, L33, L33{DW}, M11M{PR}, M39M, etc.

Scarlet Surprise:<sup>5</sup> Very ornamental and unusual red-fleshed apple. Large, long-conic fruits; bright red skin; striking dark-red flesh, sweet and flavorful; quality good to very good. Large, attractive, deep pink blossoms, resembles a peach tree when in bloom. Brilliant, reddish foliage. E87, I49P, I66T

Sekai Ichi: Very large fruit, up to 2 pounds if properly thinned; skin pale pink to darker red; flesh crisp, breaking, juicy, very sweet, mild; quality excellent. One of the highest priced apples in Japan where for the family dessert, a single apple is generally served on a plate in the center of the table from which slices are dispensed. A91{SC}, C27T{SC}, C30M, I68, L12, M11M{PR}

Senshu: Early Fuji type. Small to medium-sized, round fruit; skin greenish-yellow, striped with bright red; flesh yellowish-white, juicy, firm, crisp, sweet; quality excellent. Ripens about 10 days before Red Delicious. Moderately vigorous, spreading tree, resistant to powdery mildew. Originated in Japan at the Akita Fruit Tree Experiment Station. BROOKS 1997; A9, A53{PR}, A91, A91{SC}, C27T{SC}, C30M, C76M, H90M{SC}, J93{SC}, K36, M39M

Sierra Beauty: Large, blocky fruit; skin greenish-yellow, striped and blushed with red, attractive; flesh juicy, very crisp, sprightly, tart; dessert quality very good; ripens September to October, keeps very well. An old California cultivar; still grown commercially in Boonville. A53{PR}, A88M, C54, E23Z, E63I{PR}, E84{OR}, J93{SC}, LI, L12, N20

Signe Tillisch: Large, flat-round fruit; skin light green or creamy yellow, blushed with pink or orange, waxy; flesh crisp, breaking, juicy, with a fine vinous flavor; quality excellent for dessert or cooking; ripens the first 2 weeks of September. Originated in Denmark; first described in 1889. Considered one of the best dessert apples in Sweden. C27T{SC}, L12, M11M{PR}

Sir Prize:<sup>4</sup> Large, greenish-yellow fruit; skin very thin and tender, bruises easily; flavor slightly acidic; quality good; resembles Golden Delicious. Tree strong, vigorous, hardy; immune to scab; resistant to mildew and cedar rust. Good home garden cultivar, but too tender for commercial markets. A53{PR}, C27T{SC}, C30M, J93{SC}

Skinner's Seedling: (Santa Clara King) Large to very large, oblate fruit; skin rich lemon-yellow, faintly striped with bright red; flesh yellowish-white, very tender, juicy, sprightly, mildly subacid, very aromatic; quality excellent for dessert or sauce; season September and October. Tree vigorous, productive. Originated with Judge H.C. Skinner of San Jose, California, prior to 1870. WICKSON; E84, G65M, LI

Smokehouse: Fruit above medium to large, roundish-oblate; skin yellow, mottled and striped with bright-red; flesh slightly tinged with yellow, crisp, firm, very juicy, mildly subacid, delicately aromatic, with an agreeable but not high flavor; quality good; season October to February or March. Tree vigorous; hardy; rather precocious; productive. Originated in Lancaster County, Pennsylvania prior to 1837. BEACH, WEAVER 1993 [Re]; A5, A53{PR}, A82, A91, A91{SC}, B27M{SC}, B53, B53{DW}, E84{OR}, F88G, H65, LI, L12, L27M, M11M{PR}, etc.

Somerset of Maine: Fruit large; skin bright yellow, covered with splashes and stripes of brilliant red; flesh often attractively stained with red, tender, juicy, agreeably subacid; should not be allowed to get over-ripe on the tree. Tree very vigorous, upright-spreading.

Originated in Mercer, Maine; first recorded in 1849. A91{SC}, L12, M11M{PR}, N38M{SC}

Sops of Wine: Medium to large, roundish fruit; skin greenish-yellow, almost entirely overspread with purplish-red; flesh yellowish often stained with pink, soft, juicy, aromatic, mild, pleasant, subacid; quality good; season August to October. Tree vigorous, precocious. A very ancient English apple; described by Ray in 1688. BEACH; A91, A91{SC}, B27M{SC}, B53, C27T{SC}, C30M, E84{OR}, F24G{SC}, F43M, H65, LI, L12, M11M{PR}, N38M{SC}

Spartan: Fruit medium-sized, flat-round to roundish-conical; skin solid mahogany red; flesh white, very firm, crisp, juicy, fairly sweet, quality and texture very good, fully equal to McIntosh; ripens 2 to 3 weeks later than McIntosh. Tree upright-spreading; bears heavy crops annually. McIntosh x Yellow Newtown Pippin. BROOKS 1972; A5, A53{PR}, A91{SC}, B83, C30M, C58, F53, G66, I23M{PD}, L12, L27M, L73{PD}» M39M, N24M

Spencer: Medium to large, oblong fruit; skin greenish-yellow, largely blushed with bright scarlet, attractive; flesh creamy-white, crisp, firm, juicy, subacid; quality extremely high; matures about 3 weeks later than McIntosh. Tree vigorous, upright, spreading; very hardy; slow to come into bearing but then high yielding. Originated in Summerland, British Columbia, Canada. BROOKS 1972; A91{SC}, C27T{SC}, L12, L27M, M11M{PR}

Spigold: Large to very large, oblong-conical fruit; skin golden yellow, highly blushed and striped with red, very attractive; flesh creamy-white, very firm and crisp, fine-grained, melting, sweet, sprightly; dessert quality exceptionally high; ripens through October. Tree very vigorous; productive; requires a pollinator. Red Spy x Golden Delicious. A53{PR}, B53, C30M, C76M, E84, F88G, H65, J93, J93{SC}, LI, L12, M11M{PR}, M99G

Splendour: Medium-large, roundish fruit; skin yellow, blushed with pinkish-red; flesh yellow, crisp, firm, juicy, very sweet, flavor mild but distinctive; ripens in early September; keeps extremely well for a fall apple. Tree vigorous, spreading; productive. Originated in New Zealand, where it is a commercial export apple. A53{PR}, A91{SC}, C27T{SC}, E23Z, E84, G65M, J93{SC}, LI

St. Edmund's Pippin: (St. Edmund's Russet) Fruit small to medium; flat-round to round conical; skin golden-yellow, heavily covered with fine grayish-golden russet; flesh creamy-white, fairly firm, tender, juicy; flavor very rich and quite sweet but with a nice balance of acidity; season late September to early October. Tree upright-spreading, handy. Raised about 1870 at Bury St. Edmund's, England. SANDERS, SIMMONS 1978; C27T{SC}, C30M, E84{OR}, F88G, I49G{SC}, LI, L12, L27M, M11M{PR}, M22, N24M, 081, R77

Stearns: Very large, roundish-conical fruit; skin yellow, striped with red; flesh crisp, melting, tender, with a rich pure apple flavor; quality excellent for dessert or cooking; ripens in early September. Originated in North Syracuse, New York prior to 1900. A91{SC}, B27M{SC}, C27T{SC}, J93{SC}, LI, L12, M11M{PR}

Sweet Sixteen: Medium to large, roundish-conical fruit; skin red-striped; flesh cream-colored, firm, crisp, juicy, subacid, aromatic, with a pleasant anise-like flavor; ripens just after McIntosh; keeps well. Tree cold hardy; precocious; blooms late; annually productive; resistant to scab and fire blight. Released by the Minnesota Agricultural Experiment Station. A53{PR}, A91, A91{SC}, C27T{SC}, D65, D65{DW}, F53, G4, G66, H90{DW}, I49G, I49M, J93, J93{SC}, L27M, L70, L70{DW}, N24M, etc.

Tangowine: Fruit medium-sized; round to slightly elongated; skin dark red over yellow; flesh smooth, medium tender, moderately juicy, pleasantly subacid; quality good; ripens about with McIntosh, keeps well in common storage. Some resistance to scab. Tree large, vigorous, spreading; hardy; produces spurs freely. Originated in Petitcodiac, New Brunswick, Canada. BROOKS 1972; C58

Thornberry:<sup>5</sup> Small, finely formed fruit; translucent yellow skin; flesh raspberry-pink, sprightly, refreshing, with a unique berry-like flavor, not as sweet as Pink Pearl; ripens 2 months later than Pink Pearl. Keeps well in storage, becoming sweeter and mellower in flavor. Ornamental lilac-pink blossoms. Discovered in an abandoned orchard. Probably originated by Albert F. Etter. Thornberry is a registered trademark of Greenmantle Nursery. FISHMAN; C30M, E84

Twenty Ounce: (Cayuga Redstreak) Very large, roundish to round-conic fruit; skin yellow, washed and splashed with bright red; flesh whitish, coarse, moderately tender, juicy, subacid; suitable for dessert or culinary use; season late September to early Winter. Tree moderately vigorous, upright; precocious; productive. Of uncertain American origin; first recorded about 1844. BEACH; A91, A91{SC}, B53, C27T{SC}, E84, F88G, H65, LI, L12, M11M{PR}, M22, M59M, M99G, N38M{SC}

Wagener: Medium to large, oblate fruit; skin glos<sup>^</sup>, clear pale yellow, striped and mottled with bright pinkish-red; flesh whitish slightly tinged with yellow, fine-grained, crisp, juicy, subacid, aromatic, sprightly; quality excellent; season October or November. Tree small to medium. Originated in Rnn Yan, New York from seed planted in 1791. BEACH; A53{PR}, B27M{SC}, E63I{PR}, E84, F88G, H65, I49G, J93{SC}, LI, L12, M11M{PR}, M22, N38M{SC}, 081

Washington Strawberry: Medium to large, globular fruit; skin greenish or yellow, prominently splashed and striped with bright carmine; flesh whitish tinged with yellow, firm, crisp, very juicy, pleasantly subacid, sprightly; quality good to very good; season September or October. Tree vigorous, spreading; hardy; precocious; reliably productive. Originated in Washington County, New York prior to 1849. BEACH; A91{SC}, B53, N38M{SC}

Wealthy: Medium to large, roundish-conic fruit; skin pale yellow or greenish, blushed and striped with red; flesh whitish sometimes stained with red, crisp, tender, very juicy, agreeably subacid, sprightly, somewhat aromatic; quality good to very good for dessert or culinary uses; season October to January. Tree small to medium, moderately vigorous; very hardy. Originated in Excelsior, Minnesota prior to 1869. BEACH; B53, C58, E84, F88G, G16, G65M, H65, H90{DW}, I97{PR}, LI, L27M, M11M{PR}, M39M, N20, N24M etc.

Westfield Seek-No-Further: Medium-sized, roundish-conical fruit; deep yellow skin, overspread with bright pinkish-red, striped with deep carmine; flesh slightly tinged with pale yellow, crisp, tender, juicy, mildly subacid, rich, peculiarly aromatic, sprightly; dessert quality excellent. Tree medium to large, vigorous, spreading; very hardy. Originated in Westfield, Massachusetts prior to 1845. BEACH; A91, A91{SC}, B27M{SC}, B53, C27T{SC}, D69, E84{OR}, F88G, G65M, H65, LI, L12, L27M, M11M{PR}

Winesap: Medium-sized, round to oblong fruit; skin yellow heavily striped with red; flesh yellow, firm, coarse, juicy; flavor sprightly, slightly acid; ripens midseason to late, keeps well. Good for dessert or canning. Tree vigorous, slow to come into bearing. First described in 1817. SIMMONS 1978, STEBBINS; A82{DW}, A85M, D2{PR}, E4, E45, E84, G66, G79M{DW}, LI, L90, M22

Wolf River: Fruit large to very large; broad and flat at the base, often somewhat irregular; skin pale bright yellow, blushed with bright deep-red; flesh slightly tinged with yellow, moderately coarse, tender, juicy, subacid; dessert quality fair to good; season September to December. Tree large, moderately vigorous, very spreading; very hardy. Originated near Wolf River, Wisconsin prior to 1875. ARMSTRONG [Re], BEACH; A82, A91, A91{SC}, B53, C58, E84{OR}, E97, F53, F88G, G16, G16{DW}, H65, LI, L27M, L70, M11M{PR}, etc.

WINTER HARVESTING

Adam's Pearmain: (Norfolk Pippin) Fruit medium-sized; conical to long-conical; skin pale golden-yellow, prominently blushed with dull crimson-red, attractive; flesh creamy-white, crisp, juicy, aromatic; quality excellent; season November to March. Tree moderately vigorous, wide-spreading; partially tip-bearing; tends toward biennial bearing. Of English origin. Introduced in 1826. SANDERS, SIMMONS 1978; C27T{SC}, E84{OR}, F88G, J93{SC}, L12, M11M{PR}, M22, 081

Arkansas Black: Medium-sized, nearly round fruit; skin covered with bright red, deepening to purplish-red on the exposed side; flesh yellow, very firm, crisp, moderately juicy, sprightly subacid, quality very good; season December to April or later. Tree moderately vigorous, upright-spreading; unproductive. Originated in Benton County, Arkansas, and bore its first fruit about 1870. BEACH; A39, A53{PR}, A82, A91, C75M, D2{PR}, E4, E84, F43M, F88G, F93, J93{SC}, LI, L47, M11M{PR}, etc.

Ashmead's Kernel: Medium-sized, flat-round fruit; skin pale greenish-yellow, prominently covered with cinnamon-brown russet; flesh yellowish-white, firm, crisp, juicy, highly aromatic, subacid; dessert quality excellent, also makes delicious cider; season December to February. Tree moderately vigorous, upright-spreading; bears irregularly. Raised about 1720 by a Dr. Ashmead of Gloucester, England. SANDERS, SIMMONS 1978; A53{PR}, C34, F88G, G65M, I49M, J93{SC}, LI, L12, L27M, M11M{PR}, M99G, N20, 081

Baldwin: Large, roundish-conic fruit; skin light yellow, blushed and mottled with bright red; flesh yellowish, very firm, crisp, juicy, agreeably subacid, sprightly; quality very good for dessert and culinary uses; season November to March or April. Tree large, very vigorous, upright-spreading; very productive. Originated near Lowell, Massachusetts, about 1740. BEACH; A53{PR}, A91, A91{SC}, B53, D74M{PD}, E84, G65M, G79M{DW}, H65, LI, L12, M11M{PR}, M99G

Belle de Boskoop: Medium to large, roundish-oval fruit; skin golden yellow, mottled, dotted and striped with bright red; flesh creamy yellow, aromatic, firm, coarse, rather dry; good for dessert, excellent for cooking; season December to April. Tree vigorous, upright-spreading; spur-bearing; productive. Originated in Boskoop, Holland about 1856. SANDERS, SIMMONS 1978; A53{PR}, C30M, E84{OR}, F88G, I49G{SC}, I61M{SC}, J61M, J93{SC}, LI, L12, M11M{PR}, M22, N20, 081

Ben Davis: Medium to large, roundish-conic fruit; skin waxy, clear yellow blushed with bright red, striped and splashed with bright dark-carmine; flesh whitish, moderately coarse, not very crisp, somewhat aromatic, juicy, mildly subacid; quality good; season January to June. Tree vigorous, upright; hardy; precocious; annually bears heavy crops. An American apple of unknown origin; first recorded in 1857. BEACH; A53{PR}, A91, A91{SC}, B27M{SC}, C27T{SC}, K36, L12, M11M{PR}, N38M{SC}

Black Ben Davis: (Gano) Medium to large, roundish-ovate fruit; skin almost completely overspread with brilliant red, becoming dark purplish-red on the exposed cheek; flesh whitish, somewhat coarse, moderately juicy, mildly subacid; quality good; season January to April or May. Tree vigorous, upright, spreading. Said to have originated about 1800 on the farm of M. Black in Washington County, Arkansas. BEACH; A91{SC}, C30M, F43M, F88G, G65M

Black Gilliflower: (Sheepnose) Medium to large, long-ovate fruit; skin striped or mostly covered with red, deepening to dark purplish-red or almost black; flesh whitish, firm, rather coarse, moderately juicy eventually becoming dry, mildly subacid, rich, peculiarly aromatic; good for dessert and specialty markets; season November to January or February. Tree large, moderately vigorous, upright-spreading. An American apple of uncertain origin; known in Connecticut as early as the latter part of the 18th century. BEACH;

A53{PR}, A91{SC}, B27M{SC}, B53, C27T{SC}, E84{OR}, G79M{DW}, H65, LI, L12, M11M{PR}, M22, N38M{SC}

Blacktwig: (Paragon) Medium-sized, roundish fruit; skin yellowish, largely covered with dull deep-red; flesh greenish, slightly coarse, juicy, mildly subacid, somewhat aromatic; quality good to very good; season January to May. Tree moderately vigorous, roundish. Originated near Fayetteville, Tennessee, from a seed planted about 1830. Once very popular in the South. BEACH; A53{PR}, B53, C30M, E23Z, G65M, L12, M11M{PR}, N38M{SC}

Braeburn: Medium to large, oval fruit; skin glosy, covered with short stripes of dark crimson, 75% overlaid with dark scarlet blush; flesh pale cream, firm, crisp, very juicy, mildly sweet; quality excellent; ripens very late, keeps well in storage. Tree moderately vigorous, spreading; precocious; productive, with a slight tendency toward biennial bearing. Originated in Nelson, New Zealand. Introduced in 1952. BROOKS 1972; A5, A53{PR}, A91, B27M{SC}, B83, D81M{PO}, F15{PR}, F53, G8, I23M{PD}, I83M, J61M, J93, J93{SC}, K73M, L33, M39M, etc.

Bullock: (American Golden Russet) Small to medium, roundish-conic fruit; skin attractive, pale yellow, more or less overspread and splashed with thin russet; flesh slightly tinged with yellow, crisp, very tender, juicy, with an agreeable rich, spicy, mildly subacid flavor; quality excellent for dessert or cider; season October to January. Tree vigorous, upright. Originated in Burlington County, New Jersey prior to 1817. BEACH; I49G, I49G{SC}, L27M, M22

Calville Blanc d'Hiver:<sup>1</sup> (White Winter Calville) Fruit medium to large; flat-round, with uneven ribs terminating in unequal ridges at the base; skin pale green with white dots, turning golden yellow in storage; flesh tender, sweet, juicy, aromatic, with a delicate spicy flavor; very high in vitamin C. Tree weak-growing; bears irregularly; requires a warm, sunny location. The classic dessert apple of France; first recorded in 1627; still served for dessert in the finest Paris restaurants. A53{PR}, A91, A91{SC}, E84{OR}, F88G, G65M, H65, I49M, J93{SC}, LI, L1{ES}, M11M{PR}, M22, N24M

Canada Red: (Red Canada) Medium to large, roundish fruit; skin largely overspread with a deep red blush, indistinctly striped with darker red; flesh whitish, crisp, juicy, aromatic, rich, agreeably subacid but becoming too mild toward the end of the season; quality very good; season November to March. Tree moderately vigorous, upright. Probably originated in New England prior to 1822. BEACH; E84{OR}, L12, M11M{PR}, N38M{SC}

Canada Reinette: Medium to large, roundish-conic fruit; skin yellow, sometimes blushed, marked with dots or patches of russet; flesh tinged with yellow, firm, moderately tender, coarse, not crisp, juicy, subacid; quality very good; season early winter to March or April. Tree moderately vigorous, spreading. Origin unknown; recorded in France as early as 1771. BEACH; A91{SC}, F88G, G79M{DW}, I49G{SC}

Christmas Pink:<sup>5</sup> Medium to large, round fruit. Translucent skin. Firm pink flesh, becoming watermelon-red in storage with pockets of deeper colored "water core" that enhance the sweetness. Ripens in November, but needs a few weeks in storage to mellow, becoming pleasantly tart-sweet by Thanksgiving and quite sweet at Christmas. Excellent sliced in fruit salads or for cooking. Discovered in the abandoned orchard of Albert F. Etter. Christmas Pink is a registered trademark of Greenmantle Nursery. FISHMAN; E84{OR}

Claygate Pearmain: Medium-large, oblong-conical fruit; skin dull yellowish-green, slightly covered with grayed-orange blush and light-gray russet; flesh whitish tinged slightly green, crisp, juicy, aromatic, with a rich almost nutty flavor; season December to March. Small, compact tree; very suitable for a small garden; vigorous, upright-spreading; very productive. Originated in Claygate, Surrey, England. Introduced about 1823. SANDERS, SIMMONS 1978; A91{SC}, C27T{SC}, F88G, G65M, L12, M11M{PR}, 081

Connell Red: (Connell Fireside) Large, slightly conic fruit; skin dark-red, smooth, glossy; flesh creamy white, juicy, firm, tender, crisp, mildly acid; quality high; ships and stores well until April and May. Tree very hardy; very productive. Bud mutation of Fireside. Originated in Dunn County, Wisconsin. BROOKS 1972; 474, A74{Wfj}, A91{SC}, C27T{SC}, F53, G4, G16, I49G, I97{PR}, L27M, L70, L70{DW}

Cornish Gilliflower: Fruit medium-large; oblong to oblong-conical; skin deep yellow-green, blushed and streaked dull-red; flesh pale yellow, very firm, very juicy, with a clove-like perfume, flavor sweet and rich; quality excellent; season December to May. Tree moderately vigorous, very spreading; a tip-bearer. Discovered in a cottage garden near Truro, England about 1800. SANDERS, SIMMONS 1978; A91, A91{SC}, C27T{SC}, E84{OR}, F88G, J93{SC}, L12, M11M{PR}, M22, 081

Court Pendu Plat: (Wise Apple) Fruit medium-sized; round, very flattened at base and apex; skin greenish-yellow, covered with orange-red blush and slight russet; flesh creamy-white, very firm, fairly juicy, aromatic; flavor rich, with a good balance of acid and sugar; season December to April. Tree small, weak-growing, upright-spreading; productive; blooms late. An ancient apple; widely planted in Tudor times. SANDERS, SIMMONS 1978; A91{SC}, C27T{SC}, C30M, E84{OR}, J93{SC}, LI, L12, M11M{PR}, M22, 081, R83

Criterion: Medium to large, long conical fruit, resembles Red Delicious; skin light greenish-yellow, often blushed with rose, very attractive; flesh firm, mild in flavor, quality very good; ripens in October, stores very well. Tree vigorous and productive. A chance seedling found near Parker, Washington in 1968. A53{PR}, A91{SC}, C27T{SC}, E631{PR}, G66, H65, H89M, I61M{SC}, /75, M11M{PR}

D'Arcy Spice: Medium-sized, oblong fruit; skin pale greenish-yellow, covered with fine gray russet; flesh white tinged with green, firm, juicy, richly aromatic, with a sweet yet acid, spicy flavor; quality very good; in season from November to April. Requires a hot, dry summer to develop a spicy flavor. Tree of weak and slow growth, moderately productive, tends toward biennial bearing. Originated in England. Introduced about 1850. SANDERS, SIMMONS 1978; M22, 081

Enterprise:<sup>4</sup> (Co-op 30) High quality apple with multiple disease resistance. Medium to large, roundish-ovate fruit, resembles McIntosh; skin greenish-yellow, highly blushed with bright red; flesh creamy-white, crisp, breaking, moderately acid. Immune to scab; highly resistant to fire blight and rust; moderately tolerant to powdery mildew. Introduced in 1993. A5, 49, A39, A53{PR}, B53, B74, B83, C34, C76M, D37, F53, /75, J61M, J93, L33, etc.

Esopus Spitzenberg: Medium to large, roundish-ovate fruit; skin predominantly covered by bright red, attractive, slightly russet; flesh tinged with yellow, crisp, juicy, very aromatic; flavor excellent, a perfect balance of sweetness and acidity; season November to February. Tree moderately vigorous, spreading; moderately productive. Originated at Esopus, New York in the late 18th century. Thomas Jefferson's favorite apple. BEACH; A53{PR}, D37, E84, F88G, G79M{DW}, H65, J93, J93{SC}, LI, L1{ES}, L73{£D}, M11M{PR}, M99G, N38M{SC}

Fireside: Large, conical fruit; skin medium-red, lightly striped with darker red; flesh yellowish, medium coarse, moderately tender and juicy, mildly subacid; dessert quality very good; season of use November to April; resembles Red Delicious. Tree vigorous; hardy; resistant to cedar rust. BROOKS 1972; 474, A91, A91{SC}, C27T{SC}, C58, E97, F53, G4, I49G, I49G{DW}, L12, L27M, L70, M11M{PR}

Fountain Pippin:<sup>2</sup> (Hollywood Pippin) Flattened globe-shaped fruit, green russet with a pinkish blush; flesh slightly yellow, firm; flavor tart-sweet, very rich. Ripens extremely late, December through February in southern California; keeps well. Not totally

deciduous but fruits regularly. Originated as a seedling in Hollywood, California. D57{OR}

Freiherr von Berlepsch: (Baron de Berlepsch) Ananas Reinette x Ribston Pippin. Connoisseur German apple with an intense pineapple flavor. Crisp and juicy; sweet but with plenty of acidity. Reportedly high in Vitamin C. Also used for cooking. First raised circa 1880 by Diedrich Uhlhorn at Grevenbroich, Rhineland. Still valued and grown commercially near the Rhine and in Belgium. MORGAN,.; C76M

Gilpin: (Carthouse) Small to medium, roundish-oblong fruit; skin very smooth and attractive, richly streaked with deep red and yellow; flesh yellow, firm, juicy and rich, becoming tender and sprightly in the spring. Highly regarded for cider in the 1800's. Tree vigorous, spreading, very hardy and productive. A91{SC}, C27T{SC}, L12, M11M{PR}, N38M{SC}

Golden Nugget: (Golden Nugget Spur) Small, broadly-conical fruit; skin predominantly yellow, streaked and splashed with bright orange, sometimes netted and spotted with russet; flesh fine-grained, crisp, very sweet and rich, quality excellent; keeps well. Tree moderately vigorous. Golden Russet x Cox's Orange Pippin. Originated in Kentville, Nova Scotia, Canada. BROOKS 1972; A82, A91, A91{SC}, C30M, C58, F88G, L12, M11M{PR}

Golden Russet: Medium-sized, roundish fruit; usually almost entirely covered with yellow or golden russet; flesh yellowish, moderately crisp, tender, juicy, rich, agreeably subacid, quality excellent for dessert, culinary use and cider; season December to April or later. Tree vigorous, spreading; hardy; productive. Very old cultivar of unknown origin. BEACH; A39, A53{PR}, A91, A91{SC}, C58, E84{OR}, F53, F88G, G79M{DW}, H65, I49G, J93{SC}, LI, L27M, M11M{PR}, N20, etc.

GoldRush: (Co-op 38) Multiple disease resistant apple with outstanding flavor. Medium-sized fruit, resembles Golden Delicious; flesh pale yellow, very firm, juicy, breaking; flavor very rich, well-balanced. Makes a very yellow sauce and crisp slices for baking. Keeps exceptionally well. Immune to scab; moderately resistant to fire blight; moderately tolerant to powdery mildew; susceptible to scab. A5,49, A53{PR}, B53, B74, C30M, C76M, D69, F53, /75, J93, K36, L33, M11M{PR}

Granny Smith: Medium-sized, roundish fruit; skin grass-green, with conspicuous whitish or pinkish dots; flesh white tinged green, firm, crisp, juicy, tart; season January to April; keeps well, becoming sweeter in storage. Suitable for dessert, cooking and sauces; also excellent for juicing and drying. Tree vigorous, upright-spreading; spur-bearing; requires a long season. Originated in New South Wales, Australia prior to 1868. SANDERS, SIMMONS 1978; A53{PR}, C75M, C89{PR}, D2{PR}, E4, G17M{DF}, J83, J83{DW}, L1{ES}, M13M{£D}, M39M, M63M{DF}, M63M{PR}, M99G

Grenadine:<sup>5</sup> One of the darkest-colored of all the red-fleshed apples. Dull grayish-transparent skin. Deep purplish-red flesh. Needs at least several weeks in storage to mellow into an enjoyable dessert apple. Suitable for all culinary purposes especially cider blends and cranberry-like sauces. Requires a very long growing season to ripen properly. Developed by Albert Etter. Grenadine is a registered trademark of Greenmantle Nursery. FISHMAN; E84{OR}

Hadlock Reinette: Fruit medium-sized; skin blushed bronze-orange, resembling Cox's Orange Pippin; flesh firm, fine-grained, moderately subacid, quality good for dessert or cider; keeps late in cold storage; resembles Golden Russet. Tree very hardy. Originated in Hammond, New York. Introduced in 1964 by Fred L. Ashworth, Heuvelton, New York. BROOKS 1972; C27T{SC}, L27M

Hidden Rose:<sup>5</sup> (Airlie Red Flesh) Unique red-fleshed apple with outstanding flavor. Medium-sized, conical fruit; attractive yellow skin with whitish dots; firm, crisp, juicy, striking rose-red flesh; excellent, rich, sweet-tart flavor. Ripens in early October, keeps

very well. Attractive red flowers. Discovered by Bill Schultz near Airlie, Benton County, Oregon. E87,149M, I49P, I66T, J93{OR}, L12, M11M{PR}

Hudson's Golden Gem: Large to very large, conical fruit; skin covered with dull-yellow russet, very attractive; stem very long; flesh juicy, crisp, subacid, excellent for dessert; hangs on the tree a long time; ripens in late October. Tree vigorous, spreading; productive; beais annually. Originated in Oregon by A.D. Hudson. Introduced in 1931. BROOKS 1972; A53{PR}, A91, A91{SC}, B27M{SC}, E84{OR}, I49M, J61M, J93{SC}, LI, L12, M11M{PR}, M22, M99G

Hunt Russet: Medium-sized, roundish-oblate fruit; skin golden russet, with patches of smooth bright red on the cheek; flesh whitish tinged with yellow, tender, juicy, subacid, sprightly becoming mild; quality excellent; season January to April or later. Tree moderately vigorous, upright-spreading; moderately productive. Probably originated in New England in the latter part of the 17th century. BEACH; B27M{SC}, C27T{SC}, L12, M11M{PR}, N38M{SC}

Hyde King: Large to very large, globular fruit; skin glos<sup>^</sup>, pale green or yellow, thinly blushed with red; flesh whitish, very firm and crisp, rather coarse, juicy, mildly subacid, somewhat aromatic; quality good for dessert and culinary uses; season December to April or May. Tree vigorous; annually productive. Originated prior to 1892. BEACH; E84, L12, M11M{PR}

Idared: Medium to large, roundish fruit; skin nearly solid red over yellow, attractive; flesh white, crisp, fine-grained, juicy, mild, aromatic; excellent dessert and cooking quality; keeps exceptionally well, with flavor improving in storage. Tree vigorous, upright; very productive; somewhat susceptible to fireblight. Jonathan x Wagener. BROOKS 1972; A5, A53{PR}, A91, A91{SC}, B83, C34, C95M{PR}, F53, F88G, J93{SC}, M39M, M63M{PR}, M99G

Jonagold: Large, roundish-oblong fruit; skin yellow, highly blushed and striped with red, attractive; flesh cream-colored, firm, slightly coarse, crisp, juicy, subacid; quality excellent for dessert or cooking, rated A plus in customer taste tests of Applesource; ripens with Golden Delicious; keeps well in storage up to 6 months. Tree vigorous, spreading; productive; spur-bearing. BROOKS 1972; A5, A53{PR}, B83, C34, D37, F53, G44M{PR}, H65, H89M{ES}, J61M, J93, J93{SC}, L73{PD}, M63M{PR}, M99G, etc.

Keepsake: Medium-sized, often irregular fruit; skin predominantly red; flesh light yellow, very crisp, juicy, with a semi-tart, strongly aromatic flavor. Very hard when picked in mid-October, but mellow with age and attains its peak eating quality between December and February. Stores through April. Tree resists fire blight and cedar rust. A53{PR}, A74, A82, A91, A91{SC}, C27T{SC}, E84{OR}, F53, I49G, I49G{DW}, J89M, L27M

King David: Small to medium, round fruit; skin medium pale green, overspread with deep dark-red, very attractive; flesh yellow, firm, crisp, juicy, sprightly, briskly subacid; quality very good for dessert, pies and cider; ripens in early November, keeps very well. Tree vigorous; hardy; precocious; productive. Probably Jonathan x Arkansas Black. Found in a fence row in Washington County, Arkansas in 1893. A39, A53{PR}, A91, A91{SC}, B27M{SC}, E84{OR}, F43M, G8, G65M, I49G, LI, L12, M11M{PR}, N33

King of the Pippins: Medium-sized, oblong-conical fruit; skin yellow blushed with brownish-orange, smooth; flesh pale yellow, firm, dry, highly aromatic; flavor very rich, distinctive, vinous, somewhat almond-like; quality excellent; in season November to March. Tree moderately vigorous, upright, very productive. Susceptible to canker. Originated in England. Introduced in 1899. SANDERS, SIMMONS 1978; C30M, F88G, M22, 081

Knobbed Russet: Unusual looking English apple. Green and yellow, sometimes streaked with scarlet on the side exposed to the sun; surface uneven, overlaid with rough grey and black russet, with welts and knobs worthy of its name. Crisp, rich, sugary, highly flavored flesh of excellent quality. First brought to notice in 1819 in

Sussex. C27T{SC}, E84{OR}, F88G, L12, M11M{PR}, M22, N24M

Lady: (Christmas Apple, Pomme d'Api) Small to very small, oblate fruit; skin glossy, clear pale yellow, with a sharply outlined deep red blush, very attractive; flesh white, crisp, juicy, pleasantly aromatic, mildly subacid becoming nearly sweet; quality good to very good; season December to *Ma*. Widely used for decorations, especially for Christmas wreaths. Originated in France prior to 1628. BEACH; A53{PR}, A91, A91{SC}, B27M{SC}, B53, E13G{PR}, E84, F88G, G79M{DW}, H65, LI, L1{ES}, L12, M22, N40{PR}, etc.

Lady Sweet: (Ladies Sweeting) Medium to large, roundish-conic fruit; skin greenish-yellow, overspread with bright red splashed with carmine; flesh whitish, crisp, tender, juicy, decidedly sweet, with a distinct and pleasant aroma; quality excellent for dessert or culinary uses; season November to April or May. Tree moderately vigorous, upright; precocious; annually yields heavy crops. Originated near Newburg, Nov York prior to 1845. BEACH; A53{PR}, G65M, L12, M11M{PR}

Limberrwig: (Old Limberrwig) Medium-sized, roundish fruit; skin greenish-yellow, largely blushed with deep red, attractive; flesh yellowish, hard, moderately fine-grained, not very crisp, juicy, aromatic, subacid; quality good; season January to March or April. Tree very productive. An old southern apple. BEACH; B27M{SC}, C30M, E84{OR}, G8, G65M, L12, M11M{PR}, M22

Malinda: Fruit medium to large; sharply conical, somewhat angular and ribbed; skin rich yellow, blushed with dull red; flesh yellowish-white, firm, juicy, very mildly subacid with a sweet after-taste; quality fair; season late winter. Tree very hardy; comes into bearing late. Originated in Orange County, Vermont; introduced into Minnesota about 1860. BEACH; A91{SC}, C27T{SC}, I49G, I49G{SC}, N38M{SC}

Mammoth Black Twig: (Arkansaw, Arkansas) Medium to large, roundish fruit; skin yellow, largely overspread with dull deep-red, obscurely striped with darker red; flesh tinged with yellow, very firm, crisp, moderately juicy, subacid; quality good; season December to *M*<sup>^</sup>. Tree large, vigorous, upright-spreading. Originated near Rhea Mills, Arkansas, from seed planted about 1833. BEACH; A39, B27M{SC}, G8, LI

Margil: Small to medium-sized fruit; flat-round to conical; skin greenish-yellow to yellow, highly blushed and streaked with deep-red; flesh creamy-white, firm, rather dry, sweet, rich, aromatic; ripens in January, will keep hard and crisp well into *M*<sup>S</sup>. Tree very small and weak-growing, well suited to small gardens. An old English cultivar, known prior to 1750. SANDERS, SIMMONS 1978; A53{PR}, A91, A91{SC}, C27T{SC}, F88G, J93{SC}, L12, M11M{PR}, M22, 081

Mutsu: (Crispin) Medium to large, oblong fruit; skin golden yellow, blushed with orange on the exposed cheek; flesh creamy-white, firm, coarse but crisp, juicy, mildly subacid; dessert quality excellent, rated A plus in customer taste tests of Applesource, also good for culinary use; season late October to early April. Tree large, spreading, very vigorous; annually produces heavy crops. BROOKS 1972; A53{PR}, A91, B83, C76M, E4, E84, F88G, J93, I68{ES}, L1{ES}, L73{PD}, M39M, M59M, M99G

Northern Spy: Large, roundish-conical fruit; skin thin, tender, pale yellow highly blushed with pinkish-red; flesh yellowish, very tender, crisp, very juicy, sprightly, aromatic, subacid; quality excellent for dessert or culinary uses; season November to March or April. Tree large, vigorous, upright; very hardy; blooms very late. Originated in East Bloomfield, New York about 1800. BEACH; A5, A53{PR}, A91{SC}, C76M, E84, F42M{PR}, F53, F88G, H65, J16, J93{SC}, M39M, M99G, N38M{SC}

Northwestern Greening: Medium to large, roundish fruit; skin somewhat waxy, clear pale yellow or greenish; flesh tinged with yellow, moderately crisp and firm, juicy, slightly aromatic, mildly

subacid; quality good for dessert or cooking; keeps fairly well. Tree vigorous, upright; hardy; yields good crops biennially. Originated in Waupaca County, Wisconsin. Introduced in 1872. BEACH; A5, A74, B4, B27M{SC}, B53, B83, C27T{SC}, C58, F53, F88G, G4, G16, G16{DW}, I49G{DW}, L70, M11M{PR}, etc.

Orin: Medium-large, oblong to conic fruit; skin yellow-green, highly russet, slightly blushed with red-orange; flesh firm, juicy, highly aromatic, sweet; very fruity, pineapple-like flavor; quality excellent. Ripens 1 week before Fuji, keeps very well. Requires a long season to mature. Upright, moderately vigorous tree. Originated in Fukushima Prefecture, Japan. BROOKS 1997; A53IPR, B27M{SC}, C27T{SC}, C30M, F91T{SC}, H90M{SC}, I61M{SC}, J93, J93{SC}

Paradise Sweet: (Winter Sweet Paradise) Large, roundish-oblate fruit; skin dull-green, blushed with brownish-red; flesh fine-grained, juicy, sweet but sprightly; season early to mid-winter. Tree vigorous, upright; productive, but slow to come into bearing. Probably originated in Pennsylvania, prior to 1845. BEACH; B53, C30M, I49G{SC}

Peck's Pleasant: Medium to large, oblate fruit; skin bright waxen yellow, blushed with orange-red; flesh yellowish, crisp, juicy, pleasantly subacid, aromatic; quality very good; season October to March. Tree moderately vigorous, upright-spreading; moderately productive. Originated in Rhode Island prior to 1832. BEACH; A91{SC}, C27T{SC}, L12, M11M{PR}, N38M{SC}, Q30{SC}

Pink Lady: (Cripps Pink) Medium to large, oblong fruit, prominently ribbed; skin yellowish, highly blushed with pinkish-red, very attractive; flesh white, resists browning, very dense; distinctive, subacid flavor; quality good to very good. Ripens 10 days after Granny Smith, keeps very well. Very vigorous tree. Originated in Western Australia by John Cripps. A5, A53{PR}, A88M, B53M, C76M, I61M{SC}, LI, N20

Pink Parfait:<sup>5</sup> Pink-fleshed apple of extraordinary quality. Large, roundish fruit; skin greenish, striped with red. Brilliant pink flesh, marbled with swirls of white; exceptional crystalline texture. Rich, complex aromatic flavor, somewhat reminiscent of cherries. Ripens very late. Apparently only adapted to certain favorable locations in California and Oregon. Discovered in the abandoned orchard of Albert Etter. Pink Parfait is a registered trademark of Greenmantle Nursery. FISHMAN; E84{OR}

Prairie Spy: Large, roundish fruit; skin yellow, blushed with attractive red; flesh creamy-white, crisp, juicy, subacid; dessert and culinary quality high; keeps until spring, with flavor developing and improving while in storage; resembles Northern Spy. Tree vigorous; very hardy; annually productive, but slow to bear; somewhat resistant to scab and cedar rust. BROOKS 1972; A91, A91{SC}, C27T{SC}, D76, E97, F53, F88G, G4, G16, G16{DW}, I49G, I49G{DW}, L27M, L70

Ralls Janet: (Ralls, Genet) Medium to large, roundish-oblate fruit; skin yellow or greenish, blushed and mottled with pinkish-red; flesh whitish, firm, crisp, juicy, subacid to sweet, aromatic, pleasant; dessert quality very good; keeps well; season December to May. Tree moderately vigorous, upright-spreading; productive; blooms late. Originated in Virginia prior to 1831. BEACH; A91{SC}, B27M{SC}, C27T{SC}, E84, G65M, J93{SC}, N38M{SC}

Raven: Small to medium-sized fruit; skin of ripe fruit in full sun dark burgundy, almost black; flesh about 50% watercore, yielding a good volume of bright red juice which has excellent flavor and balance and does not turn brown. Also makes very good dried fruit, cider, and a fine wine. Local selection from Waldron Island, Washington. C27T{SC}, F88G

Reinette Ananas: (Ananas Reinette) Medium-sized, tallish round fruit; skin lemon-yellow blushed with brownish-red; flesh yellowish-white, firm, fairly soft, sweet, juicy, aromatic, with a sub-acid slightly pineapple-like flavor; ripens very late, keeps well. Tree very

small and upright, suitable for small gardens, fairly productive. First recorded in 1821. SIMMONS 1978; F88G, M22

Reinette Simirenko: Fruit medium to large, sometimes obscurely ribbed; skin waxy, yellowish-green, usually blushed with pale pink on the side exposed to the sun; flesh tender, very juicy, vinous, subacid, with a very pleasant spicy after-taste; ripens in December and keeps well into spring. Tree moderately vigorous, pyramidal; precocious; high yielding. Originated in the Ukraine in the 19th century; first described in France in 1895. A91{SC}, B27M{SC}, C27T{SC}, C30M, D69, J93{SC}, M22

Ross Nonpareil: (French Pippin) Fruit small to medium; flat-round to short conical; skin pale yellow, blushed and streaked with deep-orange and red, almost covered with russet; flesh creamy-white, crisp, sweet, aromatic, with a pronounced anise-like flavor; season December to February. Tree moderately vigorous, upright; productive. Originated in Ireland; introduced into England in 1819. SANDERS, SIMMONS 1978; A91{SC}, E84{OR}, M11M{PR}, O81, Q30{SC}

Roxbury Russet: Medium-large, oblate fruit; skin largely covered with greenish to yellowish-brown russet; flesh tinged with yellow, firm, somewhat coarse, juicy, sprightly subacid; dessert quality good to very good, excellent for juice and cider; season December to May. Tree large, vigorous, roundish-spreading; productive, but tends toward biennial bearing. Originated in Roxbury, Massachusetts, early in the 17th century. BEACH; A39, A53{PR}, B27M{SC}, E84{OR}, F88G, G65M, G79M{DW}, J93{SC}, LI, L12, M11M{PR}, M22, N24M

Royal Limbertwig: Large, round to somewhat conical fruit; skin red, with greenish-yellow stripes and white dots; flesh firm and crisp, aromatic, juicy; ripens late, keeps well. A good all purpose apple. Apple butter made from this cultivar will have an intense aroma when taken from the container. G65M

Rubaiyat:<sup>5</sup> Relatively small fruit; ruby-red inside and out. Intense aromatic flavor, both very sweet and very tart. Texture excellent, simultaneously crisp, melting and juicy. Ripens in late October. Keeps well. One of the finest flavored of the apple cultivars developed by Albert Etter. Probably a hybrid of Surprise and a crab apple. Rubaiyat is a registered trademark of Greenmantle Nursery. FISHMAN; E84{OR}

Salome: Medium-sized, roundish-oblate fruit; skin pale yellow blushed with pinkish-red, obscurely striped with carmine; flesh tinged with yellow, firm, crisp, juicy, sprightly, subacid; quality good to very good; season November to March. Tree large, vigorous, upright; very hardy; precocious. Originated in Ottawa, Illinois about 1853. BEACH; J93{SC}, L12, M11M{PR}, N38M{SC}

Sandow: Medium to large, round-oblate fruit; skin yellow over-spread with dull scarlet; flesh yellowish, juicy, tender, crisp, slightly subacid, aromatic; quality very high; season mid-winter to later. Tree very upright; slightly more hardy than Northern Spy; susceptible to fireblight. Open-pollinated seedling of Northern Spy. Originated in Ottawa, Ontario, Canada. BROOKS 1972; C27T{SC}, C30M, C58, L27M

Stark: Medium to large, roundish fruit; skin yellow, blushed and mottled with red; flesh yellowish, very firm, juicy, sprightly, mildly subacid; dessert quality good, very good for baking and drying; season January to June. Originated in Ohio prior to 1867. Tree large, vigorous, upright-spreading; hardy; reliably productive. BEACH; C27T{SC}, D69, E84, N38M{SC}, O81

Stayman Winesap: Medium to large, roundish-conic fruit; skin greenish-yellow, highly blushed with dull-red; flesh slightly greenish, very firm, juicy, aromatic, sprightly, pleasantly subacid; quality very good; season December to M<sup>^</sup>. Tree moderately vigorous, spreading; precocious; annually bears heavy crops. Originated in Leavenworth, Kansas from seed of Winesap planted in 1866. BEACH; A53{PR}, A82, A91{SC}, C76M, E45, G65M, G72, LI, L1{ES}, M13M{PD}, M69M

Stone: (Stone Pippin) Medium to large, roundish fruit; skin pale yellow blushed with dark red, overspread with bluish bloom; flesh nearly white tinged with yellow, somewhat coarse, juicy, mildly subacid becoming nearly sweet; quality good to very good. Tree very hardy and productive. Brought from Bethel, Vermont into Potsdam, Nov York about 1836 by a Mr. Stone. BEACH; C27T{SC}, I49G, I49G{SC}, L27M, N24M, N38M{SC}

Sturmer Pippin: Medium-sized, round-conical fruit; skin greenish-yellow blushed with brown; flesh yellow, very firm, crisp, juicy, rich sub-acid; quality excellent; ripens in November, at its best the following M<sup>^</sup>. Requires a warm summer to ripen properly. Tree moderately vigorous, compact, productive. Originated in Suffolk, England, about 1827. SANDERS, SIMMONS 1978; F88G, F91T{SC}, M22, 081, Q30{SC}, R83

Surprise:<sup>5</sup> Small, clear green fruit; juicy, sprightly, creamy red flesh; ripens late, during October in central Viiginia. Was used in the breeding program of Albert F. Etter, and is one of the parents of his well-known cultivar Pink Pearl. First recorded in England in 1831. Brought to the United States by German immigrants in the 1840's. Probably originated in Russian Turkestan. FISHMAN; C27T{SC}, E23Z, L1{SC}, L12, M11M{PR}

Swaar: Medium to large, roundish-oblate fruit; skin yellow covered with dots and flecks of russet, often blushed with bronze; flesh yellowish, very firm, crisp, juicy, mildly subacid, aromatic, flavor rich; dessert quality excellent; season November to March or April. Moderately vigorous, spreading tree. Originated in Nov York prior to 1804. BEACH; A53{PR}, A91, A91{SC}, B27M{SC}, \*C27T{SC}, E23Z, E84, F88G, I49G{SC}, LI, L12, M11M{PR}, M22, M99G

Tydemans Late Orange: Fruit medium-sized, roundish to slightly conical; skin greenish-yellow, blushed with dull brownish-purple, covered with patches of brownish-grey russet; flesh creamy yellow, firm, crisp, sweet, subacid, aromatic, rich; quality excellent; season December to April. Tree vigorous, upright-spreading; productive. Originated at the East Mailing Research Station. SANDERS, SIMMONS 1978; B27M{SC}, C27T{SC}, C30M, E84{OR}, H90M{SC}, L12, M11M{PR}, M22, 081, R83

Vandevere: (Newtown Spitzenberg, Honey Grindstone) Medium-sized, roundish-oblate fruit; skin deep yellow, blushed and mottled with dull red, striped with carmine; flesh yellowish, crisp, tender, juicy, mildly subacid mingled with sweet, rich, aromatic; quality very good for dessert and cider; keeps until February or March. Tree vigorous, spreading. Originated in Newtown, Long Island, New York prior to 1817. BEACH; A91{SC}, C27T{SC}, E84, G65M, N38M{SC}

Virginia Gold: Medium-sized fruit; skin smooth, waxy, clear bright yellow blushed with pink; flesh creamy-white, crisp, juicy, mildly subacid; dessert quality very good, also excellent for sauce and pies; ripens very late, does not reach maximum quality and flavor unless held in cold storage until late January. Tree productive; tends toward biennial bearing. Newtown Pippin x Golden Delicious. A5, B27MISC, C27T{SC}, C30M, E84{OR}, G65M, L12, L21P, M11M{PR}

Von Zuccalmaglio's Reinette: Medium-sized, roundish fruit; skin golden-yellow, blushed with brownish-red, faintly striped with red, some russet, rough, sticky; flesh deep cream, crisp, juicy, fine-grained; flavor intensely subacid, reminiscent of pineapple, quince and wild strawberry. Very vigorous tree. Ananas Reinette hybrid. Originated in Rhineland, Germany, in 1878. MORGAN, J.; C27T{SC}, F88G, J93{SC}, L12, M11M{PR}

Waltana: Medium to large fruit; skin greenish-yellow, striped with red; flesh crisp, firm, juicy, subacid; quality excellent for dessert and all culinary purposes, including cider; ripens late October into November, stores until spring; hangs well on the tree. Tree vigorous; annually productive; requires a long growing season. Originated in Ettersburg, California ty Albert F. Etter. A91{SC}, C54, E84, LI, L12, M11M{PR}

White Pfirmain: (White Winter Pearmain) Medium to large, roundish-ovate fruit; skin slightly waxy, pale yellow lightly blushed with brownish-red; flesh slightly tinged with yellow, crisp, tender, juicy, mildly subacid, sprightly, very pleasantly aromatic; quality very good; season December to March. Tree vigorous, spreading. Originated in the Midwest prior to 1849. BEACH; A53{PR}, A91, A91{SC}, B93M, E23Z, E84, F88G, LI, L1{ES}, L12, M11M{PR}, N20

Willow Twig: (Willow) Medium to large, roundish-conic fruit; skin pale yellowish-green, mottled and blushed with red; flesh yellowish or greenish, very firm, coarse, crisp, juicy, sprightly, slightly aromatic; quality fair to good; season of use January to May. Tree large, vigorous, upright spreading; precocious; annually productive. An American apple of uncertain origin; first recorded in 1848. BEACH; C30M, G65M

Winter Banana: Medium to large, roundish-conic fruit; skin waxy, bright pale yellow blushed with dark pinkish-red, very attractive; flesh whitish tinged with pale yellow, tender, juicy, mildly subacid, distinctly aromatic; dessert quality good, too mild for culinary use; season mid-November to April. Tree medium-sized, vigorous, spreading; precocious; very productive. Originated in Adamsboro, Indiana about 1876. BEACH; A53{PR}, A91, A91{SC}, B53, D81M{P0}, E23Z, E84, F88G, H65, I68, LI, L12, M11M{PR}, M99G, N38M{SC}, etc.

Yates: Small fruit with bright-red, dotted skin; flesh creamy-white tinged with red, very firm, juicy, spicy, aromatic, tart; ripens late, keeps well in regular storage. Popular in the South for dessert, cider making and table decorations. Tree vigorous; very productive; semi-spur-bearing; a good pollinator. Originated in Georgia in 1813. A39, A91{SC}, C30M, E38M{DF}, E45, E84{OR}, E99M, F93, G8, G65M, I41P, I53M, K76, L21P

Yellow Bellflower: (Bishop's Pippin) Medium to large, roundish-oblong fruit; skin pale lemon-yellow, often blushed with brownish-red on the exposed side; flesh tinged with pale yellow, crisp, tender, juicy, aromatic; excellent for pie and sauce, dessert quality very good after being held in storage for a few months. Tree very vigorous, upright spreading; hardy; fairly productive. Originated in Burlington County, New Jersey prior to 1806. BEACH; A53{PR}, A91{SC}, B27M{SC}, C58, E84, F88G, G65M, LI, L1{ES}, L12, M11M{PR}, M22, M99G, N38M{SC}

Yellow Newtown Pippin: (Newton Pippin, Albemarle Pippin) Medium to large, roundish-oblate fruit; skin bright yellow, often blushed with pink; flesh yellowish, firm, crisp, tender, juicy, aromatic, subacid to tart; quality good for dessert and culinary uses; season February to May; keeps well. Tree large, vigorous, upright-spreading. Originated in Newtown, Long Island, New York early in the 18th century. George Washington's favorite apple. BEACH; A53{PR}, A91{SC}, D3M{PR}, D37, E4, E631{PR}, E84, G44M{PR}, G65M, H65, J93, K73M, LI, L1{ES}, M39M, etc.

YorkImperial: (York) Medium-sized, roundish-oblate fruit; skin yellow blushed with pinkish-red, indistinctly striped with carmine; flesh yellowish, crisp, moderately juicy, sprightly becoming mildly subacid or nearly sweet; quality good to very good; season January to April or May. Excellent for drying. Tree vigorous, upright-spreading; annually productive. Originated in York, Pennsylvania early in die 19th century. BEACH; A53{PR}, A91, A91{SC}, B27M{SC}, B53, C30M, E84{OR}, G47D{DF}, G65M, H65, I41P, M39M, M99G, N20, N38M{SC}, etc.

## APRICOT {GR}

## ARMENIACA VULGARIS

## ORANGE-FLESHED

Alfred: Medium-sized fruit, 1 3/8 inches in diameter, roundish; skin bright orange, sometimes with a pinkish-red blush; flesh orange, moderately juicy, medium firm, fine-grained; flavor excellent, sweet and rich; freestone; ripens early. Tree moderately vigorous; hardy; a consistent producer; blooms early but has some resistance to late frost injury; self-fruitful. F91T{SC}, H90M{SC}, L12, 081, R77

Amateur:<sup>3</sup> Small, yellow fruit; very sweet. Has an edible kernel. Tree blooms over a long period with some fruits ripening as late as August. Adapted to Zones 5-8. An old cultivar that probably originated in Central Asia. F43M

Autumn Royal: Medium to large, somewhat flattened fruit; skin golden-orange, with a slight orange blush; flesh yellow, firm, juicy, slightly acid; ripens in late summer, being the only really late apricot known; may pitburn in hottest summers. Tree large; vigorous; produces regularly; consistently reverts to spring bearing after about 5 years. Bud mutation of Ro>al with the same quality. STEBBINS; A63, C54, 183M, LI

Bryan: (Dr. Bryan) Medium-sized, roundish fruit with very sweet flesh; freestone; ripens the end of M<sup>^</sup>. Medium-sized tree, a regular and productive bearer; susceptible to bacterial spot. Recommended for Central Texas and similar climates. Relatively low chilling requirements. Originated in Dublin, Texas. 168, M83

Chinese: (Mormon, Chinese Golden, Large Early Montgamet) Fruit small to medium; skin golden-orange, with a red blush, smooth in texture; flesh sweet, juicy, firm, quality fair; ripens unevenly. Tree medium-sized, spreading; hardy; precocious and heavy bearing; blooms late. Good selection for high elevation or late-frost areas. C54, H89M, H89M{DW}, 168, 199M, K88T, L47, M39M, mo

Curtis: Medium-sized, round fruit; skin rich golden with a bright blush, attractive; flesh medium firm, flavor excellent when fully ripe; ripens about July 27 at South Haven, Michigan; inclined to drop when mature. Tree tall, open, slow growing. Originated in Charlotte, Michigan. BROOKS 1972; B53, F91T{SC}, L12, M11M{PR}

Deatrick: Fruit large, averages 1 3/4 inches in diameter when a heavy crop is borne, round; skin golden, slightly blushed. Tree vigorous and productive; upright; hardy, setting crops under eastern climatic conditions; tends to be bushy. Originated in Franklin County, Pennsylvania. BROOKS 1972; A5, B53, F91T{SC}, M99G

Early Golden: Small to medium, roundish oval fruit; skin smooth, pale orange blushed with carmine; flesh yellow-orange, moderately juicy and sweet, of good flavor; freestone; ripens in early August. Tree vigorous; productive; haidy. Origin unknown. WICKSON; A63, A82, C54, E99M, G72, G72{DW}, H65, I9M, K28, K28{DW}, L47, L90, M69M, M83

Farmingdale: Fruit medium-sized, 1 1/2 inches in diameter, roundish; skin orange-yellow with a red blush; flesh orange, moderately juicy, flavor very good; freestone; ripens early. Tree very vigorous; productive; haidy. Originated in Geneva, New York by Robert C. Lamb. Introduced in 1965. BROOKS 1972; F91T{SC}, L12, 081, Q30{SC}, R77

Flora Gold: Small to medium-sized fruit with yellow skin; flesh of very good quality; ripens midseason to late. Tree relatively small but a heavy, consistent cropper; resistant to temperature fluctuations

during bloom. Originated in Modesto, California by Floyd Zaiger. A88M, I83M, N20

Garden Annie:<sup>1</sup> Fruit medium to large; skin gold to yellow-gold; flesh orange, juicy, firm; semi-freestone. Tree a genetic dwarf, grows 7 to 8 feet tall; self-fruitful; bears a good crop in its 3rd year; lower chilling requirement than Royal. C54, 168, 76S{ES}, L47

Gold Kist:<sup>2</sup> Medium to large fruit; skin yellow with a red blush, has slight tendency to crack; colors 2 to 4 weeks before ripening; flesh orange, firm, flavor mild; quality very good; freestone; ripens early, or 4 to 5 weeks before Royal. Tree large, upright; vigorous; a regular and heavy bearer. Low chilling requirement; highly recommended for warm winter areas. BROOKS 1972, STEBBINS; A63, A88M, D23M, 168, 168{ES}, I83M, N20

Goldcot: Fruit medium to large, nearly round; skin moderately thick, tough, golden colored; flesh medium-orange, firm, sprightly flavored; shipping quality good; ripens late. For fresh use and home processing. Tree exceptionally strong; very hardy; recommended for areas with a cold, humid climate. BROOKS 1972; A5, B53, D76, D76{DW}, E97, E97{DW}, F53, G16, H49, L12, L33{DW}, M11M{PR}, M39M, N20

Golden Amber: Fruit large, uniform, symmetrical; skin light orange; flesh yellow, firm, melting, slightly acid; quality excellent; ripens mid-June to mid-July; resists pitburn well. Tree large, upright; hardy; productive; has extended period of bloom, resulting in less loss due to frost injury. A88M, C54, 168

Goldenglo:<sup>1</sup> Medium-sized fruit; skin golden, blushed with red; flavor mildly sweet; quality high. Tree a genetic dwarf, growing only 4 to 6 feet tall; bears the second year after planting; ornamental. Ideal tub or container plant for the home garden, terrace, balcony, conservatory or sun room. L33, 097

Harcot:<sup>3</sup> Medium to large, ovate fruit; skin orange with a slight red blush, attractive; flesh orange, firm, smooth, usually freestone; flavor and texture very good; ripens very early. Sweet, edible kernels. Tree cold hardy; vigorous and productive with good resistance to perennial canker, bacterial spot and brown rot. A5, A88M, A91, C54, C76M, E91M, F53, 149M, L12, M11M{PR}, N20

Harlayne: Medium-sized, oblong fruit; skin orange, 20% blushed with red; very firm, fine-textured orange flesh of good flavor; ripens 4 days after Harogem. Vigorous, spreading, consistently productive tree; disease resistant. Recommended for fresh market and processing. Named in honor of apricot breeder Richard E.C. Layne. A5, C45M, D69, F53, F91T{SC}, L12, M11M{PR}

Harogem: Fruit small to medium; skin glos<sup>^</sup>, orange with a bright-red blush, exceptionally attractive and highly colored; flesh orange, very firm, flavor and texture good; freestone; ripens mid to late season; keeps very well at room temperature and in cold storage. Tree cold hardy; consistently productive. Resistant to perennial canker and brown rot. A5, F53, F91T{SC}, 149M, M11M{PR}, M22, M99G

Hemskirke: Fairly large, conical fruit, somewhat flattened; skin pale yellow with red patches; flesh golden yellow, fine-grained, very sweet and rich; stone medium-sized; kernel bitter; ripens in early August. A hardy tree of stocky growth; fairly productive. SIMMONS 1978; F91T{SC}, K88T, R77

Henderson: Fruit large, roundish; skin yellow, with a crimson blush; flesh yellow, thick, slightly fibrous, sweet; semi-clingstone; ripens in late August. Quality good fresh; very good for sauce, canning and jelly. Tree strong; vigorous; very haidy. Originated in Geneva, New York by Georgs W. Henderson. Introduced in 1935. BROOKS 1972; D76

Hungarian Rose: Medium to large, sheep-nosed fruit; skin bright yellow, attractive; flesh orange; flavor sweet; excellent to eat fresh, can or dry; ripens mid-July in Zone 6; susceptible to sunburn. Tree self-fruitful, relatively productive. Well known, dependable cultivar. Originated in Hungary. L33, M83, N33

Katy:<sup>2</sup> Large, uniform fruit, slightly flattened on the sides; skin yellow-orange, blushed with red on the side exposed to the sun; flesh deep yellow, firm, freestone; ripens early. Tree strong; vigorous; upright; withstands varying temperatures during blooming season without dropping blossoms. Low chilling requirement. STEBBINS; A63, A88M, B71M, C54, D81M{PO}, G49, H4 J68, N20

Luizet: Medium to large, roundish fruit; skin bright yellow, with a carmine flush and darker dots; flesh deep yellow, firm, rich and sweet; ripens in late July. Vigorous, hardy tree; produces fairly good crops. First raised in France, about 1838. SIMMONS 1978; F91T{SC}, 071M

Moongold: Fruit medium-sized, oblate; skin orange, rather tough; flesh orange-yellow, medium juicy, sweet to slightly subacid, very pleasant, quality very good; fine for dessert and processing; freestone; ripens in late July, before Sungold. Tree vigorous; spreading; intended for the Minnesota climate; self-unfruitful, but pollinated by Sungold. BROOKS 1972; A74{DW}, B15M, D65, D76, E97, H65, H89M, H90, L70

Moorpark: Large, round, sometimes slightly flattened fruit; skin maize-yellow with brownish-red flush and darker spots; flesh yellow-orange, firm, juicy, sweet, rich; stone large, free; quality excellent; sometimes one side of the fruit ripens before the other. Long considered the standard of excellence among apricots. Originated in England. Introduced about 1760. SIMMONS 1978; A82, B53, B73M, B73M{DW}, D65{DW}, E99M, G72, G72{DW}, H65, H90, 19M, K28, N33

Morden 604: Fruit large; skin golden-yellow; flesh thick, deep orange, moderately firm, of very fine texture; flavor sweet, pleasing; excellent as dessert, preserves or jam; ripens mid-August. Tree upright, spreading, rounded; vigorous; haidy. Originated in Morden, Manitoba, Canada. BROOKS 1972; H85

Newcastle: (Early Newcastle) Small to medium-sized fruit; round, with spherical pit; skin lemon yellow; flesh coarse and soft in texture, flavor good; ripens early. Tree large and vigorous; a regular and heavy bearer; needs relatively little winter chill; very subject to brown rot and bacterial gummosis. Originated in Newcastle, California. Introduced in 1881. STEBBINS, WICKSON; I68, Q93

Patterson: Reliable commercial cultivar, widely planted in California's San Joaquin Valley. Very firm, medium-sized fruit; ripens about 1 week before Royal. Suitable for canning, drying or fresh use. Holds its shape and texture very well after canning. Moderately vigorous, spreading tree; productive. A9, B71M, D81M{PO}, E4, K73M, K88T, N20

Pêche de Nancy: (Ffeach Apricot) Very large, round fruit; skin pinkish-orange with a deep red blush; flesh deep yellow, soft, juicy, very rich, flavor good; ripens the end of August. Tree vigorous, fairly productive. Recommended for small gardens because it takes heavy pruning better than others. Thought to be the parent of Moorpark. SIMMONS 1978; T49M{SC}

Perfection: Fruit large, oval, blocky; skin pebbled, light yellow-orange, not blushed; flesh bright orange, firm, quality fair; ripens about 1 week after Wenatchee. Tree vigorous; hardy; blooms early; self-unfruitful. Preferred for commercial planting in Washington state. Parent of many modern cultivars. BROOKS 1972; B83, B93M, C41M, E99M, H89M, K88T, M39M, N46

Precious:<sup>3</sup> Orange fruit with soft, sweet and very juicy flesh. The kernel has a sweet almond-like flavor. Largely self-fruitful, its seedlings appear to be close to the parent in fruiting characteristics. Original tree is estimated to be over 100 years old. Still produces excellent crops despite very cold winters, late frosts, and spring temperature fluctuations that would kill most apricot trees. F91T{SC}, N24M

Puget Gold: (Copeland) Medium-sized, roundish ovate fruit; skin clear yellow blushed with red-orange; flesh deep yellow-orange, firm, sweet; quality good; ripens in early August. Tree moderate to

low in vigor, spreading; said to be a natural semi-dwarf. Sets and sizes fruit in cool, frosty spring weather where most other cultivars fail. Discovered in Anacortes, Washington by Jean Copeland. Introduced by Washington State University. B74, B83, C34, C54, E87, H89M, H89M{DW}, I49M, 174, J61M, LI, N20

Ram Roc: Large to very large fruit; flesh orange, exceedingly juicy, with a very rich flavor resembling that of Moorpark, of excellent quality. Rated one of the finest-flavored of all apricots. Tree relatively unproductive. Introduced into California from Iran in the 1960's by P.A. Mariani. MARIANI1994; T49M{SC}

Redsweet:<sup>4</sup> Medium-sized, oval fruit, almost completely covered with a deep red blush; freestone. Quality and flavor similar to Royal, but fruit has a tendency to split in some climates. Tree a very heavy producer. Flowers pink, somewhat small. Bud mutation of Royal, discovered in 1954. Introduced in 1961 by Armstrong Nurseries. BROOKS 1972; T49M{SC}

Reliable:<sup>3</sup> Fruit orange, blushed with red; texture dry and firm, maintaining firmness on the tree for about 10 days after attaining full color; dessert quality fair; ships well; not suitable for canning. Kernel sweet and edible. Tree upright-spreading, vigorous; hardy; bears regularly and heavily. BROOKS 1972; F91T{SC}

Riland: Large, flat-oval fruit; skin light yellowish with a bright, deep red blush over one-half or more; flesh slightly coarse, firm, melting; flavor rich, plum-like, somewhat acid; freestone; keeps well; ripens early, and tends to ripen from pit out. Young trees have vigorous growth and an upright form. BROOKS 1972, STEBBINS; B83, F91T{SC}

Rival: Very large, oval fruit; skin light orange, blushed on the exposed side; flesh deep orange, very firm, low in acid, flavor mild; good for canning but skin turns brown; ripens early to midseason. Tree very vigorous, leggy; productive; requires an early-blooming pollinizer; more resistant to cold than Wenatchee. STEBBINS; B53, B83, C41M, D81{PO}, F91T{SC}, H49, H89M, M39M, N46

Routier's Peach: An old California variety worthy of greater cultivation. Very distinctive shape, compressed on the sides and with a recurved suture, somewhat reminiscent of a mango. Rich, melting flavor. Reportedly does well in interior valleys. Originated in Sacramento, California by J. Routier. MARIANI 1994; U7G{SC}

Royal: (Blenheim) Medium to large, oval fruit; skin pale yellow, dotted purplish-red on the side exposed to the sun; flesh yellow-orange, firm, very juicy, delicately aromatic; stone round, free; kernel bitter; ripens early to mid-season. Tree very productive; low chilling requirement. Principal commercial cultivar in the United States. A9, A88M, D23M, D81M{PO}, E4, G49, G92{DF}, I83M, K73M, LI, L47, L97G{DF}, M39M

Skaha: Large to very large, oval fruit; skin well colored with a reddish cheek; flesh orange, meaty, flavor very good when fully ripe; ripens in midseason; resembles Perfection but of better quality. Originated at the Summerland Experiment Station, British Columbia, Canada. F91T{SC}, I61M{SC}, K88T

Sparks Mammoth: Rare, choice heirloom suitable only for collections. Very large, oblong fruit; light golden in color; extremely sweet and flavorful. Susceptible to cracking. A very shy bearer. Originated in Ventura County, California. Recently rediscovered by members of the California Rare Fruit Growers. MARIANI 1994; T49M{SC}

Sundrop: Fruit medium-sized, roundish to slightly oval; skin bright-orange with a slight red blush, attractive; flesh orange, medium firm, juicy, smooth, flavor sweet and mild; semi-freestone; ripens about 2 days before Alfred. Tree productive; a reliable bearer, bearing heavily in clusters. F91T{SC}, I61M{SC}

Sungold: Round to slightly elongated fruit; skin medium thin, tender, gold with an orange blush; flesh clear orange, tender, medium juicy; flavor very mild and sweet, quality very good; fine for dessert and processing; freestone; ripens in early August. Tree

vigorous; exceptionally hardy; self-unfruitful but pollinated by Moongold. BROOKS 1972; *A74{DW}*, A91, B15M, D65, D76, E97, H65, *H89M*, H90, L70

Sweet Pit:<sup>3</sup> Sweet-kernel type, also called *alpricots*. Fruit large, 2 1/4 to 2 1/2 inches; skin deep-orange; flesh sweet; preferred for jam, drying and roadside markets. Kernel 1/2 to 3/4 inch long, quite sweet, easy to shell, long lasting. Tree self-fertile; winter hardy to Zone 5; can be maintained at 15 feet tall. Still grown commercially in British Columbia at the northern limits of apricot culture. D76, E97, L74

Sweetheart:<sup>3</sup> Produces both fruit and sweet, almond-like kernels. Medium-sized, freestone fruit; juicy and firm, with a sweet, sprightly flavor; quality good for fresh eating, also very good for canning and drying; ripens mid-July in Zone 6. Tree hardy; productive; grows 15 to 20 feet tall; usually bears fruit in its third year. L33, L33{DW}

Tilton: Fruit large to very large, symmetrical; skin orange; flesh yellow-orange, fair flavor when eaten fresh; freestone; ripens evenly, and 7 to 10 days later than Royal; widely used for drying. Tree vigorous; prolific and regular bearer; high chilling requirement. A9, A63, A88M, *B71M*, B83, D81{PO}, D81M{PO}, I23M{PD}, I99M, *K37M*, L47, M39M, M83

V510915:<sup>3</sup> Medium to large, oval fruit, cracks if weather is wet; quality and flavor excellent; ripens a week later than Sundrop. Kernel plump and sweet. Tree a consistent producer; handy. One of the best of the *alpricots*. Sibling of V60031. E91M

V60031:<sup>3</sup> Dual purpose apricot. Produces both a fine quality fruit and an excellent nut. Medium-sized nut with a very good flavor, fills well. Tree hardy and productive. Seedling of Reliable. E91M

Victoria: (Wilson Delicious) Fruit large; skin golden-orange blushed with red; flesh firm, golden-orange; flavor good, rich and distinctive; ripens in early July in Zones 5 and 6. Good flesh, dry, canned or frozen. Tree productive; hardy; blooms late. Originated in Hannibal, Missouri by H.J. Jenner. Introduced in 1948. BROOKS 1972; L33, L33{DW}

Wenatchee: (Wenatchee Moorpark) Fruit large, oval, flattened; skin and flesh orange-yellow; suffers from uneven halves and uneven ripening; texture and quality fair; ripens mid-season. Tree a heavy, annual bearer; adapted to Northwest climate conditions. Originated in Wenatchee; Washington. A88M, B53, B83, C54, *H89M*, *H89M{DW}*, I99M, M39M, N20

Westcot: Medium to large, roundish fruit; skin yellow-orange with a reddish blush; flesh orange, fine-textured, juicy, freestone. Dessert quality very good, especially for a hardy apricot; also holds its shape after cooking. Tree vigorous and productive, has great bud hardiness. Originated in Morden, Manitoba, Canada. Introduced in 1982. A65, A91, H85, J89M, K64, N24M

#### WHITE-FLESHED

Afghanistan: Medium-sized, oval fruit; skin whitish with a red blush, very smooth; flesh white, rich, juicy, very sweet, too soft and tender for commercial use; flavor and quality excellent; one of the best dessert cultivars. Originated in Summerland, British Columbia, Canada from seeds brought from Teheran, Iran in 1957. T49M{SC}

Canada Light: Medium-sized, oval to oblong fruit; pale yellow skin; creamy-white flesh, light orange near the pit, soft, juicy, very sweet, richly flavored; excellent quality. Highly ornamental tree with spectacular sprays of perfumed, pinkish blossoms. Healthy, vigorous tree, somewhat of a shy bearer. Apparently has a high chilling requirement. MARIANI1994; T49M{SC}

Moniqui: Fruit very large, about twice the size of others; skin light cream blushed with bronze-red, velvety, very attractive; flesh juicy, tender, sweet, very low in acid, becomes mushy when fully ripe; quality good fresh or for preserves, very good for drying; ripens in June. Tree large, vigorous; reported to succeed in many different

climatic regions of Spain. Requires 800 to 900 hours of chilling. RUCK; A88M, C54, 071M

Suphkany: Small, glossy oval fruit; flesh soft, juicy, sweet. Somewhat susceptible to cracking. Not as flavorful as some other white-fleshed varieties. A fairly reliable producer in California. May require less chill than other Asian strains. Introduced into the United States from Central Asia. MARIANI 1994; T49M{SC}

Turkish White: Small, white-fleshed fruit; very sweet but nicely balanced by some acidity, flavor excellent. Susceptible to shot hole fungus, *Coryneum* blight and sunburn. Tree relatively unproductive. Introduced into the United States from Iran in the 1960's. MARIANI 1994; T49M{SC}

#### CODES FOR SPECIAL TYPES

1. Genetic Dwarf
2. Low-Chill
3. Sweet-Pit (*Alpricots*)
4. Red-Skinned

## ASIAN PEAR {GR}

PYRUS PYRIFOLIA

PYRUS USSURIENSIS

#### RED-SKINNED

Huhoot Li: Medium-sized, roundish fruit; skin highly blushed with red over a yellow ground color, smooth; flesh firm, crisp, juicy; ripens in early October. Tree cold-hardy, productive. N24M

Tarusa Gimson: (Tamared) An attractive Asian pear with a pronounced red or orange blush. Ripens later than other cultivars to spread the season. Crisp when first ripe, it eventually develops a smoother texture, more like a European pear. Vigorous tree with attractive, red-hued leaves when young. Excellent commercial potential and a fine garden fruit tree. LI

#### YELLOW/BROWN-SKINNED

A-Ri-Rang: (Don Bae, Koian Giant) Very large round fruit, average weight over 1 pound; skin dark brown, russet; flesh very juicy, crisp, sweet, sugar content 14.5%, flavor excellent; ripens late; can be stored in non-refrigerated air cooler into late March. Tree upright-spreading; precocious; productive. A39, A53{PR}, A91, B74, C27T{SC}, C30M, I49M, *I49P*, 174, J61M, J93, J93{SC}, M99G, N24M

Chojuro: Medium-sized fruit; skin greenish-brown to brown, russet; flesh white, mildly sweet, somewhat bland, core somewhat sour, aroma and flavor distinctive; texture firm, crisp, somewhat coarse and pulpy, some stone cells; quality good; ripens in mid-season. Tree medium-sized, spreading; vigorous; very productive; requires a pollinator for best production. Introduced about 1895. GRIGGS; A39, A91{SC}, C34, E84, E87, E99M, J61M, J93, LI, L12, L90, N24M

Daisui Li: Large to very large fruit, weight 12 to 16 ounces; skin medium green to light green, smooth; flesh white, firm, somewhat coarse, crisp, tender, juicy, subacid to sweet, aroma distinct; ripens the first 3 weeks of September; good shipping and keeping qualities. Tree medium to large, moderately vigorous; a regular and productive bearer; blooms early, usually in the third week of March. Kikusui x Tsu Li. Originated at Davis, California by Ben Iwakiri. E4

Doitsu: Small, variably shaped fruit; skin coarse, tough, predominantly light brown; flesh white, sweet, mild; texture firm, crisp, juicy, pulpy, coarse and slightly granular; quality fair; ripens in mid to late August. Tree small to medium, open, spreading; moderately productive. GRIGGS; F91T{SC}, I61M{SC}

Hamese: Medium-sized fruit with yellow skin; very sweet and crisp, flavor superior; ripens very early, around mid-August, just before Shinsui. Vigorous tree that produces large crops. The top rated Asian pear in tests at the Mount Vernon Research Station in Washington state. J61M

Hosui: (Much Water) Medium to large, round fruit; skin greenish-brown, russet, medium tough; flesh white to off-white, firm and crisp, fine-textured, very sweet and juicy, quality excellent; ripens in July and August, harvested through November. Tree medium-sized, spreading, very vigorous; productive, requires cross-pollination. Developed in Japan. Introduced in 1972. A5, A88M, B83, D34M{PR}, E4, E87, E99M, F43M, G37, I83M, LI, M11M{PR}, M39M, N20, N33, N40{PR}, etc.

Ichiban Nashi: Small to medium-sized fruit; skin light yellow, russet; flesh yellowish-white, soft, juicy, sweet, tender and crisp, quality good; ripens extremely early, late June to early July, harvested through August. Tree moderately vigorous; productive, bears on spurs; pollinated by Chojuro, Kosui, Hosui and Nijisseiki. B74, C34, E4, E23Z, J61M, N20

Ishiiwase: Medium to large fruit; skin greenish-brown to yellowish-brown, russet; flesh white with a faint yellow cast, juicy, faintly sweet; core sour; texture firm, relatively tough, crisp, juicy, relatively few stone cells, quality fair to good; ripens early; resembles Chojuro. Tree large, very vigorous; moderately productive; tends to drop fruit when temperatures are hot. GRIGGS; A88M, E99M, N20

Japanese Golden Russet: (Taihe) Medium-sized, attractive fruit; skin dark brown, russet; flesh juicy and sweet; ripens in late September. Among the favorites at the Oregon State University test orchards. GJ7{OR}, L12

Kikusui: Medium to large fruit; skin yellowish-green, thick and tough, slightly bitter; flesh white, sweet, mild, with a trace of tartness, aroma faint but distinct; texture firm, tender, crisp, juicy; quality good to very good; ripens in midseason. Tree vigorous, spreading; very productive. Originated in Tokyo, Japan. Introduced in 1927. GRIGGS; A63, A88M, A91{SC}, C54, E4, E87, G57{OR}, I68, J93{SC}, N20, N24M

Kosui: (Good Water) Small to medium-sized fruit; skin light green to golden-bronze, partially russet; flesh white, crisp and tender, very juicy, exceptionally sweet, flavor mellow, quality excellent; ripens in early August, harvested through September. Tree vigorous; moderately productive. Recognized in Japan as the highest quality commercial cultivar. B83, C34, D37, E4, G17, I49P, I66T, J93, J93{SC}, M11M{PR}

Meigetsu: Medium to large-sized fruit; smooth, russet skin. Sweet white flesh with a refined, perfumed and delicate flavor. Ripens in mid-September. Stores well. Vigorous, very productive, spreading tree. Apparently resistant to fireblight. Older Japanese cultivar. Name translates as "Bright Moon" or "Full Moon". A39, D28J, J93{SC}

Mishirasu: Relatively new cultivar from Japan. Very large, oval fruit with brown russet skin, resembles a European pear; very crisp and juicy, flavor excellent; ripens in mid to late September, just after Shinko. J61M

Niitaka: Fruit very large; skin brown to golden-bronze, with brown russeting, attractive; flesh white tinted with yellow, coarse, crisp and juicy, somewhat mild but sweetens with storage, quality good; ripens in early October, keeps for several months. Tree very upright, somewhat weak growing; highly productive; not a good pollinator. A5, A39, A91, A91{SC}, D34M{PR}, E4, E99M, GJ7{OR}, I61M{SC}, I68, J93, J93{SC}, LI, N24M

Nijisseiki: (Twentieth Century, Er Shi Shinge) Fruit round to oblong; skin greenish-yellow, thin, tender, smooth; flesh white, sweet, mild, refreshing, slightly tart; core slightly sour; texture firm, tender, crisp, very juicy, somewhat coarse and pulpy; ripens in

midseason. Tree moderately vigorous; productive. Most widely grown Asian pear worldwide. Introduced in 1898. GRIGGS; A5, A91, A91{SC}, E4, E84, E87, G37, G49, I6S{ES}, I83M, LI, M11M{PR}, M39M, M63M{PR}, N33, N40{PR}, etc.

Okusankichi: (Bansankichi, Nihon Nashi) Medium to large, turbinate fruit; skin tannish-green to tan, tough, relatively thick, russet, somewhat bitter; flesh dull white, mildly tart, refreshing, flavor improves in storage; texture firm, crisp, juicy, relatively few stone cells; quality fair to good; ripens late; stores very well. Tree relatively large, spreading; very vigorous and productive. GRIGGS; E4, I68, N24M

Olympic: Large, Korean pear, 3/4 pound or more in weight; skin brown-green, russet; flesh very juicy, somewhat coarse, of very good flavor, sugar content 13 to 15%; season mid-September to early October in the Sacramento Valley, excellent storage life. Tree cold hardy; blossoms with Nijisseiki, Hosui and Bartlett. A5, D37, E4

Seigyoku: Large, oblong fruit; skin light greenish-yellow, usually free of russet, attractive; flesh white, sweet, mild, slightly tart; texture firm, tender, crisp, juicy, somewhat coarse and pulpy, relatively few stone cells; quality very good; ripens early. Tree moderately vigorous; very productive. Seedling of Nijisseiki x Chojuro. GRIGGS; A88M, E4, GJ7{OR}, N20, N24M

Seuri: Fruit large to very large, round to oval; skin greenish-brown, with partial yellow-orange russeting; flesh pure-white, crisp and juicy, fine-grained, aromatic, with a distinctive flavor, quality good; ripens in mid-September, harvested through October. Well liked in taste tests. Tree very vigorous, extremely strong; heavy bearing; blooms early. D28J, E4, E99M, G57{OR}, I49M, I49P, I66T, I74, J61M, J93{SC}, LI, N24M

Shin Li: Medium to large, round-oblate fruit; skin light green to yellowish-green when ripe; flesh white, firm but tender, fine-grained, crisp, sweet and juicy, quality excellent; ripens with Daisui Li; good keeping and shipping characteristics. Tree medium to large, vigorous; productive; blooms early, with Daisui Li, with less thinning needed. Kikusui x Tsu Li. Originated at Davis, California by BenLwakiri. A39, E4, E87, I49P

Shinko: Medium to large, oval fruit; skin golden-bronze, russet, thick; flesh white, crisp and juicy, very sweet, flavor rich and distinct; ripens in September, stores until March or April; retains its rich flavor through storage. Rated by Sunset magazine as the best tasting in their test kitchens. Tree precocious; bears very heavy crops regularly; chilling requirement 500 hours. Popular in Korean markets. A39, A88M, B74, C54, D34M{PR}, E4, E87, I49M, I68, I83M, J61M, J93, J93{SC}, LI, M11M{PR}, N20, N40{PR}, etc.

Shinseihō: Fruit very large for an Asian pear; skin light yellow-green; flesh sweet, with a hint of tartness. Flavor improves after being stored for a couple of weeks. Ripens in mid to late September. Pollinate with Bartlett or any other Asian pear. A91, A91{SC}, GJ7{OR}, J93{SC}, N24M

Shinseiki: (New Century) Fruit medium to large, round to oblong; skin yellow, thick, smooth; flesh white, sweet, mild; texture firm, tender, crisp, juicy, stone cells more numerous than in Nijisseiki fruit; quality good to excellent; ripens early. Tree moderately vigorous, spreading; productive. Seedling of Nijisseiki x Chojuro. Introduced in 1945. GRIGGS; A5, A39, A91, A91{SC}, E4, E84, E87, G37, G49, I83M, J93{SC}, LI, M11M{PR}, M39M, M63M{PR}, N40{PR}, etc.

Shinsui: (New Water) Small to medium-sized fruit; rounded, somewhat flattened; skin green with brown to orange-brown russet; flesh white, crisp but tender, very sweet and juicy, moderate number of stone cells; quality excellent for its season. Tree an excellent pollinator. Recognized in Japan as the highest quality early maturing cultivar. Constitutes 30% of new plantings in Japan's major nashi growing district. A63, A91, E4, G49, H90M{SC}, I68, J61M, J93, J93{SC}, N20, N24M, 081

Singo: Very large fruit, average weight up to 1 pound; skin yellowish-tan, attractive; flesh white, tender, juicy; ripens in mid-season, from late September to the first week in October. Tree vigorous, has a tendency to grow very upright; productive; good pollinator for A-Ri-Rang. In order to produce large fruit thinning is required. A91,A91{SC}

Tsu Li: (Tse Li) Ovate to pyriform fruit; skin light green to yellowish-green, slightly bitter; flesh white with a faint tint of yellow, sweet, refreshingly mild, aroma distinct, tender, crisp, juicy, somewhat coarse and pulpy. Tree large, upright, vigorous; requires cross-pollination for best results. An old and famous cultivar in the Shantung Province of northeastern China. GRIGGS; A63, A88M, C54, E4, E87, H4, H53M, I49M, I49P, I66T, 168, I83M, L12, N20, N24M, etc.

Ya Li: (Duck Pear) Medium to large, pear-shaped fruit; skin light greenish-yellow, smooth; flesh white, mildly sweet, slight trace of tartness, aroma distinctly fragrant; texture tender, crisp, juicy, slightly pulpy and coarse, relatively few stone cells. Tree large, upright; vigorous; requires cross-pollination. An old cultivar, commonly cultivated in northeastern China. GRIGGS; A63, A88M, C54, E4, E87, E99M, G37,I49M, I49P, 168,183M, J93{SC}, LI, N20, N40{PR}, etc.

Yakumo: Small to medium-sized fruit; round to oval, with a very short neck; skin bright yellow, smooth, glossy, unblemished; flesh white, fine-grained, crisp, very juicy, sweet; flavor very good, with a subtle melon-like aftertaste; ripens very early, will keep for months in cold storage. E87, J93{SC}, L12, N20

Yoinashi: Large fruit; skin yellow to yellow-orange, russet, medium thick; flesh white tinged with yellow, juicy, sweet, fine-grained, tender and crisp, quality excellent; ripens in August and September, harvested through January. Tree moderately vigorous to vigorous, fairly productive; pollinated by Hosui, Ichiban Nashi and Ya Li. E4, J61M, N20

Yongi: Large fruit; skin brown to golden brown, with large lenticels; flesh white to off-white, firm, crisp, sweet, aromatic, of good flavor, quality good to very good; ripens in August, harvested through December. Tree medium to large, fairly vigorous, upright-spreading; pollinated by Nijisseiki, Shinseiki and Chojuro. H90M{SC}, J61M

or more longer. Equally good for fresh eating, canning and freezing. C20Af{S}, DIT{S}, 053{S}

Conover's Colossal: {S} An very old cultivar, still unsurpassed for quality and earliness, being ready before most other types. Strong grower, producing thick, fleshy stalks. Has the advantage that male seedlings, which are better producers than females, are stockier and denser and more easily selected when planting out. Originated with Abmham Van Siclen of Long Island, Nov York. Introduced about 1873. HEXAMER; B49, N84, 053M, PIG, R0, R32, R83, S55

Dulce Verde: Sibling of Purple Hssion. Very large spears with typical green color. Sweet and tender, contains approximately 20% more sugar than common types. Also less stringy, the lower part of the spear even being useable. Mild, nutty flavor when cooked. Excellent eaten raw in salads or as crudites. Very vigorous plants, susceptible to asparagus rust. Developed by Brian L. Benson. B91, B91{S}

Early Giant Argenteuil: (D'Argenteuil Hative) An old traditional French cultivar, obtained by selection from seedlings of the Giant Dutch Purple. Hie shoots are notably thicker than those of the parent plant, the head is slightly pointed, and the scales with which it is covered are very closely set, overlapping each other. VILMORIN; B8{S}, G68{S}, P59M{S}

Franklim: (Limbras 126) Large, thick, very solid stalks; perfectly uniform in shape and size; tends to be somewhat hollow. Suitable for both green and white asparagus, but more commonly used as white asparagus. Very precocious and productive. Highly resistant to botrytis and rust. FEHFIR; B49{OR}, N84{S}, R32{S}, S55{S}, S61M{S}

Jacques Marionnet Pourpre:<sup>2</sup> New purple asparagus from France. Destined to capture the interest of home gardeners and specialty growers seeking a unique product. Dark-purple, medium-thick stalks; closely set tips which remain tight after harvesting. Medium early maturity. Very uniform. N84, Q11M{S}

Jersey Centennial: First hybrid introduced by the New Jersey asparagus breeding program. Large, tender bright-green spears with good quality and excellent appearance. Vigorous and highly productive plants, well adapted to the Northeast. Good rust resistance; increased tolerance to fusarium. Developed by Professor J. Howard Ellison of Rutgers University. Introduced in 1978. C61, G87, J82

Jersey Giant:<sup>1</sup> All-male type, producing only male plants which are more vigorous and productive than female plants. Since there are no female plants to produce seed, it also eliminates volunteer seedlings in the asparagus bed. Heavy producer of large, attractive, high quality spears with purple bracts and tight purple tips. Yields have consistently surpassed the Washington strains by greater than 300% in tests across the country. Fusarium and rust tolerant. Developed by Professor J. Howard Ellison of Rutgers University. AZ{S}, B15M, B75, C61, D11M, D11M{S}, E33, F70, F87, G3, G44, G82, H42, J2M, L91M{S}, M29{S}, etc.

Jersey King:<sup>1</sup> Hybrid all-male type. Large, thick, very tender spears of fine eating quality; green with purple bracts. Excellent for home gardeners and commercial growers. Vigorous plants give consistently high yields; highly tolerant to fusarium and rust diseases. The most widely adapted of the new cultivars developed at Rutgers University in New Jersey. Introduced in 1995. J47{S}, D69, F13, G6, G16, G44, H49{S}, 150, J20, K50{S}

Jersey Knight:<sup>1</sup> All-male hybrid type. Large, thick, flavorful spears. Vigorous, high yielding plant; tolerant to fusarium crown and root rot, highly resistant to rust. Widely adapted to most climates; does particularly well in heavy clay soils. Hardy to USDA Zone 5. Developed at Rutgers University by Professor J. Howard Ellison. A1{S}, A24, B58, B73M, C53, E24, E97, F87, G3, G43, G71, H49,I49M, 191, J2M, J61M, K66, L33, L91M{S}, M77, etc.

## ASPARAGUS {PL}

### ASPARAGUS OFFICINALIS

Apollo: Newer hybrid that is highly productive and disease tolerant, more so than U.C. 157. Medium-large, green spears with purplish-green tips and bud scales. One of the highest yielding cultivars grown in California. Produces both male and female plants. Developed by Brian L. Benson. B91, B91{S}

Atlas: High-yielding, disease resistant hybrid. Produces green spears that have very tight heads under warm to hot growing conditions during harvest time. Has outproduced other California and New Jersey cultivars in University trials. Developed by Brian L. Benson. B91,B91{S}

Barr's Mammoth: Early, very productive, and grows to a large size. Withstands extreme heat or cold, with less winter kill or "pencil grass" reported. Also tolerant of rust and fusarium. Originated with Crawford Barr, a prominent market gardener from Pennsylvania. At one time highly sought after in the Philadelphia markets, bringing the highest prices. HEXAMER; K71

Brock's Imperial: Vigorous hybrid, produces up to 30% larger crops than standard strains. Plump, bright green stalks with tight tips; very tender and fiber-free. Rust resistant and heat tolerant. Matures a week earlier than most, and harvest lasts up to 2 months

Larae: Gourmet quality French type widely used for the production of white asparagus. Not often grown in the United States because of the need for hand harvesting. Heavy producer of uniform, thick, high quality spears of exceptional flavor and tenderness. Adaptable to different soil types, from sandy to light cky. C92{S}, L89{S}, S95M{S}

Martha Washington: Large, crisp, uniform shoots produced in great abundance; tips firm, tightly folded and tender; harvest period extends for up to two months. Excellent for fresh use, canning and freezing. Rust resistant and tolerant to fusarium. A82, F20M, J83, M69M

Mary Washington: Long, straight shoots, very thick and heavy; color rich dark green, slightly tinged purple at the tightly folded tips. Uniform, heavy yields. Holds a tight bud longer than most. Somewhat rust resistant. Standard fresh market and home garden cultivar. B73M, B75, C44{S}, C61, E3, E24{S}, E97, G16, G16{S}, G43, G44, K71, M46, M46{S}

Palmetto: Nineteenth Century heirloom originating in the Southern states. Large, very uniform shoots, nearly free of culls. In its region of origin it is somewhat earlier than Conover's Colossal. Relatively tolerant of rust. Also does well in the North. HEXAMER; U8D

Precoce d'Argenteuil: (Early Argenteuil) An old traditional cultivar, highly esteemed by European gourmets for its large, white stalks and attractive rose-colored scales. Produces a crop early in the season. Well suited to forcing under plastic or glass. E63D{S}, F44{S}, K49M{S}, N84, N84{S}, Q11M{S}, S17{S}

Purple Risson: Very large, burgundy spears with creamy white interiors. Tender and sweet, contains about 20% more sugar than other types. Also less stringy, the whole spear being useable. Mild, nutty flavor when cooked. Excellent eaten raw in salads or as crudites. Very vigorous plants, susceptible to asparagus rust. Developed by Brian L. Benson from Violetto di Albenga, an Italian heirloom grown for more than 300 years. B91, B91{S}, C84, E97, F87, G43, G44, H49, H65, J9M{S}, J63M, L33

Roberts: (Mary Washington Roberts Strain) Very large, rich green spears; tender with a low fiber content; holds quality a long time, never becoming stringy or woody. Heavy yielding, vigorous, resistant to rust. Popular with home gardeners and commercial canners. B58, D76, E97, M37M

Ruhm von Braunschweig: (Glory of Braunschweig) Widely used in Austria and Germany for the production of white shoots. Well-developed, pointed, white spears; tightly closed. Somewhat inclined to turn violet. Medium late to late harvests. High yielding, of long life. Very old heirloom. FEHER; N81{S}

Sweet Purple:<sup>2</sup> Extra large, attractive, deep-burgundy spears; slightly more uniform than Purple Passion. Sweet, mild, nutty flavor; 20% higher sugar content. More tender and less stringy than green asparagus, the whole spear being usable. Excellent raw or cooked. Turns green when cooked. High yielding plants; susceptible to rust and lodging. Developed by Stan Cutter from the same stock as Purple Passion. C84, D74B{S}, D76, I18M, 191, K71, M46, M77

U.C. 72: Large, dark green spears with fairly compact, purple-tinged heads. Highly productive and tolerant to fusarium wilt and rust. Mary Washington type developed by the University of California, Davis. Highly recommended for home gardeners in California. A1{S}, B75M{S}, C54, DIT{S}, G13M{S}, G93M{S}, H85M{S}, K5M{S}, M29{S}, N16{S}

U.C. 157: Deep green, smooth, cylindrical spears with tight tips and scales; uniform in color and size. Vigorous plants come into production early; have a tendency to produce 3 to 5 spears at one time. Some resistance to fusarium root rot. Widely adapted to California and the major asparagus growing areas. A1{S}, A87M{S}, B75, C54, G7JM{S}, G23, G93M, G93M{S}, H61{S}, J99G, K66, M29{S}

Viking: (Vineland No. 35) An improved strain of Mary Washington. Vigorous growing plants with heavier stalks and a greater tendency to resist rust. Large spears and tight heads. Recommended for home garden or market. Developed in Vineland, Ontario, Canada. C85M, C85M{S}, D27{S}, E38{S}, H44, J83, L70

Waltham: (Waltham Washington) The result of 20 years of breeding by the Waltham, Massachusetts Field Station. Will produce approximately 25% more asparagus than ordinary cultivars. Large, tender spears, uniform in both size and color; heads tighter than most. Buds hold tightly longer, providing an extended harvest period. Bred for increased rust resistance. C61, D76, E97

#### CODES FOR SPECIAL TYPES

1. All Male
2. Purple

## AVOCADO{GR}

### PERSEA AMERICANA

#### GUATEMALAN

The Guatemalan avocados are primarily winter and spring ripening. Skin varies from thin to very thick and is granular or gritty. The flesh is rich in flavor and relatively high in oil content. Grown in both Florida and California.

Anaheim: Large oval to elliptical fruit, weight 18 to 32 ounces; skin green, glossy, rough, thick; flesh of fair to good flavor, up to 22% oil, but inferior to Fuerte, Hass, and Nabal; seed medium to large. Tree slender, erect, tall; resistant to adverse weather, but cold-sensitive; bears regularly and prolifically, up to 220 pounds annually. Season June to August. MORTON 1987a, ROUNDS; G49

Edranol: Medium-sized, pyriform fruit, weight 10 to 12 ounces; skin green, thick, russets badly in interior areas; flavor excellent, quality high, oil content 22.5%; seed small; ripens from February to July at Vista. Tree vigorous, bears heavily, adapted to coastal areas of California. Originated in Vista, California. Introduced in 1932. BROOKS 1972, ROUNDS; Q93, S97M

Gwen:<sup>1</sup> Small to medium-sized, ovoid fruit, weight 7 to 12 ounces; skin medium dark-green, medium thick; flavor excellent, nutty, similar to Hass but richer; oil content 18%. Seed small to very small. Season very long, February to October. Tree small to medium, upright; produces consistently heavy crops; more cold-hardy than Hass. Introduced by the University of California, Riverside. A63, B58M, D23M, G49, H78, 183M

Hazzard: Medium-sized, pyriform fruit; weight 12 to 16 ounces; skin green, thin, rather rough, peels readily; flavor good to excellent, oil content 27.5%; seed small to medium; ripens from April to July. Slow growing tree, a dependable producer. Popular in Queensland, Australia where it ripens in July and August. Originated in Vista, California by A.G. Hazzard. Introduced in 1932. MORTON 1987a, ROUNDS; Q93

Linda: Round to oblong fruit; weight 16 to 48 ounces; skin purple, smooth, medium thick; flavor excellent, oil content 12%; seed small; season May to October. Shipping quality good. Introduced in 1914 by E.E. Knight at Yorba Linda, California from Antigua, Guatemala. ROUNDS; J22

Nabal: Medium to large, nearly round fruit; weight 16 to 24 ounces; skin dark-green, nearly smooth, thick, granular; flesh yellow, green near skin, of high quality; oil content 10 to 15%; seed small, tight. Season June to September in California; January and February in Florida. Tree strongly alternate-bearing. BROOKS 1972, MORTON 1987a; A63, B58M, G49, 183M

Pinkerton: Fruit of early crop roundish; late crop fruit pear-shaped with a neck; of medium size, 8 to 14 ounces; skin green, medium-leathery, pliable; flesh thick, up to 10% more than in Hass or Fuerte; smooth-textured, of good flavor, high in oil; of good quality but inferior to Hass and Fuerte; tends to darken in the latter part of the season; seed small. First crop, October or November; second crop, December or January. MORTON 1987a; *A63, B58M, B58M(SC), D23M, G49, I83M, Q93*

Queen:<sup>2</sup> Very large, pyriform fruit, weight 20 to 30 ounces; skin rough, medium-thick, color dull-purple; flavor fine; oil content 13.5%; seed small. Season July to August. Shipping quality good. Introduced to California in 1914 by E.E. Knight of Yorba Linda, from near Antigua, Guatemala. ROUNDS; *A63*

Reed: Medium to large, round fruit, 8 to 18 ounces; skin green, slightly rough, medium thick, pliable, peels easily; flesh cream-colored, smooth, buttery, firm, with a rich, faintly nutty flavor; oil content 18 to 20%; doesn't darken when cut; quality excellent; seed small to medium, tight. Season July to October in California. May remain on the tree for a relatively long time after reaching maturity. BROOKS 1972, MORTON 1987a; *A63, B58M, B58M(SC), D3M(PR), D23M, G49, I83M, Q93, S59*

Shepherd: Small to medium, pyriform fruit; weight 7 1/2 ounces; thick, green skin, peels easily; flavor excellent, quality high; oil content medium; keeping quality good. Spreading, high yielding tree, apparently resistant to frost. Seedling of Edranol that originated in Carpinteria, California. BROOKS 1972; *Q93*

Whitsell:<sup>1</sup> Medium-sized, pyriform fruit, weight 10 to 12 ounces; skin very dark-green, thick and rough; flavor very good, rich and spicy, oil content 18%; quality very high. Season February to August, hangs well on the tree. Tree compact, semi-dwarf, mature height 12 feet; precocious and high yielding; of average hardiness. Introduced by the University of California, Riverside. *A63, B58M, G49, I83M*

Wurtz:<sup>1</sup> (Little Cado) Fruit pear-shaped, small to medium, 8 to 12 ounces; skin green, medium thick; quality good, oil content 18%; seed large. Season May to September in California. Tree small and slow-growing, mature height 8 to 12 feet; distinctive weeping growth habit; bears moderately but regularly. Suited for planters, containers, patios, and greenhouse use. Originated in Encinitas, California by Roy Wurtz. Introduced in 1948. BROOKS 1972, MORTON 1987a; *A63, D23M, D23M(ES), G49, I74, Q93, S59*

#### GUATEMALAN X MEXICAN

Bacon: Ovoid fruit, weight 7 to 12 ounces; skin green, thin, smooth; flesh an unusually pale yellow-green; oil content high; flavor good; keeping quality good. Matures November to March in southern California. Tree upright, slender; consistent, a heavy producer; frost tolerance excellent. BROOKS 1972; *A63, B58M, £55M(SC), B93M, D3M(PR), D23M, G49, H78, I83M, Q93, S59*

Fuerte: Pear-shaped fruit; small to medium or a little larger, 8 to 16 ounces; skin green, slightly rough, thin, not adherent to flesh; flesh green near skin, oil content 12 to 17%; flavor excellent, buttery; seed medium to large. Vigorous, spreading tree with decidedly alternate year bearing habit. Ripens November to June in California. Often used for *cocktail avocados*. Natural hybrid originated at Atlixco, Mexico, elevation 6150 feet. Introduced into California in 1911. MORTON 1987a, ROUNDS VAN AKEN; *A63, B58M, B58M(SC), B93M, D23M, G49, H78, I74, I83M, J22, Q93*

Greengold: Medium-sized, oval to pyriform fruit, weight about 12 ounces; skin green; rich and nutty flavor; small seed. Ripens from February to M<sup>^</sup>, and has good handling quality. Upright, very productive tree; type A flowering; somewhat alternate bearing. Sharwil cross developed by R.A. Hamilton of the University of Hawaii. BROOKS 1997; *E8M, J22*

Hass:<sup>2</sup> Fruit pear-shaped to ovoid; size medium, 10 ounces; flesh creamy, flavor excellent, no fiber, oil content 18 to 25%; skin leathery, rough, dark-purple to black when ripe, thick; seed small, tight in cavity; keeping qualities excellent; good shipper; ripens in summer. Tree heavy bearing; starts bearing the second year. Leading commercial cultivar in California. BROOKS 1972, MORTON 1987a; *A41G, A63<sub>f</sub>, B58M, B58M(SC)<sub>f</sub>, B93M, D23M, G49, H78, I83M, J22, Q93*

Jim: (Jim Bacon) Small to medium-sized, pyriform to long-necked fruit; weight 8 to 10 ounces; skin green, medium thick; oil content 14%, quality and flavor very good; seed medium-sized, tight; ripens September to January, ships well. Tree vigorous, semi-upright; a precocious and regular bearer. Slightly more frost resistant seedling of Bacon. Originated in Buena Park, California by Jim Bacon. *A63, G49, I74*

Lula: Fruit pear-shaped, sometimes with a neck, medium-large; skin almost smooth; flesh pale to greenish-yellow, oil content 12 to 16%; seed large, tight. Season medium-late (mid-November and December). Tree tall; bears early and heavily; cold-resistant, successful in central and southern Florida where it was formerly the leading commercial cultivar. MORTON 1987a; *G58D(PR), N53M*

Rincon: Fruit pear-shaped, small to medium, 6 to 10 ounces; skin green fairly thin, smooth, leathery, peels well; flesh buttery, contains 15 to 26.5% oil; fibers in flesh near base turn black when fruit is cut; seed of medium size. Season January to April in California. Tree medium to small; weak growing; a consistent and heavy bearer. BROOKS 1972, MORTON 1987a; *Q93, S59, S97M*

Sharwil: Medium-sized fruit, weight 7 to 13 ounces; resembles Fuerte in shape but a little more oval; skin green, rather rough, fairly thin; flesh rich in flavor, of excellent quality; 15 to 26% oil content; seed small. Tree bears regularly but not heavily. Represents 18 to 20% of all avocados grown in New South Wales and Queensland, Australia. BROOKS 1972, MORTON 1987a; *E8M, J22, Q93, S59*

Winter Mexican: Oblong to pyriform fruit, weight 12 to 18 ounces; skin thick, leathery, dark green; seed medium, tight in cavity; season December and January. Tree very vigorous, bears heavily and regularly; very hardy; resistant to scab; susceptible to anthracnose. Originated in Palm Beach, Florida. BROOKS 1972; *G2M, I77G, N53M*

#### GUATEMALAN X WEST INDIAN

Most of these hybrids were developed in Florida, where they represent more than half of the more than 20 major and minor commercial cultivars grown there at this time. MORTON 1987a.

Booth 8: Fruit oblong-obovate, of medium size, 14 to 18 ounces; skin dull green, rough, fairly thick, brittle; flesh contains 6 to 12% oil; seed medium-large, tight. Season late (November to mid-December). Tree a very prolific bearer; class "B" for pollination purposes. Originated in Homestead, Florida by William Booth. Introduced in 1935. BROOKS 1972, MORTON 1987a; *S97M*

Choquette: Large, oval fruit, weight 30 to 40 ounces; skin glos% smooth, dark-green, slightly leathery; flesh thick, yellow, of very good quality, oil content 13%; seed medium, tight. Season January to March. Tree bears heavily in alternate years. Resistant to common avocado diseases. Recommended for home plantings in Florida. BROOKS 1972, MORTON 1987a, VAN AKEN [Re]; *G2M, N53M*

Hall: Large, pear-shaped fruit; skin bright-green, attractive, smooth, fairly thick; flesh deep-yellow, oil content 12 to 16%; seed medium-large, tight. Resembles Monroe in being excellent for the limited fancy-fruit market. Season November and December. Tree an alternate but heavy bearer; cold-haidy; subject to scab. Originated in Miami, Florida by Willis Hall. BROOKS 1972, MORTON 1987a; *N53M*

Kahaluu: Fruit obovate to pyriform; weight 12 to 18 ounces; skin smooth, green; flesh rich, oil content high, quality excellent; seed

small, tight in cavity; ripens November to January; resembles Fuerte. Tree large, upright, vigorous; bears annually, but only moderately. Originated in Kahaluu, North Kona, Hawaii. BROOKS 1972; J22

Monroe: Large fruit, weight 26 to 36 ounces; skin dark-green, glossy, attractive; flesh yellow, slightly green near skin, fiberless, oil content 10 to 30%; flavor nutty; season December and January. Tree a heavy bearer; class "B" for pollination purposes. Originated in Homestead, Florida by J.J.L. Phillips. Introduced in 1937. BROOKS 1972; N53M

#### MEXICAN

Mexican avocados have thin, tender skin that clings to the flesh. The flesh has a high oil content, up to 30%. Leaves have a pronounced anise-like scent and are favored for cooking. The tree is more cold-resistant than those of the other races or hybrids, thriving near Puebla, Mexico, at 500 feet above sea level. MORTON 1987a.

Brogdon:<sup>2</sup> Fruit somewhat pear-shaped, weight 7 to 20 ounces; skin purple, very thin; susceptible to handling; flesh yellow, buttery; ripens late July-August. Tree small to medium; vigor moderate; productivity low; very hardy; susceptible to anthracnose. Recommended for Central Florida. Originated in Winter Haven, Florida by Tom W. Brogdon. Introduced in 1951. BROOKS 1972; E29, G2M, I77G, N53M, N84

Mexicola:<sup>2</sup> Fruit very small, spherical to pyriform, weight 3 to 5 ounces; skin black, thin, smooth; flesh of excellent flavor; seed large. Season August to October. Bears early and regularly; very heat and cold-resistant. Much used as a parent in California breeding programs. Originated about 1910 at Pasadena, California; first propagated in 1912. MORTON 1987a, ROUNDS; A63, B58M, G17, I28, I74, I83M

Puebla:<sup>2</sup> Small to medium, obovoid fruit, weight 8 to 10 ounces; skin smooth, glossy, deep maroon-purple; flesh buttery in texture, of a rich nutty flavor, quality very good; seed medium to large, tight in the cavity; season December to February in southern California. Tree vigorous and hardy. Introduced in 1911 from Atlixco, Mexico. POPENOE, W. 1920; T49M{SC}

Stewart:<sup>2</sup> Medium-sized, pyriform fruit; skin slightly rough, a rich dark purple at maturity; flesh clear, bright, light yellow shading to green toward the skin, firm but melting, of excellent quality; ripens from early October to mid-December. Oil content about 8% by Oct 1 to about 16% in mid-November. Tree spreading, strong and vigorous, bears well. BROOKS 1972; B58M

Zutano: Fruit pyriform, medium-small, 8 to 12 ounces; skin very thin, light green, russets in inland areas, leathery; oil content medium, 15 to 22%; flavor fair to good; seed medium. Season October to February in southern California. Tree a consistent producer; harder than Fuerte and Hass; vigorous, upright grower. Originated in Fallbrook, California by W.L. Ruit. Introduced in 1941. BROOKS 1972; A63, B58M, B58M{SC}, B93M, D23M, G49, I83M

#### WEST INDIAN

West Indian avocados are generally summer and fall ripening. They have leathery, pliable, non-granular skin, and the flesh is low in oil. The leaves are not aromatic. Grown in Florida, the West Indies, Bahamas, Bermuda and the tropics of the Old World. Not grown in California.

Catalina: Large fruit, weight 18 to 26 ounces; smooth, glossy, light-green, thick skin; small seed, loose in cavity. Flowering Group A. A minor commercial variety in Florida. Originated in Cuba. BROOKS 1997; N53M

Pollock: Oblong to pear-shaped fruit; very large, up to 5 pounds; skin green, smooth, glossy; flesh firm, smooth and fine in texture, deep yellow changing to yellowish-green close to the skin, contains 3 to 5% oil; seed large, frequently loose in cavity. Season early, July to August or October. Shy-bearing. Fruit too large but of superior quality. Originated in Miami before 1896 on the property of H.S.

Pollock. MORION 1987a, POPENOE, W. 1920, ROUNDS; L33M{PR}, N53M

Russell: Large fruit, weight 24 to 36 ounces; pear-shaped at apex with long neck giving it a total length up to 13 inches; skin green, smooth, glossy, thin, leathery; flesh yellow, of excellent quality; seed small; cavity low in the broad end of the fruit, often a solid neck of flesh 5 to 6 inches long. Season August and September. E29, N53M, N84

Simmonds: Fruit large, oblong-oval to pyriform; skin smooth, light-green; flesh of good flavor, oil content 3 to 6%; seed of medium size, usually tight. Season mid-July to mid-September. Tree bears more regularly than Pollock but is less vigorous; sometimes sheds many of its fruits. MORTON 1987a; L33M{PR}, N53M

#### OTHERS

Fujikawa: Large, oval-pyriform fruit; green skin; green, smooth, melting flesh with high oil content, excellent flavor; small seed; ripens in spring. Vigorous, canopy shaped tree; highly productive. Local Hawaiian selection. J22

Yamagata: Large, oval-pyriform fruit with a curved neck; skin green, thick, gritty; flesh green, smooth, flavor nutty; seed medium sized; ripens over a long season, from March through July. Vigorous, upright tree with dark green foliage; bears heavily. Local Hawaiian selection. J22

## BANANA {PL}

MUSA X PARADISIACA

MUSA TROGLODYTARUM

#### DESSERT BANANAS

Included here are the sweet bananas which are primarily eaten out of hand and in various desserts, and also cultivars such as Iholena that are of dessert quality when fully ripe and are also very good cooked.

Brazilian: (Hawaiian Apple, Pome) Plants vigorous, sturdy, productive, semi-hardy; mature height 15 to 25 feet; able to stand wind slightly better than other tall cultivars. Medium bunches of small fruit, 4 to 6 inches long; skin medium-thick, yellow; flesh white or cream-colored with a pleasing, slightly acid apple-like flavor. Hardy in dry areas; tolerant to Panama wilt. Has a longer shelf-life compared to other cultivars. Introduced into Hawaii from Java about 1855. POPE; A28, A41G, D57, E55M, G2M, I53M, I77G, I83M, J81G, J81G{PR}, L43, N84

Cocos: (Highgate, Dwarf Gros Michel) A dwarf form of Bluefields whose mature height of 10 to 15 feet makes it more windproof and easier to site in a sheltered spot. Bunch size and fruit quality are

similar to Bluefields but the individual bananas are shorter, only 5 to 7 inches long. Ornamental plant with contrasting black and ivory coloration of the trunk. A41G, E55M, G2M, I77G, J81G

Colorado Blanco:<sup>3</sup> Vigorous plant, 20 to 25 feet tall; bunches 45 to 60 pounds in weight. Plump fruits, 5 to 7 inches long; flesh cream colored, firm, of a distinctive flavor. Resembles Jamaican Red and Green Red in growth habit, fruit characteristics and quality, but the color of the fruit skin is yellow. Productive as well as ornamental. Introduced into Hawaii from Puerto Rico in 1904. POPE; A28, A41G, I77G, J81G

Dwarf Brazilian:<sup>2</sup> (Santa Catarina Prata) Flavor, fruit and shelf life identical to Brazilian. Mature height 10 to 15 feet. Produces bunches of 25 to 50 pounds, 5 to 7 hands per bunch; 5 to 6 inch long fruit. Resistant to Panama wilt. Recommended as a replacement for Brazilian where height or heavy winds are a concern. A28, A41G, D57, E55M, E8M, I77G, J22, J81G, L43, N84

Dwarf Cavendish:<sup>2</sup> (Dwarf Chinese, Governor) Very sturdy plant, 6 to 8 feet tall with broad leaves on short, stout petioles; hardy and wind resistant; a reliable producer. Bunches weigh 40 to 90 pounds. Fruit of medium size, 6 to 8 inches long, of good quality, but thin-skinned and must be handled and shipped with care. Pulp cream-colored, rich and sweet. Found growing in southern China by early travelers to the Orient. MORTON 1987a, POPE; A79M, D57, E3, E29, E47M{DF}, E55M, G17, G99M{PR}, H4, I77G, I78, I83M, J81G, J81M

Dwarf Jamaican Red:<sup>12</sup> Dwarf form of the Jamaican Red whose mature height is only 7 to 8 feet, one-third the height of the standard cultivar. More easily protected from wind, more easily harvested, and quicker to bear. A41G, D57, E55M, G2M, H4, I77G, I83M, J22, J81G, L43, N84

Ebon M[usak: (Crocodile Fingers) One of the few bananas that ripens green. Must be watched very closely or the fruit will become overripe. Attractive, pointed fruits with excellent flavor, 4 to 6 inches long. Grows 10 to 12 feet tall. Recently introduced from Borneo. E55M, I77G, L43, N84

Enano Gigante:<sup>2</sup> (Mexican Dwarf) High-quality, sweet fruit of large size under ideal conditions. Semi-dwarf habit, shorter than Valery; heavy producer. Tender, often needing support when bearing; subject to cigar end rot in cold wet weather. Widely planted as a commercial banana in Mexico and Central America. A28, A41G, D57, H4, H78, I77G, I83M, J81G, M82

Giant Cavendish: Plant reaches 10 to 16 feet; the pseudostem is splashed with dark-brown, the bunch is long and cylindrical, and the fruits are larger than those of Dwarf Cavendish and not as delicate. Produces very large bunches of fruit of excellent quality. MORTON 1987a; E55M, I77G

Golden Aromatic: (Go San Heong) Medium-sized plant, grows 10 to 12 feet tall. Produces bunches that weigh 30 to 40 pounds, with 4 to 5 hands per bunch. Medium-sized fruit, 6 to 9 inches long; skin golden-yellow; flesh very sweet and aromatic, resembles Gros Michel. Has good shelf life. A41G, E55M, G2M, I77G

Golden Pillow: A moderately vigorous plant similar in appearance to Manzano but more slender in all its parts and more pink coloration in the leaf sheaths. Bunches take longer to appear and ripen. The fruit is short, fat, thin-skinned, very sweet and the flavor and texture are somewhat better than Manzano. Mature height is 12 to 16 feet; first harvest 18 to 24 months after planting. A28, A41G, G2M, I77G, J81G

Goldfinger: Large, heavy bunches with 8 to 12 hands; fruit thicker and more angular than the typical Cavendish type. Vigorous stalks, 8 to 13 feet tall. Resistant to all races of Panama disease, black Sigatoka, nematodes and crown rot. The only hybridized banana currently being grown commercially. Originated in La Lima, Honduras. BROOKS 1997; A41G, E55M, G49, I77G, I83M, L43, N84

Grande Nain:<sup>2</sup> Plant sturdy, semi-hardy; mature height 6 to 8 feet; vigorous; productive, bunches of fruit commonly weighing over 100 pounds. Currently one of the most important commercial clones in the world. Developed in Central America. A41G, E55M, H4, I77G, I83M, L43, N84

Green Red:<sup>13 4</sup> Strong, vigorous plant; mature height 20 to 25 feet; trunk 14 to 18 inches thick at the base; variegated green and red. Produces medium bunches weighing 30 to 50 pounds, 4 to 7 hands per bunch. Stout fruits, 5 to 7 inches long; skin thick, brilliant dark purplish red and gold on ripening; pulp firm, aromatic, cream-colored, of good flavor. Comes into bearing at 20 to 30 months, bears on a one year cycle thereafter. Bud mutation of Jamaican Red. POPE; A41G, E55M, I77G, J81G, L43

Gros Michel: (Bluefields) Very tall, vigorous plant; mature height 25 to 30 feet. Bears fruit in long bunches, weighing 60 to 100 pounds. Needs high temperatures and humidity to ripen its fruit. Large, slightly curved fruit, 7 to 9 inches long; flesh firm, consistency and flavor excellent. Was formerly the leading commercial cultivar in Central America, Latin America and the Caribbean, but has been phased out because of its great susceptibility to Panama disease. Originated in Martinique, West Indies. MORTON 1987a, POPE; E55M, G2M, I77G, J81G

Haa Haa:<sup>2 3</sup> (Ha\*a) Plant low-growing, resembles the Dwarf Cavendish in size with a 6 1/2 to 7 foot trunk; new leaves have burgundy overtones. Fruit medium sized, plump in the middle, tapering towards the ends; yellow-skinned; orange-fleshed. The fruit can be eaten raw or cooked, and when fried is similar in taste to apple fritters. An Iholena type banana. A28, A41G, E55M, G2M, H4, I77G, J81G, J81G{PR}

HuaMoa:<sup>3</sup> Tall Hawaiian cultivar which likes protected locations in filtered light with ample moisture; height 16 to 18 feet. Produces small to medium bunches of very plump, roundish fruits with golden-yellow skin and pinkish-yellow flesh. Flavor sweet and delicious. May be eaten fresh or cooked. Very good when sliced green and fried in hot oil like French-fried potatoes. Also good eaten ripe or baked with cinnamon and brown sugar as a dessert. A28, A41G, E55M, G2M, H4, I77G, I83M, L43, N84

Ice Cream: (Blue Java) Somewhat leaning trunks, 10 to 15 feet tall; leaf midrib light pink. Flower stalk may be several feet long, but the bunch has only 7 to 9 hands; bunch weight 40 to 60 pounds. Stout, straight fruit, 5 to 7 inches long and up to 2 1/2 inches in diameter, 4 or 5 angled; skin bluish with a silvery bloom when young, pale-yellow when ripe; flesh white, sweetish, eaten raw or cooked. MORTON 1987a, POPE; A28, A41G, D57, G2M, G17, G49, G99M{PR}, I77G, I83M, J81G, J81G{PR}, L43, N84

Jamaican Red:<sup>13</sup> (Cuban Red, Morado, Macaboo) Large plant, 20 to 25 feet tall; takes 18 months from planting to harvest; highly resistant to disease. The pseudostem, petiole, midrib, and fruit peel are all purplish-red, but the latter turns to orange-yellow when the fruit is fully ripe. Fruit of medium size, with thick peel, and light orange-colored pulp that is very aromatic and has a strong distinct flavor when fully ripe. MORTON 1987a; A41G, E13G{PR}, E55M, F15{PR}, G99M{PR}, 174, I77G, I83M, J81G, J81G{PR}, K8, N40{PR}

Kauai Red:<sup>13</sup> Large plant, 15 to 20 feet tall. Similar to Maroon but larger. Long, reddish-maroon fruits turn orange when ripe; flesh orange-colored, rich and sweet. Originated in Hawaii. D57

KlueNam Wa: (Pisaqg Awak, Nam Wa) The most popular eating banana in Thailand. Short, waxy, oblong fruits; pale yellow when ripe. Very firm texture which holds up well in cooking. Also preferred for dried bananas (*klue tark*) because it produces a paler product. Very vigorous and hardy; somewhat susceptible to Panama disease. The leaves, known as *bai tong*, are used for wrapping banana and glutinous rice dishes. A pink-fleshed form occurs, known as Klue Nam Wa Daeng. KONGPAN [Cul, Re], LOHA-UNCHIT [Re], SIMMONDS 1966; E55M

Kru:<sup>13</sup> (New Guinea Kru) Attractive, red-trunked plant; mature height 10 to 12 feet; moderate wind tolerance. Reddish fruits with orange pulp; highly esteemed flavor. Resembles Jamaican Red in appearance and fruit but is more precocious and the flavor is superior. Originally from New Guinea. A41G, E55M, I77G, I83M, L43, N84

Lacatan: (Pisang Masak Hijau, Bungulan, Hamakua, Monte Cristo) Plant rapid growing, tall and slender; height 15 to 25 feet; prone to wind injury, especially when bearing fruit. Produces large bunches weighing 50 to 100 pounds, 6 to 9 hands per bunch. High-quality fruit, 6 to 8 inches long; skin greenish-yellow when ripe. Flavor similar to Cavendish. Poor keeping quality, but good tolerance of Panama wilt. E55M, G2M, I77G, J81G

Lady Finger: (Ney Poovan) Plant 20 to 25 feet tall at maturity; has a slender trunk but a heavy root system that fortifies it against strong winds. The bunch consists of 10 to 14 hands, each with 15 to 20 fingers; weight 40 to 65 pounds. Short fruits, 4 to 5 inches long; skin thin, light-yellow; flesh firm, whitish, sweet and extremely rich and agreeable. Resistant to drought, Panama disease and black weevil but subject to sigatoka. MORTON 1987a, POPE; A41G, G17, G49, I83M, J81G, J81G{PR}

Mahoi:<sup>2</sup> (Double Cavendish, Doubling) Fruit similar in size and sweetness to Dwarf Cavendish. Dichotomous fruiting head. Second generation may produce 2 to 4 heads of fruit simultaneously and can total over 100 pounds; first generation will be "normal". Plant resembles a Dwarf Cavendish; 4 to 8 feet tall; fairly wind resistant, but should be planted in a protected place. A41G, E55M, G2M, I77G, L43, N84

Manzano: (Apple, Silk) Trunks reclining, 10 to 12 feet tall, only medium in vigor. Produces bunches of 25 to 45 pounds. Plump, slightly curved fruits, 4 to 6 inches long; skin rich, clear yellow; pulp firm, astringent when unripe but pleasantly subacid when fully ripe, apple-scented, drier than most other bananas, of excellent quality. The most popular dessert banana in the tropics. MORTON 1987a; A28, A41G, D57, E13G{PR}, E47M{DF}, F15IPR}, G44M{PR}, G49, H4, I77G, I83M, J81G, J81G{PR}, L33M{PR}, N40{PR}

Maroon:<sup>13</sup> Medium tall plants with slightly red midribs; height 10 to 12 feet. Similar to Kauai Red but smaller. Fruits maroon, turning yellowish-orange when ripe; flesh orange, soft, rich and filling. Originated in Hawaii. D57

Misi Luki: Bears large bunches of flavorful fruit, 4 to 5 inches long, 1 1/4 to 1 1/2 inches in diameter. First harvest can be expected 15 to 18 months after setting out. Originally from the highlands of Samoa. Has grown well in the warmer areas of New Zealand. E55M, Q49M

Monkey Fingers: Very unusual banana with long, slender, slightly curved fruits; 8 to 10 inches in length. Refreshing, slightly tart flavor. Vigorous plant, 18 to 20 feet tall; racemes 5 to 6 feet. Produces large bunches that weigh 60 to 75 pounds, and may need propping to keep from falling. A41G, E55M, L43, N84

Mysore: Plant large and vigorous, mature height 25 feet; immune to Panama disease and nearly so to sigatoka; very hardy and drought-tolerant. Bears large, compact bunches weighing 50 to 60 pounds, 8 to 10 hands per bunch, Medium-sized, plump, attractive fruit; about 6 inches long; skin thin, bright-yellow; flesh moist, pale yellow, slightly subacid in flavor. The most important banana type of India, constituting 70% of the total crop. MORTON 1987a; A28, A41G, D57, E55M, G17, G49, G99M{PR}, H4, I77G, I83M, J81G, L43, N84

Nino: (Sucrier, Honey, Pisang Mas, Klue Kai) Slender plant, less vigorous than most other cultivars; height 10 to 15 feet; fair wind tolerance. Ornamental, with long narrow leaves and an unusual shade of green and black coloration in the trunk and leaf sheaths. Produces small to moderate sized bunches of small, 4 to 5 inch long fruits that are thin-skinned and very sweet. Best grown in partial

shade or morning sun. LOHA-UNCHIT [Re]; A41G, E55M, E13G{PR}, I77G, J81G

Orito: Very similar to Nino, but produces much larger bunches and slightly larger fruit. Excellent sweet flavor. Sold as "baby" bananas in specialty stores in the United States. Tall plant, as high as 20 feet; produces bunches of 50 pounds or more; resistant to Panama disease. Very popular in Ecuador where it is sold in local markets. LESSARD; A41G, I77G

Philippine Lakatan: Medium-tall plant, mature height 15 to 20 feet. Produces moderately large bunches weighing 40 to 60 pounds, with 6 to 8 hands per bunch. Well-shaped, firm fruits, 5 to 7 inches long, of excellent flavor and quality. Susceptible to Panama wilt. Highly esteemed in the Philippines. E55M, J81G

Pisang Raja:<sup>2 3</sup> (King Banana) Large, solid green plant with bluish overtones, growing 8 to 10 feet tall; tolerates wind and cold very well. Bears medium to large bunches of medium-length fruit, oval on one end; thick-skinned; orange flesh, very sweet and firm; quality very good. In Indonesia, often used for *pisang goreng* and *nagasari*—fried bananas and rice cake with bananas, respectively. OWEN [Re]; A28, A41G, E55M, I74, I77G, J81G, L43, N84

Pitogo: Rare, very unusual banana. The small fruits are nearly round in shape instead of elongated, somewhat reminiscent of figs. Slightly drier in texture than regular dessert bananas, but the flavor is excellent. Solid green pseudostem, 10 to 12 feet in height. E55M, I77G, L43, N84

Praying Hands: Very unusual banana with hands that are fused together to resemble praying hands, hence the name Very sweet fruit, ripens on the plant without splitting. Individual fingers may be pulled from the hand and eaten individually or the hand can be cut across the top and the pulp scooped from the cells with a spoon. Grows to 14 feet tall; resistant to Panama disease. LESSARD; A41G, E55M, G2M, G17, I74, I77G, L43, N84

Rajapuri:<sup>2</sup> A vigorous dessert cultivar from India which withstands wind, cold, and adverse conditions. Produces small to medium bunches of sweet, fine flavored fruit of high quality. Mature height 8 to 10 feet. One of the favorite bananas of India. A28, A41G, D57, E55M, G2M, G17, I74, I77G, J81G, L43, N84

Red Iholena:<sup>3</sup> Very rapid growing plant; mature height 10 to 12 feet; attractively colored with red and ivory on the trunk and reddish-purple undersides of the leaves; moderate wind tolerance. Bunches of yellow-skinned, horn-shaped fruits are borne on brilliant red stalks. Fruit pink-fleshed; flavor very good. A favorite Hawaiian cultivar eaten fresh or cooked. A28, A41G, E55M, I77G, I83M, J81G, J81G{PR}

Thousand Enger: Very distinctive banana that continues to produce fruit on the flower stalk until the trunk dies or the flower bud is broken off. The result is a fruiting stem of up to 8 or 9 feet with hundreds of bananas. Tiry, sweet fruits with a pleasant flavor, about 1 inch long. Grows to 12 feet tall; resistant to Panama disease. LESSARD; A41G, E55M, G2M, G17, I74, I77G, L43, N84

Tuu Gia: Thin, green trunk, 14 to 16 feet tall. Long fruits, similar to Bluefields in shape but with a unique, slightly curled tendency. Sweet fruits that are good raw or cooked. Very productive. Originated in Vietnam. A41G, D57, E55M

Valery: (Robusta) Plant semi-dwarf in stature, mature height 10 to 15 feet; wind and cold resistant. Produces large bunches weighing 60 to 90 pounds, with 8 to 10 hands per bunch. High quality fruit, 7 to 10 inches long. Compared with other clones in cooking trials, it has low ratings because cooking hardens the flesh and gives it a waxy texture. Widely planted as a commercial banana in the tropics. MORTON 1987a; A41G, E55M, I77G, I83M, J22, J81G

White Iholena:<sup>3</sup> Stout, vigorous, hardy plant, with a predominant ivory hue on the trunk and pink coloration on the underside of new leaves. Maximum height 10 to 15 feet; moderate wind resistance. Bunches rather small. Fruit 5 1/2 to 6 inches long; pulp firm, light

salmon-pink, flavor subacid. Eaten cooked, or raw when fully mature. The skin turns bright yellow several days before the fruits are ready to harvest, therefore they should be left on the bunch until they are soft. POPE; A28, A41G, D57, E55M, I77G, J81G, J81G{PR}, L43, N84

Williams: Relatively sturdy plant, 9 to 12 feet high; has considerable red pigmentation; resists Panama disease. Bunch large, heavy, 60 to 90 pounds; 9 to 14 hands per bunch. Fruit larger and more attractive than parent, 7 to 9 inches long, of good quality and flavor; ripens about with Cavendish, which it resembles. Bud mutation of Cavendish. Originated in Coffs Harbor, New South Wales, Australia. Introduced into Hawaii in 1954. BROOKS 1972; A41G, E55M, I77G, J81G

Zanmoreno:<sup>2</sup> Very similar to the Dwarf Cavendish except its maximum height is only 5 to 6 feet. Plant is slower growing, slower to flower, and has a smaller bunch than Dwarf Cavendish, but fruit quality is excellent. Recommended where space is limited or for container culture, indoors or out. A41G, E55M, J81G

#### COOKING BANANAS

Included here are the true *plantains*, which are starchy and almost exclusively used as a cooked vegetable, either green, semi-ripe or ripe, and cultivars that can be eaten both cooked and raw but are more often cooked. *Tostones* are green plantain slices that have been partly fried, then flattened and fried until crusty and brown on both sides. Also called *banane pese* or *pressed plantain*. HAWKES [Re], ORTIZ 1973 [Re], SCHNEIDER 1986 [Cul, Re], WILSON, E.G. [Re]. E13G{PR}, G47F{PR}, G99M{PR}, N40{PR}

Aeae:<sup>4</sup> (Koae) Tall, vigorous plant, mature height 15 to 20 feet. Very ornamental, the trunk, leaves and fruit are variegated white, gray, and green. Bunches large, heavy. Fruit oblong, 6 to 7 inches long, 3 or 4 angled; pulp coarse, firm, yellow, of fairly good flavor. Primarily used as a cooking banana, though it may be eaten fresh. POPE; A41G, D57, E55M, F69, I77G, I83M, J81G, L43, N84

African Rhino Horn: Slender, somewhat fragile plant, 10 to 12 feet tall, needs protection from the wind. Only a few very large fruit (up to 2 feet long and 3 pounds each) are produced which may be cooked green as a vegetable or eaten ripe. Attractive red coloration on the trunk and in the leaf. A41G, E55M, G2M, I53M, I77G, I83M, J81G, L43, N84

Cardaba:<sup>3</sup> Large triangular fruit with a bright, waxy yellow skin. Flesh is pale salmon-orange and when fully ripe is sweet and flavorful with a refreshing tartness. Eaten both raw, and cooked as a starchy vegetable or as a sweet dessert. Fairly good source of vitamin A. Originated in the Philippines. A28, A41G, E55M, G49, I74, I77G, J81G, J81G{PR}, L43, N84

Dwarf Orinoco:<sup>2</sup> Similar to the standard Orinoco in vigor, hardiness and fruit quality but its mature height is only 6 to 7 feet. Bunches are large, reaching 40 to 50 pounds. Can be eaten fresh or cooked. A useful plant where space is limited and easier maintenance is desired. A41G, D57, I77G, J81G, L43, N84

Eleele:<sup>3</sup> A distinctive Hawaiian cultivar with almost black trunk sheathes, petioles, and midribs. The plants are 20 to 25 feet tall and produce large bunches averaging 60 to 80 pounds in weight. Plump, well-filled fruit; skin thick and tough, clear yellow at maturity; pulp firm, orange colored, of good flavor. A highly prized cooking banana. POPE; A41G, E55M, I77G, J81G, L43, N84

Fehi:<sup>3</sup> (Fe'i) (*M. troglodytarum*) Vigorous, upright plant, often reaching 36 feet tall; sensitive to cold. Fruit stalk upright growing even when carrying bunches that can weigh 50 pounds. Short, stocky fruit; skin thick, orange to copper-colored when ripe; pulp very firm, orange-yellow, turns a greenish-yellow when cooled. Very good when boiled, baked or roasted. Also known for causing the urine to turn a chartreuse color. POPE; I77G, J81G

French Horn: Plant 10 to 12 feet tall, rather slender; mostly green with its leaves outlined in red; fair wind resistance. Produces bananas up to 12 inches long which are primarily eaten boiled, fried,

baked or broiled but can be eaten raw when thoroughly ripe. A41G, E55M, I77G, J81G

Giant Plantain: (Macho) Rather slender plant; grows to a height of 12 to 14 feet; not very wind tolerant but grows well in protected areas. Produces large fruit usually eaten cooked rather than fresh. The standard plantain of commerce. E55M, H4, I77G

Kaulau: Sturdy, vigorous plant, mature height about 16 feet. Bunches large, 60 to 125 pounds in weight. Straight, plump fruits, 6 to 8 inches long; skin medium thick and tough, rich waxy yellow; flesh light yellow, fine-textured. A Hawaiian cooking banana of excellent quality. The Hawaiian name means "rain on the leaf". POPE; A28, A41G, J81G, J81G{PR}

MaiaMaoli: Tall, erect, attractive plant; mature height 18 to 22 feet. Produces heavy, well-packed bunches weighing 60 to 90 pounds. Long, round fruits, well-filled at both ends, often weighing 10 to 14 ounces; skin thick and tough, bright waxy yellow at full ripeness; pulp yellow, firm; core distinct; flavor good. Excellent broiled or baked; may also be eaten raw. The favorite cooking banana in the local Hawaiian markets. JOSSELIN, POPE; A41G, E55M, J81G

Manaiula:<sup>3</sup> Large, vigorous plant, 18 to 20 feet tall; attractive, with red coloration in the new growth and suckers and the underside of leaves and midribs washed in pink. Produces medium-sized bunches weighing 50 to 75 pounds. Slightly curved, 4 to 5 angled fruit, 6 to 8 inches long; skin thick and tough, waxy yellow when ripe; pulp orange, coarse, firm; core distinct. An excellent Hawaiian cooking banana. POPE; A41G, J81G

Orinoco: (Bluggoe, Burro, Better's Select) Medium-tall, sturdy plant, height 12 to 16 feet; very vigorous and particularly hardy. The bunch consists of only a few hands of very thick, three-angled fruits about 6 inches long. Flesh has a salmon tint, is edible raw when fully ripe but is much better cooked, either as a starchy vegetable or dessert sweetmeat, depending on the degree of ripeness when used. MORTON 1987a; A28, A41G, D57, E13G{PR}, E29, G99M{PR}, I77G, J81G, L43, N40{PR}, N84

Popoulo:<sup>3</sup> Slender plant, 14 feet tall at maturity; prefers a protected location in filtered light with ample moisture. Bunches medium-sized, compact. Short, thick, blunt-ended fruit; 7 inches long and 1 3/4 inches in diameter; skin yellow, medium to thin; pulp firm, light salmon-pink; flavor pleasing, subacid, apple-like. May be eaten fresh or cooked. Well liked Hawaiian cultivar whose name translates to "ball-shaped like a breadfruit". JOSSELIN, POPE; A28, A41G, E55M, J81G, J81G{PR}, L43, N84

Puerto Rican Dwarf:<sup>2</sup> Attractive plant with distinctive bronze-salmon coloring in the trunk and leaf sheathes; growing about 7 to 9 feet tall. Produces a small bunch with 3 to 12 fruit of very large size which are delicious cooked. Normally the plant does not require staking and it can produce bunches with individual fruits weighing up to a pound. D57, E55M, I77G, J81G

Saba: (Sabah) Short, stubby fruit with a full-bodied flavor; similar to Orinoco; large bunches weighing 50 to 75 pounds. Often used for *Banana-Q—di* peeled, skewered Saba banana roasted over live coals. Cold tolerant plant, grows 15 to 20 feet tall. Originated in the Philippines, where it is one of the most common bananas grown. Sometimes available at Filipino markets. GELLE [Cul, Re], O'BOYLE [Re]; E55M, I77G, L43, N84

#### CODES FOR SPECIAL TYPES

1. Red-Skinned
2. Dwarf
3. Orange-Fleshed
4. Variegated

## BASIL {S}

### OCIMUM SPP.

**African Blue:** (*O. kilimandscharicum* x *O. basilicum*) {PL} Attractive plant has dark-green leaves with purple veining; flowers and flower-spikes also purple. Height 2 to 3 feet. The whole plant has a sweet camphor-like scent. Hybrid of *O. kilimandscharicum* and *O. basilicum* 'Purpurascens' (purple-leaved basil). C43M, C89M, F35M, F93G, G96, H51M, H94M, I99P, 757{ES}, J66, J82, K66, L94M, M15T, M35, M82, R53M, etc.

**Ball Basil:**<sup>1</sup> (Compact Green Bush, Hn Vert Compact) Small, compact plant with a great number of stems and leaves, causing the plant to have the appearance of a round mass or ball. Top leaves are bronze; appealing clove-like scent. Very well suited for growing in pots and ornamental vases. VILMORIN; K22, M82{PL}

**Cinnamon:** Attractive, stocky plants with a warm, spicy, cinnamon-like aroma and flavor with a hint of cloves. Purplish, concave venation on the leaves and dark, rose-colored blooms. Vigorous plants; hardier than other basil. Makes a fine jelly and chutney and is good in fruit salads, sweet-and-sour dishes, rib and chicken marinades, or other dishes where a sweet, spicy flavor is desired. HAMPSTEAD [Re]; B75, C53, D11M, D92M, E5T, F70, F80, J20, J76, K22, K57{PL}, K66, M35{PL}, M53{PL}, N19M{PL}, N19M{DF}, etc.

**Cuban:** Small, light green leaves with good basil flavor and fragrance, somewhat spicier than common sweet basil. Grows to a height of 12 inches, forming a strong, upright, compact bush. Appears to withstand light frost. One of the best basil for growing indoors on a windowsill. M82{PL}

**Dark Opal:**<sup>4</sup> Attractive, dark-purple leaves with bronze overtones; height 12 to 18 inches; pale lavender-white flowers. Scent and taste are more subtle and delicate than sweet basil. Good for making basil vinegar to which it readily imparts its rich purple color - add a few sprigs of sweet basil to intensify the flavor. Developed at the University of Connecticut in the late 1950's. HAMPSTEAD [Cul, Re], HUTSON 1987 [Re]; C3, D92M, E13G{PR}, F80, I64M{PD}, J20, K22, L94M, M53{PL}, N19M{PL}, N40{PR}, R47

**Genovese:** (Genova Profumatissima, Perfume Basil) Shiny, bright-green, slightly wrinkled leaves with symmetrical veins often purple in color. Height 18 inches. Intensely strong, almost perfumed aroma and flavor. Very popular for culinary use, especially in tomato salads and *pesto* sauces; combines well with garlic. Very productive; branches vigorously, and can thus be harvested in abundance over a very long season. Widely grown under glass in Italy, this strain is suited for both fresh use and drying. HAMPSTEAD; C53, C95, D92M, E91G, G6, K49T, K49Z, K66, L42, M82{PL}, N19M{PL}, Q11M, Q34, S55

**Greek Bush:**<sup>1</sup> (Fine Leaved Miniature) Attractive bushy plant, height 6 to 9 inches; compact, umbrella-shaped form; leaves 1/4 to 1/2 inch long. Extremely strong sweet basil scent; good for all culinary usage. Typically grown in Greek homes and restaurants in pots and window boxes. Excellent for border edgings. DIT, DI 1M, D92M, E81M, F70, F86G, G57M, /57{PL}, J97M, K49Z, K66, N19M{PL}, Q11M, Q34, S55

**Green Bouquet:**<sup>1</sup> Round, bushy plants have miniature, full-flavored leaves 1/4 to 3/4 inch long; use fresh or dried like other basil. Compact plants are perfect for pots, edging, borders, or indoors year-round on a sunny windowsill. Height 10 to 12 inches. B75, B75{PL}, C44, D26D, E81M, E91G, F35M{PL}, H57M, I50G, J82, M35{PL}, S55

**Green Bush:**<sup>1</sup> (Dwarf, Hn Vert, Fine Green, French, Miniature) Attractive, compact plant; trim and ball-shaped, attaining as much as 2 feet in width. Bright green leaves, only 1/4 to 1/2 inch in length;

numerous small clusters of rosy-white flowers. Strong aromatic odor and flavor, similar to that of common sweet basil. Particularly well suited for growing as an ornamental in pots. HAMPSTEAD [Cul, Re], VILMORIN; A2, C67M{PL}, D92M, F32D{PL}, 139, J20, J82, K2, M53{PL}, M82{PL}, R47

**Green Ruffles:** Fragrant, ornamental leaves are rich green, serrated and crinkled. Height 24 inches. Slightly more subtle flavor, but much larger leaves than common sweet basil. Fine for all culinary uses. Attractive companion to Purple Ruffles. B75, C53, C67M{PL}, D11M, D92M, E81M, F70, L42, M82{PL}, N84

**Holly's Pointed:**<sup>3 4</sup> (*O. basilicum* x *O. americanum*) Green, heart-shaped leaves, strongly splashed with purple on both sides; 2 1/2 to 3 3/4 inches long and 1 3/4 to 2 1/2 inches wide, strongly serrated. Strong licorice scent with a hint of sweet cinnamon. Pink to light purple flowers. Selected by Tom DeBaggio. Named for Holly Shimizu of the U.S. Botanic Garden. DEBAGGIO; H94M{PL}, M82{PL}

**Lemon:**<sup>2</sup> Attractive, spreading, gray-green plants with rather small, thin, pointed leaves and a distinct lemon-like aroma and flavor. Height 12 to 18 inches. Resents transplanting; direct seed where it is to be grown. Good in potpourris, herbal teas, cold drinks and for seasoning poultry and fish. HAMPSTEAD [Cul, Re], HUTSON 1987 [Re]; B75, C53, C67M{PL}, C81M, D92M, E13G{PR}, E61, F80, 139, J20, K22, M35{PL}, N19M{PL}, R47

**Lettuce Leaved:** Very large medium-green leaves, 3 to 5 inches in length and 4 or more inches in diameter, crimped and undulating. Similar scent to that of common sweet basil but the flavor is not as strong. Low growing, thick-set habit. One of the most vigorous and prolific basil and thus recommended for making *pesto* sauce. Also good as a finger food wrapper. HAMPSTEAD [Cul, Re]; B78, C67M{PL}, D92M, E91G, F32D{PL}, F80, 139, J76, J76{PL}, K2, K49M, L42, M53{PL}, N19M{PL}

**Licorice:**<sup>3</sup> (Anise, Oriental, Thai, Horapa) Stems, leaf veins and flower bracts are deep-purple while the flower-stalks are a pale violet. Vigorous plants; height 2 to 3 feet. Very strong licorice or anise-like aroma and flavor. Makes a nice addition to fruit salads and poultry. Also widely used in Southeast Asian cuisine. COST 1988 [Cul], HAMPSTEAD, HUTSON 1987 [Re], ROUTHIER 1989 [Cul, Re]; A2, C43M, C53, D55, D92M, F80, G6, J20, K66, M53{PL} \ M82{PL}, N19M{PL}, R47

**Lime:** (*O. canum*) Similar in growth habit to Lemon basil but with small, darker green leaves. Strong, distinct lime-like aroma and flavor; excellent in salads or with fish and seafood. Grows 20 to 26 inches tall. Originated in Thailand. A97{PL}, C81M, C81M{PL}, E28M, F93G{PL}, G6, G80{PL}, /57{PL}, J82, K57{PL}, Q34, S55

**Maeng Lak Thai Lemon:**<sup>2</sup> (*O. canum*) Sweet basil with a concentrated lemon fragrance and flavor. Excellent in rice dishes, with fish and poultry or in salads and marinades. The seeds are also used as a condiment in sweets. Vigorous plants, 11/2 feet tall, 2 inch leaves. Originally from Bangkok, Thailand. D92M, E81M, K66

**Mammoth:** (Mostrooso) Very large, lettuce leaf type, nearly the size of a human hand; ideal for drying, stuffing, or making *pesto* sauce. The leaves are large enough to use for wrapping chicken or fish before grilling. Dries well, and does not get bitter after long cooking. C53, C81M, D68, D92M, E7M, E28M, E81M, G6, G68, I99P, J20, J82, L89, Q11M

**Mexican:** (Mexican Spice) Leaves dark-green, glossy, thick; upper stems purple-tinted. Strong, spicy cinnamon-like scent and flavor. Dried, the fragrance keeps for many months. Excellent for tea. Tall, vigorous, bushy growth habit; height 2 to 3 feet. Similar to Cinnamon basil but somewhat coarser. Will grow year round if taken indoors for the winter. B1M, C95, F73D, 139, J20, J76, J76{PL}, L94M, M82{PL}, 053M

Mrs. Burns Lemon:<sup>2</sup> A pure strain that has been grown for 60 years in southeastern New Mexico. Many people consider this cultivar far superior to the more common sweet basil. Readily self seeds. Fine for all culinary uses, especially soups, roasts, and fried chicken. Flowers tend to be pink rather than white. C43M, D92M, F32D{PL}, F35M{PL}, F73D, H94M, 116, /57{PL}, J66{PL}, J82, K57{PL}, M82{PL}, N84, 053M

Napoletano: (Italian) Very large, rounded, deeply crinkled leaves; light green in color; luxuriant. Height 18 inches. Very sweet fragrance and distinctive, mellow, rich flavor is only slightly inferior to that of common sweet basil, with less deterioration after flowering. Especially good for making *pesto* sauce. The cultivar most commonly grown in the Naples region. C43M, D92M, E5T, E81M, F37T, F80, 191, J73, J76, K2, K57{PL}, K66, M82{PL}, N19M{PL}

New Guinea: Attractive plant with green, arrow-shaped leaves suffused with dark purple, 1 1/2 to 2 inches long and 1/2 to 3/4 inch wide. Small, light violet flowers splashed with purple. Strong, sweet licorice-like aroma and flavor with mint and cinnamon overtones. Introduced into the United States by Kim Kuebel. DEBAGGIO; C43M, C43M{PL}, J76{PL}, M82{PL}, 053M

Persian Anise:<sup>3</sup> 75-80 days. Large, vigorous plant, 2 to 2 1/2 feet tall with attractive purplish foliage. Very aromatic anise-like fragrance and flavor. Excellent for culinary purposes. Also very good for drying. Large, shrubby plants, 2 1/2 feet tall. C95, F73D, J73, K49T

Piccolo: (Piccolo Rno Verde Compatto) Small, light green leaves have intense sweet basil aroma and flavor but the plant has more closely placed leaves and proportionately less stem. Height 2 1/2 feet. Reputed to be the true, authentic *pesto* basil. Particularly favored for this purpose, because unlike common sweet basil it retains its flavor after flowering. HAMPSTEAD [Cui, Re]; C43M, C53, D92M, E81M, F32D{PL}, F80, J73, K2, K66, Q34

Portuguese: Long, drooping, light-green leaves with a spicy aroma and strong flavor. Stems and flower bracts are an attractive purplish color. Excellent for culinary use. Upright, somewhat willowy growth habit; height about 12 inches. M82{PL}

Purple Ruffles:<sup>4</sup> Large, heavily ruffled and fringed purple-black leaves; pinkish purple flowers; larger and showier than Dark Opal. Height 18 to 24 inches. Flavorful, colorful leaves are especially fine for herb vinegars and for garnishing; strongly aromatic when crushed. Germination and early growth tend to be slower than other basils; start indoors for best results. HUTSON 1987 [Re]; B75, C53, C67M{PL}, D68, D92M, E81M, 191, J20, J76, K22, L42, L91M, L94M

Red Ball:<sup>3</sup> (Thyrsiflora) Plants grow 15 to 18 inches tall, and 20 inches in diameter. Leaves are green at the base of the plant but may be purple near the flowers. Inflorescence is in the form of a thyrus; showy, with lavender or lavender and white flowers and deep purple flower-stalks, bracts, and calyces. The very fragrant aroma is sweet and anise-like. Used in Thai cuisine. An excellent ornamental as well as culinary cultivar. DARRAH, HAMPSTEAD; N19M{PL}

Red Rubin:<sup>4</sup> (Purple Passion) Smooth, oval, reddish-purple leaves, 3 1/4 inches long and 1 3/4 inches wide. Deep pink flowers with violet throats. Mild, sweet cinnamon scent with hints of mint and anise. Height 18 to 24 inches. Produces very few green-leaved plants, unlike Dark Opal and Purple Ruffles. Developed in Denmark. DEBAGGIO; C53, D68, E81M, F35M{PL}, F93G{PL}, G6, H94M{PL}, 139, J9M, J82, K66, K73, L42, L89, L94M, M49, M82{PL}, 053M, etc.

Siam Queen:<sup>3</sup> Large leaves, 3 to 4 inches long and 1 1/2 to 2 inches wide, short internodes. Has a sweet spicy flavor with overtones of anise or licorice. Best harvested when 4 to 6 inches tall with harvesting continuing for 3 to 6 months. Ornamental plants with reddish-purple stems and purplish flowers, 30 to 40 inches tall, very high yielding. All America Selections winner for 1997. B73M, B75,

C53, C92, E24, E75{PL}, E97, F13, F37T{PL}, F82, G6, G16, 191, J82, J97M, K66, K71, L89, L91M, M29, etc.

Spice: (O. basilicum x O. canum) Slender, spreading, bushy plant; 2 to 2 1/2 feet high; leaves dark-green; inflorescence dark-purple. Has a very pleasant, strong, spicy fragrance suggestive of O. sanctum, and is one of the best basils for tea. Easily grown and thrives with little care. It breeds true and self sows as far north as Connecticut. Probably a natural hybrid. DARRAH; D92M, E81M, J66{PL}, J82, M82{PL}, N84, S55

Spicy Globe:<sup>1</sup> Attractive, bushy, small-leaved cultivar forming a tight mound that retains its shape all season without pinching; height 10 inches, 12 to 18 inches across. Strong aroma; good for all culinary uses. Recommended for pot culture, and as edging for borders and beds. Produces clouds of tiny white flowers in late summer. A97{PL}, C67M{PL}, C81M, E81M, J76, J82, K22, K49M, L89, M53{PL}, N19M{PL}

Sweet Dani:<sup>2</sup> Attractive, upright plants with a branching habit and uniform shape; height about 26 inches; very strong lemon scent when lightly touched. Excellent with fish and savory dishes. Bred for high essential oil and citrol content, and increased leaf production. Can be cut back several times with excellent regrowth. All America Selections winner for 1998. A97{PL}, E75{PL}, E91G, F35M{PL}, G82, H33M, 139, I50G, 191, J82, K57{PL}, K71, M29, M46, Q34, TIM, etc.

Thai Seed:<sup>3</sup> The seeds are used as decoration on desserts and as topping for ice cream. Soaked in water before use, they swell up to eight times their original size. On desserts they somewhat resemble tapioca, adding an interesting quality and texture. The foliage resembles Licorice basil. Native to Thailand and Burma, and used extensively in Thai and Indian cooking. M82{PL}

Well-Sweep Miniature Purple:<sup>4</sup> Very showy and decorative basil with tiny, purple leaves. Good flavor for culinary use, especially in salads, pastas and meat dishes. Also excellent for tinting herb vinegars a burgundy color. Grows into a small mound, 6 inches wide and 8 inches high. Developed in 1974 at Well-Sweep Herb Farm, by Cyrus Hyde. K57{PL}, M82{PL}

## BEET {S}

### BETA VULGARIS CRASSA GROUP

---

#### GARDEN BEETS

#### ORANGE-SKINNED

Burpee's Golden: (Golden) 55 days. Attractive, bright golden-orange roots, develop rapidly; best when eaten small, but retain their sweet flavor and do not become fibrous when larger. Will not bleed like red beets. Excellent in salads, slaws, gourmet borscht, or pickled. Tops are very good boiled as greens. Sow seeds thickly, as germination rate is lower than other beets. A16, B75, C53, C85M,

D11M, D82, E13G{PR}, E24, F44, F70, G16, G44M{PR}, K66, L79, N40{PR}, R47, etc.

### RED-SKINNED

#### *Hybrid*

Red Ace: 55 days. Very early Detroit Short Top type with extremely smooth skin and even, deep red color throughout. Smooth, medium size crown with short, erect tops nearly free of red pigment. Very high sugar content throughout the root and leaf. Bolt and heat resistant and tolerant to cercospora leaf spot. *A87M, DI 1M, D76, E38, F70, F82, H85M, 191, J20, K50, K71, K73, L89*

Sangria: 50-55 days. Uniform, very smooth, globe-shaped roots with small taproots; intense bright red interior color free from zoning; fine texture, rich sweet flavor. Forms globes quickly which can be harvested for "baby" beets. Excellent for fresh use, canning or freezing. Very adaptable and bolt tolerant. *B75M, C85M, D26D, D65, G27M, G57M, G71, G79, G87, H42, K66, L79*

Solo:<sup>5</sup> 45-50 days. Hybrid mono-germ type. Extremely early and higher yielding. Uniform, top-shaped, deep red roots, similar to Red Ace but slightly larger. Glossy, dark-green leaves, 14 to 16 inches tall. Recommended for bunching or processing. Resistant to Cercospora Leaf Spot, downy mildew and root rot. *Al, A87M, C20M, D26D, G82, J84, K10, K73, L42, N52, S75M*

Warrior: 57 days. Highly uniform, globe-shaped, unusually smooth root; tender, smooth-textured, well colored flesh. Includes sugar beet material in its breeding, therefore it is sweeter than other cultivars. Develops very quickly, yet holds its quality even as it grows larger. Good for bunching or processing. Introduced in 1979 by Joseph Harris Seed Co. *A87M, F13, P59M*

#### *Open-Pollinated*

Baby Ball:<sup>3</sup> 58 days. Gourmet specialty market type. Round, smooth, deep-red roots. Developed for its tiny, sweet, exceptionally tender "baby" beets that remain pleasantly small at maturity. Also produces delicious, fast-growing tops for early-spring salads. *F44*

Boltardy: 58 days. Smooth, deep-red roots with very good internal color. Highly resistant to bolting, the solid flesh staying ringless and tender even when grown to a large size; also stands early cold periods especially well. Ample tops make good "greens". Can be sown from early spring into fall. *B49, G53M, N84, O53M, PIG, R32, R47, S55, S75M, TIM*

Bulls Blood:<sup>1</sup> A very old cultivar which is grown especially for its extremely attractive dark reddish-purple leaves which make excellent greens. Delicious, especially when picked young. Dark red roots of good sweetness and quality. Ornamental as well as useful. *A2, E24, I18M, 177, J9M*

Cheltenham Green Top: Long, medium-sized, tapering roots with broad shoulders and dark-red flesh. Bronze-green leaves with red-tinged stems. Very long roots have the advantage of searching for water in dry summers, especially on sandy soils. Hardy; lift with care in late autumn and store. Introduced in 1905. *B49, N84, R32, S55, S75M*

Chioggia: (Dolce di Chioggia, Peppermint Beet, Candy Cane Beet) Attractive rosy-pink skin. White flesh with bright-pink alternating concentric rings. Smooth, medium height tops are solid green with red-shaded stems. Most attractive grated raw but tastier cooked. Becoming well-known in U.S. specialty markets. An old traditional Italian cultivar. *B8, B8M, B49, D68, E13G{PR}, E24, E97, G6, G93M, 177, K49M, K66, K71, L7M, L89, N40{PR}, O53M, Q11M, Q34, R32, S55, etc.*

Crapaudine: (Rough Skinned) 53 days. One of the oldest cultivars, distinguished by the peculiar appearance of the skin, which is black and resembles the skin of a black winter radish. Root rather long, almost entirely buried in the soil; flesh very red, sugary and firm.

Leaves almost entirely green, with red stalks. *VILMORIN; E63D, S95M*

Crimson King: (Improved Crimson Globe) Medium-sized, globe shaped, 3 inch diameter roots; deep crimson, slightly zoned. Excellent flavor and tenderness; good in salads. Grows quickly for early use. Good keeper; can be sown late for autumn and winter use. An improved version of an old, well-established favorite. *B49, R32*

Crosby's Egyptian:<sup>4</sup> (Early Crosby Egyptian, Crosby's Extra Early Egyptian) 55 days. Deep-red, smooth, turnip-shaped root; dark-red internal color, with slight zonation; rapid growing. Tall, erect tops are bright glossy-green; very flavorful; excellent for markets where beets are sold in bunches. Ideal for forcing for early market. Introduced in 1880. *A75, C92, C95, E38, F92, G68, G79, K49M, K71, L7M, M46, M95M, N52*

Cylindra:<sup>2</sup> (Tendersweet Cylindra) 60 days. A unique, long cylindrical beet that will give 3 to 4 times the number of uniform slices as a round beet. Smooth, dark-red roots, up to 8 inches long and 1 3/4 inches in diameter, grow almost entirely underground. Will grow over a long season, maintaining its sweet, tender flavor. *B73M, B75, B75M, C44, C85M, D65, D82, E38, F82, G16, H42, R47*

Cyndor:<sup>2</sup> 45-50 days. Early cylindrical type with deep red color. Long, smooth, uniform roots; 8 to 10 inches long and 2 1/2 to 3 inches in diameter; free from zoning. Medium tall tops, dark-green with a maroon tinge. Ideal for slicing, pickling or freezing. Excellent germination and vigor. Resistant to curved root. *C28, DI 1M, F70, G57M, M49, N52, TIM*

Deacon Dan: Heirloom from Lancaster County, Pennsylvania. Striated red and white when cut raw. Slightly golden when cooked, turning deep red after cooling. Sweet and tender even as it grows large. Delicious served plain, with butter, or a vinegar-based sauce. Long season type that stores well. Thought to have originated with Deacon Dan Burkholder. *F24G, L88J*

Detroit Dark Red: 58 days. Smooth, uniform, globe-shaped, dark-red root; small tap root; interior color blood-red, with indistinct zonation. Tops are 13 to 15 inches tall; glossy dark-green tinged with maroon. Standard all-purpose cultivar. Introduced in 1892. *A16, A75, B73M, B75M, E24, E59Z, H33M, H42, H85M, I67M, 184, K73, L7M, M49, N16, etc.*

Dwergina:<sup>3</sup> 58 days. Improved short-topped beet in the Detroit Dark Red class. Distinguished by its intense color, tender, dense and smooth texture and sweet flavor. Round, very smooth-skinned beets; completely free from zonation; grows slowly at maturity, staying relatively small. Recommended for "baby beets" as well as growing on to normal size. *B49, J39, N84, R32, R47*

Early Blood Turnip-Rooted: (Early Dark Blood Turnip) 55 days. Root smooth, flattened and symmetrical; about 4 inches in depth and diameter; skin deep purplish-red; flesh deep blood-red, sometimes circled and rayed with paler red, remarkably sweet and tender. Adapted for summer or winter use. Known prior to 1863. *BURR; F24M, G57M, I63Z, M95M*

Early Wonder:<sup>4</sup> (Greentop) 55 days. Semi-globe shaped, smooth-skinned, uniform roots; about 3 inches in diameter; skin dark red; flesh deep red, with lighter zones. Medium-tall, bright glossy-green tops grow quickly and are excellent for bunching and beet greens. *A16, A25, A75, B73M, B78, C44, D82, E38, E59Z, G68, G79, H33M, J20, M46, N16, etc.*

Early Wonder Staysgreen:<sup>4</sup> (Staysgreen) 50 days. A favorite where beets are grown primarily for their greens. These are sold bunched, with large vigorous tops attached to young beets. Extra tall, bright glossy-green, tender, red-veined tops; stay green in cool weather longer than other Early Wonder strains. Smooth, flattened globe-shaped root. *H54*

Flat Egyptian: (Early Flat Egyptian, Egyptian Turnip-Rooted, Noir Plate d'Egypte) Root rounded and flattened, growing almost

entirely above ground; becoming irregular as it increases in size; skin very smooth, violet or slate red; flesh deep purple-red. Excellent for forcing for early market. Roots are somewhat flatter when transplanted from indoors to out. Introduced before 1885. VILMORIN; N81, PIG, P59M, P75M, T27M

Formanova:<sup>2</sup> (Cylindra Improved, Cook's Delight) 50 days. Unique, cylindrical-shaped root; 6 to 8 inches long and 2 1/2 inches in diameter. Flesh is dark red, tender and flavorful. Especially useful for slicing, the slices being very uniform in size, resulting in little waste. Also very popular for home pickling or freezing. A16, B49, D27, D68, E59Z, FI, F92, G6, G87, K49M, L42

Forono:<sup>2</sup> 60 days. A long, tankard-shaped beet which grows as much above as below ground. Smooth, ruby-red roots cook quickly and have a high sugar content. Tops are quite short. Suitable for winter storage. Developed especially for canning, the unusual shape making it perfect for uniform slices. E97, G6, L39, L77, J9M, L89, N81, R32

Green Top Bunching:<sup>4</sup> 55 days. Attractive, heavy, bright glossy-green tops maintain their appearance well during adverse cooler weather; medium length is ideal for bunching; excellent flavor. Uniform, slightly-flattened, smooth-skinned roots; flesh is sweet, tender and fine-grained. Good all-purpose cultivar. AI, C28, DIT, D26D, F63, G57M, G79, G93M, H61, J84, K71, K73, L42, N52

Little Ball:<sup>3</sup> 45 days. Specially selected for gourmet "baby beets", if closely spaced Little Ball will produce uniform, smooth-skinned, globular roots about the size of a silver dollar. The flesh is sweet flavored whether used fresh or for pickling. Retains its deep-red interior color even after cooking. A16, B75, C20M, D11M, E38, F70, G57M, G79, G93M, H95, K66, L89C

Little Mini Ball:<sup>3</sup> 54 days. One of the first true "baby beets". Roots are about the size of a silver dollar at maturity; round, not globe-shaped. Used for whole pak pickled beets. Short tops are good for greens. D27

Lutz Green Leaf: 70 days. Very popular for using fresh in summer; roots also hold well for picking into fall and for winter storage. Glossy green, elongated tops with pink midrib have excellent eating quality. Top-shaped roots are rich purplish-red, with dark red flesh shading to lighter zones. Sweet and tender used small or large; even large roots are quick-cooking. D11M, F70, F82, G57M, G71, G71M, L39, L84, J20, K49M, K71, L7M, N34{PR}, R47

MacGregor's Favorite:<sup>1</sup> (Dracena Beet) 60 days. An old Scottish heirloom that is very ornamental with a profusion of narrow, spear-shaped leaves that are a striking blood-red with a metallic sheen. Deep-red, elongated, 3 inch roots have a fine flavor. The slender leaves interplant attractively with flowers, borders and beds. C53, L77, O53M

Monodet:<sup>5</sup> 45 days. A mono-germ type producing only one sprout per seed, thereby reducing the need for thinning. Well-rounded flavorful roots for use in summer and autumn. Tops make excellent "greens" for cooking. S61, S75Af

Monogram:<sup>5</sup> 65 days. High quality mono-germ type with excellent internal color. Uniform, smooth, globe-shaped roots; medium to small in size Very good flavor. Each seed produces only one seedling, eliminating the chore of thinning. Ideal for precise, intense plantings. Vigorous and productive. J20, L91M, S75M

Monopoly:<sup>5</sup> 60 days. Mono-germ type, bred to produce only one sprout per fruit. Elongated, globe-shaped root with a fine texture and sweet taste; holds well in the garden without getting pithy or tough. Derived from Boltaidy, having the same high quality and resistance to bolting. K66

Ruby Queen: 60 days. Round, smooth, globe-shaped, deep blood-red root; deep red interiors are free from zonation under normal conditions; very uniform; tender, sweet flesh. Tops are short, bright green, narrow-leaved and turn red in cool weather. Leading canning cultivar in the Northeast. All America Selections winner in 1957.

A16, B6, B75M, D11M, E38, FI, F70, G16, G57M, G71, H33M, H61, H95, L84, K73, N16, etc.

Spinel:<sup>3</sup> 60 days. Small, Detroit-type "baby beet" bred for the critical gourmet trade of the expensive restaurants of Europe. Smooth, globe-shaped root; bright-red internal color. Can be harvested as a baby beet after 40 to 45 days, but can stand in the field much longer without getting over mature. Often used for whole pack canning. L39, L91M, N24M

Sweetheart: 58 days. Round to top-shaped roots are not smooth or uniform, but make up for it in flavor; solid red flesh that's uniform throughout. Sugar beet in the parentage makes this cultivar extra-sweet. Tops are of medium height, tinged with red. For fresh use, canning and storage. Developed by Professor E.M. Meader at the University of New Hampshire. Introduced in 1958. G6, J39, L7M

Winter Keeper: (Long Season) 78 days. Produces a very large, rather rough, almost mangel-like beet with deep red interior. Remains sweet and tender even when very mature. Large green tops can be harvested separately for "greens". Mature beets are easily stored in a bushel of moist sand for winter consumption. A2, B6, E24, F13, F24M, F80, G82, J25M, L42, L89, N24M, N84

#### WHITE-SKINNED

Albina Vereduna: (Snowwhite) 55 days. Large, globe-shaped root; white inside and out. Has a high sugar content and a rich flavor. Unusually thick and durable skins make for excellent storage in the ground during fall and winter. Curled, wavy leaves make tasty "greens". D56M, L77, J39, J9M, L89, L91M, O89

Albino White: 50 days. A novel "non-bleeding" beet with pure-white, fairly smooth, globe-shaped roots that are sweet and mild-flavored. Makes unusual sliced and pickled beets. Plain green tops, high in vitamins, may be used as "greens". C20M, F73D

White: 55 days. Globular, white roots with all the flavor of a red beet. Tender, edible skin. Can be cooked with other vegetables without staining. Larger, taller and more succulent foliage. Good specialty market item. B49, G6, G68, PIG, R47

#### MANGELS

Large, swollen-rooted beets generally used as animal feed due to their coarseness although some types are suitable for the table when young. Almost certainly originated by crossing a form of garden beet with a leaf beet. J97M, K49M

Colossal Long Red: 100 days. Roots frequently grow 2 feet long, about half growing above the surface; weighing up to 15 pounds each. Skin is bright rich-red. Flesh is white, tinted with rose. Relished by livestock, particularly milk cows. A2, F73D, K20M, K71

Golden Tankaid: (Yellow Tankard) Large, heavy, smooth root; tapering at both ends, more abruptly at the bottom; deep orange-red skin; firm, thick, creamy yellow flesh, very sweet. Excellent for the table. Hardy and drought resistant. Will keep all winter if stored well. VILMORIN; F73D, K71

Jaune d'Eckendorf: 110 days. Very large, round, yellow, sweet forage beet. Keeps all winter if properly stored. Best planted in late spring for fall harvesting. A good food supplement for rabbits, goats and chickens. Will yield up to 50 tons an acre. For the table, boil and then add butter and chopped chives. N81, Q11M

Long White Green Top: (Blanche a Collet Vert) Long, cylindrical root, 20 inches in length and 5 to 6 inches in diameter; often grows 1/2 or 2/3 above ground; skin white below ground, greenish above. Very vigorous and productive, growing for a long period late into the season. VILMORIN; Q11M

Mammoth Long Red: (Long Red) 110 days. Roots extremely large, tapering; grow half above ground, half below; weigh up to 30 pounds each; skin light-red; flesh white, tinged with rose Very productive; will yield from 30 to 40 tons per acre on well-prepared

land. Good livestock fodder; also good for table use. E97, F80, G16, G57M, H85M, I63Z, J39, K5M, K10, M49, Q11M

Prizewinner: 110 days. Large, half-long, oval roots that grow partly above ground; golden-orange in color; solid flesh. Tops grow 12 to 18 inches tall. Unusually sweet for a mangle, so sweet it is prized by home-made wine enthusiasts in England. Easy to dig and top. An old English heirloom. B49, R32, S55

Wintergold: 100 days. Large, heavy roots, often 12 inches in length. High in vitamins and sugar. Suitable for use as a beetroot, juiced, or in salads. Tops can be used like Swiss chard. Also used as animal fodder. Sown in autumn in warm winter areas; keeps well. FI, PIG

Yellow Globe: Large, roundish yellow roots with a high sugar content. May eventually grow as large as a football. Can be sown in spring, summer or fall. Popular in Australia. R47

Yellow Intermediate: (Giant Yellow Intermediate) Large half-long roots, grayish-green above ground, orange below; sweet solid white flesh. Easy to pull and top. Yields well under varied conditions. One of the most widely grown of all mangels. Developed by Vilmorin in the 1800's. A2, B49, 199M, K49T, L77D, N84

#### SUGAR BEETS

Relatively highly bred types, mostly bred for sucrose extraction commercially. Generally lacking in pigmentation, they have a high root sugar content. Occasionally grown for home sugar extraction or as a home garden vegetable which can be used in soups and stews. Grated sugar beet is said to bring out the true flavor of accompanying vegetables when added to vegetable dishes. BIANCHINI, CLARKE, ORGAN [Cui]. C20M, H85M, J82, K10, R47

Giant Half Sugar: 120 days. Long, oval-shaped roots, slightly tapering at the bottom; reddish above ground and white below. Thick white flesh, higher than normal in sugar content. High in nutritive value. Twice as productive as common sugar beets. Grows half out of the ground to make harvesting much easier. K71

Giant Western: 80 days. Grown for sugar making or stock feeding. Roots are medium large; 10 to 12 inches long, 4 inches wide at the shoulder; yellow-fleshed; weigh 2 to 3 pounds each. High sugar content. Will take on the color of red beets when canned with them; will also add sweetness. Yields 20 to 40 tons per acre. Can be used for fall or spring harvest. D76, E97, F73D, F80, /59M, K71, N84, PIG

Half Sugar Rose: 100 days. A cross between a mangel and a sugar beet. Oval-shaped root; green above the ground, white below; flesh white and sweet. Keeps well. Heavy yielding. Mature roots supply food of high nutrient value for feeding purposes. U8D

Klein Wanzleben: Long, tapering roots with large shoulders. White skin and flesh. Ideal for sugar manufacture, containing the highest percentage of sugar of any sugar beet. Two large roots can produce 1 cup of sugar and 1/2 cup of blackstrap molasses; 100 tons of roots have yielded as much as 18 tons of sugar. Also used as feed for sheep, but is too sweet for cattle. U63

## BLACK WALNUT {GR}

#### JUGLANS NIGRA

Beck: Medium-sized nut, averaging about 37 per pound; shell thinner than average; kernel cracks out nearly 100% in quarters and halves; flavor superior to most cultivars; ripens early. Tree vigorous, symmetrical; produces heavy crops regularly; disease resistant. Won first prize in Michigan nut contest in 1932. BROOKS 1972; I25M{SC}, 140

Bicentennial: Nut size medium to large; flavor good; kernel filling good; cracking quality equal to Thomas. Tree vigorous, a precocious bearer; very haidy. Originated in Huevelton, New York. E91M, L27M{PL}

Bowser: (Boser) Nut size medium, averaging 30 to 35 per pound; shell very thin, cracking qualities excellent; kernel averages 37 % of weight of whole nut; flavor very good. Tree noted for rapid growth. Originated in Xenia, Ohio by John Mitchell Davidson and Homer G. Bowser. Introduced in 1958. BROOKS 1972; I60{PL}

Clermont: Nut 1 1/4 inch long; apex slightly pointed; shell extremely thin, about 1/16 inch thick; kernel creamy white, plump, flavor excellent; cracks out about 40%. Tree produces heavy crops. Resistant to anthracnose. Originated in Clermont County, Ohio by Albert M. Kirtnes. Discovered in 1912, growing along the Ohio River. Introduced in 1959. BROOKS 1972; 140

Cooksey: Medium-sized nuts with thin shells, regularly cracks out halves and sometimes whole kernels; excellent, mild flavor. Vigorous, self-fertile tree, produces very good crops. Very popular in the Pacific Northwest. J61M, NO

Cranz: Small, elliptical nuts, about 35 per pound; very high meat to shell ratio; cracks out readily; ripens in midseason. Protogynous flowering type, must be pollinated by another variety. Bears on lateral branches. Recommended for commercial plantings. Originated in Ira, Ohio by Eugene F. Cranz. BROOKS 1997; B74, I25M{SC}, NO

Deming's Purple:<sup>1</sup> Purple leaves, flowers and husks distinguish this ornamental cultivar, which also has a purple spot on the nut-meat. I25M{SC}

Emma Kay: Has a thin shell, and cracks out a very high percentage of kernels; 30 nuts per pound. Bears heavily in southern Ontario, but in heavy crop years not all the nuts fill well. Nut flavor is reputed to be excellent but the cultivar has not yet been extensively tested. The tree has a spreading crown. Originated in Illinois. JAYNES; B99{PL}, E62{PL}, E62{DF}, E62{SC}, 140, 160{PL}

Farrington: Very large nut; shape distinctive; shell somewhat thick, but cracks well; kernel light-colored, flavor mild, fills well. Tree bears early, regularly and heavily. Anthracnose resistant. Originated in Fayette County, Kentucky by O.M. Farrington. Introduced in 1959. BROOKS 1972; B99{PL}, I25M{SC}, 140

Fonhill: Medium-sized nut; kernel filling very good; good flavor. Tree vigorous, upright; hardy; heavy-bearing; selected for its good qualities as a timber tree. E91M

Football: (Football #2) Large, elliptical nut, about 25 per pound; kernel weight 30% of nut; very good cracking qualities; ripens in midseason. Bears on lateral branches. Susceptible to anthracnose. Recommended for the Plains states and northern areas. Seedling selection made by Leon Falconer of Sarcoxie, Missouri. I25M{SC}, 140

Hare: Very large nut; 20 nuts per pound. Large kernel; good cracking quality, with a high percentage of kernel crack-out. Tree blooms late; yields well. Originated in Rushville, Schuyler County, Illinois by F.M. Hare. Introduced in 1930. BROOKS 1972; B74, I25M{SC}

Harney: Nut shell thin, excellent cracking quality; high kernel percentage. Survival rate in all plantings has been below average. Originated in Cynthiana, Harrison County, Kentucky by Cullie Baughn, U.S.D.A. Soil Conservation Service. Introduced in 1939. BROOKS 1972, JAYNES; 140

Krause: Nut averages about 23 per pound; cracks well; kernel averages about 27% of total weight; quality very good; ripens rather late, first of October. Tree very hardy; very vigorous; produces a great deal of pollen which is shed early. Originated on the farm of Russell Krause, Toddville, Linn County, Iowa. Introduced in 1940. BROOKS 1972; I25M{SC}

Kwik Krop: (Boellner) Precocious bearer, often bears 2 to 3 years after planting. Medium-sized, elliptical nut; kernel 31 % of nut weight; shell thin, cracks easily; kernel plump, mild-flavored, light in color; matures early. Tree hardy, large and vigorous, moderately productive. Originated in Roswell, New Mexico by Louis B. Boellner. BROOKS 1997; B74,I25M{SC}, L33, NO

Lamb: (Lamb's Curly) Fairly large nut; quality better than average. Tree a rapid grower; primarily of use for veneer because of curly-grained wood, but in the majority of sites where grafts have been tested, the curly grain has not been observed. Originated in Ada, Michigan by George N. Lamb of the Walnut Manufacturers Association of Chicago. Introduced about 1935. BROOKS 1972; 140

Minnesota Native: Self-pollinated seedlings of the hardest black walnut tested by St. Lawrence Nurseries, Potsdam, Nov York. The mother tree ripens nuts 2 to 3 weeks before any other black walnut in this area. Nuts are small, but the tree is exceedingly precocious and timber-type. Its seedlings are uniformly vigorous and fast-growing. L27M{PL}

Mintle: Small nut, averaging somewhat less than 10 grams; kernel content about 24% of nut; cracking quality good. It is reputed to have the best flavor of all black walnuts and the ability to store at room temperature for two years without becoming rancid. Survives exceptionally well in plantings. Originated in Glenwood, Iowa by J.R. Mintle. Introduced in 1931. BROOKS 1972, JAYNES; I25M{SC}

Myers: (Elmer Myers) A standard cultivar noted for its very thin shell and good cracking qualities. It has exceptional total-kernel and first-crack kernel percentages and a high recovery of quarters. Resistant to anthracnose. Best adapted to southern growing conditions; at more northern locations kernels tend to be shriveled and bearing is often erratic. Originated in Bellefontaine, Ohio by Elmer R. Myers. Introduced about 1930. BROOKS 1972, JAYNES; B99{PL}, E62{PL}, E62{DF}, E62{SC}, I25M{SC}, 140,160{PL}

Ogden: Large nut, averages 20.7 grams per nut; cracking quality very good; kernel averages 26.6% of nut; pellicle easily removed. Tree bears well in Arkansas and Oklahoma. Originated in Bedford, Kentucky by Joe Ogden. Introduced in 1928. BROOKS 1972; I25M{SC}

Ohio: Well known for its fine cracking qualities. It is moderately resistant to anthracnose, but highly susceptible to husk maggot. Biennial bearer. Discovered in Ohio in 1915. JAYNES; I25M{SC}, I60{PL}

Patterson: Yields large nuts that are pollinated by Minnesota Native. Its seedlings are hardy and grow vigorously, showing a straight, timber-type growth habit. L27M{PL}

Putney: (Green) Exceptionally large nut with good cracking qualities, fills well in short season areas. Produces seedlings that are vigorous and show an excellent timber-type growth habit. Parent tree is probably the largest and oldest black walnut tree growing in northern New York. L27M{PL}

Ridgeway: (Rabbit Ridge) This two-time Kentucky State Fair winner has a very large nut, cracks well, shows anthracnose resistance, and bears heavily. Discovered by Henry Converse. Originated in Illinois. Introduced in 1984. 140

Rohwer: Broadly obovate nut, about 24 per pound, light kernels; kernel weight 25-35%. Excellent quality and cracking characteristics. Krause and Sparrow can be used as pollinizers. Recommended especially for Nebraska and Pennsylvania. Originated in Grundy

Center, Iowa by John W. Rohwer. Discovered in 1926. I25M{SC}, 140

Sauber: (Sauber #1) Medium to large, broadly elliptical nut with a thin shell; light-colored kernels of very high quality; kernel weight 39% of nut. Excellent shelling qualities. Vigorous and very productive. Seedling selected by Paul J. Sauber of Barberton, Ohio. Introduced in 1978. BROOKS 1997; E62{DF}, E62{SC}, I25M{SC}, 140

Schreiber: Large nut; very high total kernel percentage; of good quality. Tree bears very well. Originated in New Albany, Indiana by R.H. Schreiber. Introduced in 1941. BROOKS 1972; 140

Sparks #127: Small, broadly elliptical nut, about 32 per pound; kernel weight 32% of nut; ripens early. Protogynous flowering type that bears on lateral branches. Somewhat prone to alternate bearing and overproduction. Recommended for commercial plantings. Seedling selected by Archie Sparks of Beaver, Iowa. BROOKS 1997; B74,I25M{SC}

Sparks #147: Medium-sized, elliptical nut, about 27 per pound; strongly pointed on both ends, and basal point distinctively long; kernel weight 38% of nut; ripens in midseason. Has the thinnest shell of any black walnut. Bears on lateral branches. Originated in Beaver, Iowa by Archie Sparks. I25M{SC}

Sparrow: Medium to large nut; 27 per pound; hull very thin, hulling readily; shell rather thin, cracking quality good; kernel sweet, rich; quality very good, as good as, or better than Thomas. Ripens about with Snyder and 2 weeks before Thomas. Tree retains foliage well into fall, later than most other cultivars; hardy. Very resistant to anthracnose. Originated in Lomax, Illinois by Harry C. Sparrow. Introduced in 1935. BROOKS 1972; A91{PL}, B74, B99{PL}, I25M{SC}, 140,160{PL}

Stambaugh: A large-kemeled cultivar that bears at an early age. It is susceptible to anthracnose leaf spot infection. Won first prize among 1229 entries in 1926 contest sponsored by the Northern Nut Growers Association. Originated in Browning, Illinois by H.V. Stambaugh. Introduced in 1928. BROOKS 1972; I25M{SC}, NO

Surprise: Large, depressed-obovate nut, about 25 per pound; kernel weight 34% of nut; fills well, and cracks out in quarters; ripens in midseason. Bears on lateral branches. Seedling selection made by Leon Falconer of Sarcoxie, Missouri, sometime during the 1970's. I25M{SC}, 140

Thomas: Large nuts; 30% kernel; cracks well; high-quality kernels with a good flavor. Bears heavily and at an early age. One of the most popular and widely planted cultivars. However, it is considered a poor selection for the Midwest, where the most frequent criticism is that the nuts do not fill well, especially on trees more than 5 years old. Susceptible to anthracnose which can cause early defoliation and poor nut development. Discovered in Pennsylvania in 1881. JAYNES; C11M{PL}, E97, E91M, H4, H65,I25M{SC}, 140,174, L33, M83

Thomas Myers: A selection of Leander Hay, produced by crossing Thomas and Elmer Myers. Probably the same as the Hay cultivar. A very large nut, 20 per pound, with 30% kernel; cracks out easily; medium shell thickness. Bears early, annually, and heavily. Originated in Missouri in 1980. I25M{SC}, 140,186{SC}

Vandersloot: Very large nut, 23 per pound; good cracking qualities. Nut kernel fills poorly; larger but thicker shell than Thomas; excellent flavor. Tree protogynous flowering. Superseded now by other and better cultivars but still preferred by some growers. Largest black walnut in the 1926 Northern Nut Growers Association contest. Originated in York County, Pennsylvania by C.E. Vandersloot. Introduced in 1927. BROOKS 1972; 140

Weschcke: Nut elongated, pointed at both ends; shell thin, cracks easily; kernel sweet, mild, bright, plump; keeps well up to 2 or 3 years without rancidity; ripens in mid-October. Tree vigorous, large, hardy. Originated in River Falls, Wisconsin by Carl

Weschcke. Introduced in 1953. BROOKS 1972; E91M, L27M{PL}, NO

#### CODES FOR SPECIAL TYPES

1. Purple

## BLACKBERRY {GR}

RUBUS SPP.

### UPRIGHT BLACKBERRIES

The type most often grown in northern areas, they grow very tall and upright with long, vicious thorns. Generally easier to care for than trailing blackberries, the canes being self-supporting.

Arapaho:<sup>1</sup> The earliest ripening thornless blackberry. Medium-sized, bright glossy black fruit with excellent quality and flavor both fresh and processed. Ripens over a 4 week season, stores well. Very erect canes; good cold hardness. Resistant to orange rust and rosette. Originated in Fayetteville, Arkansas by J.N. Moore. Introduced in 1993. BROOKS 1997; A39, B19, B75, C15M, D37, D43M, E97, F16, F87, F93, I49M, J2M, J61M, K67, L33, M83, N33, etc.

Bedford Giant: Very large, round fruit; skin black, glossy; flesh very juicy, sweet, flavor good; not as seedy as most blackberries; very good for canning and freezing; ripens very early. Very vigorous plant, with stems often 10 feet in length; very productive, the berries being borne in prolific clusters. Thought to have been selected from a Veitchberry seedling. SIMMONS 1978; R83

Black Satin:<sup>1</sup> Very large, oblong fruit; skin dull black at full maturity; flesh firm, juicy, sweet; quality good; ripens mid-season, mid to late-July. Bush heavy yielding; non-suckering; highly resistant to septoria leaf spot and anthracnose, and moderately resistant to mildew; self-fruitful, but more productive when planted with Dirksen; canes semi-erect. A82, A88M, B43M, C61, F16, F93, H4, I53M, J63M, K67, M65M, M83, O81

Brazos: Fruit very large, with size being maintained longer during harvest than Lawton; attractive; flesh fairly firm, somewhat tart; quality good for fresh market; ripens early, earlier than Lawton. Bush vigorous; productive; resistant to stem and leaf diseases; canes erect. Lawton x Nessberry. Originated in College Station, Texas by J.B. Storey. Introduced in 1959. BROOKS 1972; A19, A82, B19, B43M, C54, C61, E8M, H4, K75T, M83, N33

Brison: Fruit similar to Brazos, but more attractive and with smaller seeds; the flesh is firmer and somewhat sweeter. Recommended for home gardens and pick your own operations. Bush slightly more upright; adapted to the Waco, Texas and south central Texas region. Originated in College Station, Texas by H.H. Bowen, Texas Agricultural Experiment Station. Introduced in 1979. N33

Cherokee: Medium-large fruit; skin black, glossy; flesh firm, sweet; quality good; good for processing; ripens late July. Bush very vigorous and productive; canes very erect in growth habit; moderately thorny. The erect habit results in fruit being borne higher from the ground and more accessible to machine harvest. Developed at the Arkansas Agricultural Experiment Station. B19, B43M, B45M, C54, C61, F87, I83M, J2M, K75T, L47, M83

Chester:<sup>1</sup> Fruit large; skin black; flavor very good; quality high, does not soften, leak or lose color on hot sunny days; ripens after Black Satin. Bush productive, yields about twice as much as most thorned types; very resistant to caneblight. Considered one of the more winter-hardy thornless blackberries; has been grown successfully in Michigan and upstate New York with winter protection. B43M, B58, C15M, C30M, D37, F16, F43M, I50, J61M, J63M, K17, L33, M65M, N24M

Cheyenne: Fruit large, up to 1 inch long; quality excellent; ripens mid-season. Bush productive; canes very erect growing. Excellent for machine harvesting, for processing, pick-your-own operations and home gardens. Developed at the Arkansas Agricultural Experiment Station. B19, B43M, B45M, B58, C54, F93, I83M, J2M, K75T, L47, M83

Choctaw: Medium-sized, short conic fruit with an attractive glossy black finish; similar in firmness to Shawnee but slightly less firm than Cheyenne; excellent flavor; significantly small seed size. Ripens very early and tends to be more concentrated in ripening than other cultivars. Very vigorous and prolific plant; very erect growth habit. Developed by Dr. J.N. Moore of the University of Arkansas. B43M, B45M, F16, F87, F93, I53M, J2M, K17, K75T, M83

Comanche: Very large, attractive fruit; skin black, glossy; flesh very firm; quality good to excellent; makes a good frozen or canned pack; also excellent for pies and jams; ripens after Brazos. Canes vigorous, very upright growing; productive; moderately thorny. Developed at the Arkansas Agricultural Experiment Station. A82, B45M, I53M, J2M, K75T

Darrow: Large fruit, 1 inch long and 3/4 inch wide; skin black, glossy; flesh firm, mildly subacid, quality good; ripens early or about with Eldorado, continuing over a long period. Bush vigorous; reliable and heavy bearer. Originated in Geneva, New York by George L. Slate. Introduced in 1958. BROOKS 1972; A82, B19, B73M, C47, C61, D76, E3, G71, I78, J63M, J83

Dirksen:<sup>1</sup> (Dirksen Thornless) Large fruit; skin black, glossy; flavor sweet; ripens in early July, or a week sooner than Black Satin. Bush very vigorous; heavy yielding; cold-hardy; resistant to leaf spot, mildew and anthracnose; canes thornless. More cold-hardy than Black Satin, which it resembles. One of the hardiest thornless blackberries. B19, B45M, C54, C61, D76, F87, I53M

Doyle Thornless:<sup>1</sup> Sweet, juicy fruits of fine flavor; ripen over a 4 to 6 week period in June and July. Large, bushy plant with ornamental foliage; unusually long primocanes; totally thornless, disease-resistant and non-sucker ing. Produces 10 to 20 gallons of fruit per plant when mature. Cold-hardy to at least -20° F. Ideal for home gardeners. Originated in Washington, Indiana by Tom Doyle. K55

Ebony King: Fruit as large as Eldorado, which it resembles; skin black, glossy; flavor sweet, tangy, pure; ripens early. Bush upright; hardy, having withstood temperatures of 22 degrees below zero; resistant to orange rust; bears annually. Introduced about 1940 by Krieger's Wholesale Nuisery, Bridgman, Michigan. BROOKS 1972; B19, C61, E97, H58, J63M, N24M

Eldorado: Large, roundish to slightly elongated fruit; skin jet black; flesh firm, juicy; flavor rich, sweet; quality good to very good; ripens early midseason, ripening period long. Bush tall, upright-spreading; hardy and productive; seldom attacked by orange rust. Originated about 1880 near the village of Eldorado, Ohio. HEDRICK 1925; I41P

Flordagrind: (R. *trivialis* x) Large, oblong fruit; skin shiny black; flesh somewhat tart, softer than strawberries, juice very red; aroma delightful; very acceptable for pies, preserves and jellies; ripens very early. Bush vigorous; evergreen; canes long, somewhat trailing; adapted to hot, humid summers; winter chilling requirement very short. Originated in Gainesville, Florida. BROOKS 1972; U7D

Hull:<sup>1</sup> Fruit very large; skin black, glossy when ripe; flesh firm, sweet; quality high, does not soften, leak or lose color on hot sunny days; ripens somewhat later than Black Satin. Bush vigorous; very productive, yields of 19,842 pounds per acre have been reported; slightly more winter hardy than Black Satin. Recommended for home gardens and pick-your-own operations. A24, B19, B43M, B58, B75, C15M, C30M, C61, F87, F93, I50, M81M, M83

Illini Hardy: (Illini Winter Hardy) Large, black fruit; flavor sweet, quality good; resembles Harrow. Vigorous, thorny plant; very hardy, has been tested at temperatures as low as -24° F. Should allow blackberries to be grown farther north than previously possible. New introduction from the University of Illinois. FI6, F87, H65, L50, K71, L33

Kiowa: Very large, glossy black fruit of good quality; somewhat firmer than Shawnee; ripens in midseason, 3 days later than Shawnee, has a long harvest season. Moderately vigorous, erect plant, productive; appears immune to orange rust. Originated by J.N. Moore. BROOKS 1997; B19, B43M, C15M, D43M, F93, J2M, K17, N33

Lawton: Large, slightly elongated fruit; skin jet black but becoming bronzed when over-ripe; core large, rather hard; flesh soft, juicy; flavor acid at first, becoming sweet only at full maturity, rich; quality very good; ripens late midseason. Bush tall, upright-spreading; vigorous; productive. Originated prior to 1854. HEDRICK 1925; B19, C61, J2M

Loch Ness:<sup>1</sup> Large, glossy black fruit of good quality; richly tart flavor; ripens with or shortly before Hull. Semi-erect, spineless plant; less vigorous than Chester, Hull or Black Satin; can be grown with little support. Hardy to USDA Zone 5. Originated in Invergowrie, Scotland. Introduced in 1988. BROOKS 1997; B43M, F16, F87, J2M, J61M, K17, M81M, O81, P68M

Navaho:<sup>1</sup> The first erect-growing thornless blackberry. Short-conic fruit, comparable in size to that of Cheyenne; bright glossy black in color; firmer flesh than Cheyenne and Shawnee; sweeter flavor and smaller seed size than other thornless cultivars. Ripens about 15 days after Cheyenne. Developed by Dr. J.N. Moore of the University of Arkansas. A39, B58, C15M, C61, D37, D43M, E97, F16, F87, F93, G8, I49M, 174, J2M, K17, K67, L33, N33, etc.

Oklawaha: (R. *trivialis* x) Fruit about 1 1/8 inches long by 1/2 inch in diameter, somewhat blunt; skin black, turning reddish if exposed to sun after picking; juice deep red, aroma delicate and delightful; ripens 2 to 5 days before Flordagrind, which it resembles. Bush vigorous; canes trailing; semi-evergreen to evergreen; largely self-fruitful. Originated in Gainesville, Florida. BROOKS 1972; U7D{SC}

Rosborough: Fruit very large; flavor sweeter than Brazos which it resembles; quality good; ripens early, average ripening date mid-May; ripens over a long period, approximately 25 days. Bush heavy yielding; withstands moderately dry weather; canes erect. Originated in College Station, Texas by H.H. Bowen, Texas Agricultural Experiment Station. Introduced in 1979. B43M, F93, J2M, K75T, L33, M83, N33

Shawnee: Fruit very large, attractive; skin black, glossy; flesh firm, very sweet and juicy; ripens later and over a longer period of time than other Arkansas blackberry cultivars. Canes very upright growing. Bush vigorous; disease resistant; productive; in production tests, Shawnee produced 13,391 pounds per acre, compared to 5,598 pounds for Cheyenne. Developed at the Arkansas Agricultural Experiment Station. B15M, B19, B43M, B45M, C15M, C30M, F87, F93, G17, I53M, I83M, J2M, K17, L33, M83, etc.

Silvan: Large, maroon-black fruit; mild very sweet flavor; excellent fresh or for processing; ripens very early. Vigorous, productive plant; shows excellent tolerance to heavy soils, wind and drought; also very disease resistant. Selected in Victoria, Australia from a progeny raised from a cross made in Oregon between Marion and a Boysen hybrid. JENNINGS; B43M, C15M, K17

Smoothstem:<sup>1</sup> Fruit large, blunt conic; skin jet black, firm; flavor good; matures about August 1, or a month later than Eldorado. Bush winter hardy at Beltsville and southward; productive; non-suckering; canes thornless, semi-upright, 8 to 10 feet long. Recommended for local market and home gardens. Originated in Beltsville, Maryland. Introduced in 1966. BROOKS 1972; B19, B73M, E3, G23, I78

Thornfree:<sup>1</sup> Fruit medium-large, blunt conic; skin glossy black; flavor good, tart; adheres firmly; ripens 3 weeks later than Eldorado. Bush winter hardy at Corvallis, Oregon and Beltsville, Maryland; very productive in fertile soils; canes thornless, semi-upright, 7 to 8 feet long. Originated in Beltsville, Maryland. Introduced in 1966. BROOKS 1972; A82, B19, B43M, C61, H49, I53M, K71, L33

Thornless Evergreen:<sup>1</sup> Fruit large, 1 1/2 inches long; skin black; flesh very firm and sweet; seeds large; quality fair; excellent for pies, jellies and jams. Bush very vigorous and productive; disease resistant; must be propagated from tip layering to preserve thornless trait; canes semi-trailing. Grown commercially in Oregon. STEBBINS; A82, C54, K17, P59M

Waldo Thornless:<sup>1</sup> Produces high yields of highly-flavored berries that are easy to pick. Unlike some other thornless cultivars, Waldo remains thornless, even from the suckers. Originated in Corvallis, Oregon at the Oregon Agricultural Experiment Station. Named after Dr. George F. Waldo, who developed the Marionberry. C15M, I49M, K17, M81M

Womack: Fruit similar to Brazos, but more attractive and with smaller seeds; the flesh is firmer and somewhat sweeter. Recommended for home gardens and pick your own operations. Bush slightly more upright; adapted to the Waco, Texas and north Texas region. Originated in College Station, Texas by H.H. Bowen, Texas Agricultural Experiment Station. Introduced in 1979. M83, N33

#### BLACKBERRY-RASPBERRY HYBRIDS

Included here are direct crosses between species of blackberry and raspberry as well as progeny of such crosses. They are characterized by a distinct flavor that combines the best qualities of both parents.

Boysen: (Boysenberry) Fruit very large, 1 1/4 inches or more long; skin dark red to purplish-black; flesh rather soft; aroma distinct; flavor very fine but not as sweet as Young, suggestive of raspberries; ripens 1 week before Young. Bush trailing, more vigorous than Young, high yielding. Originated in Napa, California by Rudolf Boysen. Introduced in 1935 by Walter Knott, Knott's Berry Farm, Buena Park, California. BROOKS 1972; A82, A88M, A98{ED}, C54, C61, H3{PD}, H49, J2M, J61M, K17, K75T, M81M

Cascade: Loganberry hybrid that was popular about 30 years ago. Bright deep red fruit with excellent flavor, dessert quality high, also excellent for canning or freezing; very small seeds; ripens in July. Vigorous, productive bush, hardy only in the Pacific Coast and similar regions. Originated by George M. Darrow and George F. Waldo. BROOKS 1972; C15M, J61M

Douglass:<sup>1</sup> Medium to large, glossy black fruit of excellent quality and flavor, similar to Marionberry; small seeds; ripens in mid-season. Excellent fresh or made into jelly or juice. Vigorous, trailing canes that require trellising; thornless; hardy to at least 5° F. Complex hybrid involving Boysenberry, Marionberry and several blackberries. Developed by Barney Douglass. C15M, J61M

Logan: (Loganberry) Large fruit, up to 1 1/4 inches long; skin dark-red to dusty maroon, covered with dark hairs that dull its color; flesh firm, very juicy; flavor tart unless fully ripe; excellent for canning and pies. Bush trailing; very vigorous; needs trellis support. Originated in Santa Cruz, California by Judge J.H. Logan. Introduced in 1880. SIMMONS 1978, STEBBINS; A98{PD}, B19, C25P{PD}, C61, D7{PD}, I49M, J61M, K17, LI, O81, P68M

Marion: (Marionberry) Medium to large fruit; skin bright black; flesh medium firm; quality high with excellent flavor; ripens with Boysen. Excellent for local markets, canning, pies, jams, etc. Bush trailing; a vigorous grower; very productive, has higher yields for a longer period than Boysen; adapted to western Oregon and western Washington. Chehalem x Olallie. Originated in Corvallis, Oregon by George F. Waldo. Introduced in 1956. BROOKS 1972; A38M{PD}, A98{PD}, B19, C15M, C25P{PD}, C34, C54, I49M, J61M, K17, M81M

Nectar: (Nectarberry) Very large fruit; dark red to purplish black; drupelets large, 9 around the core instead of 10 or usually 11 as in Boysen; flesh juicy, somewhat acid, flavor pleasant, seed very small; ripens from late July to late August. Bush trailing; production and habit almost if not identical with Boysen. Thought by many to be a chimera of Boysen, which it resembles. BROOKS 1972, SIMMONS 1978; C54, 153M

Ness: (Nessberry) (*R. rubrisetus* x *R. strigosus*) Fruit larger than Logan; skin deep-red to blood-red, turning brown when overripe, glossy; drupelets large; flavor of raspberry, high acidity; keeping quality good. Bush very vigorous; growth habit like raspberry; canes up to 15 feet in length. Originated in College Station, Texas by H. Ness. Introduced in 1921. BROOKS 1972; H4

Olallie: (Olallie Berry) Large fruit, slightly longer and more slender than Boysen; skin black, glossy, attractive; flesh firm; flavor good but peak quality reached only at full maturity; excellent for processing. Bush very vigorous; canes trailing; very susceptible to orange rust when grown in a warm climate; winter-chilling requirements shorter than for Boysen. Logpi x Young. BROOKS 1972; A63, A88M, C15M, C54, G87M{ED}, H4, I49M, I58P{PD}, I83M, J11M{PD}, K17, LI, M81M

Sun: (Sunberry) (*R. ursinus* x *R. idaeus*) Similar to T<sup>h</sup>berry, but fruits are slightly smaller and are produced much more abundantly. Fruits are also darker colored and sweeter than Tayberry. Originated at the East Mailing Research Station. Hybrid cross between a wild blackberry and a red raspberry. JENNINGS; 081

Tay: (Tayberry) Fruit large, long conical in shape; 50% larger than Logan, with a brighter and less downy appearance; skin deep purple when fully ripe; flavor sweet, strong; quality excellent; suitable for fresh market, frozen fruit, jam or wine. Bush similar to Boysen and Young in growth habit; produces fruit on short, strong laterals, making it easy to pick. Originated at the Scottish Horticultural Research Institute. Introduced in 1979. JENNINGS; B19, B43M, C54, D7{PD}, E97, G5M{PD}, G87, H42, I49M, I49M{PD}, J61M, K17, M81M, 081

Thornless Boysen:<sup>1</sup> Similar to Boysen but fruit is smaller; bush is less productive. Originated in El Monte, California by D.L. Duffin. Introduced in 1938. Bud mutation of Boysen; discovered in 1936. BROOKS 1972, STEBBINS; A63, B43M, B73M, C34, C61, D76, E3, I74, I78, J2M, J63M, K71, L33, M65M, M83, N33, etc.

Thornless Logan:<sup>1</sup> Medium-large, lavender-red fruit, does not darken while ripening; fine hairs dull its color; flesh soft, tart, high in acidity. Excellent for pies, juice, canning, and wine making. Ripens earlier, produces over a longer period, and is more prolific than standard Logan. Plants are more vigorous and canes are stronger. Introduced about 1935. C15M, C34, C54, M81M, 081, R83

Thornless Young:<sup>1</sup> Large, dark-red fruit. Similar to Boysen, but is shiny and less acid in taste. Bears 10 days earlier than Boysen, but is about 20% less productive. Good for canning and freezing. Bush vigorous; productive; canes trailing, thornless. C54

Young: (Youngberry) Fruit very large, roundish, appearance outstanding; skin deep wine-colored, glossy; flavor very sweet, excellent for frozen pack and jam; ripens mid-season. Bush trailing; high-yielding; productive; very vigorous; adapted to east Texas and southern Arkansas. Phenomenal berry x Austin Mayes dewberry. Originated in Morgan City, Louisiana by R.M. Young. Introduced in 1926. BROOKS 1972; B19, B43M, C54, C61, K75T, M81M, 081

#### DEWBERRIES

Sometimes called trailing blackberries, they are more tender as a rule than upright types and are generally winter-killed when grown in the North. More difficult to care for with weak canes that must be tied to poles or trellises. B73M, D81P{PD}, D97{PD}, E3, F93, H4, I78

Austin:<sup>1</sup> (Austin Mayes, Austin Thornless) Said to be a seedling of Mayes and similar to that cultivar, but thornless; ripens early to mid-season. Originated about 1918 with J. Parker, Tecumseh, Oklahoma. Introduced in 1924 by J.M. Parker & Son Nursery Company, Fayetteville, Arkansas. HEDRICK 1925; A82, B19, B43M, C54, H4, I49G, I53M, J2M, K75T, M83, N33

Lucretia: (*R. flagellaris*) Medium to large fruit; skin jet black; drupelets large; core soft; flesh juicy, firm; flavor pleasantly sprightly when fully ripe, otherwise rather tart, rich; quality very good; ripens early. Bush vigorous; trailing; very productive; almost immune to orange rust; susceptible to anthracnose. Originated before 1875. HEDRICK 1925; B19, C61, D76, J2M, J63M, K75T, M83

Perron's Black:<sup>1</sup> (*R. canadensis*) Very large, aromatic fruit; high sugar content; quality excellent; ripens from mid-July to late October. Excellent for pick-your-own, home gardens and roadside markets. Very vigorous, trailing, suckerless plant; thornless. Developed by W.H. Perron & Co. of Quebec, Canada. Selected for its hardiness. BROOKS 1997; B43M, D11M, F70, G50

#### CODES FOR SPECIAL TYPES

##### 1. Thornless

## BLUEBERRY {GR}

#### VACCINIUM ASHEI

#### VACCINIUM CORYMBOSUM

#### HIGHBUSH

Generally grown in northern areas with 1,000 or more hours of temperatures below 45° F. every year. Considered to be superior in flavor to rabbiteye blueberries, however they require more pruning. Southern types are being developed that combine the high quality fruit of the northern highbush with the low chilling requirements of rabbiteyes. Mostly *V. corymbosum*.

#### NORTHERN

Atlantic: Fruit cluster loose; berry large, oblate; skin blue, attractive; flesh firm, aroma slight, flavor good, dessert quality medium; resistant to cracking; ripens late, just before Jersey. Bush vigorous, open spreading; very productive; subject to bacterial dieback in Oregon and Washington. BROOKS 1972; H65

Berkeley: Fruit cluster loose; berry medium-large, about 70 per cup, oblate; skin very light blue, very attractive; flesh firm, aroma slight, slightly subacid; dessert quality medium; not subject to cracking; stores well; scar very good; ripens in late midseason, about a week after Stanley and a week before Jersey. Bush medium productive, yields approximately 5 pounds of fruit; height 5 to 6 feet. BROOKS 1972; A40, B58, C61, C93, C93Z, D60, D65, D79M, E87, F16, G23, G71, I27M, J99G, M99G, etc.

Bluechip: Fruit cluster loose; berry large, averaging 65 per cup; skin light blue; quality very good; scar small to none; ripens in mid-June at Castle Haynes, North Carolina. Bush upright, never spreading; height 4 to 5 feet; a reliable bearer, yields up to 20 pounds of fruit at maturity; disease resistant. C93Z, D79M, F16

Bluecrop: Large, medium loose cluster; berries large, about 65 per cup; skin very light-blue; flesh very firm, subacid, flavor good, dessert quality good, moderately aromatic; resistant to cracking; scar small; ripens early-midseason, about 4 days before Berkeley. Bush upright-spreading, height 4 to 6 feet; vigorous; a consistent producer of 10 to 20 pounds of fruit. BROOKS 1972; A24, A39, A40, A84M, B43M, B58, C9, C61, C93, C93Z, D60, D79M, F16, F48, I73M, J2M, J16, M3, etc.

Bluehaven: Very large, round fruit, 60 per cup; skin light blue; flesh very firm, flavor and quality excellent; picking scar very small and dry; ripens about July 15 at South Haven, Michigan; holds

quality well on bush; can be picked over a 4 to 6 week period. Bush vigorous and hardy; an inconsistent producer, yielding between 5 and 20 pounds of fruit; widely adapted; height approximately 4 feet. BROOKS 1972; C93, F16

Bluejay: Medium-large fruit, about 76 per cup, spherical; skin light blue; flesh firm; mild pleasant flavor, only slightly tart; small, dry scar; will not drop, crack or bleed; ripens early-midseason, 3 to 4 days before Bluecrop. Bush upright, only slightly spreading, height 5 to 7 feet; extremely vigorous; yields 10 to 20 pounds of fruit. A40, A84M, B43M, B75, C93, D60, D76, F16, F48, H65, I73M, J2M, M3, M81M

Blueray: Small, tight cluster; berry very large, about 60 per cup; skin medium light-blue; flesh firm, aromatic, flavor fine; non-cracking; scar medium; ripens in midseason, with Ivanhoe and Rancocas; resembles Dixi. Bush upright, height 4 to 6 feet; very productive, yields 10 to 20 pounds of fruit at maturity. BROOKS 1972; A39, A84M, B43M, B58, B73M, B75, C61, C93, C93Z, D60, D65, E47, F16, F48, G16, G72, I27M, 178, J2M, J16, J83, etc.

Bluetta: Medium-sized fruit, about 71 per cup; skin blue-black; flesh firm, has more flavor than Weymouth; ripens early, with Weymouth. Bush short, compact-spreading; height 3 to 5 feet; vigor medium; consistently productive, yields 10 to 20 pounds of fruit; more resistant to spring frosts than Weymouth. BROOKS 1972; A18, A88M, BIG, C61, C93, C93Z, D11M, D60, D79M, E87, F16, F70, H88, J99G, M3, etc.

Brigitta: Large medium-blue, very firm berry, cup count about 65; scar small and dry; flavor good; quality excellent; ripens late, between Bluecrop and Lateblue; ships and stores well. Vigorous, upright, high yielding bush; easy to propagate by softwood and hardwood cuttings. One of the most important blueberry cultivars developed in Australia. Has been introduced into the United States and Chile. Originated in Knoxfield, Victoria. BROOKS 1997; A24, A84M, C93, F16, I73M, J61M, M3

Burlington: Medium tight cluster; berry medium-small, 75 per cup; skin blue; flesh firm, aroma slight; dessert quality very good; small scar; resistant to cracking; matures late, lasting 1 week after Rubel. Bush vigorous, upright spreading; height 5 to 7 feet; an inconsistent producer in colder climates, yielding between 5 and 10 pounds of fruit. BROOKS 1972; A18, E47, F16, F48

Collins: Medium-sized, tight cluster; berry medium-sized, about 70 per cup; skin light blue; flesh very firm, highly flavored, sweet to mildly subacid; resistant to cracking; does not drop; ripens early, midway between Earliblue and Bluecrop. Bush erect, slightly spreading, height 4 to 6 feet; yields between 10 and 15 pounds of fruit. BROOKS 1972; A40, B19, B43M, C61, F16, F48, G79M, J2M, K75T, M92

Coville: Fruit cluster loose; berry large, about 65 per cup; flesh firm, flavor tart until ripe, aromatic; dessert quality good; little or no picking scar; resistant to cracking; does not drop; ripens late, 30 days after Earliblue. Bush upright, height 4 to 6 feet; vigorous; productive, yields 5 to 8 pounds of fruit. BROOKS 1972; A40, B19, B58, B73M, C47, C61, C93Z, F16, F48, G43, G71, G79M, H49, I27M, 178, etc.

Darrow: Medium-sized, attractive cluster; berry large, 57 per cup; skin light blue; flesh firm, aromatic, highly flavored, tart to mildly tart depending on maturity; neither drops nor cracks during wet weather; scar medium; ripens about with Coville, which it resembles. Bush erect; vigorous; consistently productive, more so than Coville. BROOKS 1972; A40, B74, C34, C54, D60, E87, F16, I49M, 174, J61M, M81M

Duke: Ivanhoe x Earliblue. Medium-sized, light blue fruit; firm, somewhat aromatic, ripens early about the same as Bluetta. Vigorous, upright bush, produces consistently. Developed by the New Jersey Agricultural Experiment Station and the USDA as an alternative to Bluetta. Introduced in 1986. ECK 1988; A40, A84M, BIG,

B58, C34, C93, C93Z, D37, D60, D69, D79M, F16, F48, H49, 150, I73M, M3, etc.

Earliblue: Fruit cluster medium, long, loose; berry medium to large, about 65 to 75 per cup, oblate; skin light blue; flesh very firm, subacid, flavor good, moderately aromatic, dessert quality good; resistant to cracking; ripens very early, with or before Weymouth. Bush upright, height 4 to 6 feet; vigorous; yields 8 to 15 pounds of fruit. A24, A40, B58, C93Z, D60, E47, F16, G72, H88, I73M, J16, K28, M99G

Elizabeth: Very large, tender fruits; skin color fair. Excellent, sweet flavor, of gourmet quality. Ripens over a very long season, from midseason to very late. A good shipper. Upright, spreading bush with loose fruit clusters. Originated in Whitesbog, New Jersey by Mrs. Elizabeth White. Discovered about 1950. BROOKS 1972; C93Z

Elliott: Small to medium fruit, about 75 per cup; skin light blue; flesh very firm, good mild flavor when fully ripe; small, dry scar; won't crack or drop; ripens very late. Bush very upright, slightly spreading, height 5 to 7 feet; consistently yields 10 to 20 pounds of fruit. BROOKS 1972; A18, A40, A84M, B75, C93, C93Z, D60, F16, H49, H88, I73M, J61M, M3

Herbert: Fruit clusters loose; berry large, averaging 65 per cup; flesh soft; scar large, will leak, making the fruit an unattractive black color; hangs well on the bush; ripens late, about the same time as Jersey, Rubel, and Dixi, earlier than Coville and later than Berkeley. Bush consistently productive. BROOKS 1972; A18, A24, A40, BIG, C61, C93Z, D65, F16, G23, H65, H88, M81M

Jersey: Fruit cluster very loose, long; berry medium-small, about 110 per cup, round-oblate; skin blue; flesh firm, aroma lacking; dessert quality fair; picking scar small; ripens late, with Rubel; keeps well. Bush upright-spreading, height 5 to 7 feet; vigorous; productive, yields 7 to 10 pounds of fruit. Very widely grown. BROOKS 1972; A24, A40, A84M, B58, B73M, C61, C93, D60, F16, H65, I78, J16, J83, M65M

Lateblue: Medium-sized cluster; berry small, about 94 per cup; skin light blue; small stem scars; flesh firm, highly flavored; smaller and ripens 7 days after Coville. Has the outstanding feature of simultaneously ripening its fruit during high temperatures. Bush erect, vigorous, height 5 to 7 feet; consistently productive, yielding about 9 to 12 pounds of fruit. BROOKS 1972; A40, H88, M92

Legacy: Medium-sized fruit with superior flavor; very small stem scar; good firmness; ripens in late midseason, after Bluecrop. Vigorous, upright, high yielding bush. Recommended for the warmer parts of the northern highbush growing area. Selected at Weymouth, New Jersey. Released in 1993. BROOKS 1997; B74, C34, C93Z, D60, E87, I49M, J61M

Meador: Medium to large fruit, about 65 per cup; skin medium blue; flesh very firm, of good quality; small, dry scar; ripens in midseason. Bush upright, slightly spreading; height 5 to 7 feet. Recommended for areas where winter temperatures drop below -25° F., and heavy snow loads are frequent. Originated in New Hampshire by Professor E.M. Meador. F16

Northblue:<sup>1</sup> Large, attractive dark-blue fruit; flesh firm, quality very good; stores well with refrigeration; ripens early-midseason. Bush vigorous; half-high, height 20 to 30 inches; yields between 3 and 7 pounds of fruit annually. Can survive winter temperatures of -30° to -35° F. A65, A84M, B26, C34, C93, D60, D76, E87, E97, F16, G16, L27M, L70, L79, M81M, N24M, etc.

Northcountry:<sup>1</sup> Medium-sized fruit, 1/2 inch in diameter; attractive sky-blue skin; quality good, flavor sweet to mild, reminiscent of wild lowbush blueberries; little or no picking scar; ripens early-midseason. Bush vigorous; half-high, height 18 to 24 inches; yields between 2 and 7 pounds of fruit. Can survive winter temperatures of -30° to -35° F., but production is maximized when snow protection

is adequate. A74, A84M, C34, C93, D60, D65, F16, I49M, 174, L27M, L79, M81M

Northland:<sup>1</sup> Fruit clusters long, loose; berry medium-sized, about 136 per cup, round; skin medium blue; flesh firm, flavor good, reminiscent of wild blueberries; picking scar small and dry; ripens early-midseason. Bush moderately spreading, height 3 to 4 feet; vigorous; a consistent bearer of 15 to 20 pounds of fruit. BROOKS 1972; A24, A40, A74, B26, C61, C93, D60, D65, F16, F48, G16, G23, H65, L27M, M3, etc.

Northsky:<sup>1</sup> Fruit small; skin an attractive sky blue color; flesh firm, highly flavored; quality very good; stores well with refrigeration; ripens early-midseason. Bush 18 to 24 inches; yields between 1 and 2 pounds of fruit. Classified as a half-high but grows as a low spreading bush. Would make an excellent low border for edible landscaping. Can survive winter temperatures of -35° to -40° F. A65, A84M, C93, D60, E87, F16, H65, I49M, J61M, L27M, M3, M81M

Olympia: Medium-large fruit; skin medium blue, thin; flesh aromatic, flavor very good; resists cracking; does not drop; ripens in midseason. Bush very tall, spreading; vigorous; very productive; adapts well to most types of soil. Originated in Olympia, Washington by Joseph Eberhardt. A18, A88M, B74, C34, D60, E87, I49M, 174, J61M, J99G, LI, M81M

Patriot: Fruit cluster tight; berry very large, between 50 and 60 per cup, slightly flat; skin medium blue; flesh firm, flavor very good; small, dry, recessed scar; ripens early. Bush upright-spreading, height 4 to 6 feet; very vigorous; consistently yields 10 to 20 pounds of fruit. A40, A84M, B26, B58, B74, C93, C93Z, D60, D76, F16, F48, G16, H65, H88, I49G, 150, J2M, L27M, Mi, M81M, etc.

Pemberton: Very loose cluster; berry medium to large, roundish; skin darker blue than Atlantic and Jersey; flesh firm, aroma slight, dessert quality fair to good; scar poor; season late, just before Jersey and Rubel; difficult to pick; cracks some in wet weather. Bush very productive; extremely vigorous. BROOKS 1972; A18, D76, E47

Rancocas: Fruit cluster tight; berry small, about 130 per cup, oblate; flesh firm, crisp, aroma slight, flavor mildly subacid; large scar; dessert quality fair to good; ships well; ripens early-midseason, after Collins; cracks badly in wet weather. Good for processing. Bush upright-spreading, height 5 to 7 feet; a consistent producer of 10 to 20 pounds of fruit. BROOKS 1972; A18, F16

Rubel: Fruit cluster long; berry small, 132 per cup; skin light blue; flesh firm, flavor very good; medium picking scar; ripens late. Bush upright, height 5 to 7 feet; very vigorous; yields between 8 and 10 pounds of fruit. An older cultivar, still preferred by many for pies. Originated as a wild seedling in Whitesbog, New Jersey. Selected by Elizabeth C. White in the early 1900's. A18, A84M, F16, G72, I41P, K28, M3

Sierra: Large, medium-blue fruits, about 50 per cup; small stem scar; quality very good to excellent; ripens in midseason. Extremely vigorous, upright bush, very productive. Recommended for fresh market and U-Pick operations. Chilling requirements high. Widely adapted, has tested well in all major blueberry growing regions in the United States. Originated at Beltsville, Maryland. Introduced in 1988. BROOKS 1997; A24, A40, A84M, C93, D60, F16, H88, I49M, I73M, 174, J61M, Mi, M81M

Spartan: Very large fruit, about 60 per cup; skin powdery to dark blue; flesh very firm, quality excellent; medium dry scar; ripens early. Bush upright, height 5 to 7 feet; vigorous; yields between 8 and 10 pounds of fruit. After the first 2 pickings the fruit size drops off considerably. A18, A40, A84M, B74, C93, C93Z, D60, D79M, F16, F87, J7M, 174, J2M, J61M, Mi, etc.

Tophat:<sup>2</sup> Ornamental, dwarf type cultivar. Height of bush only 20 inches at maturity, with a spherical shape of about 20 inches in diameter. Perfect for growing in a pot on the patio or indoors on a sunny windowsill. Berries medium-sized, bright blue, firm, of good

flavor. B73M, C34, C61, D60, D65, D79M, D95, E97, F16, F48, 174

Toro: Medium-sized fruit, about 75 per standard cup; skin medium blue; flesh firm, flavor good; quality excellent; small, dry scar; ripens early-midseason. Bush upright, height 5 to 7 feet; very vigorous; a consistent and heavy producer. Released by the New Jersey Experiment Station in 1987. A40, A84M, B74, C34, C93, C93Z, D11M, D60, D79M, F16, F70, H88, I49M, I75M, J61M, Mi, M81M, etc.

Weymouth: Fruit cluster loose; berry medium to large, round oblate; skin dark blue; flesh soft, aroma lacking; dessert quality usually poor; scar medium; tends to drop; season very early. Bush erect, spreading, low in vigor; very productive. Originated in Weymouth, New Jersey by F.V. Coville. Introduced in 1936. BROOKS 1972; A18, C93Z, E47, 081

### SOUTHERN

Avonblue: Medium to large fruit, about 75 or 80 per cup, very round; skin attractive; flavor mild and acid, quality best of the southern highbush cultivars; ripens May 7 at Gainesville, Florida. Bush somewhat spreading, height 4 to 5 feet; yields 7 to 14 pounds of fruit on well-kept irrigated plantings. F48, G17

Challenger: (Misty) Large fruit, about 65 per cup; very attractive with a light blue cast that holds up when packed for fresh market; flesh firm; little or no picking scar; ripens May 1 to 3 at Gainesville, Florida about 4 days later than Sharpblue. Vigorous upright bush, height 6 feet. Used for commercial plantings and to pollinate Sharpblue. Released by the University of Florida in 1989. D37, D79M, F16, G17, I83M

Georgiagem: Medium-sized fruit, about 80 per cup; flesh firm, flavor pleasant; small, dry scars; ripens early, May 8 at Gainesville, Florida. Bush vigorous, tall and upright, height 5 to 6 feet; moderately productive; self-fruitful. Very good for fresh markets. Introduced in 1986 by the Coastal Plains Experiment Station, Tifton, Georgia. A84M, A88M, B45M, C54, D37, D60, D79M, E87, F16, F5JM, G17, I83M, J99G, LI, M81M, N20, etc.

O'Neal: Very large, attractive fruit with excellent firmness and little to no picking scar. Quality will not deteriorate under high temperatures. Spreading, well-proportioned bush; height 6 feet; will produce fruit in the South without a pollinator; appears to do well in lighter soils where others fail. Earliest ripening highbush cultivar. A84M, A88M, B45M, C54, D37, D60, D79M, E87, F16, F5JM, I49M, 174, I83M, J61M, J99G, LI, M81M, N20, etc.

Reveille: Small to medium-sized, light blue fruit with good flavor and quality; excellent firmness; ripens slightly earlier than O'Neal. Productive bush with excellent vigor and precocity; resistant to stem canker. Requires 600 to 800 hours of chilling. Originated in North Carolina. Introduced in 1990. BROOKS 1997; A84M, C54, D60, D79M, F16, I49M, J99G

Sharpblue: Fruit medium to large, about 75 or 80 per cup; quality fair to good; small scar; ripens April 27 at Gainesville, Florida. Bush fast-growing and very vigorous, height 5 to 6 feet; yields 8 to 16 pounds of fruit. The number one southern highbush planted in Florida. B45M, C54, D79M, F16, G2M, G17, Q93

Sunshine Blue: Medium-sized fruit, about 80 per cup; flesh very firm, quality good; ripens May 10 through June 15 at Gainesville, Florida; can be stored. Bush 3 to 4 feet tall and wide; yields between 5 and 10 pounds of fruit; appears to tolerate high pH soils better than all other southern highbush and rabbiteye types. Grows well in pots. B74, C34, D60, E63, E87, F16, F5JM, I49M, J61M, M81M

### RABBITEYE

Native to the southeastern United States. Requires less chilling, only about 500 hours below 45° F. every year. Grows taller than highbush types, ranging from 8 to 20 feet tall. Also not as sensitive to soil acidity and is far more heat and drought resistant. Much more productive than highbush blueberries. (*V. ashei*)

**Aliceblue:** Large fruit, about 70 to 75 per cup; flesh firm, aromatic, flavor very sweet, quality good; ripens early. Bush tall and spreading, height 6 to 10 feet; yields between 7 and 14 pounds of fruit. Good for fresh or processed sales. B45M, D79M, G17

**Baldwin:** Fruit medium-sized, dark blue; flesh firm, flavor good; small, dry scars; ripens over a 6 to 7 week period, beginning the same time as Delight. Recommended for pick-your-own and backyard plantings. Bush vigorous, upright, produces large crops regularly. Originated in Tifton, Georgia. B45M, D79M, G17

**Beckyblue:** Large fruit, about 70 to 75 per cup; flesh firm, very sweet with a mild blueberry flavor; quality excellent; no picking scar; ripens early; stores well. Bush tall and upright, height 6 to 10 feet; yields between 8 and 12 pounds of fruit. One of the leading cultivars in north Florida. B45M, D79M, F16, G17

**Bluebelle:** Large, dark fruit; flavor very good; ripens over a relatively long period of time, three to four weeks. Bush upright, moderately vigorous; productive. An excellent cultivar for pick-your-own operations. A82, B45M, D79M, G17, K75T

**Bonitablue:** Fruit large, between 70 and 75 per cup; flesh firm, quality excellent, very sweet, with a mild blueberry flavor; no picking scar; ripens early; stores well. Bush tall and upright, height 6 to 10 feet; yields 8 to 22 pounds of fruit. One of the leading cultivars in northern Florida. B45M, D79M, F16

**Brightwell:** Medium to large fruit, between 75 and 80 per cup; skin light-blue; flesh firm, sweet, quality excellent; little or no picking scar; ripens early to midseason and over a long period. Bush tall and spreading, height 8 to 12 feet; vigorous; consistently yields 8 to 14 pounds of fruit. Good for commercial or home use. A84M, B45M, D79M, F16, F93, G8, G17, H4, I53M, K75T

**Briteblue:** Medium-large fruit, about 75 to 80 per cup; skin light blue; flesh very firm, flavor fair; ripens in midseason, later than Tifblue; handles well for distant marketing. Bush open-headed and spreading; height 8 to 12 feet; vigorous; yields 8 to 12 pounds of fruit. A82, B45M, D79M, I53M, M69M

**Centurion:** Fruit medium to large; darker in color than most rabbiteyes, moderately firm; of excellent dessert quality; ripens midseason to late, 2 weeks after Tifblue. Bush upright, easy to manage, vigorous and productive; adapted to heavy soils. Developed by the North Carolina Agricultural Experiment Station and the USDA. Introduced in 1978. ECK 1988; B45M, D79M, G17

**Chaucer:** Medium-large fruit, about 75 or 80 per cup; quality fair; has a tendency to tear when picked; ripens early to midseason. Bush tall and spreading, height 8 to 12 feet; vigorous; yields 12 to 25 pounds of fruit. Should be planted in areas of low frost damage. B45M, D79M

**Choice:** Fruit small to medium, about 80 or 90 per cup; skin darker than normal; quality very good but mainly used for the process market; ripens midseason to late. Bush tall and upright with some spreading, height 8 to 12 feet; vigorous; yields 8 to 12 pounds of fruit. D79M, G17

**Climax:** Medium to large fruit, about 75 to 80 per cup; quality good; little or no picking scar; ripens early. Bush tall and spreading, height 6 to 10 feet; yields between 8 and 22 pounds of fruit. Good for fresh market or processing. One of the leading pollinators for other rabbiteyes. A82, A85M, C30M, D79M, F16, F93, G17, G65M, G72, H4, M83

**Delite:** Fruit medium to large, about 75 to 80 per cup, round; skin light blue; flavor excellent, not tart before becoming fully ripe as are other cultivars of rabbiteye blueberries; ripens a few days later than Briteblue. Bush tall and upright, height 6 to 10 feet; yields between 8 and 15 pounds of fruit. BROOKS 1972; A82, B45M, D79M, F93, G17, G65M, H4, I53M, M69M, M83

**Garden Blue:** Medium-sized, round fruit; skin light blue; flesh firm, flavor good; scar small, dry; ripens early to midseason. Bush

upright; vigorous; consistently high yielding; fruit well distributed on long shoots making picking easy. D79M, G72, K28

**Homebell:** Medium-large fruit; skin medium dark blue; flesh firm, flavor mild; ripens in midseason. Bush very vigorous and fast growing, productive; easy to propagate. Recommended for home gardens. Selected at Tifton, Georgia. Introduced in 1955. BROOKS 1972; I4IP, K76

**Powderblue:** Fruit large, about 75 to 80 per pound; skin powder blue, attractive, stands out well amongst other blueberries; flesh very firm, subacid, distinct blueberry taste; quality very good; ripens in midseason. Bush tall and upright, height 8 to 12 feet; vigorous; yields 8 to 14 pounds of fruit. Good pollinator and companion producer for Tifblue. B45M, D37, D79M, F16, F93, G17

**Premier:** Medium-large fruit, about 75 to 80 per cup; skin light blue; flavor and quality very good; ripens early to midseason; stores very well. Bush tall and upright, height 6 to 10 feet; vigorous; yields 8 to 16 pounds of fruit. Recommended for home and commercial use. A85M, B45M, D79M, F16, F43M, F87, F93, G17, H4, I41P, I53M, K75T

**Southland:** Medium-sized fruit, about 80 to 90 per cup; skin light blue; flesh firm, flavor good; ripens late midseason, with Tifblue; turns soft if stored too long. Bush tall and upright with some spreading, height 8 to 12 feet; yields 8 to 16 pounds of fruit. Recommended for home and commercial use. A82, B45M, D79M, G72, H4, K28

**Tifblue:** Medium to large fruit, about 75 to 80 per cup; skin very light blue; flesh firm, flavor very good; scar very dry and small; ripens early to midseason. Bush tall and vigorous; height 8 to 14 feet; yields 8 to 25 pounds of fruit. Quality holds up well until the last berries are harvested. The present standard among rabbiteye blueberries. C30M, D37, D79M, F16, F43M, F93, G65M, G72, H4, I53M, K76, L33, M69M, M83

**Woodard:** Fruit large, about 70 to 75 per half-pint cup; skin light-blue, appearance excellent; flesh firm, flavor mild, slightly more acid than Tifblue, quality very good when fully ripe; stem scar dry; ripens early to midseason; holds up well in shipping. Bush spreading, height 6 to 10 feet; precocious; yields 8 to 16 pounds of fruit. B45M, D79M, G17, G72, H4, I41P, K28, L33, M69M, M83

## BOK CHOY {S}

### BRASSICA RAPA CHINENSIS GROUP

---

#### COMMON BOK CHOY

Grown for the broad, white or green leafstalks which are widely used in Chinese cuisine. The smaller green-stalked types, known as *Ching chiang*, *Chin gen sai*, *Shanghai bok choy* or "baby bok choy" are becoming popular in specialty markets. Some types of common bok choy are occasionally grown for their flowering shoots, called *bok choy sum*, although the shoots are considered inferior to regular choy sum. *Bok choy sum*, however, is easier to grow. LARKCOM 1991; G33

#### HYBRID

**Joi Choy:** 45 days. Hybrid version of Lei Chcy, with more uniform growth and maturity and more resistance to bolting. Plants grow 10 to 12 inches tall. Petioles are longer and slimmer than Mei Qing Chcy. Extra dark green, glossy leaves provide an attractive contrast to the ivory white stalks. Good cold tolerance. Can produce 20% more marketable plants than Lei Chcy. A79M, D55, D11M, F70, G82, G93M, H61, 139, 191, K10, K16M, K73, L42, L89, M29, M46, M49, etc.

Mei Qing Choy:<sup>1</sup> 45 days. Green stem Ching Chiang or “baby bok choy” type, more tender and flavorful than white stem bok choy, and favored by selective cooks. Flat, pale misty green stems form a thick, heavy base with broad, oval, rich green leaves. Compact, vase-shaped plant about 1/2 to 2/3 the size of Prize Choy. Highly bolt-resistant and uniform. Tolerant of heat and cold. Easy to grow. *Al*<sub>o</sub>, D55, D68, G6, G93M, 139,177, J20, K10, *K16M*, K66, K73, L42, L91M, M29, M46, etc.

#### OPEN-POLLINATED

Canton Dwarf:<sup>1</sup> 42 days. “Baby choy” type. Semi-compact open plant; produces small to medium-sized heads. Leaves glossy dark green, round in shape, with broad white stalks that are very thick and of excellent quality. Very heat tolerant; adapted to the tropics, subtropics, and summer culture in temperate areas. C92, *G13M*, G33, G93M, *K16M*, S55

Chinese: (Chinese Bok Choy) 60 days. Thick, round, glossy leaves and wide, pale green, crisp stems. Compact and long-standing; excellent resistance to bolting to seed, bolts only when quite mature, if at all. Has good flavor and hearty, wild plant-like quality. Very easy to grow; may be sown from early spring to late fall. A2, *C20M*, E24, G6,139, J9M, 053M

Chinese Flat Cabbage: (Tah Tsai, Tatsoi, Chinese Savoy) Stout, low-spreading plant producing rosettes 12 to 14 inches across of thick, puckered, dark-green leaves with broad, pale green petioles. Leaves and petioles have a thick, dense texture which makes them well suited for cooking in soups. The plants can survive the winter without protection from severe frosts and can also survive heavy falls of snow. Will grow more upright and go to seed in warmer weather. DAHLEN [Pre, Cul], HERKLOTS; B49, D3M{PR}, D55, D68, E59Z, F13, G6, G33, H73{PR}, 139, 177, K66, L42, L59, L89, M46, R47, S55, *S63M*, S70, TIM, etc.

Ching Chiang:<sup>1</sup> (Ching Chiang Cabbage) 40 days. “Baby bok choy” type. Small, compact plants growing only 8 inches tall. Smooth, rounded, very tender leaves on thick, crisp, long green petioles. Fast growing; grows very well in mild and hot weather. Tolerant to rain and dampness. A2, D55, *L79G*> *Q39*

Choho: 25 days. Newly developed hybrid type resembling Misome. Fleisty, dark green, semi-savoyed leaves; light green petioles. Suitable for salads, cooking, stir frying and pickling. Excellent tolerance of high and low temperatures. Also possesses strong disease resistances Very easy to grow. Adapted to growing in all seasons. C20A/, G33,177, M46, Q34, *S63M*

Green Boy: (Benri-Na) 35 days. Developed in Japan by crossing green bok choy with komatsuna. Slender, spoon-shaped, dark green leaves; long, light green petioles. Suitable for stir-frying, pickling or adding to soups Very vigorous, fast growing plant; widely adapted. Benri-na means “convenient leaf” in Japanese. LARKCOM 1991; C20M, D11M, D55, F13, F70, N84, Q3, S55, *S63M*, TIM

Hy Sawi Manis: 30 days. Smooth, dark-green, spoon-shaped leaves, about 2/12 inches wide; light-green, thin, ribbed stalks. One of the most tender of all the bok choys. Has a slightly spicy, non-mustard like flavor. Grows about 9 inches tall, with 9 or 10 stalks per plant. Originated in Malaysia. J73, N84

Lei Choy: 50 days. A slow-bolting strain developed in Holland, which has become popular in the oriental vegetable markets of California. Each plant bears 10 to 14 erect, medium-thick, round, pure-white stalks, 8 to 10 inches long; topped by broad, dark green leaves. Easy to grow. B75, C20M, D55, F13, G71, G93M, H61, K49M, K50, L42, M29, N84

Ming Choi: 45-50 days. Improved type developed for slow bolting and field holding ability. Attractive, deep dark-green leaves; long, erect, round white petioles, tender and succulent. Adapted to spring, summer and fall plantings. Recommended for home gardens and fresh market. C2S, C97, G16, *G83M*, G87, K10, L42

Misome: Newly developed cross of komatsu-na and Chinese flat cabbage. Upright growing plant that grows rapidly during summer and can be harvested just 30 days after sowing. Dark green, savoyed leaves, thick and very tender. Excellent in gourmet salads, for stir-frying, tsukemono pickling, and general Oriental cooking. D11M, D55, F70,177, M46, N84, Q34, *S63M*

Prize Choy: 50 days. Large, tender, dark green, spoon-shaped leaves contrast with thick, rounded, solid white stems which form a celery-like base Vase-shaped heads are 15 to 18 inches tall, compact, heavy, and very attractive with good quality. Slow-bolting. D68, J9M, L13M

Qin Tah Tsai: 40 days. Roundish, dark-green leaves on short, upright stems; very tender. Excellent for stir-frying. Fast growing, suitable for year round production. Good for home gardens, greenhouses, and roadside markets. Recently developed hybrid between Tah Tsai and green stem bok choy. D55, S70

Ryokusai: (F.) 52 days. Hybrid form of Chinese Flat Cabbage or Tah Tsai. Forms a small, semi-erect rosette of bright pine-green leaves. More erect, and therefore cleaner than open pollinated strains. Slow bolting Young leaves add color and flavor to salads. Also tasty in soups or cooked like spinach. There are two forms available. G1M, J20, *K16M*, N84

Seppaku: (Seppaku Tai Sai) 45 days. Larger form of Tai Sai, with mature plants weighing about 2 pounds each. Medium green, spoon-shaped leaves with long, succulent, pure-white petioles that have a somewhat swollen base. A very hardy type, well suited to growing in a cool greenhouse or frame in late fall or early spring. E83T, Q88

Shanghai: (Green Petiole, Green Stalk, Tsing Kang) 45 days. Ching Chiang type. Small, sturdy, erect plants with tender, flat, light green petioles topped by succulent, light green leaves. Harvest can begin at a very early stage. Grows rapidly and tolerates heat very well. Can be planted from spring to autumn, but is more suited to mid-summer growth. C20M, C92, E24, *G13M*, G27M, G93M, 139,177, *K16M*, L11, L59, PIG, Q34, TIM

Spoon Pak Choy: (Spoon Cabbage) 55 days. Smooth, dark-green, rather succulent leaves; rounded, and the edges curved inward like porcelain chopsuey spoons; large, white midribs. Large, fleshy leaf-stalks; fatter near the base; white, tender and crisp. Forms a clump so dense it has been confused with pe-tsai. Easily bolts to seed if grown in the fall in north temperate regions. K49M

Tai Sai: (Taisai, Japanese Bok Choy) Upright plant, 12 to 13 inches tall; uniform, spoon-shaped, bright green leaves with long, stocky pure-white stalks, thicker at the base. Widely adapted and disease resistant. Used at any stage of its rather quick growth. Matures in 35 days if sown in August or early September; 65 days if sown in mid-September; 85 days if sown in early October in Japan. A2, C85M, J73, K49T, L59, L77D, Q34, S55, *S63M*, TIM

Vitamin Green: 45 days. Broad, slightly curled, dark-green leaves, 3 to 4 inches long; thick, narrow, white stalk or greenish white on outermost stalks. Mild, very juicy; tasty either stir-fried or steamed. Individual leaves may be harvested at all stages of growth. Vigorous, slow to bolt, very hardy. Can be grown nearly year round in suitable climates though best sown in late summer in temperate regions and in autumn in warmer areas. LARKCOM 1991; D26G, G6, N84, R47

White Ching Chiang:<sup>1</sup> White “bal-y bok choy” type. Small, dark green leaves; very tender white petioles. Excellent for stir-frying. Fast growing vegetable, can be harvested 30 days after sowing. Suitable for growing all year round in California. D55, N84

Yukina Savoy: Thick, glos<sup>^</sup>, heavily savoyed leaves; dark green in color. Vigorous, upright plant. Heat and cold tolerant. Suitable for year-round production. Recommended for salad mixes and oriental braising mixtures. S70

Yukosai: A hybrid of komatsu-na and pak-choi. Bright dark-green leaves with long dark-green leafstalks. Grows more vigorously than other leafy cultivars from a summer planting. Plant grows 8 to 12 inches tall 25 to 30 days after sowing. Shows stronger heat tolerance and moderate tolerance to turnip mosaic virus. Good for all season cropping. *Q28*

#### FLOWERING BOK CHOY

Also known as *tsoi sum*, *flowering white cabbage* or *mock pak choy*, this type is grown for its thick-stemmed flowering shoots which are cut when the yellow flowers begin to open. The stems are tender enough to cook without peeling. Some forms are called *edible rape* or *yow choy*. DAHLEN [Pre, Cul], HERKLOTS, ROSS [Re], ROUTHIER 1989 [Cul, Re], TANAKA; A2, *C20M*, N40{PR}, FIG, Q34, *Q39*, *S63M*, TIM

hybrid

Autumn Poem: 35 days. Glossy, deep green leaves, flower stalks and buds. Succulent, sweet and tender. Excellent in salads, steamed or fried. Produces many lateral stalks after the central stalk is harvested. Developed for summer and fall sowing for fall and winter harvest, but also adapted to spring sowing. Sprouts from the base for continued harvest. D11M, F70, G6, J20, *K16M*, M46, N84, 053M, *S75M*

Bouquet: 60 days. Vigorous, uniform plant produces numerous side shoots. Harvested for the savoy-type leaves, edible flowers and stalks. Unopened buds should be harvested when stalks are about 6 inches long, then pick side shoots as they form. Also used as a cut flower in the Orient. *Al*, 139, L89, L91M, M29, N84, Q34, R32, *S55*, *S75M*

#### OPEN-POLLINATED

40 Day Yow Choy: 40 days. Early cultivar from Hong Kong. Does not produce side shoots. Seeds are sown mid-April to September, the main marketing period being June to September. HERKLOTS; *L79G*

50 Day Yow Choy: 50 days. A fast-growing type that matures earlier than its name implies. Plants can be harvested 30 days after sowing in the spring and 45 days after sowing a fall crop. Harvest the plant for vegetable use when bolting. Seeds are sown from September to November in Hong Kong. *D55*, *L79G*

60 Day Vbw Choy: 60 days. Slightly slower in bolting than 50 Day Yow Choy. Equally good in quality and taste. Seeds are sown from October to March in Hong Kong. Seedlings are transplanted after 25 to 30 days, 8 inches apart in well-manured beds. One or two side shoots may be harvested after the central stem has been cut a few leaves from the base. HERKLOTS; *C20M*, *D55*, *L79G*

80 Day Yow Choy: 80 days. A rare cultivar that is larger and slower in bolting. Grown mainly for the tender and delicious young leaves and stems. Strongly resistant to low temperatures. A very popular vegetable in China during fall and winter. *C20M*, *D55*, *L79G*

ChinGu Yow Choy: Dark green leaves and stems. The flowering shoots are used extensively in Cantonese cooking. Very easy to grow, suitable for sowing in the spring through the fall. *D55*

Hon Tsai Tai: (Flowering Purple Pak Choy) 45 days. Vigorous, cool-weather plant grown for its attractive flowering stalks. Leaves are dark green, deeply lobed and have purple-red veins. Under ideal conditions each plant will produce up to 40 deep purple-red stalks, which should be harvested as the bright yellow flowers begin to open. Cut above the leaves to ensure continuous production. A2, *D55*, G6, 139, 177, *K20M*, 053M, Q34, R32, R47, *S55*, *S75M*

Hong Kong Yow Choy: (Yu Choy, Oil Vegetable) 45 days. Long, light green petioles are topped by rounded, glossy light green leaves. Tender and delicious with a unique sweet flavor; both the stem and leaves are harvested when the plant begins to flower and used in stir-fried dishes. Grows best in spring and fall. May be sown in summer

but has a tendency to bolt to flower prematurely. *C20M*, N84

Kwan-Hoo Choy: (Kwan-Hoo Chin Tsoi Sum) 50 days. Dark green, narrow leaves with slender, lighter green petioles, few in number; grow alternately on a long, smooth, round stem of green color. Widely grown throughout southern mainland China and the whole South Seas area due to its distinguished resistance to heat as well as abundant rainfall. Sweeter than bok choy. *R47*

Long White Petiole: 45 days. Thick, glossy, spoon-shaped dark green leaves with crisp, tender, sweet white stems. Very good for stir-frying. Produces a large number of inflorescences for vegetable use. Grows to 24 inches tall. Plant in early spring or fall, and harvest when beginning to bolt. *D55*, H49, N84, *S70*

Nabana: Flowering bok choy with distinctive, savoyed leaves. Both the stalks and flower buds are edible. Harvestable 60 days after sowing. May also be picked before flowering when 7 1/2 or 8 inches long. Potential specialty market item. *S70*

Short White Petiole: 45 days. Similar to Long White Petiole, but with a shorter white petiole. Equally good in quality and taste. Excellent for steaming, stir-frying or adding to soups. May be harvested any time after reaching 3 to 8 inches tall. Has become very popular in supermarkets. *D55*, N84

Tsoi Sum: (Flowering White Cabbage) 55 days. A type of bok choy grown for the sake of its flowering shoots. The long, narrow stems are non-clasping, crisp, and are topped by thick, glossy medium-green leaves. Delicious in stir-fried dishes. Unopened flower buds and flowers are also tasty. HERKLOTS; C82, F73D, F85, G93M, 139, L59, *S55*

#### CODES FOR SPECIAL TYPES

1. Baby

## BROCCOLI {S}

### BRASSICA OLERACEA ITALICA GROUP

#### GREEN SPROUTING

#### HYBRID

Emperor: 58 days. Vigorous, early hybrid producing large, uniform dark-green heads that are well-domed, compact and heavy. Generally free from bracting, open florets and other defects. Long stems facilitate harvest. Highly tolerant to black rot, downy mildew and hollow stem. Good secondary side shoot production. Suited for spring or fall crops. D68, *E91G*, G6, *G13M*, G93M, *J74*, K10, K50, L42, M29, M49, N52, R32

Green Comet: 55 days. Upright, compact, 12 to 16 inch tall plants produce rich blue-green, large tight heads; 6 to 7 inches in diameter, without leaves in the center; weight up to 1 pound. Plentiful side shoot production. Resistant to heat and disease. For both spring and fall crops. All America Selections winner for 1969. A16, C85M, E24, *E91G*, *E53M*, *H33M*, H61, J14{PL}, K71, ZJ0, M46

Green Valiant: 65 days. Uniform, compact plants, 18 to 20 inches tall produce domed, very dense blue-green heads; 7 to 8 inches in diameter with fine beads and heavy stems. Good production of 3 inch diameter side shoots. Thin-skinned, sweet and tender. Adapted to a wide range of seasons, but does especially well when planted for a fall crop, as it shows good frost resistance. *Al*, D68, *E75*{PL}, G1M, G6, *G13M*, G93M, *J74*, K73, L42, L89, M29, M49

Packman: 55 days. Heavy yielder of uniform, light bluish-green domed heads, 7 to 8 inches in diameter, set well above the plant. Holds well in hot weather. Excellent side shoot development over an extended period of time. Now the standard, early hybrid broccoli. A87M, C85M, D11M, *E91G*, FI, F70, F82, G6, G16, G71, *H33M*, H42, H61, 139, J20, K50, K73, L89, N16, etc.

Paragon: Hybrid of broccoli and Chinese broccoli. Produces more tender, sweeter tasting stems with less fiber. Unique, umbrella-like, extra long stems. Blue-green heads, about 8 inches across, medium-sized beads. Longer stems also allow for easier bunching. Excellent for freezing. E63D, L42

Premium Crop: 60 days. Medium-sized plant that produces large, compact heads averaging 8 to 9 inches across; rounded, deep-green in color, solid and thick. Small, tight green buds hold longer than most. Produces side shoots, but somewhat fewer than others due to short stem. Excellent quality and uniformity. Resistant to downy mildew. All America Selections winner in 1975. *AI*, D11M, D76, E24, *E91G*, F13, F70, G79, *H33M*, H95, 139, *J74*, J97M, K10, M49, etc.

Small Miracle:<sup>1</sup> 55 days. Unique dwarf broccoli. Only grows about 12 inches tall and 18 inches across. Will produce large numbers of high quality heads in half the space. Dome-shaped, 6 to 7 inch heads with very tight beads; pleasant, sweet flavor. Excellent for erudite. Early enough to be direct seeded in many areas. Can be spaced as close as 8 inches apart, although best yields occur at 12 inch spacings. D26D, D56M, D65, *F63*, G16, *G53M*, 139,191, J20, L79, M46, M65

#### open-pollinated

Atlantic: 55 days. Short, compact fast-growing plant suitable for high-density plantings. Produces medium-large, rounded, compact, solid main heads; averaging 6 1/2 inches in diameter, followed by a good crop of large secondary shoots. Good for fresh market, home gardens and freezing. For spring and fall planting. Introduced in 1960. D76, G71, H54

Calabrese: (Green Sprouting Calabrese, Early Green Calabrese) 60 days. Tall, upright plant, 24 to 30 inches tall; produces small, deep blue-green central heads, 3 to 6 inches in diameter; numerous smaller side shoots are produced for several months. Good for fresh market, canning and freezing. Introduced to the United States by Italian gardeners around the turn of the century. B8, B49, D27, E5T, F24M, F80, G57M, 164, K49M, K71, L7M, N16, R47

De Cicco: 60 days. A rich-tasting old Italian cultivar with small main heads projected well above the foliage. Non-uniform in maturity, resulting in a long cutting period. Large yields of side shoots can be encouraged by harvesting the main head when 3 inches in diameter or less. For spring or fall crops. A25, C85M, C92, *DIT*, E24, E59Z, F44, G6, G57M, L7M, R47

Green Goliath: 55 days. Large, tightly-budded, blue-green central heads mature over a 3 week period instead of all at once. Good side shoot production extends normal harvest period. Quality very good, either fresh or frozen. Widely adapted. Bred especially for home gardens, to give early, extended harvests. Introduced in 1981 by W. Atlee Burpee & Co. B6, B75, C85M, D26D, D82, E24, G16, G57M, G71M, I39M, L7M, N24M

Green Mountain: 85 days. Solid, blue-green, fine-budded heads; main head 5 to 6 inches in diameter; good production of medium-sized lateral heads. Stands a long time before bolting. Recommended for short season areas where nights are cold. Originated in Europe. G68

Italian Green Sprouting: (Calabria) 60 days. Vigorous plants producing heavy yields of large, compact dark-green center heads with tight attractive buds, about 6 inches across. Matures uniformly, the medium-sized lateral heads producing over a long season. Good for home gardens, bunching and freezing. *E53M*, F92, G57M, G87, G79, G93M, 139, L42

Spartan Early: (Spartan) 52 days. Short, compact, uniform plants with heavy central heads, 6 to 8 inches in diameter, solidly packed with medium-sized, deep green buds on short stems. Moderate side shoot production. Standard open-pollinated early broccoli, developed by the Michigan Agricultural Experiment Station. L35{PL}

Umpqua: Introduced by Territorial Seed Company, Umpqua has out-performed all other open-pollinated cultivars in Pacific Northwest trials. Produces less side shoots than Waltham 29, but tends to have darker green buds with larger central heads. Good flavor. Not suitable for commercial growers because of lack of uniformity. Developed by Tim Peters. A2, J9M, K20M, L89, M27

Waltham 29: 75 days. Dwarf, compact plants producing medium to large main heads of uniform dark blue-green color, followed by a heavy crop of side shoots late into the fall. Thick stalks of even length facilitate bunching and freezing. Widely adapted to late summer and fall harvesting, as it yields best under cool growing conditions. A25, B6, B75M, B78, C44, D27, E38, G71, *H33M*, H61,184, J97M, K10, K27M, L7M, etc.

#### PURPLE/RED

Also called *purple cauliflower* and *purple sprouting broccoli*. Many require a long growing season, being adapted to warm winter areas, with heading occurring early the following spring. Easier to grow than either green sprouting broccoli or white cauliflower. The flavor is richer than that of white cauliflower, but milder than that of green sprouting broccoli. E13G{PR}

#### hybrid

Violetto de Catania: One of the earliest purple-headed cultivars. Upright, medium-tall plants; thick, deep purple curds, 15 inches in diameter and weighing 24 to 28 ounces. The head turns bright green after cooking. Adapted to fall cropping in mild climate areas. Q11M

Violet Queen: 70 days. Similar to Burgundy Queen in size and shape. Dark purple heads, not as intense as Burgundy Queen which is a slower growing strain. Turns a lime green color when cooked. Also good raw or frozen. Intermediate between cauliflower and broccoli. Recommended for short season areas where cooler night temperatures arrive in late August and September. C53, D68, E63D, *E91G*, G6, *G13M*, G82,177, *J74*, K10, K50, K73, L42, R32

#### OPEN-POLLINATED

Cardinal: Late purple sprouting type. Produces good sized spears with good flavor. Sown the end of May until mid July, and harvested from mid March into early May. The latest maturing of the cultivars developed by the HRI program in Wellsbourne, England. *S75M*

Early Purple Cape: (Early Purple Sprouting, Purple Sicilian) 220 days. Prolific, frost-hardy, dwarf plants; heads compact, medium-sized, firm but tender, purplish-green becoming green when cooked. Leaves almost entire, mid-rib marked with purple. Excellent, sweet flavor. Should be sown in early April for an early harvest the following Match. GRAY, A., GRAY, P. [Cui]; A2, B49, K71, M46, N24M, N84, PIG, Q11M, Q34, R32, R47

Late Purple Sprouting: Large, upright plants, bred for over-wintering. Produces numerous small, purple heads of excellent, sweet flavor. A longer-flowering strain of Purple Sprouting; from a spring planting, comes into bearing the following April and M<sup>^</sup>, and continues to produce a large number of shoots until July. B49, N84, R32, S55, *S75M*

Purple Cape: 365 days. Plants grow 12 to 18 inches tall, producing medium to large, rich purple heads, very compact and firm. Excellent, mild flavor. Large, dark green leaves, wavy, almost crimped; good to eat when young. Ready for harvesting February through April. May be closely related or synonymous with Early Purple Cape Very old cultivar, known before 1818. GRAY, A.; B49, C95, J9M, 053M, L89, R32, S55, *S75M*

Purple Giant: 80 days. Large, spreading plants produce very large, deep-purple heads on long stalks. Quality excellent; flavor mild; very good in salads. Turns green when cooked; freezes well. Harvested in the fall. Highly recommended for home gardens and roadside stands. G71, K49M

Purple Head: 80-85 days. Large, deep-purple, 8 inch diameter central heads; hold well when mature; non-uniform in maturity; will

not produce side shoots when cut. Fine quality; mild broccoli flavor; turns green when cooked. Good for fresh use or freezing; makes an attractive addition to salads. Hardy; pest resistant; easy to grow. C85M

**Purple Sprouting:** 220 days. Large, 24 to 36 inch tall plants are planted in spring to early summer, and harvested the following March and April after overwintering. Extremely hardy, to 10° F. Produces numerous small, purple heads that are tender, very sweet-tasting, and turn green when cooked. Stalks and leaves may be cooked as well. A2, C53, G53M, K49T, L89, 053M, S55

**Purple Sprouting Christmas:** 210 days. Winter-hardy cultivar that produces very heavy crops of medium-small, purple, juicy, full-flavored heads of excellent quality. Extends the harvesting season; from a July transplanting, will start to bear in January and continue into spring. U15

**Red Arrow:** Improved early purple sprouting type. Ready for harvest in late February, continuing through mid April. Vigorous, very productive plants, easy to grow. Excellent uniformity and winter hardiness. Developed in Wellesbourne, England by A.R. Gray. J9M, L91M, R32, S75M

**Red Head:** Midseason purple sprouting type. Produces larger primary heads and good side shoots. Sown from the end of May to mid June, and harvested from the beginning of March through much of April. Relatively new cultivar developed by HRI of Wellesbourne, England. S75M

**Red Spear:** Early purple sprouting type, earlier than Red Arrow. Produces fine quality spears. Sown from the end of May to mid July for harvesting from mid February to the end of March. Developed in Wellesbourne, England by A.R. Gray. S75M

**Rosalind:** 60-65 days. Early purple heading type with improved violet-purple coloration and a finer texture than other purples. Tolerant of hot summer weather, being sown in late May and June. Usually harvested in the fall. Developed in England by the National Vegetable Research Station. L89, S75M

**Rudolph:** Extra early purple sprouting type. Produces large, good quality spears beginning in January. Usually sown from the end of May to mid July for harvesting in January and February. May produce a December crop in favorable locations from the earliest sowings. Developed by A.L. Tozer. S75M

#### WHITE SPROUTING

Two types are known. Early cultivars, belonging to the Italica Group, mature January through March and produce small, greenish-yellow, fine-grained floral shoots on long stalks with wide internodes. The late cultivars, belonging to the Botrytis Group, mature March through May and develop larger, greenish-white or white floral shoots on relatively short stalks, some bearing a close resemblance to small cauliflower heads. GRAY, A.

**Early White Sprouting:** 220 days. Produces abundant, tender, small white heads over a long period. Frost hardy; can be sown in late spring for a fall harvest, or if sown in fall, plants will stand over winter for a crop early in spring. Small and flavorful heads; delicious raw or cooked. N84, Q34, S55

**Late White Sprouting:** 250 days. Handy, overwintering broccoli that produces numerous small, creamy-white, cauliflower-like heads. Somewhat later than other types, from a spring to early summer sowing will begin to bear the following March and continue into late spring. L89, N84

**White Eye:** Early white sprouting type. Relatively new cultivar that produces very white spears early in the season. Usually planted from the end of May until mid July for harvesting the following winter. Developed by A.L. Tozer of Cobham, England. S75M

**White Sprouting:** 220 days. Handy, overwintering broccoli sown in spring to early summer for a harvest the following April. Large plants producing numerous, small, creamy-white, cauliflower-like

heads that have a mild, delicate flavor. The leaves and stems can be cooked along with the heads. B49, G53M, 053M, R32

**White Star:** Late white sprouting type. Produces good quality spears. Usually sown from the end of May until mid July, and harvested during March and April of the following year. Developed by A.L. Tozer of Cobham, England. S75M

#### CODES FOR SPECIAL TYPES

1. Dwarf

## BRUSSELS SPROUTS {S}

### BRASSICA OLERACEA GEMMIFERA GROUP

#### HYBRID

**Bubbles:** 110 days. Round, dark-green sprouts, 3/4 to 1 inch in diameter; well-spaced on stems; flavor excellent. Holds up well for extended harvests. Somewhat tolerant of warm weather, drought and powdery mildew. Widely adapted and relatively easy to grow. Recommended for home gardens and bedding plant sales. C85M, C92, D26D, D56M, E97, G71, G87, H57M, I67M, J14{PL}, J20, K10, L42, L89, M46, M65, etc.

**Jade Cross:** (Jade Cross E) 95 days. Compact growth habit; height 18 to 24 inches. Sprouts medium-sized, about 1 1/2 inches in diameter; oval; dark blue-green; firm and tightly wrapped. Excellent flavor and quality. Early maturing, uniform and very productive. All America Selections silver medal winner in 1959. Especially recommended for short season areas. A16, B6, C85M, DI 1M, D76{PL}, E38, E97{PL}, F70, G16, M49

**Lunet:** Medium-large, firm sprouts have excellent appearance and very good flavor. Dark green in color; well-spaced; suitable for market or freezing. Consistently high yielding. Cold hardy and long-standing. For harvesting November through December. One of the standards for production and quality in Europe. A87M, C20M, C53, L89C, N52, N84, TIM

**Oliver:** 90 days. The standard in extra-early brussels sprouts. The flavorful, medium green, smooth sprouts are very large and mature remarkably early. Excellent quality. A vigorous, easy-to-grow cultivar for diverse climates. For August and September harvests. C20M, F13, G6, I18M, K73, L42, N52, R32, S75M

**Peer Gynt:** 140 days. Compact growth habit; height 3 feet. Dark green, firm, medium-sized sprouts; easily picked; remain tightly closed longer than other types. Produces high quality sprouts from the base of the stem right to the top. Excellent for market or freezing. Heavy cropper. Unusual for a hybrid in that it crops over a long period. For harvesting September to January. G53M, N84, R32, S55, S61

**Prince Marvel:** 95 days. Uniform, upright plants have long petioles offering good insect control; height 3 feet. The tall stalk produces very uniform, firm, round, smooth, medium-sized sprouts from top to bottom that hold well without rot or cracking. Excellent for fresh market and processing. AI, E24, E91G, G13M, G79, I91, J74, J84, K73, L89, M46

**Royal Marvel:** 85-90 days. Early Jade Cross type. Uniform, round, dark-green sprouts; well-spaced for ease of harvest. Even higher yielding than Jade Cross. Highly tolerant to bottom rot and tip burn. The tight sprouts also tend to resist insect attack. Recommended for home gardens, fresh markets, and processing. AI, A87M, G13M, K10, K16M, M29

**Valiant:** 110 days. Early to midseason type developed in Holland. Produces heavy yields of tight buds on each tall, vigorous stalk. Sprouts are cylindrical in shape; delicate and rich-flavored; both burst and rot-resistant. Plant in early to mid-summer for abundant

fall harvests, extending into winter in mild areas. *150G*, *K66*, *L42*, *M49*

#### OPEN-POLLINATED

**Bedford Fillbasket:** 95 days. Strong plants produce heavy crops of very large, solid, dark-green sprouts, tightly packed on the stems. Provides a continuous harvest from early autumn until Christmas. Height 3 1/2 to 4 feet. *K49T*, *N84*, *O53M*, *S55*, *S61*

**Cambridge #5:** 150 days. Popular winter-hardy cultivar. Very late to mature, the solid sprouts remaining firm until New Year when they should be used, not before. High quality, walnut-sized sprouts. Very heavy yields. Cropping continues until March. Height 4 feet. *B49*

**Darkmar 21:** Very early, high quality Bedfordshire type which produces dark green sprouts of fine flavor. Produces heavy crops that are ready for harvesting beginning in late November. Harvest until December, or through the winter in suitable climates. Originated in England. *B49*, *N84*, *R32*

**Early Dwarf Danish:** 95 days. Compact growth habit; in some years the short stature allows for snow to insulate and protect the sprouts against freeze damage. Good yields of large, high quality sprouts with very good flavor. Early maturing; well suited to areas with short growing seasons. *F44*

**Early Half Tall:** (Continuity) Plant of compact habit; excellent for windy or exposed gardens. Dark foliage. Large, medium-green sprouts of very high quality are produced from top to bottom of the stalk. Height 2 1/2 feet. Very early; for harvesting in September and October. *B49*, *N84*, *R32*

**Energy:**<sup>2</sup> Unique "baby" brussels sprout from Suttons Seeds of England. Specially bred to give outstanding flavor in a small size. Delicious, nutty, buttery flavor when picked at the thumbnail stage. Excellent raw in salads, steamed or stir-fried. Ideal for growing in a pot on a balcony or where space is limited. *E33*

**Evesham Special:** An old traditional variety from England. Strong growing plant, matures to a medium height. Produces heavy crops of good flavored sprouts that are particularly large and bulky. Harvest begins in late September and continues into early December. *N84*, *S55*

**Long Island:** 95 days. Strong, robust plants of compact growth habit; height 18 to 24 inches. Large, thick and close-jointed stalks. Round, tight, dark-green sprouts; 1 1/2 inches in diameter; tender and succulent. Sprouts cover the stalk and are solid the entire length. Good for local markets, home gardens and freezing. For late fall and winter harvests. *G71M*, *G87*, *K5M*, *K49T*

**Long Island Improved:** (Long Island Improved Catskill, Catskill) 100 days. Comparatively dwarf growth habit; height about 2 feet. Well-covered with medium green, globe-shaped, firm sprouts, 1 inch to 1 1/2 inches in diameter; maturing over a period of several weeks. Freezes very well. Hardy and productive. At one time the principal commercial sprout in California until hybrids with more uniform ripening came on the market. *A2*, *B75M*, *B78*, *C44*, *D82*, *E38*, *F80*, *F82*, *G79*, *H61,164*, *K49M*, *L7M*, *L35{PL}*, *N16*, *R47*, etc.

**Noisette:** Small to medium-sized, tight sprouts with a very distinctive nutty flavor. An old French cultivar of gourmet quality. Can be picked over a long period, e.g. from late October to mid-February from a mid-June planting. Height 2 feet. *B49*, *N84*, *R32*, *S55*

**Paris Market:** 90 days. Medium-green, firm sprouts with a rich sweet flavor. Especially sweet after a frost. Sturdy plants set 50 to 100 sprouts over an extended season. Sown in early August for a harvest in the fall. French heirloom, popular since the 1890's. *M32*

**Roodnerf Early Button:** (Early Button) 100 days. High yields of small-sized sprouts of excellent quality. Sprouts keeps well on the stem over a long period of time. Bred specially for its small, even,

deep-green sprouts. For best quality harvest when not much larger than a thumbnail. Matures in late December. *S59M*, *S61*

**Roodnerf Seven Hills:** (Seven Hills) Produces a heavy crop of small to medium-sized, tight sprouts of fine quality. Very hardy; harvest begins in early December, but plants will stand all winter and can be picked as late as March. Most reliable late standard cultivar. *B49*, *N84*, *R32*, *S55*

**Rubine:**<sup>1</sup> (Red) A large, late cultivar with small, tight sprouts of a bright crimson color. Lower yields than green types, but of excellent, gourmet flavor. Said to be less attractive to white cabbage butterflies. For harvesting in December. To preserve the color when cooking, a small amount of vinegar should be added. *GENDERS 1975*, *ORGAN*; *B49*, *C53*, *C85M*, *E63D*, *K49M*, *L89*, *M46*, *N84*, *O53M*, *P59M*, *R32*, *R47*, *S55*

#### CODES FOR SPECIAL TYPES

2. Baby

## BUTTERNUT {GR}

#### JUGLANS CINEREA

**Ayers:** Medium-sized nut; good kernel percentage; has a 30% higher crackout rate than the average cultivar. Tree vigorous, upright; late blooming. Foliage appears to be resistant to the anthracnose fungus and is moderately susceptible to the eriophyid mite. Originated in Bellevue, Michigan by Corwin Davis. Appears to be worth propagating. *140,186{SC}*

**Beckwith:** Medium-sized nut with good flavor and cracking qualities, about 35 nuts per pound; kernel 21 % of nut. Very productive tree, one of the most prolific of all butternut cultivars; grows 40 to 60 feet tall; very cold hardy. Originated in Ohio in 1985. *E91M*, *E91M{PL}*, *140*

**Booth:** Very good nut; cracking qualities equal to that of Buckley and Craxey, two of the highest rated for this trait; characteristic buttery flavor. Received a top rating in a Northern Nut Growers Association contest. Vigorous, productive tree with good form, grows 40 to 60 feet tall; very hardy. Originated in Ohio. *140*

**Buckley:** Large nut. Tree a very vigorous grower; appears to have some resistance to the anthracnose fungus but is susceptible to the eriophyid mite. Originated in Iowa. Worthy of propagation. *140,186{SC}*

**Chamberlain:** Nut shell large, medium-thick; kernel plump, without ridges, flavor good; skin medium brown; kernel extraction moderately easy; resembles Love; ripens about September 27 in Heuvelton. Tree extremely hardy; somewhat tolerant of melanconis dieback; susceptible to anthracnose. Introduced in 1967 by Fred L. Ashworth, St. Lawrence Nurseries, Heuvelton, Nov York. *BROOKS 1972*; *E91M*, *140*

**Craxey:** Medium-sized nut; cracks easily, yielding twin halves; kernels average 56% of nut; flavor very good. Tree vigorous; hardy; bears heavily; moderately susceptible to melanconis dieback; somewhat resistant to anthracnose. One of the most widely grown butternuts. Originated in Union City, Michigan by H.P. Burgart. Introduced in 1934. *BROOKS 1972*; *E91M*, *140*

**Creighton:** Medium-sized nut; good cracking qualities, cracks out 50% halves. Tree vigorous; leafs out late and retains its foliage after most others are completely defoliated; foliage normally very clean, occasionally susceptible to eriophyid mite. Originated in Clinton County, Pennsylvania by R.L. Watts. *140*

**George Elmer:** Tree is vigorous and has a rounded nut, medium in size but has not been fully evaluated. Very good cracking qualities.

Foliage is susceptible to anthracnose fungus and eriophyid mite. Needs additional study but appears to be a good cultivar. E91M

Kenworthy: Very large nut with an excellent flavor, fills well. Tree vigorous; very hardy; quite dwarfed in size; appears to be resistant to anthracnose fungus and eriophyid mite. Has characteristics suggesting that it may be a hybrid between butternut and heartnut. Originated in Wisconsin. E91M, E91M{PL}

My Joy: Oval shaped nuts with rich, buttery kernels. Large, spreading tree, 40 to 60 feet tall; somewhat slow to come into bearing. Originated in Pennsylvania. Selected by noted plantsman John Hershey in the 1930's for its good nut qualities. 140

Van Syckle: Nut very large; kernels crack out in halves; flavor excellent. Tree bears heavily. Originated in Johnstown Township, Barry County, Michigan by the Burgess Seed and Plant Company. Introduced in 1959. BROOKS 1972; 140

Weschcke: Medium to large nut; kernel light-colored, tender; smooth convolutions of shell allow kernels to drop out freely; hull easily removed. Tree extremely hardy; very productive when grafted on black walnut or butternut, but difficult to graft. Originated in River Falls, Wisconsin by Carl Weschcke. Introduced in 1938. BROOKS 1972; 140

---

## BUTTON MUSHROOM {SN}

AGARICUS BISPORUS

---

### BROWN-SKINNED

81 Brown: Noted for its yield consistency and virus resistance even in adverse growing conditions. Steady production through later breaks. Produces high quality medium to dark brown mushrooms for the fresh market. Higher disease resistance than white strains. During spawn run and casing the compost temperature should never be allowed to rise above 72° F. G55M

Amycel 2400: Very heavy bodied mushroom with a slightly flat cap and smooth, brown skin; ivory white, medium length stem, often rather thick at the base. Firmer texture and enhanced flavor compared to white strains. Has greater eye appeal when sliced due to the contrast between the brown cap color and white internal sections. Very even cropping facilitates harvesting. A41

Italian Brown: (Cremini, Portobello) {KT} Known as *cremini* in the button stage and *portobello* after the caps open fully. Cremini have fawn colored caps, are similar to the white button mushroom but have a much firmer texture and a more intense, nutty flavor. Portobello mushrooms are much larger and heavier, may reach 8 inches in diameter and have very dark chocolate, almost black caps and gills. Portobellos are excellent when grilled. Popular specialty market items. A7{DF}, D3M{PR}, E13G{PR}, E21{CU}, D76, E97, F13, G16, H73{PR}, I1M{CU}, 149,149{CU}, 174,191, J11, J11{PR}, J60{SN}, N40{PR}, N40{DF}, etc.

Royal Tan: {KT} Unusual, rich beige-colored mushrooms. More robust flavor than common white button mushrooms. Prized by gourmets. Begins to produce in one month; will continue to produce for several more months. D76, E97, G16, H49, J20

### WHITE-SKINNED

46 White: Produces high yields of smooth white mushrooms over several breaks. Adapted to a wide range of productive growing conditions. High tolerance to verticillium. Does not require as high a carbon dioxide level as hybrids to control pinning. Bed temperatures should never be allowed to rise above 75° F. during spawn run or after. G55M

501 Hybrid Off-White: Produces high quality mushrooms for the fresh market with off-white hybrid's characteristic superior shelf

life. Not as sensitive to scaling as first generation off-white hybrids. Produces good size mix when picking for fresh market. 501 will scale, as do all off-whites or off-white hybrid crosses, if exposed to excessive air velocity or dryness. G55M

900 Off-White: Prolific producer of first and second break mushrooms. Quality is maintained for fresh market packs during the third and succeeding breaks. Thick, flaked pellicle; off-white in color with good shelf life. Low CO<sub>2</sub> sizing levels. Off-white strains in general are characterized by their flaked or rough surface. G55M

Amycel 2100: Produces a mushroom with a well rounded cap and good white coloring. Excellent for fresh market as well as the processed market. High percentage of large mushrooms. Very good shelf life, with a thick veil and good holding ability when stored between 33° F. and 35° F. Does well on a broad range of composts, and is very tolerant of varying substrate conditions. A41

Amycel 2800: Hybrid off-white, easy pinning strain. Well-suited to the fresh market with excellent growing characteristics and handling qualities. Well-rounded, firm mushrooms with good color. Small gill area and heavy stipe encourages a longer shelf life Very tolerant of a wide range of growing conditions. A41

Horst U-1: Produces one of the highest quality, fresh market mushrooms. A true cross between the best white and off-white strains. Deep, white and dense, with well-rounded cap shape. Capable of producing one of the highest percentages of large mushrooms. Long shelf life. Thick veil delays opening. Low sensitivity to bruising. A41

Sylvan 100: High yielding strain. Produces a white, well-rounded mushroom with a dense, fleshy cap. Cap may be slightly scaled, depending on climatic conditions. Mushrooms are medium to large and have a relatively long shelf life. Temperature should be in the 78 to 82° F. range and should not exceed 88° F. at spawning and during spawn run; relative humidity should be 90% or more. Highly suited for prepack, fresh bulk or canning purposes. L77

Sylvan 130: High yielding strain. Produces a white, well-rounded mushroom with a dense, fleshy cap. Cap may be slightly scaled, depending on climatic conditions. Mushrooms are medium to large in size and have a relatively long shelf life. Temperature should be in the 76 to 82° F. range and should not exceed 85° F. at spawning and during spawn run; relative humidity should be 92% or more. Highly suited for prepack, fresh bulk and canning purposes. L77

Sylvan 381: High yielding strain. Generates a pure white, densely tissue mushroom which is medium to large and has a relatively long shelf life. Often produces about 3/4 of its total yield on the first two breaks. Temperature should be in the 75 to 85° F. range and should not be higher than 95° F. at spawning and during spawn run; relative humidity should be 90% or more. Well suited for prepack, fresh bulk or canning purposes. L77

---

## CABBAGE{S}

BRASSICA OLERACEA CAPITATA GROUP

---

### COMMON GREEN CABBAGE

#### HYBRID

Discovery:<sup>2</sup> 75-85 days. High quality salad cabbage. Round, medium blue-green heads with good wrapper leaves; very tight and solid; weight 4 to 5 pounds; good, crisp texture Very sweet flavor, excellent eaten raw in salads. Small, compact, upright plant allows for high density plantings. Resistant to fusarium yellows. C53, C92, D26D, E53M, E97, F63, G13M, H42, H61,164, J20, K10, L91M, M46, N52, etc.

Dynamo:<sup>15</sup> 70 days. Unique mini or "baby" cabbage, the perfect size for a single meal. Small, bluish-green heads, 22 to 24 inches

wide and weighing 2 to 2 1/2 pounds; densely packed, short-cored. Vigorous and widely adapted, tolerant of severe weather and undesirable growing conditions. Resistant to fusarium yellows. All America Selections Winner in 1997. C85M, D26D, E97, G6, G16, G87, H95, I39, I50G, 191, K10, K66, K71, L42, M29, M46, M49, etc.

Grenadier:<sup>2</sup> 65 days. Relatively open plants with few wrappers. Dense, medium-green heads; weight 2 to 2 1/2 pounds; small cores. Crisp, juicy leaves; sweet, delicate flavor. Very good eaten fresh out of hand or thinly sliced in salads. Bred to be crack resistant and to hold for very long periods. Tolerant to thrips and tip-burn. C20M, F63, G71M, G93M, I18M, J74., K66, K73

Minicole:<sup>1 5</sup> 66 days. Small, round to slightly oval heads; good interior color. Very short core means more cabbage and less waste. Few dark-green outer leaves. Can stand for up to 4 months without slitting. Very compact plant; well-suited to dense plantings or container culture. For late summer and fall harvests. D11M, F70, M49, N81, R32, S55

O.S. Cross: (Flat Top) 75 days. Extremely uniform, flat-topped, oval heads; stay firm a long time; crisp, mild flavor. Excellent for slaws, salads or stir-frying. Very adaptable; good for both summer and fall harvests. Famous for producing the giant Alaskan exhibition cabbages that grow 3 to 4 feet across and weigh up to 70 pounds. All America Selections winner in 1951. C97, E53M, G83M, H33M, H57M, I50G, L79, L91M, RUM, S63M

Safekeeper:<sup>4</sup> 95 days. Hybrid Green Winter type. Much more tolerant to autumn rains and more winter hardy than Green Winter or Storage Green types. Medium length stems. Heavy frame and wrapper leaves give added head protection from early frosts. Sown from June 25th to July 10th for mid-October harvests. Fair tolerance to black rot; not yellows tolerant. B6, L42

Salarite:<sup>2</sup> 57 days. An extra early, semi-savoy ballhead type. Small heads; weight 2 to 3 pounds. Wrapper leaves dark-green, attractively ruffled; thick, tender, juicy and sweet, almost lettuce-like in taste. Interiors solid; butter-yellow in color. Very compact plant. Recommended for home gardeners or super market sales. I39, I91, Q11M

Stonehead:<sup>1</sup> 67 days. Round, very solid, light-green heads; weight 3 1/2 to 4 pounds. Few outer leaves; very short core. Stands a long time without splitting. Compact plant; produces an abundant crop in a small area. Yellows resistant. For early market, home gardens and shipping. All America Selections winner in 1969. B6, D65, E24, E38, E97, G82, H33M, I39, J14{PL}, J20, K10, K71, L42, M49, N81, etc.

#### OPEN-POLLINATED

April Green:<sup>4</sup> 105 days. Most popular Langedijker type in Holland. An excellent keeper; will retain its green color right through the winter. Short stems. Good internal quality and flavor. Exterior color darker green than most other winter types. Recommended for home gardeners and commercial growers. K49M, S55

Brunswick: 90 days. Compact, flattened, dense heads; 9 inches in diameter; weight 7 to 9 pounds. Few outer leaves. Popular for fresh market and kraut. For late summer and autumn crops. Stores very well. Popular in severe climates where late storage types are difficult to mature. Introduced prior to 1876. C28, DIT, D12, E24, F80, G57M, I64., K10, Q11M, S17

Charleston Wakefield: 73 days. Improved form of Early Jersey Wakefield, about a week later in maturing but yielding nearly twice the crop. Dark-green, very solid, conical heads, 6 to 8 inches in diameter; weight 4 to 6 pounds; medium-sized core. Good wrapper leaves. Slow bolting. Popular in the South for over-wintering. C28, DIT, E38, G1M, G27M, G57M, H54, K49M, K71, M95M

Christmas Drumhead: 110 days. Large, flattened, solid heads. Dwarf, compact plant; very hardy, productive and reliable. Can be sown later than most other cultivars, July or August for December

and January harvests. Introduced about 1903. B49, K71, R32, S55, S61

Copenhagen Market: (Copenhagen, Early Copenhagen Market) 68 days. Uniform, globe-shaped light green heads, firm and solid; 6 inches in diameter, weight 3 to 4 pounds. Good wrapper leaves. Stands for a long time without splitting. Compact, short-stemmed plant; heavy yielding. For early markets and home gardens. A16, A75, B75M, C44, D82, E38, E91G, FI, F92, G27M, G57M, G79, H33M, H85M, K10, N16, etc.

Danish Ballhead: 105 days. Medium-sized, round heads, medium dark green with a gray bloom; extremely firm and solid; weight 7 to 9 pounds. Short stem. Good all-purpose cabbage; very good for kraut. Withstands hot, dry weather. Excellent for storage, keeping its fine qualities until spring. Introduced in 1887. A25, B75M, C85M, DIT, D11M, D65, D82, E24, E38, FI, F70, G16, G57M, G71, K27M, L79, M95M, etc.

Delicatess:<sup>2</sup> 70 days. Round, solid, medium-sized heads; of excellent quality and texture, with no coarse ribs. Wrapper leaves few, small. High sugar content; lacks the typical strong cabbage flavor. Excellent in salads and coleslaw. Matures in late summer. E38

Earliana: 60 days. Very early Golden Acre type; quite uniform in size and maturity. Small, deep round heads; 4 1/2 to 5 inches in diameter, weight 2 to 2 1/2 pounds; compact and well-folded. Attractive, medium-green color well into interiors. Ideal size, shape and quality for home gardens. Small plants take less space. B6, B75

Early Flat Dutch: 90 days. Large, flattened, solid heads; 6 to 7 inches deep, 11 inches in diameter; weight 6 to 10 pounds; short stems, medium-sized core. Few outer leaves; can be planted closely. Excellent for sauerkraut and storage. Resists heat, therefore popular in the South. Introduced prior to 1875. E53M, G57M, H61, H85M, K10, K27M, K71, L7M, L10, L35{PL}

Early Jersey Wakefield: (Early Wakefield, Jersey Wakefield) 65 days. Medium-sized, conical, pale green heads; often tinged with red on the side exposed to the sun; weight 2 to 3 pounds. Outer leaves glaucous-green. Slow bolting, but cracks easily. Small plants permit close spacing. For home and market gardens, or shipping. Introduced prior to 1865. BURR, VILMORIN; A16, A75, B78, C44, D82, E24, E38, E59Z, F80, F82, G6, I64, L7M, L35{PL}, M46, N16, etc.

Early Round Dutch: (Round Dutch) 80 days. Large, rounded dark-green heads, 7 to 8 inches in diameter, weight 5 to 7 pounds; very solid; short stems. Few outer leaves. Slow to bolt. Adapted to a wide range of conditions. Popular in the South for kraut. Good for early markets and shipping. A75, C28, DIT, D26D, E5T, G1M, G57M, K49M, M95M

Flower of Spring: (Offenham Flower of Spring) Medium-sized, conical pointed, solid heads; compact and short-stemmed; very good flavor. Ideal for autumn or early spring sowing. Selected from Offenham. Introduced about 1905. Still a very popular home garden cultivar in England. 053M, R32, S61, TIM

Friihes Wiener Breindl: 80 days. Small, flattened globe-shaped heads; gray-green leaves; weight 2 1/2 to 3/12 pounds; very good flavor. Harvested from June and July to September. Soft white cabbage that originated in Austria, where it is used for the fresh market. N81

Glory of Enkhuizen: 75 days. Large, globe-shaped, deep bluish-green heads, 7 1/2 inches in diameter; weight 5 to 10 pounds; good interior quality and flavor. Wrapper leaves few, wavy. Good for cabbage rolls, early kraut and coleslaw. Keeps well. Good market cultivar. C28, C85M, DIT, E5T, E38, FI, G57M, K49M, Q18, R50, S17

Golden Acre: (Golden Acre Yellows Resistant) 65 days. Early Copenhagen Market type. Uniform, round grey-green heads; firm and dense; 6 to 7 inches in diameter, weight 4 to 5 pounds; medium-

sized core; short stems. Good wrapper leaves. Bolts readily. Keeps 60 days after harvest. Small plants permit close spacing. Yellows resistant. A16, A25, B75M, D82, E24, F82, G16, G57M, G71, G79, H33M, H61, H85M, K10, N16, etc.

Greenhead:<sup>4</sup> Medium-large, somewhat flattened heads; firm and solid. Short stem. Retains its light green color in storage. Has a more appealing color than white late cabbages and is preferred by stores and super markets. E38

Greyhound: 64 days. Similar to Early Jersey Wakefield, but much earlier. Small, conical heads, very dense and solid; weight 2 to 3 pounds. Few outer leaves. Very mild flavor; quality good. For spring and fall sowings; can also be over-wintered. Popular in Europe. B49, 053M, R32, S55, S75M, TIM

Harbinger: Small, uniform, conical pointed heads; firm and solid, of good quality and fine flavor. Not prone to bolting. Few outer leaves. Compact plants, suitable for close spacing; very reliable. Recommended for autumn sowing; matures quickly in spring. Introduced about 1891. S61

Holland White: (Holland Late Winter) Traditional Dutch storage cabbage of the ballhead type. Large, light-green heads; firm, close-textured. Very good for cooking, coleslaw or salads. Usually sown in May and June for harvesting October through December. Stores very well. B49, R32, R47, S55

Houston Evergreen:<sup>4</sup> 95 days. Round, solid heads; 7 to 8 inches in diameter, weight 3 to 4 pounds. Few outer leaves. For fresh market, shipping, or winter storage. Retains its apple-green color in storage. Half-tall type. Used primarily on heavy muck land where other Wintergreen types get a bit too tall. D27, L42, M49

Kamtner Steirisches Gebirgskraut: Fresh market cabbage from Carinthia and Styria, two mountainous areas of Austria. Can also be stored for a short period of time. Name translates as "cabbage for use in the hilly regions". N81

Late Flat Dutch: (Large Late Flat Dutch) 105 days. Large, roundish, flattened head; very firm and solid; 12 to 14 inches in diameter; weight 12 to 15 pounds. Outer leaves fairly numerous. Good keeper and shipper. Exceptionally hardy; also resists drought. Introduced prior to 1846. VILMORIN; B78, D82, E97, F24M, G57M, G71, G79, H33M, H61, H85M, 184, K10, K73, L35{PL}

Marion Market: (Yellows Resistant Copenhagen) 75 days. Round, solid heads, 6 to 7 inches in diameter; weight 3 1/2 to 4 pounds; crisp and tender; good wrapper leaves. Widely used for fresh market and kraut. Resistant to bolting. Medium to large plants, larger and coarser than Copenhagen Market; yellows tolerant. Bl, G71, /59M, K27M

Marner Allfriih: 65 days. An open-pollinated German cultivar that has the vigor and uniformity of a hybrid. Small to medium, round, compact head; weight 3 pounds. Stands well without splitting. Numerous tennis-ball sized heads can be harvested if sown May through June. B49, N81

Penn State Ballhead: (Penn State Danish Ballhead) 100 days. Well-wrapped, slightly flattened bail-shaped heads, very firm and solid; 7 to 9 inches in diameter; weight 8 pounds. Good for kraut. Very resistant to splitting. Keeps perfectly in storage until late spring. Not yellows tolerant. B6, E38, G57M, M27

Premium Late Flat Dutch: 100 days. Large, solid head, broad and flat on top; bluish-green, often tinted with red or brown; weight 10 to 15 pounds. Inner leaves creamy white; crisp, tender and flavorful. Outer leaves few, tinged with purple when mature. Good for kraut. Excellent storage cabbage; retains its freshness and flavor till late in the spring. Sure Heading. Introduced prior to 1865. BURR; B73M, D65, D76, F24M, H49,163Z, K49M, K71, L7M, N16

Premstattner Schnitt: Flat-headed cabbage widely used for the production of canned sauerkraut. Also good for fresh salad use, and

when cooked as a vegetable has a slight, fine taste of horseradish. Originally from the town of Premstatter in Styria, Austria. N81

Pride of India: 60-70 days. Early Golden Acre type. Small, round heads weighing 2 1/4 to 4 1/2 pounds; outer leaves few. Susceptible to cracking if not harvested promptly. Higher yielding than Golden Acre under Indian conditions. One of the most popular cultivars in India. Apparently selected from Copenhagen Market. BOSE 1993; N91, Q18, Q45M, R0, R50

Primo: (Golden Acre Primo) 65 days. Small, round, ball-like heads; large, heavy, solid hearts. Few outer leaves. Delicate flavor and tenderness. Grows well in any soil. Good market cultivar and ideal for a small family. Best used for successional sowing from February until mid-July. B49, J20, R32, R47, S55, S75M

Quick-Green Storage:<sup>4</sup> 90 days. Tested for several years as an early green storage type in the Montreal area. Excellent in short season areas where it is difficult to mature good-sized heads before heavy frosts. Retains good color until spring in storage, harvested with Penn State Ballhead. L42

Quintal cPalsace: (D'Alsace) 115 days. A 19th century French heirloom. Large, flattened, compact heads, sometimes slightly tinged with brown on the upper part. Harvested in late fall for winter storage. Long standing, old-fashioned choice for the famed sauerkraut of the Alsace-Lorraine region of France. VILMORIN; G68, K49M, S17

Very Early Paris Market: (Coeur de Boeuf Moyen de la Halle) 60-70 days. Nineteenth Century heirloom still requested by farmers and home gardeners in France for its taste. Numerous, smooth green outer leaves. Large, conical heads weighing 4 to 6 pounds or more. Broad, low growth habit; short stalks. VILMORIN; E63D

Wheeler's Imperial: Solid, conical pointed, dark-green heads; dwarf and compact; mild flavor. Sown in early spring for a crop in April and May, and again in August for a late harvest. An old favorite in England. Introduced about 1884. 053M, S61

Winnigstadt: (Early Winnigstadt, Winnigstadter) Solid, conical pointed, grey-green heads; compact and well-shaped; short stem. Very good flavor. Does well on any soil. Sown in May for a harvest in October, November and December. Stores well. Of German origin; introduced prior to 1860. BURR, VILMORIN; B49, F24G, 053M, R32, S55

Wintergreen:<sup>3 4</sup> Quick maturing, leafy, loose-headed cabbage. Good dark green color. Suitable for growing as *spring greens* or "collards" early in the season, or small-hearted cabbage in late spring. Very high in vitamins A and C, calcium and other minerals. Produces a good crop at the first cut. Can be direct sown. Hardy. Selected from Offenham. BISSELL [Cui]; B49, R32, R47, S55, S75M

Wisconsin All Seasons: 95 days. Flattened, globe-shaped heads, very solid and uniform; 7 to 8 inches in diameter; weight 8 to 10 pounds. Blue-green outer leaves, white inner leaves. Excellent for kraut. Yellows resistant. Good for home gardens; well-suited for winter storage. Resistant to bolting, drought and hot weather. D12, D26D, D65, G57M, G79, /59M, K10, K27M, K71, M46, M95M

Zwaan Jumbo: (Jumbo) 105 days. Very large heads, average weight 20 to 25 pounds, occasionally reaching 35 pounds; very firm and salad. Crisp, pale green leaves, very good for stuffed cabbage. Resistant to splitting. Keeps well. Yields best in peat or muck soils. D11M, D27, F70

## RED CABBAGE

### HYBRID

Red Rookie: (Rookie) 75-80 days. Round, purple-red, medium-sized heads, 6 inches across and weighing 3 to 5 pounds; short to medium-cored; solid and full-colored. Excellent appearance, shape and uniformity. Suitable for sauerkraut, slaw or storage. Semi-open

plant with good wrapper leaves, widely adapted, tipburn tolerant. *AI, C20M, C25, E91G, G75M, G82, G93M, H61, /74, J84, K10, A/6M, K50, K73, M29, M46, Q34, etc.*

**Ruby Ball:**<sup>1</sup> 65 days. Nearly spherical, well-filled, deep purplish-red heads; 6 inches in diameter, weight 4 to 5 pounds; very firm and dense; extremely uniform, short-cored. Excellent wrapper leaves. Good color inside and out. Holds well in the field without splitting. All America Selections winner in 1972. *A16, G71, G82, H61, H95, I39, J20, L89, M46, N52*

**Ruby Perfection:** 85 days. Medium-sized, round, bright purple-red heads; 6 inches in diameter, weight 3 to 4 pounds; very uniform, firm and solid. Good wrapper leaves; good color right to the core. Holds well without splitting. Not yellows tolerant. Ships well. Ideal for late summer crops, or fall harvests for medium-term storage. *AI, C20M, C85M, D68, E75{PL}, G6, G16, H61, /50G, /74, J84, K10, M29, S63M*

#### OPEN-POLLINATED

**Lasso Red:** 70 days. Small, rounded, very firm heads; attractive bright red color; weight 2 to 4 pounds; very uniform. Few outer leaves. Keeps in die field several weeks without splitting. For salads, cooking and red kraut. Can be stored if sown to mature in autumn. *C95, D68, E24, F44, J20, K49M*

**Mammoth Red Rock:** (Red Rock) 95 days. Large, flattened, dark purplish-red heads; 8 to 10 inches in diameter, weight 5 to 8 pounds; firm and solid; rich, distinctive flavor. Popular for pickling, boiling and kraut. Sure heading. Stands fairly well without splitting. Excellent for storage. Standard large late red cabbage. *C85M, E24, G57M, G71, G79, H42, H85M, /64, K10, K71, N16*

**Red Acre:** 80 days. Globe-shaped, deep purplish-red heads; 5 1/2 to 6 inches in diameter, weight 2 1/2 to 4 pounds; firm and solid. Good wrapper leaves. Holds well for a long period without splitting. Compact, short-stemmed plant; yellows resistant. For spring and summer harvests. Excellent for storage. *A16, A25, B75M, C44, D65, D82, E59Z, F82, F92, H61, /64, K10, L7M, M95M*

**Red Danish:** (Red Danish Ballhead) 95 days. Medium-sized, uniform, very solid heads; round, slightly flattened on top; average weight 4 to 6 pounds; good purple-ied color. Widely used for pickling and coleslaw. For fresh market or short term storage. Adapted to late summer and fall crops. Fairly tolerant to yellows. *F24M*

**Red Drumhead:** Round to slightly flattened, deep purplish-red heads; 7 inches in diameter; very solid. Fine, sweet flavor; good raw as well as for cooking and pickling. Holds its color well when pickled. Excellent winter keeper. Medium-sized plant; very haidy. Sow in early spring for an autumn harvest. Introduced about 1867. *B49, F24G, K49T, 053M, 089, R32, R50, S55*

**Red Express:** 55-65 days. Extra early non-hybrid red cabbage. Round to oval, medium-sized heads weighing 2 to 4 pounds; good, dark-red color; tight, solid and dense; flavor very good. Relatively resistant to splitting. Compact, space-saving plants. Bred for Canada and the northern United States. *C20M, C85M, D56M, G6, G87, L79, M65*

**Red Meteor:** (Meteor) 75 days. Uniform, deep globe-shaped, dark red heads; 6 to 8 inches in diameter; weight 2 1/2 to 4 pounds; very solid and sweet. Very good wrapper leaves. Darker, more uniform, and more stable red color under mild weather conditions than Red Acre. Excellent field-standing ability and cold weather tolerance. *B8M, C20M, G93M, K10, K49Z, L42, N52*

**Testa di Negro:** Excellent late maturing cultivar. Very solid, finely ribbed heads. Cooked for kraut or eaten raw as coleslaw. Sown in summer for a harvest in autumn and winter. Originated in Holland. *Q11M, S17*

#### SAVOY CABBAGE

Considered to be the best flavored cabbage. Generally milder than others^ with a tasty, buttery yellow interior. Makes excellent shredded cabbage or "coleslaw", and can be substituted for vine leaves when making *dolmas*. Also has ornamental value with its wavy leaf edges and blistered leaf surface. GRAY, R [Cui]. R47

#### HYBRID

##### *Green*

**Savoy Ace:** 80 days. Uniform, semiglobe-shaped, dark green heads; weight 3 1/2 to 5 pounds; very firm, with a small to medium-sized core. Finely crinkled leaves; sweet, tender flavor. Holds well without splitting. Vigorous, productive plant; resistant to both heat and frost. Tolerant to fusarium yellows. All America Selections winner in 1977. *A87M, B73M, C85M, D65, E9/G, F13, G16, G82, H54, H61, J20, K10, K73*

**Savoy King:**<sup>1</sup> 85 days. Uniform, semi-flat, dark green heads; 9 to 10 inches in diameter, weight 4 to 6 pounds; short core. Good flavor and texture. Stands heat better than other savoy types. Can be harvested 2 to 3 times a year in mild climates. Heads somewhat smaller in the spring; lighter green in warm weather. Yellows resistant. All America Selections winner in 1965. *A87M, C28, F63, G79, I39, J97M, K16M, K73, L91M, M29, M49*

##### *Red*

**Colors:**<sup>1</sup> (B-1568) 100 days. Unique, high quality red savoy. Round, medium-sized head, very firm, short-cored; excellent wrappers. Internal leaves an attractive creamy-purple. Red savoyed leaves turn blue-purple when cooked. Delicately sweet flavor fresh or cooked. Resistant to fusarium yellows. Tolerant of tip bum. *K50, L91M*

#### OPEN-POLLINATED

##### *Green*

**Best of All:** (Sutton's Best of All) 90 days. Early Drumhead type. Very large, solid, medium-green heads. Outer leaves coarsely crinkled. Stands a long time without splitting. Does well on all soils. Very cold resistant. Harvested during September and October. Introduced about 1897. *B49, R32, S55, S61, TIM*

**Blue Max:** (D'Aubervilliers) 75-80 days. Slightly flattened, heavily crinkled closed heads; weight 3 to 4 pounds; attractive, blue and lime-green coloring; tender texture. Quality and flavor very good. Outer leaves appear to be resistant to white cabbage butterflies. *E63D, F44, P59M, 577, S95M*

**Des Vertus:** (Large Drumhead) 75 days. Broad, compact heads, flattened on the top; sometimes slightly tinged with a wine-lees-red color; weight 3 pounds. Deep blue-green, moderately crinkled leaves; mild, sweet flavor. Stands heat very well. Very adaptable; can be planted in spring, summer or fall in mild climates. Introduced prior to 1885. *VILMORIN; U15*

**Lisboa Savoy:** 90 days. Round, light green heads with excellent appearance, about six inches in diameter. Heavily crinkled, tender leaves with a delicious buttery-sweet flavor. Traditionally grown as a late summer and fall crop. Very old heirloom from Portugal. Highly recommended for home gardens. *J73*

**Ormskirk Late:** (Irish Giant Drumhead) Large dark-green heads; very firm and solid. Coarsely crinkled leaves, of good flavor. Will stand for a long time without splitting. Extremely haidy. Sown in May and June for a December through March harvest. An old favorite in the British Isles. Introduced about 1899. *F73D, 053M, R32, S55*

**Perfection Drumhead:** (Perfection Drumhead Vertus Strain) 90 days. Large, nearly round, solid, deep green heads. Very finely curled and crinkled leaves; mild in flavor when touched by frost. Compact, short-stemmed plant. Has the size of the Drumhead, with

the curled leaves and fine flavor of the savcy. Excellent keeper. Introduced prior to 1888. *C20M*, *C85M*, *G57M*, *K49M*

**Savoy Chieftain:** (Chieftain Savoy, Chieftain Drumhead Savoy) 90 days. Large, slightly flattened head; 8 to 10 inches in diameter, weight 4 to 6 pounds; very firm and solid. Dark green, densely crinkled leaves; mild in flavor. Stands well without splitting. For late summer and fall harvests. All America Selections winner in 1938. *A16*, *C44*, *E24*, *F92*, *G13M*, *G27M*, *G71*, *G79*, *G93M*, *184*, *L7M*, *M46*, *M95M*

**Tardivo di Milano:** 120 days. Excellent, traditional Italian variety. Forms large heads with very crinkled, dark-green leaves; matures late. Very resistant to frost. Sown in June and July in Italy. *Q11M*

**Winter King:** 80 days Very late, hardy Ormskirk type. Uniform, solid, slightly flattened heads; short stems. Finely crumpled, ribbed, dark-green leaves; of excellent quality. More resistant to frost than other savoy; can be kept over winter in mild areas. *C85M*, *S61*

### Red

**January King:** 110 days. Semi-savoy type. Solid, flattish, light-green heads; weight 3 to 5 pounds; of excellent quality and flavor. Bluish-green wrapper leaves, tinged with purple in cool weather. Compact, very cold-hardy plants. Sown from May to July; harvested November through January. Will stand without splitting for most of the winter. *A2*, *B49*, *C95*, *J9M*, *K49M*, *L13M*, *L89*, *053M*, *089*, *R32*, *S55*, *S75M*

**Red Verona:** 100 days. Small, attractive, purplish-red heads merging into green at the center. Lightly crinkled leaves. Delicious when cooked with apples and a dash of vinegar added to preserve its color. Harvested in the fall. *K20M*

## CARROT {S}

### DAUCUS CAROTA SATIVUS GROUP

---

#### BABY CARROTS

Gourmet type carrots, bred to develop flavor and bright color while still young. Many have a unique rounded shape. Usually harvested when 2 to 3 inches long. Very popular specialty market item.

**Amsterdam Forcing:** 60 days Very smooth, slender, cylindrical, stump-rooted type for forcing and harvesting early as "baby carrots". Grows 6 or 7 inches long and 1 inch in diameter when mature. Flesh is reddish-orange, juicy, crisp, very sweet, virtually coreless, of excellent quality. Short pale green foliage allows for dense plantings. *A2*, *A66*, *B49*, *C85M*, *C95*, *DIT*, *D12*, *E5T*, *E63D*, *G57M*, *K49M*, *RUM*, *R32*, *R47*, *S75M*, etc.

**Babette:** 75 days. Long, slender mini carrot. Smooth, cylindrical roots, 3 to 4 inches long and 1/2 inch in diameter at the shoulder; rounded tips. Good internal and external color. Sweet, crisp flesh with a rich flavor. Excellent early color and sugar development.

**Strong,** 12 inch tops do not break when pulled. *F63*, *G16*, *118M*, *177*, *K49Z*, *K73*, *S95M*

**Baby Spike:** 55 days. Miniature Amsterdam type, 3 to 4 inches long and 1/2 inch in diameter; crisp, very sweet, with exceptional internal color. Colors up and becomes sweet at an early age. Unlike true Amsterdams which become oversized if not harvested at maturity, Baby Spike holds its quality veil past maturity. *C20M*, *C28*, *D76*, *E97*, *184*, *L79*

**Early French Frame:** 67 days. Very smooth, nearly round root, seldom exceeding 2 inches in length or diameter; deep orange-red flesh of good flavor. Quick maturing; ideal for forcing under frames and tunnels, or for early successional sowing outdoors. Performs well in shallow soils. *RUM*, *S61*

**Early Scarlet Horn:** (Dutch Early Scarlet Horn, Early Horn) 68 days. A centuries old cultivar of "baby carrot" for greenhouse forcing and early outdoor use. Root nearly cylindrical, blunt-tipped; 6 inches long, 2 1/2 inches in diameter; skin orange-red; flesh deep orange-yellow, fine-grained, of superior flavor and delicacy. Well-adapted to shallow soils. Introduced prior to 1865. *BURR*, *VILMORIN*; *A2*, *B49*, *F24G*, *I63Z*

**Lady Finger:** 65 days. A gourmet carrot for cooking and serving whole, or canning and pickling whole. Small, cylindrical, golden-orange root; 3 to 5 inches long, 1/2 inch in diameter; flesh tender and sweet, nearly coreless. Short tops. Withstands close planting and produces abundant crops. *DIT*, *D65*, *E5T*, *G13M*, *G57M*, *G87*, *G79*, *H85M*, *184*, *J20*, *J25M*

**Little Finger:** 60 days. Cylindrical, well-stumped root; 4 inches long, 1 inch in diameter; skin very smooth; flesh deep-orange, core very small, very sweet and tender; tops 8 to 10 inches tall. High-density planting recommended. A "baby carrot" suitable for canning, pickling or eating fresh. *A16*, *B6*, *C44*, *F80*, *F82*, *F92*, *G16*, *G79*, *G83M*, *H33M*, *H95*, *I64*, *J97M*, *M46*

**Minicor:** (Amsterdam Minicor) 55 days. A popular Dutch strain of Amsterdam which is used by large commercial packers of baby carrots. Roots are very slender, cylindrical, blunt-tipped; 6 to 7 inches long when mature; flesh deep orange, tender, sweet, fine-grained, never coarse or woody. Usually harvested when 3 inches long. Does well in most soils. *C53*, *D26D*, *D68*, *E24*, *F24M*, *F44*, *G13M*, *K10*, *L7M*, *L42*, *L89*, *L94*, *M32*, *M49*, *Q34*, etc.

**Orbit:** 50 days. A new introduction that is highly tolerant to splitting and yellowing when harvested past maturity, in contrast to Parisienne type carrots. Smooth, round, spherical root; approximately 1 inch in diameter; very sweet; short, dark-green tops, 8 to 10 inches tall. Perfect for the home, market garden or specialty trade. *C28*, *G53M*, *M46*, *M95M*, *N52*

**Parisian Rondo:** (Parisian Ball, Rondo, Round Paris Market, Parisian Market) A 19th century French heirloom that is still popular. Small, uniform, nearly spherical root; only 1 to 1 1/2 inches in diameter when mature; reddish-orange throughout, of excellent sweet flavor. Ideal for processing whole or as a fresh market specialty item. *B49*, *C20M*, *F82*, *N81*, *089*, *Q34*

**Parmex:** 50 days. Paris Market type; an improvement over the standard Planet. A unique round carrot, 1 to 1 1/2 inches in diameter; matures extra early, sometimes with peas. Develops flavor and bright color while still young and smooth. Perfect for growing in heavy soil. For earliest home canning and freezing, and specialty markets. *C53*, *E33*, *G53M*, *111*, *K66*, *P59M*, *S55*

**Sucram:** 65 days. Amsterdam Forcing type. Specifically bred and developed for the select gourmet restaurant and fancy canning trade of Europe. Smooth, slender, cylindrical roots, 2 1/2 to 3 inches long when mature; flesh orange, sweet, tender, of distinct flavor. Good for canning and freezing. *139*, *K49M*, *K49Z*, *RUM*

**Thumbelina:** 50 days. Small, very uniform round roots, 1 to 1 1/2 inches in diameter; thin, tender skin, does not require peeling; bright orange inside and out; crisp, sweet flesh; small core. Short, strong

tops; little or no digging needed. Excellent for “baby” carrots. Widely adapted to various soils, even clay. Ideal for close spacing. All America Selections Winner in 1992. B73M, B75, C92, D26G, D74B, E24, E97, G6, G16, G71, H49,191, J9M, J97M, L89, M29, M32, R47, etc.

### COMMON CARROTS

#### HYBRID

Apache:<sup>1</sup> 65 days. Contains the new Super Sweet gene which contributes high sugar and vitamin A contents Very smooth, dark orange root; grows to 10 inches long; has good early tip fill. Tops reach 18 inches tall; are tolerant to *altmaria*. *AI*, *C20M*, K73, L42, L59G, N52

A-Plus:<sup>1</sup> 65 days. Developed by Dr. Clinton Peterson, the result of new “consumer preferred” plant breeding that is designed to introduce Super Sweet taste and higher vitamin content into new hybrid carrots. Contains 2 1/2 times the carotene and vitamin A of regular strains. Roots medium length, 8 1/2 inches long, dark orange and rich in flavor. H95

Bolero: 70-75 days. Hybrid Nantes type highly rated for flavor. Smooth, uniform, slightly tapered roots; 7 to 8 inches long; good internal and external color; medium core. Excellent sweet flavor, particularly after long term storage. Resistant to *altmaria* blight. One of the most popular carrots in Europe. *AI*, C85M, C92, D27, E24, G6,177, J84, K50, K66, K73, L42, L89, M29, N81, S61M, S95M, etc.

Flyaway: The first carrot to be relatively tolerant of the carrot root fly. Not resistant, but unattractive to egg laying flies and the maggots grow poorly on it. Medium-sized, smooth, sweet roots with the quality of premium Nantes strains. Especially crisp and flavorful when eaten raw. Ideal for organic gardeners. L89, L91M, R32, S55, S75M

Healthmaster:<sup>1</sup> 110 days. Hybrid Danvers type with a high nutritional content. Typically contains 33 to 35% more beta carotene than most other carrots Very large, dark reddish-orange roots, 3 inches or more in diameter and up to 10 inches long. Excellent for slicing or juicing. Usually harvested in the fall, becoming sweeter in storage. D26D, D76, E53M, E97, G57M, G87, H42, H95,139, J20, J97M, L89, L91M, M49

Ingot:<sup>1</sup> 68 days. Long Nantes type. Contains the Super Sweet gene and extra vitamin A content. Cylindrical, 9 inch long root, fills to the tip quickly; deep orange color; good flavor. Similar to A Plus but more slender and cylindrical. Strong, medium-tall tops. Has better seed quality and uniformity than A Plus. For home use, storage and the specialty fresh market. *C20M*, C28, D76, E38, F82, G82, H33M, H42, H54, H95,164,, L7M, L10, L91M

Orlando Gold:<sup>1</sup> 75 days. Contains approximately 50% more carotene and vitamin A than standard cultivars. Extra long, slender root; slightly tapered, almost to a point; rich reddish-orange interior, of high quality and superior flavor; relatively small core. Roots average 12 inches long on muck soils, 10 inches on sand. Introduced in 1982 by Dr. Clinton Peterson. *C20M*, C28, D76, G16

#### OPEN-POLLINATED

Afghan Purple:<sup>4</sup> Very old strain from Afghanistan, one of the centers of diversity for carrots. Dark-purple skin and orange flesh; strong, distinctive flavor. Traditionally used by native tribesmen to produce a fermented alcoholic beverage. In northern India, a similar beverage is known as *kanji*. CAMPBELL-PLATT; F73D

Autumn King: (Autumn King Improved) 70 days. Large, uniform, cylindrical roots; 10 inches long, blunt tipped; crisp, tender flesh, of good flavor, red-cored. A reliable and heavy cropper. Sow in spring for summer use; late May or June for winter storage Very hardy; can be stored in the ground for long periods. B49, K71, L89, N84, O53M, R11M, R32, TIM

Belgium White:<sup>3</sup> 75 days. Pure white carrot of very mild flavor; 7 to 8 inches long, 3 inches across at the top, tapered and pointed; nearly coreless. Can be harvested small, but retains its flavor and quality when older. Good for steaming or cooking in casseroles. Vigorous and productive. Not hardy; must be harvested before frost. B49, O89

Berlicummer: (Berlicummer Bercoro) 65 days. Improved Nantes type. Long, straight, blunt tipped root; up to 10 inches in length, 1 3/4 inches in diameter; orange throughout; coreless; excellent flavor; does not split or crack. One of the best late cultivars; an excellent keeper. For home gardens or market. C85M, RUM, R32, S55

Beta III:<sup>1</sup> 80 days. Contains 3 to 4 times the carotene and vitamin A of regular strains. Developed by Dr. Clinton Peterson of the University of Wisconsin and the USDA. Initially bred to help prevent vitamin A deficiency blindness in underdeveloped countries. D26D, D33

Beta Sweet:<sup>14</sup> Unique purple carrot developed at the Texas A & M Vegetable Improvement Center. Slender, tapered roots, 7 or more inches long and about 1 inch in diameter; attractive, maroon-colored skin and 1/5 inch radius of flesh; bright orange core. Very sweet and flavorful. High in beta-carotene. Dark-green tops, 12 to 12 1/2 inches tall; very tolerant of *altmaria*. Good specialty market item. L89G{OR}, N40{PR}

Blanche a Cbilet Vert:<sup>3</sup> (White Belgian) Root long and thick, sunk in the ground for two-thirds or three-fourths of its length, white on the underground portion, and green or bronze purple above; flesh white, usually tinged with yellow. Heavy yielding. Primarily used for feeding cattle and horses. Introduced prior to 1885. VILMORIN; E5T

Camberley: An excellent combination of Berlicummer and Danvers types. Uniform, 7 to 9 inch long roots, very deep orange throughout. Unique, delicious flavor. Will grow in heavy soils and can be left in the ground over winter. Bred for the canning market and the increasing numbers of organic commercial growers. B49, E24, S75M

Danvers Half Long: (Danvers) 75 days. Roots 5 to 6 inches long by 1 1/4 to 1 3/4 inches thick when used for bunching, tapering to a short-tapered or slightly rounded end; deep-orange flesh, slightly more yellow core. Not adapted to heavy or shallow soils. Standard cultivar. Originated in Danvers, Massachusetts. Introduced in 1871. MAGRUDER 1940; A2, A16, A25, B75, B78, D82, E38, E59Z, F82, F92, G57M, H33M, 184, K5M, L7M, etc.

Dragon:<sup>4</sup> (Purple Dragon) 75 days. Unique purple carrot. Resembles Danvers or Berlicummer in shape. Deep purple skin with contrasting interiors which may vary from solid orange to orange-yellow to bright yellow. Distinctive, sweet spicy flavor. Excellent either raw or cooked. Ideal for specialty markets and farm stands. E24, N24M

Flakkee Long Flacoro: (Flakkee Long Red Giant, Flakee Vita Longa) 65 days Very large, strong root; stump-rooted and red-cored; up to 24 inches long and 4 inches thick. Excellent for storage. High yielding, improved strain. Good flavor. Also used for stock feeding. B49, C85M, 181, N84, RUM, S55

Gelber Goliath: (Yellow Goliath) Late-maturing, very productive carrot from Austria. Extra-long, conical, yellow roots; tapering to a point. Used industrially by the frozen vegetable trade. Also grown for the edible green tops. N81

Gold Pak: (Gold Pak 28) 75 days. Emperor type. Smooth, tapered, nearly cylindrical root; 9 inches long, 11/4 inches in diameter; rich reddish-orange flesh, nearly coreless, of good quality; stores and ships well. Very short tops. Widely used for bunching and cello packs. Needs a deep loamy soil. All America Selections winner in 1956. B6, C28, C44, D27, D76, E97, G16, G57M, K71

Herz Zino: (Lange Rote Stumpfe Ohne Herz Zino) 85 days. Has appeared in the Guinness Book of World Records as the world's largest carrot, weighing in at 7 pounds 11 1/2 ounces. Also widely grown for juicing, containing 55% juice per carrot. Average length 8 to 10 inches. For late summer and fall crops. Introduced prior to 1875. L91M, Q18, R50

Imperator: 70 days. Long, tapered, deep reddish-orange, coreless root. Extensively used for bunching. Adapted only to deep, well-drained sandy or loamy soils. Needs a long growing season of moderate temperatures to produce long, straight, slender, well-colored roots. Originated as a cross between Nantes and Chantenay. Introduced in 1928. MAGRUDER 1940; A25, D65, F82, G57M, G83M, G87, 167M, K5M, K71, M46, M95M

Indian Long Red:<sup>2</sup> Very long and tapering. Offers more of the true carrot taste than the typical blunt spindly forms, and hence is preferred as a sweeter vegetable compared to American cultivars. Q45M, R50

James Scarlet Intermediate: (James' Intermediate) 80 days. Heaving yielding main-crop carrot from England. Half-long, perfectly symmetrical, tapered root; skin and flesh well-colored, reddish orange; flesh tender, of very good flavor; resists splitting. Requires a rich light soil. Introduced about 1870. VILMORIN; B49, 053M, R32, S55

Juwarot:<sup>1</sup> (Juwarot Double Vitamin A) 70 days. Contains double the vitamin A content of normal cultivars, or about 249 milligrams per kilogram. Large, deep orange root; very sweet and juicy. Heavy yielding; good for winter storage. In some countries carrot juice is made specifically from this cultivar. B49, K49T, L91M

Kinko 4 Inch: 55 days. Chantenay type. Small, conical, stump-rooted carrot; deep reddish-orange inside and out; flesh crisp and sweet; quite resistant to cracking. Achieves color and size early. Recommended as first-early carrots, especially on shallow soils. Should be harvested young for best quality. G6, G33

Kintoki Regular Strain:<sup>2</sup> (Crimson Wonder) 140 days. A unique crimson-fleshed carrot from Japan. Long, tapered root; 10 to 11 1/2 inches in length, 2 to 2 1/4 inches wide at the shoulder which is square; skin deep red, glossy; flesh tender and sweet. Best sown from July to October for winter culture in the Northern Hemisphere. F73D

Kokubu: (Japanese Long) 150 days. An endemic cultivar popular in the eastern half of Honshu, Japan where arable soil is quite deep. Roots are commonly 2 feet or more long, 1 1/2 to 1 3/4 inches wide at the shoulder, gradually tapering to a pointed tip; of deep orange color. A late cultivar adapted to summer sowing for a winter harvest. L3J

Kundulus: 65 days. Small, round root; 1 1/2 to 2 inches in diameter; deep orange skin; good flavor. Ideal for quick successional crops and forcing. Produces well when grown very close together. Suitable for window boxes, flats, frames, heavy or shallow soils. Good for freezing and canning. L91M

Kuroda: (New Kuroda) 70 days. Chantenay type. Smooth, medium-sized roots; about 6 inches long, 2 inches in diameter at the crown; tapered and stump-rooted; very good flavor for a Chantenay. Good for heavy soils. For fall crop only; to avoid bolting, do not plant before mid-June. B8M, C53, D1T, D26D, F13, F44, G16, G87, 191, J39, K49Z, Q3, Q28, S63M, 870

Lobbericher: Heirloom yellow carrot from Austria. Late-maturing and very productive. Long, cylindrical, dark yellowish-orange roots; tapering to a point. Traditionally used by the industrial frozen vegetable trade. N81, 089

Long Orange Improved: (Long Orange) 85 days. Roots 12 inches long, 2 inches thick, tapered to a point. Flesh reddish orange with a core of a lighter shade. Useful for both table and stock feeding. Plant in loose soil, and for table use, harvest before roots reach mature size. An improved strain of a cultivar introduced by Dutch breeders

in 1620 and brought to North America by early settlers. I63Z, L7M, L10, Q18

Long Red Surrey: Root very long, narrowing gradually, 5 or 6 times as long as broad, often 12 to 14 inches in length; has a distinctive yellow core. Excellent for fresh markets and also freezes well. Requires a rather deep soil, but is unusually productive. The long root makes it more drought-tolerant when grown on sandy soils. Introduced about 1834. VILMORIN; B49, F73D, N84, R32

Manchester Table: Uniformly long, cylindrical root with a blunt end; sweet, crisp, deep-orange flesh; fine-textured; small core. Selected strain of the Nantes type. Sow in spring and summer. Excellent performer in Australia and New Zealand. PIG, TIM

Nantes Half Long: 65 days. Smooth, well-shaped, perfectly cylindrical root; 6 to 7 inches long, 1 to 1 1/2 inches thick for the whole length; flesh deep orange, fine-grained, tender, sweet, practically coreless, of very high quality. Popular for home garden and local market use. A25, B75, C44, G57M, G87, /59M, L7M

Oxheart: (Guerande) 75 days. Roots short-conic or heart-shaped, very blunt at the lower end; 5 to 6 inches long, 2 to 2 1/2 inches thick; medium-orange, coarse flesh, yellowish core. Rapid growing. Produces well on shallow and heavy soils. Originated in France. Introduced prior to 1884. MAGRUDER 1940, VILMORIN; A2, D82, E24, K20M, K49M, K49T, K71, L7M, L88J, N24M, S55

Red Cored Chantenay: (Chantenay Long Supreme) 70 days. Large, smooth root; slightly tapered, stump-rooted; 5 1/2 inches long, 2 1/2 inches in diameter at the shoulder; deep orange flesh and core, of high quality. Good for bunching. Widely used for canning and freezing. High yielding. Grows well in most soil types. Introduced in 1929. MAGRUDER 1940; A16, A75, D82, E24, F1, F92, G16, G57M, 184, K49T, K73, L7M, M49, N16

Rouge Muscade: 72 days. An old North African heirloom. Large, irregular, unattractive root, often grows to a pound or more; flesh highly aromatic, thick-meated, juicy, sweet, of excellent flavor; core often tinged with green. Excellent for juicing. Bred to grow quickly in the cool winter months; has a tendency to bolt in hot weather. PHILLIPS; L77D

Royal Chantenay: 65 days. Smooth, blunt, cylindrical root, tapers only slightly; 6 to 7 inches long, 2 1/2 inches in diameter; reddish-orange, with uniform interior color; sweet, tender flesh. Used for bunching, market, storage, juicing, canning or freezing. Recommended where soils are too heavy or shallow for most other carrots. B75M, C85M, F82, G57M, H33M, H42, H61, H95, J97M, 191, K71, L79, L89

Scarlet Imperial Long: Longest carrot known; a record was set in 1975 by a California gardener, who grew a carrot that measured 38 1/2 inches from crown to root tip. Skin and flesh salmon-orange; flesh crisp, sweet in flavor. Best grown in deep loam soil. K49T

Scarlet Keeper: 85 days. A large, late cultivar exclusively for fall harvest and winter storage. Heavy, cylindrical, blunt tipped root; 7 to 8 inches long; dark orange with a large, good-colored core. Heavy yielding. Comes out of winter storage in good condition; never turns bitter. A2, E24, H15P, N24M

Scarlet Nantes: (Early Coreless, Nantes Coreless) 65 days. Smooth, cylindrical root; 6 to 7 inches long with very little taper; rich orange-red color throughout; flesh sweet, fine-grained, completely free of any heart or core, of very high quality. Freezes and stores well. Excellent for home gardens and market. A75, D82, E24, F44, F80, G6, G71, H33M, H42, H95, 184, K71, K73, M46, N16, etc.

Scarlet Wonder:<sup>2</sup> 110 days. Long, tapering root; 12 to 15 inches in length; attractive deep scarlet color; very sweet and tender. Should be grown for cooking rather than fresh use. Suitable only for summer sowing for a fall to winter harvest. Very distinct. C20M, 177, K49M, S63M

Short 'n Sweet: 65 days. Shorter Goldinart or Red Cored Chantenay type. Short, thick root; 3 to 4 inches long, 2 inches in diameter at the shoulder; bright orange throughout; flesh rich, sweet, juicy. Excellent for canning and freezing. Does well in both heavy and shallow soil. For early summer and fall crops. B75, D65, G71

St. Valery: (New Red Intermediate) 70 days Very smooth, very uniform root; 10 to 12 inches long, 2 to 3 inches broad at the shoulder; skin bright reddish-orange, attractive; flesh thick, sweet, tender, with very little core. Tops very short and sparse. Performs best in light, rich, well-prepared soil. May be regarded as the connecting link between the half-long and long types. Introduced prior to 1885. VILMORIN; B8, B49, G53M, J73, N84, 053M, R32, S17, S55

Tendersweet: 75 days. Improved Emperor type. Large, cylindrical roots, 7 to 9 inches long with semi-blunt ends and narrow shoulders; deep orange-red in color; crisp, sweet and free of fiber; coreless. Excellent for carrot sticks. Requires a loose, deeply worked soil rich in organic matter to achieve full quality. B6, B8M, D26D, D76, E97, G57M, L7M

Topweight:<sup>1</sup> 80 days. Large, smooth root; 10 to 12 inches long, 3 inches in diameter at the full round shoulder; orange-red; good, sweet flavor. Yields well under adverse growing conditions. Will over-winter in the ground for 6 months without deterioration, cracking or splitting. Extremely high in carotene, vitamin A and vitamin C content. A2, N24M, PIG, R47, TIM

Touchon: (Nantes Touchon, Nantes Special Long) 65 days. Nantes type, but has more intense coloring and is somewhat longer. Smooth, cylindrical roots; 6 to 7 inches long and 1 to 1 1/2 inches broad; deep orange throughout; flesh tender, crisp, sweet, coreless, of very high quality. Good for bunching and winter storage. Sow in spring or summer. A2, C53, D11M, D65, E38, E63D, F70, G68, G87,139, K49Z, K71, M49

#### CODES FOR SPECIAL TYPES

1. High Vitamin A
2. Rea-Skinned
3. White-Skinned
4. Purple-Skinned

## CAULIFLOWER {S}

### BRASSICA OLERACEA BOTRYTIS GROUP

#### SUMMER CAULIFLOWER

**GREEN** (Broccoflower, Cauli-Broc) Mild, delicately flavored cauliflowers with attractive light-green heads. Sweeter than either broccoli or cauliflower. The Romanesco types, sometimes called *Roman broccoli*, have distinctive, spiral-shaped heads. Becoming widely available in specialty sections of supermarkets. The name broccoflower is a trademark of Tanimura and Antle. FIELD; H49, 191, K57{PL}, M46, N24M

#### Hybrid

Chartreuse II: 62 days. Hybrid version of Alverda. Brightly colored, lime-green heads with a distinctive flavor when cooked. The heads do not require blanching as do most white types. Likes slow, steady, unstressed growth for best quality. Should not be grown for mid-summer harvests Very uniform in both curd and plant. E75{PL}, L42, Q34

Green Goddess: 65-70 days. Hybrid Alverda type with exceptional uniformity. Dome-shaped, bright lime-green heads with a distinctive mild, sweet flavor. Easy to grow, no tying of heads required. Recommended for spring and fall crops. Good specialty market item. B75, K10, K60M

Green Harmony: (Floccoli) 80 days. A new cross of broccoli and cauliflower developed in China. Heads pale green in color; medium sized, up to 1 3/4 pounds; tender, with more flavor than cauliflower. Unlike white cauliflower, it does not need to be blanched. Should not be sown before mid-May. L91M

#### Open-Pollinated

Alverda: 64 days. Very uniform, medium-sized heads with a bright yellow-green curd color. Excellent taste, raw or cooked. Medium-sized, productive plants; easy to grow, no tying required. For summer and autumn production. Very popular in specialty markets in Europe and the United States. AI, C20M, F13,177, J74, K73, L89, M49, R32, R47, S55, TIM

Brocoverde: 65-70 days. Medium-sized, semi-domed heads weighing 14 to 16 ounces; mild, sweet, distinctive flavor. Twice as high in Vitamin C and folic acid as regular cauliflower or broccoli. Strong, upright plants of medium height. Tolerant of warm weather, producing heads when regular cauliflower or broccoli fails. Recommended for home gardeners and fresh markets. Ideal for specialty markets. A16, B8M, B75M, C85M, D26D, D56M, E97, F63, G16, G27M, G82, G83M, H57M, K71, M29, M65, etc.

Bronzino:<sup>1</sup> Romanesco type. Very large, yellowish-green heads with small, compact curds. Excellent flavor. An earlier form of green cauliflower for short season areas. Matures a full month or so earlier. Q11M

Chartreuse: (Green Ball) 60 days. Pale lime-green heads, resembling cauliflower; flavor very much like broccoli; texture and quality excellent. Does not require tying or blanching like white cauliflower. Developed in America from Pua-Kea cauliflower crossed with Spartan Early broccoli. E91G

Minaret:<sup>1</sup> 75-85 days. A highly refined Romanesco type, smaller and more uniform. Unusual spiraled, peaked, pale green heads; 4 to 5 inches in diameter. Excellent in fresh salads and dips. Vigorous, productive cauliflower-like plants. For spring and fall crops, and winter harvest in mild areas. C53, G6,177, L89, N84, S75M

Natalino:<sup>1</sup> (Early Romanesco, Precoce Romanesco) 120 days. Highly refined Italian strain, well adapted in mild areas. Medium-sized, spiral-peaked heads, 5 1/2 to 6 1/2 inches in diameter; an attractive chartreuse color. Large, vigorous plants, require about 10 square feet each. Usually planted in spring and summer for fall and winter harvests. D68, J20, Q11M, Q34, S17

Romanesco:<sup>1</sup> 85 days. Unique, compact, spiral-pointed heads with a beautiful pale-green, almost chartreuse color and a delicate, sweet flavor. Individual florets make an exceptional erudite, or the entire head may be cut and used as cauliflower. For spring and fall crops, but flavor is enhanced by cool weather. Grown commercially in northern Italy. A2, B6, B49, F80, 139, K49M, K49T, K57{PL}, L91M, N40{PR}, PIG, R32, R47, S55

Romanesco M:<sup>1</sup> Attractive, light-green, spiraled cauliflower-like heads, 5 to 6 inches in diameter. Sweet, nutty cauliflower-broccoli flavor. Pleasant, firm texture. Heads are of the highest quality when formed in cool weather. Plant in May and June for a harvest in the fall. J9M

Shannon:<sup>1</sup> 80 days. Spiraled, yellowish-green heads with peaked florets, 6 to 7 inches wide; very attractive, resembles Minaret. Excellent for salads and dips. Large, uniform, very vigorous plant, produces large crops in late summer and fall. Keeps well in storage. K50, N81, P59M

Universal: 90 days. Very solid, heavy, bright green head, about 5 inches in diameter; fine beads. Excellent flavor raw or cooked. Medium-sized plant, requires no tying of leaves. Needs even, cool growing conditions. Crops are harvested in the fall. K50

ORANGE*Hybrid*

Orange Bouquet: 75 days. Hybrid of a white cauliflower and a high-carotene orange cauliflower. Semi-domed heads of pale buttery orange or creamsicle color. Much higher in Vitamin A and carotene. Retains its color after cooking. Wrapping isn't recommended as sunlight heightens the color. Suitable for spring or fall plantings. D56M, G6, M65, Q34, S63M

*Open-Pollinated*

Marmalade: Unique orange cauliflower which has good potential as a specialty market item. Domed heads of buttermilk and orange color. Excellent crunchy texture. Retains its attractive color after cooking. Tying the outer leaves over the head is not recommended. Very vigorous, early maturing plants. B49{OR}, R32

WHITE*Hybrid*

Candid Charm: 75 days. Large, very heavy, deep dome-shaped heads; 7 to 9 inches across; uniform in maturity; quality excellent, non-ricey, long holding ability without purple cast. Excellent for fresh market. Vigorous, semi-upright plant; very high yielding; large dark-green leaves for good curd protection. Does best in cool areas. A1, D68, E24, F63, G13M, G82, H61, J74, J84, K10, K16M, K50, K73, L79G, M29, R32, S55, etc.

Fremont: 65 days. Main season "two cut" hybrid. Very white, deep, smooth curds averaging 7 inches across. Large, vigorous plants with exceptional self-wrapping ability; tolerant of heat and stress. Very uniform under varying weather and soil conditions. Recommended for fresh market. Also popular with home gardeners. G6, G13M, J74, J84, K10, K50, K73, L42, L89, M29, M49, N81

Mini:<sup>2</sup> Small, perfectly formed heads of good quality. By planting 1 foot apart in all directions, 4 "baby" or "mini" cauliflowers, about 4 inches in diameter, can be harvested in the same space needed for 1 regular cauliflower. Make successive sowings from spring to fall. TIM

Snow Crown: 50 days. Extremely early, dependable hybrid that shows unusual seedling vigor. Heads are uniform, medium-sized, domed, and solid with good curd quality whether harvested in summer or fall. Flavor mild and sweet. Good resistance to moderate fall frost (25-32° F.). All America Selections winner in 1975. A16, A87M, C85M, G6, G71, G79, H33M, H61, I39, K73, L89, M46

Snow King: (Early Snow King) 45 days. Extremely early hybrid that stands heat very well, and shows good resistance to various diseases. Heads pure white, well-rounded; weighing 1 to 2 pounds each; free from leafiness and riceyness; holds quality well. Plants are erect, vigorous, with rather large leaves that protect center head from frost and sun. All America Selections winner in 1969. DI 1M, D76, E53M, E97, E97, F70, G16, M46, Q11M

*Open-Pollinated*

Alert: 55 days. Vigorous, short-stemmed plant of the Early Snowball class, but with deeper heads and finer texture than others of this type. Heads are pure-white, about 3 1/2 pounds each. Upright leaves offer somewhat better curd protection and are easier to tie and trim. When grown from spring transplants it is often earlier than Snow Crown. F44

All The Year Round: 70 days. Large, compact well-protected head; holds without going to seed for a long period even in hot weather. Suitable for sowing at most times of the year, but ideal for autumn sowing or sowing under glass in early spring. Good for freezing. Most popular cultivar in Europe. B49, K49M, N84, O53M, R32, S55, TIM

Andes: 68 days. Dense, heavy, well-domed heads; not susceptible to riceyness or pinking. Strong, upright foliage and heavy wrapper leaves assures good protection without tying. Suitable for early as well as late sowing, having good tolerance to heat as well as cold conditions. Excellent for freezing. A87M, C85M, G13M, J84, K10, K50, K73, L42, M49, N52

Dominant: 75 days. Very large, heavy, extra firm, snow-white heads. Vigorous growth gives excellent curd protection. Does best on fertile land and has an extensive root system that provides some tolerance to long dry periods. Highly recommended for the quality late crop. D68, E24, F6J, J9M, K49M, N84, R32, S55

Early Snowball: (Extra Early Snowball) 60 days. Uniform, small to medium head, 5 to 6 inches in diameter; smooth, thick and heavy; does not discolor during poor weather. Of dwarf habit, with very short outer leaves, allowing it to be planted close together. Standard main crop Snowball type. Known prior to 1884. A2, B75, B78, E59Z, F80, F82, F92, H33M, H42, H95, J9M, K49M, K71, L7M, L35{PL}, etc.

Early Snowball A: (Super Snowball A) 55 days. Uniform maturing, smooth, pure-white heads; 6 inches across, and weighing 3 to 5 pounds each. Medium-sized plant with good leaf coverage. Fine for greenhouse forcing, frames or outdoor culture. B75M, DIT, D74B, FI, F63, G27M, G71, H61, J14{PL}, J20

Garant:<sup>2</sup> 82-86 days. Early maturing "mini" cauliflower. Specially selected for direct sowing, it is quick-growing, vigorous, without a heavy foliage canopy and will not mature all at once. Harvested when 1 1/2 to 3 1/2 inches across, the small heads are ideal for freezing. Good for small gardens, the plants can be spaced at a distance of only 6 inches x 6 inches. U15

Hormade: 60 days. Produces large, extra-firm, deep white heads of excellent quality. May be harvested over a long season. Large-leaved, vigorous plants have good self-wrapping ability. Resistant to mildew, heat and water stress. R11M, S95M, TIM

Perfection: A fast-growing summer cauliflower still popular with market growers in England, but creamy curded and suffering from competition from whiter kinds. Introduced in 1905. N84, S75M

Predominant:<sup>2</sup> 90-94 days. Late maturing "mini" cauliflower. Can be sown later than Garant for heads that mature in September and October. Small heads require no trimming and are ideal for freezing. Sow in succession from June onwards. Developed by the National Vegetable Research Station of Great Britain. S75M

Self-Blanche: 68 days. Snowball type, with smooth, pure white heads, 6 1/2 to 7 1/2 inches in diameter. Under cool growing conditions, has the ability to produce wrapper leaves that will curl around the head protecting it from the sun. Early crops will not self wrap during warm weather. Best grown as a fall crop in cool growing areas. D82, E91G, G79, G82, H95, K10, K49M, K71

Snow Pak: 80 days. Large, dome-shaped, heavy heads; curds are uniform, creamy-white, deep, firm and smooth. Clasp inner wrapper leaves make it less necessary to tie the leaves for blanching. Well adapted to dry, arid growing areas. For fresh market and processing. C20M, E53M

Snowball X: (Giant Snowball X) 65 days. Large, solid, pure-white head; matures gradually over a period of days, providing a longer cutting period; sure-heading. Outer leaves are long and strong, giving complete protection. Well adapted for use under a wide range of conditions. Highly recommended for home gardens. A16, B49, DIT, D11M, F70

Snowball Y: 70 days. Vigorous growing, high quality Snowball type for an autumn crop. Large, deep, smooth, heavy white head; 6 inches in diameter; matures uniformly over a long harvest period. Heavy outer foliage provides good protection. Recommended for fresh market and home use. DIT, D26D, F6J, G13M, G57M, G82, G93M, H61, I59M, J84, M32, N16

Stovepipe: 55 days. Medium to large head, 5 to 6 inches in diameter, free of riceyness in hot weather. Tall, smooth, erect, stovepipe-like leaves protect curd from exposure to the sun. Grows well in summer, holding at temperatures of 90 to 95° F.; not tolerant of frost. Developed at Michigan State University. Introduced in 1981. U8D

Super Snowball: (Early Super Snowball) 55 days. Large, solid, deep, finely-grained, ivory-white head; 6 to 7 inches in diameter; matures evenly; fine quality, mild delicate flavor. Vigorous, compact plants. Extra early Snowball type, yet unexcelled for the late or main crop. For fresh market or freezing. A25, D27, D56M, D76, E38, G57M, L79

Veitch's Autumn Giant: (Autumn Giant) 80 days. Very large, firm, beautiful white head; well-covered by the inner leaves; matures in late autumn. Large, vigorous growing plant, with a longish stem; hardy. Very old cultivar, known before 1885. Still popular in England. VILMORIN; N84, 053M

White Rock: 75 days. Deep, firm, dome-shaped white heads; 6 1/2 inches in diameter; beautiful, smooth curds. Outstanding self-wrapping ability, can sometimes be grown without tying under cool conditions. Vigorous, erect, medium-sized plants; widely adapted. For late summer and autumn crops. *Al*, C20M, G71M, I50G, J74, J84, K10, K73, L42, L89, M29, N52, R32, S75M

White Summer: 65 days. Firm, deep, smooth pure-white heads; marketable at 6 inches; very good color and texture; can be harvested over a very short period. Excellent curd protection, although tying may be necessary for larger heads. Widely adapted for a mid-season fall crop. C20M, F63, K73

#### WINTER CAULIFLOWER

Armado Spring Plus: 210-270 days. A blend of 5 high quality, Walcherin-type cauliflowers for overwintering in moderately severe climates (above 10° F.). They produce fine, salad quality curds late March through early May. Each cultivar is bred to produce a highly concentrated harvest; when sown together at one sowing date this blend will increase the length of harvest. L89

Early March: (St. Valentine's) Medium-large plants produce large, 6 1/2 inch, smooth, white heads of excellent quality. Direct seed August 15 to 31 for a late winter harvest. C20M

Headman: Multi-headed type. Has the potential to double the yields of ordinary overwintering cauliflower. Most plants will form a typical central head and up to 3 or 4 large side heads. Very white, well-wrapped heads. Developed by Tim Peters. J9M

Inca: The best overwintering cultivar for the Puget Sound area. Developed and commercially grown in the Skagit Valley region. Produces large, firm, high quality heads weighing 2 pounds. Very good frost tolerance; abundant wrapper leaves. Sow seeds in late July and harvest cauliflower from late March to early May. F82, N84, P59M, R32, S55

Late Queen: 90 days. Very hardy, reliable, overwintering cultivar producing large, cream-curd, well-protected heads of good quality; ready for harvesting in April and May. A selection of English Winter. Popular market cultivar in England for over a century. S61

Nine-Star Perennial:<sup>3</sup> (Nine-Star Perennial Broccoli) Tall-growing perennial, producing numerous, pure-white shoots, resembling tiny cauliflowers. Each plant develops a small head surrounded by 9 or 10 smaller ones every spring and early summer, for 4 to 5 years. Plant out at 3 feet apart. Should be planted against a fence, or in an out of the way part of the garden where it can be left undisturbed. ORGAN [Cu]; K49T, 053M, S61

Snow's Winter White: 110 days. Should be sown late spring for a harvest beginning in December and lasting through March if continuous sowings are made. Cold tolerant, but not recommended for very cold districts where severe frosts are likely to discolor the curds. Easier to grow than spring cultivars. B49, 199M, K49T, N84

#### CODES FOR SPECIAL TYPES

1. Spiral-Shaped
2. Mini or Baby
3. Perennial

## CELERIAC {S>

### APIUM GRAVEOLENS RAPACEUM GROUP

#### HYBRID

Mentor: 110 days. Refined, high yielding strain. Large, uniform, smooth round roots; firm, very fine-grained white flesh with a rich, nutty flavor; quality excellent, free from discoloration, pithiness and hollow-heart. Tolerant of cold weather, becoming sweeter after the first frost. Easy to grow. Originated in the Netherlands. J97M, K66

#### OPEN-POLLINATED

Alabaster: 120 days. Round, healthy, smooth-skinned, turnip-shaped root; white inside and out; fine-textured flesh; remains white even after being cooked; keeps well. Best used when about 2 to 4 inches in diameter. Heavy yielding. C20M, G93M, J82, J84, PIG

Alba: Short leaved type. Medium to large, white-skinned roots with very firm pure white flesh. Roots remain white even after blanching. Good flavor and quality. Matures in midseason, and has good resistance to sprouting. Suitable for fresh market and processing. Originated in Europe. C95, N81

Brilliant: 100-110 days. Refined, high yielding European strain. Round, medium-large, relatively smooth roots with buff-colored skin; very uniform; firm, attractive white flesh with a richer than normal flavor; resists pithiness, discoloration and hollow-heart. Dark green foliage. Keeps very well in cold storage. A2, D11M/E75{PL}, F70, G6, G93M, K50, K57{PL}, L3J, L89

Balder: Fine, large, smooth-skinned, heavy-yielding cultivar from Europe. Excellent flavor and texture. Roundish shape and very white flesh. Resistant to septoria disease. Easily grown and requires no earthing up. B49, N84, 053M, R32

Diamant: Excellent celeriac for fresh market with nicely sized roots and excellent internal color and quality. Has no hollow crown and very little off shoots. Stands three-quarters above the ground and is therefore very easy to harvest and clean. C53, D68, K50

Dolvi: 120 days. An outstanding cultivar bred for multiple disease resistance and vigor. Large, nearly round, heavy roots; white interior of fine texture; excellent quality and flavor when cooked or used raw; stores well. 139

Giant Prague: (Prague, Smooth Prague, Large Smooth Prague) 115 days. Root large, almost spherical; evenly shaped; without rootlets, except on the bottom; smooth skin; thick, mild white flesh; stores well for winter use. Best quality is obtained if roots are harvested when 3 to 4 inches in diameter. Standard cultivar, introduced prior to 1885. A16, C44, C85M, D27, E5T, E63D, G68, G71, J20, K49M, L42, M49

Jose: 110 days. Very large roots are round, attractive and relatively smooth and free of offshoots. Tops produce little foliage. The interiors are very white and flavorful, and resist pithiness and hollow heart. Quality very good. Can be planted closer together than other cultivars. L77D, P59M

Marble Ball: 105 days. Uniformly large, smooth, globe-shaped roots; quite free of offshoots; flesh white, thick and solid, nearly free of pith; flavor and quality excellent; stores well for winter use. Best used when 2 inches in diameter. Heavy yielding. N84, P59M

Monarch: 120 days. Very large, smooth, pale-colored roots that wash well; firm white flesh; does not discolor when cut or blanched.

Very well adapted to canning. Heavy yielding. Scab resistant. C85M, C95, L91M, N81, S61M, S75M, S95M

Prague Model: 110 days. Larger in size than the old Giant Prague cultivar. Has globe-shaped roots with small rootlets, fewer in number; fine-flavored flesh; keeps well for winter use. Needs a rich soil. K49M

Snow White: Improved European strain known for its fine inner bulb quality. Large, smooth, well-shaped roots that weigh 4 to 5 pounds; firm, snow-white flesh of excellent flavor. Harvested from late summer through fall. Good bolt resistance and storage qualities. Originated in Denmark. 139, K10

Wiener Riesen: Very large, brown-skinned roots with pure white flesh. Matures midseason to late, somewhat later than standard cultivars. Good resistance to sprouting. Translates as "Viennese Giant". Originated by Austroaat. N81

## CELERY {S}

### APIUM GRAVEOLENS

#### GREEN CELERY

##### HYBRID

Victoria: 100 days. Strong, fleshy, upright stalks with an appealing apple-green color. Excellent flavor and quality. Bolt resistant, holding its quality for a long time Very widely adapted, grows where celery is traditionally difficult to grow. The first hybrid celery bred in Great Britain. Developed by A.L. Tozer. L91M, N84, S75M

##### OPEN-POLLINATED

Chemin: (Golden Yellow) Very distinct celery, the leaves and stalks being naturally suffused with a yellow or golden hue. Broad, solid, ivory-white stalks. Does not require blanching, but stalks are more tender and of better quality if earthed-up in the usual manner. French heirloom from the 19th Century. Originated by M. Chemin in a market garden near Paris. VILMORIN; P59M

EA Special Strain: Tall Utah type with more upright, bright-green stalks which are over a foot long. Better developed hearts with extra trimmed weight. High yielding plant, widely adapted. Good resistance to disease and bolting. Developed by Bountiful Gardens. Selected from Ventura. B49

Florida 683: 90-100 days. Busty, compact, full-hearted plant, 22 to 26 inches in height; medium-green in color blanching to a rich cream; stems broad, thick, solid, 10 to 11 inches long. Resistant to fusarium yellows and mosaic. Selected from Utah 52-70, for higher rib count and better heart formation. A1, C20M, F63, J84, K73, L42, N16

Fordhook: (Burpee's Fordhook, Emperor, Hauser) 130 days. Stocky, compact plants, 15 to 18 inches in height; stalks are thick, stringless, tender but crisp, juicy; after blanching they are a pure silvery-white with a large, tightly folded, full heart of a delicious nutty flavor. Ideal for fall use and winter storage. I67M

Fordhook Giant: 120 days. Short, stocky, dark-green plants, 15 to 18 inches in height; easily blanched to a greenish white with a golden heart. Stalks thick, tender and stringless; flavor very good to excellent. K49M

Giant Pascal: 120-130 days. Large, stocky, dark-green plants, 24 inches in height; hearts are tender, brittle and of good quality; broad, distinctly ribbed, thick, solid stalks, blanch easily to a good creamy-white color; quality very good, flavor nutty. Resistant to blight. Standard green celery for the fall market. C44, D26D, E63D, E53M, G57M, H57M, I59M, K27M, K49M, K71, L79

Tendercrisp: 90-100 days. A productive Giant Pascal type, more uniform and upright than other cultivars. Grows 23 inches high, with compact, massive heads; stalks are 11 to 12 inches long, smooth, glossy, and dark-green in color; large heart; quality and flavor are excellent. Highly recommended for home gardens. PIG

Utah: (Utah Green, Utah Tall Green, Utah Golden Crisp) 90-100 days. Vigorous, stocky, compact plants, 20 to 24 inches tall; medium-broad, full rounded, thick, solid stalks that are tender, crisp and stringless; quality very good, rich, nutty flavor; tightly folded hearts; readily blanches white. Popular home garden cultivar. A16, B6, D27, D82, E38, F92, G83M, G87, J97M, K49M, L11, PIG

Utah 52-70: (Tall Utah 52-70) 120 days. Green Pascal strain with an upright, compact growth habit, 25 to 30 inches in height; good heart development; dark-green stalks and foliage; 10 to 11 inches to the first joint of the stalk; stalk thick, smooth, solid, tender and crisp, of excellent quality. Highly resistant to bolting under adverse weather conditions. Recommended for home garden and commercial plantings. A2, C97, DIT, D12, FI, F63, G13M, G27M, G79, H57M, H95, J20, K50, L42, M49, etc.

Utah 52-70R Improved: A tall green Pascal type, more refined and slightly taller than regular Utah 52-70. Very compact, erect plant, 25 inches high; good heart development with thick, smooth, waxy stalks and attractive dark-green foliage. High yielder; susceptible to bolting. Standard market garden and shipping cultivar throughout the United States. A1, A87M, B75, B75M, C85M, DIT, D26D, F82, G71, G93M, H61, I91, K73, N52

Ventura: 80-100 days. A widely adapted, early, tall Utah type with more upright growth and better developed hearts. Plants average 28 inches in height with long, crisp stalks, 13 inches in length, deep glossy-green in color; retain their crispness. Some resistance to some strains of fusarium yellows. Excellent bolt resistance. C20M, D11M, D68, E24, E75{PL}, F70, G6, G79, J9M, K73, L42, L89, L94, R47

Verde a Costa Piena Gigante: Vigorous, upright plant with distinct long, slender stalks. Both leaves and stalks are an attractive deep green color. Very fragrant, of excellent flavor. Resistant to disease. Grown especially for a fall crop. Q11M, SI 7

##### SELF-BLANCHING CELERY

More compact in growth habit than green celery, if planted close enough together the plants will blanch themselves but their texture and appearance are improved if light can be partly excluded when they are growing. Of very good quality but most are not quite as aromatic as the green types.

Cornell #6-19: 95-100 days. Slightly open plant habit; height 24 to 25 inches. Round, stringless, crisp, extra thick stalks. Combines the good qualities of the Pascal type with the earliness, easy blanching character and color of Golden Self-Blanching. Resistant to fusarium yellows but not blight. Recommended for muck or upland soils in the Northeast. Introduced in 1953. S70

Golden Detroit: (Dwarf Golden Self-Blanching) 85 days. Compact, full-hearted plant; height 18 inches; thick, solid stalks; blanches to a medium yellow color. Petiole length 8 inches. Early, widely adapted cultivar similar to Golden Self-Blanching. B75M

Golden Plume: 90 days. An early yellow market celery that is also recommended for home gardens, and for selling directly from the field. Produces good sized stalks and full, compact hearts which readily blanch to a clear-yellow color; quality very good. Introduced in 1937. E24, L42

Golden Self-Blanching: 85 days. Compact, full-hearted plants, 20 to 25 inches high; thick, solid yellowish-green stalks, 7 to 8 inches long; blanches readily to a golden-yellow color; quality very good, flavor delicate. An early and widely adapted strain suitable for fresh market and home garden use. A16, B6, B49, B78, C85M, E91G, G57M, G79, G82, I39, J9M, K49M, M46

Hopkins Fenlander: 105 days. Traditional British winter variety. Self-blanching, succulent and free of strings. Excellent, nutty, old-fashioned flavor. Relatively easy to grow. Good standing ability, allowing for late harvests. L91M, S75M

Ivory Tower: Very fleshy, uniform smooth stems of high quality. Inner stalks blanch to an ivory white color at maturity. Much taller than Lathom Self-Blanching. Not as tolerant as Lathom to bolting and is best suited to late summer and autumn cropping. Bred by A.L. Tozer Ltd. J9M, S61, S75M

Lathom Self-Blanching: Very compact, solid-hearted type, no need to earth up; crisp, stringless, yellow stalks; very good, nutty flavor. Early strong grower; heavy cropper; fairly resistant to bolting. Highly commended by the Royal Horticultural Society. N84, S55, S75M

Paris Golden: (Yellow Self-Blanching) 115 days. Crisp stalks grow 18 to 20 inches tall, blanch easily to a golden yellow. Both the stem and the heart are delicious, and free from string. I67M

Pieno Bianco d'Ingegnoli: Very long, crisp stalks with yellowish external color and pure white internal color; thick, solid and fleshy. Blanches easily to golden yellow. Appealing for its uniformity, thickness and ease of self-blanching. Sown April to June outdoors, or January to March indoors. Q11M

Tall Golden Self-Blanching: 120 days. High quality, yellow blanching type, slightly taller than regular Golden Self-Blanching. Thick, heavy stalks with tender, stringless flesh. Forms solid hearts very early. Stocky plants, 25 to 30 inches tall, blanches readily. Keeps very well. Standard market and shipping type. J73

Verga d'Oro: An Italian cultivar of great merit. Vigorous, upright plant. Exceptionally wide-based, closely packed stalks; an attractive golden-yellow in color. Suitable for sowing in spring for a harvest in summer and fall. Q11M

#### TRENCH CELERY

English cultivars that are especially adapted to traditional trench culture. Most are very attractive and flavorful with long stems that turn white, pink or red when blanched. Hardier than Self-Blanching types, being ready for cutting from early winter onward.

Clayworth Prize Pink: Medium-sized, crisp heads; long standing. A standard market cultivar, the best and hardiest of the pinks. Develops its full flavor after a frost. A favorite Victorian cultivar for trenching the traditional way. Similar to Giant Pink. N84, S55

Giant Pink: Large, sturdy plants with dark-green leaves; long, thick, pale-pink stalks; solid and crisp; excellent sweet flavor. The stalks will color pink to red, depending upon the time of year (redder in cold weather). In hot areas, plant in fall for a spring crop. Heirloom English cultivar. S61

Giant Red: 120 days. Large, compact plants; broad, thick, solid, tender and crisp stems are tinged with dark-red. Turns a delicate pink when blanched, making it an unusual addition to salads; also quite attractive when eaten with a dip. Very hardy and productive; will stand well into the New Year in mild climates. Heirloom, known before 1877. J20, L89, N24M, N84, 053M, S61

Giant White: Large, compact heads with crisp, solid stems of very good flavor. Maincrop cultivar; resists frosts well. A large, white celery that has been in cultivation for at least 100 years. N84, 053M

Pink: An English cultivar which blanches fairly easily and quickly. Stalks are an attractive pink color; color remains pink even after cooking. Very hardy, will withstand some late frosts. Excellent for table use or for exhibitions. K49M

Pink Plume: 110 days. Very attractive pink celery. Large, thick stalks tinged with pink, softening into an ivory white; very crisp, solid and tender; sweet, rich, delicious nutty flavor. Pale green leaves, delicately blushed with pink. Tall plant, height about 24 inches. Requires only slight banking when blanching it. An old

English heirloom. Ideal for home gardeners and specialty markets. K71, M46

Red: 110 days. Bright red stalks which blanch pink if kept from the light. Keeps its red color when cooled. Well grown plants will mature a heart of flavorful stalks. Hardier than green types. Abundant yielder of spicy celery seed the following season. F73D, F80, J9M, K49M, N7G

Red Stalk: 120 days. Attractive, flavorful reddish stalks that keep their color when cooked. Yields an abundance of spicy seed the second season. Vigorous, stocky, branching plants, 24 inches in height. Hardier than green types. An old English heirloom. A2, I18M, I99M, K49T, L13M

Solid Pink: Attractive pink stalks that hold their color well. Should be planted 12 inches apart and earthed up as the plants grow. Blanches fairly easily and quickly. A hardy variety which will stand some late frost. Usually harvested in November and December. Old English heirloom. Introduced in 1894. B49, R32

Solid White: 100 days. Vigorous plants, 16 to 20 inches high; erect leaves; fleshy, solid, tender and crisp stalks; after blanching become yellowish-white in color; quality and flavor very good. Excellent for table use or for exhibitions. Heirloom, known before 1877. B49, Q45M, R32, R50, S61

## CHERIMOYA {GR}

### ANNONA CHERIMOLA

Bays: Medium to large, rounded fruit, weight 18 to 24 ounces; skin light yellowish-green, covered with conical protuberances; pulp white, juicy, melting, subacid, quality good; ripens February to April. Tree bushy, spreading; a good bearer; does best in coastal areas, especially near Santa Barbara. Produces without hand pollination in some years. BROOKS 1972; A63, B58M, G49, J22

Booth: Medium to large, conical fruit; skin with slight to moderately developed protuberances; flesh of very good flavor but seedy; sometimes tends to darken on the outside; ripens November to March, handles well. Tree a heavy bearer; more tolerant of temperature extremes than others. Best commercial cultivar, especially in inland areas. Originated in Hollywood, California. Introduced in 1921 by Armstrong Nurseries. BROOKS 1972; A63, D23M, G49, I83M

Chaffey: Medium-sized, short-conical fruit, about 4 inches long; weight 3/4 to 1 pound; skin smooth, thick, resists bruising; flesh light cream, quality and flavor very good; seed small, 30 to 60 per fruit; season December to March along the coast of California. Tree bears regularly; is somewhat productive without hand pollination. Grows well in both inland and coastal areas. BROOKS 1972; A63, B58M, G49, I83M

Deliciosa: Medium to small fruit, long-conical in form; skin thin, slightly downy, covered with long protuberances; fairly seedy; ripens in midseason. Flavor very good inland, poor along the coast. Generally bears well but doesn't ship well. Cold-resistant. MORTON 1987a; Q93

El Bumpo: Medium to large, conical fruit; skin with large, rounded protuberances, turns yellow when mature; flesh juicy, not seedy; excellent typical flavor; ripens December to March. Soft, edible skin. Probably a seedling of Whaley. Originated in Villa Park, California by Rudy Haluza. Introduced in 1986. A63, G49, I83M

Fino de Jete: Medium-sized fruit with thumb-print pattern; skin moderately thick, yellowish or whitish-green when ripe; juicy flesh with a subacid flavor; ripens early, beginning in late September. Very productive, but has a tendency to set small, misshapen fruit. One of the principal commercial cultivars of Spain. T49M{SC}

Honeyhart: Medium-sized, conical fruit, weighing up to 2 pounds; skin smooth, plated, yellowish green; flesh smooth-textured, sweet and juicy; flavor and quality excellent; seeds few; ripens November to March. Produces consistently good crops without hand pollination. Originated in Escondido, California by Orton H. Englehart. Introduced in 1976. A63, G49, I83M

Libby: Fruit rounded-conical; skin fingerprinted, may still be green when mature; falls from tree easily when ripe Very sweet, strong, typical cherimoya flavor. Very early maturing, late September to early October. Probably a seedling of Spain. Originated in Villa Park, California by Rudy Haluza. Introduced in 1986. I83M

Mariella: Large to very large fruit, may weigh up to 7 pounds; skin yellowish-green, knobby; flavor very good; ripens November to March; resembles White. Tree bears without hand pollination. Originated in San Diego, California from seed brought from Argentina. I83M

McPherson: Moderately large fruit; skin smooth but with some development of tubercles; quality good; midseason to late in maturity. Tree vigorous; quite productive even without hand pollination. Originated in Orange, California. Introduced in 1933. BROOKS 1972; J22

Nata: Large, conical fruit, weight 2 1/2 to 3 pounds; skin thin and delicate; flesh very juicy, sweet to very sweet; rich, tangy flavor; ripens December to March. Vigorous tree; relatively easy to pollinize. Originated in Fallbrook, California from Ecuadorian seed stock. Introduced by George Emerich. A63

Orton: Medium to large, roundish fruit, weight 12 to 16 ounces; smooth, attractive, light-green skin; creamy-white flesh, sweet and rich; excellent subacid flavor. Begins ripening very early, in October, continues into March. Moderately vigorous, slightly spreading tree. Originated in Escondido, California by Orton H. Englehart. A63

Ott: Heart-shaped fruit, averages 3 inches in diameter, weighs 7 to 12 ounces; smaller than Booth or White; skin green with brownish spots, smooth, tough, medium thick, peels easily; flesh yellow, very fine textured, flavor very pronounced and distinct; high sugar content, up to 26.5%; eating quality excellent; seeds 24 to 36 per fruit; season January through April. BROOKS 1972; A63

Pierce: Small to medium-sized fruit; skin knobby, light green; flesh very sweet, quality very good; seeds few; ripens January to March, has a longer fruiting season along the coast. Tree large, vigorous; a shy bearer with a tendency toward alternate bearing; does best in inland areas. Some production without hand pollination. A63, I83M

Sabor: Fruit of variable size, but generally medium; skin often has nubs or protuberances. Flavor pronounced, excellent. Rated as superior in taste to all others at meetings of the California Rare Fruit Growers. Tree bears well without pollination. Originated in San Diego, California by James Neitzel. Introduced in 1979. I83M

Selma:<sup>1</sup> Unusual pink-fleshed cherimoya rated very highly for flavor. Medium-sized, elongated, fairly smooth fruit; weight 1 to 2 pounds; light olive-green skin with subtle pinkish hues; flesh an attractive pink throughout, darkening to a narrow band of bright-magenta near the skin, smooth to slightly grainy; distinctive, richly complex flavor with strong hints of raspberry. Originated on the property of Lloyd von Haden, Vista, California. T49M{SC}

Spain: Small to medium-sized, conical fruit, average weight 1 1/2 pounds; skin dark green, very smooth; flesh creamy white, sweet, free of grit cells near the skin; flavor excellent; seeds relatively few, black, shiny; ripens December to April. Tree hardy; bears well in coastal areas without hand pollination; leaves very large. Introduced into California from Spain. A63, I83M, Q93

Villa Park: Small to medium-sized, round fruit; skin with small protuberances; flesh sweet, with a rich pineapple-banana flavor; ripens December to March. Originated in Villa Park, California by Rudy Haluza. I83M

White: (Dr. White) Fruit medium to large, short-conical with rounded apex; skin medium-thick, semi-smooth; flavor very good, even after fruit is quite soft; seeds few; ripens December to March. Tree bears well in San Diego County, California, especially near coastal areas. Poor bearer without hand pollination. Originated on the White ranch, Lemon Grove, California. Introduced in 1930. BROOKS 1972; A63, B58M, I83M

## CHERRY {GR}

PRUNUS AVIUM

PRUNUS CERASUS

PRUNUS X GONDOUINII

### DUKE CHERRIES

Also called *royal cherries* or dual-purpose cherries, these hybrids of sweet and sour cherries have a soft texture and semi-sweet flavor. They are valued for their hardiness in unfavorable climates and for their cooking qualities. (P. x gondouinii)

Belle Magnifique: (Belle de Chatenay) Very large, heart-shaped fruit; skin rich crimson, glossy; flesh yellowish, very soft, very acid until almost fully ripe, acid when ripe, with uncolored juice; resistant to splitting; ripens during August but will often hang until well into September. Tree vigorous, upright-spreading; needs to be pruned as a sweet cherry; self-incompatible, Morello recommended as a pollinator. SIMMONS 1978; U7G{SC}

Brassington: Large, dark red, sprightly subacid fruit; ripens with Early Richmond. Tree productive. A chance seedling found in Oceana County, Michigan, prior to 1913. HEDRICK 1915; F91T{SC}

Krasa Severa: (Beauty of the North) Large, roundish-oblate fruit; skin dark red to dark purple; flesh dark red, juice light red-purple; flavor slightly sour, refreshing, pleasant; stone medium, semi-clinging; ripens very late. Fine for home canning. Resembles English Morello more than a Duke cherry. Tree upright, productive; moderately susceptible to leaf spot disease and brown rot fungus. Originated in the former Soviet Union by I.V. Michurin. BROOKS 1972, MICHURIN; F91T{SC}

Late Duke: A variant of May Duke, ripening from 2 to 4 weeks later. Large, heart-shaped fruit; skin deep red, glossy; flesh pale yellow, soft, juicy, rich, sprightly subacid; quality very good; juice uncolored; stone large. Tree vigorous, upright-spreading; self-compatible; should be pruned as a sweet cherry. Introduced around 1797. HEDRICK 1915, SIMMONS 1978; J61M

May Duke: Roundish, medium to large fruit; skin dark red to nearly black, glossy; flesh dark red, very soft, sweeter than most Duke cherries; flavor rich; juice pinkish; quality very good when ripe; stone smallish. Tree upright, compact; somewhat susceptible to bacterial canker. Partially self-compatible; English Morello recommended as a pollinator. Probably Originated near Medoc, France around 1688. HEDRICK 1915; F91T{SC}, K88T, Q30{SC}

Reine Hortense: (Regina Ortensia) Large, round fruit; skin tender, bright glossy red slightly blushed with amber; flesh pale yellow, with colorless juice, tender and melting, sprightly subacid, flavor excellent; ripens in midseason; susceptible to brown rot. Tree of medium size, upright-spreading, productive. Originated in France early in the 19th century. HEDRICK 1915; N24M

### SOUR CHERRIES (P. cerasus)

AMARELLE CHERRIES Also called *amarella* or *Kentish cherries*. Similar in appearance to Morellos, but most have lighter colored, less acid flesh with colorless juice. In France, where they

are known as *griottes*, they are used in confectionery in many ways and are highly recommended for *cerises a l'eau-de-vie*.

**Carnation:** Medium-sized, roundish-oblate fruit; skin tender, medium to dark red, somewhat variegated with white or yellow; flesh yellowish-white, tender and melting, sprightly, quality very good; juice abundant, colorless; stone free, separates very readily from the flesh leaving it unusually bright and clean; ripens in mid-season or later. Tree medium-sized, spreading, not very productive. First recorded in 1676. HEDRICK 1915; U7G{SC}

**Dwarfrich:**<sup>1</sup> Medium-sized, roundish fruit; similar in color, flavor and flesh texture to Early Richmond, but may average slightly smaller. Bush a true dwarf, growing only 4 feet high; hardy, blooms late; requires a pollinator, Montmorency and English Morello being recommended. Very suitable for small gardens, where it is productive as well as ornamental. Seedling of Vladimir. Originated in Cheyenne, Wyoming. BROOKS 1972; F91T{SC}

**Early Richmond:** Medium-sized, roundish fruit; skin thin, rather tough, light red changing to dark red; flesh pale yellow, with light pinkish juice, striggy, tender, melting; flavor pleasant, sprightly; good to very good in quality; stone free; small; ripens early. Tree medium-sized, upright-spreading; very haidy. Similar if not identical to the Kentish Red of England. HEDRICK 1915; A82, B73M, C54, D76, E3, G72, H49, H90, I9M, K28, L90, M83, M99G, N20

**Meteor:** Large, roundish-oval fruit; skin thin, tender, clear light bright-red, very attractive; flesh light bright-yellow, medium firm, medium juicy; flavor mild, pleasantly acid; quality very good; stone small, long oval, very free; ripens in midseason, 7 to 10 days after North Star. Tree very hardy; bears regularly and annually. Introduced in 1952. BROOKS 1972; D65, E84, C27T{SC}, D69, F53, G16, H90, J16, L27M, L70, M35M, N20

**Montmorency:** Medium to large, roundish fruit; skin bright red, thin, tender, glossy; flesh pale yellow with a reddish tinge, tender, melting, sprightly, tart, of very good quality; juice abundant, light pink; stone free, small; ripens in midseason. Tree semi-dwarf; very productive. Standard sour cherry in the United States. Originated in the Montmorency Valley, Fiance in the 17th century. HEDRICK 1915; A5, A38M{DF}, B83, C29{DF}, C29{PD}, C67{PD}, C75M, E38M{DF}, G47D{DF}, J83, K28, K73M, L97G{DF}, M39M, N24M, etc.

**MORELLO CHERRIES** Similar to the Amarelle cherries, but with deep crimson-red flesh and colored juice. The tender, juicy flesh is bittersweet, too acid for most palates when eaten raw, but delicious when cooked or preserved in some way. H15T{PD}

**Del Nord:** (Griotte du Nord) Fairly large, roundish fruit; skin dark purplish red, glossy; flesh red, soft, very juicy, sub-acid, quality good; juice deeply colored; stone free; ripens about the end of August. Tree of weak growth, becomes drooping with age; self-compatible, bears good crops. Continental cooking cherry. SIMMONS 1978; F91T{SC}

**English Morello:** Large, roundish heart-shaped fruit; skin thin, tender, very dark red becoming almost black; flesh dark red, tender and melting, sprightly, tart; juice abundant, dark-red; quality good; stone free, small; ripens very late. Excellent for cooking, becoming rich dark wine-colored and pleasantly aromatic. Tree small, with drooping branchlets Very old cultivar of unknown origin. HEDRICK 1915; A63, A88M{OR}, A91, A91{SC}, C34, C54, I68, K88T, N20, 081

**Kansas Sweet:** (Hansen Sweet) Medium to large fruit; skin mahogany-red; flesh firm, juicy, somewhat sweet for a sour cherry; resembles English Morello; ripens late June to early July. Tree hardy; productive; fruits satisfactorily in the Great Plains area. Bing or Black Tartarian recommended as pollinators. Originated in Wichita, Kansas by H.J. Hansen. Introduced about 1935. BROOKS 1972; C54, J61M, K88T

**Marasca di Ostheim:** Semi-sweet Morello type of exceptional quality. Medium-sized, dark mahogany-red fruits; firm flesh and very dark red juice; ripens just before Montmorency. Excellent for freezing or cherry desserts. Prized by wine makers for its dark, clear juice. Very hardy and productive tree, does not require cross pollination. Apparently true to name from seeds. Originated in Spain. HEDRICK 1915; G16

**Mesabi:** Skin quite red; flesh lighter red than skin; sugar content midway between sweet and sour cherries; pit smaller than Meteor; very good for sauce and pie; ripens in mid-July; resembles Meteor. Tree spreading, slow growing; heavy yielding; very hardy; tends to bear when small. Originated in Duluth, Minnesota. BROOKS 1972; A74, B15M, F91T{SC}, I49G, I49G{SC}, L70, N24M

**North Star:**<sup>1 2</sup> Fruit roundish heart-shaped, about 3/4 inch in diameter; skin bright red changing to a dark, glistening mahogany red at maturity; flesh dark red, juicy, meaty, tender, flavor pleasantly acid; quality good; stone small, easily removed; ripens very early. Tree a genetic dwarf, grows less than 10 feet tall; self-fruitful; excellent for home gardens. BROOKS 1972; B73M, C75M, D65, D69, E84, E97, F53, G23, H65, I49G, J83, L27M, M11M{PR}, N24M

**Schattenmorelle:** Medium to large, roundish fruit; skin thin and tender, dark red; flesh deep red, tender and melting, sprightly tart; juice abundant, dark-red; quality very good; ripens very late. Excellent for cooking, becoming a rich dark-wine color and pleasantly aromatic. Tree smaller than Montmorency, haidy. German sport of English Morello. F91T{SC}, M22, P68M

**Suda:** Fruit roundish heart-shaped, about 3/4 inch in diameter; skin dark purplish-red; flesh dark red, with dark-colored juice, tender, somewhat meaty, sprightly, astringent, very sour; quality poor; stone free; ripens very late. Tree vigorous; rather unproductive. Originated in the garden of a Captain Suda, Louisiana, Missouri, about 1880. HEDRICK 1915; A91, A91{SC}, F91T{SC}

#### SWEET CHERRIES (*P. avium*)

#### **PURPLE-SKIN NED**

**Angela:** Large, nearly round fruit; skin dark red; flesh firm, juicy, sweet, of good flavor; resistant to splitting; ripens late, with Lambert. Tree a reliable and heavy bearer; more winter hardy than Bing or Lambert; resistant to western x disease and doubling; inter-fruitful with Bing and Lambert. Introduced in 1974. C34, E84, F91T{SC}, H90M{SC}, J61M, K88T

**Annonay:** (D'Annonay) Medium-sized, roundish fruit; skin dark red to black, fairly glossy; flesh pinkish, soft, sweet, juicy, slightly sub-acid; stone clinging. Tree of moderate vigor, tall and round-headed; hardy; bears good crops regularly. Valuable because of its early ripening, the beginning of June. Of French origin. SIMMONS 1978; U7G{SC}

**Attika:** (Kordia) Large, attractive, dark blackish-purple fruits with long stems; very firm, juicy, sweet dark-red flesh. Fresh market quality excellent. Ripens about 10 days after Bing. Blooms late. Qiance seedling that originated in the former Czechoslovakia. B83, M39M, P68M

**Bing:** Very large, heart-shaped fruit, about 1 inch in diameter; skin medium thick, tough; skin color very dark red, almost black; flesh purplish-red with dark purple juice, rather coarse, firm, very meaty, brittle, sweet; of very good quality; stone semi-free large; ripens midseason or later. Tree vigorous, upright-spreading, productive. Originated in Milwaukee, Oregon by Seth Lewelling in 1875. HEDRICK 1915; A82, B83, C29{DF}, C29{PD}, C29{PR}, D81M{PO}, E4, E97, E97P{DF}, F53, H3{PD}, I23M{PD}, J83, K73M, L97G{DF}, M39M, etc.

**Black Eagle:** Large, roundish, heart-shaped fruit; skin purplish black, fairly glossy; flesh dark red, firm, not very fibrous, sweet and rich; quality very good; stone fairly small; ripens in early July. Tree

spreading, drooping; hardy; productive; very susceptible to bacterial canker. Originated in England. SIMMONS 1978; Q30{SC}

**Black Republican:** (Republican) Medium-sized, roundish heart-shaped fruit; skin thin, purplish-black; flesh purplish-red, with dark-colored juice, tender, meaty, crisp; flavor sweet or with slight astringency before fully mature; ripens late. Tree large, spreading; tends to overbear. Originated in Milwaukee, Oregon by Seth Lewelling in the mid 19th century. HEDRICK 1915; B83, C41M, D81{PO}, D81M{PO}, K88T, M39M

**Black Tartarian:** Long, heart-shaped fruit, less than 1 inch in diameter; skin thin, deep purplish-black, glossy; flesh purplish-red, with dark colored juice; firm, meaty, crisp; flavor pleasant, mild, sweet; of very good to excellent quality; stone free, small; ripens early. Tree characteristically large and upright. Introduced into England in 1794 from Circassia, Russia. HEDRICK 1915; B53, B73M, B83, C27T{SC}, C75M, D81M{PO}, E4, E97, E84, G79M, H65, I9M, K73M

**Blackheart:** Medium-sized fruit, heart-shaped but somewhat pointed; skin dark purplish to black, glossy; flesh very dark red, soft, juice plentiful and colored, sweet; quality good; seldom splits. Tree fairly vigorous, very spreading and drooping; productive; handy. SIMMONS 1978; G65M

**Brooks:** Fruit uniformly large, particularly for an early-maturing cultivar; skin dark red; flesh firm and crisp, flavor sweet, rich, well balanced; dessert quality very good; susceptible to cracking; ripens early, about 1 week before Bing. When pitted and sun-dried, makes a large meaty "seedless raisin" that is excellent for snacks and baking. Tree upright, handy, a very productive and regular bearer. A9, B71M, D81M{PO}, E4, K73M, K88T

**Cavalier:** Medium to large fruit; skin rich purple-black, glossy; flesh firm, very sweet; quality excellent for an early cultivar; resistant to cracking; similar to Schmidt's Bigarreau, but matures 10 days earlier. Good holding qualities for the fresh market. Tree upright-spreading, moderately vigorous; somewhat slow to come into bearing; very hardy, reportedly to -26° F. F53, L12, M11M{PR}

**Compact Lambert:**<sup>1</sup> Large, heart-shaped, dark purplish fruit; firm, juicy, sweet, very dark-red flesh; quality very high; ripens mid to late July. Excellent fresh or canned. Dwarf, compact tree, growing only 7 to 10 feet tall. Suitable for growing in containers or where space is limited. E84, F88G, I49M, J61M, K88T

**Compact Stella:**<sup>1 2</sup> Large, heart-shaped fruit; skin black; flesh black, medium firm, relatively coarse; ripens mid-June to early July. Tree semi-dwarf, 40 to 60% of standard size, natural spur growth reduces height to under 15 feet at maturity; self-fertile, will also pollinize all other cherries. Sets fruit when young, with heavy, consistent crops. C54, D37, D76, E84, F88G, H65, I61M{SC}, K88T, M22, M99G, O81

**Early Buriat:** (Bigarreau Hatif de Buriat) Fruit large; skin red to dark purplish-red; flesh sweet, medium firm, more so than Black Tartarian but not as firm as Bing; semi-fiestone; ripens early, 4 to 7 days before Black Tartarian; susceptible to cracking after rain. Tree moderately vigorous; resistant to buckskin disease. Good pollinator for Bing and Mona. Originated in Morocco. BROOKS 1972, STEBBINS; B71M, C34, D18, E4, J61M, K88T, P59M

**Early Purple Gean:** (Early Purple) Large, heart-shaped fruit; skin thin, tender, purplish-black; of very good quality, ripens very early. Flesh sweet, soft, tender, juicy; of the type the French call Guigne, as contrasted to the hard, crisp-fleshed type known as Bigarreau. Tree large, upright-spreading; vigorous; very productive. Introduced about 1688. HEDRICK 1915; K88T

**Early Rivers:** Large to very large, heart-shaped fruit; skin glosly, dark purplish-red, almost black; flesh deep red, soft, melting; juice abundant, colored; quality very good when ripe; stone small; ripens in mid-June Very popular commercial cultivar in England. Tree vigorous; tends to grow too tall and weeping. Originated as a seed-

ling of Early Purple Gean by Thomas Rivers, about 1872. SIMMONS 1978; K88T, P59M, Q30{SC}

**Early Ruby:**<sup>3</sup> Small to medium-sized, dark red fruit, resembles Black Tartarian; matures 5 days after Black Tartarian. Medium-sized, upright tree. Produces regular crops of fruit in the hot, dry climate of California's San Joaquin Valley. Relatively low chilling requirement, about 500 hours. BROOKS 1997; A63, C54, D81{PO}

**Garden Bing:**<sup>12</sup> Dark reddish-black fruit, closely resembles the standard Bii<sup>^</sup>; ripens in midseason. Tree highly ornamental; a genetic dwarf, approximately 6 feet tall at maturity with a spread of 4 feet; self-fertile. Excellent for patio containers, where the height can be kept to 3 feet. STEBBINS; 174

**Giant:** Large, very dark-red, glossy fruit; flesh dark blood-red, very juicy, sweet, with a fine rich flavor; ripens in California about June 20th. Tree rapid in growth, with large and heavy foliage. First grown by Luther Burbank in 1900 and regarded by him as one of his best creations. HEDRICK 1915; F91T{SC}

**Gil Peck:** Large fruit; skin dark purplish-black; flesh firm, juicy, sweet, richly flavored; may occasionally crack, but less than Royal Ann; resembles Giant in shape and quality; ripens in late midseason. Royal Ann x Giant. Originated in Geneva, New York by Richard Wellington. Introduced in 1936. BROOKS 1972; K88T

**Hardy Giant:** (Starking Hardy Giant) Fruit large; skin dark red, attractive; flesh firm, sweet, of high quality; resembles Schmidt's Bigarreau; ripens early to midseason. Tree large, upright-spreading; vigorous; extremely hardy; a reliable and heavy bearer. Good pollinator for other sweet cherries, especially Lambert. BROOKS 1972, STEBBINS; B83, C34, F91T{SC}, J61M, K88T, M39M, Q30{SC}

**Hedelfingen:** (Hedelfingen Risenkirsche) Medium to large, roundish-oval fruit; skin glosly, deep mahogany red, almost black when ripe; flesh dark red, tender yet firm, aromatic; juice abundant, very red; quality good; ripens in mid-July. Tree tall, vigorous; productive; susceptible to bacterial canker. Originated in Hedelfingen, Germaiy in the 18th century. A5, A91, A91{SC}, B53, B83, C45M, C76M, E38, E84, F53, G16, H49, L33, M11M{PR}, M39M, etc.

**Hudson:** Medium to large fruit; skin very dark-red; flesh very firm, sweet, of good quality; resistant to cracking, even under extreme conditions; ripens very late, after Lambert, extending the cherry harvest about 10 days; best in its season. Tree very large; open-spreading; resistant to southwest trunk injury. BROOKS 1972; A5, B53, C76M, F53, H90M{SC}, K36, M11M{PR}

**Jubilee:** Large heart-shaped fruit, averages 1 inch in diameter or more; skin glosly, red to dark red; flesh red to dark red, fine-textured, moderately juicy, moderately firm to firm; flavor ranges from very sweet and mild to sweet and mildly tart; ripens 6 days before Bing. Tree similar to Bing in growth and appearance; effectively cross-pollinated by Bing, Lambert, Royal Ann, etc. BROOKS 1972; K88T

**Kristin:** Large, heart-shaped fruit, about 1 inch in diameter; skin tender, glossy, dark purplish-black; flesh sweet, firm, meaty, juicy; crack-resistant; ripens in mid-July in the Finger Lakes region of New York. Tree productive; very winter-hardy, tested for 12 years in Norway. Recommended for roadside stands or pick-your-own operations. A5, A91, B53, B74, C27T{SC}, C34, D37, D76, H65, H90M{SC}, I49M, I49P, J61M, K36, K88T, etc.

**Lambert:** Large, roundish heart-shaped fruit; skin reddish-purple, thin; flesh dark red, with scant dark red juice, meaty, firm, sweet, of pleasant flavor; quality very good; subject to cracking; ripens late. Tree vigorous and productive; resistant to doubling in hot climates; often difficult to train and prune. Originated in Milwaukee, Oregon about 1848. HEDRICK 1915, STEBBINS; B53, B83, C41M, D81M{PO}, E4, F53, K73M, LI, M39M, M63M{PD}, N20

Lapins:<sup>2</sup> (Cherokee) Van x Stella. Large, firm, sweet dark-red fruits with very good flavor; resistant to cracking. Resembles Lambert, but larger, firmer and ripens 2 days later. Upright, self-fertile tree, precocious, bears heavy crops annually. Originated in Summerland, British Columbia. A5, A91{SC}, B74, B83, C34, D65, D81M{PO}, F53, F88G, G23, G65M, H49, I49M, I68, J61M, K73M, L12, M39M, etc.

Lyons: (Early Lyons) Large, heart-shaped fruit; skin thin, rather tender, very dark red, attractive; flesh reddish, meaty, sprightly, sweet, of very good quality; stone large, semi-clinging; matures very early. Tree vigorous, upright-spreading; a somewhat shy bearer when young, becoming productive with age. Originated near Lyons, France, about 1822. HEDRICK 1915; F91T{SC}, K88T

Merton Bigarreau: Large, round fruit; skin deep mahogany red; flesh dark red, tender, meaty, flavor extremely rich; ripens in mid-season. Tree bears heavily and regularly; vigorous; very spreading; self-unfruitful, being pollinated by Black Tartarian, Black Republican and Van. Highly recommended for the home garden by Mr. J.M.S. Potter, Director of the National Fruit Trials in England. BROOKS 1972; F91T{SC}, K88T

Merton Heart: Very large, heart-shaped fruit; skin dark mahogany to nearly black, fairly glossy; flesh dark red, fairly firm, juicy, sweet, flavor excellent; stone large; ripens just after Early Rivers. Tree very vigorous, at first upright but spreading with age; productive; resistant to bacterial canker and blossom wilt. SIMMONS 1978; Q30{SC}

Mona: Large, symmetrical, heart-shaped fruit; skin glossy red to dark red, tender; flesh red to dark red, tender to moderately firm, juice red; flavor sweet, mild, considered to be superior to Black Tartarian but less tart; ripens with Black Tartarian. Tree vigorous; very productive; pollinated by Bing, Black Tartarian, Black Republican, etc. BROOKS 1972; C54, K88T, L47

Sam: Medium to large fruit; skin black; flesh firm, black, of fair to good quality; ripens about 1 week earlier than Bing; highly resistant to cracking. Tree vigorous; very hardy; productive; self-unfruitful. Widely planted as a pollinator for Bing, Lambert and Van. BROOKS 1972; B53, B74, C76M, E84, F53, F88G, I49M, I49P, J61M, K88T, M11M{PR}, N20

Schmidt's Bigarreau: (Schmidt) Very large, heart-shaped fruit; skin deep purplish-black; flesh purplish-red, very meaty, crisp, tender but firm, sweet; juice abundant, dark-colored; quality good; ripens in midseason. Tree large, upright-spreading; vigorous; slow to come into bearing. Originated in Germany about 1841. HEDRICK 1915; A5, B53, C45M, F53, G79M, H65, K88T, M11M{PR}, M39M, M99G

Starkrimson:<sup>2</sup> (Dandeecher) New self-fertile dessert cherry of exceptional fruiting qualities Yellow-amber skin, flushed with red, turning deep red as the fruit matures; ripens in midseason. Crisp, juicy flesh of excellent flavor. Tree semi-dwarf, round headed, compact; reliably productive; does not require a pollinator. High commercial potential; ideal for home gardens. L33, 097, P59M

Stella:<sup>2</sup> The first good-quality, self-fertile black sweet cherry. Large, heart-shaped fruit, resembles Lambert; skin black, fairly susceptible to cracking in rain; flesh black, medium firm, relatively coarse; ripens with Hedelfingen. Tree upright-spreading; productive; tender to winter cold; self-fertile, also a good pollinator for other sweet cherries. BROOKS 1972; A63, B53, C54, C75M, E4, E84, E97, F53, G79M, H65, K73M, LI, L47, M39M

Sweetheart:<sup>2</sup> Medium to large, very firm, bright red fruit with good flavor; susceptible to cracking. Ripens very late, about 5 days after Lapins. Upright, very precocious tree, bears heavy crops annually; self-fertile. Originated in British Columbia, Canada. B83, C41M, C45M, E4, F53, I61M{SC}, L12, M39M

Ulster: Fruit large, resembles Schmidt's Bigarreau; skin very dark red; flesh firm, juicy, sweet, crisp; quality good; highly resistant to

cracking; ripens in midseason, a few days before Schmidt's Bigarreau. Good for roadside markets. Tree more productive than Schmidt's Bigarreau. Originated in Geneva, Nov York. Introduced in 1964. BROOKS 1972; A5, B53, D37, F53, K73M, K88T, M11M{PR}, M39M, M99G

Utah Giant: Large, attractive fruit, often sets in large clusters, does not double; skin purple-black; flesh firm, more flavorful than Bing or Lambert; stone medium-sized, partially freestone. Excellent for canning since it retains its firmness, color and flavor after processing. Tree productive; hardy, but susceptible to spring frosts; resistant to western x disease. Released by Utah State Agricultural Experiment Station in 1981. A88M, C54, E4, G8, K73M, K88T, LI, M39M, N20

Van: Fruit similar to Bing, but somewhat smaller due to over-bearing; skin black, very glossy; flesh slightly firmer and equal to Bing in quality; somewhat resistant to cracking; ripens with Bing. Tree vigorous, upright; hardier than Bing; good pollinator for Bing and Lambert. BROOKS 1972; A5, B53, B83, C34, C54, D81{PO}, D81M{PO}, E4, E84, F53, F88G, K73M, L33, L47, M39M, etc.

Venus: Large, heart-shaped fruit; skin dark purplish-red, glossy; flesh red to black, of high quality, not as firm as Lambert and therefore less subject to cracking; ripens about 5 days after Black Tartarian. Tree has a slight tendency to overset in heavy-crop years, resulting in reduced fruit size. Originated in Vineland Station, Ontario, Canada. BROOKS 1972; F88G, F91T{SC}, K88T

Vic: Fruit sweet; quality good; ripens with Windsor but is larger and darker in color; satisfactory for freezing and *maraschino cherries*; superior to Windsor in canning tests; sizes well in heavy-crop years. Tree large; consistently heavy bearing. Released as a replacement for Windsor. BROOKS 1972; A5, F88G, F91T{SC}, K88T, M11M{PR}

Windsor: Fruit slightly oblong to conical; skin dark-red, almost black when mature; flesh light red, with reddish juice, tender, meaty, crisp; flavor mild and sweet; quality good to very good; stone semi-free; ripens late mid-season. Tree large, upright-spreading; vigorous; very productive. Originated in Windsor, Ontario, Canada around 1881. HEDRICK 1915; F53, G79M, H65, K88T, M11M{PR}, M22

#### WHITE-SKINNED

Coe's Transparent: (Coe) An old white-fleshed cultivar highly recommended by members of the California Rare Fruit Growers. Small, roundish-cordate fruit; delicate, comely appearance; creamy-white skin blushed with pink; tender, melting, translucent flesh; copious, sugary sweet juice. Large, vigorous, upright-spreading tree; very productive. Originated with Curtis Coe of Middletown, Connecticut, early in the 19th Century. HEDRICK 1915, MARIANI 1994; T49M{SC}

Rainbow Stripe: Very distinctive fruit; white with a narrow blood-red stripe from stem to tip, extending through the flesh; most nearly resembles Lambert. Bud mutation of Lambert; discovered in 1925. Originated in Yakima, Washington. Introduced commercially in 1930. BROOKS 1952; U7G{SC}

Vega: Fruit large; skin white with a red blush, smooth, very attractive; flesh white, slightly tart, firm; pit small, easily removed; ripens 5 to 8 days before Royal Ann. Recommended for brining, *maraschino cherries* and canning, too tart for dessert purposes until very ripe. Tree upright; vigorous; hardy; very productive. BROOKS 1972; F91T{SC}, K88T

#### YELLOW-SKINNED

Bada: Large, symmetrical, heart-shaped fruit; skin smooth, glossy, cream colored with a medium to high red blush; flesh cream colored, tender, meaty, moderately juicy; flavor mild, being less tart than Royal Ann; resistant to cracking; ripens 4 days before Royal Ann. Tree precocious; productive to very productive; interfertile with

Bing, Royal Ann, Van and Mona. BROOKS 1972; C27T{SC}, E84, F91T{SC}, H90M{SC}

Corum: Long heart-shaped fruit; skin yellow with an attractive red blush; flesh white with a yellow tinge, tender, meaty, crisp, flavor mild; ripens about 6 days before Royal Ann; moderately resistant to cracking. Tree fairly vigorous; as hardy as Royal Ann; free of known virus diseases; tolerant to bacterial canker. BROOKS 1972; E84, F91T{SC}, K88T

Elton: (Elton Heart) Large, very pointed, cordate fruit; skin pale golden-yellow with a faint red blush, glossy; flesh pale yellow, very tender, juicy, sweet, flavor very good; stone large; somewhat susceptible to splitting; ripens the first half of July. Tree erect, of fair size, lacking in vigor; bears fairly well but irregularly; susceptible to bacterial canker. Originated in England about 1806. SIMMONS 1978; Q30{SC}

Emperor Francis: Large, roundish heart-shaped fruit; skin yellowish-white blushed with reddish mahogany, fairly glossy; flesh very pale yellow, firm, sweet, rich; juice uncolored, abundant; quality good; sometimes splits badly. Tree small and compact, suitable for the garden. Introduced prior to 1876. HEDRICK 1915, SIMMONS 1978; A5, B53, B83, C45M, C76M, D37, F53, H65, H90M{SC}, J61M, K88T, M11M{PR}, M39M, M99G

Gold: Small, very firm, clear golden-yellow fruit; quality very good; ripens late, about 10 days after Hedelfingen. Suitable for fresh market, and widely used for *maraschino cherries*. Vigorous, very productive tree, one of the hardiest of all sweet cherries. An excellent pollinator, will pollinate most sweet cherry varieties. A5, A91, A91{SC}, B53, C27T{SC}, B83, D37, F53, K36, M11M{PR}, M39M, M99G

Governor Wood: Large, roundish heart-shaped fruit; skin yellowish-white with a crimson blush; flesh whitish, with abundant colorless juice, tender, meaty; flavor sweet, mild; quality very good; cracks badly in wet weather; ripens in early midseason. Tree vigorous, upright-spreading; productive. First raised in 1842 by Professor Jaied P. Kirtland at Cleveland, Ohio. HEDRICK 1915; A82, E84, G65M, M25M, Q30{SC}

Merton Late: Medium to large, roundish fruit; skin orange-yellow, blushed with dark crimson; very firm, juicy, orange-yellow flesh, flavor rich and sprightly; colorless juice; quality excellent. Ripens very late, in early September. Large, spreading tree; susceptible to bacterial canker. Originated in England. Q30{SC}

Rainier: Large, slightly obovate fruit, similar to Bing; skin attractive, yellow, highly blushed with rose-red; flesh very firm, juice colorless, of very high quality; ripens 3 to 7 days before Royal Ann; has exceptional holding ability after harvest. Sold for very high prices at specialty food stores. Tree vigorous; very productive; comes into bearing very early. BROOKS 1972; B83, C27T{SC}, C29{DF}, C29{PD}, C29{PR}, C34, C41M, D81{PO}, D81M{PO}, E4, E84, F15{PR}, F53, H69{PR}, I23M{m}\ LI, L15M{DF}, M39M, etc.

Royal Ann: (Napoleon) Long heart-shaped fruit; skin color varying shades of bright red over a yellowish background, distinctly mottled; flesh whitish, with a faint yellow tinge, meaty, tender, crisp, sweet; flavor mild, improving as the season advances; quality good to very good; ripens in midseason. Tree highly susceptible to bacterial canker. Widely used for canning and *maraschino cherries*. A very old cultivar of unknown origin. GRUBB, HEDRICK 1915; A91, A91{SC}, B83, C41M, E4, E84, E97, F53, H65, L47, M39M

Saylor: Skin pure, clear bright yellow; flesh crisp, juicy, of exceptional sweetness with a distinctive aftertaste. Ripens late. One of the best pure yellow cultivars. From the late Dr. Reid M. Brooks' collection at Davis, California. Origin unknown. F91T{SC}

Sparkle: Medium to small, attractive fruit; skin with a bright luster; flesh white, firm, flavor sweet and sprightly; fairly resistant to cracking; resembles Royal Ann but rounder and less conical,

matures 1 week earlier. Tree vigorous, upright; pollinates Bing, Lambert, Royal Ann and Van. Originated in Summerland, British Columbia by A.J. Mann. BROOKS 1972; F91T{SC}, I61M{SC}, K88T

Sue: Fruit medium-sized, roundish-conic, resembles Royal Ann in general appearance; skin yellow with an attractive bright red blush; juice colorless; flesh nearly as firm as Royal Ann, exceedingly sweet, rich and vinous; of high quality; highly resistant to cracking; ripens slightly earlier than Royal Ann. Tree bears very heavily; pollinated by Bing, Lambert, Van and Royal Ann. BROOKS 1972; B53, D37, I61M{SC}, K88T

Yellow Glass: Medium to large, roundish heart-shaped fruit; skin thin, tough, light lemon in color, attractive; flesh firm, yellow, meaty, sweet, with colorless juice; quality good; stone large, round, clinging; ripens in mid-July. Tree large, upright; very hardy; productive. Introduced about 1892. HEDRICK 1915; F91T{SC}, K88T

Yellow Spanish: Large, heart-shaped fruit; skin bright amber-yellow with a reddish blush, more attractive than Royal Ann; flesh whitish, with colorless juice, tender, meaty, crisp, aromatic; flavor sweet, very good to best in quality; ripens in midseason. Tree very large and vigorous; productive. One of the oldest known cherries, believed to have been described by Pliny and called Graffion by the early English writers. HEDRICK 1915; J16

#### CODES FOR SPECIAL TYPES

1. Genetic Dwarf
2. Self-Fertile
3. Low-Chill

## CHERRY PLUM {GR}

### PRUNUS XSP.

Alace: Medium-sized, dark purplish fruit with greenish flesh. Ripens in midseason. Low, spreading, bushy plant; vigorous and hardy. Seedling of Opata, which it resembles. Originated in Brooks, Alberta, Canada by the Canada Department of Agriculture. Introduced in 1942. F91T{SC}

Beta: Slightly oval fruit; skin thin, reddish-blue; flesh greenish, moderately firm, very mildly acid, quality good, freestone; resembles Opata. Open pollinated seedling of Opata. Introduced in 1960 for home gardens. Originated in Saskatoon, Saskatchewan, Canada, by C.F. Patterson. G54

Compass: (*P. besseyi* x *P. hortulana*) Small to medium-sized, oval fruit; skin thick, tough, dark purplish-red; flesh yellow, rather firm, cling-stone; flavor somewhat sour, quality fair to good. Eaten fresh or cooled. Very good pollinator for other cultivars. Bush-like growth habit; grows to 8 feet; bears the second year after planting. Originated by H. Knudson, Springfield, Minnesota. Introduced in 1897. WAUGH; A74, B4, D65, D69, I49G, I49G{SC}, K64, L27M, L70

Convoy: Small, roundish fruit, somewhat larger than Compass; skin scarlet red, moderately tender; flesh yellowish, tender, juicy, nearly sweet; quality good for dessert or canning; ripens during the end of August. Tree very vigorous, upright, narrow; very hardy and productive; an excellent pollinator for other cherry plums. Introduced in 1941 by Boughen Nurseries. ANDERSEN, BROOKS 1972; A65, B47, F91T{SC}, N24M

Deep Purple: (*P. besseyi* x *P. salicina*) Large, oval-conic fruit, 1 1/2 inches long; skin deep purple to black; flesh dark rich purple, firm, meaty, moderately juicy; pit small, nearly free; flavor sweet, pleasant; ripens in mid-August, hangs well on tree for up to 2 weeks. Useful mostly for processing; compares favorably with Sapa for jam; more productive than Sapa. Tree vigorous, develops naturally

into a wide-spreading bush; bears heavy crops annually; requires a pollinator, such as Compass. BROOKS 1972; F91T{SC}

**Dura:** Medium to large, oblong fruit; skin dark green, mottled with purple; flesh maroon-purple, crisp, tender, meaty, sweeter and less clingstone than Sapa; quality very good as dessert or canned; season late August to October. Bush low, spreading; very hardy; productive. Originated in Morden, Manitoba, Canada. BROOKS 1972; F91T{SC}, N24M

**Hiawatha:** Fruit fairly large, round; skin thin, mottled purple; flesh medium firm, juicy, fairly sweet, semi-freestone; usually ripens during mid-August. Rated first in its class in taste tests, being very good for culinary uses, especially jam. Bush fairly vigorous, spreading; like Sapa it suffers severe winter injury in some seasons, but makes a good recovery. F91T{SC}, N33

**Kappa:** Medium to large, spherical fruit; skin bluish-black; flesh dark red, sweet, processing quality excellent; ripens in midseason. Originated in Saskatoon, Saskatchewan, Canada by CF. Patterson. Released in 1960 for home gardens. Derived from Sapa and Oka. BROOKS 1972; N24M

**Manor:** Medium-sized, roundish fruit; skin dull, dark reddish-purplish; flesh deep red to dark purple, meaty, tender, juicy, sweet; dessert quality very good, fair for canning; ripens in mid-August. Bush hardier and more upright than Sapa; very productive; particularly adapted to northern prairies. Originated in Morden, Manitoba, Canada. Introduced in 1945. ANDERSEN, BROOKS 1972; A65, B47, F91T{SC}, G54, H85, J89M, N24M

**Mansan:** (*P. besseyi* x *P. hortulana*) Small, oval fruit; skin dark carmine with a heavy bloom; flesh greenish-yellow, firm, mildly subacid, pleasant; quality good for canning; ripens in early September. Tree resembles Compass but hardier; blooms late; to be productive requires a late-blooming cultivar for cross-pollination. BROOKS 1972; F91T{SC}

**Oka:** Medium-sized fruit, about 1 inch in diameter; skin tough, thick, deep purplish-red; flesh dark red, juicy, firm, quality good. Season from mid-August to early September. Dries naturally into a sweet prune-like fruit; later can be cooked into an excellent sweet sauce. Tree hardy; dwarf, height 4 to 6 feet; bears well. Plant with Sapa for cross-pollination. Originated in Brookings, South Dakota, by N.E. Hansen. Introduced in 1924. BROOKS 1972, HANSEN; B47, D76, E97, F91T{SC}, I49G{SC}, N24M

**Oyata:** (*P. besseyi* x *P. salicina*) Medium to large fruit; skin dark reddish-purple with blue bloom, thin; flesh yellowish-greenish, firm, flavor very pleasant; stone very small; ripens in late August. Excellent for eating fresh or for jams, jellies, and pies. Vigorous, bush-like growth habit; hardy; bears heavily. Originated in Brookings, South Dakota. Introduced in 1908. Oyata is Sioux for "bouquet". HANSEN, RONALD; A16, A65, B47, C58, F91T{SC}, G54, H85, N24M

**Red Diamond:** Fruit large, averaging up to 1 1/2 inches in diameter, maroon when ripe; flesh firm, ruby-red, smooth-textured, high in sugar; pit small and free-stone. Eaten fresh or preserved. Dwarf bush, maximum height 6 feet; bears second year after transplanting, cross-pollination commended. Very hardy and disease resistant. A74, D65, D69, I49G, I49G{SC}

**Red Orna:** Small, red fruit; flesh red, juicy, sweet. Bush very hardy; an attractive ornamental with brilliant red foliage, and delicate red-pink blossoms; grows well in a variety of soils although sandier, lighter soils are preferred. Insects sometimes have trouble pollinating the small, delicate flowers. N24M

**Sapa:** (*P. besseyi* x *P. salicina*) Small to medium-sized fruit; skin purple-black with a bluish bloom; flesh dark purple, sweet, juicy, clingstone; excellent for canning and jam; ripens very early. Bush-like, compact growth habit, can be pruned to a small tree. Bears on 1 year old wood. Needs a pollinator for best production, Compass recommended. Hardy and productive. Introduced in 1908.

CREASY 1982, HANSEN, RONALD; A65, B47, C54, C58, H85, I49G{SC}, J89M, N24M

**Sapalta:** Medium-sized fruit; skin red-purple; flesh almost black; similar to Sapa but sweeter and with a tendency toward a freestone condition. Ripens the end of July. Good in pies and preserves. Plant with Compass as a pollinator. Originated in Brooks, Alberta, Canada, by the Canadian Pacific Railway. Introduced in 1941. Probably a seedling of Sapa. A74, B4, D65, D69, I49G, I49GISC}, K64, L27M, L70, N24M

**Skinner's Favorite:** (*P. besseyi* x *P. salicina*) Medium-sized, oblong fruit; skin yellow with a purple-red cheek; flesh greenish-yellow; quality good for dessert, excellent for jam. Tree bushy, upright, averages 5 to 6 feet in height. Originated in Dropmore, Manitoba, Canada. BROOKS 1972; F91T{SC}

**St. Anthoiy:** (*P. besstyi* x *P. salicina*) Large, round fruit, slightly flattened at the base; skin dull purplish-red, medium thick; flesh dark rich red to very deep purple, fine-grained, very juicy, tender, medium firm, subacid; quality fair to good, especially fine for culinary use; ripens in midseason; resembles Sapa. Tree medium to small, upright-spreading, vigorous; bears early and prolifically; hardy. ANDERSEN, BROOKS 1972; F91T{SC}

**Wessex:** Good quality fruit; dries like a prune. Bush extremely hardy; highly productive; blooms late, escaping spring frosts. Originated in Moose Range, Saskatchewan, Canada by Percy H. Wright. Introduced in 1964. BROOKS 1972; N24M

**Winered:** (*P. besseyi* x *P. salicina*) Medium-sized, round fruit; flesh dark purple, lacks the astringency of native American plums; good cooked and for dessert purposes, resembling Damson when cooked. Tree upright, to 5 feet tall; yields well. Originated in Dropmore, Manitoba, Canada. BROOKS 1972; F91T{SC}

## CHESTNUT {GR}

CASTANEA SPP.

### AMERICAN HYBRID CHESTNUTS

A group of cultivars that show a combination of the American and Chinese chestnut characteristics. Most have large, sweet, easily peeled nuts, blight resistance, upright tree form, ornamental foliage, and are highly productive. Many were developed by noted plant breeders Dr. Robert Dunstan of Greensboro, North Carolina and Earl Douglass of Red Creek, Nov York. (*C. x sp.*)

**Alachua:** Large, sweet, easy to peel nuts. Vigorous, upright, widely adapted tree; begins to bear in 2 to 4 years. Completely immune to chestnut blight. A mature orchard will produce from 1 to 2 tons per acre. Newly released Dunstan hybrid. Very similar to Carolina. C25, I49M, J15M

**Appalachia:** Large, sweet, easy to peel nuts. Large, vigorous, upright tree; begins to bear in 2 to 4 years. Completely immune to chestnut blight. Excellent for orcharding, backyard nut production, and landscaping. Newly released Dunstan hybrid. Very similar to Carolina. C25

**Carolina:** Large, very sweet, dark glossy chocolate-brown nuts; 24 to 28 per pound. Large, spreading, very productive tree. Completely immune to chestnut blight. Excellent for orcharding, backyard nut production, and landscaping. Good pollinator for Revival. A Dunstan hybrid. C25, I49M, J15M

**Carpentier:** Large, spreading tree. Heavy production of large, very sweet, dark brown nuts. Completely immune to chestnut blight. Excellent for orcharding, backyard nut production, and landscaping. Named for James Carpentier of Salem, Ohio who sent budwood of a blight resistant American chestnut to noted breeder Dr. Robert Dunstan, in the early 1950's. C25, J15M

Douglass: A cross between the Manchurian strain of Chinese chestnut and blight resistant American chestnuts. They show occasional blight resistance, are quite hardy, and are more vigorous than either parent. Most are upright in growth habit. Excellent flavor. Hardy to -28° F. A91{PL}, B99{PL}, E62{PL}, E62{DF}, E62{SC}, E91M{PL}

Douglass #1: Medium sized nut with very good flavor. Kernels fill well. Good bearing qualities. Haidy. Similar to Douglas #1A, but with slightly smaller nuts. A selection from open pollinated American and Manchurian crosses. Originated in Red Creek, New York by Earl Douglass. E62{DF}, E62{SC}, I60{PL}

Douglass #1A: Large sized nut with a very good, sweet flavor. Early ripening. Good bearing qualities. Very haidy. Good overall blight resistance but not as much as other cultivars. A selection from open pollinated American and Manchurian crosses. E62{DF}, E62{SC}, E91M, I60{PL}

Heritage: Tall, vigorous tree, very straight timber-type bole. Bears light crops of medium-sized, elongated, sweet nuts; 45 per pound. Completely immune to chestnut blight. Recommended for timber production, woodlot, and landscape plantings. A Dunstan hybrid. C25

Revival: Produces heavy, yearly crops of very large and sweet-tasting nuts. Nuts average 24 to 32 nuts per pound, compared to Chinese nuts (40 to 100 per pound) and American nuts (75 to 150 per pound). Pellicles are easily removed. Completely immune to chestnut blight. A Dunstan hybrid. The first chestnut ever to receive a U.S. plant patent. C25, L33

Sweet Hart: A cross between Dr. Ray Cather's West Virginia sweet chestnut and the Hawk Chinese blight resistant chestnut. Nuts have the sweet taste and high quality of the American chestnut. Found growing in an orchard in Ohio several years ago, the original tree is 40 years old without any signs of blight. Introduced by Boyd Nursery Co. B52{PL}, E97, H4, H49, I53M

Willamette: Extremely large (18 to 22 per pound), sweet, easy-to-peel, reddish-brown nuts. Medium-sized, upright spreading tree; bears very heavy crops. Completely immune to chestnut blight. One of the best cultivars for commercial orcharding. A Dunstan hybrid. C25, J15M

#### CHINESE CHESTNUTS

Valued as a blight-resistant chestnut, the Chinese chestnut is resistant but not immune to the chestnut blight fungus and seedling trees vary in susceptibility. The nuts are generally considered less sweet than American or European chestnuts. Nuts do not store well. Mostly C. mollissima.

Abundance: Nut attractive; cleans well; sweet; larger and more prolific than Honan, which it resembles. Originated in Eagle Creek, Oregon by Carroll D. Bush. Introduced in 1941. BROOKS 1972; B99{PL}

Armstrong: Large nut, averages 30 to 35 per pound; kernel very sweet, of excellent quality. Possibly a hybrid of Chinese chestnut and American chestnut. Tree may show timber type growth. Originated in Kentucky. Introduced in 1980. 140

Campbell #1: Large, sweet nut; falls free of the burr at the same time as Layeroka. Tree hardy; a consistent producer yet does not over produce as Layeroka sometimes does, reducing the nut size. Seedling of Layeroka selected by Doug Campbell of Ontario, Canada. A91, A91{PL}

Ching Chow: Originated in Swarthmore, Pennsylvania by J. Russell Smith. Introduced about 1950. Seedlings of the Chinese chestnut, from seed originally brought from Nanking, China. Most trees are blight resistant. BROOKS 1972; J16{PL}

Crane: Nut averages about 32 per pound; shell dark-cherry red, nearly completely smooth; quality excellent; keeps exceptionally well. Tree blooms in midseason, with Nanking; both cultivars will

cross-pollinate with one another; slightly protandrous; precocious bearer, producing a crop the second year after planting; blight resistant. Adapted to the middle and southern chestnut growing areas. BROOKS 1972; 140

Eaton: Nut averages 30 to 40 per pound; texture, flavor and sweetness are among the very best; matures 3 to 7 days ahead of most Chinese seedlings and as much as 2 weeks ahead of Nanking, Orrin, and Crane. Tree precocious. Selected for its attractive, glossy foliage and ability to produce annual heavy crops of sweet, high quality nuts. Highly recommended for northern chestnut-growing areas. JAYNES; 140

Ford's Sweet: Small, sweet kernel that resembles American chestnut. Tree a heavy bearer; begins bearing in 3 to 4 years. Timber type growth. Good wildlife food. Complex hybrid of American, Japanese and Chinese chestnuts. Originated in Indiana. Introduced in 1980. 140

Hemming: Large, sweet nuts with very good flavor. Vigorous, fast growing tree, grows to 25 feet tall; resistant to chestnut blight disease. Begins bearing after 7 or 8 years. Self-fertile, but 2 or more trees recommended for best production. Hardy from Zone 4 to Zone 8. E62{PL}, E62{DF}, E62{SC}, E91M, 14

Killing: Nut averages 35 to 40 per pound; drops free from burr; matures in midseason; keeping quality very good. Tree medium large; moderately upright; vigorous; shoot growth slightly willowy. Originated in Philema, Georgia by the USDA. Introduced in 1949. BROOKS 1972; T41M

Layeroka: Medium to large, attractive nut; falls free from the burr when ripe; kernel sweet; ripens in early October. Tree precocious; a reliable and heavy bearer; resistant to blight; very hardy; produces up to 4 burrs per cluster; erect timber type; male bloom sterile, will not pollinate other chestnuts. Originated in Westbank, British Columbia by J.U. Gellatly. A91{PL}, B74, B74{PL}, B99{PL}, E62{PL}, E62{DF}, E62{SC}, E91M, I49M{PL}, I74{PL}, N24M

Manoka: Large nut, averaging 1 3/8 inches in diameter; shell dark brown; kernel yellow, well flavored, quality good; husk small, thin. Tree hardy, timber type. Originated in Westbank, British Columbia, Canada by J.U. Gellatly. BROOKS 1972; A91{PL}, I74{PL}

Meiling: Nut averages 35 to 40 per pound; drops free from burr; ripens midseason; good keeping quality. Tree vigorous; upright; shoot growth fairly stocky; early and heavy bearing. Originated in Philema, Georgia by the USDA. Introduced in 1949. BROOKS 1972; 140

Mossbarger: Haidy Chinese selection. Very large, sweet nuts. Properly cured nuts peel easily and store very well. Vigorous, very productive tree, quite precocious in the southern states. Originated in Glendale, Kentucky. Introduced in 1983. 140

Myoka: Nut large, averaging 1 3/8 inches in diameter; most fall free from the burr; flavor good; peels well; resembles Manoka; ripens slightly later than Layeroka. Tree large, vigorous; erect timber type; blight resistant; a good pollinator. Originated in Westbank, British Columbia by J.U. Gellatly. Introduced in 1950. BROOKS 1972; B74, NO

Nanking: Nut averages 30 to 43 per pound; shape uniform; dark tan in color; few with split shells; harvest season medium late. Tree vigorous; precocious, grafted trees frequently bearing in their second year; heavy bearer of annual crops, often producing a bushel or more of nuts at 10 years of age; midseason pollination. BROOKS 1972, JAYNES; 140, 160{PL}

Orrin: Large nut, averages 32 per pound; shell attractive, with a dark-mahogany sheen, smooth but with a slightly hairy tip; middle nut of 3 in a burr uniformly thick and not wedge-shaped; keeping quality excellent; matures before Crane and Nanking. Tree blight resistant; upright; a precocious bearer; blooms slightly later than other cultivars. BROOKS 1972; A91{PL}, B99{PL}, 140

Schrader: European hybrid of outstanding quality. Medium to large, sweet nuts with very good flavor. Nuts fall from the tree within the husk, protecting them from squirrels. Large, spreading tree, grows to 40 feet tall; very productive. A good pollinizer for Skioka. J61M, NO

Skioka: Large nut, averaging 1 5/8 inches in diameter and 35 nuts per pound; shell dark brown; not quite as free of the burr as Layeroka; kernel white, free from indentures, quality high; ripens 7 to 10 days after Layeroka. Tree hardy; produces up to 4 burrs per cluster and up to 3 nuts per burr; blooms late, the latter part of June or early July; timber type. Originated by J.U. Gellatly. BROOKS 1972; A91, A91{PL}, B74, B74{PL}, I74{PL}, J61M

Skookum: Nut attractive, glos<sup>^</sup>, of good size; falls free from the burr; kernel of good flavor; ripens early. Tree vigorous and productive; hardy to Zone 5; sheds its leaves early in the winter; erect timber form. Selected from a population of Gellatly seedlings as a superior cultivar. Tested for over 20 years. A91, A91{PL}, B74, B74{PL}

Sleeping Giant: Large, shiny, attractive nut; averages about 40 per pound; burr often slightly conical. Tree somewhat spreading; a consistent, heavy bearer; blight free; hardy; leaves large, wide, buff-colored beneath, very glossy above. Complex hybrid of Chinese, Japanese, and American chestnuts. Originated in New Haven, Connecticut by Arthur H. Graves. Introduced in 1960. BROOKS 1972, JAYNES; A91{PL}, 140

#### EUROPEAN CHESTNUTS

Produces large, sweet nuts, the kind most often found in supermarkets. Susceptible to the chestnut blight fungus, but planted trees survive outside the natural range of the American chestnut in the Midwest and western United States where they usually escape infestation. More heat tolerant than other chestnuts. Mostly *C. sativa*.

Colossal: Nut very large, with the larger ones averaging 11 per pound; skin rather thick, but easy to peel; drops free from the burr; kernel texture fine, very sweet; dries and stores well; ripens late September and early October. Tree vigorous; bears heavily. Originated in Nevada City, California by C.E. Parsons, Felix Gillet Nursery. Introduced in 1925. BROOKS 1972; A88M, A91, B74, B74{PL}, B93M{PL}, E4, E4{PL}, I49M{PL}, /49P{PL}, I83M, I83M{PL}, J15M, J61M, J61M{PL}, L1{PL}, NO, N20, etc.

Linden: Medium sized nut with good flavor; harvested in early to mid-October. Selected for use in grafted Silverleaf orchards in the Pacific Northwest. Has proven to work well as a pollinizer for Silverleaf. Possibly a Japanese x European hybrid. E4, E4{PL}

Marron de Lyon: (Lyon) Large, roundish, light-colored nuts of excellent flavor. Large, decorative tree with wide spreading limbs; bears at an early age. Originated in France and was introduced into California before 1880. One of the best European cultivars. P59M

Marron du Var: High quality marron type Very large nuts that are easily peeled. Ripens late in the season. Tree apparently pollen sterile, not very productive. Originated in France. B74

Nevada: Excellent pollinizer for Colossal due to its profuse catkin bloom that coincides with Colossal female flower receptivity. Also a good producer of medium-sized, very sweet nuts with dark brown shells. Ripen in early October. Vigorous, upright tree, will pollinize 8 to 10 Colossal trees. A88M, B74, E4, E4{PL}, J15M, L1{PL}, N20

Prolific: Large, spreading tree; produces medium to large nuts annually in great abundance. Not blight resistant. Not recommended for blight susceptible areas such as die eastern United States. B74

Silverleaf: Large, very dark brown nut, slightly smaller than Colossal; easy to peel; excellent, sweet flavor; ripens in October. Tree a consistent and annual bearer. As the crop matures, the underside of the leaves turn an attractive silver-gray. Susceptible to chestnut blight. Of French parentage, possibly a hybrid. E4, E4{PL}

## CHICORY {S}

### CICHORIUM INTYBUS

#### HEADING CHICORY

These form large, conical heads, not unlike a cos lettuce in appearance. The inner leaves are naturally blanched through lack of exposure to light and are therefore sweeter than the outer leaves, though the "sweetness" is only relative. LARKCOM 1984.

Bianca di Milano:<sup>1</sup> A Sugarloaf type chicory. Forms a crisp, dense, elongated head with dark-green outer leaves and a creamy-white heart; nearly self-blanching. Harvested in autumn and winter from a late spring to early summer sowing. Can also be used as a cut-and-come-again crop, being cut when about 2 inches tall. Relatively cold hardy. B8, L89, Q34, S77, S55

Crystal Hat: Long oval heads, similar to cos or romaine lettuce in appearance. High yielding and of easy culture. Can be sown as early as the soil can be prepared and every few weeks until August. Withstands summer heat and fall frosts. Rinsing in warm water removes all traces of bitterness and reveals a sweet, tangy flavor. 139

Dolce Bianca: (Dolce Bianca a Cuore Pieno dTnegnoli) 85 days. Bianca di Milano type. Large, broad, romaine-like head with a full, crisp, golden heart and an attractive flavor. Similar to Sugarloaf, but with broader heads and a deeper, fuller heart. Very early, being ready for harvest by the end of summer. N84, Q11M

Jupiter:(Fj) Hybrid Sugar Loaf type. Produces large, barrel-shaped heads up to 2 1/4 pounds in weight. Excellent flavor. Stands well in the field. Very uniform. Can be sown from the end of May onwards. N81, S75M

Poncho: (Pain de Sucre Race Poncho) Large, cylindrical, compact heads; thick, crisp outer leaves; tender inner leaves naturally blanch to a whitish-green color. Exceptionally good flavor. Height 12 to 14 inches. Excellent eaten cooked or in salads, like endive. N81, N84, Q11M

Snowflake: (Winter Fare) 75 days. Produces 2 to 3 pound, crisp, tight heads in late autumn and winter from a June or July sowing. Easy to grow, no forcing or blanching needed. Very cold resistant and will keep for a full 3 months. L91M

Sugarloaf: (Pan di Zucchero, Pain de Sucre) 90 days. Large, upright, slightly twisted, romaine-like head; 18 to 20 inches tall; self-blanching. Thick, crunchy, medium-green outer leaves; translucent inner leaves that form a crisp, tender heart with a very mild flavor. Normally harvested in autumn and winter. Use in salads, for wrapping meats, or in other vegetable combinations. B8, B49, C53, DIT; D11M, D68, F70, F80, J9M, K49M, N7G, Q11M, Q34, R32, S55, etc.

#### LOOSE-LEAF CHICORY

CATALOGNA Also known as *asparagus chicory*, *dandelion chicory*, or *radichetta*. Distinguished by their tall, dandelion-like leaves, long, relatively thick leaf stalks, and in some cultivars enlarged asparagus-like flower stalks called *puntarelle* or *puntini*. GRAY, P. [Cui, Re]; A87M, B71G{ER}, C44, DIT, D11M, F70, F80, G71, G93M, 139,167M, J97M, K49M, K73, L42, etc.

Catalogna Frastagliata: Long, narrow-bladed, irregularly lobed, medium-green leaves. Long, relatively thin and narrow, greenish-white leaf stalks. Tall, erect plant; spreads 8 to 10 inches across. Strongly bitter flavor. Used in mixed salads, as a cooked green or in stuffings. B8,118M, 177, L89C, N84, Q11M, S17

Catalogna Larga: Long, relatively broad, medium-green leaf blades; deeply and irregularly serrated, the lower parts with long, narrow teeth. Broad, fleshy, pure-white, celery-like leaf stalks. Tall,

upright growth habit. Excellent for winter crops, being sown from March to October. N84, Q11M

Del Yeneto: Upright growing plant with entire, medium-green leaves. Sown in early mid-summer for an autumn through winter crop. Originally from the Veneto region of northeastern Italy. Q34, S17

Dentarella: Distinct type of catalogna chicory that produces a crop of thick, succulent flowering stems or *puntarelle*. Similar to Puntarella but with a straighter stem. The dandelion-like leaves are also used. C53

Galatina: (Di Galatina, Abruzzese) 55-65 days. Grown mostly for its thick, twisted flowering shoots or *puntarelle*, which are harvested when young and tender in late winter and early spring. Delicious either raw or cooked. Dark-green, very fringed leaves with thin stalks that form vigorous bunches. May be harvested when young for use in salads. B8, L3J, N84, Q11M, S17

Giant Chioggia: Upright growing plant with deeply divided, medium-green leaves with strong white ribs. Sown in early mid-summer for an autumn through winter crop. Originally from the Chioggia region of Italy, near Venice. Q34

Pugliese: Long, narrow, dark green leaves; lobed and indented, with pronounced white midribs. Large, broad leaf-stalks, straight and elongated. Utilized for the leaves and stalks in autumn and winter, and for the twisted, flowering shoots or *puntarelle* in the spring. 060

Puntarella: (Puntarelle a Pigna) Grown primarily for the chunky, twisted *puntarelle* or flowering shoots which develop in spring and have a much-prized flavor, raw or cooked. Harvested about the same time as asparagus. Often plunged in ice water to make them curl, then dressed with oil, vinegar and anchovies. Young leaves can be used in salads. Grows 12 to 18 inches tall. DE VITA [Re], LARKCOM 1984, PLOTKIN; C53, G53M, 177, Q34, S17

Red-Ribbed: Unique red-stalked catalogna. Dark-green, serrated, dandelion-like leaves; bright scarlet leafstalks. Very distinctive and attractive. Excellent in salad and braising mixes. Tall, vigorous, upright plant. Recommended for home gardens and specialty markets. G6,177

San Pasquale: (All Seasons) 70 days. Very early strain of Catalogna chicory. Large, vigorous, very productive plant; up to 22 inches across; quickly forms large, compact rosettes that blanch in the center. Broad, light green, deeply cut, dandelion-like leaves; very thick and meaty, yet tender. Grown for early spring greens. Will occasionally produce flowering shoots. AI, DIT, D12, G6, G57M, G71, G79, G82, H49, H54, K49M, K73, M29, N84

Small Rooted: 65 days. Similar to the typical Catalogna, except the plant has slightly notched, light-green leaves, and a small taproot. The young leaves make excellent "greens" and are very desirable for use as a salad. G93M

Special: 55 days. Long, deep-green, slender, deeply cut leaves with white midribs. Can be harvested "baby size" 3 or 4 weeks after transplanting, or left to grow into heavy 18 inch tall bunches. Slow bolting. G6, N84

#### o t h e r s

Barbe de Capucin: (Barba di Capuccino, Barbi, Italian Rooted) Long, deeply-cut, dandelion-like leaves. Very little improved or identical to the wild chicory. Young leaves are shredded and used as "greens". Can also be treated in much the same way as witloof, but must be forced in soil. G68

Biondissima di Trieste:<sup>1</sup> (Di Trieste, Bionda di Triestino, Triestino da Taglio) A green cutting chicory very popular in late summer and fall in northern Italy. The smooth, rounded leaves are harvested when very young and tender, only 3 or 4 inches long. Regrows rapidly. Ideal for mesclun or other salad mixes. If thinned

to 6 inches, small heads will form in early winter. LARKCOM 1984; B8, C53, N84, Q11M, Q34, Si7, S55

Grumolo Biondo: Very cold hardy chicory from the Piedmont region of Italy. Similar to Grumolo Verde types in cultivation and usage, but with light yellowish-green leaves. Well adapted to cut-and-come-again growing techniques. B8, Q34, S17

Grumolo Verde: (Grumolo, Ceriolo^ Ceriolo Verde) A rugged chicory from the Piedmont region of Italy; will withstand poor soil conditions and extremely low temperatures. Sow from June to October for a seedling crop. If cutting stops in late summer, very early the next spring the plant will form jade-green, ground-hugging rosettes of perfectly shaped leaves. Rather bitter, but blends well in salad mixes. LARKCOM 1984 [Cu]; B8, C53, 139, N7G, N84, Q11M, R32, S55

Grumolo Verde Scuro: (Grumolo Dark Green) Semi-heading type, with a compact, upright center. Forms attractive rosettes (grumolos) of deep green, rounded leaves with white ribs and veining. Harvested like lettuce for use in salads. Popular in Italy; not often grown in the United States. 060, Q34, S17

Selvatica da Campo: Long, deeply cut, dandelion-like leaves; very similar to Barba di Capuccino. Strong bitter taste. Mature plants are usually blanched to develop a milder flavor. Also grown for spring greens or as part of a mesclun mix. In Italy, roots from mature plants are harvested, planted indoors in wet, sandy soil and placed in a dark room where they produce tender, crisp white stalks in three weeks. N84, Q11M, S17

Spadona:<sup>1</sup> (Spadona da Taglio, Lingua di Cane, Dog's Tongue Chicory) Vigorous growing, cutting type chicory. Smooth, narrow-bladed, pale green leaves; lightly and irregularly toothed; fairly bitter. Best harvested when 4 to 6 inches tall. Extremely cold hardy and widely adapted. Plant in spring or fall. B8, C53, G53M, N84, Q11M, Q34, S17

#### RADICCHIO

Also called *red chicory* or red-leaved chicory. The deep-burgundy forms such as Rossa di Verona are often called radicchio rosso, radicchio being the generic Italian name for chicory. Very popular and expensive specialty market item. Can be substituted for Witloof or endive in most recipes. Sometimes eaten with small pieces of the root. CUSUMANO [Cul, Ife], HAWKES, SCHNEIDER 1986 [Pre, Re]; D3M{PR}

**FORCING** These cultivars can be forced indoors, in the dark, like Witloof chicory. In extremely cold areas this may be the only means of obtaining a winter crop, as the plants would be killed if left outside. Forcing also produces more attractive heads with better flavor and eating qualities.

Castelfranco: (Variegata di Castelfranco) Large, crinkled outer leaves; green blotched with red. Inner leaves loose, marbled red and yellowish-white. Heads are looser than Verona types, but less likely to bolt. Developed in the 18th century in the Castelfranco region of northern Italy, probably from strains of Treviso and an escarole. B8, C53,177, L89C, N7G, N84, Q11M, Q34, S17, S55

Rossa di Treviso:<sup>2</sup> (Treviso, Red Treviso, Rouge de Treviso) Initially green and bitter during hot weather, it is cut back and its second growth produces attractive bright red, cone-shaped heads with pure-white central ribbing and leaf veins. Roots can be forced to produce pale pink chicons. Slightly less hardy than Rossa di Verona. Historically the first red chicory was a Treviso type, developed in the 16th century. B8, C53, E24, E63D, F80, G68, 139,167M, J9M, K49M, N7G, Q11M, R32

Rossa di Treviso Precoce: (Early Treviso) Selected from Treviso for more precocious growth. Can be seeded in mid-July, after the days have begun to shorten noticeably, and is therefore less likely to bolt. If heads do not form by Labor Day, it should be cut back to an inch above the crown at the beginning of cool weather. C53, G6, N7G, N84, P59M, Q34, R47

Rossa di Verona: (Verona Red, Rouge de Verone) Produces bright red, very tight heads with prominent white midribs and veins. Very cold hardy; forms during winter without protection. Also suitable for forcing and can be grown as a seedling crop. The best known of all the radicchios, and perhaps the most difficult to grow successfully. Recommended for northern areas. B49, C44, C53, G68, G93M, 139,167M, J9M, M46, N7G, Q11M, Q34, R32

**NON-FORCING** Generally not adapted to indoor forcing. Some of the newer types will also form full-sized heads outdoors without cutting back.

Augusto: 70 days. Medium-sized, round, deep burgundy-red head; slightly larger than Giulio. One of the most frost tolerant cultivars. Also has good bolting and heat resistance. Produces 85% fully formed heads from a spring sowing compared to only 30 to 40% for Verona types. Can also be planted mid to late summer for a fall harvest. D11M, D68, F70

Cesare: 90-100 days An early Verona type with a high degree of uniformity. Produces small, medium round heads with deep burgundy leaves and white midribs. Tender-crisp texture and mildly bitter flavor. Should be planted later than Giulio, in July, for harvesting in September and October. C20M, G71, K50, S55

Chioggia: (Variegata di Chioggia) A red and white variegated, heading type developed from Castelfranco lines. Forms a tighter head than Castelfranco. Foliage is green in summer, becoming variegated in cold weather. Not suitable for forcing. Plant in late summer for a fall and early winter crop. Grows well in sandy coastal soils. B8, C20M, I67M, Si 7, S55

Giulio: 80 days. An early strain, selected from the Verona type. Produces very uniform, compact, round heads with attractive burgundy leaves and pure-white midribs. Easier to grow than other radicchios; will form full-sized heads without cutting back. Can be succession planted throughout the summer but performs best when seeded in late spring for a mid-summer harvest. Bolt resistant. C53, E24, F44,191, K23, K66, N7G, S55

Marina: (Chioggia Race Marina) 100 days. Large, compact, solid, bright-red heads variegated with white; weight 8 to 12 ounces each. Good sharp flavor. Easily grown. Sow May through June for a fall harvest; plants may bolt if sown too early. J97M

Milan: 75 days. New refined, easily grown cultivar. Round, burgundy-red heads, 5 1/2 to 6 inches in diameter; very compact, with well folded leaves; attractive white veins. Excellent flavor. Vigorous plant with even growth, 18 to 30 inches tall; reliably produces heads from spring, summer and fall sowings. C92, FI, G16, G71, G87,139, M49

Palla Rossa: An earlier Verona type, suitable for spring planting. Produces dark green outer leaves which protect the red interior head. Pure white midribs. Larger, looser heads than Giulio; paler in color. Can also be planted anytime during the summer, but protect from intense heat. A good alternative to Rossa di Verona. A2, B8, DIT, D76, J9M, K23{PL}, L89, N84, Q34, S17

Palla Rossa Precoce: (Palla Rossa Zorzi Precoce) Semi-compact, solid heart, turning red at maturity. An early strain of Palla Rossa with large heads. Red Verona type. Suitable for spring planting, and can also be planted during the summer months if protected from intense heat. B8,118M, K49T, N81

Radicchio di Treviso: 90 days. Distinct from Rossa di Treviso because it does not require forcing to produce heads. Forms an elongated bunch weighing about 10 ounces. It is necessary to tie up the head 15 to 20 days before harvesting. Sown in June for harvesting in the fall. Not resistant to frost. Q11M

Silla: A newer cultivar, adapted for early spring planting under row covers. A high percentage will head up without bolting even during a late spring hot spell. Produces deep red heads the size of tennis balls with pure-white midribs and leaf veins. Small, green outer leaves. Compact growth habit permits very close spacing. J20

Sottomarina: (Variegata di Sottomarina) An unusual and very attractive radicchio. Forms large, loose heads that become red speckled with white when mature. Outer leaves are variegated with green and red. Use individual leaves or entire heads. Plant in early spring or late summer. An old cultivar named after the coastal town just south of Venice. B8, S55

#### ROOT CHICORY

Also called *radicchio amaro*, the bitter but pleasant-flavored roots are a popular winter vegetable in Italy where they are boiled until tender, then sauteed and served or dressed with olive oil and lemon juice to accompany grilled pork. BIANCHINI, GRAY, P. [Cul]

Chiavari: (Di Chiavari) Grown primarily for its root, although the leaves are also used and have a good flavor. The root is thick-colored, creamy white and uniform. Grows over a long season, from early spring until late fall. To prepare, scrape and boil the root until tender. Slice thinly and serve with vinaigrette, or it can be rolled in bread crumbs, deep fried and served with lemon and parsley. S17

Magdeburg: (Large Rooted Magdeburg, Cicoria Siciliana) 120 days. Large, thick, tapered root; 12 to 14 inches long, 2 inches in diameter below the neck; can be cooked like carrots at about 65 days. Mature roots are dried and employed for the manufacture of *coffee chicory*; also used for forcing like Barbe de Capucin. Erect, undivided leaves can be harvested for "greens" at about 65 days. VILMORIN; A2, A7{DF}, C17M{PD}, C44, D26G, E38M{DF}, F80, G93M, I8M{DF}, J82, J82{DF}, K49M, L42, Q34

Soncino: (Radison) Long, narrow roots with creamy white skin and flesh; rather bitter. May be harvested anytime from autumn until the following spring. Popular in Italy where it is considered very healthful and is cooked and eaten in many ways. B8, N84, Q11M

#### WITLOOF

Also known as *Belgian endive*, *French endive* or *chicons*. These are grown for their blanched shoots which develop after the root is forced. They are tender and crisp with a typical bitter, aromatic taste. Popular specialty market item. A45{PD}, C85M, E7M, E13G{PR}, G71, H49, J20, J73, K49M, N40{PR}, R47

#### hybrid

Bea: A Zoom type, with improved ease of utilization. Produces a high percentage of very fine quality chicons. Recommended for forcing without soil or cover from mid-September to mid-April, in particular for a harvest in November-December and February to April. One of the most popular cultivars in France. S95M

Flash: An early to midseason cultivar, usually sown mid-May to mid-June and harvested from early September to November. Roots are forced from December to April, at temperatures ranging from 60 to 68° F. Flash produces uniform, well-closed chicons of excellent quality. D11M, F70, G6,177, S95M

Magnum: An improved hybrid witloof cultivar that is a real breakthrough in growing ease. For forcing between November and April, with or without cover. Remarkable for its shape, firmness and productivity. Developed in Germany as a replacement for Mitado. 139, P59M

Roelof:<sup>2</sup> Unique, reddish-colored witloof. For forcing between October and February, with or without a covering of soil. Nice, firm chicons. Very attractive red and white coloring. Developed in Europe. P59M

Samba: Yields beautiful, very firm, globular chicons—in the traditional manner, as well as without a covering of earth. For forcing between November and April. Very reliable. Developed in Europe. P59M

Sigma: Very uniform type, with a high percentage of superior quality chicons. Shorter than Bea, therefore better suited for packing. High yield per acre. Resistant to diseases and brown axes. Sown in the field in early May, the roots being gathered from October 20th

onward; chicons are harvested at the end of November. Developed by INRA of France. *S95M*

Toner: 130 days. Easy to grow and force, by either the traditional method or without soil and cover. Rather short, firm, well-closed chicons of the highest quality. Tested as being the least fussy cultivar for home production. Very early. May be sown mid-April to mid-May for forcing the end of August to the end of September at temperatures of 68 to 75° F. *C20M*

Turbo: 110 days. Produces a refined chicon for the European restaurant trade. Uniform, well-finished heads, 6 to 6 1/4 inches tall. Very vigorous, it is preferable to force only well calibrated roots, 1 1/2 to 2 inches in diameter. Can be forced without cover, such as in hydroponic culture. Roots can be placed in soil, moist perlite or water, using trays or pails. Tolerant to brown axes. Developed by INRA of France. *C85M, D74B, E63D, L42, S95M*

Zoom: 110 days. Developed in France for forcing without being covered. The roots only need to be placed in a cool, dark place for sprouting to begin. Can be set in soil, moist perlite, or water, using trays or pails. Produces small, thick, firm, well-closed chicons of excellent quality. Approximately 21 days from the start of forcing to harvest. Productive and uniform. *C53, P59M, S55*

#### OPEN-POLLINATED

Alba: Produces large quantities of thick, attractive chicons. Good for forcing during cold weather; not suitable for warm weather forcing, the maximum temperature being about 62° F. Not recommended for forcing outside of soil or without cover. An excellent cultivar for home gardeners. *N84*

Red C:<sup>2</sup> 80 days. Unique, reddish witloof. Produces broad, tender shoots with good flavor. Excellent in salads or the individual leaves can be used as "spoons" for dipping. Grown through the summer for a fall harvest. Roots can later be dug for forcing in sand in a dark cellar at 40-60° F. *C92, K49M*

Robin:<sup>2</sup> Produces shoots that are a reddish-pink color after forcing, the first pink Belgian endive. Very good quality. Has good potential as a specialty market item. Suitable for forcing without soil or cover from October to January. Optimal temperature about 55° F. *C53, E13G{PR}, N40{PR}*

Witloof Improved: 110 days. An outstanding strain that may be used for commercial forcing in home gardens. Heads are similar in appearance to cos lettuce but much shorter. When forced for winter it produces very uniform heads, about 5 to 6 inches in length. *L42*

#### CODES FOR SPECIAL TYPES

1. Cutting
2. Pink Chicons

## CHINESE CABBAGE {S}

### BRASSICA RAPA PEKINENSIS GROUP

#### HEADING

**MICHIHLI TYPE** The head is in the form of an upright cylinder, 18 to 24 inches in height with the leaves held erect, not noticeably overlapping at the apex. In China, heads are commonly tied to encourage blanching of the heart.

#### Hybrid

Green Rocket: 50 days. Vigorous and extremely uniform; 4 to 5 pound heads are 18 inches tall, cylindrical and tightly folded, with deep-green leaves and an appealing white interior. Tolerant to most diseases. Sweet, crisp and tender; perfect in salads and stir-fried dishes. Excellent for spring or fall gardens. *C20M, G13M, K10, N81, N84, Q11M, R32, S55, S63M*

Jade Pagoda: 68 days. Cylindrical heads average 16 inches tall by 6 inches in diameter with medium-green, crisp outer leaves and a creamy yellow heart; weight 6.6 pounds. Upright in habit; suitable for close planting. Vigorous and slow to bolt. Resistant to bacterial soft rot and virus. Michihli type that is earlier in maturity and lower in plant height, with more uniformity. *Al, F13, G82, H54, H85M, 191, J84, K10, K16M, K73, L42, M29, N84*

Monument: 75 days. Michihli type, Taller and much later than Jade Pagoda; slower to bolt. Glossy green outer leaves; excellent uniformity. Plants average 17 inches high and 8 inches in diameter with firm, well-folded heads. Leaves and ribs have some tolerance to specking. Heavy yields. Mild flavor. *Al, C20M, D26D, G93M, K10, K50, K73, L42, M29, S63M*

#### Open-Pollinated

Chihli: 75 days. Tall, cylindrical, very solid heads; height up to 22 inches, width 5 inches. Broad, dark-green, well fringed outer leaves with white midribs; quality very good. Popular on the East Coast. Can be trimmed for market, still leaving a long, cylindrical head. Upright growth permits closer planting. *D27, K27M*

Michihli: 80 days. Tall, cylindrical heads average 18 inches high and 4 inches in width; long and slightly tapering to a point; crisp, tender, and tightly folded. Outer leaves are dark green with white ribs. Very good flavor. Heads blanch well, but do not store for long periods like the hybrid types. Standard commercial cultivar. *B75M, B78, C44, C69, D55, G16, G27M, G57M, G71M, H85M, K10, L59, M95M, N16*

**NAPA TYPE** The head is round and compact with the leaves usually overlapping at the apex. Some have a flat top, similar to a drumhead cabbage, others have a more or less pointed head. *E13G{PR}*

#### Hybrid

Blues: 50 days. An attractive early cultivar with disease resistance. Matures with Nagoda #50, is more vigorous, and has stronger bolt resistance. Firm, well-wrapped heads; good quality. Resists downy mildew, alternaria, soft rot, and some viruses. Sow early spring through July. *Al, C20M, D68, E24, G6, G13M, K10, K50, K73, L42, L79G, L91M, M29, N52, S63M, etc.*

China Express: 64 days. Medium to large, solid, barrel-shaped heads; average weight 5 pounds; medium light-green leaves. Slow to bolt. Suitable for spring sowing in temperate climates. May also be grown in a greenhouse in northern areas. Earlier, slightly smaller version of China Pride with more tip-burn tolerance. *Al, A87M, C20M, D26D, E75{PL}, F13, J84, K16M, K50, L79G, L89, M46, N81*

China Pride: 68 days. Large, blocky barrel-shaped heads, average weight 5 1/2 pounds; bright green leaves. Tolerant to many types of diseases including downy mildew, bacterial soft rot, and tip burn. Semi bolt-resistant. An excellent main crop Napa type for summer and fall production in cool areas. *Al, A87M, C20M, G13M, K10, K16M, K50, K73, L42, L79G, M29, 053M, Q11M*

Kasumi: 65 days. Popular new cultivar that has the best tolerance to bolting of any Napa type. Upright, barrel-shaped heads, slightly smaller than China Pride or about 5 pounds. Medium green leaves with bright white midribs. Sweet, mild flavor. Suitable for early or late sowings. *A79M, L42, M49, N81, Q28, RUM, S61M, S75M, TIM*

Kokasanto:<sup>1</sup> 90 days. Large, cylindrical, open-topped head weighing over 9 pounds, resembles romaine lettuce; good head formation; interior blanches to a distinct golden-yellow color. High quality and sweet taste. Excellent for salads or pickling. Resistant to disease and frost. *Q28*

Nagoda #50: 50 days. Versatile, early cultivar; tolerant of cool spring weather and summer heat. Medium-sized, 3 to 4 pound heads

are of the preferred barrel shape. Leaves pale yellowish-green, very tender and crisp; quality good. Sow April through July. D82

Nerva: 46 days. Remarkable earliness and strong bolt resistance combined. Rectangular, 10 inch well closed heads are very heavy for their size. Densely packed, with thick, juicy leaves preferred for stir-fried dishes and pickling. Sow early spring through May. L89, S61M

Orange Queen:<sup>2</sup> 75 days. Unique orange-hearted Chinese cabbage. Deep-green heads with a very attractive internal orange color when fully mature. Changes from light yellow to light orange when cut and exposed to sunlight. Has twice the nutrition of common light yellow forms. Excellent eaten raw in salads. Susceptible to bolting. Good potential for specialty markets. L42, L91M, N84, Q34, S55, S63M

Tropical Pride: 55 days. Vigorous, uniform grower. Very firm, oval-shaped heads, about 10 inches tall; average weight 3 to 4 pounds; medium green leaves; ideal for salads and sandwiches. Resistant to heat. Grows well during the winter in tropical and sub-tropical areas. L59, L79G

Two Seasons: (Burpee's Two Seasons) 62 days. Very large, oval heads 10 inches tall by 7 1/2 inches wide. Crisp, tender, tightly crinkled leaves and thick, succulent midribs with a sweet, tangy flavor. Holds up well in warm weather; resists bolting. Especially recommended for spring sowing; equally good for fall. Very resistant to soft rot. Keeps well. B6, B75, E97, K50, Q34

#### *Open-Pollinated*

Aichi: (Aichi Hakusai, Shantung Heading) Medium to large, round heads; weight 10 to 12 pounds; blanch easily. Thick, smooth, light green leaves. Good resistance to bolting. Sow July through August. A popular early cultivar introduced into Japan in 1875 from Shantung Province, China. The Aichi group of cultivars was derived from the Santo type. G33

Kogane:<sup>1</sup> 80 days. Leading variety of fluffy top or lettuce type Chinese cabbage. Tall, open heads resembling Romaine lettuce or Sugarloaf chicory; weight about 9 pounds; medium-green outer leaves, crumpled and frilled at the edge; creamy yellow core; excellent flavor. Suitable for pickling. Very popular in China and Japan. S70

Kyoto No. 3: (Kaga) 70 days. Very large, globular head; 12 inches high and 8 to 9 inches in diameter; weighs 14 to 16 pounds. Well blanched; crisp and tender; outer leaves medium-green colored. Winter hardy and tolerant of virus diseases. Sow in late summer or early spring. C85M, G33, Q11M

Lettuce Type:<sup>1</sup> 45 days. A tall, open-topped Chinese cabbage resembling a large romaine lettuce. The cylindrical heads reach 11 to 12 inches and about 3 pounds very early, with a ruffly appearance and a creamy yellow blanched interior. Leaves are thin, crisp, and of excellent salad quality. Potential specialty market item. Sow May through late summer. G6, L77D, N7G, N84, R47

Market Pride: 70 days. The standard Japanese autumn market type with light green, well-crinkled outer leaves and pure white hearts. Heads are cylindrical and weigh about 4 pounds. Sow in July for late fall harvest, or it can be sown in early spring. K49T

Matsushima: 80 days. Very dark green outer leaves enclose a round head of light-colored folded over leaves, shaped more like a European cabbage than a typical Chinese cabbage; weight 5 pounds. Excellent quality for cooking, salads, or pickling. Quick growing. Sow late June to early July. G33, E83T

Nozaki Early: 60 days. Light green, compact, barrel-shaped heads; weight 3 to 4 pounds. One of the earliest and most dependable open-pollinated cultivars, suited to earlier sowing than most. Usually does not make as dense a head as hybrids. Bolt resistant. Sow mid-June through July. A2, J9M

Orient Express: 43 days. Small, solid, oblong heads; 6 inches long, 4 1/2 inches in diameter; average weight 22 ounces; well-blanched leaves with a crisp texture and a pleasant, slightly pungent flavor. Very early and heat resistant; holds extremely well in hot weather. B75

Shantung: 60 days. Early, semi-heading cultivar of spreading habit. Heads weigh 4 to 5 pounds, have dense interior leaves that blanch well, and are upright when mature. Outer leaves are light green, smooth and tender. Sow in summer. F73D, L59

South China Earliest: 45 days. Very tender, compact head; 10 to 11 inches tall and about 4 1/2 inches wide at the upper portion; somewhat pointed at the base; weighs about 14 ounces, creamy white colored overall. Resistant to severe summer heat and well tolerant of stormy weather. Sow July to September. R47

#### NON-HEADING

Green Seoul: 35 days. Tall, upright-growing loose-leaf type with long white ribs. Very slow bolting; can be planted in spring, summer and fall. Disease tolerant. Outer leaves can be harvested after 30 days. When mature, it weighs up to 2 pounds. Used in soup, kimchi and as a raw or cooked green. Very popular for short-term kimchee making. Developed in Korea as a selection from the oldest and most important cultivar Gaeseong. D55, F73D, M65, N40M, N84, Q3

Hiroshimana: 75 days. A popular old cultivar of Hiroshima Prefecture, Japan. Leaves are smooth, very wide and rounded, dark-green in color with bluish-white midribs and nearly parallel veins. Succulent, with a unique mild flavor for which it is highly prized. Mostly used for winter cropping and for pickling. D55, E83T, N84

Kireba Santo: Very tall, upright, semi-heading plant. Light green outer leaves, toothed at the edges. Produces blanched inner leaves in a similar manner to Ohgon. Grows best in warm summer weather. Thinnings can be eaten after 3 or 4 weeks. E83T

Maruba Santo: 50 days. Fast growing loose heads of smooth, round, light-green leaves with wide crisp white ribs. Leaf blades are very thin, crisp and tender. Can be picked at any stage giving a continual harvest like Swiss chard. Suitable for planting all year round, being especially adapted to tropical and sub-tropical climates. D68, Q34, S70

Minato Santo: Easy to grow non-heading Chinese cabbage. Loose, 12 to 15 inch heads, bright chartreuse green; tender and mild flavored. Hilly, white-ribbed leaves. Suitable for stir-frying, salads or steaming. Vigorous and cold resistant, can be grown year round in temperate regions. 139

Ohgon: 70 days. Upright, semi-heading plant, to 15 inches tall; weight 3 to 4 pounds. Light green outer leaves, slightly ruffled at the edges. Produces blanched inner leaves with a rich yellowish-cream color. Can be sown all season long. E83T

Round-Leaved Santo: (Round-Leaved Santung) 50 days. Large, erect, fast-maturing plants are non-heading, cold resistant and very easy to grow. The leaves are broad and smooth, medium-green in color, and have white ribs. Quality is very high, either raw or cooked. Sow in spring or fall. One of the most popular vegetables in Taiwan. C20M, D55, L59, L79G, S63M, TIM

San-Feng: Vigorous, fast growing variety suitable for year-round planting. Can be harvested within 3 weeks of sowing. Light green leaves with white midribs, soft and tender. Good for stir-frying or adding to soups. High-yielding plant; weight about 1 pound. Tolerant of heat as well as cold; will not bolt in hot weather. Q39

Santo: (Santoh) 60 days. Smooth, serrated, bright green leaves with white ribs. Grows 14 to 16 inches high. Plant where warmth and plenty of moisture can be provided. Sensitive to hot summer sun; sow in spring or fall in most locations. Very old cultivar, introduced into Japan from Shantung Province, China. C20M, G33, N84

Shirona: Improved Santoh type. Light green leaves. Has a broad leafstalk similar to Swiss Chard, which may be eaten separately from the rest of the leaf. Very tender with a delicate but rich flavor. Excellent for stir-frying or pickling. Fast growing vegetable good for catch cropping. Grown extensively in Japan. D55, J73, N84

Tokyo Bekana: 30 days. Japanese Santoh type Very fast growing, to 12 inches high; tender, yellowish-green leaves with frilled edges; flat, white petioles. Excellent for stir-frying or adding to soups. Does well when planted spring through fall. Cold resistant. Very popular in Japan and Taiwan. D55, F73D, Q34, S70

#### CODES FOR SPECIAL TYPES

1. Lettuce-Leaved
2. Orange-Hearted

---

## COLLARD {S}

### BRASSICA OLERACEA ACEPTALA GROUP

---

#### HYBRID

Blue Max: 68 days. Deep blue-green leaves; slightly crinkled for a unique appearance; larger, denser and more attractive than conventional collards; very good flavor. Very uniform and disease tolerant; widely adapted. Up to 30% higher yielding than Vates. Suitable for fresh markets, home gardens and processing. Introduced in 1982 by Abbott and Cobb. *AI, M29*

Flash: 75-80 days. Hybrid, refined, early Vates type. Smooth, flat, broad dark blue-green leaves. Tall, upright plant, height 18 to 26 inches; vigorous and productive; very slow to bolt; very uniform when ready for harvest. Recommended for fresh market or processing. *AI, A87M, C28, G1M, G82, H54, H61, J84, K10, K50, K73, L42, N52*

Hevi-Crop: 65 days. A tybrid Vates type with superior vigor and performance. The large, smooth, medium blue-green leaves are closely spaced on the stem and carry more leaf surface down the petioles. Early, very uniform plants are more disease tolerant and recover faster when cut. Up to 30% higher yielding than Vates. Bolt resistance comparable to Champion. *AI, A87M, K10, K50, K71, K73, M46, S63M*

Hi-Crop: 68 days. Very uniform, slightly crinkled, blue-green leaves; hold their color better than other types; good texture, even in hot weather; mild, sweet flavor. Vigorous, heavy-yielding, upright plants; height 15 inches; clean growth habit; closely spaced internodes. Highly resistant to bolting. Replacing Vates as die standard collard. *Q34, S63M*

Top Bunch: 71 days. Tall, semi-erect plant; broad, deep-green, slightly wavy leaves. Highly productive, excellent for both home garden and local market sales. Vigorous, rapid regrowth. Generally earlier, more uniform and less susceptible to bolting than open pollinated types. *AI, A87M, C20M, C28, G1M, G27M, H61, 191, J84, K10, K16M, K50, K73, L42, M29, etc.*

#### OPEN-POLLINATED

Cabbage: 70 days. A heading collard with cabbage-like characteristics. Produces very hard, compact, dark-green heads on short stems; height 24 to 28 inches; light-green midribs and leaf veins. Combines die flavors of collards and cabbage. Hardier than cabbage. Very slow bolting, will stand 3 weeks longer than Georgia. *D12, G1M, L10*

Carolina: 70 days. Extremely uniform, dark-green leaves. Upright plant; height 28 to 32 inches; bolting resistance similar to Georgia; very wind and cold tolerant; resistant to one or more races of downy mildew. Released in 1980 by the South Carolina Coastal Experiment Station in Charleston. *B1M*

Champion: 78 days. Longer standing Vates type released by the Virginia Truck Experiment Station in 1976. Selected to hold longer in the field without bolting. Somewhat taller than the regular strain, to 34 inches. Uniform, vigorous, blue-green leaves; close internodes; good flavor; high yield potential. Adapted wherever collards are grown. *A27M, A87M, F13, G1M, G6, H54, J14{PL}, J84, K10, K73, L42, L89, M29, M95M, R47, etc.*

Georgia: (Georgia Southern, Southern) 70 days. Large, moderately crumpled, blue-green leaves; grow back well after being harvested; mild, cabbage-like flavor is improved by frost. Vigorous, upright spreading plant; height 4 feet or more; produces well in poor soils and under adverse weather conditions. Popular traditional cultivar, introduced prior to 1885. *A75, D82, G71, G68, H61, 191, K49M, L10, N16*

Georgia Blue Stem: 60 days. A popular old cultivar. Very tall, attractive, long-stemmed plants with leaves growing on widely separated internodes. The leaves can be harvested continuously as the plant quickly forms new ones. *C92*

Green Glaze: (Greasy) 73 days. A unique heirloom cultivar that many southerners refer to as Greasy Collards. Bears a loose cluster of smooth, slightly crumpled leaves that have a bright green sheen, giving the surface a "greasy" appearance. Upright plant; height 30 to 34 inches; slow bolting; resistant to cabbage worm. *C28, F73D, G57M, K71, L7M*

Morris Heading: (Morris Improved Heading) 80 days. The outer wrapper leaves close together more tightly than others, forming a large, round, very firm rosette which can be harvested for its tender, succulent growth. Dark-green, slightly crinkled leaves. Slow-bolting plants grow 18 to 24 inches tall. An old favorite with excellent flavor. *A75, C28, D12, G1M, G27M, G57M, H54, K49M, K71, L7M, Li0, M95M*

Vates: (Blue Stem) 75 days. Broad, thick, dark-green, coarsely crumpled leaves free of purpling; excellent flavor and quality. Upright spreading, heavy-bearing plants; height 24 to 30 inches; fairly resistant to bolting; winter handy. Very popular standard cultivar. Developed by the Virginia Truck Experiment Station. *A75, A87M, C44, C85M, F82, G71, H61, K73, L7M, N16*

---

## CORN {S}

### ZEAMAYS

---

#### DENT CORN

The kernels of this type have an indentation or depression on the top of the grain. This occurs when the soft, floury core in the middle part of the endosperm shrinks more than the hard, corneous portion. The most widely grown economic race of corn in the United States, it is milled into the yellow commeal of the grocery trade. *M67{DF}*

#### BLUE/PWPLE-KERNELEP

Blue Clarage: (Ohio Blue Clarage, Blue Claredge) 100 days. Highly uniform, semi-dent corn. Distinctive, medium-sized, solid-blue ears. Higher sugar content than most dent corns; may be used as a table com in the milk stage. Mills easily; makes a speckled blue and white commeal with a sweet, nutty flavor; a white meal may be obtained by sifting out the bran. Developed west of the Appalachian Mountains in the Ohio-West Virginia area between 1830 and 1850. *L7M*

McCormack's Blue Giant: 85-100 days. Large ears, 7 to 8 1/2 inches long; large, wide, smoky blue kernels. Produces a light blue flour. Well suited for making blue tortillas and blue corn chips. Also excellent for roasting. Very tall stalks, 10 to 12 feet high; 1 or 2 ears per stalk. Adapted to clay soils and drought prone areas of the Eastern States. Developed by Jeff McCormack. *L7M*

Peruvian Morado: Very attractive purple corn, darker purple than others of this type. Short, plump ears, 2 1/2 to 6 inches long; 8 to 12 rows, slightly dented. Round, deep violet kernels. Deep purple cobs. Grown primarily for growing *chicha*, a traditional alcoholic corn beverage. F80, N84

#### GREEN-KERNELEP

Oaxaca Green: 85 days. Stout ears, 6 to 8 inches long, dented with smooth, emerald green kernels. Deep, rich flavor. Grown for centuries by the Zapotec Indians of southern Mexico for making green flour tamales. Stalks grow 5 to 6 feet tall. Often grown with squash and beans which twine up the corn stalks. A2, F73D, K20M, K49T, L3J

#### MULTI-COLORED

Hickory King Composite: 95-110 days. Ears 8 to 10 rowed, cob small; large white and yellow kernels (1 to 5% blue). Excellent for roasting in early stages; also fine for commel and hominy. Contains a range of genetic diversity; selections can be made that are adapted to local regions. C59M

Mayo Batchi: A desert staple of Sonora's Mayo River heartland. Short fat ears, with mixed clear, white and yellow kernels. Red cobs. For *elote*, tamales, tortillas and corn beer. Dry farmed in the low hot desert. In temperate climates, plant in spring when danger of frost is past and the soil is warm. 116, N84

Mexican June: (Blue and White) 110 days. Long, plump ears; 8 to 9 inches long, 2 to 2 1/4 inches in diameter; rows 12 to 16, very crowded around the cob and in the row. Blue and white kernels; mostly white at roasting ear stage. Good for roasting ears. Medium heavy stalks; 7 1/2 to 8 1/2 feet tall; often 2 ears per stalk; resistant to heat and drought. Introduced about 1896. TAPLEY 1934; *DIT*, E5T, 181, K49M, N84

#### RED-KERNELED

Beasley's Red Dent: 105 days. Originally a yellow dent which was selected for red color, but still produces a small percentage of yellow and orange ears. Ears 9 to 12 inches long, containing 16 to 20 rows of red kernels. Stalks average 9 feet tall. Excellent resistance to blight and drought. An heirloom discovered in Whitley County, Indiana. K20M

Bloody Butcher: 120 days. Ears 10 to 12 inches long; 12 to 14 rows per ear; kernels cherry-red striped with darker red. Fine flavor. Very good for flour, cornmeal, or corn-on-the-cob when young. Cobs pink or red. Stalks grow 10 to 12 feet tall; 2 to 6 ears per stalk. An old-time cultivar, grown in the United States since 1845. B8M, C59M, D56M, D76, D92M, E5T, *F63*, *G13M*, G82, H49, H85M, J20, K10, K49M, K71, K73, L7M, M65, etc.

Northwestern Red: 100 days. Attractive small to medium-sized, tapered ears, 6 to 8 inches in length with 12 to 16 rows of kernels; kernels red with white tips. Sturdy stalks, 5 to 6 feet tall. Rare heirloom from the Midwest. K20M, L7M

#### WHITE-KERNELED

Boone County White: 120 days. Nearly round ears, 9 1/2 to 11 inches long; 16 to 22 medium spaced rows. Thick, blocky kernels, medium to wide and very deep. Cob white, large and heavy. Good for roasting and hominy. Heavy stalks, 9 1/2 feet tall. Originated in Indiana about 1876. D26D, K71

Hickory King White: 115 days. Medium-long ears, 7 to 8 inches in length, small cob; kernels very wide, thin and deep. Excellent for hominy, the skin of the kernel being easily removed by soaking. Also good for roasting, grits, cornmeal and flour. Heavy stalks, 7 1/2 to 8 feet tall. Popular in the South. Introduced prior to 1888. ANONYMOUS 1888, TAPLEY 1934; D26D, F73D, G27M, H49, H85M, *I64*, K27M, K49M, K71, *K94*, L7M, M95M

Pencil Cob: 100 days. Medium-sized ears; surrounded by a thick, tight shuck; very deep kernels, plump and sweet. Unusual, very

slender "pencil-sized" cob. Flavorful roasting ears in 76 days. Stalks grow 5 to 6 feet tall; 2 to 3 ears per stalk. Tolerates dry weather well. F80, K49M, N16

Posole: 100 days. Large, plump ears. Very wide, thick kernels. The traditional cultivar of dry dent corn for making *posole*, a soup-like dish that is one of the finest meals of Southwestern cuisine. The hominy of the Southwest. Vigorous, drought-tolerant plants. I63T{DF}, J25M

Silver King: (Wisconsin No. 7) 100-110 days. Ears 8 to 9 inches long, with 16 slightly wavy rows. Cob glistening white. Kernels creamy white, very wide, of medium depth and thickness. Good for roasting ears. Popular in the northern part of the Corn Belt. Originated by A.J. Goddard of Ft. Atkinson, Iowa in 1862. D26D, K71

Silver Mine: 97-110 days. Ears rounded, tapering at the tip, 11 to 12 inches long. Kernel creamy white, of medium depth and width. Cob small, white. Popular for roasting ears in Florida, Georgia, Alabama and Mississippi. Adapted to a wide range of climates and soils; does well on poor soils. Good resistance to earworm. Originated by J.A. Beagley of Sibley, Illinois, in 1890. C59M, D26D, G27M, K71

Tait's White: An heirloom white dent, now rare, originally developed and introduced by Tait Seed Company of Norfolk, Virginia. Produces 1 or 2 ears, 8 to 10 inches long, on 6 foot tall stalks. Traditionally used for roasting ears. Adapted from Virginia southward. K71

Tennessee Red Cob: Large deep-grained ears, up to 12 inches long, 12 to 16 rows. Red cobs. Good for roasting ears or cornmeal. Tall stalks, to 13 1/2 feet. Famous field com, very popular in Tennessee and other sections of the upper South. *K94*, L7M

Texas Gourdseed: 120 days. Large ears containing 18 to 22 rows of narrow, creamy-white kernels. Very easily shelled, almost with the flick of a finger. Grows about 8 feet tall; 2 ears per stalk. Locally considered the best com for making tortilla flour. Originally brought to south Texas by German farmers who migrated from Virginia, Kentucky and Tennessee during the late 19th Century. L7M

Trucker's Favorite White: (Trucker's White) 95 days. Ears 8 to 10 inches long, 6 to 6 1/2 inches in diameter with 14 to 18 rows. Kernels large and deep, nearly rectangular in shape, creamy white. Excellent for roasting ears. Stalks 8 to 8 1/2 feet, tall and heavy. Particularly popular in the Cotton Belt and all parts of the South. D26D, G1M, G27M, G57M, H85M, *I64*, K49M, K71, M95M, N16

#### YELLOW-KERNELED

Hickory King Yellow: 115 days. Medium to long ears, 8 to 9 inches in length, small cob; dark-yellow kernels, very wide, thin and deep. Excellent for hominy, the skin of the kernel being easily removed by soaking. Also very good for roasting, grits, cornmeal and flour. Heavy stalks, 8 to 10 feet tall, often produce 2 ears. E5T, F73D, *K94*

Lancaster Surecrop: (Welschkorn) One of the three parent lines used for developing modern hybrid field corns. Developed by Mennonite farmer Isaac Hershey of Lancaster, Pennsylvania. Considered to be Lancaster County's most important contribution to American agriculture. C59M, D26D, F24G, G57M, K71

Nothstine Dent: 100 days. Medium-sized ears, 7 to 8 inches long; glossy yellow kernels with white caps. Makes a sweet, flavorful cornmeal for baking and cereal. Single stalks, to 7 feet tall. Not high-yielding but of excellent quality. Successful in short season areas. A northern Michigan heirloom. A2, G6

Reid's Yellow Dent: 110 days. Most popular yellow dent corn in the United States. Ears 9 to 10 inches long, with 16 to 22 closely spaced rows. Kernels very deep and narrow, deep yellow with a lighter cap, often tinged with red. Good for roasting ears, hominy, grits and cornmeal. Tall, heavy stalks. Very productive; widely

adapted. Originated by Robert Reid of Illinois in 1847. Prize winner at the 1893 World's Fair. D26D, G57M, H85M, 164, 197{DF}, 197{ED}, J21P, K71, L7M

Trucker's Favorite Yellow: (Trucker's Yellow) 77 days Yellow strain of Trucker's Favorite White, with a red cob. Ears 8 to 12 inches long, with 12 to 14 rows. Used for a quick early crop or for late planting. Popular throughout the South and Midwest. D26D, E5T, G57M, H85M, K71

#### FLINT CORN

The kernels of flint corn are very hard and as in popcorn, nearly all the starch in the endosperm is corneous. When milled into flour it remains as small granules, not as a powdery mass. Before the development of Com Belt dent, it was the most widely distributed com in the Northeastern states. C73P{DF}

#### MULTI-COLORED

Indian Flint: (Squaw) 105 days. A hard flint com, unsurpassed for grinding into cornmeal. Despite the multi-colored ears, the ground cornmeal shows little or no trace of color. 139

Little Indian:<sup>1</sup> 75 days. Produces up to 40 pinkie-size ears per plant that are perfect for harvesting at the silking stage for "baby" corn. If left to mature, will produce very small ornamental ears, 2 1/2 to 3 inches long. Ears will be larger when well fertilized or pollinated by other corn. Widely adapted. J9M, L79

Tarahumara Maiz Caliente: "Hot corn" or summer cultivar. Onaveno Race. Small kernels, mixed white, yellow and salmon. Fast growing. For subtropical and low desert areas. In temperate climates, plant in late May or early June. From the Tarahumara Indians of Mexico. 116

Tarahumara Serape: Attractive, long slender ears. Pearly red and white striped kernels. Similar to Havasupai Chin Mark flour com. Cristalino de Chihuahua land race. Planted in early July in desert areas. Irrigated. In temperate areas plant in spring when danger of frost is past and the soil is warm. 116, N84

Tepehuan Maiz Colorado: Medium-sized ears. Long, yellow-striped red kernels with beaks on tips. Red cobs. Planted in early July in desert areas. Irrigated. In temperate areas, plant in spring. From Mexico. 116, N84

#### PINK/RED-KERNELED

Tarahumara Apachito: One of the favorite races grown by the Tarahumara of Mexico. Small pink to red kernels on long ears with numerous rows. Adapted to the high desert, above 3,500 feet elevation. 116, N84

Tarahumara Maiz Color de Rosa: 90 days. Medium-sized pink ears. Has somewhat the texture of flour corn and some pointed kernels. Planted with the summer rains in desert areas. In temperate climates, plant in late May or early June. 116, N84

#### WHITE-KERNELED

Rhode Island White Cap: 115 days. An authentic, 8-rowed white flint corn of the Narragansett Indians. Ears slightly larger than Garland, 6 to 7 inches long. Ivory-white kernels. Used for the famous Rhode Island *jonnycake* meal, Indian pudding and New England brown bread. Stalks grow 6 to 7 feet tall. Recommended for northern gardeners where seasons permit. Still grown commercially near Little Compton, Rhode Island. GUNST [Re]; E67{PD}, H86{DF}, H86{PD}

Saskatoon White Flint: 75-80 days. Traditional northern flint corn. One of the fastest maturing white dry corns suitable for grits, corn meal or flour. Produces one ear per plant, about 7 inches long and with 8 rows of kernels. Grows to about 4 feet tall when mature. J9M

#### YELLOW-KERNELED

Garland Flint: 110 days Very early Northern flint corn. Most ears are bright yellow, the balance solid, deep red; 7 to 8 inches long, 8-rowed. Used for cornmeal. Stalk grows 7 to 8 feet tall. Selected by George Garland, one of the last old-time producers of fine traditional New England com. G6

Longfellow's: 117 days. The standard 8-row Northern flint. Ears 12 to 16 inches long, well-filled to the extreme end of the cob. Kernels large and broad, rich glossy orange. Makes a sweet, rich cornmeal. Stalks 8 to 10 feet tall; extremely productive, often produces 3 full-sized ears per stalk. ANONYMOUS 1888; D29P, F46, L3J

Vermont Yellow: 95-100 days. A very early hard yellow com of fine lineage. Ears 8 inches long, straight, 8-rowed. Good for cornmeal. Stalk grows 6 to 8 feet tall. Matures well in short season areas. D29P

#### FLOUR CORN

Kernels of flour corn have an endosperm that consists entirely of very soft, white, opaque starch. It is easier to grind than flint or dent com, milling easily to a fine flour. Grown primarily in the Southwest and the Northern Plains. The Southwestern form is very distinct, with small kernels and large cobs.

#### BLUE/PURPLE-KERNELED

Alamo-Navajo Blue: (Navajo Blue) 90 days. Large, full ears of dark bluish-purple to almost black kernels. Popular for grinding into cornmeal for Southwestern blue com tortillas and *piki* bread. Can also be picked young and eaten fresh. Very vigorous plant; resistant to drought and disease. Also a good ornamental. From Magdalena, New Mexico. D26G, D56M, G6, G68, 116, 116{DE}, J25M, K49Z, N84

Hopi Blue: 80 days. Popular dark-blue com that makes a sweet blue cornmeal. Widely grown in the Southwest and used in a variety of traditional foods. Precursors of modern strains have been raised continuously for 800 years on the Hopi Indian mesas of northern Arizona, never under mechanized agriculture. Thrives in sandy soils, without irrigation when necessary. Most widely adapted of Hopi corns for other regions. COX [Be], KAVENA [Re]; A2, C95, D74B, F73D, G13M, 116, J20, J73, K10, K49M, K49M{£D}, Q34

Hopi Purple: Amethyst colored ears, 8 inches long, with 10 rows of kernels. Makes a flavorful and rich-tasting flour. Stalks have large foliage; grow 3 to 5 feet tall. An ancient strain, crossed and selected by Indian ancestors for seasonal stability with uncertain moisture. F73D, J73, K49T, N84

Hopi Turquoise: 80 days. According to legend, the original cultivar given to the Hopis for their migrations. Ears 7 to 8 inches long, with 12 rows of kernels. Pale blue kernels make delicious flour. Bushy plant; height 3 to 5 feet. Very adaptable. A2, N84

Magenta:<sup>3</sup> 110 days. Long, narrow ears, about 8 inches in length. Purplish kernels. The only parching corn that doesn't fade when parched. Grows to 5 feet tall. Developed by Carol Deppe and Alan Kapuler working for the Seeds of Change corn breeding program. K49T

Parching Lavender:<sup>3</sup> 85 days. Identified by Carol Deppe as a true parching com. Produces 1 or 2 ears, 6 to 8 inches long. Highly ornamental kernels in various shades of pearly lavender-purple. Makes delicious parched or roasted corn. Grows 4 1/2 to 5 feet tall. A2

Taos Blue: 110 days. A strain recovered from 50 years' storage in Taos Pueblo, New Mexico Very long ears with 12 to 18 rows of dark-blue, nearly black seed. Grown at high elevations at Taos Pueblo, by traditional methods. Prolific when irrigated. Successfully grown in all 50 states. PASCALE [Re]; A2, B75, J73, L11, N84

MULTI-COLORED

Flor del Rio: Rainbow corn with red, yellow, blue and some white and chinmark kernels. Spanish family heirloom from Velarde, New Mexico. Adapted to the high desert, above 3,500 feet elevation. Flour/flint type. Ears have a mix of hard, flint kernels and soft, floury kernels. 116, N84

Guadalajara All Purpose: 100 days. Produces 2 to 3 multi-colored ears per stalk. Excellent for roasting and grinding. Very tall stalks, to 12 feet high. Originally from Mexico. Has grown well in eastern Washington. A2

Hopi Supai:<sup>3</sup> (Havasupai Chin Mark) Medium-sized ears, 8 to 9 inches long with 12 rows of kernels; striking yellow-white kernels variegated brown and red. Good for flour or parching. Stalks grow 6 feet tall, yield 2 to 3 ears per stalk. Very adaptable. Also called Calico or Chin Mark in reference to its resemblance to traditional Havasupai facial decorations. 116, N84

Mandan Bride: 98 days. An early maturing corn that is ornamental as well as useful. Ears 8 inches long, 8 to 12 rowed; come in a striking array of colors including purple, white, variegated, red, yellow, speckled and some with translucent and rosy effects. Yields a white corn flour with multi-color flecks. Also good for hominy. Originally from the Mandan Indians of what is now North Dakota. A2, A66, D68, E24, F73D, G6, J26M, N34{PD}

Santo Domingo Rainbow: Attractive mix of red, blue, yellow, orange, purple, pink, pearl and chinmark flour kernels on ears up to 10 inches long. Adapted to the high desert, above 3,500 feet elevation. From the Santo Domingo Pueblo in northern New Mexico. 116, N84

Supai Red:<sup>3</sup> 110 days. Highly recommended parching corn. Kernels white, overlaid with striking blaze and starburst patterns of intense red. Grows 6 to 7 feet tall, with 1 or 2 large ears per stalk. Developed by Carol Deppe and Alan Kapuler from Hopi red flour comstock. K49T

RED/PINK-KERNELED

Aztec Red:<sup>3</sup> 160 days, Very large red kernels used for making the traditional Native American corn soup. Also excellent for parching. Large, foot-long ears with 10 to 12 rows of kernels. Tall plants, 9 to 10 feet in height. F73D, J73, N84, PIG

Hernandez Red: Not a pure strain; has a wide range of color characteristics. Some ears are pure red, others are white, blue, chinmark or yellow. Good for flour or decorative use. Originally from 5,500 feet elevation in Hernandez, New Mexico. Flour/flint type. Ears have a mix of hard, flint kernels and soft, floury kernels. 116, N84

Hopi Pink: 70 days. Medium-sized ears, 8 inches long with 12 to 14 rows of kernels; pink-capped white kernels, some red and white variations. Often matures earlier than other Hopi flour corns. Bushy plants, 4 to 4 1/2 feet tall. Does consistently best in all drought tolerance tests due in part to a long embryonic taproot. A2, F73D, 116, 199M, K23, K49T, L3J, N84

Parching Red Mandan:<sup>3</sup> 80 days. Ornamental as well as useful. Orange to deep red ears, 6 inches long. Very good green, parched or roasted. Occasionally produces some yellow ears. Green and purple stalks, 4 1/2 to 5 feet tall. One of the earliest dry corns. Identified by Carol Deppe as a true parching com. A2

WHITE-KERNELED

Hopi White: (Hopi White Hominy) 80 days. Large ears, 6 to 8 inches long; white kernels. Height 4 to 5 feet. Makes a fine flour and *goodposole* (com soup). Sand dune grown in the high desert. In temperate climates, plant in spring when danger of frost is past and the soil is warm. A2, C95, 116, J73, N84

Mayo Maiz Blando: Large, white floury kernels are traditionally ground into flour and used for baking. Collected at the Mayo village of Las Capomas in Sinaloa, Mexico. Adapted to both the high and low deserts. 116, N84

Rio Lucio Concho: Pearl white kernels that are traditionally used for chicos, posole or flour. Grown at 8,000 feet in the Spanish village of Rio Lucio, New Mexico. Flour/flint type. Ears have a mix of hard, flint kernels and soft, floury kernels. 116, N84

Tarahumara Blando de Sonora: One of the mainstays of Tarahumara corn production. Traditionally used for making tamales when in the milk stage, or ground into flour. Large ears with large white kernels. Adapted to both the high and low deserts. 116, N84

YELLOW-KERNELED

Hopi Yellow: 90-95 days. Medium-sized, straight rowed ears, 8 inches long with 10 rows; bright yellow, soft textured kernels. Excellent flavor for tortillas and tamales. Height 4 feet. Planted in July in the high desert. In temperate areas, plant in spring when danger of frost is past and the soil is warm. A2, C95, 116, J73, L3J, N84

Papago: 80 days. Small, slender, cream-colored ears. Ground into flour for tamales. Drought tolerant; adapted to the extremely arid homeland of the Papago Indians of southern Arizona. Excellent for harsh, dry sites. In wetter climates, or with irrigation, the plants are larger. J25M

Texas Shoepeg: Long, bright yellow kernels with dented beaks. Short red cobs have up to 26 rows. Sweet at the milk stage. Excellent for meal or boiling. From Cranesfill Gap, Texas. 116, N84

POPCORN

Considered the most primitive of corns, the endosperm of popcorn has starch that is almost entirely the hard, corneous, and translucent type. When heated the kernels burst and the soft, palatable inner endosperm is everted. They can also be used for sprouting, and are the class of corn used for the various *puffed corn* products. Popcorn flour can be made from unpopped kernels or from popped kernels that have been ground in a blender or food processor. KUSCHE [Pre, Re].

BLACK/BLUE-KERNELED*Hybrid*

Blue Sapphire: Gourmet type selected specifically for flavor and texture. Small, attractive, deep-blue kernels with thin hulls. Pops up primarily white with subtle hints of purple, very light and tender. Sweet and rich, may not need extra condiments such as butter and salt. An 8 ounce bag will yield approximately 6 quarts. B20{DF}

Purple Amethyst: Connoisseur type selected specifically for flavor and texture, unlike most commercial popcorn which is grown for popping ratio and size. Attractive, lustrous dark-purple kernels. Pops up snow-white, firm and crunchy, with a sweet and nutty flavor. An 8 ounce bag pops approximately 6 quarts. B20{DF}

Shaman's Blue: (Kiowa Black) 105 days. The first dark blue hybrid popcorn. Glossy, dark lavender kernels on white endosperm; pops white with high expansion rate of 43.0; tender flakes with a subtle sweetness and savory flavor; quality excellent. Large ears, 8 inches in length. Stalk quality and yield potential comparable to the best mid-season hybrids. Developed by Jim Iverson of Crookham Co. A73M{DF}, C68M, K10

*Open-Pollinated*

Black: (Blue) 100 days. Larger ears and kernels than standard popcorn. Deep blue to black kernels that pop snow-white with a tinge of bluish-black at the base. Rich, distinctive flavor. Not as vigorous as yellow or white strains, grown for flavor and visual effect. A2, C95, G68, H1M{DF}, H1M{DF}, J11M{DF}, J39, L7M, N34{DF}, 089

Black Jewell: {DF} A modern, hullless dark-blue popping corn developed in Illinois by Merle Litherland, from seed originally obtained in Germai. Pops snow white with a grayish-blue hue. Very thin hull, shatters when it pops; tender, yet crunchy texture; excellent natural flavor. Patented, no planting seed available at this time. A52M, B19M, C64, F86T, H15T

Schroeder's Black: (Black Tie) Large, bluish-black kernels. Pops into large, snow-white flakes with a bluish tint; excellent, crunchy texture; distinctive, nutty flavor. Gourmet quality. Originated in Buhl, Idaho by Elmer Schroeder. K37T, K37T{DF}

#### BROWN-KERNELED

Chapalote: *Pinole* maize. Used popped; also toasted and ground into a sweet meal. One of the four most ancient corns. Slender ears; small brown, white or yellow kernels. A long season corn from Mexico, grown in the low hot desert. In temperate areas, plant in spring when danger of frost is passed and the soil is warm. 116

Chocolate Cherry: 120 days. Dark cherry colored ears. Developed from Chocolate Pop. Selected for more uniform color and a deep reddish, cherry brown color. Introduced by Southern Exposure Seed Exchange. L7M

Chocolate Pop: 135 days. Ears average 6 inches long, with 16 to 18 rows of kernels. Kernels chocolate-colored, in several shades of brown. Bright pink silks. Pops and tastes like a well-flavored yellow popcorn, but the hulls are more tender. Very unusual and attractive. Stalks average 5 1/2 to 6 feet tall; produce 2 ears per stalk under good conditions. Good resistance to drought and earworms. L7M

#### MULTI-COLORED

Calico: 100 days. Old-fashioned popcorn that is ornamental as well as tasty. Small, uniform ears, 6 to 8 inches long; densely packed with kernels. Striped and patterned kernels of red, yellow, mahogany, brown, white, purple and blue. Plants grow 5 to 7 feet tall, produce multiple stalks. A15Z, C82, D68, D76, G13M, G93M, H49, K66, L7M, L42, L89, N24M, N34{DF}

Cutie Pops: 100 days. A unique, multi-colored, miniature popcorn. Ears 4 inches long; tiny, rainbow colored kernels. Pops white. Can be used as a "baby" Indian com for dried bouquets, or harvested for miniature white popcorn. A15Z, L42, L94

Gold 'n' Pearl: Unique multicolor popcorn of gourmet quality. Gold and white kernels, extremely tender and hullless. The only certified organic popcorn grown especially for hot air poppers. Developed and grown exclusively by Ballico Bill Reichle of Iron Horse Popcorn Co. N34{DF}

Seneca Mini Indian: 100 days. Attractive, slender ears, 4 to 6 inches long; striking multi-colored kernels in bright red, yellow, brown, black, purple, blue, solid, and variegated. Ornamental as well as excellent for popping. Bears 2 to 3 ears per stalk. Should be planted about 6 inches apart to ensure fully miniature ears. B75M, C20M, D26D, F63, G1M, G13M, G71, G93M, H85M, 139,167M, K10, K27M, L10, M95M, N16, etc.

#### RED-KERNELEP

##### *Hybrid*

Robust Ruby Red: (Indian Red, Apache Red) 100 days. Elongated, glossy, deep burgundy-red kernels. Pops into small, crispy, bright white flakes with a hint of red at the center. Has a subtle, nut-like flavor of gourmet quality. Seven inch ears with a red cob. Sturdy, single talk plants. A modern early season hybrid developed from Strawberry popcorn by Jim Iverson of Crookham Co. A73M{DF}, C68M, F63, G13M, 164, K10, K50

##### *Open-Pollinated*

Strawberry: 100 days. Short, conical ear; 2 inches long; resembles a red-ripe strawberry in shape and color. Small, dark-red kernels. Pops white. Primarily used for decorating, but can also be used for

popping. Stalk grows 5 feet tall; produces 2 to 4 ears. B73M, B78, C82, F80, G16, G71, G79, 164, J11M{DF}, K10, K73, M46, N34{DF}, N40{DF}

#### white-kernelep

##### *Hybrid*

Peppy: (Burpee's Peppy Hybrid) 90 days. Small ears; 4 inches long. Deep, pointed, hullless kernels; large and tender when popped. Excellent popping expansion and flavor. Stalk grows 5 to 6 feet tall; high yielding, 2 or 3 ears per stalk. Does well in short summer areas. B75

Robust 21-82W: 106 days. Well-filled ears, slightly longer than White Cloud. Deep, pointed, pure white kernels; high expansion rate of 42.0; crisp, tender flakes of excellent flavor and quality. Vigorous stalks, resistant to lodging; high yielding. Early maturing; does well in northern regions. Dent sterile: will not accept pollen from dent corns. B75M, C68M, F63,164, K10, L42

Snow Puff: 90 days. Small ears; 5 inches long. Small, completely hullless kernels with no hard center. Excellent quality, flavor and tenderness. High popping volume for a white cultivar. Stalks grow 5 to 6 feet tall; produce 3 or more ears per stalk. B1, B6, B73M, D26D, G79, /59M, J97M, K10, K27M, K71, M46

White Cloud: (White Cloud Hullless) 95 days. Small plump ears, about 4 inches long; well-filled. Deep, pointed, thin-skinned kernels. Excellent popping expansion; tender, fluffy and hullless; of excellent flavor and quality. Vigorous, sturdy stalks; high yielding. Does well in northern areas. A15Z, C85M, D11M, D27, D68, F13, F70, G13M, G16, G79, H33M, H95,167M, K10, K50, K73, etc.

##### *Open-Pollinated*

Baby Rice: (Baby Hullless, Paiute Pearl) 70 days. Japanese Hullless type. Small, white kernels. Pops up snow white with virtually no hulls. Very tender and flavorful. High yielding plant, well adapted to short season growing conditions. An old Wisconsin heirloom that's been grown for over 100 years. A73M{DF}, G16, G79, K49M

Bearpaw: 95 days. Heirloom strain from New England. Ears somewhat flattened and "paw" shaped at the silk end, hence the name. Large white kernels. Stalk grows 5 feet tall; often produces 2 ears. Grown commercially in Vermont in the early 1900's. By the 1970's there remained only one farmer in Dummeiston, Vermont who maintained the seed. A2, J39, K49M

Japanese Hullless:<sup>1</sup> (Japanese White Hullless, White Hullless) 100 days. Short ears, about 4 inches long. Small white kernels; irregularly set on the cob. Pops snow-white; very tender, with no hard centers, of excellent quality. Stalk 4 1/2 to 5 feet tall; very productive, 3 to 6 ears per stalk. Very popular, old standard cultivar. Also commonly grown in Asia for canned "baby" corn. A75, B1, B6, D68, D76, E97, G13M, H49,139, K10, K27M, K49M, K71

Pennsylvania Butter-Flavored: 100 days. An heirloom popcorn maintained by the Pennsylvania Dutch since 1885 or earlier. Ears 4 to 6 inches long. Small creamy-white kernels; very tender and delicious. Stalk grows 8 feet tall; produces 2 or 3 ears. Very drought resistant; will grow in poor soils. F24G, L7M

#### YELLOW-KERNELED

##### *Hybrid*

Crema-Puff: 105 days. Medium-sized ears. Tender, puffy, high quality golden-yellow kernels with a delicious flavor. Excellent popping expansion. Stalks grow 8 to 8 1/2 feet tall; high yielding, often produces 2 ears per stalk. B6, D26D, G57M, 159M, K10, K27M, L10

Iopop 12: 100 days. Large, slender, orange-yellow ears; 7 to 8 inches long. Small, deep and rounded kernels, nearly as free of hulls

as Japanese White Hulless. Excellent popping volume of 38.0; 15% mushroom shape. Pops to large, tender, flavorful flakes. Strong, erect, high yielding plant; widely adapted. A15Z, C20M, D26D, G13M, G79, H33M, K10

Petite Princess Amber: Gourmet type selected specifically for flavor and texture. Small ears, only 2 to 3 inches long. Tiiy, yellow kernels with ultra-thin hulls. Produces creamy-yellow, light, very tender popcorn with excellent flavor. An 8 ounce bag pops approximately 8 quarts. Small, busy plant. Very difficult and costly to grow, having a low per acre yield. B20{DF}

Purdue 410: 110 days. An improved South American type. Tapered ears, 7 to 8 inches long. Unusually large, plump yellow kernels. Excellent popping expansion; produces large, fluffy, nearly hullless popcorn with 40% mushroom shape. Sturdy stalks, 6 feet tall; high yielding. Widely used for commercial popcorn, especially caramel com. *Al, Bl, C92, D26D, F6J, G13M, H85M, H95, K10, K71, K73, M95M*

Robust 10-84: 98 days. Large ear size. Large yellow kernels, 52 per 10 grams with popping volume of 38.0 Metric Weight to Volume Test (MWVT). Pops into very large flakes that are excellent for candied popcorn. Very vigorous plant with high earing potential. Can tolerate more adverse conditions than most hybrids. Does well in short season areas. L42

South American Yellow: (South American Giant, T.N.T.) 100 days. Hybrid version of South American. Large, well-filled ears. Tender, golden-yellow, flavorful kernels that pop perfectly white. Excellent popping expansion. Very productive. G71

#### *Open-Pollinated*

Lady Finger: Short, slender ears, 3 to 5 inches in length. Very small, deep yellow kernels. Pops well, leaving few unpopped. Flakes are tiiy, tender and delicate with excellent flavor. Too tender to microwave. Also good in dried arrangements. Short, stocky plants bear multiple ears. Heirloom cultivar grown in the Amish communities of Ohio, Indiana and Iowa. B6, F80, N84

Reventador: Old-fashioned *pinole* corn with translucent kernels. *Maiz reventador* is a generic term for the small-grained pearl popcorns of western Mexico, where they are preferred over other types for making pinole. Forms of Reventador com have been grown in Sonora, Mexico for at least 200 years. ANDERSON, E.; 116, N84

South American: (South American Yellow) 105 days. Long, slender, tapered ears; 7 to 8 inches long; 14 to 16 rows of kernels. Medium-sized, golden-yellow kernels. Stalk grows 76 inches high. Resistant to bacterial wilt. A75, D26D, G1M, G13M, G83M, /59M, K10, M95M

South American Dynamite: (South American Giant) 100 days. Very large ears, 9 inches long. Kernels large, nearly round, orange-yellow. Creamy white when popped, mushroom-shaped, with a buttery flavor. Expansion rate 20 to 30 times volume. High yielding; 2 to 3 ears per stalk. *Bl, H54, K71, M32*

Tom Thumb:<sup>2</sup> 85 days. Small ears, 3 to 4 inches long. Small, smooth, golden-yellow kernels. Pops very well. Dwarf stalks, only 3 1/2 feet tall, will not shade other garden vegetables; 1 or 2 ears per pod. Very early; matures well in far northern areas. Refined from a genuine New Hampshire heirloom by Professor E.M. Meader, and Johnny's Selected Seeds. B75, D82, E24, F46, G6, J9M, J39, K10, K49M, L89

#### SWEET CORN

Kernels of sweet corn are easily recognized by their wrinkled exterior. Their sweetness is the result of a genetic defect in metabolism which prevents the sugars in the kernel from being completely transformed into starch. They require more favorable growing conditions than other types of corn. Mostly used as corn on the cob, they can also be allowed to mature on the plant, cooked, and used as "dried corn", or the dried seeds can be sprouted.

#### BI-COLOR

##### *Normal Sugary (F.)*

The standard sweet corns, they have moderate but varying degrees of sugar due to one or more of the sugary-1 (*su*) genes, depending on the cultivar. They are best used immediately after harvest, as their sugars convert to starch rapidly. Isolation is not required.

Bi-Queen: 92 days. Ears reach 8 to 9 inches long, with 14 to 16 rows of sweet, tender kernels; quality resembles Silver Queen. Attractive dark-green husks and long flag leaves. Plant grows 6 1/2 to 7 feet tall; tolerates Stewart's wilt and northern and southern corn leaf blights. Requires 60° F. soil temperature for germination. Silver Queen x Golden Queen. C20M, F6J, G71, G79, /59M, J97M, K10, K50, K71, L70, M29, M46, M95M

Burgundy Delight: 80 days. Ears average 7 to 8 inches long, with 12 to 14 rows of kernels; well-filled to the tip. Good yellow and white kernel pattern. Sweet and tender, even when past its prime. Burgundy stalks and husks. Stalk grows 7 feet tall, often with 2 good ears. Very popular mid-season cultivar. For home gardens, roadside stands and pick-your-own operations. D68, J20, K50

Butter and Sugar: 75 days. Medium-sized, tightly wrapped ears; 7 to 8 inches long, with 12 to 14 rows. Broad kernels; good yellow and white pattern; very sweet and tender, of good quality and flavor. Snaps easily. Dark green husk. Stalk grows 7 feet tall. Excellent cold tolerance and seedling vigor; good resistance to Stewart's wilt. A25, B6, C44, D65, F6J, G16, H21, H49, /59M, 184, J97M, K10, K50, M95M

Calypso: 82 days. Large, well-filled ears; 8 to 8 1/2 inches long, with 18 to 20 rows of kernels. Narrow, deep yellow and white kernels with excellent eating quality and fine appearance. Sturdy plant grows 7 to 8 feet tall; produces a high percentage of doubles. Becoming a standard for bi-colors, with quality rivaling Jubilee. *Al, C20M, F63, G13M, M29, M95M*

Harmony: 73 days. Medium-large ears, 7 to 7 1/2 inches long, well-filled to the tip with 12 to 14 rows of kernels. Narrow yellow and white kernels; tender and sweet with high quality. Deep green husks with plentiful flag leaves. Strong, upright plants with few tillers; show good seedling vigor. Developed for the second-early season. F13, M49

Honey and Cream: 78 days. Ears 6 1/2 to 7 1/2 inches long, with 12 to 14 rows of kernels. Bright kernels of white and yellow, very sweet and tender, of excellent quality. Long, tight husks provide good protection from earworms. Stalk grows 5 to 6 feet tall. Popular home garden cultivar. A25, B75, E97, G57M, G82, H33M, H49, H85M, J20, K10, N16

Honeymoon: 78 days. Large ears, 7 1/2 to 8 inches long, well-filled with 14 to 16 rows of kernels. Medium-sized, deep, yellow and white kernels; tender and sweet. Butter and Sugar quality on a larger, more attractive ear. Uniform plant height of 6 feet. Excellent germination and seedling vigor. Tolerant to maize dwarf mosaic virus and Stewart's wilt. B6, F65, K50

Sugar and Gold: 66 days. Medium-sized ears, 6 1/2 inches long; well-filled with 10 to 12 rows of tender, sweet kernels. Good for freezing. Plant grows 4 to 5 feet tall with few tillers; tolerates southern corn leaf blight. Performs well in cooler growing areas. Developed in 1942 by Agway and still popular in New England. A25, C44, D65, E97, K50

##### *Sugary Enhanced (F.)*

Also called Everlasting Heritage corns, these contain the sugary enhanced (*se*) gene which modifies the normal sugary (*su*) gene. The result is increased tenderness and, to a varying degree, sweetness. Conversion of sugar to starch is slowed. No isolation from "normal sweet corn is necessary to maintain quality.

Ambrosia: 75 days. High quality bicolor Bodacious type. Ears average 8 inches long with 16 rows of kernels. Exceptionally tender, flavorful, yellow and white kernels. Dark green husks, easy to pick. Homozygous type, 100% of the kernels on each ear being sugary enhanced. Good spring vigor. Somewhat tolerant of rust and smut. *Al*, A15Z, B6, C68M, F63, G13M, G82, H61, 191, J97M, K10, K50, K71, L42, M29, M46, M95M, N16, etc.

D'Artagnan: 64 days. One of the earliest maturing sugary enhanced bi-colors. Ears grow 7 1/2 to 8 inches long, with 14 to 16 rows of kernels. Narrow yellow and white kernels; tender and sweet with good holding ability. Superior quality for an early corn. Tight, dark green husks give good protection. Plant grows 5 to 5 1/2 feet tall. *Al*, B1M, C68M, D11M, F70, G13M, G82, 164, K10, K50

Delectable: 80-85 days. High quality bicolor Incredible type. Large, bulky, well-filled ears, 8 to 9 inches long; 16 to 18 rows of small kernels. Very sweet and tender. Homozygous type, 100% of the kernels on each ear being sugary enhanced. Dark green husk. Widely adapted, tiller-free plant. Good home garden variety. *Al*, A15Z, C68M, D26D, E97, F13, F63, G6, G13M, G82, H61, J97M, K10, K27M, K50, K73, L42, M29, etc.

Gold-N-Pearl: (Seneca Gold-N-Pearl) 68 days. Medium-sized ears, 7 to 7 1/2 inches long, with 12 to 14 rows of kernels; excellent tip cover. Attractive yellow and white kernels; very sweet, tender and flavorful. Homozygous type, 100% of the kernels on each ear being sugary enhanced. Dark green husks; provides better husk protection than others when stressed. Very good cold soil tolerance. Not tolerant to Stewart's wilt. B3M, TIM

Peaches & Cream: 68 days. Ears 7 to 7 1/2 inches long, with 14 to 16 rows. Kernels average 80% golden yellow, 20% white; very sweet, tender and flavorful. Remains sweet up to 14 days after maturity. Stalk grows 6 1/2 feet tall, produces 2 ears. Does well in short season areas. B73M, C85M, C92, D11M, D27, D76, F70, F92, G87, H54, H61, H85M, K10, K27M, M46, M95M, etc.

Quickie: 62-65 days Very early, good quality bicolor. Medium-small ears 7 to 7 1/2 inches long with 12 to 14 rows of kernels. Large, sweet, tender kernels. Heterozygous type, 25% of the kernels on each ear being sugary enhanced. Dark green ears with short flags. Short, sturdy plant, 4 1/2 to 5 feet tall. Good vigor in early, cool soil plantings. C68M, D11M, D68, E24, E97, F63, F70, G6, G13M, G57M, G82, H61, 184, K10, K50, M49, etc.

#### *Xtra Sweet* (F)

Also called Super Sweet, or Shrunken corn due to the effect of the shrunken-2 gene (*sh<sub>2</sub>*) on the appearance of the dry kernel. Its presence creates greatly heightened sweetness and very slow conversion to starch after harvest. Must be isolated from Normal Sugary or Sugary Enhanced corns, or both types will have tough, starchy kernels. M67{DF}

Candy Store: 80 days. High quality supersweet developed by Harris Seeds. Rated best in taste, appearance, yield and uniformity in a comparison test conducted by Organic Gardening magazine. Very good flavor and aroma; very pronounced sweetness. Good for freezing. Also rated better at the end of one week storage. Grows about 5 feet tall. F13, G93M, N52

Honey 'N Pearl: 82 days. Large, well-formed ear, 8 1/2 to 9 inches long; with 16 to 18 straight rows of kernels; excellent tip fill. Deep, glossy yellow and white kernels. Extra sweet and flavorful; rated high in All America taste trials. Excellent holdiqg ability. Sturdy, medium-tall plant. All America Selections winner in 1988. *Al*, B6, B75, F86, G27M, G82, H33M, H42, H49, H85M, H95, 191, K10, K71, M46, M95M, etc.

Ivoiy 'N Gold: 76 days. Large ear, 8 1/2 inches long, 1 3/4 inches in diameter; with 16 well-ordered rows of kernels; fair tip cover under stress. Especially attractive husked appearance. Bright kernels of ivory white and golden-yellow; extra sweet and tender. Tight,

medium green husks provide good earworm protection. Very similar to Honey 'n Pearl. F63, K10, M46

Seneca Appaloosa: 73 days. Refined ears with good tip fill, 8 to 8 1/2 inches long with 14 to 16 rows of kernels. Very sweet and tender, eating quality very good. Dark green husks with excellent, attractive flags. Good cold germination and seedling vigor. Stocky, tiller-free plants. Recommended for home gardens and fresh markets. *Al*, D26D, D65, F63, G13M, H61, 164, K10, K50, K73, L42, L89, L91M, M29, M49, etc.

Twice-As-Nice: 78 days. Large ears, about 8 inches long, well-filled to the tip with 14 to 16 rows of kernels. Bright yellow and white kernels; tender, extra sweet. Holds for an exceptionally long period, on or off the stalk. Tight, dark green husks. Plant grows 7 1/2 to 8 inches tall with few tillers; tolerates Stewart's wilt and southern corn leaf blight. F63, K50

#### *Open-Pollinated*

Double Standard: First open-pollinated bi-color sweet com. Somewhat variable ears, 7 inches long, with 12 to 14 rows of yellow and white kernels; some ears with yellow kernels only. Better than average flavor and tenderness. Early maturing, with unusually good germination in cool soil. Developed by Johnny's Selected Seeds for northern home gardeners, especially seed saving enthusiasts. E59Z, G6, M32

#### ***BimimACErsmim***

Black Aztec: (Aztec) 75 days. Medium-sized ears, 7 to 8 inches long, with 8 to 10 rows of kernels. Kernels bluish-black when mature. Used as corn-on-the-cob or roasting ears in the white-kernel stage. Ground into a sweet, bluish-black cornmeal when dry. Stalk grows 5 1/2 to 6 feet tall, produces 2 ears. Reportedly grown by the Aztecs 2,000 years ago. A2, B49, C20M, C82, D26G, D56M, I99M, J73, K23, K46T, K49T, K49Z, L3J, M65

Black Mexican: 85 days. Slightly tapered ear, 7 to 8 inches long, with 8 rows. Kernels white at milk stage, changing to bluish-black in the late edible and dry stages; tender, very sweet and flavorful. Medium-tall plant; height 5 1/2 to 6 feet; often bears 2 ears per stalk. Very hardy and weather tolerant. Introduced prior to 1865. TAPLEY 1934; B75, K20M, K71, L7M

Hooker's Sweet Indian: 75- 85 days. Long, thin ears, 5 to 7 inches in length. Fine flavor in white-kernel stage, either fresh or frozen. Kernels bluish-black when mature. Makes a very sweet cornmeal. Stalk grows 4 to 4 1/2 feet tall, produces 2 to 3 ears. Originally obtained by Ira Hooker, over 50 years ago near Olympia, Washington. A2, F73D, K49T, L11, L13M, L89

Midnight Snack: 81 days. Ears 7 to 7 1/2 inches long, with 14 to 16 rows. Kernels wide; ivory white and sweet at milk stage, bluish-black when dry. Makes an excellent sweet cornmeal. Sturdy plant; height 5 1/2 feet. Developed by Professor E.M. Meader at the University of New Hampshire; selected from Black Aztec. A2

#### **MULTI-C.OLORED**

Bronze-Orange: 90 days. A combination of the old traditional American Indian cultivars Tarahumara Sweet, Guaymas Orange and Faro Chilean. Yellow, orange and red kernels. Short plants, 3 to 4 feet tall, with 3 to 5 ears per stalk. Bears well under variable conditions. Very rare. C95

Rainbow Inca: 85 days. Rare sweet corn with visually attractive cobs and multicolored seeds. Purple, red, yellow, white and blue kernels, paler in the fresh eating stage. Good as fresh com, either raw or cooked. Stout, robust stalks, 8 to 10 feet tall. Developed by Alan Kapuler from crosses of a large, white flat-seeded Peruvian Indian chokelo variety, multicolor Southwest Indian corns, and heirloom sweet corn A2, B49, C95, D29P, I99M, K23, K46T, K49T, L3J, L11, L55J, L77D, N84

Triple Play: 70-80 days. Unique, short-season sweet corn that produces tri-colored multiple ears—white, yellow and blue. Good, sweet flavor. Medium-sized stalks, to 6 feet tall. Grows well early in the season. Tolerates cool soil. Developed by John Sundquist of River's Tim Farm. K49T

#### RED-KERNELED

Guarjio Red: 90-120 days. Slender ears with red kernels. Very unusual. Grown only in summer in low hot desert areas. Sown with the summer rains. In temperate regions, sow in late May or early June. F73D, 116, N84

Mandan Red Nuetta: 85 days. Short ears, 5 to 6 inches long, with 10 rows of kernels. Kernels reddish-brown with yellow at the crown; hard when mature. More often used as a roasting corn rather than a fresh green corn. Easily ground into flour; the fur traders dried this variety for winter provisions. Very short stalk, 2 1/2 to 4 feet tall. A primitive, genetically variable, low yielding corn. Originated in the 19th century or earlier. C95, F73D, IIG{OR}, LI 1

#### WHITE-KERNELED

##### *Normal Sugary (F<sub>1</sub>)*

Baby:<sup>1</sup> (Miniature) Tiry, finger-like ears; tender and delicately flavored. Best when harvested within 5 days of the appearance of silks. The husked and desilked ear, cob and all, is used in stir-fry dishes, vegetable salads and as pickles. Commonly found canned in Oriental and specialty markets, occasionally available fresh. C82, D55, E97, H49, N40{PR}

Baby Asian:<sup>1</sup> Medium-sized plant; bears 2 or 3 ears per stalk if plants are thinned to 12 inches apart. Grown as ordinary corn, but harvested 2 or 3 days before or after silk emergence, usually when 4 inches long and about 1/2 inch in diameter. Lower ears are commonly harvested for "baby corn", while the top ear can be left to mature for corn-on-the-cob. C20M, Q34

Quicksilver: 75 days. Medium-sized ears, 7 to 7 1/2 inches long, filled to the tip with 14 to 16 rows of kernels. Small, tight, pearl-white kernels; tender and sweet with very good flavor. Quality similar to Silver Queen, but matures 2 weeks earlier. Sturdy, erect, high yielding plants. Strong germination and seedling vigor in cold soil. G1M, H85M

Silver Queen: 88 days. Ears 8 to 9 inches long, with 14 to 16 rows of straight kernels; good tip cover. Kernels snow-white, very sweet and tender. Holds for several days without losing quality. Stalk grows 7 1/2 to 8 feet tall. Widely adapted. Tolerant to bacterial wilt and northern and southern leaf blights. Most popular white sweet corn in the United States. A25, C44, G6, G71, G79, H21, H61, 164, J97M, K10, K50, K66, K73, L10, M46, etc.

Silver Treat: 85 days. Ears reach 8 to 8 1/2 inches long, with 16 rows of kernels. Small, deep kernels of excellent eating quality that closely resembles that of Silver Queen. Medium green husks with short flag leaves. Vigorous plants, 7 to 8 feet tall with few tillers; produce a high percentage of 2 marketable ears per stalk. Good seedling vigor in cold soils. Resistant to Stewart's wilt and southern corn leaf blight. F63, J97M

Stardust: 70 days. Very attractive ears, 7 to 7 1/2 inches long, with 14 to 16 rows of kernels. Small, pearl-white kernels with a high luster; tender and sweet with excellent eating quality. Dark green, clasping husks. Sturdy plants, 5 to 6 feet tall, with moderate tillering. Resistant to Stewart's wilt and southern corn leaf blight, susceptible to drought. Excellent germination and seedling vigor in cold soils. F63, 191, K50

White Sunglow: 68 days. Medium-sized, moderately tapered ears, 7 to 7 1/2 inches long; well-filled to the tip. Sweet, tender, snow white kernels of excellent quality. Vigorous, productive plants, 8 to 9 feet tall. One of the earliest white corns. Recommended for short season areas, or as a first crop corn in more temperate regions. B75

##### *Sugary Enhanced (F<sub>2</sub>)*

Argent: 86 days. High quality white version of Incredible. Large, uniform ears, 8 1/2 to 9 inches long with 14 to 16 rows of kernels. Very sweet and tender; excellent old-fashioned corn flavor. Heterozygous type, 25% of the kernels on each ear being sugary enhanced. Good cold soil vigor and superior husk protection. Tolerant to Stewart's wilt. *Al*, A15Z, C68M, G6, G13M, G82, H49, H61, H85M, J97M, K10, K27M, K50, K73, L42, M29, M95M, N16, etc.

Platinum Lady: 80 days. Ears average 7 1/2 to 8 1/2 inches long, with 14 to 16 rows of kernels; good tip fill. Narrow, deep, white kernels; very sweet and tender, good flavor, of high quality. Heterozygous type, 25% of the kernels on each ear being sugary enhanced. Green husks, attractively tipped with buigundy. Ships well. Sturdy plant, to 6 1/2 feet tall. Good tolerance to rust, northern corn leaf blight and drooght. Very popular. B75, B75M, C44, E24, G93M, 139, J20, K71, M46

Silver King: 80 days. Improved sugary enhanced version of Silver Queen. Large, uniform ears, 8 to 8 1/2 inches long; 16 to 18 rows of snow-white kernels. Tender and sweet with good corn flavor. Homozygous type, 100% of the kernels on each ear being sugary enhanced. Good tip fill and husk protection. Widely adapted plant with multiple disease tolerance. C85M, D26D, F63, G13M, G57M, H61, H95, 191, J84, J97M, K10, K50, K73, L42, M46, M95M, etc.

Silverado: 79 days. Slightly tapered ears, 7 to 8 inches long, with 16 rows of kernels. Snow-white kernels; very sweet and tender with excellent flavor. Good for freezing. Very good husk appearance. Vigorous plant; height 6 to 7 feet; tolerant to Stewart's wilt. Excellent cold soil germination. C20M, D26D, F13, G1M, G93M, J97M, N52

White Knight: (Seneca White Knight) 74 days. Large, well-filled ears; 8 to 8 1/2 inches long, with 14 to 16 rows of kernels. Tender, very sweet kernels that hold their quality longer than other sugary enhanced types. Tight husks with excellent dark green flag leaves. Vigorous plant with one tiller; grows 7 1/2 feet tall; partially resistant to Stewart's wilt. *Al*, F65, G16, G79, G83M, H61, M29

##### *Xtra Sweet (F<sub>2</sub>)*

How Sweet It Is: 87 days. Slightly tapered ear, 8 inches long, containing 18 to 22 rows of kernels. Kernels pearl-white; tender, crisp, exceptionally sweet. Excellent holding ability, both on the stalk and in storage. Good for all purposes. Widely adapted plant, to 6 1/2 feet tall; produces 2 ears per stalk. Tolerant to Stewart's wilt. All America Selections winner in 1986. D74B, G71, G82, H61, H85M, H95, 139, J97M, K10, M46, M95M, N16

Snowbird: 75 days. Medium-large ears, 7 to 8 inches long, with 16 rows of kernels. Tender, juicy white kernels, extra sweet. Very good dark-green husk color, flags and tip fill. Sturdy, very vigorous plant, about 6 feet tall. Popular, widely adapted cultivar. Recommended for home garden, roadside markets or shipping. F63, G1M, G71M, H61, K10, K50, K73, L42, M29

##### *Open-Pollinated*

Adams Early: 70 days. Large, heavy ears, 6 to 7 inches long with 12 to 14 rows of kernels. Large, deep, white kernels that lack the sweetness of true sweet corns; quality good when harvested at the correct stage of maturity. Husks very tightly wrapped, difficult to remove. Vigorous, productive plants; height 5 1/2 to 6 feet; tillers entirely absent. Introduced prior to 1848. BURR, TAPLEY 1934; G57M, K49M

Art Verrell's: 60 days. Very tender white ears, about 6 1/2 inches long. Selected for over 30 years by Art Verrell of Oregon for cold-soil germination, earliness, uniformity and fine eating quality. Grows to about 4 1/2 feet tall. Discovered and introduced by Peters Seed & Research. E24, J9M, K49M

Country Gentleman: (Shoe Peg) 95 days. Medium-sized, tapered ear, 8 to 9 inches long, with irregularly spaced kernels. Kernels white, deep, very long and narrow; sweet, tender, milky, of good quality. Good fresh, frozen and canned; popular for cream-style corn. Moderately heavy stalk, 7 to 7 1/2 feet tall, often produces 2 ears. Originated in Orange, Connecticut by Frank C Woodruff. Introduced in 1890. TAPLEY 1934; A2, B49, B75, D26D, F24M, F73D, G57M, H85M, 164, J73, K49M, K71, L7M, L10

Early Pearl: 84 days. Moderately short, nearly cylindrical ears, 5 to 7 inches long with 10 to 12 rows of kernels. Small, shallow kernels; very sweet and tender, of good quality. Husks loosely wrapped and easily removed. Very productive plant with numerous tillers; height 5 1/2 to 6 1/2 feet. Introduced in 1932 by Charles C. Hart Co. TAPLEY 1934; U14

Evergreen Early: 96 days. Very old traditional cultivar, selected for earliness from Stowell's Evergreen. Ears 7 to 8 inches long, with 16 to 18 rows of kernels. Deep, medium-broad white kernels; tender, sweet and rich. Good for home gardens, local markets and canning. Heavy stalk, 8 to 9 feet tall; tillers few. TAPLEY 1934; K20M

Howling Mob: 80-85 days. Ears 7 to 9 inches long with 12 to 14 rows of kernels. Thin-skinned, tender white kernels, juicy, very sweet and rich. Extremely thick husks are excellent for wrapping dumplings and com bread. Named after the crowd of customers who clamored for the ears when the originator brought them to market. Originated by C.D. Keller of Toledo, Ohio. Introduced in 1905 by W. Atlee Burpee. TAPLEY 1934, WEAVER 1997; E5T, K71

Luther Hill: 75-80 days. Stalk grows 5 to 5 1/2 feet tall; produces 2 to 3 ears, 3 to 6 inches long. Excellent, extra sweet, old-fashioned flavor. Fresh ears sell for \$3 per dozen in New Jersey. One of the parents of Silver Queen; used by breeders to impart exceptional flavor to hybrid sweet corn. Can be grown as far north as Ontario. Very weak vigor; not recommended as a main crop com. Originated in Andover, New Jersey in 1902. C95, D68, E5T, G44M, F73D, J39, K20M, K46T, L11, L13M, L88J, N24M

Norfolk Market: (Tait's Norfolk Market) 74 days Very large ears, 9 to 10 inches long, with 12 to 14 rows of pearly white kernels that have excellent quality. Plant grows 6 to 7 feet tall; usually produces 2 ears. Largely grown by home and market gardeners from Norfolk to Florida. Introduced by Tait Seed Company of Norfolk, Virginia. K71

Six Shooter: 80 days. Novelty corn. Slender ear, with 10 rows of kernels. Small white kernels; solid, meaty and tender, of good flavor. Excellent for freezing. Dried kernels can be used for hominy and commeal. Tall, vigorous plant; produces as many as 6 good ears per stalk. D76, E5T, E97, K20M, K71

Stowell's Evergreen: 90 days. Slightly tapered ear, 8 to 9 inches long, with 16 to 18 rows. Kernels silver-white at milk stage, sweet and tender. Retains its fresh quality for an extended time. Ripens over a long period. Popular for home gardens, local markets and canning. Stalk grows 7 1/2 to 8 feet tall, produces 1 or 2 ears. One of the oldest sweet corns still in existence. Originated in Burlington, New Jersey prior to 1848. BURR, TAPLEY 1934; B49, B75, D26D, E97, F73D, G57M, H85M, I99M, J73, K27M, K49M, L7M, L10

True Platinum: 80 days. Long slender ears, 8 to 9 inches in length, wrapped with attractive burgundy-purple husks. Sweet, tender very flavorful kernels, in 10 to 14 rows. Medium-sized stalks, 5 to 7 feet tall, produce 2 ears per stalk. Fairly resistant to blight, rust and drought. Open-pollinated strain of Platinum Lady. Developed by Alan Kapuler. Introduced by Seeds of Change. K46T, K49T, L3J, L94

White Sugar: 80 days. The first open-pollinated super sweet corn. Produces 1 or 2 plump ears, 7 to 8 inches long. Germinates well in cool soils. Widely adapted. Contains the shrunken-2 gene (*sh<sub>2</sub>*),

therefore needs to be isolated from regular sweet corns. Developed for home gardeners by Tim Peters. J9M

### YELLOW-KERNELEP

#### *Normal Sugary (F)*

Earlivee: 55 days. Medium-sized ear, 6 1/2 to 7 inches long, with 12 to 14 straight rows; good tip fill. Large, golden-yellow kernels, of good flavor. Medium green husks. Short plant; height 5 feet; produces very few tillers. Very popular early maturing cultivar for the northern United States and Canada. D11M, D65, E24, F70, F92, G6, G82, H95, K10, K50, L42, L79, M49

Early Sunglow: 63 days. Attractive ears, 6 to 7 inches long, with 12 rows of kernels. Deep, medium-yellow kernels; sweet and tender. Green husks, lightly streaked with purple. Stalk grows 5 to 6 feet tall; often produces 2 ears; tolerant to bacterial wilt. Good seedling vigor in cold weather. B75, D65, D82, F82, G83M, H49, 139,191, K10, K50, K71, M46

Golden Beauty: (Early Giant Golden Bantam) 65 days. Slightly tapered ear, 7 to 8 inches long, with 14 rows of kernels; good tip fill under stress. Kernels of medium width and depth, sweet and tender. Dark green husks. Stalk grows 5 to 6 feet tall; resists wilt. Recommended for home gardens and early markets. All America Selections winner in 1955. A15Z, B75M, C69, D65, G79, G87, H95,184, K10, K27M

Golden Cross Bantam: 85 days. Uniform ears, 7 1/2 to 8 inches long, with 10 to 14 rows. Large, deep, rich yellow kernels of good quality. Excellent for market growers and well adapted to freezing and canning. Sturdy stalk; height 6 feet; very prolific. Highly resistant to bacterial wilt. 475, B3M, B73M, B75, F82, G79, G83M, K10, L10, M46, N16

Golden Queen: 88 days. Yellow version of Silver Queen. Uniform ears, 7 to 9 inches long, with 14 to 16 rows; excellent tip fill. Golden yellow kernels, very sweet and tender, of *high* quality. Very dark green husks and flag leaves. Stalk grows 7 to 9 feet tall. Tolerant to northern and southern leaf blights. Especially suited for the South. D65, G27M, G71, G79, G93M, H54,191, J97M, K10, K50, K71, L10, M95M

Iochief: 89 days. Ears 9 to 10 inches long, with 14 to 18 rows. Uniform, deep, golden-yellow kernels; good "real corn" flavor. Excellent fresh, frozen or canned. Sturdy stalk; height 6 to 7 feet; produces 2 ears. Drought resistant. All America Selections winner for 1951. Rated highest overall in a reader poll conducted by Organic Gardening magazine. A15Z, 475, B6, B73M, D65, D76, G82, H33M, H85M, H95, K10, K50, K71, M46, M95M, etc.

Jubilee: (Golden Jubilee) 83 days. Large ears, 8 to 9 inches long, with 16 to 20 rows. Deep, narrow kernels; sweet, tender, flavorful, of *hgh* quality. Holds quality well, both on the stalk and after picking. Excellent fresh or for processing. White inner silk. Strong, sturdy stalks; height 7 to 7 1/2 feet. Extremely popular and very widely adapted. A25, B73M, D65, D74B, F82, G16, G79, H95, 164, K10, L13M, L89, M46, N52

Merit: 80 days. Large, heavy ears, 8 to 9 inches long; with 16 to 18 rows of kernels and well-filled tips. Kernels bright yellow, deep and narrow, tender and sweet with good flavor. Vigorous, productive, widely adapted plants; height 7 feet. Rapidly becoming the favorite yellow corn in the South. A27M, G57M, G79, H61, H85M, 191, J97M, K10, K50, K71, M46, M95M, N16

N.K. 199: 80-85 days. Large ears, 8 inches long and with 18 to 20 rows. Deep, tender, very flavorful, golden-yellow kernels. Excellent fresh, canned or frozen. Strong, easy to pick plants, 6 to 7 feet tall. Versatile, very popular standard cultivar. Good for home gardens, roadside stands or shipping. Developed by Northrup King. A15Z, C20M, F63, G13M, G57M, G79, H85M, H95, /59M, K10, K50, M95M

**Polarvee:** 53-58 days Very early, cold weather corn. Recommended for northern regions where other varieties have difficulty maturing. Can also be used in other areas for extra early crops. Small, well-filled ears, 5 1/2 to 6 1/2 inches long; 12 rows of tender kernels. Good flavor for an early variety. Good cold soil emergence and seedling vigor. C97, DI 1M, D26D, D27, D76, E24, E97, F70, H42, M49

**Seneca Horizon:** 65 days. Large ears, 9 to 10 inches long, with 16 to 18 rows; good tip fill. Bright yellow kernels, tender and sweet. Superior eating quality compared to other early cultivars. Good seedling vigor and cold tolerance. Rapid-growing stalks; height 5 to 5 1/2 feet. Suitable for home garden, roadside and commercial use. Excellent for short-season areas. A16, A25, B75M, E24, FI, G16, G82, H85M, K10, K50, L89, M49, N16

#### *Sugary Enhanced (FJ)*

**Bodacious:** 75 days. Ears average 8 inches in length, with 16 rows of kernels well filled to the tip. Deep, golden-yellow kernels; very sweet and exceptionally tender. Homozygous type, 100% of the kernels on each ear being sugary enhanced. Flavor and tenderness hold well after harvest. Excellent for roadside stands and shipping. A1, B6, B1M, C68M, G13M, G82, G87, H85M, J84, J97M, K10, K50, K73, L89, M46, N16, N52, etc.

**Incredible:** 85 days. An improved Miracle type, with taller plants and higher yields. Ears average 8 inches in length, with 20 rows of kernels and well-filled tips. Exceptionally tender, very sweet kernels with real com flavor. Homozygous, 100% of the kernels on each ear being sugary enhanced. Good husk protection and better tip fill than Miracle. Stalks grow 6 1/2 to 7 1/2 feet tall. Has multiple disease resistance. A1, B6, C68M, F63, G13M, G82, G93M, H49, H61, H85M, J20, J84, J97M, K10, K50, K73, M95M, N52, etc.

**Kandy King:** 73 days. Very early, high quality Kandy Korn type. Large, uniform, well-filled ears; 7 1/2 to 8 1/2 inches long, with 16 to 18 rows of kernels. Extra sweet and tender, golden-yellow kernels. Homozygous, 100% of the kernels on each ear being sugary enhanced. Dark green husks with pink silks. Grows 6 to 7 feet tall. B6, C85M, D26D, D68, D76, E24, E97, G13M, G16, G71, H61, J97M, K10, K71, K73, M46, M95M, etc.

**Kandy Korn:** 89 days. Very uniform ears, 8 inches long, with 16 to 18 rows. Golden yellow kernels; tender, extremely sweet. Holds sweetness for 10 to 14 days after harvest. Heterozygous type, 25% of the kernels on each ear being sugary enhanced. Excellent for freezing and canning. Attractive purple-striped husks; burgundy red stalks. Height 8 to 9 feet. Very good seedling vigor. Adapted to a wide range of climates. A27M, B73M, B75M, D68, D82, F82, G16, H61, J97M, K10, K66, L89, M46, N16

**Miracle:** 84 days. Large well-filled ears, 8 1/2 to 9 1/2 inches long, 16 to 20 rows of kernels. Large, light golden-yellow kernels; very sweet and tender. Retains sweetness up to 2 weeks after reaching maturity. Homozygous type, 100% of the kernels on each ear being sugary enhanced. For home gardens, local markets, shipping and processing. White silks. Height 6 to 6 1/2 feet. Good tolerance to rust. B6, B75, C68M, D65, E63D, G82, G93M, H61, H85M, H95, I39, K10, L89

**Sugar Buns:** 70 days. Ears 7 to 7 1/2 inches long, with 14 rows of kernels. Relatively narrow, deep, medium-yellow kernels, very sweet and tender. Remains tender for up to 2 weeks in the field. Homozygous type, 100% of the kernels on each ear being sugary enhanced. Tight, dark green husk; good flag leaves. Short, sturdy plant. Recommended for home gardens, roadside stands and short-distance shipping. A1, B6, C44, D68, E24, G6, G79, G82, H61, H95, J84, K10, K73, L89, N16

**Tendertreat:** 95 days Well-filled ears, 9 inches long, with 16 to 18 rows. Light golden-yellow kernels; sweet, tender and flavorful. Long-lasting sweetness allows for a longer harvest period. Suitable for home gardens and local markets. Attractive purple stalks; purple

and green husks. Good seedling vigor. Large plants; height 9 to 10 feet. D26D, D76, F63, G13M, H33M, H85M, I64, K10, M29

#### *Xtra Sweet (FJ)*

**Crisp 'n Sweet:** 87 days. Large ears, 9 to 9 1/2 inches long, with 18 to 20 rows of yellow kernels. Has twice the sugar content of regular sweet com. Holds its quality for up to 2 weeks, on or off the stalk. Height 7 feet. Resistant to northern leaf blight; tolerant of Stewart's wilt. B75M, C20M, C68M, D12, F63, G1M, G79, N16

**Early Xtra-Sweet:** 71 days. Same high quality as Illini Xtra-Sweet, but about 2 weeks earlier. Uniform ears, 7 to 9 inches long, with 12 to 16 rows of kernels. Small golden-yellow kernels, extra sweet and tender. Vigorous plant; height 5 to 6 feet; produces few suckers. All America Selections winner in 1971. B6, B75, D11M, D65, D76, E63D, F70, G16, H33M, H49, I59M, K10, K27M, K71, M46, etc.

**Florida Staysweet:** 84 days. Uniform well-filled ears, 7 to 8 inches long, with 14 to 18 rows of kernels. Refined golden-yellow kernels, tender and extremely sweet. Good husk protection and appearance. Very good seedling germination and vigor. Does well in northern areas. Widely used for commercial shipping and freezing. D1T, D12, F86, G27M, K71, M46, TIM

**Frosted Gold:** (Xtra-Sweet 82) 72 days. Large, uniform ears, 9 inches long. Narrow, golden-yellow kernels; tender and extra sweet with very good flavor. Long holding ability. Superior husk cover ensures minimum insect damage. Excellent germination and seedling vigor. Developed by Illinois Foundation Seeds as an early maturing companion to Illini Xtra Sweet. F63, F86, G13M, G79, G82, H85M, I64, M95M

**Illini Xtra-Sweet:** (Illinichief Xtra-Sweet) 85 days. The original Xtra-Sweet hybrid. Twice as sweet as other hybrids at harvest time, four times as sweet 48 hours later. Large ears, 8 inches long, with 14 to 18 rows. Rich golden-yellow kernels, extra sweet and tender. Excellent fresh, frozen or canned. Height 7 feet. B1, B6, B75, D65, F86, G82, G93M, H33M, H49, H61, I59M, K10, K71, M46, M95M, etc.

**Minor:<sup>1</sup>** 64 days. Extra sweet variety specially bred for the production of "baby" com. Begins bearing in mid-summer when plants are only 20 inches tall, each plant producing 4 to 6 cobs. Best picked when 2 1/2 to 3 inches long, before the grains begin to swell. Very popular in Chinese restaurants and gourmet cuisine. L91M

**Northern Xtra-Sweet:** (Northern Supersweet) 67 days. Earliest maturing yellow Xtra-Sweet hybrid. Large ears, 8 to 9 inches long, with 16 rows of extra sweet kernels. Attractive unhusked appearance, with dark green husks and long flag leaves. Good seedling emergence and vigor under cool, wet soil conditions. Short, sturdy plant; height 5 feet. D1T, D27, D65, F86, G6, G16, H42, I67M, K10, L42, L79, M46

**Sugar Loaf:** 83 days. Ears 8 inches long, with 16 rows of kernels. Deep, narrow kernels, very sweet and tender. White silk. Relatively strong seedling vigor. Stalk 6 feet tall, produces 2 ears; few suckers. Resistant to rust; tolerant to northern leaf blight and maize dwarf mosaic. For home gardens, fresh market and processing. B6, C20M, F63, G13M, G79, G87, G93M, H85M, H95, N16

**Super Sweet Jubilee:** 83 days. Supersweet version of the popular Jubilee cultivar. Combines the ear shape and eating quality of Jubilee with extra sweetness. Large, attractive ears, 8 to 9 inches long and with 16 to 18 rows of kernels. Refined, smooth, tender kernels. Rated very highly for flavor. Holds well on and off the plant. Sturdy, 8 foot plants. C20M, D76, G13M, G16, G93M, H61, I39, L89, N52

#### *Open-Pollinated*

**Ashworth:** 75 days. Selected from a composite of numerous early cultivars. Ears 6 to 7 inches long, well-filled with 12 rows of kernels. Kernels bright-yellow, of excellent flavor. Matures with early

hybrids. Stalk grows about 5 feet tall. Developed by Rob Johnston Jr. of Johnny's Selected Seeds. A2, D68, E24, F46, F73D, G6, I39M, J25M, J39, K20M, K49M, L7M, M27

Early Golden Bantam: (Extra Early Golden Bantam) 70 days. Very uniform ears, 6 to 7 inches long, with 8 rows. Kernels bright golden-yellow, sweet and flavorful, of very good quality. Short, vigorous high-yielding plants; height 5 to 6 feet. A25, A75, B78, C69, C85M, D27, F44, G16, G87, I64

Fisher's Earliest: 60 days. One of the earliest open-pollinated sweet corns. Ears 5 to 6 inches long, with 8 to 12 rows of kernels, thin cob. Golden-yellow kernels, very sweet, tender, flavorful. Good for freezing and canning. Short, vigorous plant; height 5 feet; tolerates frost. Developed by Fisher's Garden Store. D82, F44, L3J

Golden Bantam: (Golden Bantam 8 Row) 75 days. Slender ears, 6 to 7 inches long, with 8 uniformly straight rows. Large, broad kernels; sweet, tender, very flavorful. Stalk slender, 5 to 5 1/2 feet tall, often produces 2 ears. Still the most popular open-pollinated yellow sweet corn. Introduced by W. Atlee Burpee Company in 1902. TAPLEY 1934; B49, B75, B75M, E59Z, F80, F92, G57M, G71, H33M, K49T, L7M, L13M, Q18, R47

Golden Early Market: (Gill's Early Golden Market, Golden Market) 68 days. Slightly tapered ear, 6 to 7 inches long, with 10 to 12 rows. Kernels golden-yellow, moderately deep, of good flavor. Slender stalk, 4 1/2 to 5 feet tall; occasionally produces 2 ears. Originated in Portland, Oregon by Gill Brothers Seed Company. Introduced in 1925. TAPLEY 1934; G87

Golden Midget:<sup>2</sup> 68 days. Tiny ears, about 4 inches long, with 8 rows of kernels. Golden-yellow kernels; sweet, tender, flavorful. Very good fresh; ideal for packing in freezer containers. Dwarf plant; height 2 1/2 to 3 feet; produces 3 to 5 ears per stalk. Well-suited to small gardens. A2, F73D, G68, J25M, K49M, K49T, K71, M46

Golden Sunshine: (Sunshine) 68 days. Slightly tapered ear, 7 to 8 inches long, with 10 to 12 rows of kernels. Light yellow kernels, moderately broad and medium deep; tender and sweet. Stalk 5 to 5 1/2 feet tall. Originated by A.F. Yeager of the North Dakota College of Agriculture. Introduced in 1926. TAPLEY 1934; U14

Hawaiian Supersweet #9: 80 days. Bred in Hawaii specifically for warmer climates. Has tighter husks to resist borer entrance and is resistant to corn stripe mosaic. Retains its sweetness for 7 to 10 days after harvest without refrigeration. M32M

Improved Golden Bantam: (Golden Bantam 12 Row) 75 days. Medium-sized, slightly tapered ear; 6 to 7 inches long, with 10 to 14 rows. Kernels deep, light yellow; tender and sweet. Stalk slender, 4 1/2 to 5 feet tall, often produces 2 ears; tillers numerous. Introduced in 1922 by the Everett B. Clark Seed Company. TAPLEY 1934; A2, G57M, H85M, H95, I64, K20M

Lorrie: 68-70 days. Open pollinated super sweet corn. Uniform yellow ears, 7 inches long, with 14 rows of tender kernels. Contains the shrunken-2 gene (*sh<sub>2</sub>*), therefore needs to be isolated from regular sweet corns. Grows 5 to 5 1/2 feet tall. Developed for home gardeners by Tim Peters. J9M

Montana Bantam: 65 days. An extra early strain of Golden Bantam developed by Fisher's Garden Store. Ears 6 to 7 inches long, with 8 rows of deep golden kernels of very good flavor and quality. D82

Orchard Baby: 60-65 days. Heirloom sweet corn that matures as early as any hybrid. Small golden ears, 4 to 6 inches long, well filled with juicy kernels. Fine, sweet flavor. Small plants, 3 to 5 feet tall; 1 to 3 ears per plant. Excellent germination and production under cool weather conditions. Introduced by the old Oscar Will Seed Co. B49, K20M

True Gold: 80 days. Large, plump ears, 8 to 8 1/2 inches long. Golden-yellow kernels with excellent flavor. Maintains its sweet-

ness well. Productive medium-tall plant, to 6 or 7 feet, resists lodging. Dependable new cultivar introduced by Seeds of Change. Developed by Alan Kapuler. A2, 199M, K46T, K49T

## CORN SALAD {S}

### VALERIANELLA LOCUSTA

A Grosse Graine: (Large-Seeded Round, Ronde a Grosse Graine) 45 days. A strong-growing type, differing from common com salad in the greater size of the plant, and also of the seed, which is nearly twice as large as other kinds. Large, comparatively narrow, grayish-green leaves; thin and very tender. Early maturing. Grows better in warmer weather than small-seeded types. Widely grown in Europe. Introduced prior to 1865. BURR, VILMORIN; E63D, G68, I77, J20, J73, K49M, N84, S95M

Coquille de Louviers:<sup>1</sup> (Scallop of Louviers) 40-45 days. Small, attractive, spoon-shaped, glossy-green leaves. Very fine flavor. An autumn and winter grower; plant in September for harvesting December through March. May be harvested sooner for "baby mache". Unique cupped leaves catch the dressing when fixed up in a salad. C53, E63D, N81, N84

Elan:<sup>1</sup> Small, glossy, smooth, very attractive leaves. Small, upright plant habit makes it one of the best choices for "baby mache". Resistant to mildew, making it ideal for fall and winter crops where conditions are cold and wet. C53, N81

Gala: 70-80 days. Improved Verte d'Cambrai type. Now the most widely marketed cultivar in France due to its greater vigor, earliness and cold tolerance. Attractive, oval, deep-green leaves, 4 to 5 inches long; delicate, buttery texture and rich flavor. Good resistance to mildew. Usually sown in late fall for overwintering. K66, P59M

Grote Noordhollandse: (Large Seeded Dutch, Large Dutch) 50 days. Large, rounded, lush, dark-green leaves. Very early and productive. Most suited for warm winter areas as it cannot tolerate frost; normally planted no later than mid-August for harvesting in October and November. Will germinate under warmer temperatures than other sorts. An old heirloom European strain. G68, I39, P59M

Large Round Leaved: Leaves larger, of a deeper green color, thicker, and more succulent than those of common corn salad. The leaves are most tender, and should be cut for use while young and small. Introduced prior to 1865. BURR; C85M, D68, K71, R32, S55

Ronde Maraichere: (Round-Leaved) An heirloom French cultivar which has very distinct short, oval, almost rounded clear-green leaves. Growth is half-erect, instead of spreading, making harvest easier during wet weather. Productive and of rapid growth. Widely grown by market gardeners around Paris. VILMORIN; C20M, G68

Topaze: Late maturing type with very attractive, rounded, blonde-colored leaves. Excellent resistance to cold winter temperatures. Very heavy yielding. Relatively new cultivar developed in Europe. P59M

Valgros: 45 days. Refined, large-leaved type. Large, elongated medium-green leaves. Vigorous and productive. Often sown in early September for harvesting in winter and spring. Can also be used as a green manure. Originated in the Netherlands where it is sometimes grown as a greenhouse crop. D11M, F70, L89, Q11M, R11M, S95M

Verte a Coeur Plein: (Green Full Heart, Dark Green Full Heart, Cabbaging) 40-45 days. A very distinct type with short, roundish, smooth, half-erect, stiff and intensely green leaves. Forms a compact rosette, the heart of which is full and firm. Very agreeable flavor. Holds its quality well when shipped. Very winter hardy. Introduced prior to 1885. VILMORIN; P59M

Verte d'Cambrai:<sup>1</sup> (Green Cambrai) 60 days. Compact plant. Small, round to oval, flat, dark-green leaves; 3 to 4 inches long; tender and mild in flavor. High yielding and pest-resistant. Very cold tolerant; best planted in October and harvested February through March. May be harvested sooner for "baby mache". Standard cultivar in France and Germany. A2, B49, D68, E24, E63D, F44, G68, I39, J20, K49M, L42, Q34, R32, S55, S95M

Verte d'Etampes: (D'Etampes) Rosette somewhat more compact and stiff than common corn salad. Leaves extremely dark-green in color; rather narrow, and often undulated or folded back at the edges; veins prominent; much thicker and fleshier than those of other cultivars; maintain their freshness longer than any other kind while being brought to market. Remarkably cold tolerant. Introduced prior to 1885. VILMORIN; C53, G68, Q11M

Vit: Most vigorous cultivar for spring and fall crops, as well as for over-wintering. Long, glossy green, tender leaves form a heavy bunch. Delicious, mild, minty flavor. Mildew tolerant. G6, K57{PL}, N81, N84, S55, S95M

#### CODES FOR SPECIAL TYPES

##### 1. Baby

## COWPEA {S}

#### VIGNA UNGUICULATA

Bettergreen: 69 days. Small-seeded cream type developed by the USDA Vegetable Lab of Charleston, South Carolina. Contains a homozygous gene trait that allows for harvesting at the near-dry seed stage of maturity without loss of the seed's fresh green color. Planted in spring, mid-season or fall in the Southeast. L4

Bettersnap:<sup>1</sup> Edible-podded cowpea developed by the USDA Vegetable Lab of Charleston, South Carolina. Slightly curved pods, 8 to 10 inches long and containing 12 to 16 seeds. Pods or "snaps" make a good substitute for green beans. Snap peas are often canned with peas and sold as "blackeyed peas with snaps". Cream-colored peas can be used as a cream type shell or dry pea. L4

Big Boy: 70 days. Very prolific bush type pea, producing green pods borne well above the foliage. Pods 8 to 9 inches long, with 13 to 16 oblong peas per pod; peas cream-colored with a light brown eye. Resistant to wilt and nematodes. Similar to blackeye in taste and appearance but shells much more easily. G1M, G27M, K71, N16

Big Red Ripper: (Mandy) 60 days. A well-flavored table pea with 10 inch long pods, containing 18 large peas per pod. Pods are easy to see amongst the foliage, and plants are resistant to very hot, dry summers. Use green shelled or dry. Heirloom from Virginia and North Carolina. F80, L7M

Black Crowder: 63 days. Very prolific, high bush-type plant; bears unusually long, green pods at foliage level. Very flavorful peas have a deep-purple cast at the green shell stage, turning black when mature. Sweet and nutty. Easy to shell. F73D, G1M, N16, N84

Blue Goose: (Gray Crowder) 80 days. One of the best all-purpose cultivars. Excellent for soil building, h<sup>a</sup>, or edible peas. Heavy, productive vines; height 3 feet. Long pods, producing well-flavored speckled, purplish-gray peas. A90M{DF}, F73D, G1M, H54

Bombay:<sup>1</sup> (All Seasons Red-Seeded) Superior to any Indian cultivar. Soft and tasty green fruits, one cubit (18 inches) long, generally

with red seeds. Can be sown from January to December, but highest yield is obtained if sown in April and September. N91

Brown Crowder: 65 days. Medium-sized pods; about 8 inches long; dark-gray at green shell stage. Seeds are smooth; "crowded" in the pod, thus becoming flattened and misshapen; brown, with a dark-brown eye when mature. Unique, strong nutty flavor preferred by many in the South. Will do well on thin soil. D76, F73D, G1M, G27M, G57M, H49, H61, I59M, N16, N84

Burgundy Purple Hull: Semi-bush type purple hull pea with excellent production, quality and shelling characteristics, Long, slender non-shattering pods; bright red at green shell stage, turning light brown; held well above the foliage; easy to harvest, giving good shell-out over a relatively wide range of maturity. Excellent quality for fresh market, freezing or canning. L89G

Calico Crowder: (Hereford Pea, Polecat Pea) 80 days. One of the more flavorful cowpeas, recommended for southern states and warm coastal areas. The 5 1/2 inch long pods are green at the green shell stage and turn dark tan when dry. Dried peas are buff-colored with maroon splashes, especially around the eye. F73D, L7M, N84

California Blackeye #5: 65 days. Improved strain of Giant Ramshom. Very vigorous and heavy yielding. Pods are up to 12 inches long, with plump, cream-colored peas larger than ordinary blackeyes. Tall, bunch-type plant with good root system; resistant to nematodes, wilt and other diseases. Leading *black-eyed pea* in the U.S. HAWKES [Re]; A75, B75M, D76, G27M, G57M, G71, G82, G93M, H95, J84, M95M, N16

Clemson Purple: 67 days. Improved Knuckle Purple Hull type. Very large, smooth, dark-brown seeds; crowder shaped; 16 per pod. Large, straight pods, 6 1/2 inches long; dark purple at green shell stage. Easy to pick and shell. Very productive, upright plant. Highly tolerant of mosaic and rootknot nematode. G1M, L4, L10, N16

Colossus: 60 days. Extra large brown crowder type. Pods 7 to 9 inches long; straw-colored, with a red tinge. Peas are brown when mature. Tends to produce pods in bunches for easy harvest. Popular home garden pea for canning, freezing and green shell peas. Developed by Dr. W.L. Ogle of Clemson University. G1M, K71, L4, L10, M95M

Dixie Lee: 60 days. Hardy, heavy-bearing plant produces 8 inch pods, turning from green to light yellow; borne well off the ground; easy to shell. Peas are small to medium-sized, brown, and excellent for home or commercial use. Yields 2 crops a season. Nematode tolerant. G1M, L4, L10

Hercules: A late season brown crowder type that continues producing for 4 weeks or more, longer than most cultivars. Pods are 8 to 9 inches long, reddish at maturity, bear a heavy crop of large size peas of pronounced flavor. Peas are green fresh, brown when dried. Developed by Dr. W.L. Ogle of Clemson University. G1M, L4

Iron and Clay: Mixture of Iron and Clay cultivars, producing a heavy growth of vines used for soil improvement and forage. Small seed, usually harvested as dry peas as they are too tedious to shell fresh. Iron and Clay are considered to be among the types brought from Africa by slaves and slave traders to the United States in the 1700's. A90M{DF}, G27M, L4, M25

Knuckle Purple Hull: (Knucklehull Purple Hull) 65 days. Large-seeded brown crowder type. Strong, erect bush-type plant. Short, 6 inch pods; purple when mature; relatively easy to shell; late maturing. Seeds are dark-brown when mature. Called "knucklehull" because of the large, plump peas. F73D, G1M, G27M, G57M, K49M, K71, M95M, N16

Lady: (Lady Finger) 65 days. Very small, tender, well-flavored peas; white in green shell stage, turning cream when mature; freeze well when young, and are good for drying when mature; hold well on the vine when green. Bush-type plant; very prolific; excellent for the home garden. F73D, G1M, G27M, K49M, N16

**Magnolia:** 65 days. Small-sized, very high-yielding blackeye type of excellent quality. Bush-type plants; pods approximately 7 inches long. Good for canning and freezing. Bred to be resistant to fusarium fungi, root knot nematodes, and tolerant to viruses. 164, K10, K50, K73

**Mississippi Cream:** High-yielding plants; tolerant to root-knot nematodes and most viruses. Pods are 7 inches long; green to nearly white at green shell stage, straw-colored when dry; peas shell much easier if left overnight after picking. Peas are green turning to light cream when dry. N16

**Mississippi Pink Eye Purple Hull:** 65-70 days. Improved Pink Eye Purple Hull type with enhanced disease resistance and yield capability. Pods grow about 6 1/2 inches long and have white seeds with pink eyes. Excellent for fresh market or processing. Medium-sized vines; extremely productive; resistant to all major cowpea diseases. A27M, G1M, 164, K10, K73

**Mississippi Purple:** 65-70 days. Mississippi Silver x Knuckle Purple Hull. Large-seeded brown crowder type. Pods are about 7 inches long; light green, turning purple first at the tip and along the suture, at which time they will shell; mature over a short time span. Easy to pick and shell. Resistant to most major cowpea diseases. F73D, G1M, K50, K73, N16, N84

**Mississippi Silver:** (Mississippi Silverhull) 85-100 days. Large-seeded brown crowder type. Low, bushy plants produce few runners, are somewhat insect resistant. Pods are 6 to 6 1/2 inches long, slightly curved, silver colored at green shell stage. Peas set early at the top of the vines and shell very easily. Excellent in hot, humid southern climates; also does well in northern areas with longer seasons. A27M, A90M{DF}, G71, G93M, 191, J11M{DF}, K10, L7M, M46, N16

**Pink Eye Purple Hull:** 65 days. Semi-vining plant grows 18 to 24 inches tall. Pods are 6 to 7 inches long; are held slightly above the foliage; turn purple at shell stage. Peas are medium-sized, rounded on ends; light-green with a red eye at green shell stage, turn white with maroon eye when dry. Good producer, usually produces 2 crops per season. A90M{DF}, D76, G27M, G82, G93M, J11M{DF}, J84, K71, K73, M29, M46, N16

**Pusa Barsati:**<sup>1</sup> 45 days. Heavy-yielding short plant, does not require support. Produces light-green, cylindrical pods, 10 to 12 inches long, stringless. An improved type, recommended for sowing during the rainy season in India. Pods can be harvested after 45 days. Seeds are boldly striped white and dull red. N91, Q45M, R0, R50, S59M

**Pusa Dofasli:**<sup>1</sup> (Two Flashes) Bushy plant producing yellowish-green pods, approximately 7 inches long, in great profusion. Suitable for both the plains and hills. In India, grown as an irrigated crop during the summer and as a rainfed crop during the monsoon. S59M, S93M

**Pusa Phalguni:**<sup>1</sup> 60 days. High-yielding cultivar, suitable for growing in spring to early summer. Dwarf, bushy plants freely produce dark green pods, 7 to 8 inches long. Pods can be harvested after 60 days. R50, S59M

**Queen Anne:** (Queen Anne Blackeye) 65 days. Very dependable, heavy yielding blackeye introduced by the Virginia Truck Experiment Station. Plants are compact, 26 inches tall and runnerless. Pods are 7 to 9 inches long, with 8 to 12 seeds per pod. Highly recommended for green shell or dry use, freezing or canning. B73M, G57M, H54, K50, L7M, L10, M29, M95M

**Running Conch:** 90 days. Produces 7 inch long pods, containing 12 to 14 peas per pod. Gives a clear pot-liquor when cooked. Non-climbing vine. Harder to shell than modern types, but valuable for its ability to resist curculio and suppress weeds. An heirloom, dating from the late 1800's. The original *conch pea* from which the various cream peas were developed. F73D, L7M

**Six Week Brown Eye:** 65 days. Long, green pods, about 6 1/2 inches in length. Small, smooth, cream colored peas with brown eyes. Very good flavor. Vigorous and productive plants. Susceptible to mosaic and rootknot nematodes. Excellent for home gardens. Very popular in parts of the South. G1M

**Tennessee White Crowder:** 65 days. Large, rounded seed; eggshell-white with a protruding, light brown eye; cream-pea-like flavor. Pods light green at green shell stage, dark green at maturity; 6 inches long. Vining type plant usually blooms over a longer period than other types. Very good producer if mature peas are kept picked off. L10

**Texas Cream 40:** 70 days. Bush type, high-yielding conch usually producing 2 crops a season. Long, cream-colored pods are oval, straight, and closely filled with medium-sized, tender cream-colored peas. Pods form at the top of the bush in hands, making for easy picking. Cross between an extra early blackeye and a midseason cream cultivar. G27M, L89G, N16

**Thailand Long:**<sup>1</sup> Catjang type. Developed especially for the tasty pods which are picked when they are 8 to 10 inches long and cooked like snap beans. The seeds can be used as shell beans if the pods become too mature to eat. Disease-resistant vines are either grown on a trellis or they can be left to sprawl along the ground. D33

**Tohono O'odham:**<sup>1</sup> (Papago) 80 days. Delicious, delicately flavored pods. Small to medium-sized seeds usually have white eyes with black splotches (Dalmatian dog style), but may be all black. Similar to blackeyes but much more prolific and drought resistant, especially in the Southwest. C95, F73D, F80, 116, K46T, K49T, L77D, N84

**Whippoorwill:** 80 days, Very prolific, heavy vining type. Green pods, about 10 inches long; medium maturing. Smooth, speckled buff-brown peas. Will bear peas over a long period of time. A good general purpose old standard Southern pea. C20M, F73D, L77D, N16, N84

**White Acre:** 75 days. Large, bush-type plant producing green pods with numerous small, creamy-white seeds. Pods set at the foliage level and are light straw-colored. Matures early and bears for a long period of time. The small seeds are harder to shell, but it is still one of the best-liked peas for home use with excellent fresh eating quality. A90M{DF}, G27M

**Zipper Cream:** 70 days. Medium-green pod, turns a light straw color when dried; has a "zipper" for easy shelling. Peas are creamy-white; very large, especially for a cream type; of very good flavor. Low, bushy, compact plants with high yields. Resistant to curculio, stink bug and weevil damage due to its thick pod walls. D76, G27M, K50, K71, N16

#### CODES FOR SPECIAL TYPES

1. Edible-Podded

---

## CUCUMBER {S}

CUCUMIS SATIVUS

---

### PICKLING CUCUMBERS

#### COMMON

##### *Hybrid*

**Anka:** 50 days. Small, uniform fruit; smooth, tender, bright-green skin; crisp, crunchy flesh, with a fine flavor and no trace of bitterness; extremely small-seeded. Excellent eaten whole, fresh from the garden. Vigorous, heavy-yielding vine, produces fruit in three flushes; resistant to disease. The type of pickling cucumber most favored in Germany. 139

Calypso: 56 days. Uniform, straight, medium dark-green fruit; blocky, slightly tapered at the blossom end; white-spined. High yielding, gynocious vine; highly disease resistant; adapted to high density planting and machine harvest. For home gardens, local markets and commercial production. Introduced by the North Carolina Agricultural Experiment Station. A25, E75{PL}, F63, G13M, G27M, G82, J84, J97M, K10, L4, L42, L59G, M29, M46, M49, N16, etc.

County Fair: (County Fair '83) 52 days. Dual-purpose cucumber. Can be used for pickling when small, and for slicing if allowed to grow larger. Sweet, non-bitter flavor; white-spined. Seedless if isolated from other cucumbers. High yielding, all-female vine; sets fruit without pollination; highly disease resistant; excellent trellising qualities. E24, L89

Liberty: 54 days. Blocky, nearly cylindrical, dark-green fruit; black-spined. Excellent for pickling whole; also produces uniform slices for bread and butter pickles. Vigorous, widely adapted vine; tolerant to cool spring weather; produces heavily over an extended period; resistant to or tolerant of most cucumber diseases. All America Selections winner in 1978. E38

Saladin: 55 days. Short, bright-green fruit; 4 to 5 inches long, 1 1/2 inches in diameter; flesh crisp, tender, non-bitter; white-spined. Dual-purpose; ideal for pickling and salads. High yielding, gynocious vine; widely adapted; resistant to cucumber mosaic virus, tolerant of powdery mildew and bacterial wilt; well suited for trellising. All America Selections winner in 1979. K66

#### *Open-Pollinated*

Arkansas Little Leaf: (H-19) 52 days. High quality pickling cucumber with a unique plant type. Medium-sized, blocky, fruits; distinctive, emerald green color. Suitable for pickling or slicing. Compact, multi-branching vine, produces well even under stress; parthenocarpic; readily climbs a trellis. Smaller leaf size provides easier visibility of fruits. C85M, D11M, E53M, F63, F70, G6, G71, G87, J91, J9M, L7M, LIO, L89C, R47

Boston Pickling: (Green Prolific) 58 days. Smooth, long oval, dark-green fruit; 6 to 7 inches long, 2 1/4 to 2 1/2 inches in diameter; slightly tapered, blunt-ended; flesh tender, crisp, very white; black-spined. Suitable for either sweet or dill pickles. Early and very prolific. Very popular home garden cultivar. Introduced about 1880. TAPLEY 1937; A2, A25, A75, B3M, C44, E59Z, G57M, G79, G83M, H85M, J59M, K49M

Bush Pickle:<sup>3</sup> 45 days. Slightly tapered, cylindrical, medium-green fruit; 4 to 5 inches long; white-spined. Short-vined plant; only 2 to 3 feet in diameter; highly productive over a concentrated period; tolerant to scab and cucumber mosaic virus. Widely adapted. Ideal for container culture and miniature gardens. Introduced in 1882. D76, E91G, F13, G16, G27M, G71, G82, H33M, H54, H61, H85M, J91, J97M, K49M, L42, etc.

Chicago Pickling: 60 days. Uniform, tapered, medium-green fruit; 5 to 6 inches long, 2 to 2 1/2 inches in diameter; nearly square-ended; black-spined. Especially well adapted for use as dill pickles; good for slicing when young. High yielding, precocious vine. Traditional home garden favorite. Introduced in 1888. TAPLEY 1937; A75, B8M, C92, D65, G57M, G87, L67M, K20M

Early Cluster: (Early Green Cluster) 55 days. Short, medium plump, light-green fruit; tapered towards the stem end; 5 to 6 inches long, 2 1/4 to 2 1/2 inches in diameter; flesh white, seedy, tender, well-flavored; black-spined. Vigorous, productive vine, often bears fruit in clusters near the root. One of the oldest of all cultivated cucumbers. Introduced prior to 1778. BURR, TAPLEY 1937; K20M, K49M

Early Russian: 50 days. Very short, oval, medium-green fruit; 3 1/2 to 4 inches long, 1 1/2 to 2 inches in diameter; flesh tender, crisp, well-flavored; black-spined. Highly prolific vine; generally bears fruit in pairs; produces until frost. Does well in northern short-

season areas. Similar to Early Cluster. Introduced prior to 1854. BURR, TAPLEY 1937, VILMORIN; A2, D27, D29P, E5T, F24M, K49M, K49T, K71

Edmonson: 70 days. Uniform, whitish-green fruit; about 4 inches long; flesh crisp, tender and non-bitter, even when past its prime. Best used for pickling; also good for slicing. Very hairy, prolific vine; has good resistance to disease, insects and drought. Family heirloom from Kansas since 1913. F73D, L7M

Homemade Pickles:<sup>3</sup> 56 days Versatile new variety especially bred for growing and making pickles at home. Medium-green fruits with small white spines. Solid, crisp and crunchy. Can be harvested when 1 1/2 inches long for tiny sweets, or at 5 to 6 inches for robust dills and spears. Vigorous, short-vined plant; high yielding and disease tolerant. A25, B6, B73M, D56M, D65, E24, G16, G83M, H57M, H85M, J91, J20, K71, L89, M46, M65, N16, etc.

Japanese Long Pickling: 60 days. Slender, dark-green fruit; 12 to 18 inches long, 1 1/2 inches in diameter; flesh crisp, very mild and easy to digest; extremely small seeds. Should be harvested when about 12 inches long. Excellent for slicing for salads and bread and butter pickles. Often referred to as a "burpless" cucumber. L42

Jersey Pickle: 55 days. Straight, medium long fruit; 7 to 8 inches in length, 2 to 2 1/2 inches in diameter; skin deep medium green, tinted yellowish-white at the apex; flesh moderately thick, white; black-spined. Used for dill and ripe, sweet chunk pickles; considered too slender and long for smaller sizes. Heirloom that originated in Burlington County, New Jersey. TAPLEY 1937; G57M, K49M

Mincu:<sup>3</sup> 4 (Baby Mincu) 50 days. Slightly tapered, short oval, bright green fruit; 3 to 4 inches long, 1 3/4 inches in diameter; firm, crisp, snow-white flesh; white-spined. Compact, short-vined plant, only 2 feet in diameter; highly prolific. Ideal for small gardens and containers. Developed at the Minnesota Agricultural Experiment Station. A16, D27, D82, F44, H42

National Pickle: (National Pickling) 56 days. Short, slender, medium-green fruit; 5 1/2 to 6 inches long, 2 inches in diameter; thick walled; black-spined. Widely adapted, high yielding vine. Traditional home garden favorite. Introduced in 1929 by the National Pickle Packers Association. Selected for adaptability to both small pickles sizes and dills. TAPLEY 1937; A16, A75, C85M, E38, F60, F92, G16, G57M, G68, G79, H42, H85M, K27M, M95M, N16, etc.

Northern Pickling: 48 days. Medium-long, medium green fruit; slightly tapered towards the blossom end; black-spined. Should be picked frequently when small to maintain acceptable color and fruit shape. Relatively short, space-saving vine; resistant to scab, susceptible to mosaic; reliably high yielding. Adapted to cool northern areas. E24, F44, F46, G6, J9M, J39, K49M, K49T, L13M

Picklebush:<sup>3</sup> 52 days. Short, blocky fruit; 4 1/2 inches long, about 1 1/2 inches in diameter; skin light green, moderately waxy; white-spined. Suitable for pickling at any stage, from small sweets to large dills. Very compact vine, grows only 20 to 24 inches long; tolerant to powdery mildew and cucumber mosaic virus. Ideal for gardeners with limited space. B75

SMR 58: (Wisconsin SMR-58) 56 days. Straight, blocky, medium-green fruit; 6 1/2 inches long, 2 1/2 inches in diameter; black-spined. Good processing qualities. Vigorous, prolific vine; widely adapted; resistant to cucumber mosaic virus and scab. Standard home garden and market cultivar. A75, B75M, C85M, F60, F82, G16, G71, G93M, H95, J39, J84, J97M, K5M, L89, M95M, etc.

Vyaznikovsky: 40-55 days. Medium-sized fruits, 5 to 7 inches long; black-spined. Excellent for pickling and canning. Well suited to cold climate regions. An old Russian cultivar. Pickling of fruits may be accelerated by packing alternately with cabbage leaves or adding a piece of rye bread to the barrel. BOLOTNIKOVA; K47

**CORNICHONS** Small French pickling cucumbers. Traditionally served with meat pates and *terrines* (foods cooked in earthenware containers) because their tart pungency cuts the richness of these fatty dishes. VONWELANETZ. J66M{PD}, K66

#### Hybrid

**Cool Breeze:** 45 days. High quality French comichon. Small, uniform fruits, 4 to 5 inches long; heavily stippled, dark-green skin, non-bitter; crisp, seedless flesh. Usually harvested when about 2 inches long for pickles. Excellent for salads or pickling. Vigorous, all-female plants, highly productive. Resistant to cucumber mosaic virus, scab and powdery mildew. E75{PL}, F13, H42, 139, J20, L79, M1P, M46

**Parigyno:** Small, somewhat blocky, medium green fruit; resembles Vert Petit de Paris. Black spined. Remains firm and highly colored when pickled in vinegar. Vine very vigorous and productive, 100% gynoeious; resistant to cucumber mosaic virus. Introduced by Vilmorin. S95M

**Witlo:** 53 days. Tiiy, well-shaped, European-style “mini” cucumbers or cornichons. Traditionally used for making very small, sour pickles. Slightly tapered fruit; firm and crisp. Should be harvested frequently, as they are bred to be picked at no more than 2 inches long. Vigorous, productive vine; resistant to cucumber mosaic virus, scab and powdery mildew. P59M

#### Open-Pollinated

**De Bourbonne:** (Comichon de Bourbonne) Tiny, spiny cucumbers bred especially for making the whole, very small sour pickles that are served with pate. Should be harvested at 2 to 2 1/2 inches in length. Soak in brine for a few hours, then pack in jars with mustard seed and a few sprigs of tarragon. Cover with vinegar and they will keep for months in the refrigerator. K49Z

**Fin de Meaux:** (Fine Meaux) 60 days. Similar to Vert Petit de Paris, but fruits are longer and darker green. Should be picked when 2 inches long and 1/2 inch in diameter for comichon pickles, or at 4 inches long and 1 1/2 inches in diameter for dills. Bears heavily until frost. G68

**Vert de Massy:** 53 days. High quality French comichon. Distinctive fruits, considerably more slender than American pickling cucumbers. May be picked at “baby” finger size for tiny pickles, or when 4 inches long for pickling whole or sliced. Suitable for salads and snacks, with excellent taste and texture. For home gardens and specialty markets. Tolerant to scab. Black-spined. B75, C53, C92, D68, D74B, F44, G16, 139, J20, K49M, L3J, L77D, M46, N16, S95M, etc.

**Vert Petit de Paris:** (Small Green Paris) 60 days. European strain of cucumber cultivated especially for use in making cornichons. Short, green, spiny fruit; should be harvested when about 2 inches long. Vigorous, compact, highly productive vine. An old standard cultivar that is very popular with French gardeners. Introduced prior to 1885. BRENNAN [Re], VILMORIN; E63D, G68, K49M, P59M, Q11M

### SLICING CUCUMBERS

#### COMMON

#### Hybrid

**Burpless:** 60 days. Hybrid version of Japanese long. Straight, slender, bright-green fruit; 10 to 12 inches long; soft, tender, non-bitter skin, does not require peeling; crisp, mild flesh, very low in acid, easy to digest. Excellent for slicing or pickling. Vigorous, high yielding vine; bears over a long period; resistant to downy and powdery mildews. Should be grown on a trellis, otherwise the fruits may curve. B6, D65, D76, F92, G57M, G79, G83M, G87, H33M, H42, H61, J20, K71, K73

**Fanfare:**<sup>3</sup> 63 days. Uniform, slender fruits; 8 to 9 inches long; smooth, dark-green skin; white spined; extra crisp flesh; mild, sweet flavor. Dwarf plants with short internodes, monoecious, highly productive over a long season; multiple disease tolerant. Ideal for growing in containers or where space is limited. All America Selections Winner in 1994. B73M, B75, D65, D74B, E91G, E97, F82, G16, G27M, G71, G82, H49,139,191, J97M, L91M, M29, etc.

**Pot Luck:**<sup>3</sup> 58 days. Slightly tapered, medium dark-green fruit; 6 1/2 to 7 inches long, 2 1/4 inches in diameter; white-spined. Vigorous, short-vined plant, only 18 inches long; extremely productive; tolerant to cucumber mosaic virus and scab. Ideal for pots, window boxes and limited space gardens. B6, D11M, E53M, F70, G71, G93M, H33M, I50G, K10, L79, N16

**Salad Bush:**<sup>3</sup> 57 days. Smooth, uniform fruit, 8 inches long; skin dark green. True dwarf plant, with a spread of only 24 inches; highly productive. Strongly resistant to powdery and downy mildews, target leaf spot, cucumber mosaic virus and scab. Excellent for patio containers. All America Selections winner in 1988. E53M, F13, G27M, G82, G87, H33M, H42, H95,139,191, J20, J84, L10, M49

**Sweet Slice:** 62 days. Straight, cylindrical, dark-green fruit; 10 to 12 inches long, 2 1/2 inches in diameter; thin, tender skin, does not require peeling; crisp, non-bitter, extremely sweet flesh. Vigorous vine; productive over a long season; resistant to or tolerant of most cucumber diseases. A25, B8M, B75M, C85M, D11M, E63D, F70, F82, G16, G71, G82, H61, H95, L79, M46, M49, N16, etc.

**Sweet Success:** 55 days. Smooth, straight, medium-green fruit; 12 to 14 inches long; tender skin; sweet, crisp, mild flesh; white-spined. Vigorous, productive vine; sets fruit without pollination; has multiple disease resistance. Best grown on stakes or trellises. Suitable for greenhouse or outdoor cultivation. All America Selections winner in 1983. A16, B75, C44, C85M, D11M, D76, FI, F13, F70, G16, G71, G82, H95,139, L79, etc.

**Tasty Green:** (Burpless Tasty Green) 58 days. Slender, dark-green fruit; 12 to 15 inches long; smooth, tender skin; crisp, mild flesh; white-spined. Best when harvested at 9 inches long and 1 inch in diameter. Vigorous vine; highly productive over a long season; tolerates summer heat; resistant to downy and powdery mildews; requires support for best results. C85M, E53M, FI, G33, 139, K16M, L59, L91M, M46, M49, R32, S55, TIM

#### Open-Pollinated

**Ashley:** 65 days. Straight, dark-green fruit, tapered at the stem end; 7 to 8 inches long, 2 1/2 inches in diameter; white-spined. Good for shipping. Vigorous, high yielding vine; widely adapted; resistant to downy and powdery mildews. Developed at the Clemson Trnck Experiment Station, Charleston, South Carolina. Introduced in 1955. A75, B6, B8M, C69, DIT, G1M, G16, G27M, G71, G79, L7M, N16

**Boothby's Blonde:**<sup>1</sup> 63 days. Heirloom perpetuated by the Boothby family of Livermore, Maine. Medium-sized fruits, 6 to 8 inches long; creamy white skin, deeper and richer than typical white cucumbers; contrasting black spines; crisp and sweet, pleasant flavor and texture. Excellent for slicing or pickling. Very small fruits can be used for making white cornichons WEAVER 1997; D29P, F73D, H15P, J20

**Bush Crop:**<sup>3</sup> 60 days. Straight, medium-green fruit; 6 to 8 inches long; flesh crisp, tender, flavorful. Ideal for slicing and salads. Compact, short-vined plant, only 2 1/2 to 3 feet long; nearly free of runners; very productive. Excellent for containers and small space gardens. E53M, E91G, G16, H21, H33M, H54, H61, H95, I50G, J20, J97M, K10, M46, M95M

**Carosello Barese:** (Nun's Tits) Unique cucumber from the Puglia region of Italy. Short, oval fruits; bright green skin with lighter green stripes, slightly hairy; distinctive, gray, areole-like scar at the

stem end. Young fruits are dressed with oil and vinegar and eaten like cucumbers. If 1 or 2 fruits are left on the vine, they mature into melon-like fruits which keep until Christmas. Mature fruits are traditionally served with *prosciutto crudo*. GRAY, P.; B8, Q11M, S17

Crystal Apple:<sup>1</sup> (White Lemon) 65 days. Similar to Lemon, but distinctly lighter in color. Short oval, creamy white fruit; 3 1/4 inches long, 2 1/2 inches in diameter; flesh crisp but tender, sweet, very flavorful; white-spined. Suitable for either slicing or pickling; also very good for stuffing. Vigorous, highly prolific vine. Originated in Australia prior to 1933. TAPLEY 1937; A2, B49, C20M, E5T, F73D, J39, PIG, R32, R47, S55

De Bouenil:<sup>1</sup> Medium-sized, white fruits borne on spreading plants. Popular in Europe for larger sized pickles because the white color allows the cook to choose the color the relish will be. Can also be used for whole pickles if harvested young, or for salads after peeling. C53

Early Yellow Dutch: (Gele Tros) Fruit longer and later than that of Early Russian; at first yellowish-green, becoming slightly orange-yellow when quite ripe. Usually only one or two fruit on each plant. Adapted to greenhouse or outdoor culture. Introduced prior to 1885. VILMORIN; K49M, N24M

Improved Long Green: (Long Green) 68 days. Straight, warted, medium dark-green fruit; 10 to 12 inches long, 2 1/2 to 3 inches in diameter; flesh tender, crisp, mild, black-spined. Suitable for both slicing and pickling. Vigorous, reliably productive vine. Long-time home garden favorite. Introduced in 1870. TAPLEY 1937; A16, A25, A75, E5T, G57M, G79, H49, H85M, H95, K27M, K71, M95M

Lemon:<sup>1</sup> (Apple, True Lemon) 65 days. Short oval, lemon-yellow fruit; 3 to 3 1/2 inches long, 2 to 2 1/2 inches in diameter; flesh very thin, white, with a faint lemon-like flavor in late stages of development; black-spined. Excellent for both slicing and pickling. Vigorous, highly prolific vine. Introduced about 1894. TAPLEY 1937; C44, C53, D82, E24, F42M{PD}, F60, F80, F92, G16, I64, I67M, J97M, K23{PL}, K71

Long Paris White:<sup>2</sup> (Bianco Lungo di Parigi) 62 days. Long, knobby cylindrical white fruit with firm, creamy-white flesh; white-spined. The best white cucumber for use in salads. Also excellent for pickling. Vigorous, rapid growing vine, yields continuously into early October. Resistant to cucumber mosaic virus. J20, J39, N84, O53M, Q11M

Marketer: (Early Green Market) 65 days. Straight, slightly tapered, dark-green fruit; 8 inches long, 2 1/2 inches in diameter; flesh white, solid, tender, very small seed mass; white-spined. Vigorous, productive vine. Popular for home gardens, local markets and shipping. All America Selections winner in 1943. C44, C85M, D1T, D12, G57M, G68, G71, G79, H49, P59M, TIM

Marketmore 76: 58 days. Dark-green fruit; 8 to 9 inches long; white-spined. Productive vine; has multiple disease resistance. Contains the uniform dark-green color gene which reduces the number of "yellow bellies" at harvest time. For home gardens and commercial production. Developed by Dr. Munger at Cornell University. B1M, B75M, C44, D74B, F60, F82, G57M, G71, H61, K10, K73, M46, N16

Perfection: (Perfection King of the Ridge) Cross between a frame and a ridge type, with the best qualities of both. Straight, nearly spineless, dark green fruit; 8 to 10 inches in length; excellent flavor. Vigorous, productive, comparatively hardy vine. Once grown extensively for the seaside salad trade in England. G44M, L13M, N84

Poinsett: 70 days. Cylindrical, dark green fruit, slightly blockier than Ashley; 7 1/2 inches long, 2 1/2 inches in diameter; white spined. Highly productive vine, especially in the Southeast. Strongly resistant to downy and powdery mildews. Moderately resistant to

anthracnose and angular leaf spot. C20M, G57M, G71M, G79, K27M, K49M, Q45M, R50

Poona Kheera: (Puna White Khim) Very unusual cultivar from India. Small, smooth, greenish-white fruit, 4 to 5 inches long; flesh very tender, crisp, flavorful. May be eaten at all stages, skin and all. Concentrated fruit set. K20M, K49M, R0, R50

Precoce Grosso Bianco Crema:<sup>2</sup> (Early Large Creamy-White) Unusual Italian cultivar with attractive, creamy-white fruits, 5 inches long and 2 inches in diameter. No bitterness, with a mild, slightly sweet flavor. J73, N84

Spacemaster:<sup>3</sup> 58 days. Smooth, cylindrical, dark-green fruit; 7 to 8 inches long. Compact, short-vined plant, only 2 feet long; extremely productive; resistant to cucumber mosaic virus and scab; should be picked regularly to avoid misshapen fruit late in the season. Well suited to container culture. A25, B6, C44, C85M, D82, E24, G79, G83M, H85M, J25M, K49M, K71, L7M, M46

Straight Eight: 60 days. Uniform, straight, deep-green fruit; 8 inches long, 2 to 2 1/2 inches in diameter; well rounded at the ends; white spined. Excellent for slicing; also used for pickling when small. Vigorous, productive vine; susceptible to most cucumber diseases. Popular home garden cultivar. All America Selections winner in 1935. TAPLEY 1937; A16, A25, A75, B73M, C44, C85M, D65, D82, E38, FI, F60, H33M, M46, N16, R47, etc.

Telegraph: (Rollinson's Telegraph, English Telegraph) 60 days. Smooth, glossy dark-green fruit, tapered to a distinct neck at the stem end; 15 to 18 inches long; thin, palatable skin; flesh solid, crisp, of excellent quality; black-spined. Vigorous, productive vine. Suitable for cold greenhouses, frames and outdoor trellis culture. Traditional English cultivar. Introduced prior to 1885. VILMORIN; D11M, D27, E75{PL}, F70, F92, I67M, L42, O89, S75M

Telegraph Improved: 62 days. Smooth, straight, dark-green fruit, distinctly tapered at the stem end; up to 18 inches long; flesh crisp, tender, mild, flavor excellent, very few seeds. Vigorous, high yielding vine; very reliable. Suitable for greenhouse, polytunnel or outdoor culture. Traditional English cultivar. Introduced about 1897. C85M, G53M, N84, R32, S55, S61

Uzbekski: 50-60 days. Light green-skinned fruits that turn golden russet-brown when mature. The sweet flesh remains crisp and tasty up to 60 days after harvest. Very prolific. Originally from Uzbekistan. A2, K46T

White Spine Improved: (Fordhook White Spine) 65 days. Uniform, straight, medium-green fruit; 7 to 8 inches long, 2 1/2 to 3 inches in diameter; tapered at the blossom end; flesh thick, seed mass moderately small; white-spined. Suitable for both slicing and pickling. Very productive. An old time favorite. H15P, M95M

White Wonder:<sup>2</sup> (Long White) 60 days. Medium oval, cylindrical fruit, rounded at the stem end; ivory-white at all stages of growth; 6 to 7 inches long, 2 1/4 to 2 1/2 inches in diameter; flesh nearly white, crisp, firm, very mild; black-spined. Used primarily for slicing, can also be pickled. Introduced in 1893 by W. Atlee Burpee Company. TAPLEY 1937; A2, B6, B73M, D11M, D26D, E97, F60, F70, G13M, K49M, K71, M65, PIG, TIM

Zeppelin: Extremely large fruit, 10 to 12 pounds or more. Has produced some of the largest cucumbers ever grown, including the world record of 13 pounds 10 3/4 ounces. Can be used when green, or after turning golden yellow. It remains firm and juicy and may be sliced thinly, diced or chopped. 181, K49M

**GREENHOUSE** Also called *European cucumber*, this is the type seen in stores individually wrapped in plastic. They cannot be grown outdoors as they are seedless and self-pollinating. Their culture is quite demanding, and requires exact feeding schedules to maintain deep green color. They are bitter free and easily digested. E13G{PR}, N40{PR}

*Hybrid*

Carmen: Straight, slightly ribbed, glossy dark-green fruit; 13 1/2 to 15 1/2 inches long; short necked; very good flavor and quality. Excellent shelf life Very prolific, all-female vine; resistant to scab and leaf spot, tolerant to downy mildew and powdery mildew. For heated and unheated culture in spring, summer and autumn. L42, L91M, M49, N84, RUM, S95M, TIM

Corona: Dark green, slightly ribbed fruit, 10 to 16 inches long; provides 3 or 4 days longer shelf life. Excellent for slicing. Slim, all-female vine is trimmed to an umbrella fashion; does not produce heavy foliage during the summer. Performs well in hot or cold weather. Strongly resistant to botrytis and mycosphaerella. Developed to withstand consistent cooler, 66° F. night temperatures. C20M, FI, F85G, K10, L42

Fembaby:<sup>4</sup> Dutch “mini” or “baby” greenhouse cucumber. Smooth, cylindrical, dark-green fruit; 8 to 10 inches long; short necked. All-female vine; sets fruit without pollination; resistant to scab, leaf spot, and plant bitterfree. Less demanding than other greenhouse types; suitable for greenhouse or windowsill culture. The result of 8 years of breeding. L91M

Holland: 60 days. High quality greenhouse forcing cucumber from the Netherlands. Slender, cylindrical fruits, 12 to 15 inches long; thin, dark-green skin, slightly ribbed; mild, crisp flesh. Completely bitter free and seedless. All-female plants, highly productive, resistant to scab and leaf spot. Does not require indoor culture unless seedless fruits are absolutely desired. A16, C20M, C85M, E53M, E91G, 139, K66, L79, M1P, M46

Petita:<sup>4</sup> 60 days. Easy to grow “mini cuke”. Has the high qualities of the extra-long European-style cucumbers, in the popular American size. Slightly ribbed, dark-green fruit; 7 to 8 inches long; tender, glossy skin; crisp, sweet flesh. Vigorous vine; highly productive over a long season; resistant to cucumber mosaic virus, race 1. N81, N84, R32, S55, S61

Superator: Medium length, straight fruit, 12 to 15 inches long; smooth dark green skin; excellent color and shape. Good shelf life. High yielding, all-female vine; produces well when night growing temperatures are reduced; easy to prune. Slight tolerance to powdery and downy mildews. Resistant to scab, leaf spot and plant bitterfree. L42, N84, RUM

**MIDDLE EASTERN** Also called *beit alpha cucumber*, this type is considered by many to be the most delicious salad cucumber. They are smooth-skinned, crisp, tender, bitter free, nearly spineless and require no peeling. Suitable for greenhouse, poly tunnel, and outdoor crops. DIT, K49M, 089

*Hybrid*

Amira: 62 days. Slightly tapered, bright green fruit; 6 to 6 1/2 inches long, 1 1/2 inches in diameter; tender, spineless, non-bitter skin; crisp, sweet, “burpless” flesh. Should be picked when 4 to 5 inches long for best quality. Excellent for slicing and pickling. Very prolific vine; resistant to cucumber mosaic, tolerant to downy and powdery mildews. B73M, C53, C85M, C92, D11M, D27, D65, D68, F70, G71, G87, H95, 139, 177, J20, L79, L89, M46, etc.

Aria: 52 days. Dark-green, cylindrical, slightly ribbed fruits; about 8 inches long; thin skin; tender, brittle, bitterfree, very sweet and delicious; quality excellent. Best when 4 or 5 inches long. All-female, parthenocarpic plants with multiple disease resistance. High early and total yields. Suitable for indoor or outdoor crops. G6, R47

Delila: Most popular gynocious hybrid of the Beit Alpha type. Dark green fruit; 6 1/2 to 7 1/2 inches long. Vigorous plant; early, with exceptionally high yields; resistant to cucumber mosaic virus and melon mosaic virus race 1. Suitable for all open field production seasons. Grown extensively in the Middle East. P75M, T27M

Jordan: 56 days. Straight, cylindrical, glossy green fruit; 6 1/2 to 7 inches long; smooth, non-bitter skin; crisp, easily digested flesh;

quality very high. Excellent for either slicing or pickling. High yielding, all-female vine; resistant to cucumber and melon mosaic viruses. C20M, C97, F60

Kidma: 59 days. Smooth, glossy, medium-green fruits; thin, tender skin. Crisp, juicy, very sweet flesh. Excellent for eating out of hand as a juicy thirst-quencher on hot summer days. Best harvested when 5 to 8 inches long. Strong plants, resistant to watermelon and cucumber mosaic viruses and powdery and downy mildew. C20M, D68, P75M

Sweet Alpee: 55 days. Extra-dark green Beit Alpha type with a small seed cavity and a nice, bitterfree flavor. Ideal for small scale production because it does not need a separate pollinator. Has an extended picking period but must be picked small, no larger than a pickle. Developed for outdoor and poly tunnel crops. Tolerant to scab and both mildews. C20M, G6, K16M, N84

Tenderfresh: 56 days. Straight, cylindrical, glossy green fruit; 6 1/2 inches long, 1 1/2 inches in diameter; smooth, non-bitter flesh; crisp, “burpless” flesh, very good flavor and quality. Excellent for home grown pickles at shorter lengths. Very prolific, gynocious vine; resistant to cucumber mosaic virus Very similar to Jordan. D82

*Open-Pollinated*

Amira II: 65-70 days. Intermediate in size between ordinary slicing cucumbers and pickling cucumbers. Thin, very smooth skin, does not require peeling. Sweet and juicy with a very fine, full flavor. Grows better in cool weather than most Middle Eastern types. E63D

Beit Alpha M.R.: 58 days. Straight, cylindrical, glossy medium-green fruit; tapered towards the blossom end; 6 1/2 to 7 inches long, 1 1/2 to 2 inches in diameter; tender skin, with fine black spines; crisp, sweet flesh. Excellent for slicing or pickling. Gynocious vine, entirely free of male blossoms; widely adapted; resistant to cucumber mosaic virus. B49, RUM

Muncher: (Burpless Muncher) 59 days. Attractive, smooth, medium-green fruit; 6 1/2 to 7 inches long, 2 inches in diameter; bitter free at all slicing stages. Excellent for slicing; can be pickled at smaller lengths. Vigorous, productive vine; resistant to cucumber mosaic virus. A25, B75M, F60, 164, PIG

Timor: (Tamra) 58 days. Uniform, slightly ribbed fruits, 4 to 7 inches long; extra thin, dark-green skin; firm, thick, juicy, very sweet. Predominantly female plants with multiple disease resistance. Vigorous and high yielding, suitable for all open field production seasons. Used by Middle Eastern villagers to quench the thirst on hot market days. C20M, K66, L91M, P75M

**ORIENTAL** These cultivars have been developed especially for their crispness. Most are very long and narrow and have numerous, long spines which can be easily brushed off. Some newer types produce straight fruit even if allowed to sprawl on the ground, older types should be trellised or the fruit will curve. E13G{PR}

*Hybrid*

Natsuhikari: (Tokyo Slicer) 35 days. Very smooth, dark-green fruit, 12 inches long and 1 1/2 inches in diameter; very low spined; of excellent quality. Very vigorous plant with numerous side branches, enabling a high yield over a long period. Good for sowing from spring to summer. Suitable for growing without support or trellis. C20M, D55, N84, Q11M, S63M, S70, S75M

Orient Express: 55-60 days. Long, slender fruits, 10 to 12 inches in length and 1 1/2 inches in diameter; extra thin, dark-green skin; very crisp and sweet, mild flavor, easy to digest. Ripens over a long season. Harvest every 2 to 3 days. Vigorous plant with wide disease tolerance; highly productive. Should be trellised to keep fruit straight. B6, B73M, B75, C53, D26D, F13, F63, G13M, G16, G83M, H49, H61, K10, K50, L42, L89, N16, etc.

Palace King: Slender, dark green fruit; 12 or more inches long, only 1 1/2 to 2 inches in diameter; thick, crisp flesh of fine flavor; white-spined. Provides thin-skinned fruit for salads or in mixed pickles. Vigorous, productive vine, produces over a long season; tolerant to powdery mildew. Needs to be trellised for straight fruit. B75

Palace Pride: Refined Suyo type. Moderately ribbed, dark green fruit; 10 to 12 inches long, 1 1/4 inches thick; high, white spines; small seed cavity. Crisp, sweet flesh. Excellent in salads. Also good for bread 'n butter pickles. Strong, vigorous, productive vines; suitable for trellising. B73M, G33

Silver Star: Slender, black-spined fruit; greenish-white, except at the stem end where it is darker green; firm flesh with excellent palatability. Best harvested when about 8 inches long. Primarily used for kimchee and pickling. Vigorous, high-yielding vine; female-node ratio about 72%. Suited for early spring growing in tunnels or greenhouses. C20M, Q3

#### *Open-Pollinated*

Aodai: (Japanese Climbing) 60 days. Straight, cylindrical, bright-green fruit; 9 to 10 inches long, 2 to 2 1/2 inches in diameter; spineless; very crisp, mild flesh. Vigorous, climbing vine; very hardy, also tolerant to heat; can be grown on poles, trellises, or without support. Main stem should be cut to encourage side-branching. R47

China Long: (Chinese Long Green) 70 days. Straight, slender, dark-green fruit; prominently ridged and warted; 15 to 20 inches long, 2 to 2 1/2 inches in diameter; firm, crisp, mild flesh, few seeds. Vigorous, high yielding vine; dependable and widely adapted; resistant to mosaic; requires support, or fruit may curve. Introduced in 1862. TAPLEY 1937; D27

Early Ochiai: Slender, dark green fruit; 7 to 8 inches long, 1 1/2 inches in diameter; high black spines; quality excellent. Usually harvested when about 6 inches in length. Well suited for forcing. High yielding in cooler areas. When unstaked, fruits coil into "serpent" form. A2

Heiwa Green Prolific: (Heiwa Prolific) 65 days. Straight, bright-green fruit; 9 to 10 inches long, 2 inches in diameter; "burpless", non-bitter. Insensitive to day-length; prolific even under tropical conditions. Can be grown without support outdoors, or trellised in a cold-frame. Very popular in Japan. K49T, L13M

Kyoto Three Feet: (Kyoto Yard Long) 62 days. Long, slender, light bright-green fruit; 24 to 30 inches in length, 1 1/2 inches in diameter; firm, crisp, mild flesh, small seed mass, confined to the blossom end, very good quality. Good for slicing and pickles. Requires trellising to produce the straightest fruit. For early summer planting. F80, K49M, L59, L91M

Sanjiaku Kiuri: Straight, slender, light-green fruit; 18 to 24 inches long; thin, smooth skin; crisp, mild flesh, very good flavor. Best quality is obtained when harvested at 18 inches in length or less. Excellent for slicing or pickles. Should be grown with support, otherwise the fruit may curve. G33

Suyo Long: (Soo Yoh) 65 days. Slender, deep-green fruit; 12 to 15 inches long; highly ribbed and spined; crisp, sweet, "burpless" flesh, few seeds, very high quality. Excellent for slicing and bread and butter pickles. Vigorous, productive vine; widely adapted; grows well in hot weather; resistant to powdery mildew; requires staking for best results. D55, D68, E24, G6, G33, J9M, J20, J73, K49M, L7M, L11, L59, L79G, Q34, R47, etc.

Tokiwa: (Tokyo Green) 35 days. Very deep green fruit, 12 inches long and 1 1/2 inches in diameter; low spined. Highly prolific vine; very well suited for growing without support or trellis. For sowing from spring through summer. D55, N84, S70

Yamato Extra Long: 65 days. Straight, slender, dark-green fruit with narrow yellow stripes; 18 to 24 inches long, 1 1/2 to 2 inches in

diameter; smooth skin; firm, crisp, mild flesh, few seeds, very good flavor. Excellent for slicing. Should be trellised for best results. C20M, D74B, 139, L7M, Q11M, R32, S55

#### CODES FOR SPECIAL TYPES

1. Round
2. White-Skinned
3. Short-Vined
4. Mini or Baby

## CURRENT{GR}

### RIBES SPP.

---

#### BLACK CURRANTS (*R. nigrum*)

Baldwin: Medium to large fruit; skin fairly thick and tough; flesh juicy, subacid, very rich in vitamin C; ripens evenly and hangs well on the bush. Medium-sized bush; suitable for small gardens; susceptible to leaf spot and mildew diseases. Main commercial cultivar in England, where it has been cultivated for over 100 years. SIMMONS 1978; D47, N24M, 081

Ben Lomond: Vigorous, upright bush, free of foliage damaging insects. Flowers almost 3 weeks later than Baldwin but fruits at the same time. One of the highest producing black currants and also one of the least prone to mildew. Developed at the Scottish Horticultural Research Institute. D47, NO, 081, R83

Ben Nevis: Large-fruited black currant with good frost tolerance. Large fruits with intensely colored juice and good color stability. Vigorous plant, somewhat taller than Ben Lomond. Resistant to leaf spot; some resistance to American gooseberry mildew. Susceptible to gall mite. High chilling requirement. Originated in Scotland. D47,174, NO, 081

Ben Sarek: Large, black fruit of good quality. Small, compact bush, highly productive. Can be planted at 4 foot x 5 foot spacing, yet bears as heavily as full-sized bushes. Resistant to frost and mildew. Developed at the Scottish Horticultural Research Institute. D47, F87, J61M, NO, 081, R83

Black September: A late-ripening cultivar with very large, firm fruit that has a mild flavor and aroma typical of black currants. Ripens unevenly. Makes excellent jam, preserves and jelly. Upright bush; very hardy and disease resistant. D47,149P, I66T, 174, NO

Blackdown: (Baldwin x Brodtop) Large, jet-black berries, very juicy and flavorful with a distinctive musky taste. Excellent in jams, jellies and juice. Vigorous bush with an upright growth habit. Resistant to white pine blister rust and mildew. Originated in Great Britain. D47,149M, 149P, 174, NO

Blacksmith: Basal berry large, graduating to a small berry at the end of the strig; skin thin and tender; flesh juicy, subacid, somewhat sweet when fully ripe; ripens in midseason, hangs well on the bush. Bush large to very large, spreading; bears a good crop even on light soil. Very easy to pick. Introduced in 1916. SIMMONS 1978; D47, N24M

Boskoop Giant: (Boskoop) Fruit large to very large, but smaller at the end of the strig; skin thin and tender; flesh juicy, rich, subacid, sweetish when fully ripe; ripens early and fairly evenly; does not hang very well. Bush vigorous; production fair to heavy; usually 1 sprig of berries to a spur; strig long and drooping and easy to pick. Raised at Boskoop, Netherlands, before 1895. HEDRICK 1925, SIMMONS 1978; A65, B47, D11M, D47, F70, G50, G54, H42, 174, J89M, NO, R83

Brodtop: Large, sweet fruit with a mild flavor. One of the best black currants for drying into raisin-like fruits. Can either be left to dry on the bush or harvested and dried. Excellent for adding a

distinctive flavor to desserts and other dishes. Lew, spreading bush, disease resistant. Originated in Scandinavia. D47,174, J61M, NO

**Champion:** Fruit small to large, round; skin medium in thickness and toughness; skin color dull black; flesh yellowish, firm, not very juicy; flavor sprightly, becoming nearly sweet; quality good to very good; ripens late and unevenly. Bush large; vigorous; upright-spreading. Originated in England; introduced to the United States prior to 1897. HEDRICK 1925; D47, NO

**Climax:** Large, black fruit; skin relatively thick; flavor briskly subacid; quality good; ripens in mid-season. Bush vigorous and productive; bunches large. Originated by William Saunders, London, Ontario, Canada about 1887, from a seedling of Naples. HEDRICK 1925; N24M

**Consort:** (R. ussuriense x) Medium to large fruit, 1/2 to 3/4 inch in diameter; skin bluish-black; flesh somewhat soft; flavor strong; ripens late July; clusters medium long. Bush resistant to white pine blister rust; self-fruitful, not requiring insect pollination; vigorous and productive; upright. Originated in Ottawa, Ontario, Canada. Introduced in 1952. BROOKS 1972; A91, B43M, C34, C58, D37, D47, G50, H65, J29, L27M, M81M, NO, N24M

**Coronet:** (R. ussuriense x) Medium-sized, black fruit; resembles standard black currant cultivars. Bush immune from rust. Originated in Ottawa, Ontario, Canada by Canada Department of Agriculture Research Station. Introduced in 1948. BROOKS 1972; D47

**Crusader:** (R. ussuriense x) Fruit large; skin black; resembles standard black currant cultivars; ripens later than Consort. Reported to have poor fruit set when planted alone. Most valuable characteristic of the bush is its immunity from rust. Originated in Ottawa, Ontario, Canada. Introduced in 1948. BROOKS 1972; A74, A91, D47, F87, J61M, NO

**Green's Black:** Medium to medium large fruit; skin thick and fairly tough; flavor subacid. Ripens second early to midseason, being ready for harvest just before Wellington. Bush moderately vigorous, very heavy bearing; benefits from cross-pollination; flowers partly resistant to frost damage. Usually 2 or 3 fairly short strigs to a spur. SIMMONS 1978; D47

**Jet:** (Mailing Jet) Small fruits borne in long clusters, mostly bland in flavor; matures very late, one of the latest. Bush very prolific; flowers late and thus avoids early frost damage. Ideal for U-Pick operations. Highly regarded in Great Britain where it originated. D47, R83

**Laxton's Giant:** Very large fruit, excellent for exhibition; skin thin and tender; flesh juicy, somewhat sweet when fully ripe, quality very good; ripens early and fairly evenly. Bush vigorous, spreading, resistant to disease and frost, bears heavily. Usually 1 or 2 strigs to a spur. Strigs fairly long, easily picked. Originated in England. Introduced in 1946. SIMMONS 1978; D47, NO

**Mendip Cross:** Medium-sized fruit; skin thin and tender; flavor subacid to sweet when fully ripe; ripens early July. Unpopular commercially because it ripens unevenly and the overripe berries soon become squasy. Bush medium-sized; spreading; sensitive to poor drainage conditions. Usually 1 or 2 long strigs to a spur. SIMMONS 1978; D47, L12, NO

**Silver Gieter:** (Silvergieters Zwarte) Fruit large; skin thick and tough; flesh juicy; flavor subacid; quality very good; ripens in early mid-season. Very tall, vigorous bush; production fairly good; strigs long and easily picked. Originated in the Netherlands. SIMMONS 1978; D47, L12, NO, N24M

**Strata:** Large, roundish fruit; skin purple-black, glossy, very attractive, resembles that of an eggplant; flavor very sweet for a black currant, quality excellent. Bush vigorous and productive, low-spreading. D47,174, NO

**Wellington XXX:** Medium to large fruit; skin thick but tender; flavor subacid, somewhat sweet when fully ripe; ripens early mid-

season. Berries do not hang well on the bush and often split. Bush large; very vigorous and productive; spreading; strigs usually 1 or 2 to a spur. Popular commercial cultivar in Kent, England. SIMMONS 1978; D47, NO, P59M, R83

**Willoughby:** Fruit medium to large; skin black; flesh juicy; quality good; clusters large. Bush highly resistant to mildew and white pine blister rust; self-fruitful; very hardy; productive; more spreading than Consort. Originated in Parkside, Saskatchewan, Canada by Walter Willoughby Sr. Introduced in 1953 by Honey wood Lilies & Nursery. BROOKS 1972; A16, B47, D47, F67,174, J89M, L12, NO, N24M

## PINK CURRANTS

**Couleur de Chair:** (Champagne) Bunches medium in length, loose; berries large, pale pink, rather acid; ripens late. Esteemed in France for makiqg jelly. Bush vigorous, productive. Probably a cross between the common red and the common white currant. Introduced prior to 1778. HEDRICK 1925; U7D{SC}, Y83{SC}

**Gloire de Sablons:** Fruit small; skin white, striped with red; flavor acid; quality considered poor; bunches short, small. Bush upright; vigorous; moderately productive. Introduced prior to 1858. HEDRICK 1925; U7D{SC}, Y83{SC}

**Rosa Hollandische:** Reddish-pink, relatively smooth and glossy fruit; quality fair to good. Vigorous, upright-spreading plant, free of thorns; moderately productive; easy to harvest. Originated in Europe. ANONYMOUS 1990; U7D{SC}, Y83{SC}

**Tinka:** Medium to large, rose pink fruit; sweet flesh, contains a higher percentage of sugar than that of other pink currants. Recently introduced into the United States from Germany. D47

## RED CURRANTS

**Cascade:** Large fruit, larger than Red Lake, sweeter than most; matures 1 week earlier than Red Lake; clusters not as long as those of Red Lake. Moderately vigorous, upright bush; productive; somewhat susceptible to leaf spot. Originated in Excelsior, Minnesota. Introduced in 1942. 174, NO

**Cherry:** (Cherry Red) Fruit large, not very uniform, round; skin thin, smooth, tough; skin color bright but dark red; flesh very juicy, firm; flavor pleasant, acid or mildly subacid; quality good; ripens early. Bush medium to large; vigorous; upright when young, becoming more spreading with age; resistant to mildew. Short strigs make picking difficult. Known prior to 1840. HEDRICK 1925; A91, B47, C34, D37, F16, F53M, H49,149M, I49P, I66T, 174, M81M, NO, N24M

**Jonkheer van Tets:** (Von Tets) Medium to large fruit; deep-red in color; flavor subacid; quality very good; ripens early, late June to early July. Bush fairly upright; very productive; mildew and aphid resistant. Strigs of medium length. Seedling of Fay's Prolific; originated in the Netherlands. SIMMONS 1978; B74, D47, F16, F87,174, J61M, L12, NO, 081

**Laxton's No. 1:** Medium-sized fruit; skin very bright red; flesh juicy, seeds small; ripens in midseason, about the middle of July. Strong vigorous bush, upright to spreading; a heavy and consistent bearer. Berries thickly bunched on strigs of medium length. SIMMONS 1978; D47, L12, 081, R83

**Mailing Redstart:** (Redstart) Medium to large fruit; has a stronger flavor and greater acidity than Red Lake; quality very good; ripens late, about 2 weeks after Red Lake. Bush moderately vigorous and upright, a consistent and heavy bearer. Strigs long, with up to 2 secondary trusses. D47, F16, J61M, 081

**Perfection:** Uniformly large fruits, roundish or slightly oblate; skin smooth, thin but tough; skin color medium to dark red; flesh juicy, tender; flavor sprightly subacid becoming mild when fully ripe; quality very good; ripens early mid-season. Bush large, vigorous;

upright-spreading; productive. Originated in Rochester, Nov York by C.G. Hooker in 1887. HEDRICK 1925; C61, D76, G43, N24M

Red Lake: Fruit large, borne on long stems; skin tough, bright-red; flesh juicy; seeds fairly large but quality equal to that of Perfection; excellent for jelly; ripens late; clusters long, well filled. Bush upright; vigorous; superior to Perfection. Originated in Excelsior, Minnesota by W.H. Alderman. Introduced in 1933. BROOKS 1972, SIMMONS 1978; A16, B43M, B73M, C61, E38, G16, G54, G71, I78, K64, M65M, NO

Rotet: Large, medium to dark-red fruits with very good flavor; quality excellent. Ripens mid-season to late, about 2 to 3 weeks after Jonkheer van Tets. Strong, erect growth habit; long trusses. Attractive, luxurious foliage, suitable for landscape plantings. Very high yields. Resistant to mildew and leaf spot. Suitable for fresh markets, commercial processing and home gardens. Originated in Holland. L12, P68M

Rovada: Large to very large, dark-red fruits; quality excellent. Ripens late, 3 to 4 weeks after Jonkheer van Tets. Strong, erect growth habit; very long trusses. Attractive, luxurious foliage, suitable for edible landscaping. Very high yields. Resistant to mildew and leaf spot. Originated in Holland. The main variety used for commercial production in Central Europe. L12, P68M

Versailles: (Red Versailles) Large, juicy, dark-red fruit; ripens in midseason, about the second week in July. Vigorous, upright bush, fairly productive; blooms early; medium length strigs with loosely hanging berries. Originated in Versailles, France around 1835. SIMMONS 1978; L12

Wilder: Medium to large, roundish oblate fruit; skin smooth, thin, tender; skin color dark-red; flesh firm, juicy; flavor pleasantly subacid; quality good; ripens late mid-season to late; hangs on a long time after ripening. Bush large; vigorous; upright to slightly spreading; very productive. Originated in Irvington, Indiana ty E.Y. Teas about 1877. HEDRICK 1925; A91, B19, B47, C45M, C54, C61, E97, F43M, LI, M81M

#### WHITE CURRANTS (*R. sativum*)

Bar-le-Duc a Fruits Blanc: A white currant used in the preparation of the famous seedless currant jelly made only in Bar-le-Duc, France, since 1559. In the preparation of this gourmet delicacy a goose feather is used to gently pick out the currant seeds one by one without damaging the berries. HENDRICKSON; U7D{SC}

Bianca: Large to very large fruit with an exceptionally high sugar content. Has good shelf life. Vigorous and productive, averaging 30 pounds of fruit per bush. Blooms late, avoiding spring frosts. Self pollinating. Relatively new cultivar that originated in Sweden. D37, D47, F16, NO, P68M

White Dutch: Medium-sized, milky yellow fruit; flesh juicy, fairly sweet when fully ripe; ripens in midseason, about the second week of July. Bush moderately vigorous, upright to spreading, fairly productive. Strigs of medium length. One of the oldest white currant cultivars. SIMMONS 1978; D47, L12

White Grape: Medium to large, round ovate fruit; skin smooth, thin, tender; color clear translucent yellowish-white; flesh firm, juicy; flavor pleasantly subacid; quality good; ripens mid-season. Bush of medium size and vigor; spreading, sometimes sprawling; productive. Strigs difficult to pick without crushing some berries. HEDRICK 1925, SIMMONS 1978; A16, D47, R83

White Imperial: Medium to large, rounded fruit; skin smooth, thin, tender; color creamy white, a shade darker than White Grape; flesh firm, juicy; flavor pleasantly subacid to rich and sweet; quality very good to best; ripens mid-season. Large, dark-colored seeds show through flesh and skin. Bush above medium in size and vigor; broad, spreading; productive. HEDRICK 1925; B74, D47, F87, I49M, I74, J61M, L12, NO

White Jiiterboig: (Weisse aus Jiiterborg) (*R. petraeum*) Medium to small, white fruit of good quality. Bush not a heavy bearer. An old European heritage cultivar that still has merit. D47

White Pearl: Large, pale-yellow fruit; flavor briskly subacid; quality good; bunches large, well filled; ripens mid-season. Bush moderately vigorous; upright-spreading; unproductive. Originated in Brussels, Belgium prior to 1875. HEDRICK 1925; A65, D47, G50, H85, I66T, L12, N24M

White Versailles: Large, light yellow fruit; juicy sweet flesh; ripens early, about the beginning of July. Bush fairly strong, vigorous, upright; very heavy bearing. Strigs of medium length. SIMMONS 1978; D47, L12, 081, P59M, P68M

## DATE {DF}

### PHOENIX DACTYLIFERA

Abbada: Attractive, glossy black fruit with frost-like bloom; 2 inches long, 3/4 of an inch wide; cures to black with a purple glume; flesh not thick, soft, melting. Novelty because of its black appearance in variety packs. Early to midseason ripening. Originated in Brawley, California. C34M

Amir Hajj: Rare, high quality date that originated in the Mandali oasis of Iraq. Medium-large, deep, rich orange-brown fruits, unusually translucent. Excellent chewy, caramel-like texture and very pleasant, delicious flavor, rich and sweet but not cloying or overly strong. Tree a shy bearer. Amir Hajj means Commander of the Pilgrimage Caravan, so named because the owner of the original tree reportedly held this important position. POPENOE, P.; EI 1M

Asharasi: Medium to medium-large? fruits; skin dry, thin and tender, coarsely crinkled and folded; flesh hard, opaque, creamy white, changing to translucent brownish amber at tip, with a softer consistency; flavor excellent, rich, sweet and nutty. Well adapted to California conditions. One of the best dry dates in the world. POPENOE, P.; U7Z{PL}

Barhi: (Barhee, Honey Ball) Small to medium fruit; amber when ripening, deep golden brown when cured; flesh firm but very tender, very syrupy, rich yet not heavy or cloying; relatively little astringency in khalal stage for fresh consumption; highest sugar content—2% invert sugar. Late ripening. Moderate damage by rain and humidity. Fresh fruit widely available in Middle Eastern stores sold as *khalal dates*. Frozen fruit is said to taste like caramel candy. Originated in Iraq. C34M, C87M, E11M, E97P, 159, I83M{PL}, L15M

Blond Beauty: Semi-dry type. Large, oblong-elliptical fruit; skin tender, yellow when immature, amber to reddish-brown after ripening; soft, melting flesh, medium-sweet; pleasant, taffy-like flavor; ripens in midseason. Moderately vigorous tree, somewhat resistant to checking. Seedling of Deglet Noor. Originated in Indio, California between 1911 and 1917. Further developed by E.F. Shields. BROOKS 1997; K68

Brunette Beauty: Semi-dry type. Medium-sized, oblong-elliptical fruit; skin moderately tough, red when immature, nearly black after ripening; soft, very sweet flesh; flavor good; ripens late. Moderately vigorous tree with a thin trunk. Seedling of Deglet Noor. Originated in Indio, California between 1911 and 1917. Further developed by E.F. Shields. BROOKS 1997; K68

Dayri: (Dairee, Dairi) Fruit medium to large, oblong to oblong-elliptical; skin red when immature, brown to black when soft and ripe; flesh soft, amber, texture good, semitranslucent; flavor good, with a heavy sweetness. Ripens in midseason; ripens well in high humidity and extreme heat. Apparently best adapted to heavy soils. Originated in Iraq. BROOKS 1972; I83M{PL}, L15M, L53

Deglet Noor: (Date of the Light) Medium to large fruit; semi-dry; amber on ripening, deeper brown when cured; flesh deep golden brown, conspicuously translucent; flavor delicate, mild, very sweet, distinctive. Susceptible to rain and high humidity. Late ripening, requires a large amount of heat to mature properly. Originated in the Saharan oasis of Balad al Ahmar more than 375 years ago. A13M, A86, C34M, C81, C87M, E11M, E31, E97P, F97M, G3Z, G44M, I59, K68, L15M, L97G, M63M, etc.

Empress: Large, dry type date. Skin medium thick, amber to medium brown when ripe; flesh medium soft; flavor rich; quality very good; ripens in midseason. Moderately vigorous tree with good productivity. Seedling of Thoory first planted in 1916. Originated in Cathedral City, California by Everett K. Da Vail. BROOKS 1997; C81, E47M, F97M

Halawi: (The Sweet) Fruit medium large; translucent bright golden brown; skin thin, tender, adheres closely to the flesh; flesh firm but tender, often more like a soft date than a dry date; flavor sweet and honey-like, but not rich; good keeping qualities. Midseason ripening. Originated in Algeria. POPENOE, P.; A13M, C34M, C87M, E11M, E47M, F97M, L15M, L53

Honey: Medium-sized, semi-dry type. Skin medium thick, reddish-brown when ripe; soft, melting flesh with a mild and pleasant flavor. Ripens over a long period. Moderately vigorous tree. Seedling of Deglet Noor discovered in 1916 or 1917. Originated in Cathedral City, California by Eveiett K. DaVall. BROOKS 1997; A86, C34M, C81, E47M, E97P, G3Z, F97M

Khadrawi: (The Verdant) Medium to large fruit, oblong to oblong-elliptical; translucent orange-brown to light brown in color; skin firm, medium thick, fairly tough; flesh thick, firm and meaty, translucent orange-brown; flavor rich and extremely pleasant, never cloying the palate, even if eaten in quantity every day. Ripens in midseason. Originated in Iraq. POPENOE, P.; A13M, C34M, C87M, E11M, E47M, E97P, F97M, G3Z, L15M, L53

Khalasa: (Quintessence) Medium-sized, oblong fruit; satiiy, very translucent, light orange-brown skin; flesh firm but tender, caramel-like in consistency, entirely free of fiber; flavor delicate, but deliciously bringing out the characteristic date taste. Makes excellent date paste. Originated near Hofuf, Saudi Arabia. One of the most famous dates of the Persian Gulf region. POPENOE, R; U7Z{PL}

Khisab: (The Abundant Producer) A fresh fruit date, rarely cured. Medium sized, broadly oval fruit; deep amber when ripe; skin moderately thick, tough, coarsely wrinkled; flesh tender, deep amber, 1/2 inch thick, quality fair. Produces fresh fruit later than all other cultivars. Originated in Oman. I83M{PL}

Kustawi: (The Date of the Grandees) Medium-sized, oblong-oval fruit; translucent orange-brown to bright brown skin; translucent golden brown flesh with a pronounced caramel-like consistency; unusually rich and sweet flavor, yet not cloying; quality excellent. Ripens fairly early, the first half of September. Originated in Iraq. POPENOE, R; G3Z

Maktum: (The Bitten) Medium-large to large fruit; skin deeply wrinkled, occasionally forming folds and blisters; translucent, light golden-brown flesh, very soft and delicate, almost melting in the mouth; flavor very mild and pleasant; quality superior. Ripens somewhat later than Halawi. Does well in both California and Arizona. POPENOE, R; U7T{PL}

Medjool: Large to very large fruit; amber when ripening, reddish brown when cured; flesh soft, rich and delicious, firmer than Barhi, with high invert sugar; needs thinning for largest size and uniformity. Early ripening. Only slightly damaged by occasional rains and high humidity; susceptible to bayoud (fusarium) disease. Originated in Bou Denib, Morocco. Popular for gift baskets. A13M, A25G, A86{PD}, C34M, C87M, D3M, E1G, E11M, E31, E97P, F97M, G3Z, G92, I59, I83M{PL}, L15M, L53, M63M, N84{S}, P5{S}, etc.

Sphinx: (Black Sphinx) Large, oblong fruit, 1 3/4 inch by 1 inch; skin brownish-black, thin and delicate; flesh amber, soft and melting, slightly syrupy; flavor excellent, mild and pleasant, not cloying; ripens midseason to late. Tree vigorous; very productive, yielding 250-330 pounds of fruit annually. Originated in Phoenix, Arizona. Introduced about 1925. BROOKS 1972; C87M, L15M

Thoory: (The Bull's Date) Medium to large, oblong fruit; ripens and cures to light grayish-brown to straw color; flesh golden brown, thick, firm and nearly dry but not hard or brittle; flavor sweet, nutty, and delicate; does not deteriorate even if kept for a year or more. Sometimes known as the *bread date*. Late ripening. Bears heavily, with clusters of exceptional size. Originated in Algeria. 159

Zahidi: Fruit medium sized; surface smooth, glossy, attractive; skin rather thick; flesh translucent golden-yellow close to the skin, whitish near the seed, soft, meaty and full of syrup; flavor sweet, sugary, and not cloying; can be used either as a dry date or a soft date. Much used in the manufacture of *arrak*. One of the earliest dates to mature. Originated in Iraq. POPENOE, R; A13M, C34M, C87M, E11M, E47M, F97M, G3Z, I59, I83M{PL}, L15M, L53

## EGGPLANT {S}

SOLANUM AETHIOPICUM SOLANUM MACROCARPON  
SOLANUM MELONGENA

### GREEN-SKINNED

#### HYBRID

Harabegan: Very attractive, elongated fruits, usually somewhat curved; glossy, bright olive skin; firm white flesh with few seeds. Does not become mushy when boiled. Erect plant, bears fruit in bunches. Flowering begins 55 to 60 days after transplanting. Fruits are harvested at 5 to 6 day intervals. Originated in India. N16

#### OPEN-POLLINATED

Applegreen: 62 days. Small to medium-sized, egg-shaped fruit, averaging 4 ounces in weight; light-green skin, does not need peeling; mild, non-acid white flesh. Productive, upright plant, sets fruit under adverse northern conditions. Developed at the New Hampshire A.E.S. in 1964. K20M, L7M

Louisiana Green Oval: 90 days. Large, round oval fruit, attains a weight of 2 to 4 pounds; resembles Black Beauty, but larger; glistening, light-green skin; quality excellent, flavor mild; seed cavity confined to the blossom end. Best harvested while skin is still glossy. Sturdy, upright plant; height 2 to 3 feet; holds fruit well off the ground. F73D

Louisiana Long Green:<sup>1</sup> (Green Banana) 100 days. Long, well-shaped fruit; 8 inches in length, 3 inches in diameter; skin green with dark-green stripes; quality excellent. Similar to Louisiana Green Oval, except for the longer shape: Very prolific plant; height 3 feet. Highly recommended for roadside markets. F73D, I18M, I77, L7M

Thai: (Thai Round Green, Green Tomato) 80 days. Small, round fruits, 1 to 2 inches in diameter; borne in clusters; skin green and white, turning gold on full maturity. May be seedy or even bitter, but provides authentic fruits for Southeast Asian cuisine. Excellent for pickling, stuffing and stir-frying. Tall, bushy plants; height 3 feet; some may have thorns. B60M{PR}, C20M, D55, E13G{PR}, N84

Thai Green: (Thai Long Green, Elephant Tusk) 90 days. Long, slender, cylindrical fruit; 12 to 14 inches in length, 1 1/2 to 2 inches in diameter; skin light-green, thin, attractive; flesh tender, flavor very mild. Vigorous and prolific plant. Heirloom from Thailand. C20M, D55, F73D, J9M, L7M, N84, O53

## PURPLE/PINK-SKINNED

## HYBRID

Baby Bell:<sup>2 3</sup> (Bambino) 55 days. Tiny, oval fruit; 2 inches deep and 1 1/2 inches wide; glossy jet black skin; purple calyx. Dwarf, bushy plants, 10 to 12 inches tall; produce about 6 fruits per plant. Ideal for pots, beds or borders. Unusual "baby vegetable" becoming very popular with the salad bar trade. C92, DI 1M, F13, F70, G71, G82, H95,139,177,191, J97M, K57{PL}, L42, L89, L91M, M46, Q34, etc.

Classic: 76 days. Recommended where a longer, slimmer fruit shape is preferred. Rich, glossy purple-black color that holds well after picking. Its tapered shape is uniform in all sizes. Vigorous, erect plant; bears abundantly; stands up to stress better than most. A87M, C20M, F13, G1M, H61, H85M, N52

Dusky: 63 days. Medium-sized, long oval fruit, 8 inches in length and 3 1/2 inches in diameter; glossy, purplish-black skin; firm flesh of quality good; ripens extremely early; packs and ships well. Very uniform color and shape. Upright plant; height 2 to 3 feet; high-yielding; resistant to tobacco mosaic virus. Recommended for commercial growers and home gardeners. A16, C44, D11M, E75{PL}, F1, F70, G71, G79, H33M, H85M, 139,164, J14{PL}, K73, L89, etc.

Haguro Hitokuchimaru:<sup>2</sup> 35-40 days. A genetically small eggplant. Highly prolific; produces dozens of very small, oval fruits the size of large pecans. Very dark purple, glossy skin. The calyx and stem are deep purple as well. Good for pickles; suitable for processing. Compact, semi-upright plant; tolerant to heat and dry conditions. Q28

Ichiban: 58 days. Hybrid oriental type. Long, slender, cylindrical fruit; 10 inches in length, 2 inches in diameter, slightly tapered towards the blossom end; skin dark purple, glossy; flesh soft, slow to develop seeds, quality and flavor good. Tall, upright plant; height 36 to 40 inches; highly productive. For local markets and home gardens. C20M, D11M, F70, H33M, H61, H95,139,191, J20, J84, M29, N52

Little Fingers:<sup>2</sup> 68 days Very early oriental type used for "baby" eggplants. Can be picked when 3 to 7 inches long and 3/4 to 1 1/4 inches in diameter. Long, slim, cylindrical fruit; attractive, glossy, dark-purple skin; quality high; spineless. Vigorous plant; bears fruit in clusters of 5 to 10; continues to produce over a long season. C20M, D68, F13, G13M, I18M, I18M{PL}, 177, K57{PL}, K66

Neon: 68 days. Unique rose-colored eggplant. Medium to long fruits, 6 to 8 inches in length and 3 inches across at the bottom, tapered slightly at the calyx end; attractive, rose-lavender skin; tender, pure white flesh with very few seeds, free of bitterness. Recommended for Asian markets and the salad bar trade Very popular in the Caribbean. B8M, C53, D11M, D26D, D26G, E75{PL}, F70, G6,118M, 177, K10, K50, K57{PL}, K60M, N84, etc.

Pink Bride:<sup>1</sup> (Asian Bride) Fruit slender and straight, 7 to 8 1/2 inches long and 2 1/2 inches in diameter; weight 3 to 4 ounces; skin pink-violet with white stripes; green calyx; flesh white, tender, of good quality. Similar to Pinky, but long. Small, compact plant; strong-growing and well-branched; bears 2 to 3 fruit on each cluster. C20M, J20, K10, K66, L42, L89, Q34, Q39

Short Tom:<sup>2</sup> 75 days. Small fruit, only 3 to 5 inches long and 1 inch in diameter; shiny black skin, thin and tender; excellent eating quality, can be picked when young or left to grow larger. Vigorous plant; sets fruit prolifically. Bred for extremely early harvest at the sacrifice of fruit size. Suitable for container culture. L89, N52, S55

Vittoria: 61 days. High quality Italian type eggplant. Long, cylindrical fruits, about 9 inches long and 2 1/2 inches in diameter; attractive, deep purple skin; green calyx; firm, mild flesh. Perfect size and shape for slicing. Vigorous, high yielding plant, 3 feet tall.

Resistant to tobacco mosaic virus. B8M, B75, B75{PL}, E53M, G71,164,167M, 191, K10, L7M, L42, M46

## open-pollinated

Black Beauty: 80 days. Large, round oval fruit, 4 to 6 inches long; skin purplish-black, smooth, glossy; calyx bright green; good quality and flavor; holds color and quality well after being picked. Medium-tall plant; bears 4 to 6 fruit held well off the ground; widely adapted. Popular with home gardeners and commercial growers. Introduced about 1910. B75M, B78, C44, G79, H33M, H61, 164, 184, K23{PL}, K49T, K73, L7M, N16, R47

Chinese Long: (Chinese Long Sword) 75 days. Unusual long, thin fruit; 10 to 12 inches in length, 1 1/2 to 2 inches in diameter; tapers to a sword-like point; skin purple, thin; flesh white, very tender, of good flavor. Robust, heavy-yielding plant; tolerant to diseases. C20M, G33

Dark Long Red: Long, narrow, reddish-purple fruits, 7 to 13 inches in length. Very attractive plant, can tolerate cold and grows better in partial shade than full sun. A valuable type when attempting to grow eggplants in regions colder than Zone 6. A popular favorite in Malaysia. D29P, F73D, J73

De Barbentane: 70 days. A French heirloom, has been grown in the south of France since the 19th century. Long, cylindrical fruit; skin purplish-black, glossy; flavor good. Sturdy vigorous plant; not highly productive, but hardy. Traditionally used for *ratatouille*, a stew of eggplant, tomato and green pepper. D74B, G68, K49M, P59M

Early Black Egg: 70 days. Small, pear-shaped, slightly blocky fruit; 5 to 6 inches long; skin purple; flesh unusually tender and flavorful. Bushy, purple-tinted plant; height 2 feet; sets well in cool, short season areas. Should be picked when young for best quality and to encourage continuous fruit setting. E24, J9M, L7M

Early Long Purple: 75 days. Long, slender fruit, about 12 inches long and 3 to 4 inches in diameter; skin dark violet; flavor very good; ideal for slicing. Bushy, prolific plant; height 24 to 38 inches. Mediterranean type, similar to *Violette Longue*. Introduced prior to 1885. VILMORIN; C44, D74B, C69, F80, K49M, K73, L77D, PIG

Florida Market: Very large, oval fruit, 9 inches long and 6 1/2 inches in diameter; skin dark-purple, smooth, glossy; calyx green; resistant to fruit rot. Vigorous, upright plant; height 30 to 36 inches; holds fruit well off the ground; productive over a long harvesting season. Grown widely in Florida for the fresh market. A87M, C20M, F80, G1M, G27M, H54, H61,184, K49M

Improved Muktakeshi: Oblong, deep-purple fruit; very thin skin; extremely palatable flesh with very few seeds; quality excellent. An improved strain of a traditional Indian cultivar; developed by Sutton & Sons, India. Popular in the state of Bihar. S59M

Italian Pink Bicolor:<sup>1</sup> 75 days. Large, bell-shaped fruit; skin creamy white overlaid with rose-pink vertical stripes. Tender, sweet flesh. A popular novelty with the European trade. An open-pollinated cultivar with a percentage of off types. A2, D11M{PL}, F70{PL}, , I99M, K49T, L42

Japanese Pickling: 75 days. Long, thin, uniquely shaped fruits; 6 to 8 inches in length; very long, wavy stems; thin, deep purple skin; tender flesh, sweet and mild. Excellent for pickling. Extremely productive plant, about 18 inches tall. Has traditionally won first prize at several county fairs. Heirloom from the early 1900's. K23{PL}, K49T

Kurume Long: (Kurume Long Purple) Long, slender fruit; 12 inches in length, 2 inches in diameter; skin purplish-black, attractive, glossy; flavor excellent. Resistant to fusarium wilt. A standard long purple type from Japan. Does well in warm areas. A79M, C20M, D55, G33, H49, J82, K71, L79G, N84, S63M

Listada de Gandia:<sup>1</sup> 75 days. Fruit egg-shaped, 5 to 6 inches long; skin very attractive, purple with irregular white stripes; calyx green, somewhat spiny; mild-flavored, snow-white flesh, of fine texture. Compact, productive plant; height 2 feet; somewhat drought tolerant; sets fruit well during high temperatures. C95, F73D, K20M, K49Z, L7M

Morden Midget:<sup>3</sup> 65 days. Very early cultivar that produces full-sized fruit on dwarf plants. Medium-sized, oval fruit; purple skin; good flavor. Small, sturdy plant. Most reliable eggplant for far northern gardens. Developed at the Morden Research Station, Morden, Manitoba, Canada. J9M, J20, K20M, L79, M27

Pallida Romanesca:<sup>1</sup> (Pale Roman) Large, broad, oval fruit, sometimes ribbed; skin white blushed with lavender-purple; flesh meaty, mild-flavored. Compact plants. Grown for market in Rome. G53M, S17

Pingtung Long: 65 days. Long, slender fruits, 10 to 11 inches in length and 1 1/2 inches in diameter; attractive, dark purple skin; pure, bright white flesh. Very vigorous and hardy plant, highly productive, resistant to many diseases. Tolerant of extreme heat and wet conditions. Very popular in Taiwan. A2, C20M, D55, D68, F73D, I18M, 177, 191, J20, L11, N84, Q39, S70

Pingtung Long Improved: (Pingtung Extra Long) Light-purple fruits, 11 to 12 inches long, 1 to 2 inches in diameter. Excellent for slicing and pickling. Plants more upright than some of the other eggplants; very early and very productive, producing up to 20 fruits per plant; resistant to extreme heat and humidity. Improved strain of a traditional Taiwanese cultivar. F80, J73, L59

Pusa Purple Cluster: 75 days. A small-fruited cultivar with fruits of a deep-purple color, borne in clusters of 4 to 6; weight about 21 grams. Tall, erect, purplish plants; often produce up to 50 fruits per plant. Resistant to bacterial wilt and little leaf disease. Developed at IARI, New Delhi, India. BOSE 1993; Q45M, R50, S59M

Pusa Purple Long: 60 days. A greatly improved extra early strain from India. An excellent producer of tender, thick, glossy deep-purple fruits, about 12 inches long. Semi-erect plants. Suitable for spring and autumn seasons. Developed at the Indian Agricultural Research Institute, New Delhi. BOSE 1993; N91, Q18, Q45M, R50, S36

Rondede Valence: (Violetta Tonda) 75 days. Small, truly round fruit; skin dark purple, sometimes tinged with green at the shoulders, even when fully ripe; should be picked when the size of a large naval orange or a small grapefruit. Excellent for stuffing. Not very productive; requires a hot climate. Old, traditional cultivar; named after the city on the Rhone River in France. B8, C20M

Rosa Bianco:<sup>1</sup> 75 days. Very attractive, globular fruit; 4 to 6 inches in length and 3 to 4 inches across; skin colored with shades of true lavender and creamy white; calyx very large compared to other eggplants, often enclosing the fruit for days; flesh meaty, of very fine, delicate flavor. Commands premium prices in specialty markets. B75, B75{PL}, C20M, D68, F73D, I18M, I18M{PL}, 177, K49M, K66, M27, M32, 089

Slim Jim:<sup>2 3</sup> 75 days. Long, slender fruit, 4 to 6 inches in length when mature; skin lavender to purple, colors up while still the size of a peanut. Small, compact plant; ideal for growing in pots; produces fruit in clusters close to the main stem; has ornamental violet foliage. Recommended for market gardeners growing "baby" vegetables for the specialty trade. C53, 089, Q11M

Taiwan Long: 70 days. Long, slender fruit, about 7 inches in length and 1 1/2 inches in diameter; skin purplish-black, glossy; flesh tender; ripens early; should be picked when young. A continuous and heavy yielder, can produce as many as 45 fruits; disease resistant. L59

Violetta di Firenze:<sup>1</sup> 97 days. Unusual, attractive fruit; rich lavender, sometimes striped with white; very large, round to oblong, grooved. Very good for stuffing or using as a centerpiece. Very

spreading, upright plant. Needs high temperatures to mature a crop; cloches and black plastic recommended in far northern areas. C53, J20, K20M, M46, 089, Q11M, Q34, S17

Violette Longue: (Violetta Lunga) 65 days. An early cultivar, very popular in southern France. Fruit oblong-oval, slightly club-shaped, thickest at the blossom end; 6 to 8 inches in length; skin purplish-black, attractive, smooth; flesh firm, contains few seeds, quality excellent; well-suited to slicing. Produces 8 to 10 fruits per plant. Introduced prior to 1885. VILMORIN; B8, C53, E63D, F73D, Q11M, S17

#### RED/ORANGE-SKINNED (*S. aethiopicum*, *S. macrocarpon*)

Jaxatu Soxna: 60-80 days. Bitter-fruited African type. Small, flattened, ribbed fruits; 2 to 2 1/2 inches in diameter; weight 50 to 80 grams. Upright plant, about 20 inches tall. The immature, light green to creamy white fruits are eaten as a bitter vegetable. Leaves are used like spinach. Adapted to hot and dry or rainy season growing. S66M

Keur M'bir N'dao: 60-80 days. Bitter-fruited African type. Small, flattened, strongly ribbed fruits; 2 3/4 inches in diameter; weight 100 grams. The immature, light green fruits are cooked and eaten as a vegetable. Leaves are used like spinach. Spreading plant, about 15 inches tall; yields 10 fruits per plant. Harvested over a 30 to 40 day season. S66M

N'Drowa Issia: 50-70 days. Sweet-fruited African type. Small, flattened, ribbed fruits; about 2 inches in diameter; weight 70 to 80 grams; red-orange when fully ripe. Fruits are picked when yellowish green and used as a vegetable. The leaves are eaten like spinach. Erect plant, 24 to 40 inches tall; resistant to aphids. S66M

N'Goyo: 60-80 days. Sweet-fruited African type. Small, flattened, ribbed fruits; about 4 inches in diameter; weight 100 to 130 grams; bright red when fully ripe. Erect plant, 20 to 24 inches tall. The fruits are harvested at the dark-green immature stage and used as a vegetable. Leaves are eaten like spinach. S66M

Small Ruffled Red: (Red Ruffles, Hmong Red) 100 days. Small, deeply creased fruit, 2 inches in diameter; skin orange-red; flesh seedy, bitter. Prized in Southeast Asian cuisines for its bitter flavor. Tall plant, height 3 feet; bears fruit in clusters; resistant to nematodes and light frost. Also used for decoration. F80

Turkish Gem: 63 days. Small, globe-shaped fruit, about the size of a Celebrity tomato; brilliant, glossy reddish-orange skin with an occasional streak of deep green. High sugar content. Very good for grilling, in vegetable arrangements or for eggplant parmesan. C92

Turkish Orange: (Turkish Italian) 75 days. Small, spherical fruit, 2 1/2 inches in diameter; skin bright orange-red; flesh seedy, with an excellent sweet taste. Usually eaten when green. Delicious in Thai curry and *caponata*. Tall, hardy plant; produces abundantly; resistant to flea beetles. Said to have originated in Turkey; now used in parts of Italy. C95, D29P, F73D, I99M, K23{PL}, K49T, L7M, L77D, 089

#### WHITE-SKINNED

White eggplants are generally firmer, less moist, and hold their shape better than purple types. They are also closer-grained, creamier, and less bitter. The flesh can be more heavily seeded, although the seeds are often less acrid. SCHNEIDER 1986 [Cul, Re]. N40{PR}

#### HYBRID

Ghost Buster: 80 days. Attractive, deep oval fruit, about 6 to 7 inches in length; bright white skin; slightly sweet flavor. Broad, vigorous, semi-spreading plant; productive; dense, bright-green foliage provides excellent cover for the fruit and holds them well off the ground. Excellent specialty market item. C44, F13, G27M, I18M{PL}, 177, K57{PL}

OPEN-POLLINATED

Banaras Giant: 63 days. Large, round fruit, 5 1/2 inches long and 5 inches in diameter; skin greenish-white; flesh white, firm, of excellent quality. Semi-erect, spineless plant, height about 20 inches; produces 5 to 9 fruits. Popular Indian cultivar. R0, S59M

Casper: 70 days. An attractive ivory-white version of Blackjack. Fruit averages 6 inches long, 2 3/4 inches in diameter; snow-white flesh, mild, delicate, mushroom-like flavor; green calyx; ripens early. Medium-sized, prolific plant. C20M, D11M{PL}, F70{PL}, F73D, K49M, L42, N24M

Dourga: 65 days. An attractive, ornamental eggplant. Fruit cylindrical, 6 inches long and 2 inches in diameter; skin shiny white; flesh white, flavor sweet and delicate; quality excellent. Compact, productive plant, about 2 feet tall, produces many small double fruits per cluster. Disease resistant. A1, D56M, F73D, K71, M29, M65

Italian White: 72-78 days. Small, plump, round fruits; 3 or 4 inches in diameter; pure white skin; creamy white flesh, milder and sweeter than purple types. Has a somewhat mushroom-like flavor, especially when picked small. Extremely productive plant, about 18 inches tall. Good for container gardening. Italian heirloom from the early 1900's. A2, F73D, K23{PL}, K49T, L11

Long White Sword: 100 days. Elongated, slender, white-skinned fruit; 6 to 9 inches in length, 2 inches in diameter; flesh very meaty, with very few seeds, flavor mild and delicate. Grows about 3 feet tall. K46T, L7M

Snowy: 58-62 days. Very uniform, early white eggplant. Long, cylindrical fruits, 7 to 8 inches in length and 2 1/2 inches in diameter; smooth, glossy white skin; firm, creamy-white flesh with a mild, delicate flavor. Upright plant. Does well in short season areas. Recommended for roadside stands and specialty markets. D74B, E91G, F63, G68, I18M, K50, K66

White Beauty: 70 days. Medium-large, nearly round fruit; 4 to 5 inches long, 5 to 6 inches in diameter; smooth, snow-white skin; flesh white, seedy, very full-flavored, quality best when eaten small. Sturdy, bushy plant; height 3 feet; holds fruit well off the ground. L7M

White Egg: (Japanese White Egg) 75 days. Small fruit, 1 to 2 inches long; the size and shape of a hen's egg; skin white; quality excellent. Prolific plant; height 3 feet; sets fruit continuously over a long season. K49M

## CODES FOR SPECIAL TYPES

1. Striped
2. Mini or Baby
3. Dwarf

**ENDIVE {S}**CICHORIUM ENDIVIA**CURLY-LEAVED**

Also called *chicoree frisee*, these are flat, low-growing plants with narrowish curled, fringed or indented leaves. They have a tendency to rot in damp, cold weather but are more tolerant of heat than broad-leaved endive, so are used mainly from late spring to autumn. LARKCOM 1984.

Bianca Riccia da Taglio:<sup>1</sup> Tender, delicious, pale green leaves. Especially adapted to cut-and-come-again techniques and salad mixes. When sown thickly will provide an abundance of greens all year long that are excellent in salads. Forms large, prostrate bunches with white hearts. Regrows quickly. G6, N84, Q11M

Elodie: 70 days. Strong, attractive plants; dense, frilly, green outer leaves; crisp but tender mid-ribs; closely-bunched blanched hearts.

Has a crunchy texture and a clean, fresh taste. More heat-tolerant than older sorts and produces over a longer harvest season. The fine-cut lacy leaves combine attractively with lettuce. French introduction. C95

Fine de Louviers: (Fine Curled Louviers, De Louviers) 90 days. Very finely curled, indented, yellow-green foliage; forms a nicely compact but curled heart; thin, white ribs. Grows 10 to 12 inches in height. Rosette almost hemispherical in form; contains a greater number of blanched leaves in proportion to its size than other sorts. Introduced prior to 1885. VILMORIN; U14

Fine Maraicheie: Very small, compact endive; grows to only 8 inches in diameter. Very frizzy, decorative leaves. Ideal for individual servings, or for picking when very young to use in mesclun. Not hardy; sow in spring and early summer for summer use. S55

Galia:<sup>3</sup> 42 days. Early Tres Fine Maraichere type Very curled leaves with fine, slender petioles; large, full heart, sweet and tender. Good self blanching qualities. Excellent for mesclun salad mixes and "baby" endive. Small plant, well suited to small gardens. Good resistance to bolting. Developed by Vilmorin of France. C53, C92, 177, S95M

Green Curled Ruffec: (De Ruffec, Green Curled, Early Green Curled, Giant Fringed Oyster) 85 days. Very large rosette, often 16 to 18 inches in diameter, resembling Moss Curled but fuller in the center. Midrib very white and thick, very tender and fleshy, nearly an inch in diameter but appearing much broader due to the blanching of a large portion of the leaf blade. Suitable for summer and autumn. Bears cold weather remarkably well. Introduced prior to 1865. VILMORIN; A16, A25, C85M, FI, F92, G16, G71, G79, G83M, 139, K49M, M46, Q34

Large Green Curled White Ribbed: (Large Green Curled) 85 days. Commercial type with attractive, bright-green leaves that are long, well-fringed, curled and have a white mid-rib. Large-framed plant, 14 to 18 inches in diameter. Excellent heart; blanches well. Most popular in the South. Tolerant to black heart. B78

Moss Curled: (Green Moss Curled, Early Green Moss Curled) 90 days. Rosette rather small, seldom exceeding 10 or 12 inches in diameter. Leaves clear dark-green, very much cut, curled, and crisped, the whole plant resembling a tuft of moss; mid-ribs narrow and very white. Not very productive, but in demand due to its unique appearance. As it occupies little space, it is very suitable for growing under cloches. Introduced prior to 1885. VILMORIN; B49, 167M, 184, 053M, R32

Pink Stem:<sup>2</sup> Unique curled endive with attractive pink midribs. Large, heavy plants; slow to bolt. Suitable for spring, summer and fall crops. Excellent for adding an extra touch of color to salads. New introduction that should be well suited to the specialty market. Q34

President: (Giant Green Curled) 85 days. Very large rosette. Deeply cut and frilled, dark-green leaves resemble Salad Bowl lettuce, but with a nicely blanched, creamy yellow-white core that is particularly tasty and tender. One of the hardiest cultivars, withstanding adverse weather in the fall. A2, K49M, L89, R11M

Riccia Pancalieri: (Green Curled Rmcalier, Grosse Pancalieri, Green Curled Upright) 95 days. Forms a very large rosette with a voluminous heart; very curled and crisped leaves have rose-tinted white midribs. The central leaves stand quite erect so that the plant is blanched naturally, without requiring to be tied up. Sow in rows from March to September; use in summer, autumn and winter. VILMORIN; B49, N84, Q11M, R32, Si 7, S55

Ricciutissima d'Ingegnoli: A distinct cultivar with very finely divided and curled, tender leaves. Produces a full heart of light yellow color and an especially delicious flavor. May be planted from March to August for continuous harvests over a period of 8 months per year. N84, Q11M

Salad King: 80 days. Vigorous, healthy, heavy-bearing plant. Large, attractive, deep-green, finely cut leaves. Deep, full heart may be easily blanched by gathering and tying the outer leaves. Early maturing; for spring, summer and fall crops. Very slow to bolt and resistant to tipburn and hot weather. Not harmed by light frosts. B75M, C20M, C44, D26D, D82, G79, G82, G93M, 164, K50, K71, K73, L42, R47

Tosca:<sup>3</sup> 45 days. Tres Fine Maraichere type Very large heads; full white blanched hearts, very mild and sweet; narrow, very finely cut, medium-green leaves. Highly recommended for "baby" endive. Suitable for spring or summer plantings. Excellent resistance to heat, drought and bolting. Developed by Vilmorin of France. C20M, C85M, I18M, 177, K49Z, L42, L91M, N81, S61M, S95M

Toujours Blanche: (Ever-White Curled) Very distinct endive, the leaves being very pale-colored, giving the appearance of having been artificially blanched. Very finely curled leaves; yellow midribs, tinged with rose. Forms rosettes 14 to 16 inches in diameter. Not very productive. An old French heirloom from the 19th Century. VILMORIN; P59M

Tres Fine Maraichere: 46 days. Long and smooth but deeply cut, toothed grey-green leaves with delicate crisp ribs; well-blanched, creamy hearts. Must be harvested early before showing tipburn or bottom rot. Mild, delicious salad ingredient for specialty markets. Grows well in a variety of soils. D68, E63D, F44, G93M, 177, I99M, J97M, K23, K23{PL}, K49M, K49T, K66, L91M, M46, N7G, Q34, etc.

Wallonne: Traditional French variety often available in several strains. Large, tightly packed heads with self blanching hearts and finely cut leaves. Vigorous and handy. Usually sown in August and September for November through January harvests. Also suitable for poly tunnel culture. K49M, N84, Q52, S17, S55, S95M

White Curled: (Ever-White, Ever-Blanched, Bianca) Rosette not very dense, 14 to 16 inches in diameter; heart loose and open. Leaves pale yellowish-green, having the appearance of being artificially blanched; frilled or curled on the borders. Midrib yellow, tinged with rose-ied. Tender and of good quality when very young, otherwise chiefly valued for its unique appearance. Introduced prior to 1865. BURR, VILMORIN; E38, Q34

#### BROAD-LEAVED

Also called *escarole*, *Batavian endive*, *scarole* and *chicoree scarole*, these are larger and taller than curly-leaved endive with broader leaves, somewhat twisted at the base. They are much hardier and more suitable for autumn, winter and, where they have been overwintered, for early spring crops. They require blanching in hot weather, when at their most bitter. LARKCOM 1984.

Broad-Leaved Batavian: (Full Heart Batavian, Batavian Green) 85 days. Leaves yellowish-green; large and broad; 10 inches long, 5 to 6 inches in diameter at the broadest part; thick and fleshy. Very deep, well-blanched, creamy white heart. Standard, traditional cultivar. Introduced from Java via Holland in 1860. BURR; A25, B49, C44, D68, G27M, G71, G93M, H95,139,164,184, K10

Casco d'Oro: 45-50 days. Large, prostrate head; broad, wavy, elongated leaves, yellowish-green with white midribs. Blanches to a golden-yellow internal color after the heads are tied up 15 to 20 days before harvest. Usually sown in spring and summer. N84, Q11M

Florida Deep Heart: (Florida Full Heart) 85 days. More upright than Full Heart Batavian; grows 12 to 15 inches tall. Thick, crumpled leaves and dense foliage encourages development of a creamy white heart that is less susceptible to basal rot. Standard broad-leaf type; grown extensively in the South for fresh market and shipping. Al, C20M, D1T, F13, G79, J84, K10, K50, M29

Geante Maraichere: Very large, vigorous growing, hardy endive that develops a blanched heart very early in its growth. The rosette is very full and dense, producing many packed leaves in the center of

the plant. Outer leaves broad, wavy, irregularly lobed. Plant June through August. D11M, F70, S66M, S95M

Gigante Degli Ortolani: Very large plant, easily growing to 15 or 16 inches in diameter. Succulent outer leaves of an attractive bright-green color. Forms a rose colored heart that blanches to a whitish-yellow in a few days. Sown in summer, harvested in autumn and winter. N7G, N84, Q11M, S17

Grosse Bouclee: 50 days. Uniform, extra large-leaved escarole from France. Large heads, up to a foot or more across; very tight, full hearts; long, smooth, well-blanched leaves, tender and delicious. Very good in salads or simply braised with olive oil and garlic. Easy to grow and slow bolting. Suitable for summer or fall sowings. Al, E63D, E91G, F44, I18M, 177, J20, K10, K49M, L91M, M46, N16, Q11M, S95M

Sinco: 85 days. Early maturing, vigorous, healthy plant produces a dense mass of large, folded outer leaves with a closely bunched, well-blanched, creamy yellow heart. Leaves are broad, slightly crinkled and dark-green in color. Good tipburn tolerance. French introduction. J97M, K66

Wivol: 80 days. Medium-green heads form a rosette of ruffled leaves whose broad central stems make a blanched heart which is very mild and tasty. Hardy to below 7° F. Selected specifically to tolerate rain, cold and general adverse weather. Usually planted in July for an autumn harvest. L89, N7G

#### UPRIGHT

A possible link between the curly-leaved and broad-leaved types, these have a distinct upright growth habit instead of the usual flat or rosette form. Most are extremely hardy.

Cartocciata d'Ingegnoli: A splendid cultivar that forms large, upright heads that are naturally self-blanching. The broad, round outer leaves wrap themselves around the golden-white inner heart in a manner similar to crisphead lettuce. Excellent flavor. Usually sown for fall and winter harvesting. N84, Q11M

Cornet d'Anjou: Broad leaved, semi-heading type Very large leaves, almost as broad as long; cut at the edges into numerous long teeth; midrib fan-shaped. Outer leaves unfold and envelope the younger leaves to form a loose head. Can be blanched to mellow its fine flavor. Named for the shape of the heart which resembles the mouth of a horn, or comet, and the town where it originated, Anjou, France. For spring or fall crops. C53, G68, S95M

Cornet d'Bordeaux: A fine old French cultivar which is very hardy. Upright in growth habit, forming a loose head. Very large outer leaves; cut at the edges into numerous long teeth; fan-shaped midrib. Can provide a constant cut-and-come-again crop through the winter. Performs exceptionally well in cold frame, tunnel, or cloche. Leaves make excellent wrappings for various stuffings. LARKCOM 1984; E83T, G68, N84, S17, S55

Cornetto della Loire: (Cornet de la Loire) Large, elongated, upright plant; pale green in color; outer leaves quickly envelope the inner ones to form a loose head. For autumn production, it may be sown later than others because it grows very rapidly. Very handy, suitable for growing until the first frost. E83T, 060, P59M

#### CODES FOR SPECIAL TYPES

1. Cutting
2. Pink
3. Baby

## FAVABEAN {S}

#### FABA VULGARIS

Aprovecho Select: 75-85 days. A selection developed in Oregon by Ianto Evans with unusually large seeds and a fine sweet flavor.

Excellent for table use, especially when mashed into a hummus-like paste. Vigorous, 3 to 4 foot plants. Hardy to below 20° F. Has excelled in trials in the maritime Northwest and on the East Coast. Introduced in 1988. C95, J39, K49T

Aquadulce: 85 days. Medium-green pods, 14 to 16 inches long and nearly 2 inches wide; 7 to 8 large, white seeds per pod; suitable for fresh use and freezing. Erect plants, 2 to 2 1/2 feet high; not very stout; sometimes quite green and sometimes slightly tinged with red. Extra hardy for autumn sowing to avoid blackfly, and to grow an early spring crop. Introduced around 1844. A2, C92, D74B, G79, K49M, K73, L42, N24M, O89, Q11M, S17, S95M

Aquadulce Claudia: 90 days. Long, 15 inch pods; 1 inch diameter seeds have pale greenish skins. Excellent for use as a dry bean; also makes a very good shelling bean. Sturdy plants, growing 3 to 4 feet tall at full maturity. The primary cultivar for a very early crop; can be sown as early as January in mild-winter areas or in the fall. Reliably hardy to 12° F. Originated in Spain. G53M, R32, R47, R83, S55, S75M

Aztec Yellow: Very large, lemon-yellow to golden-skinned beans with good flavor. Vivid lemon-yellow flesh, makes for an attractive, colorful addition to stews and other dishes. Has also been recommended for making golden tofu. Early producer of short pods containing 1 to 3 beans. Selected by Ianto Evans from ancient breeding material collected in Mexico. C95, J39

Banner:<sup>1</sup> Said to be one of the highest yielding, best-tasting commercial small-seeded field types. The stalks also make excellent silage or green manure. Vigorous, 6 foot plants shade out weeds and grasses. Very tolerant of temporarily waterlogged soils in winter. Hardy to at least 10° F. B49, C95, L89

Bell:<sup>1</sup> (Bell Bean, Peanut) Small-seeded field type which are also known as *horse beans* or *tick beans*. Round to oval, reddish-brown seeds can be used as dry beans. Also planted as a cover crop, green manure and for silage. Tolerant of a wide range of soil conditions, including wet areas, acid pH, etc. Plants are somewhat taller than those of the large-seeded cultivars. Best sown from October until February in warm-winter areas. D68, F11, G93M, I99M, K17M, K49T, K95M

Broad Windsor: (Broad Windsor Long Pod) 85 days. Glossy green, 6 to 8 inch long pods; pods solitary or in pairs, almost always curved, and usually very broad towards the end; each pod containing 5 to 7 large, oblong-shaped, flat, light-green beans used as shell beans. Very upright, 2 to 3 feet tall plants. A2, A16, A75, B49, C85M, F92, G57M, G82, I67M, I81, K49M, K73, L42, L89

Bunyard's Exhibition: 75 days. Pods 12 to 14 inches long, smooth and narrow; produce 7 to 8 large, well-flavored white seeds per pod. Very heavy cropping plants, 24 to 40 inches tall. Recommended for spring sowing. English heirloom, introduced in 1884. A2, D11M, G53M, J39, R32, R83

Cairo Market:<sup>1</sup> Small, meaty beans, less sweet than large-seeded types. Ideal for *falafel* and *hummus*. Matures very early. Short-stemmed plant, 2 to 3 feet in height; pods contain 1 to 5 beans per pod. More drought tolerant than true Broad beans, though equally hardy. Original seeds collected in a Cairo bazaar. J39

Chak'Rusga: 110-140 days. A mixture of several strains of delicious fava beans collected in northern Bolivia, near Lake Titicaca. These are the favorites of the local Aymara people. Tall, multi-branched plants yield 6-10 pods per stalk. Prolific and drought resistant. Hardy to 10° F. Should be planted in early spring or late summer. F73D, K49T

Colossal: 70 days. Exceptionally long, 7 to 10 inch pods are produced in abundance on plants that are about 4 feet tall. Plump beans of excellent flavor. Bears so heavily it is necessary to bank the soil up well around the roots to prevent the plants from falling over. Widely used for exhibition. M49, S61

Con Amore: 70 days. Refined European strain combining high yields with very early maturity. Long, straight pods, 8 to 9 inches in length. Large, oval-shaped seeds, turn brown after being cooked. Tall, robust plant; produces pods in clusters, 3 to 5 seeds per pod. Recommended for fresh market. M49, N81, R11M

Copper: Medium-sized, thick, deep copper beans with excellent flavor and a distinctive greasy seed coat. Erect, upright pods with 1 to 3 seeds, in bunches of 2 to 4. Matures very late. Copper-colored seeds are common among Criollo populations in Mexico and Central America. J39

Exhibition Longpod: 72 days. Pods 4 1/2 to 6 inches long, contain 5 to 7 large seeds per pod; seeds flat, pale green to cream when ready for use as a shell bean. Excellent for freezing. Strong-stemmed plants, 3 1/2 to 5 feet high. Very productive. Some support may be needed in unprotected areas; best planted in "block" rows because of wind. An old English favorite. D27, F73D, TIM

Express: 71 days. One of the fastest maturing cultivars, and from an early spring sowing will outyield others. Produces up to 34 seven inch long pods per plant. Medium-sized, tender, flavorful seeds. Outstanding for freezing as it does not discolor. Winter hardy. D11M, F73D, L91M, N84, R32, R83, S55, S75M

Foul Misri: (Egyptian) 77 days. Small, brown seeds of the type often found in Middle Eastern stores. Suitable for a late spring and summer sowing, this bean is heat tolerant and has a good root system. Sometimes listed as Foul Muddamma, foul is actually the Arabic name for fava bean, and *foul medammes* is the proper name for stewed fava beans, popular in Egypt and other Arabic countries. DARBY, MALLOS [Re]; B49, F73D, L50M{DF}, L50M{PD}

Frostproof: (Lima Pea) 80 days. Produces flat, straight pods; 7 inches long and 1 1/2 inches wide; 5 to 7 very large seeds per pod. Good fresh or used as dried beans. Productive, upright plants, 2 1/2 feet high with strong, sturdy stems. Very hardy; has survived -24° F. B73M

Giant Exhibition Long Pod: One of the finest of the Longpod cultivars. Very heavy cropper grown from specially selected pods. Pods of good length and beans of very good flavor. Ideal for exhibition. N84, O53M, R83

Green Windsor: A large-seeded cultivar of excellent flavor. Once used for brown Windsor soup but now a favorite for the freezer. For spring sowing only. Introduced in 1831. Similar to Broad Windsor, except for the color of the seeds, which, even when ripe, remain a deep green color. VILMORIN; R32, R83, S55

Guatemalan Purple: 80-90 days Very attractive and unusual fava. Medium-sized seeds of an intense purple color, occasionally some seeds will be black. Good flavor. Grows 3 to 4 feet tall. Has proven to be frost hardy in areas of the Pacific Northwest. Selected by Ianto Evans from seeds collected in Guatemala City. C95, F73D, K49T

Imperial Green Longpod: 84 days. Twenty years of painstaking research have developed a plant capable of continually producing 15 to 20 inch long pods, each pod containing up to 9 large beans. Eating quality very good to excellent, the beans retaining their attractive green color when cooked. A2, F73D, K49M, L91M, R83, S75M, TIM

Ipro: 78 days. Medium-sized seed, about half as large as Windsor, means that a quantity of seeds plants more. Plants grow 3 to 3 1/2 feet tall, with an easy-to-pick horizontal set of 5 1/2 inch long pods averaging 5 beans per pod. Bred for tolerance to top yellow virus and hot weather. Very good flavor when cooked fresh. E24

Masterpiece: (Masterpiece Green Longpod) 88 days. One of the finest green-seeded broad beans. Plants are 30 to 36 inches tall with 8 inch long pods. Excellent fresh or for deep freezing. Grows well under all conditions, being heavier cropping than the Windsors. Introduced in 1894. Highly commended by the Royal Horticultural Society in 1972. F73D, G53M, O53M, R32, R83, S55, S61

Metissa: Short, very well-filled pods, slightly shorter than Express. Each pod contains 4 to 5 small "petit pois" type beans with a delicious mild flavor. Excellent for freezing, as the beans retain their light color. Matures very early. High yielding and easy to pick. RUM, R32, S75M

Nintoku Giant: (Jumbo) Very large, attractive deep-green seeds, about 1 1/4 inches in diameter; excellent flavor. High yielding plant, produces 3 seeds per pod; grows vigorously in warm climates. Recommended for home garden and fresh market use. Also freezes well. D55, G27M, G33, K16M, L91M, N24M, S63M

Polar: 84 days. Medium-sized, white seeds are high in starch and low in tannin, and are said to have a 5% higher digestibility factor than other cultivars. Bred for the English freezer market, the beans not discoloring when canned or frozen. Plants grow to 36 inches tall. Hardy for fall sowing in many northern areas or as soon as soil is workable. J39, N84

Red Epicure: For sheer flavor there is no broad bean to equal this. So named because the beans are of an unusual chestnut red color, and they surprisingly possess much of the flavor of the chestnut when cooked. Cooks to a yellow shade. The plant is hardy and a heavy cropper and grows about 4 feet tall. Deep red flowers. GENDERS 1975, PHILLIPS; U33

Seville: (Tarragona, Early Seville Long Pod) Long pods more than 1/2 inch in diameter and 8 to 12 inches in length. Large seeds, 4 to 8 per pod. Matures early. Erect stems, 2 to 2 1/2 feet tall, sometimes tinged with red; produces pods singly or in pairs. Not very hardy. An early strain of an old Spanish heirloom. VILMORIN; P59M, TIM

Tarahumara Habas: Green to beige seed with black hilum. Added to soups or ground and made into thick tortillas. Planted in early summer along the continental divide of Mexico's Sierra Madre Mountains. Frost hardy. The last crop harvested by the Tarahumaras in late fall. Prolific in Tucson, Arizona. F73D, 116, N84

The Sutton:<sup>2</sup> 84 days. Six inch long, white-seeded pods; 5 small, tender beans per pod; matures early. The pods can be eaten whole even when quite large. Very hardy plant with a branched, bushy growth habit; reaches a height of only 12 inches and yet crops abundantly; perfect for small and windy gardens. Ideal for extra early sowing under tunnels. Award of Merit winner in 1952. GENDERS 1975; N84, R32, R83, S55, S61

#### CODES FOR SPECIAL TYPES

1. Small-Seeded
2. Edible-Podded

## FEIJOA {GR}

### FEUOA SELLOWIANA

Apollo: Medium to large, oval fruit; smooth, thin, light-green skin with blue-green surface bloom, subject to bruising and purpling; pulp well-developed, slightly gritty; flavor very pleasant, quality excellent; ripens mid to late-season. Tree upright spreading, to 8 feet tall; vigorous and productive; self-fertile, and will pollinate Gemini. N84, 097, R77

Beechwood: Medium-sized, elliptical fruit, weight 4 to 6 ounces; skin relatively smooth, dark green; flavor good, lacking any disagreeable aftertaste. Tree self-fruitful. Originated in Hollywood, California. I83M

Coolidge: Small to medium-sized fruit, 4 or more inches in length and 2 1/2 inches in diameter; form pyriform to oblong or elongated; skin somewhat wrinkled; flavor mild, of indifferent quality. Tree upright and strong growing; a reliable and heavy bearer; 100% self-fertile. The most widely planted cultivar in California. Originated

prior to 1926. MORTON 1987a; D57, G49, I49M, I66T, I83M, N84, R77, S97M

David: Medium to large fruit; well-shaped, round to oval; skin of sweet and agreeable flavor; flesh texture reasonably good, flavor good; ripens in mid-season. An excellent dual purpose type, ideal as a fresh fruit or useful for canning. MORTON 1987a; 097

Edenvale Improved Coolidge: Large, oblong fruit of very good to excellent flavor and quality; ripens in October. Tree slow growing; self-fertile; precocious and productive; grows best in climates similar to cool, coastal areas of southern California. Originated in Santa Cruz, California by Frank Serpa of Edenvale Nurseries. 174

Gemini: Fruit small to medium, egg-shaped; skin very smooth, thin, dark-green with a heavy bloom; flavor and texture excellent; ripens in early autumn, earlier than Apollo. Tree upright-spreading, to 8 feet tall; moderately vigorous; high yielding; partially self-fruitful, but cross-pollination is recommended for best fruit quality. 097

Jackson: Medium-sized, oval fruit, 2 1/2 inches in diameter; weight up to 4 ounces; skin thick; flesh white, ather dry, sugar content moderate; flavor very strong but pleasant, somewhat sour near the skin; nearly seedless, with smaller seed cavity and more pulp than most cultivars. Ripens in late November, keeps unusually well. Originated in San Jose, California. I83M

Lickver's Pride: Large, round fruit, weight 6 to 12 ounces; very sweet, rich flavor; quality excellent. Tends to brown when overripe. Very attractive tree with a rounded growth habit; self-fruitful. Originated in San Marcos, California by Gary Lickver. I83M

Mammoth: Large, round to oval fruit, to 8 1/2 ounces, resembles Coolidge; skin somewhat wrinkled, thick; flesh somewhat gritty, quality and flavor very good; matures early to midseason; softer and not as good a shipper as Triumph. Tree of upright habit, to 10 feet tall, strong growing; self-fertile, but bears larger fruit with cross-pollination. Selected in New Zealand from seedlings of the Choicena cultivar. MORTON 1987a; H4, I83M, N84, Q49M, Q93, R77

Nazemetz: Large, pear-shaped fruit, averaging 3 ounces in weight; side walls moderately thin; pulp translucent, sweet; flavor and quality excellent; ripens late October to mid-December. Unlike that of many other cultivars, the pulp of Nazemetz does not darken after being cut or as it ripens, but retains its clear color. Tree self-fertile, but bears most heavily when cross-pollinated. Good pollinator for Trask. Originated in San Diego, California by Alexander Nazemetz. G17, G49, I49M, 174, I83M, J61M, S97M

Pineapple Gem: Small, round fruit of good to very good quality. Mid to late season ripening. Tree self-fruitful but bears heavier crops if cross-pollinated. Does poorly under cool, coastal conditions. Originated in Azusa, California by Monrovia Nursery. H4, N84

Robert: Medium-sized, very uniform, oval fruits; flesh very juicy, somewhat gritty; flavor mild; ripens very early, up to two months before Triumph and Mammoth. Tree produces heavily when well established; develops undesirable russet leaves; if not cross-pollinated adequately will produce hollow fruit, which cannot be distinguished externally from well pollinated fruit. Originated in New Zealand. 097

Smilax: Small to medium-sized, perfectly round fruits; flesh has high sugar content and extremely fine flavor; clear pulp extends almost out to the skin. Tree short and bushy; self-fertile. Originated in San Marcos, California. D57

Trask: Medium to large, oblong fruit, up to 3 1/2 inches long and weighing 3 to 5 ounces; rough, dark green skin; shells thicker and grittier than Coolidge; flavor and quality good to very good; ripens early. Tree self-fertile, but most productive when cross-pollinated; precocious. Ideal pollinator for Nazemetz. Originated as a bud sport of Coolidge. G17, G49, 174, I83M, S97M

Triumph: Short, oval, plump fruits, not as pointed as those of Coolidge; medium to large; skin uneven but firm; flesh somewhat gritty but with good seed to pulp ratio; excellent sharp flavor; ripens in midseason. Tree upright, of medium vigor; bears very heavily if pollinated. Good pollinator for Mammoth. Along with Mammoth, one of the two leading cultivars in New Zealand. Selected there from seedlings of the Choiceana cultivar. N84, 093{S}, Q49M, Q93, R77

Unique: Fruit large, oval; skin smooth, light-green with a blue-green surface bloom; pulp very smooth in texture, flavor good; ripens early. Excellent as a fresh dessert fruit and also good for canning. Tree upright spreading, to 8 feet tall; vigorous; self-fruitful and precocious; a regular and heavy bearer. Originated in Inglewood, New Zealand by Dennis Barton. H4, N84, 097, R77

## FIG {GR}

FICUS CARICA \*2

### CAPRIFIGS

With the exception of the Croisic cultivar, caprifigs do not produce edible fruit. They are important, however, as a source of pollen for Smyrna type figs. Three crops are produced by a caprifig tree, the spring or profichi crop, the summer or mammoni crop, and the autumn or mamme crop that overwinters in a dormant state. H4

Croisic: (Cordelia, Gillette) Fruit of profichi crop medium or above, up to 1 3/4 inches in diameter, pyriform with a distinct neck; ribs prominent, with surface often somewhat corrugated; eye fairly large, with yellowish-green scales; color greenish-yellow; interior white; edible pulp insipid, lacking in sugar; staminate flowers few, generally lacking in pollen. Mammoni crop figs much the same as profichi. Tree vigorous and productive. CONdit; 174, J51P

### COMMON FIGS

Common fig cultivars produce fruit parthenocarpically, i.e. without caprification. Generally, they develop and mature both breba and fig crops, brebas being the smaller crop of the two. These are much appreciated as fresh fruit early in the season. The figs, or second crop, are also fine for eating fresh, but of the two, are preferred for drying.

### DARK-SKINNED

Beall: Medium to large fruit; skin purplish-black; pulp amber, has a delicate, mildly sweet flavor. Tree moderately vigorous; produces 2 crops for fresh fruit purposes. Excellent in Imperial Valley, San Diego County and Fresno, California. Originated in Santa Clara, California by W.A. Beall. Introduced in 1924. BROOKS 1972; C25, H4, R77

Black Jack:<sup>1</sup> Large to very large fruit; skin purplish-brown; flesh reddish-amber to strawberry; flavor sweet. Dwarf, heavy bearing, spreading plant. Ideal for growing in containers, greenhouses or small gardens. Needs protection during the winter in cold areas. A88M, C54, D37, H4, H78, 149M, 168, 174, 183M, M16, N20

Black Madera: Large, oval fruit; skin purple-black; eye small, closed; flesh deep red, sweet, of excellent flavor. Ripens well on the coast of southern California as well as inland. I83M

Black Mission: (Mission, Franciscana) Breba crop good in most seasons; fruits large; color black; pulp light strawberry; flavor rich. Second-crop figs medium to large; eye small to medium; color black; pulp amber to light strawberry; flavor distinctive, rich; quality excellent, both fresh and dried. Used as a fresh fruit, and can also be dried and canned. Introduced at San Diego, California about 1768 from mission stations in Baja, California. CONdit; A38M{PD}, A88M, D7{PD}, D23M, D77M, E31{DF}, E84, F15{PR}, F97M{DF}, G92{DF}, H4, 168{ES}, 174, I83M, LI, L47, L97G{DF}, etc.

Bourjassotte Gris: Brebas few, many not maturing properly. Second-crop figs medium, 1 1/2 to 2 inches in length, pyriform; eye medium, open; skin greenish violet, darker at the apex; pulp strawberry, quality fair to good. Caprifigged figs with violet-brown external color; pulp blood red; flavor subacid, rather strong. Highly regarded in England, especially for forcing. CONdit; N84, R77

Brogiotto Nero: (Bamissotte) Brebas rare, above medium to large, pyriform, purplish black; pulp strawberry. Second-crop figs medium to large; turbinate-pyriform; color purplish-black. Meat white; pulp light strawberry; flavor fairly sweet and rich; quality good to excellent, especially in coastal climates. Caprifigged figs larger, subject to spoilage; pulp dark strawberry to blood red. The same cultivar described by Pliny and other Roman writers as Fico Africano. CONdit; 071M, R59M

Brown Turkey: (Eastern Brown Turkey, Black Spanish, Italian Everbearing) Medium-sized fruit; skin thin and tough, mahogany-brown tinged purple; eye small to medium, partially closed; seeds few; meat white or amber-white; pulp pink or rosy; flavor rich; quality good. Best eaten fresh; not good for canning or drying. Tree cold handy, stands cold better than most other cultivars. STEBBINS; A85M, C25, C54, D77M, G17, G23, H4, 174, 183M, K28, NO

Celeste: (Celestial, Malta) Breba crop small, or mostly none. Second-crop figs small, pyriform; eye medium, partly open, but not readily admitting dried-fruit beetles; color violet-bronze to chocolate-brown; pulp strawberry; flavor sweet and rich; seeds hardly noticeable; quality very good. Figs drop and dry without spoiling. Caprifigged figs are larger; pronounced violet tint outside and dark strawberry inside; flavor subacid. CONdit; A85M, C25, D37, D77M, F43M, F93, G8, G17, H4, H65, 174, I83M, L90, M69M, N33, etc.

Flanders: Medium-sized, pyriform fruit with a long, slender neck; skin light tawny with violet longitudinal stripes and scattered white flecks; meat white; pulp light strawberry, has a strong, rich flavor; eye medium, tight. Excellent fresh fruit fig for the home garden. Virtually no splitting. Dried figs dark, commercially unattractive. D57, H4, 174

Hardy Chicago: Medium to small, black fruit; flavor sweet and very rich. Originated near Chicago by a gardener who grew the tree up against his home, where it was protected annually and fruited consistently. One year, the tree was not protected and its top growth died due to cold. Surprisingly, the tree produced an abundant crop from the new growth, without protection. B32, D37, F16, 174, K67

Hunt: Breba crop small; fruit small to medium; skin green; pulp red, somewhat dry, mealy, quality poor. Second-crop fruit small to below medium, elongated, pyriform; skin bronze, dull; flesh amber with some red; flavor rich, sweet, quality fair to good; resembles Celeste. In Georgia, fruit parthenocarpic; in California, fruit incompletely parthenocarpic. Originated in Eatonton, Georgia by B.W. Hunt. Introduced about 1932. BROOKS 1972; H4

L.S.U. Purple: Medium-sized fruit with red to dark-purple skin; light amber to light, strawberry red flesh; excellent mild flavor, high sugar content. Small, closed eye that resists spoilage. Very vigorous, upright tree, hardier than most. Highly resistant to leaf diseases and nematodes. May produce 3 crops a year in suitable climates. Developed by Dr. Ed O'Rourke of Louisiana State University. C30M, D37, H4, K67, N33

Magnolia: (Brunswick) Breba crop generally very small; brebas large; color reddish-brown; pulp amber, with a tinge of pink, texture mealy; flavor flat. Second-crop figs medium, oblique-turbinate; color bronze; pulp amber, tinged with strawberry, hollow at center; seeds small or rudimentary; flavor sweet, fairly rich. Quality good fresh; excellent for preserving; inferior for drying. In Texas, it is grown extensively as a preserving fig. CONdit; C25, D28J, F43M, H4, 141P, 174, N84, R77

Negronne: (Bordeaux, Violette de Bordeaux) Breba crop fair to good; purplish-black; meat white tinged with violet; pulp strawberry, rich; quality very good. Second-crop figs small to medium, spherical, or pyriform to obovate; color purplish-black; meat white; pulp strawberry, fairly rich in flavor. Good for home planting as tree is dwarf and prolific in fruit production. CONDIT; D28J, D37, E87, I49M, I49P, I66T, 174, J61M, R77

Nero: (Black Ischia) Breba crop fair; fruits medium or above; eye medium, open; color purplish black; meat thin, white with a violet tinge; pulp strawberry; flavor fairly sweet and rich. Second-crop figs small to medium, oblique pyriform to turbinate; surface dull, bloom fairly heavy; color purplish-black; pulp strawberry; quality good. CONDIT; C25, D77M, H4, 174, N84, R77

Osborn's Prolific: (Archipel, Neveralla) Breba crop good. Figs in hot interior valleys above medium; color bronze, tinged with violet; pulp cottony white, tinged with pink; texture spongy or mealy; flavor somewhat strong; quality fair. Second-crop figs variable in size; eye medium, open; color bronze with violet tinge; pulp amber, almost seedless; flavor insipid; quality poor. In cool, coastal climates, fruit sizes are larger, and figs are of good to excellent quality for fresh consumption. CONDIT; A88M, C25, C54, D37, D77M, G17, D28J, H4, I68, 174, 183M, J61M, LI, N20, N84

Pasquale: (Vernino) Breba crop none. Second-crop figs small to medium; oblate-spherical to pyriform; eye medium, slightly protruding; skin tough or rubbery in texture; color purplish-black on body, greenish toward the base. Meat thin, white; pulp solid, strawberry in color (darker when caprifigged); flavor fairly rich; quality good. Season late. CONDIT; C25, D57, D77M, G17, H4, 174, 183M

San Piero: (California Brown Turkey, Old Brown Turkey, Granata) Breba crop fair; figs large; color greenish-purple; meat violet; pulp strawberry; flavor rich; quality good. Second-crop figs medium to large, obovate to oblique-pyriform; eye large, open; color purplish-black; pulp strawberry, center hollow; flavor fairly rich. Quality fair to good when matured on the tree. Consumed fresh; worthless for drying. CONDIT; E84, J61M, LI

Texas Everbearing: (Southern Brown Turkey) Medium to large fruit with purple skin; mild sweet flavor, quality good. Very similar to, if not identical with, Brown Turkey. Tree large, very vigorous and productive. Best in the Southwest, especially in higher elevation areas that have a short growing season. MCEACHERN, STEBBINS; C54, F93, G72, H4, I41P, I68, 174, I77G, K28, L90, M69M, M83, N33

#### LIGHT-SKINNED

Adriatic: (Verdone) Breba crop very small, or none. Second-crop figs in hot, interior valleys are medium, turbinate; eye medium, open; color green to greenish-yellow; meat thin, white; pulp light strawberry, somewhat hollow at the center. Flavor fairly rich, of a characteristic fig type. Quality good, especially for drying. In cool climates figs are large, grass-green outside; blood red inside; quality excellent. CONDIT; D57, E31{DF}, H4, 174, LI, N84, R77

Alma: Medium-sized yellow to tan fruit; meat white, thick; pulp light tan with pink undertones in the center, very succulent and sweet; seed hulls hardly noticeable; quality excellent; eye well-sealed. Ripens in late July and early August. Tree compact and rounded, with glossy leaves that are sparse compared to other cultivars; prolific and cold-hardy, displaying prolonged spring dormancy. Introduced in 1974 by the Texas Agricultural Experiment Station. MCEACHERN; A19, B32, C25, D37, D57, D77M, G8, G17, H4, 174, K67, M16, M83, N33

Angelique: Small to medium-sized, bright yellow fruit. Attractive, waxy skin and rosy eye scales. Pulp light strawberry to almost amber. Very susceptible to insect infestation through the large open eye. Moderately vigorous tree. Does well in pots and greenhouses. Very old French fig grown by Thomas Jefferson at Monticello. CONDIT; L90M, N84, R77

Armenian: Breba crop fruit very large; hollow, thick-fleshed, very flat, deep yellow in color; flesh amber, mildly sweet, quality good. Second-crop fruit not as large but still has rather good quality. Does well in pots. D57, 174

Conadria: Fruit flesh very firm; smaller eye, lighter dry color and higher sugar content than Adriatic, which it resembles, also more resistant to fruit spoilage. Tree vigorous, precocious; produces two crops; breba crop good, second crop very good. Widely planted in San Joaquin Valley for production of dried figs and in dooryards for fresh fruit. Originated in Riverside, California by Ira J. Condit. Introduced in 1955. BROOKS 1972; A63, A88M, C25, C54, D57, D77M, F15{PR}, G17, H4, I68, 174, M81M, N20

Deanna: Fruit oblate; eye medium, tight; skin light-yellow; meat white; pulp amber, sweet, quality good; ripens in mid-season. Yields well. Attractive. No splitting. Developed by Ira J. Condit to replace Calimyrna. D57, 174

Drop of Honey: Medium to large, light-colored fruit; flesh yellowish, very sweet, of excellent quality. Has an open eye which fills with a drop of nectar to seal off the opening, protecting it from insect damage. I83M

Excel: Fruit medium to large, ovoid to globose; skin light greenish-yellow; meat white; pulp light amber; slightly higher sugar content, with smaller eye than Kadota; less likely to spoil. Excellent Kadota type for fresh fruit, canning, and drying. Virtually no splitting. Tree a strong, vigorous grower. Developed by Ira J. Condit. D57, G17, H4, 174, K67

Golden Celeste: Deep yellow to golden colored fruits, about the size and shape of a large Celeste; very sweet and tender, of excellent flavor and quality. Small, closed eye, resists spoilage during inclement weather. Vigorous and productive. Developed by Dr. Ed O'Rourke of Louisiana State University. H4, K67

Green Ischia:<sup>1</sup> (Verte) Brebas few, or rarely produced. Second-crop figs small, turbinate, without neck, or pyriform; with prominent, somewhat flattened neck; eye small, fairly well closed; color grass-green; meat white; pulp dark strawberry; quality very good. Season late. CONDIT; A19, C25, D37, D77M, G17, H4, I53M, 174, I77G, LI, M16, N24M

Gulbun: Large, oblate fruit; eye medium, tight; skin light greenish-yellow; meat white; pulp light pink, delicately sweet, quality good; few split; ripens in mid-season. Tree productive; does well in containers. Originated by Ira J. Condit. D37, 174

Ischia: (White Ischia) Breba crop small or none. Second-crop figs small, turbinate; skin greenish-white, transparent, sometimes tinged by the red flesh below; meat white, thin; pulp strawberry, very sweet, rich; ripens early. Good for homemade preserves and pickles. Tree compact, not handy. Popular in England for pot culture and for forcing, where three crops is the aim. CONDIT, SIMMONS 1978; N84, R77

Kadota: (Dottato) Breba crop none, or late. Second-crop figs medium to occasionally large; shape spherical to obovate; eye medium, often sealed with drop of gum; skin rather thick, rubbery in texture; color green to golden yellow; meat white; pulp amber; seeds few, small. Flavor very sweet, but lacking distinctive character; quality excellent, especially for preserving and canning; skin of dried fruit somewhat thick and tough. CONDIT; A88M, B74, B93M, C25, C54, D37, D77M, F15{PR}, G49, H3{P£}, H4, I68, 174, K67, L15M{PD}, L47, N20

Janice Seedless Kadota: Newly introduced Kadota type. Large, light greenish-yellow fruit with virtually no seeds; sweet, delicious flavor. Has a very long harvest season, August through November at Fremont, California. Adapted to both coastal and inland climates. A88M, N20

L.S.U. Gold: Very large, flattened, bright golden fruits; up to 1 3/4 inches in diameter; tender, amber flesh, exceptionally sweet. Slightly open eye, but still resists splitting and souring. Quality

excellent, especially in dry climates. Vigorous and very productive. Developed by Dr. Ed O'Rourke of Louisiana State University. H4

Mary Lane: (Jelly) Medium-sized, round fruit with a short neck; skin yellowish-white, smooth in texture; pulp amber, fills in well, nearly seedless; good, sweet flavor; ripens summer through fall. Good for fresh fruit and canning. Originated in Escondido, California by John Stevenson. C25, C54, D57, G17, H4, I74

Nardine: Attractive, oblate fruit; skin light yellow; meat white; pulp amber, sweet, quality good; eye medium, tight; ripens in midseason. Yields well. Few split. Originated in Riverside, California by Ira J. Condit. Developed as a replacement for Calimyrna. H4

Panachee: (Tiger) Brebas none. Second-crop figs medium; shape pyriform; ribs practically absent; surface glossy with a delicate bloom; eyes medium or above, open; color light yellow with alternate stripes of green, the latter fading out at complete maturity; meat thick, white; pulp strawberry, mealy in texture; quality fair to good. Caprifigged figs are somewhat larger, with pulp blood-red in color. Fruit splits badly, even when uncaprifigged. CONDIT; H4, 174, I83M, LI, N84, R77

Peter's Honey: (Rutara) High quality fruit has tender glossy greenish-yellow skin when ripe, and very sweet and flavorful dark amber flesh. A warm location with southern exposure is important for ripening this cultivar in the Maritime Northwest. Introduced from Sicily. D28J, H78, I49M, I49P, I66T, J61M, N24M

Petite Negri: Large, black fruit; sweet, exceedingly rich flavor. Tree dwarfish, handy, sets 2 crops and usually sets more fruit per plant size than other cultivars. Excellent for pot culture, having produced as many as 65 fruits in a 2 gallon container. Resembles Black Mission but hardier and more productive under cool climate conditions. B32, D37, E87, I74, J61M

Tena: Fruit oblate with little or no neck, medium in size; skin light greenish-yellow; meat white; pulp light strawberry in color; flavor excellent; eye medium, but very tight. Ripens in mid-season; highly resistant to splitting under adverse weather conditions. Tree a strong grower with ascending branches. C25, D57, G17, H4, I74, R77

Tennessee Mountain: Medium sized fruit; sugar content high enough for use in drying, fig newtons, or preserves. Very hardy tree; bears heavily. Recommended for outdoor growing in marginal areas. Originated in the mountains of Tennessee. Introduced by Dr. Silas Harmon, former Professor of Horticulture at the Coastal Plains Experiment Station in Tifton, Georgia. C25, F43M, I53M, 174

Troiano: (White Mission) Breba crop none. Second-crop figs below medium to small, spherical to turbinate; eye large, open; skin prominently checked crisscross at maturity; color yellow, sometimes faintly tinged with brown on the exposed side; meat white; pulp strawberry; quality fair to good. Caprifigged specimens larger; color green; pulp dark strawberry; seeds fertile. CONDIT; U7G{SC}

Ventura: (Verdal) Brebas rare. Second-crop figs medium, turbinate to obovate; eye medium, open; skin green; meat thin, white; pulp strawberry; flavor rich, quality good; ripens late but matures well in cool areas. Caprifigged figs medium to large; pulp solid, blood red, flavor very strong and rich; considerably better in size, appearance, and quality than uncaprifigged fruit. Season late. CONDIT; D57, G17

White Genoa: (Genoa) Breba crop small; fruits large; shape oblique-pyriform; eye medium, open; pulp light strawberry, hollow at center; flavor sweet but not rich; seeds few, small; quality fair. Second-crop figs medium or above, somewhat oblique, turbinate; color greenish-yellow, blemished by circular brown spots at maturity; skin thin, tender, peeling readily; pulp amber, tinged with strawberry; texture gelatinous; flavor mild; quality very good; seeds practically none. Very susceptible to spoilage. CONDIT; A63, B93M, C54, D23M, G49, H4, I68, LI, N20, R77

White Marseilles: (Marseilles, Blanche, Lattarula, Lemon) Breba crop fair; figs medium or above; color light green; pulp and meat

white; seeds large, conspicuous; quality fair to good. Second-crop figs similar to brebas, except for smaller size; shape spherical to oblate. Flavor fairly rich and sweet; quality fair as a fresh fruit, of light weight and poor quality when dried; susceptible to fruit spoilage. Caprifigging has little effect upon size and color, either of skin or pulp. CONDIT; C25, D37, D77M, G17, H4, I49M, I49P, 174, J61M, K67, L90M, M77, M81M, 081

#### SAN PEDRO FIGS

Cultivars of this class have characteristics intermediate between the common figs and the Smyrna figs. The breba crop develops, matures, and ripens fruit parthenocarpically on the previous year's wood. Fruit of the second crop, which forms on the current year's wood, requires pollination by the fig wasp in order to develop, or they will shrivel and fall from the tree.

#### PARK-SKJNNEP

Dauphine: (Violette Dauphine) Breba crop generally good; fruit large, 2 1/2 inches long; ribs broad; eye large, protruding; skin greenish-violet to violet-purple; meat white; pulp light strawberry, flavor fairly rich; especially good for shipping fresh. Second crop figs similar to brebas, except for smaller size. Cultivated extensively in southern France. CONDIT; N84, R77

Pied de Boeuf: Breba crop fair to good; fruits large, oblique-pyriform with a prominent, often curved neck; skin tender, Hessian brown; meat white tinged with pink; pulp light strawberry, texture rather coarse, quality good. Second-crop caprifigged figs medium to large, prominently ribbed; skin chocolate brown to mahogany red, tender; pulp dark strawberry, flavor rich and sweet, quality excellent. CONDIT; T49M{SC}, U7G{SC}

Royal Vineyard: (Drap d'Or) Breba crop small; fruits large, pyriform; ribs prominent; color light coppery-bronze, attractive; pulp light strawberry; flavor sweet and rich; seeds few. Eating quality excellent; regarded by French confectioners as one of the best figs for crystallized and glace fruit. Caprifigged figs of the second crop medium to large; color reddish-brown to violet-brown; pulp strawberry; flavor rich; quality good. CONDIT; C25, I74, K67

#### Light-skinned

King: (Desert King) Large, pyriform fruit; skin dark green, thin, smooth; flesh pink, sweet, quality excellent; matures in cool coastal climates as far north as British Columbia, Canada; resembles Genoa. Tree moderately vigorous; breba crop prolific; severe dropping of second crop in inland districts. Originated in Madera, California by Sisto Pedrini. Introduced in 1940. BROOKS 1972; A88M, B74, C25, C34, C54, D77M, G17, H4, I49M, I49P, I74, I83M, J61M, M81M, NO, etc.

San Pedro: (San Pedro Miro, White San Pedro) Breba crop good; figs medium to large, turbinate; skin yellowish-green; meat white; pulp amber tinged with strawberry, flavor sweet, fairly rich. Second-crop figs medium to large; skin green to yellowish-green; meat white, thick; pulp strawberry, gelatinous; flavor insipid, flat. CONDIT; N84, 097, R77

#### SMYRNA FIGS

Cultivars in this class set virtually no breba crop. The second crop develops on the current season's growth and reaches full maturity only when the flowers are pollinated by the fig wasp and the ovules develop into fertile seeds; the fertile seeds adding a nutty flavor to the meat and pulp. This class contains some of the finest tasting cultivars.

#### DARK-SKINNED

Marabout: Large, pyriform fruit, 2 1/4 inches in diameter; neck very prominent; eye large, open; skin purplish-black, shading to light green on the neck; pulp strawberry, rather coarse in texture, flavor rich and sweet; quality very good fresh. Season later than that of Calimyrna, with figs continuing to mature over a long period. Introduced into the United States from Algeria in 1928. CONDIT; U7G{SC}

Zidi: Large, pyriform fruit; skin violet-black; pulp dark strawberry, rich and sweet; quality excellent fresh. Resembles Marabout superficially but is self-colored throughout, and 50% larger on the average. Tree vigorous, large and open; leaves often very large. Introduced into the United States from Tunisia in 1950. U7G{SC}

#### LIGHT-SKINNED

Calimyrna: (Sari Lop) {DF} Breba crop fair in some seasons. Second crop figs large, up to 2 1/2 inches in diameter; eye large, open; skin golden-yellow to light lemon-yellow; pulp amber to light strawberry, flavor rich and sweet; quality excellent both fresh and dried; seeds numerous. Regarded as the "ne plus ultra" of fig cultivars in California. Has been grown in the Meander Valley of Turkey for several centuries. First planted commercially in California in 1886. CONDIT; E31, F15{PR}, G92, H4{GR}, K68, L97G

Shirazi: Small, pyriform fruit; eye large, open; skin light yellow, thin; pulp golden amber, honey sweet, quality excellent; seeds numerous. Grown commercially near Shiraz, Iran. Dried figs are readily available at Persian markets. K60D{DF}

Snowden: Breba crop none. Second crop good; figs large, pyriform, ribs fairly prominent; skin lemon yellow, attractive; meat white; pulp amber, flavor rich and sweet; quality excellent, both fresh and dried; inclined to split in unfavorable weather. Tree vigorous and productive. Discovered in 1922 on the place of P.W. Snowden, Modesto, California. CONDIT; U7G{SC}

#### CODES FOR SPECIAL TYPES

##### 1. Genetic Dwarf

## FILBERT {GR}

#### CORYLUS AVELLANA

#### CORYLUS MAXIMA

Barcelona: Medium-large, round nut; kernel rough, averages about 40% of nut. Tree moderately productive and hardy; highly susceptible to bacterial filbert blight and brown stain. Accounts for approximately 85% of the Pacific Northwest filbert production, supplying the inshell market demand for a round nut with good flavor. Has been the leading cultivar for over 60 years. JAYNES; A88M, B74, H8, H49, H65, J15M, LI, M39M, NO, N20

Butler: Nut medium-large, oval; shell thicker than Daviana; kernel smooth, averages 46% of nut. Tree productive, much more so than Daviana; hardy; somewhat resistant to bud mite, but much less susceptible than Daviana. Excellent pollinizer for Barcelona and Ennis. Gradually replacing Daviana as the principal pollinizer in commercial orchards of the Pacific Northwest. A88M, A91, B93M, H49, H65, H89M, J15M, LI, M39M, NO, N20, 081

Cassina: Heavy producer of small, thin-shelled nuts that fall free and at the same time as Barcelona. Kernels crackout at 50% of nut and are very even in size, compared to Barcelona with a 40% crackout and kernels of 5 or more size. Will pollinize Barcelona and Ennis. A88M, E91M, H89M, J15M, N20

Cosford Cbb: (Miss Young's) Nut medium-sized, oval with a broad shoulder; shell thin, medium brown in color; flavor sweet, quality high; borne in clusters of 2 or 3. Tree upright, fairly vigorous; hardy; a reliable bearer; produces abundant pollen. Will pollinate other cultivars. One of the best English cobs. 081, Q30{SC}, R77, R83

Daviana: Long, medium-sized nut; shell thin, very susceptible to bird and rodent damage; kernel smooth, averages about 48% of nut. Tree unproductive; moderately hardy; extremely susceptible to eastern filbert blight and bud mite; more finely branched than Barcelona. Main pollinizer for Barcelona. Accounts for approximately 7% of the Oregon filbert crop. B93M

Du Chilly: (Kentish Cob) (C. maxima) Nut large; long and rather flattened with a well-defined seam; shell moderately thick; flavor and quality excellent; has a tendency to remain in the clinging husk when falling from the tree. Tree spreading; heavy yielding; hardy; produces better in colder climates. Pollinized by Butler, Royal and Daviana. Main cultivar in the United Kingdom; selected in Kent, England in 1830. A88M, B93M, K43{DF}, M39M, M63M{DF}, N20, 081, R77, R83

Ennis: Large, round nut; kernel smooth, averages 46 to 48% of nut. Tree productive; moderately hardy; somewhat resistant to bud mite. Has a larger nut and is more productive than the standard cultivar, Barcelona. Has less of a tendency toward biennial bearing. Produces approximately 20% fewer blank nuts. Gradually replacing Barcelona in commercial orchards. A91, B74{DF}, C34, H89M, J15M, NO, N20, 081, Q30{SC}, R77

Grand Traverse: Nearly round, brownish nut with a thin shell; kernel 51% of nut by weight; kernel plump, clean and of excellent flavor; ripens with Ennis. Introduced for the in-shell trade. Vigorous and productive tree; not precocious; very hardy. Resistant to big bud mites. Originated in Lansing, Michigan by Cecil Farris. E91M, E92

Hall's Giant: Nut large, round; kernel smooth, averages 40% of nut. Tree hardy; resistant to bud mite; yields poorly. Late-flowering pollinizer compatible with Barcelona and Ennis. Recommended for planting in small numbers along fence rows or odd spaces to cover late-flowering blossoms of the main crop cultivar. JAYNES; A91, B74, B74{PL}, C34, J15M, 081, Q30{SC}, R77

Lisa: Slightly elongated nut with a lightly striped shell; smooth, light colored kernel with excellent flavor. Well-suited to marketing in the shell. Ripens the first week of September in central Michigan. Resistant to big bud mites. Originated in Traverse City, Michigan by Cecil Farris. E92

Nut Washer: Very large, thin-shelled nut, almost as thin as an eggshell. Excellent flavor, smooth, delicious and very sweet. Produces heavy crops in midseason. Filbert-like appearance and bearing characteristics, with some indications of a wild hazel background. Discovered at the old J.U. Gellatly plantation. A91

Red Aveline: (Red, Avelinier Rouge) Large, oval, thin-shelled nut; kernel smooth, red-skinned, of a sweet nutty, excellent flavor. Heavy yielding tree with long, claret-red catkins. At one time prized in eastern California as a productive sort of good quality. BAILEY, L. 1947; Q30{SC}, R77, R83

Royal: Barcelona x Daviana. Nut oval, larger than either parent; shell thin; kernel large, rough, averages 43% of nut; color and markings similar to Daviana; ripens about the same time as Barcelona. Tree hardy; produces early and heavily; sheds pollen medium to early; susceptible to bud mite. Introduced in 1934. BROOKS 1972; B93M, B99{PL}, C82{PL}, H65, H89M, L33

Tonda di Giffoni: One of the leading cultivars in Italy. Notable for its excellent flavor, strong resistance to blight, and ability to blanch perfectly. Round, medium-sized nut. Very good pollinizer for Willamette. Productive tree; grows 10 to 15 feet tall; precocious. Also resistant to mites. Recommended for backyard orchards. B74, C34, J61M, R77

Tonda Gentile delle Langhe: Small, round nut; sweeter and more flavorful than standard filbert cultivars; ripens a month before Ennis. Most popular cultivar in Italy; widely grown in the Piedmont region. Bears only a moderate crop due to susceptibility to big bud mite. Nearly male sterile, should not be relied upon as a pollinizer for other cultivars. U7D{SC}

Whiteskin: (White, Alba, Avelinier Blanche) Medium-sized, oval nut; kernel covered with a white skin, quality and oil content high. Can be kept in the husk longer than others due to constricted form of husk. Vigorous, heavy bearing tree, produces fruit in clusters. Regarded in England as one of the best cultivars. Does well in California. BAILEY, L. 1947; Q30{SC}, R77, R83

Willamette: Attractive, medium-sized, dark brown nut; flavor and texture very good. Good for blanching, the skin being easily removed by briefly heating in an oven. Vigorous and productive; somewhat resistant to Eastern Filbert blight. Interfertile with Tonda di Giffoni. Requires 800 hours of chilling. Developed at Oregon State University. BROOKS 1997; A88M, J15M, J61M, N20

## GARLIC {PL}

### ALLIUM SATIVUM

#### HARDNECK GARLIC

A distinct type that produces bulbs as well as a cluster of bulbils at the top of the stalk. Generally hardier than softneck garlic, but much more difficult to braid and with a shorter storage life. Also more demanding in its cultural requirements. Some cultivars are becoming popular as seasonal gourmet items because of their superior flavor, few but large bulbs, and ease of peeling. The oldest form of cultivated garlic, evolving directly from wild garlic, *A. longicuspis*. ENGELAND; D78{PR}. (*A. sativum* Ophioscorodon Group)

Bai Pi Suan: Marbled purple stripe type Very attractive bulb and clove characteristics. Often produces 6 to 8 mahogany colored cloves. Matures about one week earlier than most marbled types. Long storing. Very rare strain from the interior of western China's Xinxiang province. D78

Brown Tempest: Marbled purple stripe type. Very attractive bulbs blotched with purple; brown cloves, blushed with rose, about 6 per clove. Excellent shape and size. Intense hot flavor when eaten raw, mellowing to a warm, pleasant aftertaste. Keeps very well for a hardneck. Collected by John Swenson. D78, F51M, F51M{PR}, J99G, L7M

Carpathian: Originally from the Polish side of the Carpathian Mountains in central Europe. It is common throughout the countries in that region. A garlic with good size and an excellent, pleasantly pungent flavor, fine for all cooking needs. Also makes attractive braids. Matures one week after Spanish Roja. Keeps well. C24, C24{PR}, C24{PJ2}, D78, F73D

Chengdou Hard Leaves: Extremely early strain with broad leaves and thick stems. Both the young leaves and the spears are harvested. The spears have an especially tasty, highly aromatic flavor. Brought to market when plant reaches 20 inches in height. High yielding plants that are sown in August in Chengdou, Sichuan Province, central China. 054

Chesnok Red: Purple stripe type Very large, attractive bulbs, striped with purple; 9 or 10 cloves per bulb, buff-brown streaked and blushed with reddish-purple; easy to peel. Rich aroma and lingering flavor. Excellent for cooking and baking, holding its shape well and retaining flavor. Originated in Shvelisi, Republic of Georgia. D78, J99G, K49T, L7M

De Vivo: Large bulbs with large, easily peeled cloves, 4 to 6 per bulb. Hot and spicy with a good lingering aftertaste. Has excellent commercial potential for the restaurant trade. One of the most dependable cultivars of hardneck garlic for the Mid-Atlantic region. Heirloom from Dr. Gilbert McCollum of the USDA. L7M

Duganskij: Marbled purple stripe type. Attractive, splotched bulbs; usually 6 cloves per bulb. Medium brown cloves, slightly blushed with purple. Productive, late season strain. Also one of the best storing hardnecks. Plants somewhat shorter than most. Originally from Kazakhstan. D78

Georgian Crystal: (Cichisdzhvari #1) Porcelain type. Large, plump, striking paper-white bulbs; very symmetrical and easy to clean; 4 to 7 cloves per bulb Very mild and flavorful when eaten

raw. Stores very well. Deep green plants, 3 to 4 feet tall. Originated in the Republic of Georgia. D78, E34M, J99G, L7M

Georgian Fire: (Cichisdzhvari #4) Porcelain type with smooth, paper-white bulbs and tight wrappers. Similar to Georgian Crystal, except cloves average 5 to 8 per bulb. Also has a stronger flavor, somewhat hot but not unpleasantly so. Excellent raw in salads or salsas. Originally from the Republic of Georgia. D78

German Red: Gourmet rocambole type. Large, light brown bulbs, splashed with reddish-purple; weight 1/4 pound; 8 to 12 cloves per bulb; yellow-fleshed, easy to peel cloves. Strong, hot spicy flavor. Excellent for sauteeing, pureeing, dehydrating or placing the peeled cloves in oil. Also produces large topsets. Optimum vigor, flavor and quality occur when grown where winters are cold. C24, C82, C92, D78, F40M, G16, Fl, F35M, F51M{PR}, 139, 160, J99G, K49T, K71, L7M, L89, M82, M46, etc.

Italian Purple Hardneck: Medium sized bulbs with a strong spicy, pungent flavor preferred by some connoisseurs. White skin with purple stripes. Excellent storage capabilities. Produces clusters of topsets, much like the Egyptian onion. Topset bulblets may require two seasons to produce a full-sized bulb of garlic with separate cloves. C24, F40M, L89

Leningrad: Outstanding porcelain type similar to Romanian Red, but matures slightly later. Large bulbs and cloves, with 4 to 6 cloves per bulb. Dark green plants, up to 4 feet tall. Collected in western Russia near Leningrad, now St. Petersburg, close to the Estonian border. D78, J99G, L7M

Killarney Red: Outstanding rocambole from Idaho. Better adapted to wet conditions than most other strains. The top producing garlic at Filaree Farm in 1994 and 1995. Original source unknown. May have been German Red or Spanish Roja, but now considered superior to both. D78, J99G

Metechi: Marbled purple stripe type Very firm bulbs, nicely marbled or blotched; cloves few, large and plump; thick, brownish skin, blushed and lined with purple. Raw taste fiery, but with a nice finish. Also produces large bulbil capsules and bulbils. Stores very well for a hardneck. D78, F51M, F51M{PR}, J99G

Nichols Top Setting: Produces well-developed, medium sized bulbs that are harvested at the end of the growing season. Easy to peel skin; biting and pungent flavor; keeps well. Also produces several small bulbils at the top of each plant. May be planted in the fall or early spring. 139

Persian Star: Purple stripe type. Outer bulb wrapper occasionally solid white, but inner wrappers streaked with purple; vivid red-tipped cloves with marbled streaks on whitish or yellow-brown background. Mild, spicy, very pleasant flavor. Purchased in a Samarkand, Uzbekistan bazaar by John Swenson. Brought to the United States in the late 1980's. D78, E34M, F73D

Pskem: Very unique marbled purple stripe type. Usually produces only 2 to 4 cloves, but of extremely large size. Bulbs marbled or spotted with purple; brownish cloves. Stores very well for a hardneck. Originally from the Pskem River Valley in Uzbekistan. Collected by John Swenson. D78

Purple Glazer: (Mchadidzhvari #1) Glazed purple stripe type. Similar to Red Rezan. Plumb bulbs with almost satiny bulb and clove wrappers. Cloves not as tall and fewer per bulb than standard purple stripe types. Originally from the Republic of Georgia. D78

Red Rezan: Glazed purple stripe type. Similar to other purple stripe garlics but the bulb color is more of a glazed purple with a tinge of gold. Cloves also have a partial reddish-purple blush in addition to streaks and lines. Strong, lasting flavor but not hot and without an aftertaste. Originally from near Rezan, south of Moscow in the Russian Republic. D78, F73D

Romanian Red: Porcelain type. Attractive, buff-brown bulbs streaked and lined with bright dark-purple. Mostly 4 to 6 cloves per

bulb, and 65 to 80 cloves per pound. Easy to peel. Hot, pungent flavor that lingers. Ripens late in the season and stores well for a hardneck. From Romania via British Columbia, where it is called *red elephant garlic*. D78, F51M, F51M{PR}, J99G, L7M, L89

Russian Red: Large, plump bulbs, veined and blotched with copper and purple; 8 to 13 brown cloves per bulb, doubles common. Strong-flavored but with a sweet aftertaste. Matures with Spanish Roja. Heirloom from British Columbia. Brought there by Doukhobor immigrants from Russia in the early 1900's. D78, M46, N34{PR}

Siberian: Marbled purple stripe type. An outstanding strain with very large bulbs due to weak flower stalk growth in most U.S. latitudes. Produces 5 to 7 plump, dark brown cloves. Originally secured by fisherman trading green leafy vegetables with poor peasants who only grew roots crops. D78

Salt Spring: Purplish bulbs and cloves, about 8 cloves per bulb. A strong but sweet purple garlic with no bitterness; adds an earthy richness and depth to cooked foods. Easy to peel. Good keeping qualities. Grown on Salt Spring Island, British Columbia for more than 15 years. K17M

Spanish Roja: (Rojas) Very large gourmet type, popular in specialty markets. About 10 cloves per bulb, with smaller bulbils on top stems. Teak-brown skin, blushed with reddish-purple, peels easily. Excellent, rich spicy flavor. Good fresh or cooked. Excellent keeper, can be stored 4 to 6 months. Winter hardy. C24, C82, D78, E24, E34M, E59Z, F11, F35M, 139, J99G, J99G{PD}, L7M, L89

Yugoslavian: From a strain adapted to Hornby Island, British Columbia, this garlic has a crisp texture and a strong garlic aroma. Large bulbs, veined and blotched with copper and purple; dark brown cloves, 9 to 14 per bulb. Initially hot and spicy, but mellowing to a warm, pleasant sweet aftertaste. Good keeper. C82, D78, F73D, K17M, L7M

#### SOFTNECK GARLIC

The most common and widely grown garlics in the world. Mostly larger, more productive and adaptable, and longer storing than hardneck types, but generally considered less flavorful. They also produce more cloves per bulb, and only rarely produce topsets. Softneck garlics were developed from the more ancestral hardneck garlics. Sometimes called "artichoke" garlic after the formation of clove layers which resembles the flower head of an artichoke. ENGELAND; D78{PR}

Asian Tempest: Asiatic type with few but large bulbs. Bulbs marked with a very attractive royal purple blush. Nice clove color and shape. Mild and flavorful raw. Beak on topset can reach 18 inches in length. Long storing. Very vigorous and productive plant with broad leaves. Originally from South Korea. D78, I99M, J99G

Burgundy: Creole type with unusually dark coloration. Medium to large, attractive bulbs; 8 to 12 cloves per bulb. Very striking, deep solid burgundy cloves; clove tips not elongated like those of other Creole strains. Sweet, mild flavor. Stores well. Adapted to mild winter climates. Origin unknown. D78, F73D

California Early: (Early California White, Early California Braiding) The well-known white cultivar most commonly seen in markets. Large, clean, well-filled bulbs; flatter than California Late; 10 to 20 cloves per bulb; skin off-white or tan; exceptionally fine appearance; mild delicate flavor. Easily peeled cloves. Matures in about 7 months, but stores for only 4 to 6 months. D78, F11, I99M, K49T

California Late: (California Late White, California White) Firm, strong-flavored bulbs of high quality; skin light pink to deep red or pinkish brown when mature. Ripens June through July, 8 months after planting and as much as 2 to 4 weeks later than California Early. Best keeper of all the white garlics, will last from one harvest to the next. Good for braiding. D76, D78, E97, F11, G16, I99M, J89, J89{PR}, K49T, K66, K71, M46

Chet's Italian Red: Large artichoke type. Averages 5 or 6 bulbs per pound, 15 to 20 cloves per bulb; skin papery white, streaked with purple; medium-sized cloves; keeps very well. Notable for its mild flavor, but may become hot with extreme winter cold. Re-selected from Italian Purple for over 25 years by master gardener Chet Stevenson of Tonasket, Washington. D78, L7M

Chinese Purple: True turban type. Attractive bulbs with medium to dark purple stripes over a purple blush; 7 to 11 cloves per bulb. Very plump, brownish cloves with short dark purple slashes over a light purple blush. Early maturing. Unique turban-shaped bulbil capsule with reddish stripes. D78

Creole Red: (Mexican Purple) Creole type that has won several taste tests. Very attractive bulbs; cloves pinkish-red, with slightly elongated tips. Sweet, mild flavor. Adapted to southern, mild winter areas. Popular in parts of California and the Southwest, and often seen in the markets of Mexico. D78

Dushanbe: True turban type. Very attractive, heavily striped bulbs; 8 to 11 cloves per bulb. Rose brown to mahogany cloves. Unique turban-shaped bulbil capsule with light red stripes. Very early maturing. Bulbs usually attain good size even when plants appear smallish. Originally from Dushanbe, the capital of Tajikistan. D78

Early Italian Red: (Early Italian) A very early maturing artichoke-type garlic. Fairly large bulbs with good reddish-purple color; not as pungent as Italian Red. Looser cloves that are easy to peel. Best red garlic for braiding. Ripens a couple of weeks earlier than Italian Red. D78, K49T

Inchelium Red: Very large bulbs, up to 3 inches or more; 4 to 5 clove layers with 12 to 20 cloves per bulb. Light purple blotching. Cloves milk white or yellowish, with faint purple at base. Mild but lingering flavor that sharpens with storage. Extremely vigorous. Found at Nespelem on Colville Indian Reservation in northern Washington. Winner of a Rodale Kitchen taste test. D78, E24, E34M, E63D, J99G, K49T, L7M

Italian Red: Large bulbs; very large, easily peeled, red-skinned cloves with a consistent symmetrical shape. Very strong, spicy flavor, preferred by garlic connoisseurs. Excellent keeper. Bulbs for planting are available in 2 sizes: 2 inches or larger and 1 to 2 inches. I99M

Japanese: Very unique strain of Asiatic garlic. Produces 5 to 7 large, yellow-tan cloves that are similar to Elephant garlic in appearance. Topsets may reach 20 inches in length. Productive in both cold winter and wet, mild winter climates. Obtained from an elderly Japanese farmer in western Washington. D78

Lorz Italian: Large, occasionally flattened globe-shaped bulbs with 3 to 5 clove layers and 12 to 19 cloves. Excellent strong flavor, sometimes very hot in front of the mouth. Well adapted to summer heat. Northwest heirloom brought to Washington state's Columbia River basin from Italy by the Lorz family, prior to 1900. D78, L7M

Maiskij: True turban type. Attractive, heavily striped bulbs; 7 to 11 cloves per bulb. Plump, blunt-topped cloves with short purple dashes and a partial blush. Unique turban-shaped bulbil capsule. One of the earliest maturing of all garlics. Obtained by John Swenson from a bazaar in Ashkabad, Turkmenistan. D78

Mild French Silverskin: Red blush overlaid with dark thin red lines on yellow-white background. Mostly 4 clove layers and 13 to 16 cloves per bulb. Hot, sharp taste raw, but smooth and nutty when cooked. Earlier maturing than many silverskins. Well adapted to hot, dry climates. Originally from Texas. D78, E28M, L7M

Morado de Pedronera: (Spanish Morado) Premium Creole type garlic preferred in Europe and South America. Very attractive bulbs; striking, red-skinned cloves. Sweet, mild flavor. Stores well. Adapted to mild winter climates. Softneck garlic that bolts weakly. Originally from the Andalusia region of Spain. D78, K66

Munhung: Arti-Bean type. Has some of the characteristics of turban and Asiatic garlics but matures later. Bulbils may appear in short bean-shaped capsules. Attractive bulbs; 7 to 9 cloves per bulb. Brown cloves, slightly blushed and striped with purple. Originally from North Korea. D78

Nichols Silverskin: A strain of silverskin garlic developed through many years of selection for strong flavor, large size, and easy-peeling qualities. Small, individually wrapped cloves; 2 inch diameter bulbs. Good flavor and keeping qualities. 139

Nootka Rose: Silverskin type, more elegant and refined in appearance than common artichoke types but fussier about soil and climate. Well-colored bulbs with mostly 5 clove layers; 15 to 24 cloves per bulb, up to 35 if large outer cloves subdivide. Mahogany cloves, streaked with red. Strong flavor. Excellent for braiding. Northwest heirloom from the San Juan Islands off the coast of Washington. D78, F73D

Pyongyang: Asiatic type with few but large bulbs. Bulbs blushed and striped with purple; 6 to 8 cloves per bulb. Light brown cloves, elongated at the tips and blushed with rose-purple. Bulb capsule with a 7 to 10 inch beak. Originally from near Pyongyang, the capital of North Korea. D78

Red Janice: Turban type. Attractive bulbs with heavy solid stripes over a purple blush; 8 or 9 brownish cloves per bulb. Topsets do not have the typical turban shape. Matures somewhat later than other turban types, but stores longer. Originally from near Nmarazeni in the Republic of Georgia. Named in honor of Janice Masterjohn. D78

Rose du Var: Silverskin type originally imported from France by Basic American Foods. Attractive bulb and cloves with nice reddish colors. Generally quite strong flavored, and can be extremely hot under certain growing conditions. Stores very well. Also very good for braiding. D78

Silverskin: Attractive, firm, pure-white bulb; medium to large in size, about 10 bulbs per pound; large, reddish-purple cloves. Classic culinary type; excellent, strong distinct flavor. Good keeping qualities. Regarded as one of the finest standard white garlics and a favorite for braiding. F40M, FI 1, F35M, K49M

Susanville: Small to medium-sized bulb; 1 to 2 inches in diameter; weight 1/4 pound; skin thin, white; 19 to 22 cloves per bulb; cloves large, somewhat flattened in shape; keeps very well, one month to six weeks longer than California Late. The flavor is excellent for all culinary uses. Popular and widely adapted strain. Introduced in 1982. D78

Tipitilla: Silverskin type. Mid-season garlic with high oil content and superior flavor. Numerous, dull pink cloves. One of the longest keeping cultivars, often storing until the following harvest. Heirloom from Arizona that should perform well in other southern latitude areas. D78

Tzan: Turban type. Very attractive bulbs, heavily striped with purple; 8 to 11 cloves per bulb. Light brown cloves, blushed with rose on the back. Very early maturing but does not store well. Grown commercially in China's Shandong Province and often marketed in Mexico. D78

## GOOSEBERRY {GR}

RIBES SPP.

### AMERICAN GOOSEBERRIES

Generally smaller and less flavorful than European types, American gooseberries are more tolerant of heat and cold and can be grown over a wider area. Many are also more resistant to powdery mildew. The dark-skinned cultivars are considered to be the sweetest. Mostly *R. hirtellum*.

### PARK-SKINNEP

Canada 0-273:<sup>1</sup> Fruit medium in size, pear-shaped; skin copper red; flavor very good; quality excellent. Bush relatively thornless; pest resistant; light bearing. Originated in Ottawa, Ontario, Canada at the Central Experiment Farm. NO

Captivator:<sup>1</sup> Medium to large, pear-shaped fruit; skin light red to full red when ripe; flavor very sweet; ripens in late July. Bush vigorous and productive; upright, 4 to 6 feet tall; completely thornless; very winter hardy; resistant to mildew. Originated in Ottawa, Ontario, Canada. Introduced in 1952. BROOKS 1972; A74, B43M, B74, F43M, F87, I49G, 174, J61M, J89M, L12, M81M, NO, 081

Clark: Very large fruit; skin thick, rather tough; skin color greenish-yellow turning red when mature; flesh color red; flavor mild, sweet; quality fair to good; free of mildew; easy to pick; ripens in late mid-season. Bush moderately vigorous; handy. Originated in Burlington, Ontario, Canada by M.C. Smith. Introduced in 1922. BROOKS 1972; L12, NO

Glennedale: (*R. missouriensis* x) Fruit roundish-elliptic; skin smooth, thin; skin color dark reddish-purple; seeds small; quality good; excellent for jam; resistant to mildew. Bush vigorous and productive; erect, up to 8 feet tall; resistant to leaf spot and mildew. Best suited for southern limit of gooseberry growing in the United States. Originated in Little Silver, New Jersey. Introduced in 1932. BROOKS 1972; D37, D47

Houghton: Very small, roundish fruit; skin smooth, thin, dull dark red; flesh greenish, moderately juicy, tender, very sweet, of a pleasant rich flavor; quality very good; ripens in midseason. Bush very large, vigorous; upright, becoming very spreading; productive to very productive; very hardy; widely adapted. Originated in 1833 by Abel Houghton, Lynn, Massachusetts. HEDRICK 1925; C45M, K75T

Josselyn: (Red Jacket) Fruit medium in size, roundish oval; skin smooth; skin color reddish green, becoming pale red when ripe; flesh rich, juicy, fragrant, sweet; quality very good to excellent; early ripening. Bush large, spreading; vigorous and productive; practically free from mildew. Originated in London, Ontario, Canada. Introduced about 1890. HEDRICK 1925; C61, G71, N0

Mountain: (Pence's Champion) Medium-sized, oblong fruit; skin smooth, thick; skin color dull brownish-purple; flesh moderately juicy, sweet. Bush tall, upright; vigorous; very disease resistant. Does well in hot weather. Discovered by a colony of Shakers about 1846 growing wild at Lebanon, Nov York. HEDRICK 1925; D47

Pixwell: (*R. missouriensis* x) Fruit medium in size; borne in clusters and on long stems away from the thorns which makes for easy picking; skin pale green, becoming pink when ripe, thin; few thorns; good for all culinary purposes. Bush compact; hardy; very productive; widely adapted. Originated in Fargo, North Dakota by A.F. Yeager. Introduced in 1932. BROOKS 1972; A16, B19, B43M, B73M, C61, F43M, G16, H65, J2M, J63M, K64, M65M

Poor man: (Early Poorman) Medium to large, roundish oval to somewhat pear-shaped fruit; skin smooth, rather tough; skin color pale silvery-green gradually changing to pinkish-red to almost wine-red when ripe; flesh greenish, juicy, tender, aromatic, very sweet; quality excellent. Bush very large and productive; disease resistant. Originated in Brigham City, Utah by William H. Craighead. Introduced in 1896. HEDRICK 1925; A91, B43M, D47, I49M, J61M, L12, L79, M81M, NO

Sylvia:<sup>1</sup> Fruit round, medium in size, about 1 inch in diameter; skin silvery-green, with a light pinkish-red blush when fully ripe; flesh aromatic; quality excellent, flavor mild, sweet, delicious; ripens in mid-July. Bush spreading; heavy bearing; relatively thornless; disease resistant. Originated by William Saunders, Central Experiment Station, Ottawa, Canada. L12, NO

Welcome: Medium-large fruit; skin light dull-red, glabrous; flesh pink; quality good, flavor tart; seeds few, small; ripens before Pixwell. Often picked when green for use in pies and preserves. Bush vigorous; productive; relatively free of disease, especially anthracnose; spines sparse, short, weak, missing on older wood. Originated in Excelsior, Minnesota. Introduced in 1957. BROOKS 1972; B19, C47, C61, D37, D65, D76, E97, I66T

#### LIGHT-SKINNED

Colossal: Very large, oval fruit, 1 1/2 inches in diameter; skin translucent green, refreshingly tart; flesh sweet and mild; ripens in mid-July. Ideal for pies, jams or jellies. Bush vigorous, about 5 feet tall; very winter hardy; heavy bearing; disease resistant. C34, D47, D65, I49M, I49P, I66T, J61M, NO

Oregon Champion: (Champion) Medium to large, roundish-oval fruit; skin greenish-yellow; quality good, flavor tart; ripens early; holds its color well. Good for pies, jams and wines. Bush vigorous, 3 to 5 feet tall; productive; resistant to mildew. Originated in Salem, Oregon by O.D. Dickinson, prior to 1880. HEDRICK 1925; A91, B19, B43M, C54, H49, I49G, J63M, L12, M65M, M81M, NO

#### EUROPEAN GOOSEBERRIES

Generally considered superior to American gooseberries in both size and flavor. However, they require a more moderate climate with less extremes of both heat and cold. The yellow-skinned types are most highly valued for eating out of hand. Mostly R. grossularia.

#### DARK-SKINNED

Achilles: Very large, elliptical fruit; skin red; flavor sweet; dessert quality very good; ripens late. An old English cultivar still grown in northern Europe where the small unripe berries are used for compote and jelly and the ripe fruit is used for jam and preserving. Bush spreading. C34, D47, J49P, I66T, L12, NO

Black Velvet: (Wine Velvet) (R. divaricatum x) Small, grape-like fruit, about 5/8 inch in diameter; unique, very attractive, reddish-black to jet-black color. Dessert quality very good. Very vigorous, easy to grow bush, 3 feet tall and 4 feet wide. Completely resistant to mildew. Worcesterberry x Red Champagne gooseberry. Originated in England. B74, D47, F16, H49, I49M, J61M

Crown Bob: Medium to large, oblong fruit; skin somewhat hairy, thin; skin color dark-red; flesh firm, juicy, sweet; quality good; ripens in mid-season. Used for dessert or cooking; also good for canning and jam. Bush large, spreading, pendulous; vigorous and productive; fairly resistant to powdery mildew. Has been grown in England for well over 100 years. HEDRICK 1925, SIMMONS 1978; NO, R83

Dan's Mistake: Very large, roundish, pale red fruit; thin skin with only a few scattered hairs; delicious flavor; ripens in midseason. Excellent for dessert and exhibition. Vigorous, spreading bush, fairly productive. Chance seedling which originated in England before 1865. R83

Fredonia: Fruit very large, roundish oval; skin attractive, thick, tough; skin color dark red; flesh tender, mild, juicy, subacid to sweet; quality very good; keeps and ships well; ripens late. Bush vigorous and productive; upright-spreading; thorny. Originated in Geneva, New York by Richard Wellington. Introduced in 1927. Open-pollinated seedling of an unknown English-type. BROOKS 1972; 174

Hinnonmaki Red: Large fruit; skin dull-red; flavor very good, having a perfect balance of sweetness and acidity. Good for pies, jams and jellies. Bush vigorous and productive; spreading; very hardy and disease resistant. Developed at the research station in Hinnonmaki, Finland. A74, C58, F16, G50, H42, K64, L33, 081

Lancashire Lad: Large, oblong-oval fruit; claret red, becoming dark red when fully ripe, hairy; flesh juicy, flavor fair; at its best when picked green for cooking, excellent for jam, canning and exhibition. Bush fairly vigorous, upright at first but becoming

spreading; has good resistance to American powdery mildew. First recorded about 1824. SIMMONS 1978; R83

Lepaa Red: Medium to large fruit; skin red; rich tart flavor. Excellent for pies and jams. Bush exceptionally vigorous; very hardy; disease and pest resistant. Developed at the research station in Hinnonmaki, Finland near the gardening school of Lepaa. First cultivated in 1950. Widely grown in Europe. A91, D47, F87, I74, J61M, L12, NO

London: Very large, oval fruit; skin smooth, dark red to crimson; flavor good; ripens midseason to late. Bush spreading, but makes few branches; requires a rich soil; flowers mid-period. Production very good. One of the best red exhibition cultivars. SIMMONS 1978; R83

May Duke: Medium to large, roundish, dark-red fruit with slightly downy skin; flavor good when cooked, only fair for dessert. One of the earliest varieties for picking green. Grown commercially in England for the early berry trade in May. Upright, moderately vigorous bush, very productive. Introduced in 1900. SIMMONS 1978; L12, 081, R83

Red Champagne: Small, roundish fruit; skin somewhat hairy, dark red; flesh sweet, of very good quality. Bush vigorous, resistant to mildew. A very old English cultivar once generally grown in eastern North America. HEDRICK 1925; D47

Whinham's Industry: Large, oval fruit; skin hairy, light to very dark-red; flesh yellowish-green, juicy, tender; flavor very sweet; ripens mid-season. Very popular all-purpose cultivar; excellent for picking green, for canning, freezing and jam making, and for dessert. Bush vigorous and productive; upright; susceptible to powdery mildew. HEDRICK 1925, SIMMONS 1978; D47, I66T, L12, NO, 081, P59M, R83

#### LIGHT-SKINNED

Broom Girl: Large, roundish-oval fruit; skin dark golden-yellow; flavor very good; ripens very early. Good for dessert and exhibition. Bush very vigorous and productive, blooms late. Originated in England. Introduced prior to 1852. At one time a good commercial cultivar. SIMMONS 1978; D47, R83

Careless: Large, oval fruit; skin smooth, transparent; skin color green milky white when ripe; flavor sweet; quality good; ripens early mid-season. Good for jams, bottling, canning, freezing and dessert. Bush upright when young but becoming spreading and somewhat pendulous. Most popular cultivar in England. Known before 1860. SIMMONS 1978; C58, D47, L12, NO, N24M, 081, R83

Catherina: (Catherine) Large to very large oval fruit; skin thick, nearly smooth, bright orange-yellow with a few green marks and a single green stripe; flavor sweet, quality very good; ripens late. Bush moderately vigorous; productive; slightly inclined to mildew. Excellent exhibition cultivar. Originated in England about 1840. HEDRICK 1925; D37, D47, I49M, I49P, I66T, L12, NO, 081

Cousen's Seedling: Medium to large, oval fruit; skin clear pale yellow, slightly hairy; flesh firm, sweet, flavor fairly good; ripens very late. Excellent for dessert, cooking, canning and jam. Bush vigorous, spreading, rather prickly, bears well. Popular due to its lateness and attractive color. SIMMONS 1978; D47, R83

Criterion: Very large, oval, plump fruit; skin smooth, deep yellow mottled with green; quality and flavor very good; ripens midseason to late. Excellent for exhibition. Bush large, upright to spreading. Originated in England. R83

Early Sulphur: Medium-sized, roundish oblong fruit; skin thin, covered with rather long hairs; skin and flesh color pale golden-yellow; flavor sweet, fairly good; ripens very early. One of the best early gooseberries for cooking; also excellent for dessert. Bush large, vigorous and productive; upright to spreading. Raised before 1825. SIMMONS 1978; D47, L12, NO, 081, R83

Glenton Green: Medium-sized, translucent, pale green berries, 1 inch or more in diameter; quality very good. An old English gooseberry rated as "best flavored" by Bunyard. D47,149M, 149P, 166T

Green Ocean: Very large, roundish, dark-green fruit; smooth skin; very good, sweet flavor; ripens in early mid-season, about mid July. Excellent for dessert and exhibition. Fairly vigorous, spreading bush, relatively productive. First recorded in England in 1834. SIMMONS 1978; R83

Gunner: Very large, round-oval fruit; skin dull olive green, somewhat transparent but hairy; sweet, meaty flesh, mild flavor; excellent for dessert, exhibition or jam making; ripens midseason to late. Bush spreading with long, stout shoots; very productive. SIMMONS 1978; D47, R83

Hinnonmaki Gold: (Hinnonmaki Yellow) Fruit very large to exceedingly large, round or oval; skin smooth, shiny; skin color yellowish-green. A dessert berry of sweet, rich flavor. Bred in Finland from large-berried European cultivars and mildew-resisting American cultivars. Completely haidy, surviving the severest winters in Finland. Widely grown throughout Europe. C58, D47, F87, G50,174, J61M, K64, L12, NO, 081. P68M

Hoenings Earliest: (Honing's Fruheste) Roundish, medium to large fruit; skin hairy, thick, beautiful golden yellow; flesh very tender and juicy with a sweet, mild plum-like flavor; quality very good; ripens in early July. Large, vigorous, productive bush. Originated in Neuss, Germany about 1900. One of the earliest and most attractive of gooseberries. SIMMONS 1978; D47, NO

Howard's Lancer: Fruit medium-sized, roundish to oval; skin smooth, transparent, thin; skin color yellowish-green when ripe; flavor excellent. Useful for dessert or picking green for cooking; also good for jam, canning or freezing. Bush large, vigorous and spreading; susceptible to mildew. SIMMONS 1978; D47, NO, 081, R83

Invicta: Medium-sized, greenish fruit of excellent quality. Suitable for pies, jam or freezing. Ideal for U-Pick operations. Precocious, well-shaped bush. Resistant to mildew. One of the newest releases from the East Mailing Research Station. (Resistanta x Whinham's Industry) x Keepsake. B74, D37, D47, F16, H42, I66T, J61M, L33, NO, 081, P68M

Keepsake: Fruit medium to large, oval; skin slightly hairy, thin; skin color whitish-green; flesh greenish, juicy, firm; flavor very good; ripens in mid-season, but one of the earliest when picked green for cooking. Excellent for canning and freezing. Bush vigorous and very productive; spreading and pendulous; susceptible to powdery mildew. HEDRICK 1925, SIMMONS 1978; D47, NO, 081, R83

Langley Gage: Large, roundish oval fruit; skin transparent giving it a silvery appearance; skin color pale yellow; flesh very sweet; flavor exceptionally good. Excellent for dessert. Bush strong growing; upright at first but tending to spread with age. Its tendency to produce berries in the center of the bush makes picking difficult. D47, R83

Leveller: Large, oval fruit; skin slightly dowry, almost smooth; skin color yellowish-green; flavor excellent; ripens in mid-season. Most widely grown dessert gooseberry in England; like Cox's Orange Pippin of apples, it is the aristocrat of gooseberries. Bush vigorous and productive; spreading and pendulous. SIMMONS 1978; D47, NO, 081, R83

Pitmaston Greengage: Small, oval fruit; skin smooth, yellowish-green; excellent dessert flavor; ripens midseason to late, hangs on die bush a long time. Bush fairly vigorous and erect; blooms in early mid-period; bears good crops. SIMMONS 1978; R83

White Lion: Large, oblong fruit; skin slightly hairy, pale whitish-green; flavor very good; ripens very late. Bush vigorous and spreading; high yielding; blooms late mid-period; grows well on soils on which other cultivars do poorly. An excellent late white dessert

gooseberry. Can also be picked green for cooking. SIMMONS 1978; D47, R83

Whitesmith: Roundish oval, medium to large fruit; skin thin, tender, downy; skin color very pale cream with slight green tinge; flesh light green, juicy, firm but tender; excellent sweet flavor; ripens mid-season. Popular for both cooking and dessert purposes. Bush vigorous; upright at first but becoming spreading. First raised about 1824. HEDRICK 1925, SIMMONS 1978; D47, H85,166T, J61M, L12, NO, 081, P59M, R83

### VITIS SPP.

---

#### TABLE GRAPES

AMERICAN These are mostly slipskin grapes, characterized by pulp that readily slides out of the skin. They have soft flesh and a distinctive, "foxy" or musty flavor and aroma. Most have moderately vigorous vines that are trailing instead of upright, and are resistant to many insects and diseases. Generally more cold hardy than Vinifera and French hybrid grapes. Mostly *V. labrusca*.

#### *Blue-Skinned/Seeded*

Alden: Large, oval fruit; skin purplish-black, adherent; flesh firm, juicy, meaty, tender, pleasantly aromatic; quality very good; ripens just after Concord. Vine vigorous, productive, tends to overbear; adapted to a wide range of soils; somewhat susceptible to winter injury. Large, loose clusters. Recommended for home garden and local market use. BROOKS 1972; E1{SC}, H65, J98{SC}, J98{OR}, LIM, LIM{SC}, L12, M81M

A1 wood: Medium-sized fruit; skin blue-black with heavy waxy bloom, slipskin, not subject to cracking; flesh sweet, moderately foxy, flavor comparable to Worden or Concord; quality good; ripens a few days after Fredonia. Vine moderately vigorous, productive; hardy; tolerant to black rot, anthracnose, downy mildew and powdery mildew. Cluster medium-sized, compact. BROOKS 1972; A39, C45M, M81M

America: Medium-sized, globular fruits; skin thin and tender, black with little bloom; flesh juicy, melting, very rich in sugar and agreeable acids; flavor distinct, not foxy, much appreciated by some; ripens slightly after Concord. Quality high for dessert or wine. Capable of producing a very good Port wine without fortification. Prolific, drought tolerant, and extremely haidy. Cluster conical, compact. MUNSON; D37,11{SC}, J98{SC}, J98{OR}

Bailey: Medium to large, roundish fruit; skin purplish-black, covered with a heavy blue bloom; flesh moderately juicy and tender, coarse, vinous, quality good; seeds numerous; ripens as late as Catawba; keeps well. Vine vigorous; productive; injured in severe winters. Cluster large, long, compact. Originated in Denison, Texas by T.V. Munson; first fruited in 1889-90. HEDRICK 1908; II{SC}

Bath: Medium-sized, round oval fruit; skin bluish-black; flesh tender, juicy, sweet, quality fair; ripens the end of September in New York; lacks the foxy flavor of Fredonia, which it resembles.

Vine vigorous; very productive, tends to overbear; fairly hairy. Cluster medium-sized, compact. Originated in Geneva, New York. Introduced in 1952. BROOKS 1972; C82, J98{SC}, J98{OR}, M81M

Beaver: Fruit medium-sized; skin black; flesh firm, tender, juicy, separates easily from seeds, highly flavored; quality high; ripens a week before Moore Early; hangs well without cracking or shattering. Makes an excellent jelly. Vine vigorous, productive, self-fertile. Medium-sized clusters. Originated in Mountain Grove, Missouri. Introduced in 1947. BROOKS 1972; L12

Beta: Small to medium-sized fruit; skin bluish-black, slip-skin; flesh juicy, foxy, tart; table quality fair, excellent for juice, jams and jellies; ripens early. Vine extremely hardy; productive, self-fruitful. Cluster fairly large. Originated in Carver, Minnesota prior to 1908. HEDRICK 1908; A74, B4, B47, C45M, C58, D65, D69, E97, H42, I49G, L27M, L70

Black Spanish: (Lenoir) Small to medium-sized, roundish fruit; skin dark bluish-purple, nearly black, with lilac bloom, rather thick, tough; flesh slightly juicy, tender, subacid, very rich in coloring matter. Popular for juice, jelly and a dark red wine. Vine vigorous, usually quite productive; semi-hardy; tolerant to drought and Pierce's disease. Probably originated in one of the Carolinas or Georgia some time in the 18th century. HEDRICK 1908; A19, C54, N33

Blue Lake: (*V. simpsonii* x) Skin uniformly blue with a light surface bloom; flesh spicy, slightly tart; ripens from late June to late July at Leesburg, Florida. Suitable for fresh and processed juice, jellies and preserves. Vine self-fruitful; resistant to Pierce's disease. Cluster large, loose. Excellent for home gardens in the Deep South. BROOKS 1972; I41M, K76

Bluebell: An older grape becoming more popular. Medium-sized, bluish-black fruit, resembles Concord but with more tender skin. Dessert quality high, also excellent for juice and jelly. Ripens in early to mid-September. Medium-sized clusters. Vigorous, very hardy, productive vine. Hybrid of Beta. Originated in Excelsior, Minnesota. Introduced in 1944. A74, D69, G4, I49G, I49G{SC}, L70

Buffalo: Medium-sized fruit; skin reddish-black, bloom heavy, tough, slip-skin; flesh translucent, moderately juicy, tender, sweet, not aromatic; flavor pleasant, tart, spicy; quality excellent; ripens about 1 week before Concord. Vine vigorous, productive, hairy. Medium-large, well-filled cluster. For home gardens and local markets. BROOKS 1972; B6, C45M, H65, J98{SC}, J98{OR}, K36, L12, M81M

California Concord: (Pierce, Isabella Regia) Fruit very large, oblong; skin black, with a light bloom; flesh tender, very sweet, strongly aromatic; quality good for table use, juice and jelly; keeps fairly well. Vine very vigorous, prolific. Cluster large. Bud-sport of Isabella, originating about 1882 with Mr. J.P. Pierce, of Santa Clara, California. HEDRICK 1908, WICKSON; C54, E1 {SC}, G49

Campbell Early: Medium to large fruit; skin dark purplish-black, bloom heavy, slip-skin; flesh juicy, slightly foxy, somewhat vinous, sweet; quality good, improves by hanging on the vines; ripens over a long period; keeps and ships unusually well. Vine vigorous, hardy, productive; canes of average length. Originated in Delaware, Ohio in 1892. HEDRICK 1908; B74, F43M, J98{SC}, J98{OR}, M81M, P68M

Carman: Small, roundish fruit; skin dark purplish-black, glossy; flesh yellowish-green, not juicy, vinous, spicy, sweetish near the skin to tart by the seeds; ripens just before Catawba; keeps exceptionally well, both on the vine or in storage. Vine vigorous; lacking in productiveness; hardy. Cluster medium-sized, tapering, compact. Originated in Denison, Texas by T.V. Munson. Introduced in 1892. HEDRICK 1908; I1{SC}, N33

Champanel: (*V. x champini* x *V. labrusca*) Large, globular fruit; skin black; quality excellent when fully ripe (about 2 weeks after turning blue); ripens with Concord. Makes a dark-blue juice and excellent jelly. Vine very vigorous; tolerant to adverse soil and weather conditions; resistant to Pierce's disease. Clusters large, loose, conical. Adapted to the prairies of the Southwest. Originated in Denison, Texas by T.V. Munson. MCEACHERN; A19, C54, E39, E39{SC}, I1{SC}, J83D{PE}, M83, N33

Concord: Medium to large, roundish fruit; skin black, slightly adherent, bloom blue, abundant; flesh juicy, foxy, sweet near the skin, somewhat tart near the seeds; quality good; ripens in mid-season; keeps from 1 to 2 months. Vine vigorous, productive; hardy; widely adapted. Medium to large clusters. Standard American grape for juice, jelly, etc. Originated in Concord, Massachusetts in 1849. B43M, B53, B58, B73M, C61, C82, D37, D76, G23, G43, I83M, J2M, J83, L70

Conquistador: Attractive deep purple fruit with a light gray bloom; good foxy flavor; ripens mid to late July; resembles Concord. Excellent table and juice grape, also makes good jelly and a beautiful red wine. Medium-sized, tight clusters. Usually grafted onto a nematode resistant rootstock to insure good vigor and highest yields. Resistant to Pierce's disease. Originated in Leesburg, Florida. Introduced in 1983. G17, I41M, M95T

Fern Munson: Medium to large fruit, very dark purplish-red to nearly black; very juicy, with an agreeable, sprightly flavor reminiscent of Catawba when ripe. Ripens very late, in August and September, holds until frost while improving in quality. Vigorous vine with medium to large clusters. Hardy to about -27° F. Originated in 1883. MUNSON; F43M

Fredonia: Fruit large; skin black, thick, tough; quality good, superior to any other black cultivar of its season; inclined to shatter badly at maturity; ripens early. Vine vigorous, fairly productive; hardy; susceptible to powdery mildew. Cane prune. Cluster medium-sized, compact. BROOKS 1972; A82, B43M, B53, C61, D65, F93, G16, H65, I49G, J2M, J16, L70, M99G

Isabella: Medium to large, oval fruit; skin deep black with a heavy blue bloom, very tough, adherent; flesh juicy, tender, foxy, sweet to subacid; quality good; ripens with Catawba or earlier; keeps and ships well. Vine moderately vigorous and productive, hardy, susceptible to mildew. Cluster medium to large. Introduced about 1816. The most widely grown American cultivar in other parts of the world. Grown commercially in tropical and sub-tropical regions of Colombia, Brazil and India. HEDRICK 1908, WINKLER; C45M, E1{SC}, E39, E39{SC}

Lomanto: Medium to large, spherical fruit; skin black, thin but tough; juice claret red; quality excellent; seeds small and few. Vigorous, prolific vine; resistant to rot and mildew; does well on alkaline soils and in hot, dry climates. Nearly extinct cultivar introduced by T.V. Munson in 1902. C54, I1{SC}, I83M, N33

New York Muscat: Medium-sized, oval fruit; skin reddish-black, bloom heavy; flesh juicy, richly sweet, with a fine muscat flavor; quality very good; ripens early, with Delaware. Suitable for table use and sweet red wines. Vine moderately vigorous and productive; may suffer winter injury below -15° F. Cluster medium-sized, loose to well-filled. BROOKS 1972; E1{SC}, E39, E39{SC}, J61M, J98{SC}, J98{OR}, LIM, L7Af{SC}, NO, R77

Niabel: Uniformly very large, spherical fruit; skin jet black; ripens in midseason. Suitable for table use, fresh juice, and semi-sweet wines. Vine vigorous, canes long; productive; tolerant to cold and powdery mildew; grows and fruits well even in shade. Short, conical, well-filled clusters. Spur or cane prune. BROOKS 1972; A88M, C54, E1 {SC}, I83M, LIM, LIM{SC}

Price: Medium-sized, bluish-black fruit; pure, sweet flavor lacking any of the American foxiness; ripens 3 weeks before Concord. Very good for table use and juice. Vine vigorous, productive. Relatively small, medium compact clusters. One of the best cultivars for extra

cool areas of the Pacific Northwest because of its ability to ripen early, even in cool weather. J61M, J98{SC}, J98{OR}, M81M, NO

Schuyler: Fruit medium-sized; skin bluish-black, tough, astringent; flesh soft, juicy, has much of the flavor of a vinifera grape; ripens 3 to 4 weeks before Concord. Excellent for table use, fresh juice, or light red wine. Vine, moderately vigorous; productive; fairly hardy and disease resistant. Cluster large, well-filled. BROOKS 1972; B74, C82, E1{SC}, H65, J98{SC}, J98{OR}, M81M, N84

Sheridan: Large, round fruit; skin tough, black with a fine light-blue bloom; flesh firm, sweet, delicately flavored; quality very good; ripens late, about 1 week after Concord. Vine moderately vigorous, productive, handy. Cluster large, compact. Originated in Geneva, New York by S.A. Beach. Introduced in 1921. BROOKS 1972; B19, C45M, H65, L12

St. Croix: Medium-sized fruit; skin blue; flesh very juicy, flavor neutral, *su&r* usually 18 to 20 Brix, acid .80 to .90; ripens early, about 6 weeks before Concord. Makes an excellent, almost neutral vinifera-type red wine. Vine productive; haidy to about -40° F. without protection, less in windy areas. Clusters medium-sized. Originated in Osceola, Wisconsin by Elmer Swenson. A74, I49G{SC}, J98{SC}, J98{OR}, L27M, N24M

Steuben: Medium-sized fruit; skin bluish-black, slightly tough; flesh high in sugar, non-foxy, flavor rich and vinous; table quality very good; ripens with Concord, keeps well. Makes an aromatic white wine. Vine vigorous, very productive; hardy; tolerant to downy mildew and black rot. Cluster medium-sized, compact. BROOKS 1972; A91, C45M, G54, G79M, G87, H49, H65, J98{SC}, J98{OR}, L12, M81M, M99G

Valiant: Small, dark-purple, slipskin fruit; flesh sweet, mildly foxy; quality very good for its class; ripens 1 month before Concord. Vine vigorous; extremely haidy, to -50° F.; very precocious, often bearing the same year it is planted; self-fruitful. Small, tight clusters. Developed by Dr. Ron Peterson of the University of South Dakota. A65, B4, C45M, C58, D76, G54, H42, H85, I49G, J98{SC}, J98{OR}, L27M, L70, L79, NO, etc.

Van Buren: Medium-sized fruit; skin jet black; flesh juicy, sweet, foxy; table quality good; quality of unfermented juice not equal to Concord; ripens very early; teeps poorly. Vine fairly vigorous, moderately productive; hardy; susceptible to downy mildew. Small to medium, well-filled cluster. Recommended as an early maturing Concord type. BROOKS 1972; A91, H65, J98{SC}, J98{OR}, K36, M81M

Worden: Large, roundish to oval fruit; skin dark purplish-black, glossy, covered with a heavy blue bloom; flesh juicy, slightly foxy, sweet, mild; quality good to very good; ripens 1 or 2 weeks earlier than Concord; does not keep well. Vine vigorous, productive; very hardy. Introduced about 1867. Clusters large, compact. HEDRICK 1908; A74, C45M, G4, H65, H88, I49G, I49G{SC}, J98{SC}, J98{OR}, K36, L27M, M81M, N24M

#### *Blue-Skinned/Seedless*

Concord Seedless: Bud-sport of Concord released by the New York Agricultural Experiment Station. Similar color to its parent; smaller clusters and fruit; sweeter flavor; ripens about 1 week earlier. Excellent for pies. Occasional seed vestiges present. Vine vigorous and productive with age. B53, B73M, B75, C45M, D76, E3, G43, H49, H58, H65, J2M, J63M, L12, L70, M65M, etc.

Glenora: Small to medium-sized fruit; skin blue-black, thin; flesh firm but tender, juicy, sweet, somewhat foxy, entirely seedless; quality very good for table use; ripens 2 to 3 weeks before Concord. Vine vigorous, moderately productive; hardy; resistant to mildew. Clusters loose. Released by the Nov York Agricultural Experiment Station. C45M, G23, G43, H49, H65, I49M, J2M, J98{SC}, J98{OR}, K89, L33, M81M

Mars: Medium to large, round fruit; skin blue, slipskin; flavor rich and sweet, slightly foxy, somewhat resembling that of Campbell Early; ripens about 2 1/2 weeks before Concord; handles and ships well. Vine vigorous, productive; resistant to black rot, anthracnose, powdery and downy mildews. Clusters medium-sized, compact. Originated in Clarksville, Arkansas by Dr. James N. Moore. A39, B22, B43M, B73M, C45M, D65, F93, I49G, 178, J2M, J98{SC}, J98{OR}, L33, M99G, N33, etc.

Venus: Fruit large; skin blue-black, attractive, resists cracking; flesh sweet, flavor somewhat reminiscent of muscat; ripens 3 to 4 weeks before Concord. Occasional seed vestiges present. Vine productive, very vigorous; buds out early. Clusters large, compact. Developed at the University of Arkansas by Dr. James N. Moore. B22, B43M, C45M, C61, F93, G23, J2M, J61M, J98{SC}, J98{OR}, L90, NO, N33

#### *Green-Skinned/Seeded*

Diamond: (White Diamond, Moore's Diamond) Medium-sized, roundish fruit; skin greenish-yellow, tough, adherent; flesh juicy, tender, somewhat melting, slightly aromatic, sprightly, sweet, quality very good; ripens slightly before Niagara, keeps well. Makes excellent white grape juice. Vine moderately vigorous, haidy, productive. Clusters medium-sized, compact. Introduced about 1885. HEDRICK 1908; C45M, E1 {SC}, H65, J98{SC}, J98{OR}, L12, M81M

Dutchess: Fruit medium-sized, roundish to oval; skin pale yellowish-green, tough, adherent; flesh juicy, tender, vinous, sweet, of pleasant flavor; quality high; ripens in midseason; keeps and ships well. Vine moderately vigorous and productive, often not haidy. Cluster medium to large, relatively compact. Introduced about 1880. HEDRICK 1908; E1 {SC}, J98{SC}, J98{OR}

Edelweiss: Medium-sized, greenish-yellow, slipskin fruit; flesh tender, very juicy, sweet, slightly foxy; quality good for table use, juice and wine; ripens with or just after Himrod. Vine vigorous, productive; disease resistant; haidy to about -30° F. without protection. Cluster large. Introduced by the University of Minnesota. A39, A74, B74, C45M, D65, E97, F43M, G16, I49G, J98{SC}, J98{OR}, L27M, L70, NO, N24M, etc.

Eona: Small to medium fruit; skin white; flesh very sweet, lacks the tartness of purple types; table quality fair, suitable for wine; ripens mid to late September. Vine productive; very hardy; self-pollinating. Clusters loose. Originated in Brookings, South Dakota by N.E. Hansen. Introduced in 1925. BROOKS 1972; D11M, F70, G50, J98{SC}, J98{OR}, N24M

Golden Muscat: Large, round-oval fruit; skin golden-yellow; flesh very juicy, soft, sweet, aromatic, slight muscat flavor; quality excellent; ripens 2 weeks later than Concord. Vine vigorous, productive; not as hardy as Concord; susceptible to powdery mildew and bunch rot. Cluster large, well-filled; subject to cluster spoilage. BROOKS 1972; B73M, C45M, C54, E3, G49, H49, H65, I83M, J98{SC}, J98{OR}, L12, M81M

Green Mountain: (Winchell) Small to medium-sized, roundish fruit; skin light green, covered with a thin white bloom, adherent; flesh juicy, tender, sweet, very good to best in quality; ripens very early, keeps and ships well for an early grape. Vine vigorous, hardy, very productive. Clusters large, moderately compact. Introduced in 1888. HEDRICK 1908; U7J{SC}

Kay Gray: Medium to large fruit; skin greenish-yellow; flesh firm, slightly foxy, very mild, sugar usually near 20 Brix, acid .70 to .90; ripens about with Edelweiss. Good for table use, juice and wine. Vine productive; disease resistant; haidy to -40° F. unprotected. Cluster small, compact. Originated in Osceola, Wisconsin by Elmer Swenson. A74, D11M, F70, I49G, I49G{SC}, J98{SC}, J98{OR}, L27M, L70, L79, N24M

LaCrosse: Medium-sized, greenish-white fruit; flesh juicy, sweet, flavor neutral; ripens shortly after St. Croix and Kay Gr<sup>^</sup>. Sugar

content usually 18 to 19 Brix, acid 1.10 to as low as .90. Mainly a wine grape but pleasant to eat. Good disease resistance. Clusters medium-sized, moderately compact. Originated in Osceola, Wisconsin by Elmer Swenson. A74, I49G, I49G{SC}, J98{SC}, J98{OR}, N24M

Lake Emerald: (V. simpsonii x) Medium to large fruit; skin emerald green to light-golden, fairly tough; flesh soft, sweet, uniquely fragrant, agreeably flavored; juice aromatic, sweet, well-flavored, light-colored; ripens during July at Leesburg, Florida. Primarily for home gardens and local markets in the Deep South. Vine high yielding; tolerant to Pierce's disease. BROOKS 1972; I41M, K76, M95T

Niagara: (White Concord) Medium to large, slightly oval fruit; skin yellowish-green; flesh juicy, foxy, sweet, of good quality; ripens with Concord, keeps fairly well. Vine vigorous; very productive; resistant to powdery mildew. Standard green grape for home gardens and market. Produces strong, foxy-flavored wines. Introduced about 1882 by the Niagara Grape Company. HEDRICK 1908, ROBINSON, J. 1994; A82, B43M, B53, B58, B73M, C61, D59, E1M{PD}, G23, G71, I25{PD}, J2M, J83, L12, M65M, etc.

Ontario: Small to medium-sized, greenish-yellow fruit; flesh juicy, tender, very aromatic, rich, slightly foxy; quality very good; ripens 4 weeks before Concord, holds well on the vine. Vine moderately vigorous; productive. Clusters large, loose, single-shouldered. Originated in Geneva, New York. Introduced in 1908. E1{SC}, H65, J98{SC}, J98{OR}, K36, L12, M81M

Seneca: Small to medium-sized, oval fruit; skin thin, tender, yellowish-green becoming a translucent golden; flesh firm, tender, juicy, very sweet, melting, flavor rich, aromatic; quality very good to best; ripens with Ontario, hangs well on the vine. Vine vigorous, productive; hardy; susceptible to powdery mildew; requires long cane pruning. Cluster medium-sized, loose. BROOKS 1972; E1{SC}, E39, E39{SC}, H65, J98{SC}, J98{OR}

St. Pepin: Medium-sized, greenish-white fruit; flavor fruity, slightly reminiscent of muscat; ripens with LaCrosse. Makes an excellent German-style white wine, and an outstanding non-foxy white juice. Vine female; blooms with LaCrosse which makes a good pollinator for it. Large, loosely formed clusters. Originated in Osceola, Wisconsin by Elmer Swenson. A74, G4, I49G, I49G{SC}, J98{SC}, J98{OR}, N24M

Stover: Medium-large, ellipsoidal fruit; skin translucent light green to golden at maturity; sugar content averages 17 to 18%; flavor mild, free from excessive sweetness or tartness; quality good for table use; ripens in late June or early July. Vine self-fertile; tolerant to Pierce's disease and downy mildew. Cluster medium-sized. Originated in Leesburg, Florida. BROOKS 1972; F93, I41M, I53M, M95T

Suwanee: High quality light green fruit; excellent flavor much like Thompson Seedless, but with a hint of muscat; resembles Golden Muscat. Also makes a very good wine. Ripens late June to early July. Very vigorous vine; satisfactory on most soils without grafting; resistant to Pierce's disease. Large, compact clusters. Originated in Leesburg, Florida by John A. Mortensen. Introduced in 1983. G17, I41M, K76, M95T

#### *Green-Skinned/Seedless*

Himrod: Small, oval fruit; skin greenish-yellow, translucent; flesh tender, juicy, melting, vinous, quality good; small soft seeds; ripens 1 week before Fredonia. Vine vigorous, not productive, fairly hardy. Cluster large, very long, poorly filled. Ontario x Thompson Seedless, the same parentage as Interlaken, Romulus and Lakemont. BROOKS 1972; B43M, B53, C47, C61, C82, D59, E39, E39{SC}, G43, G71, G79M, J2M, J98{SC}, J98{OR}, N33, etc.

Interlaken: Fruit small; skin greenish-white, adherent; flesh crisp, sweet, entirely seedless, quality excellent; resembles Thompson Seedless but has a flavor reminiscent of Ontario; ripens early. Vine moderately vigorous, productive; semi-hardy; requires long-cane

pruning. Cluster medium-sized, loose, tapering. BROOKS 1972; B73M, C61, D59, D65, E39, E39{SC}, F53M, G23, G71, G79M, J98{SC}, J98{OR}, M65M

Lakemont: Medium-sized fruit; skin greenish-yellow; flesh crisp, tender, juicy, very sweet; quality very good for table use, makes excellent raisins; ripens 3 weeks after Himrod, keeps very well in cold storage. Vine moderately vigorous; hardy; very productive, tends to overbear; disease resistant. Clusters large, well-filled to compact. B53, B73M, D65, G23, H49, H65, 178, J98{SC}, J98{OR}, L33

Orlando Seedless: Medium-sized, round fruit; skin light golden-green, attractive; flesh firm, crisp, very sweet; flavor pleasant, vinous; ripens in early July. Excellent for table use and juice. Vine moderately vigorous, productive; resistant to powdery and downy mildew. Long, tapered, loose clusters. The first seedless grape with resistance to Pierce's disease. Introduced in 1985 by the University of Florida. F93, G17, I41M, I53M, J98{SC}, J98{OR}, L90, M83, M95T

Remaly: Medium to large fruit; skin greenish-white, adherent; flesh crisp, tender, juicy, sweet, entirely seedless; quality very good for table use; ripens in late midseason. Vine vigorous; more cold-hardy than most seedless grapes; very productive, should be cluster thinned. Clusters large, moderately compact. B43M, B53, C30M, C45M, 174, J98{SC}, J98{OR}, L33, M81M

Romulus: Small to medium-sized, roundish fruit; skin greenish-yellow; flesh melting, juicy, vinous, quality good, seedless; resembles Thompson Seedless; ripens with Concord. Vine very vigorous and productive, fairly hardy. Cane prune. Cluster large, shouldered, compact. Originated in Geneva, New York. Introduced in 1952. BROOKS 1972; C45M, E1{SC}, L12, P68M

#### *Red-Skinned/Seeded*

Agawam: Large, roundish fruit; skin purplish-red, thick, tough, adherent; flesh firm, foxy, rich, sweet, aromatic, quality good; ripens soon after Concord, keeps until mid-winter. Vine vigorous, moderately productive; hardy; self-fertile; susceptible to mildew. Clusters medium to large, moderately compact. Introduced about 1861. HEDRICK 1908; C45M, J98{SC}, J98{OR}

Brilliant: Medium-sized, roundish fruit; skin attractive bright-red, covered with abundant lilac bloom; flesh pale green, juicy, slightly stringy, fine-grained, sweetish at skin but tart near the seeds; quality very good; ripens with Delaware; keeps very well. Vine vigorous; hardy; moderately productive. Cluster large, cylindrical, medium to compact. Originated in Denison, Texas by T.V. Munson. Introduced in 1887. HEDRICK 1908; C54, F43M, I1{SC}, J98{SC}, J98{OR}, L12, N33

Caco: (Red Caco) Fruit medium to large, roundish; skin light red, thick, attractive; flesh juicy, tender, vinous, rich and sweet; quality good; ripens 7 to 10 days after Concord. Vine moderately vigorous; hardy; very productive. Cane prune. Clusters large, conical, moderately compact. B19, C45M, H44, H88, I41P, J63M, M65M, M81M

Captivator: Fruit large; skin orange-red, with a lilac bloom; flesh very sweet, slightly foxy, flavor excellent; ripens with or just after Himrod, 2 weeks before Concord. Vine vigorous, very hardy. Cluster small, moderately compact. Originated in Denison, Texas by T.V. Munson. C45M, F43M, H49, I1{SC}, L12

Catawba: Medium-sized, oval to roundish fruit; skin reddish-purple, adherent; flesh juicy, vinous, often sprightly with some foxiness, sweet and rich; quality very good; ripens late, keeps until March or later. Vine vigorous, hardy, productive. Clusters large, moderately compact. Used in roses, white wines and sparkling wines. A standard for over 150 years. Origin unknown. Introduced about 1823. HEDRICK 1908, HERBST, R.; A82, B53, B58, B73M, C45M, C61, C67{PD}, D59, E1M{PD}, E3, E39, E39{SC}, H65, I25{PD}, I49G, J2M, J63M, etc.

Daytona: Round, medium to large fruits; skin pale pink covered with a frosty white bloom, thin, attractive; flesh firm, sweet and juicy; dessert quality excellent; ripens early to mid August; resembles Tok<sup>^</sup>. Rampant growing vines produce large, loose clusters. Resistant to Pierce's disease and downy mildew. Introduced by the University of Florida in 1983. G17, I41M, I53M, K76, M95T

Delaware: Small to medium-sized, roundish fruit; skin light red, thin, adherent; flesh juicy, tender, aromatic, vinous, sprightly and refreshing, sweet, quality excellent; ripens a few days earlier than Concord, keeps well. Vine fairly vigorous and productive, hardy. Clusters small to medium-sized, compact. Was the standard of excellence for American grapes after its introduction about 1851 in Delaware, Ohio. HEDRICK 1908; C45M, C54, C82, H65, J98{SC}, J98{OR}, L12

Swenson Red: Medium to large fruit; skin dark-red, non-slip-skin; flesh firm, meaty, juicy, sweet, non-foxy; table quality excellent, also makes a good white wine; ripens a month or more before Concord, keeps well in cold storage. Vine productive, hardy to about -30° F. without protection. Clusters distinctively shaped. Originated in Osceola, Wisconsin by Elmer Swenson. A74, C45M, D37, D65, G4<sub>9</sub>, G16, I49G, J61M, J98{SC}, J98{OR}, L27M, L70, NO, N24M

#### *Red-Skinned/Seedless*

Bronx Seedless: Small, oval fruit; skin red, cracks easily during wet weather; flesh soft, juicy, mild in flavor, quality good; ripens 1 week before Concord. Vine vigorous, fairly hardy; productive; susceptible to anthracnose and downy mildew. Cluster large, long conical, loose. Originated in Geneva, New York. Introduced in 1937. BROOKS 1972; E1{SC}, J98{SC}, J98{OR}

Canadice: Small to medium-sized fruit; skin bright red, thin; flesh soft, rich, vinous, sweet, of very good quality; ripens about 1 week after Himrod, holds well on the vine. Vine moderately vigorous; hardy; very productive, tends to overbear if not pruned; fairly resistant to black rot. Clusters large, well-filled, attractive. B53, B58, B73M, G23, G43, H65, J2M, J63M, J98{SC}, J98{OR}, L33, M99G, NO, N24M

Einset: Medium-sized, ovoid fruit; skin bright red with a light, waxy bloom, resistant to cracking; flesh crisp, firm, juicy. Flavor non-foxy, somewhat reminiscent of strawberry, quality excellent; ripens early, stores well. Vine productive, extremely hardy for a seedless grape; resistant to botrytis, susceptible to powdery mildew. Cluster medium-small. Introduced by the New York State Agricultural Experiment Station. B74, C34, C45M, I49M, J2M, J61M, J98{SC}, J98{OR}, M81M, NO

Reliance: Medium-sized, round fruit; skin pinkish-red; flesh firm, tender, melting, sweet; quality excellent for table use; ripens about 2 1/2 weeks before Concord; stores and ships well. Vine vigorous, productive; widely adapted; very hardy, to about -23° F; susceptible to black rot. Clusters large, compact. Developed by Dr. James N. Moore at the University of Arkansas. A39, B22, B43M, B73M, C45M, D65, E97, F93, G16, G23, H65, J2M, J98{SC}, J98{OR}, L33, N33, etc.

Saturn: Large, oblong fruit; skin bright red, deeper red than Reliance, adherent; flesh firm, very crisp, sweet; vinifera in character; ripens in early September in Zone 6. Fruit quality and appearance are maintained well in storage. Vine moderately vigorous and hardy; precocious, may tend to overbear when young. Clusters medium-sized, compact. Introduced in 1987 by the University of Arkansas. C45M, H65

Suffolk Red: Fruit large, round; skin bright red, attractive; flesh crisp, meaty, juicy, non-foxy, vinous, entirely seedless, quality excellent; ripens early, 2 to 3 weeks before Concord. Vine very vigorous, fairly hardy; productive; disease resistant. Cluster medium to large, long, loose. Introduced in 1972. B53, C45M, C61, G23, G79M, J63M, J98{SC}, J98{OR}, M65M, M81M

Vanessa: Medium-sized, oval fruit; skin deep red, adherent, very attractive; flesh crisp, firm, juicy, very sweet and aromatic; superior flavor reminiscent of Seneca; dessert quality excellent; ripens early, 7 to 10 days after Himrod. Vine vigorous, moderately hardy and productive. Clusters medium-sized, loose to well filled. Originated in Vineland, Ontario, Canada. Introduced in 1984. B22, B43M, B75, C30M, C45M, F16, H65, J2M, J61M, J98{SC}, J98{OR}, L12, NO

**FRENCH HYBRID** Developed by French breeders to combine the wine quality of Vinifera grapes and the durability of American grapes. They have the necessary disease resistance, winter hardiness and the ability to meet adverse conditions while still yielding good red and white table wines. Most were bred as wine grapes but some have excellent dessert qualities.

#### *Blue-Skinned/Seeded*

Dattier de Conzieu: (Landot 2832) Large to very large, pale blue fruits with a neutral flavor. Excellent for dessert; also makes delicious jellies and fresh juice. Vine somewhat particular about growing conditions, but worthy of trial. U7G{SC}

#### *Green-Skinned/Seeded*

Dattier de St Vallier: (Seyve-Villard 20-365) Large, elongated fruit; skin greenish-yellow, thin; flesh tender, meaty, sweet, flavor neutral, dessert quality very good; subject to rot. Vine vigorous, very productive, buds out late; highly tolerant to downy mildew. Must not be allowed to overbear or quality will be indifferent. Cluster large, short conic, loose. BROOKS 1972; J98{SC}, J98{OR}

Verdelet: (Seibel 9110) Medium-sized, oval fruit; skin golden-yellow often tinged with pink, very attractive, tender, adherent; flesh firm and crisp, flavor neutral but pleasing. Vine moderately vigorous, productive when short cane-pruned. Cluster medium-sized, cylindrical, well filled to compact. An excellent table grape. Also produces an above average wine with a delicate aroma, good balance, and attractive flavor. BROOKS 1972, WAGNER; B43M, C45M, C54, G79M, I49G, I49G{SC}, J98{SC}, J98{OR}, L90, M83, N33

**VINIFERA** These produce the choicest dessert grapes, characterized by non-slip skin, firm flesh and a relatively mild flavor. Most premium wines are also made from Vinifera grapes. Less hardy than American or French Hybrid grapes, they require a long, warm, drier growing season. More susceptible to insect pests and diseases. The vines are more vigorous and upright growing. (V. vinifera)

#### *Blue-Skinned/Seeded*

Black Hamburg: Medium to large, roundish to slightly oval fruit; skin dark purplish-red or purplish-black, bloom heavy; flesh juicy, sweet, of fair flavor and quality; ripens in midseason. Vine of good to moderate vigor. Cluster medium-sized, compact. Of German or Italian origin. Introduced into England in 1720. SIMMONS 1978; N84, 081, R77, R83

Blackrose: Fruit large; skin jet black with a light grayish bloom, tender, very attractive; flesh sweet, juicy, more flavorful than Ribier; quality high; ripens in early midseason. Vine vigorous, productive. Spur or cane prune. Cluster large, conical, well-filled but not usually compact unless girdled. Originated in Fresno, California. Introduced in 1951. BROOKS 1972; E1{SC}, E39, E39{SC}, J98{SC}, J98{OR}, LIM, LIM{SC}

Exotic: Medium-large, spherical fruit; skin black, splits badly in some localities; flesh firm, crisp, quality good; ripens in midseason, about 10 days later than Cardinal. Vine vigorous and productive; should be spur pruned. Cluster very large, long, well-filled. Originated in Fresno, California. BROOKS 1972; E1 {SC}, L/Af, LIM{SC}

Gros Colman: Large to very large, round fruit; skin blackish-blue with a delicate bloom, thick but tender, attractive; flesh moderately

firm, juicy, sweet, flavor good; ripens very late, keeps well on the vine. Vine vigorous and productive, prefers rather heavy soils. Cluster large, cylindrical, well-filled. SIMMONS 1978, WICKSON; N84, R77

Mrs. Prince's Black Muscat: A very good late cultivar that will ripen in a cool greenhouse. With care will keep until February. Large bunches which hang well. An easy to grow but superb grape. N84, R77

Muscat Hamburg: Large, roundish-oval fruit; skin black, covered with a heavy bloom; flesh sweet; excellent for dessert, also makes a good red wine; ripens in midseason. Vine moderately vigorous; productive. Cluster medium-long, loose, does not require thinning. One of the best black muscat-flavored grapes. Used in California for making *Elysium* dessert wine. SIMMONS 1978; E1{SC}, E39, E39{SC}, J53M{PD}, J98{SC}, J98{OR}, LIM, LIM{SC}, 081, R77

Purple Cornichon: (Olivette Noir) Fruit large, long, with a distinctive more or less curved shape; skin thick, dark-purple with a light bloom, attractive; flesh firm, sweet, of good quality; ripens late, ships exceptionally well. Vine a vigorous grower, spur pruned. Cluster very large, loose, on long stems. WICKSON; S59

Ribier: (Alphonse Lavallee) Large to very large, round fruit; skin nearly black, moderately tough; flesh juicy, sweet, flavor mild, mildly astringent; ripens in early midseason; holds well on the vine. Vine moderately vigorous; very productive. Spur prune. Cluster medium-sized, short-conical, loose. Widely used as a shipping grape in California. A88M, B93M, C54, E1 {SC}, E39, E39{SC}, K96M{PR}, N20

Teinturier:<sup>2</sup> (Purpurea) Unusual, purple-leaved grape. Mostly grown as an ornamental. Produces small, subacid-fruits that make a very good jelly. Ripens late in the season. Vigorous, highly decorative vine with claret-colored leaves, deepening to purple; striking autumn coloring. At one time widely used in France for dyeing wines to prevent discoloration during storage. SIMMONS 1978; C2, D95, E87, N84, 081, R77, R83

Tressot Panache:<sup>1</sup> Distinctive cultivar with skin that is mottled or blotched with purple and white. Dessert quality only average, of value mostly as a novelty. An old classic French grape. Probably a chimera of the wine-grape cultivar Tressot Negra. U7G{SC}

#### *Blue-Skinned/Seedless*

Beauty Seedless: Small to medium-sized, ovoid fruit; skin bluish-black, waxy; flesh firm, tender, flavor spicy; quality good at full maturity; ripens very early, with Perlette. Vine very vigorous; very productive as spur-pruned cordon. Cluster large, conical, heavily shouldered. Originated in Davis, California by H.P. Olmo. The first black seedless cultivar produced by breeding. BROOKS 1972; E1{SC}, E39, E39{SC}, J98{SC}, J98{OR}, LiM, ZJM{SC}

Black Emerald: Early ripening, seedless black grape for fresh markets and raisins. Medium-sized, round to slightly oval fruits; flavor sweet and neutral. Ripens early, between Perlette and Flame Seedless. Moderately vigorous vine, productive when cane pruned. Cluster medium-sized, conical, shouldered, well-filled to slightly compact. Originated in Fresno, California. Introduced in 1994. BROOKS 1997; C54, E1{SC}, 168

Black Monukka: Medium-sized, elongated fruit; skin reddish-purple, thin and tender; flesh yellow, crisp, sweet and juicy; ripens in early midseason. Excellent for dessert and raisins, also used for juice and wine. Requires less heat to ripen than Thompson Seedless. Spur or cane prune. Cluster large, very long, loose to well filled. One of the hardiest vinifera grapes. A88M, C54, D3M{DF}, D59, E39, E39{SC}, E97P{DF}, F97M{DF}, G49, LI, L15M{DF}, L47, L97G{DF}, N20

Fantasy: Large, oval fruit; skin bluish-black; flesh pale green, sweet, quality very good to excellent. Ripens in midseason, slightly

before Ribier. Very vigorous, moderately productive vine; cane pruned. Cluster medium large, moderately compact to loose. Recommended for fresh markets. Originated in Fresno, California. Introduced in 1994. BROOKS 1997; A63, A88M, C54, DJ9, E1 {SC}, G49,168, J31M, J98{SC}, J98{OR}, LI, LIM, LIM{SC}, N20

Marroo Seedless: Carolina Black Rose x Ruby Seedless. Medium-large, short-elliptic fruit; skin bluish-black; flesh firm, juicy, neutral in flavor. Ripens about 2 weeks before Ruby Seedless. Very vigorous vine, similar to Ruby Seedless. Uniform, large, loose clusters. Originated in Merbein, Victoria, Australia. Introduced in 1990. BROOKS 1997; E1 {SC}

#### *Green-Skinned/Seeded*

Calmeria: Fruit large, ovoid-elongated; skin greenish-white, tough; flesh white, meaty, sugar content medium, acidity low. Vine moderately vigorous; very productive. Cluster large, well-filled. A very late maturing cultivar; well adapted for cold storage. Originated in Fresno, California. Introduced in 1950. BROOKS 1972; E1 {SC}, L47

Cannon Hall Muscat: Fruit medium to large, round to slightly oval; skin thick and firm, pale amber with a heavy bloom; flesh firm, with a strong muscat flavor, quality very good; ripens mid-season to late. Vine vigorous, an irregular bearer, spur pruned. Cluster very large, tapering, cylindrical. SIMMONS 1978; N84, R77, S59

Chaouch: An early fruitful cultivar with juicy, sweet, perfumed berries. The favorite grape of the Sultan of Turkey in the 19th century. N84, R77

Chasselas d'Or: Small to medium, round fruit; skin pale amber with a golden tinge, tawny-gold when fully ripe, firm but tender; flesh very juicy, sweet, of pleasant flavor, at first crisp but becoming soft with full maturity. Vine moderately^ vigorous, bears well. Cluster medium to above medium, long and cylindrical. A famous French dessert grape of the 16th century. SIMMONS 1978, WICKSON; E1{SC}, N84

Ciotat: (Parsley Leaved) Small, round fruit; skin thin, very pale green; flesh firm, sweet; ripens early. Vine vigorous, very productive; of ornamental value because of its parsley-shaped leaves. Cluster small and long, berries loose in the cluster. Known in France since the beginning of the last century. SIMMONS 1978; N84, 081, R77

Early Muscat: Medium-sized, uniform fruit; skin dull yellow; flesh white, firm, meaty, with a distinct muscat flavor; seeds small; ripens very early, just after Perlette and Pearl de Casaba; ships well. Quality excellent for dessert and raisins, also makes a sweet, varietal muscat wine. Vine moderately vigorous; very productive; should be girdled to increase berry size. Cluster large, loose, pyramidal. Originated in Davis, California by H.P. Olmo. BROOKS 1972; E1{SC}, J98{SC}, J98{OR}, LIM, LiM{SC}

Foster's Seedling: Medium-sized, roundish-oval fruit; skin pale greenish-white; flesh soft, sweet, of good flavor, quality excellent; ripens very early. Vine moderately vigorous, heavy bearing; very suitable for forcing in a greenhouse. Cluster fairly long. Originated about 1835. SIMMONS 1978; N84, 081, R77

Gold: Large, oval fruit; skin tender, with a golden sheen; flesh firm, meaty, with a light but distinct muscat flavor; quality excellent for table use, also used for the production of a light muscat wine; seeds few, small; ripens in early August. Vine moderately vigorous; very productive; canes short. Cluster medium-sized, short, conical, well-filled. Originated in Davis, California by H.P. Olmo. Introduced in 1958. BROOKS 1972; E1{SC}, J98{SC}, J98{OR}, LIM, LIM{SC}

Italia: (Italian Muscat) Very large fruit; skin golden-yellow, tender; flesh juicy, with a mild muscat flavor; dessert quality excel-

lent, also used for wine; ripens in midseason. Vine moderately vigorous; very productive. Spur prune. Cluster large, loose, conical. Bicané x Muscat Hamburg. Originated in Rome, Italy by A. Pirovano, Institute of Fruit Culture. BROOKS 1972; B93M, E1 {SC}, E39, E39{SC}, LIM, LIM{SC}

July Muscat: Medium-sized, sub-ovoid fruit; skin whitish-yellow, resistant to weather; flesh greenish-yellow, firm, with a strong muscat flavor; ripens in late July, ships well. Vine vigorous; moderately productive. Cluster loose. Originated in Davis, California by H.P. Olmo. Introduced in 1958. BROOKS 1972; E1{SC}, E39, E39{SC}, LIM, LIM{SC}

Lady Finger: Large, slender, very elongated fruit; skin bright green to greenish-white, sometimes blushed with pink, thin, easily bruised; flesh firm, tender, low in acid, with a mild, neutral flavor; ripens in midseason. Vine very vigorous and productive. Spur or cane prune. Cluster conical, compact. C54

Madeleine Angevine: Medium-sized, oblong fruit; skin yellowish-green to golden, transparent, rather thick; flesh sweet and juicy, non-muscat in flavor; ripens very early. Vine moderately vigorous, heavy yielding. Cluster medium, compact, shouldered. Suitable for table use, juice and wine. C34, J61M, N84, 081, R77

Monte Senario: Reportedly blessed by Christ when he stayed at the home of a poor farmer in Jerusalem, and brought to Italy by the Crusaders. A start was taken to the Sanctuary of Our Sorrowful Mother in Portland, Oregon in 1933. Vines are offered free in return for a donation to the Sanctuary, which is in need of repairs and updating of buildings. J98{SC}, J98{OR}

Muscat of Alexandria: (Muscat) Large, oblong fruit; skin light-yellow, tinged with copper when well ripened, transparent, covered with white bloom; flesh very sweet, strongly aromatic, with a decidedly musky flavor; ripens in late midseason; excellent for dessert, also used for raisins and aromatic, somewhat spicy wines. Vine vigorous; moderately productive. Spur or cane prune. Cluster very long, loose, heavily shouldered. Of North African origin; first recorded in 1584. A88M, B93M, C54, C60D{PD}, E1 {SC}, E39, E39{SC}, J9P, LI, LIM, LIM{SC}, N20

Olivette Blanche: (Lady Finger) Long, slender fruit, broader than Rish Baba; skin darker green than Rish Baba, sometimes tinged with pink, easily bruised; flesh firm and tender, neutral in flavor, quality very good for table use or raisins; ripens in late midseason. Vine very vigorous and productive if cane pruned. Cluster very large, irregular conical, well filled. WINKLER; B93M

Pearl of Casaba: (Perle de Czaba) Small to medium-sized, round fruit; skin light golden-yellow, thin, adherent; flesh crisp, meaty, sweet, aromatic, with a light but distinct muscat flavor, contains a single small seed; ripens very early. Vine moderately vigorous; fairly productive; hardy in Michigan. Spur prune. Cluster medium-sized. Originated in Hungary. J98{SC}, J98{OR}, N84, R77

Queen of the Vineyard: (Scolokertek Kiralynoje) Medium to large, oval fruit; skin greenish-yellow; flesh crisp, meaty, with a delicate muscat-like flavor; ripens with Delight. Originated in Hungary. Widely used for breeding at Davis, California; one of the parents of Perlette, Delight, July Muscat, Gold, Early Muscat and Beauty Seedless. J98{SC}, J98{OR}

Rish Baba: (Lady Finger) Long, slender fruit, sometimes slightly curved; skin pale greenish-white to light yellow, tender, easily bruised; flesh firm but tender, very low in acid, neutral in flavor; ripens in early midseason. Vine vigorous, moderately productive when cane pruned. Cluster small-medium, long cylindrical, very loose. Originated in Persia. WINKLER; E39, E39{SC}, LIM, L7M{SC}

White Malaga: Large, oval fruit; skin yellowish-green, covered with a white bloom, moderately tough; flesh sweet and tender, quality good for table use, also used for raisins; ripens August into September. Vine a strong grower, very productive. Spur or cane

prune. Cluster very large, loose shouldered, long. Grown in southern California in situations where the muscat does not do well. WICKSON; B93M

#### *Green-Skinned/Seedless*

Delight: Medium-sized, oval fruit; skin dark greenish-yellow, thick, resists bruising; flesh firm, crisp, flavor distinct, slightly muscat-like, sometimes astringent; ripens early, just after Perlette; very good for table and raisin use; resembles Thompson Seedless. Vine moderately vigorous; very fruitful when spur pruned. Cluster large, conical, well-filled to compact. C54, D59, E1 {SC}, E39, E39{SC}, J98{SC}, J98{OR}, LI, LIM, LIM{SC}

Emerald Seedless: Medium-large, obovoid fruit; skin greenish-yellow, tender; flesh moderately firm, light green, seedless; ripens in midseason, 2 weeks before Thompson Seedless. Recommended for fancy raisins and as a table grape. Vine vigorous, moderately productive. Cluster large, conical, loose to well-filled. BROOKS 1972; E1 {SC}, LIM, LIM{SC}

Fiesta: Medium-sized, oval fruit; skin greenish-white; flesh firm, juicy, sweet, quality very good for dessert or raisins; ripens 1 to 2 weeks before Concord. Vine vigorous and productive. Cluster large. Appears less prone to bunch rot than some vinifera cultivars in rainy Pacific Northwest fall weather. D59, E1 {SC}, E39, E39{SC}, J31M, LIM, LIM{SC}

Perlette: Medium-sized, spherical fruit; skin white to yellowish, translucent, thin, very tender; flesh translucent, crisp, juicy, flavor mild but distinctive, low in sugar and acidity; ripens very early, 1 month before Thompson Seedless. Vine vigorous; more fruitful than Thompson Seedless; requires less heat than most vinifera grapes. Spur or cane prune. Cluster large, compact to very compact, requires heavy thinning. A88M, C54, E39, E39{SC}, G49, I68, J31M, L47, N20

Thompson Seedless: (Sultanina) Small to medium, elongated fruit; skin greenish-white to golden-yellow, thin; flesh crisp, juicy, flavor sweet but mild; ripens early to midseason. Vine very vigorous and productive; does best in hot areas. Cane prune. Cluster large to very large, well-filled. Most popular grape for table use and raisins in California. World's leading raisin grape. Named after W. Thompson of Yuba City, who introduced it into California in 1878. WICKSON; A88M, D59, E39, E39{SC}, F93, G49, K75Z{DF}, K96M{PR}, L7M, LIM{SC}, L47, N33

Thomuscat: (Seedless Muscat) Somewhat small fruit, mostly seedless, with a muscat-like flavor when fully ripe. Vine low in vigor; sets irregularly; tends to over produce. Cluster rather loose, not uniform. Primarily for home gardens. Muscat of Alexandria x Thompson Seedless. Originated in Fresno, California. Introduced in 1949. BROOKS 1972; E1{SC}, E39, E39{SC}, LIM, LIM{SC}

#### *Red-Skinned/Seeded*

Cardinal: Fruit large; spherical to oblate, often lobed or creased; skin dark red to reddish-black, thin; flesh greenish, firm, crisp, with a slight muscat flavor; seeds few; ripens very early. Vine very vigorous to rampant; very productive; requires heavy flower cluster removal to increase cluster size. Spur or short cane prune. Cluster medium-sized, short conical, well-filled. Flame Tokay x Ribier. BROOKS 1972; B93M, E1{SC}, E39, E39{SC}, LIM, LiM{SC}, N84, R77

Emperor: Large, oval fruit; skin light red to reddish-purple, thick, tough; flesh very firm and crisp, meaty; ripens late; quality good for table use and raisins; ships and stores extremely well. Vine a strong, vigorous grower; very productive; does well in hot interior areas of California. Spur or cane prune. Cluster very large, long-conical, loose. Leading red table grape in California. B93M, E1 {SC}, E39, E39{SC}

Queen: Large, uniform, ellipsoidal fruits; skin dark red; flesh firm at maturity, but not as firm as Flame Totey, sugar and acid content

medium; ripens in midseason, just after Red Malaga, stores and ships well. Vine moderately vigorous, fruitful when spur pruned. Cluster large, loosely winged. BROOKS 1972; E1{SC}, LIM, LIM{SC}

Red Malaga: (Molinera) Large, oval fruits; skin pink to reddish-purple with blue bloom, tender; flesh very crisp and firm, flavor neutral; ripens in early midseason, just before White Malaga; good shipping and keeping qualities. Vine vigorous, well suited for growing on an arbor. Spur or cane prune. Cluster very large, irregular, loose to well filled. WINKLER; B93M, E1{SC}, E39, E39{SC}

Redglobe: Late-season shipping grape widely grown in California. Very large, roundish fruits, often weighing 13 grams or more; skin dark-red, thick; flesh whitish, meaty, flavor neutral; seeds large, readily separating from pulp. Vine resembles Emperor, but more productive. Excellent for long periods of cold storage. Originated in Davis, California ty H.P. Olmo. BROOKS 1997; D19, E1{SC}, I68, J9P, LiM, LIM{SC}

Tokay: (Flame Tokay) Large to very large, oblong fruit; skin brilliant red to dark red, covered with fine lilac bloom; flesh crisp, juicy, sweet, with a distinctive wine-like flavor; dessert quality good, also used for wine; ripens in late midseason; keeps and ships well. Vine vigorous; grows best where summer nights are cool. Spur or cane prune. Cluster very large, moderately compact, shouldered. One of the leading commercial grapes in California. A88M, B93M, C54, E1{SC}, LIM, LIM{SC}

#### *Red-Skinned/Seedless*

Crimson Seedless: Medium-sized, cylindrical to oval fruits; skin bright red, thick, moderately tough; flesh light yellow, translucent, crisp, firm, meaty; flavor sweet, neutral, quality excellent. Ripens late, slightly before Emperor. Very vigorous vine; cane pruned. Cluster well-filled to slightly compact. Originated in Fresno, California. Introduced in 1989. BROOKS 1997; A88M, C54, D19, E1{SC}, G49, J9P, J21M{PR}, J31M, LIM, LIM{SC}, N20

Flame Seedless: (Red Flame) Small to medium-sized, round fruit; skin light pinkish-red, attractive; flesh firm, crisp, meaty, very sweet; excellent for table use and raisins; ripens early, before Thompson Seedless; hangs well on the vine without loss of quality. Vine very vigorous; very productive. Spur or cane prune. Cluster medium-sized, conical, loose. A88M, D59, E39{SC}, E56{DF}, F93, I83M, K75Z{DF}, LIM, LIM{SC}, L33, L47, L56M{DF}, M63M{DF}, N33, N40{DF}, etc.

Ruby Seedless: (King's Ruby) Medium-sized, ovoid fruit; skin reddish-black to dark red, tender; flesh firm, crisp, meaty, sweet; quality excellent for table use or raisins; ripens in late midseason; stores well. Vine very vigorous; very productive. Spur or cane prune. Cluster very large, conical, well-filled, shouldered. Originated in Davis, California ty H.P. Olmo. BROOKS 1972; A88M, C54, E39, E39{SC}, I83M, J31M, J98{SC}, J98{OR}, LIM, LIM{SC}, L47, N20

### WINE GRAPES

#### AMERICAN

##### *Red-Wine Grapes*

Cynthiana: Small, roundish, purplish-black fruit; ripens in late midseason. Vine vigorous and rampant in growth, of less than average productivity. Cluster small to medium. Yields wine that has intense color, and a distinct, agreeable, non-foxy aroma. Can acquire bouquet with aging. Until the appearance of the French hybrids, was considered perhaps the best of the American red-wine hybrids. WAGNER; J2M

##### *White-Wine Grapes*

Blanc du Bois: Round, light green, slipskin fruit; flesh juicy, with a slight muscat flavor. Vigorous, semi-erect vine; resistant to Pierce's disease and downy mildew, tolerant of root-knot nematodes. Cluster moderately compact. Makes a spicy white wine of very good quality. Maintains its fruity quality and delicate sugar/acid balance through fermentation and into the bottle. Released by the University of Florida in 1987. G17, I41M, M95T, N33

Cayuga White: (GW-3) Medium-sized, greenish-white fruit; ripens with Concord. Vine large, vigorous, very productive, moderately hardy; somewhat susceptible to wind damage. Resistant to mildew and bunch rot. Cluster large, compact. Produces an excellent light, fruity wine that resembles White Riesling. Originated in Geneva, New York. Introduced in 1972. B43M, C45M, E1M{PD}, F87, H65, J2M, J98{SC}, J98{OR}

Elvira: Medium-sized, round, yellowish-green fruit; susceptible to cracking; ripens with Concord, does not keep well. Vine vigorous and productive, hardy, somewhat resistant to diseases. Cluster small to medium, cylindrical, compact. Produces a light wine with a sharp aroma and a slightly foxy flavor. Originated in Morrison, Missouri by Jacob Rommel. Introduced in 1874. HEDRICK 1908, WAGNER; C45M, G4

Horizon: Fruit greenish-white; ripens in late September at Geneva, New York. Vine vigorous, very productive, hardy; responds favorably to grafting. Produces a neutral wine that is fruity, clean, and tart with good body and balance. Lacks any of the flavors associated with native grape cultivars. Introduced in 1983 by the New York State Agricultural Experiment Station. C45M, J98{SC}, J98{OR}

Melody: Fruit greenish-white; ripens in early October at Geneva, New York. Vine vigorous, productive, moderately hardy; apparently resistance to powdery mildew and botrytis. Yields an excellent Vinifera-type wine of neutral fruitiness, slightly floral, with good body and balance. Introduced in 1985 by the New York State Agricultural Experiment Station. C45M, H65

#### FRENCH HYBRID

##### *Red-Wine Grapes*

Baco Noir: (Baco 1) Small, round fruit; skin jet black; flesh soft; ripens early. Vine rampant, resistant to downy mildew, somewhat susceptible to powdery mildew; useful for arbor type plantings. Cluster very small, cylindrical, compact. Produces wine that is highly colored, heavy, bitter and herbaceous in character, requiring long aging to improve. Originated in Belus, Landes, France by Francois Baco. BROOKS 1972; C45M, G71, H49, H65, J98{SC}, J98{OR}, L12

Chambourcin: (Joannes Seyve 26-205) Medium-sized, nearly black fruit; ripens in mid-October at Geneva, New York. Vine medium in vigor, moderately hardy, practically disease free; productive when short cane-pruned. Cluster large. Yields a wine without pronounced aroma but with the "seve" or body that many of the hybrid wines lack. Popular in France, especially in the Loie Valley and the Touraine WAGNER; C45M, C67{PD}, I25{PD}, J2M, J98{SC}, J98{OR}, N33

Chancellor: (Seibel 7053) Roundish, jet black fruit; flesh very firm, not juicy; ripens 2 weeks before Concord. Vine moderately vigorous and productive, upright; susceptible to downy and powdery mildews. Cluster medium-sized, cylindrical, fairly compact. Produces very agreeable dark red wines of good body. In France, one of the most popular of all hybrids. Originated in Aubenas, Ardeche, France by Albert Seibel. BROOKS 1972; C45M, C67{PD}, G79M, J98{SC}, J98{OR}, M13M{PD}

Chelois: (Seibel 10878) Small, round, firm black fruit; ripens medium early, a week before Concord; may crack in some years. Vine moderately vigorous and productive, susceptible to winter damage and fungal diseases, buds out late. Cluster medium-sized,

elongate, compact. Makes a fruity, dry red wine somewhat reminiscent of Buigundy. Best when produced in a hearty style and aged 3 or 4 years. BROOKS 1972; J98{SC}, J98{OR}

De Chaunac: (Seibel 9549) Medium-sized, bluish-black fruit; ripens with Concord. Vine vigorous, productive, hardier and more resistant to disease than many other French hybrids. Cluster medium to large, somewhat loose. Yields pleasant, fruity, well-balanced red wines with good tannin and color. One of the most widely planted French hybrids in New York state. BROOKS 1972; B43M, C45M, H65, 125{PD}, J98{SC}, J98{OR}

Leon Millot: (Millot, Kuhlmann 194-2) Small, bluish-black fruit; ripens very early, about 1 week before Marechal Foch. Vine somewhat more vigorous and productive than Marechal Foch; does well even in the climate of Minnesota. Cane pruning. Produces a wine similar to Marechal Foch, but deeper in color. Will develop a Burgundy-like bouquet with bottle aging. WAGNER; C45M, H65, J98{SC}, J98{OR}, N84, 081, R77

Marechal Foch: (Foch, Kuhlmann 188-2) Very small, bluish-black fruit; ripens very early. Vine very vigorous, not very productive; disease resistant; best adapted to difficult areas with short growing seasons. Cluster small, cylindrical, loose. Produces deep-violet, hearty, Burgundy type wines without blending. Originated in Colmar, Alsace, France by Eugene Kuhlmann. BROOKS 1972; A74, C45M, D69, F87, G50, H65, I49G, I49G{SC}, J98{SC}, J98{OR}, L12

Villard Noir: (Seyve Villard 18-315) Small to medium, bluish-black fruit; ripens late. Vine moderately vigorous, very productive when spur pruned. Produces a very good heavy-bodied wine that is deep-colored and somewhat astringent. Also excellent for blending. The most widely grown red-wine hybrid in southern France. Well adapted in North America in all but short-season areas WAGNER; C45M

#### Rose-Wine Grapes

Cascade: (Seibel 13053) Medium-sized, black fruit; ripens very early, with or before Marechal Foch. Vine vigorous, hardy; very productive; adapted to moist areas with short growing seasons; susceptible to downy mildew. Cluster small. Wine low in color, makes a fine rose or "blush" wine, blends well with other red French Hybrids. BROOKS 1972; E1{SC}, N84, 081, R77

Seyve-Villard 52-47: Light blue fruit; ripens early. Vine very vigorous, productive when short cane-pruned; hardy and disease resistant. Cluster large, compact. Produces a light-bodied red wine of good quality and a still better rose. Also used for blending. Fermented free of the skins, the free-run juice makes a delightful *vin gris*. WAGNER; J98{SC}, J98{OR}

#### White-Wine Grapes

Aurore: (Aurora, Seibel 5279) Small to medium, spherical fruit; skin golden to light pink; pulp soft and juicy, very good for dessert and juice; ripens very early. Vine vigorous and productive, hardy, subject to black rot. Cluster long, loose to well filled. Makes a light, delicate wine with a neutral to foxy flavor. Often used as a base for champagne and ice wines. The leading wine grape in New York state. BROOKS 1972; A91, B43M, E1M{PD}, G79M, H49, H65, J2M, L12

Joannes Seyve 23-416: Small, very oval fruit; skin pale pink; flesh pulpy, has a good sugar/acid balance; ripens in early midseason. Vine vigorous, moderately hardy, resistant to downy mildew. Cluster large, narrow, loose. Produces a delicately aromatic wine. Considered one of the best of its series. Recommended throughout the Northeast and Middle West. GALET; J98{SC}, J98{OR}

Seyval Blanc: (Seyve-Villard 5-276) Small, round, golden-yellow fruit; ripens early to midseason; subject to spoilage. Vine moderately vigorous, hardy; highly productive; fairly resistant to downy mildew. Cluster small, cylindrical, compact. Makes a light, fruity,

aromatic wine of superior quality. Widely cultivated in France and the United States. Originated in Saint Vallier, Drôme, France by Seyve-Villard. BROOKS 1972; A74, B43M, C45M, D69, G50, G79M, H65, 125{PE}, J2M, N84, 081, R77

Vidal Blanc: (Vidal 256) Medium-sized, roundish, greenish-white fruit; ripens in midseason, shortly after Concord. Vine very vigorous, productive when spur- or short cane-pruned, moderately hardy; resistant to mildew. Cluster large to very large, compact. Yields a high quality, clean, neutral wine with good aroma. Originated in the Cognac region of France WAGNER; B43M, C45M, 125{PD}, J2M, M13M{PD}

Vignoles: (Ravat 51) Fruit greenish-white; ripens in early midseason, with or before Concord; prone to cracking. Vine vigorous and hardy, only moderately productive when cane-pruned. Cluster small; very tight, quite susceptible to botrytis. Produces a clean, crisp wine with a touch of tartness, recalling *petit chablis*. Also suitable for champagne. WAGNER; C45M, 125{PD}, J2M

Villard Blanc: (Seyve-Villard 12-375) Medium-sized, golden yellow, meaty fruit; matures in late midseason. Vine very vigorous and productive; tolerant to phylloxera, resistant to powdery and downy mildews; does best in areas with a relatively long growing season. Cluster large, loose, compact. Makes a light bodied, fruity, highly aromatic wine of good quality. The most widely planted white hybrid in France. BROOKS 1972; C45M, D37, G79M, J98{SC}, J98{OR}, N33

#### VINIFERA

##### Red-Wine Grapes

Alicante Bouschet: Medium-sized, round fruit; skin brilliant-black; juice dark red; ripens in September and October. Vine moderately vigorous, semi-erect, productive. Cluster medium to large, well filled to compact. Used in blends of standard red table and port wines because of its color. Popular with home winemakers. E1{SC}, E39, E39{SC}

Barbera: Medium-sized, long oval fruit; black with abundant color in the skin; high in acid content; ripens in September and October. Vine vigorous and productive. Cluster medium-sized, well filled but not excessively compact. Used to produce quality red table wines that are full bodied, high in acid and tannin, and deeply colored when young. Originated in the Piedmont region of Italy. B93M, D19, E1{SC}, E39, E39{SC}, J31M, LIM, LIM{SC}

Cabernet Franc: Small, round, blue-black, juicy fruit; ripens in midseason. Vine vigorous, fairly productive, usually long-cane pruned. Cluster small, cylindrical-conical, loose. Susceptible to downy and powdery mildews. Produces very aromatic red wines which have the aroma of raspberry in Touraine and of violet in Chinon and Bordeaux, and are softer and more subtle than the wines of Cabernet Sauvignon. Originally from Bordeaux, France. GALET; C45M, D19, D59, E1{SC}, E39, E39{SC}, LIM, LIM{SC}, N5

Cabernet Sauvignon: Small, black, very seedy fruit; flavor pronounced and characteristic; ripens in late midseason. Vine very vigorous and productive when cane pruned. Cluster small to medium, loose to well filled. Yields a wine of pronounced varietal flavor, good acidity, good color and excellent balance. Has produced some of the most expensive and highly sought-after red wines of California. WINKLER; A88M, B23P{PD}, C54, D76, D81P{PD}, E39, E39{SC}, I49M{PD}, I83M, J9P{B0}, K39M{PD}, LI, LIM, LIM{SC}, N5, N20, N33, etc.

Carignane: Medium-sized, oval, black fruit; ripens in September and October. Vine vigorous, highly productive. Cluster fairly large, well filled to compact. Yields standard, well-balanced red table wines. An important fresh shipping cultivar for home winemaking. Of Spanish origin, but has been grown for centuries in the south of France. B93M, D19, E1{SC}, E39, E39{SC}, LIM, LIM{SC}

**Gamay Beaujolais:** Small to medium, short-oval, black fruits. Vine more vigorous and productive than Pinot Noir. Cluster small-medium, conical, compact. Produces either a light or medium-bodied red wine of excellent quality. A clone of Pinot Noir, apparently introduced into California from the Beaujolais region of France. WINKLER; 7)59, E1 {SC}, E39, E39{SC}, J9P, J9P{BO}

**Malbec:** (Auxerrois) Fruit moderately acid; ripens early. Vine vigorous, only moderately productive in California, not troubled by disease. Traditionally blended with Cabernet Sauvignon, primarily to soften it and reduce the time required for aging. An ancient French cultivar that is perhaps more widely distributed in France than any other cultivar capable of producing superior wine WAGNER; D79, E1 {SC}, LIM, L7Af{SC}

**Merlot:** Medium-sized, round, bluish-black fruits. Vine fairly productive with head-training and either long spur- or cane-pruning. Cluster medium-large, long conical, loose to compact. Yields wines of fine bouquet that are softer, more supple in texture, and age more rapidly than those of Cabernet Sauvignon. Next in importance to Cabernet Sauvignon in the Bordeaux region of France. WINKLER; A88M, C45M, 7)59, E1{SC}, E39, E39{SC}, I68, I99M, J9P, J9P{BO}, J31M, LI, LIM, L7Af{SC}, N5, etc.

**Mission:** Medium-sized, round to oblate fruit; skin brownish-red to reddish-black; flesh firm but juicy, flavor neutral; ripens in late midseason. Vine vigorous, very productive. Cluster large, loose to well filled. Used to produce average or better quality sweet dessert wines, including *Angelica* and sherry. Introduced into California during the later part of the 18th century by the Jesuit missionaries. C60D{PQ}, E1 {SC}

**Napa Gamay:** (Gamay) Medium-sized, round fruit; skin thick and tough; ripens in late midseason. Vine vigorous, very productive when head-trained and spur-pruned. Cluster large-medium, conical, well filled. Yields simple but fruity red wines. Also produces fruity roses of bright pink to slightly orange color. WINKLER; E1 {SC}, E39, E39{SC}, LIM, LIM{SC}

**Nebbiolo:** Fruit high in acid; ripens late; tends to lack color in California, especially in the hotter districts. Vine moderately vigorous, requires short cane or long spur pruning for reliable crops. Yields the very best wines of the Piedmont district of Italy, including the famous dry wines *barolo* and *gattinara*, and *freisa*—a sweet, sparkling wine. CAMPBELL-PLATT, WAGNER; D19, E1{SC}, E39, E39{SC}, LIM, L7Af{SC}

**Petite Sirah:** Medium-sized, oval fruit; skin black covered with a light silvery bloom; flesh juicy, neutral in flavor; ripens in early midseason. Vine moderately vigorous and productive. Cluster medium-sized, compact. Used for standard red table wines because of its good, stable color. Also used for blended Burgundies and for port type wines. Introduced into California from the Rhone Valley of southern France. 7)79, E1 {SC}, E39, E39{SC}, LIM, LIM{SC}

**Pinot Noir:** Small to medium, oval, black fruits; ripens very early, sunburns badly in warmer districts. Vine moderately vigorous and of low productivity in California. Cluster small, cylindrical, well filled. Recognized as one of the outstanding red wine cultivars of the world, it produces the fine Burgundy wines of France. WINKLER; C34, C45M, 7)59, E1M{PD}, E39, I24{PD}, I49M, I99M, J3{PD}, J9P{BO}, J31M, LI, LIM, LIM{SC}, N5

**Ruby Cabernet:** Medium-sized, black, juicy fruit; ripens in September and October. Vine vigorous, more productive than Cabernet Sauvignon, more adapted to regions too hot for best quality of Cabernet Sauvignon. Cluster medium-sized, loose to well filled. Produces table wine of high quality, similar to Cabernet Sauvignon but of more intense color and earlier maturation. Carignane x Cabernet Sauvignon. Originated in Davis, California by H.P. Olmo. Introduced in 1948. BROOKS 1972; B93M, E1 {SC}, E39, E39{SC}, J31M, LIM, LIM{SC}

**Sangiovese:** Medium-sized fruits; thin, bluish-black skin. Ripens late and over a long season. Very vigorous and productive vine.

Cluster very large, broad, well-filled. Produces the high quality red wines of Tuscany such as *Chianti*. Often blended with Cabernet Sauvignon. An ancient grape, possibly even known to the Etruscans. The most commonly planted grape in Italy. Becoming popular in California. ROBINSON, J. 1994; 7)79, E1{SC}, E39, E39{SC}, J31M, LIM, LIM{SC}

**Syrah:** (Shiraz) Small to medium-sized, bluish-black fruits. Vigorous vine, reliably productive and disease resistant. Medium to long, shouldered clusters. Produces the classic, long-lived *Hermitage* wines of France's Rhone region. Very popular in Australia for making varietal wines. Becoming popular in California. May have originated in Shiraz, Iran. ROBINSON, J. 1994; 7)79, 7)59, E1 {SC}, E39, E39{SC}, J31M, LIM, L7Af{SC}

**Tempranillo:** Medium-sized, glossy black fruits with thick skins, low in tannin. Ripens early, up to 2 weeks before Grenache. Vigorous, upright vine, traditionally grown as widely spaced bushes. Long, well-filled clusters. Produces the famous, deep-colored, long lasting, *Rioja* wines of Spain. Commonly blended with Grenache. In Portugal, it is sometimes used in Port blends. ROBINSON, J. 1994; E1 {SC}, LIM, LIM{SC}

**Tinta Madeira:** Medium-sized, long-oval jet black fruit; thick but tender skin; ripens in August and September. Vine moderately vigorous and productive. Cluster medium-large, well filled to compact. Used in premium port wine production because of its rich flavor and deep color. Principally grown in the Madeira Islands of Portugal. E1 {SC}, E39, E39{SC}, L7M, L7M{SC}

**Zinfandel:** Medium-large, round, reddish-black to black fruit; ripens in September and October. Vine moderately vigorous and productive. Cluster medium-large, well filled to very compact. Widely used in red table wine blends and for full-bodied, intensely flavored varietal wines. An important fresh shipping grape for home wine making. Apparently introduced into California from Hungary about 1860. A88M, B23P{ED}, B93M, C54,7)59, E39, E39{SC}, I83M, J9P{BO}, J31M, LI, L7M, L7M{SC}, L47, N20, etc.

#### Rose-Wine Grapes

**Grenache:** Small to medium, round, reddish-purple to black fruit; ripens in September and October. Vine very vigorous and productive. Cluster large, fairly compact. Used for blending in generic rosé wines where it contributes a sweet, somewhat strawberry-like aroma. In France, it yields the famous rose wine, *Tavel*. Popular with home winemakers. A Spanish cultivar that is grown extensively in southern France and in Spain. B93M, 7)79, E1 {SC}, E39, E39{SC}, J31M, LIM, LIM{SC}

**Grignolino:** Small to medium, oval, reddish-brown fruits. Vine moderately vigorous and productive when head-trained and spur-pruned. Cluster medium-sized, long conical, well filled to compact. Normally produces an orange-pink wine that is distinctly different from most rose wines. Originated in the Piedmont district of Italy. WINKLER; L7M, L7M{SC}, S59

#### White-Wine Grapes

**Burger:** Medium to large, round fruit; skin waxy-yellow, easily broken; flesh soft, very juicy, flavor lacking; ripens late September to early October. Vine moderately vigorous, hardy, very productive. Cluster large, long. Produces a light, neutral wine of fair quality, which is primarily used in blending. Once the most widely planted white Vinifera in California. 7)79, E1 {SC}, E39, E39{SC}, L7M, LIM{SC}

**Chardonnay:** (Pinot Chardonnay) Small, round fruit with an almost ideal balance of sugar and acid. Vine vigorous, moderately productive when cane- and spur-pruned. Cluster small, cylindrical, loose to well filled. Produces some of the best dry white wines of California, having a highly characteristic bouquet and a delicious "stony" flavor. Also yields the famous white Burgundy wines of France. WAGNER, WINKLER; A88M, A91, C54, D76, E39,

E39{SC}, H90G{PD}, I24{PD}, I49M, I83M, J9P{B0}, K39M{PD}, LI, 7,7M, 7,7M{SC}, N5, N20, etc.

Chenin Blanc: Medium-sized, oval fruit; skin greenish-yellow, tough; flesh juicy; ripens late August to mid-September. Vine vigorous, very productive. Cluster medium to large, compact. Used to produce quality white table wines. Can also be used in sparkling wine production, in blending, and for sweet table wines. A leading cultivar of the middle Loire region of France. B93M, 7)79, D59, El {SC}, E39, E39{SC}, I83M, J31M, LIM, LIM{SC}, N20

French Colombard: (Colombard) Medium-sized, yellowish-green fruit; neutral in flavor and high in acid; ripens in September. Vine very vigorous and productive. Cluster medium-large, well filled. Widely used in California for blending and as the base for some inexpensive champagnes. An important cultivar in the Cognac region of France where it is used in the production of brandy. A88M, B93M, C54, 7)79, El {SC}, E39, E39{SC}, I83M, J31M, LIM, LIM{SC}, N20

Gewürztraminer: Small, oval fruits; skin tough, pink to bluish-brown; flesh firm, with a characteristic spicy flavor. Vine moderately vigorous, produces well with cane-pruning. Cluster small, cylindrical, compact. Produces slightly sweet to very sweet wines with a pronounced, spicy, aromatic flavor. Has been grown in Germany for several centuries. WINKLER; A91, 7)59, E39, E39{SC}, I24{PD}, LI, LIM, L7M{SC}, N5, N84, 081

Gray Riesling: Medium-sized, dull reddish-tan, very firm fruit; ripens in August and September. Vine strong, vigorous, moderately productive. Cluster small to medium, conical, compact. Produces a dry, medium-acid varietal wine with a light fruity flavor. Sometimes blended with Sylvaner or Chenin Blanc to uplift its character. Grown in the Arbois region of France where it is known as Chauche Gris. El {SC}, E39, E39{SC}, N33

Muller Thurgau: Medium-sized, oval fruit; skin green to grayish; pulp firm, fleshy, aromatic; ripens early. Yields wine rated between Riesling and Sylvaner. Vine vigorous, productive, blooms late. Cluster medium to large. Susceptible to powdery mildew and botrytis. Said to be a cross between Riesling and Sylvaner obtained in 1891 in Switzerland. Grown in cool, northerly regions including Alsace, Germany, England and the Pacific Northwest. GALET; J61M, N84, 081, R77

Muscat Blanc: (Muscat Canelli, Muscat of Frontignan) Medium-sized, yellowish fruit with a pronounced yet delicate muscat flavor; ripens in August and September. Vine moderately vigorous and productive. Cluster medium-sized, well filled to compact. An important cultivar in southern France where it is renowned in the production of French *muscatels*, and in northern Italy, to produce the *Asti Spumante* wines. 7)79,7)59, El {SC}, E39, E39{SC}, J98{SC}, J98{OR}, L7Af, L7M{SC}

Orange Muscat: Medium-sized, oblate to round, firm, orange fruits. Vine moderately vigorous and productive. Cluster medium-sized, short conical, compact. Yields wines that are rich in muscat aroma, but not as delicate and rich as those of Muscat Blanc. In California, it is used for making *Essensia* and *Electra* dessert wines. Originated in Italy where it is known as Muscato Fior d'Arancio. WINKLER; El {SC}, E39, E39{SC}, J53M{PD}, J98{SC}, J98{OR}, LI, L7M, LIM{SC}

Palomino: (Golden Chasselas) Medium-small, oblate fruit; skin greenish-yellow, somewhat tough; pulp firm, juicy and sweet; ripens late August to early September. Vine moderately vigorous and productive. Cluster large, loose, irregular in shape. The principal sherry grape of Jerez, Spain. In California, it is also important for sherry production, and for blending in champagne or for white table wine. El {SC}, E39, E59{SC}, 081

Pinot Blanc: Small, round fruits. Vine below average in vigor; moderately productive, fruits well with head-training and short cane-pruning. Cluster small to small-medium, long conical, compact. Produces wines that are distinct in aroma and flavor, smooth, and of

good balance, though prone to darken. Grown rather extensively in France. WINKLER; 7)79, El {SC}, L7Af, L7Af{SC}, N84

Pinot Gris: Sport of Pinot Noir with distinctive grayish-blue to brownish-pink fruits, often on the same bunch. Vine and cluster characteristics similar to Pinot Noir. May be somewhat of an erratic yielder, especially with older clones. Produces deep-colored, soft, gently perfumed, dry white wines. In France, it is most revered in the Alsace region. ROBINSON, J. 1994; 7)79, 7)59, El {SC}, I49M, J98{SC}, J98{OR}, LIM, L7M{SC}, 081

Rkatsiteli: Russian white grape which is one of the most widely planted in the world. Grown in all the wine-producing republics of the former Soviet Union, with the exception of Turkmenistan. Also popular in Eastern Europe and China. Adapted to particularly cold winters. Produces a wide range of wine styles, including brandy and fortified wines. Becoming better known in the United States. ROBINSON, J. 1994; El {SC}, L7M, L7M{SC}

Sauvignon Blanc: Small, oval to round fruit; skin moderately thin; flavor strong and distinct; ripens in August and September. Vine extremely vigorous, relatively productive. Cluster small, well filled to compact. Used for high quality, varietal dry white wines or natural sweet wines. In the proper blend with Semilion it is considered to be superior to the wine of either cultivar used alone. WINKLER; C54, 7)79, 7)59, D81P{EQ}, E39, E39{SC}, I49M{PD}, J9P, J9P{B0}, J31M, LI, LIM, L7M{SC}, N5

Semilion: Medium-sized, round fruit; skin yellow, fairly thin; flesh soft, tender, juicy; ripens in August. Vine moderately vigorous, semi-erect, productive. Cluster medium-large, conical. Produces a dry, white, medium-bodied table wine with a fig-like perfume. The most important cultivar in the famous Sauternes district of southwestern France. 7)79,7)59, El {SC}, E39, E39{SC}, H25M{PD}, J98{SC}, J98{OR}, LIM, LIM{SC}

Sylvaner: Medium-sized, round, bluish to yellow-green fruit. Vine medium in vigor, moderately productive, very susceptible to powdery mildew. Cluster small, cylindrical, compact. Yields wines that possess a delicate, lightly spicy, distinct character. Best known as the source of the Stein wines of Franconia, Germany. WINKLER; B74, El {SC}, E39, E39{SC}

Ugni Blanc: (Trebbiano, Tiebbiano Toscano, Saint-Emilion) Medium-sized, roundish fruits; skin golden-yellow. Moderately vigorous vine, very productive; spur pruned; resistant to powdery mildew and gray rot. Large, long clusters. Produces light, crisp white wines of moderate quality. More commonly used for brandies such as *Cognac*, *Armangac* and *Grappa*. The principle grape used in Italy for making *balsamic vinegar*. One of the most widely planted grapes in the world. KASPER, ROBINSON, J. 1994, WINKLER; 7)79, El {SC}, E39, E39{SC}, LIM, L7M{SC}, N84, R77

White Riesling: (Riesling, Johannisberg Riesling) Small to medium-sized, spherical fruit; skin greenish-yellow, speckled with russet dots; flesh juicy, sprightly, somewhat aromatic in flavor. Vine moderately vigorous and productive. Cluster small, cylindrical, well filled. Produces bone dry to very sweet wines with a strong varietal flavor and bouquet. Yields the famous white wines of the Rhine and Moselle valleys of Germany such as *Beerenauslese*, *Trockenbeerenauslese*, and *Eiswein*. ROBINSON, J. 1994, WINKLER; A91,7)59, E39, E39{SC}, I23M{m}, I49M, I99M, LIM, L7M{SC}, N5, N54{PD}

#### CODES FOR SPECIAL TYPES

1. Mottled
2. Purple-Leaved

## GRAPEFRUIT {GR}

### CITRUS X PARADISI

## PINK-FLESHED

Flame: Promising new red-fleshed grapefruit. Globose fruits, slightly blushed with pinkish-red on the skin; reddish flesh, darker than Ray Ruby but not as dark as Star Ruby; seedless. Holds its color later than Ray Ruby. Tree resembles Henderson. Seedling of Henderson, released in 1987. Selected by C.J. Hearn. SAUNT; A63, A71, G17, I77G

Foster: Medium-large, roundish fruit; skin moderately thick, pale to light yellow, blushed with pink under favorable conditions; flesh tender, juicy, seedy, flavor good; flesh color chamois, but under favorable conditions pink. Medium early in maturity. Tree large, vigorous, productive. The first pigmented grapefruit cultivar of record in Florida. REUTHER; N84, R77

Henderson: Similar to Red Blush in time of maturity and juice quality. Has better internal and external pigmentation than Red Blush, and flesh color is retained much better with age. Discovered in 1973 as a bud sport of Fawcett Red, a little known mutation of Pink Marsh. SAUNT; A63, C29M{SC}

Ray Ruby: Branch sport of Red Blush first propagated in Texas and introduced into Florida in the 1970's. The peel is redder than that of Ruby Red and the pulp is red though not as intense as Star Ruby throughout the season. MORTON 1987a; C29M{SC}

Red Blush: (Ruby Red, Ruby Blush) Fruit similar to Thompson in all respects except for much deeper pigmentation in the flesh (but not in the juice); crimson blush on the rind, especially at points of contact between fruit. Holds on tree as well as Marsh or Thompson but with some fading of flesh color. Bud mutation of Thompson discovered in McAllen, Texas. Introduced in 1934. REUTHER; A71, B23P{PR}, B73M{DW}, C89{PR}, E99G{PR}, G17, G58D{PR}, H69{PR}, I59{PR}, I83M, J21M{PR}, J21M{PD}, N18{SC}

Rio Red: One of the newest cultivars. Large to very large, pyriform fruit; nearly seedless. Relatively thick rind. Deep-red flesh, darker in color than Ray Ruby. Very good quality. Maintains its red pigmentation all the way through the ripening season. Ripens November to May in Texas. Develops color well in coastal areas. Developed at the Texas A & I Citrus Center. A63, A71, D13, D23M, D23M{ES}, E3M{DW}, E8M, G49, G58D{PR}, I83M, J22

Shambar: Fruit seedless; rind and flesh pink; resembles Red Blush. Considered by some to be superior to Marsh in juiciness, flavor, and long storage life. Tree similar to Marsh and Red Blush. Bud mutation of Marsh. Originated in Corona, California. Discovered in 1936. C29M{SC}, N18{OR}

Smooth Seville: (Smooth Flat Seville) Hybrid. Parentage unknown. Medium-large, somewhat flattened fruit; color reddish-orange at maturity. Rind medium-thick, surface very smooth. Flesh reddish-orange, coarse-textured, juicy; flavor pleasantly subacid with a trace of bitterness. Has a lower heat requirement for maturity than the grapefruit and hence ripens earlier and serves as a satisfactory substitute. Tree vigorous, large, and prolific. REUTHER; J73M{S}, S59

Star Ruby: Fruit with a yellow peel, distinctly red-blushed; intensely red pulp and juice, 3 times more colorful than Ruby Red. Though the color decreases with maturity, it is maintained throughout the season. The pulp is smooth and firmer than that of Ruby Red and has a bit more sugar and acid. Seedless or no more than 9 seeds. A branch mutation of the Foster cultivar discovered in San Benito, Texas in the 1930's. Only introduced into cultivation in 1971. MORTON 1987a; A63, A71, B58M{SC}, C89{PR}, D23M, D23M{ES}, E29, G49, I83M, J22, L50G{PR}, N18{SC}

Thompson: (Pink Marsh) Medium-sized, oblate to spherical fruit; seeds few or none; pale to light yellow at maturity. Rind medium-thin, tough, surface very smooth. Flesh light to deep-buff more or less flushed with pink, tender and juicy; juice colorless; flavor good, similar to Marsh. Holds on tree unusually well, but with consider-

able fading of color. Midseason in maturity. Tree vigorous, large, and productive. G2M, J17, S59

## WHITE-FLESHED

Bloomsweet: Grapefruit-sized fruit, 3 to 4 3/4 inches in diameter, distinctly pyriform; thin, fairly smooth yellow rind; fairly juice, pale straw colored flesh, low in bitterness, moderately sweet and flavorful; segments 10 to 12; seedy. Narrcw, upright tree, vigorous but slow to come into bearing. Likely of hybrid origin. NAGLE; K67

Duncan: Large, round or slightly obovate fruit. Color pale to very light yellow. Rind medium-thick, surface smooth and even. Flesh buff to chamois-colored, tender, very juicy; flavor pronounced and excellent. Medium-early in maturity. Tree vigorous, large, very productive. At one time the leading cultivar in Florida and Texas. Introduced in 1892. G17

Golden Special: Fruit of good size, thin skinned, pale yellow; comparatively seedless with a juicy tangy flavor. Once established the plants become heavy bearing, but like most grapefruit cultivars can develop biennial bearing tendencies. A New Zealand selection much grown in the home garden and also used extensively for commercial production. N84, O97, R77

Marsh: (Marsh Seedless, White Marsh) Medium-sized, oblate to spherical fruit. Color pale to light yellow at maturity. Rind medium-thin, tough, surface very smooth and even. Flesh buff-colored, tender, very juicy; flavor good but not so pronounced as in some seedy varieties. Holds unusually well on the tree. Tree vigorous, spreading, large, and productive. The leading grapefruit cultivar worldwide. REUTHER; A71, B23P{PR}, C89{PR}, D23M, D23M{ES}, E99G{PR}, G49, I77G, I77, J22, N18{SC}, N24M{DW}, Q93

Wheeny: (Wheeny Grapefruit) Hybrid. Parentage unknown. Fruit large, oblate or broadly obovate to globose; color pale to light yellow. Rind medium-thin, with moderately rugose surface. Flesh straw-colored, coarse-textured but very juicy. Flavor good but acid, virtually indistinguishable from some grapefruits. Medium early in maturity. Tree vigorous with tendency to alternation in bearing. Ripens in climates too cool for any of the true grapefruits. REUTHER; Q93

## GUAVA {GR}

## PSIDIUM GUAJAVA

## PINK/RED-FLESHED

Beaumont: Leading commercial cultivars in Hawaii. Medium to large, roundish fruit; weight 8 ounces; flesh pink, moderately thick, mildly acid; seedy. Excellent for processing. Somewhat susceptible to fruit rots. Tree vigorous, wide spreading, very productive. Selected from a seedling population derived from fruits found in Halemanu, Oahu, Hawaii. D23M, D57{PL}, G49, I74{PL}, N84{S}, P5{S}

Blood Guava: (GA11-56) Large, roundish fruit, 4 to 5 inches long; remains green when ripening; dark-red flesh with few seeds. Excellent for eating fresh or processing. Originated in Hawaii. O19{S}

Hong Kong Pink: Medium to large, roundish fruit; weight 6 to 8 ounces; flesh pinkish-red, very thick, smooth-textured; flavor subacid to sweet, very pleasant; seeds few. Tree spreading, high yielding. Selected at Poamoho Experimental Farm, Oahu, Hawaii from seeds obtained from a clone grown in Hong Kong. D57{PL}, E8M

Ka Hua Kula: Large fruit with thick, relatively tart, deep-pink flesh. Darker pink flesh, higher acidity, and with fewer seeds than Beaumont. Also a heavier bearer. Recommended for commercial

guava puree. Selected in Hawaii from a planting of 1,200 Beaumont seedlings. Introduced in 1978. MORTON 1987a; J22

Mardi Red:<sup>1</sup> Medium-sized fruit, 2 to 4 inches in diameter; skin yellow, highly blushed with red; flesh deep red, of excellent flavor, seed cavity small. Tree an attractive ornamental with wine red leaves and pink flowers. Originated in Mardi, Malaysia. I83M{PL}

Maroon:<sup>1</sup> Attractive purple-fruited guava. Small to medium-sized fruits; skin, smooth purple-green; flesh magenta, flavor deliciously sweet with a subacid tang. Tree upright; very ornamental with distinct, purple-green leaves and pinkish or purplish flowers. Originated in Java. D57{PL}, J29M{S}

Red Indian: Medium-large, roundish fruit, of strong odor; skin yellow, often with pink blush; flesh medium thick, red, sweet, quality good; ascorbic acid content averages 195 mg. per 100 grams fresh fruit; total sugars average 7 to 10%; seeds numerous but small. Good for eating out of hand. Originated in Dade County, Florida by Fred Lenz. Introduced in 1946. BROOKS 1952, MORTON 1987a; D57{PL}, 174{PL}, I83M, S97M

Ruby X: (Ruby Supreme) Small, roundish fruit; skin greenish-yellow; flesh dark pinkish-orange, flavor delicious, sweet; seed cavity 33% of pulp. Tree bushy, low growing, with vigorous branches drooping outward. Hybrid of the Florida cultivars Ruby and Supreme. D57{PL}, G2M, I77G, J22

Salvador Bahia: Medium to large, oblong fruits; skin bright yellow; flesh subacid, an attractive pinkish-orange in color; seed cavity 33% of pulp. Tree with a distinct low drooping canopy. Originated in Brazil. D57{PL}

Uma: Small to medium-sized fruit, 2 to 3 inches in diameter; flesh deep pink, sweet, of excellent flavor; lacking in heavy, musk-like aroma; good pulp to seed ratio. Very vigorous, heavy yielding tree. Seedling originating in San Diego, California, near San Diego State University. I83M

#### WHITE-FLESHED

Allahabadi: Large, white-fleshed fruit of good quality; cavity small; seeds few, medium-sized, fairly hard. Considered one of the best eating dessert guavas of India. MORTON 1987a; D57{PL}, Q12{S}

Donrom: (Bangkok Apple, Thai Apple, Giant Bangkok, China White) Fruit large to extremely large, up to 1 pound or more, rounded with slight elongation at the stem end; skin light greenish, rough textured; flesh greenish-white, firm, reminiscent of an apple in texture, pleasantly sweet; seed cavity very small. Tree dwarfish, bears when 4 feet tall. Originated in Thailand. D57{PL}, E8M, G49, I74{PL}, M17

Giant Pear: (GA-03) Large, pyriform fruit, 4 to 5 inches long; skin light green to yellow when ripe; pale yellow to white flesh; quite sweet. Excellent for eating out of hand. Usually not used for processing. Originated in Hawaii. 019{S}

Glom Toon Klau: Medium to large fruit; weight 3 to 8 ounces; smooth, greenish-yellow skin; flesh whitish, flavor mildly sweet, refreshing; seed cavity 25% of pulp. Can be eaten when still firm and crunchy. Tree very small; bears fruit in clusters; begins producing when 4 feet tall and up. Originally from Thailand. D57{PL}

Indonesian Seedless:<sup>2</sup> Virtually seedless dessert guava from Indonesia. Medium-sized fruit, 2 3/4 inches in diameter, weight about 6 1/2 ounces. Sweet, thick white flesh, low in acid; seeds few to none. Excellent for eating out of hand. Vigorous and relatively productive. Reportedly a triploid. E8M, I77G

Lucknow 49: Medium to large fruit; weight 8 ounces; flesh cream-white, thick, sweet, relatively smooth-textured; flavor sweet, slightly musky; seeds relatively few. Dessert quality excellent but tends to develop a mushy flavor when fully ripe. High in pectin and therefore desirable for jelly; halves are good for canning. Tree

spreading, productive. Ruby x Supreme. Originated in India. MORTON 1987a; R0

Mexican Cream: Small to medium-small, roundish fruits; skin light yellow, slightly blushed with red; flesh creamy white, thick, very sweet, fine-textured, excellent for dessert; seed cavity small, with relatively soft seeds. Tree upright, productive. Originated in Mexico. A41G, D57{PL}, G49, H53M, I74{PL}

Pear: (Pear Guava) Pear-shaped fruits with creamy white flesh. At one time this form was designated as a separate species along with the round form, which is sometimes known as Apple Guava. POPENOE, W. 1920; D23M{PL}, D57{PL}, I74{PL}, K8{S}, N84{S}, 053M{S}, 093{S}, Q32/S, S97M

Redland: Fruit very large, pyriform, lacking in musky guava odor; flesh white with relatively few seeds, flavor mild. Ascorbic acid content low. Tree a heavy cropper, susceptible to red algae spot. Developed at the University of Florida Agricultural Research Center, Homestead. Introduced in 1941. BROOKS 1972, MORTON 1987a; I77G

Susu: Rounded to obovate fruit with greenish-yellow skin, weight 4 ounces to one pound; crunchy white flesh with a good but mild flavor. Tree upright but compact in growth habit. Originated in Jakarta, Indonesia. Name translates as "milk guava". D57{PL}

Sweet White Indonesian: Large, round fruit, 4 inches or more in diameter; thin, pale yellow skin; thick, white, melting flesh of a sweet, delicious flavor. Edible seeds in cavity surrounded by juicy pulp. Vigorous, fast growing tree; bears several times a year. J22

White Indian: Small to medium-sized, roundish fruit, 2 1/2 to 3 inches in diameter; skin greenish-yellow; flesh thick, white, moderately seedy. Excellent, sprightly flavor. Bears from October through January. Tree somewhat of a shy bearer. Haidy to 26° F. Originated in Florida. G49, I83M

#### YELLOW-FLESHED

Detwiler: Medium to large, roundish fruit, about 3 inches in diameter; skin greenish-yellow, moderately thick; flesh yellowish to salmon, medium firm, relatively sweet, of pleasant flavor, quality very good. Tree a very heavy bearer. Originated in Riverside, California in the early 1900's. Selected by H. J. Webber. I83M

#### CODES FOR SPECIAL TYPES

1. Red-Leaved
2. Seedless

### HEARTNUT {GR}

#### JUGLANS AILANTIFOLIA VAR. CORDIFORMIS

Bates: Large nut, about 50 per pound; kernel weight 25% of nut; flavor very good; matures early. Tree vigorous; hardy; bears well. Pollinated by Canoka and Etter. An older standard cultivar. Originated by a Mr. Bates of Jackson, South Carolina. Introduced by J.F. Jones of Lancaster, Pennsylvania. E91M, N24M, N24M{PL}

Callander: Medium-sized nut; kernel averages 31% of nut; cracks out well; flavor very rich; matures early. Tree hardy; bears heavily; protandrous. Original tree noted for producing a large number of heartnut-butternut hybrids (buartnuts) among its seedlings. Originated in Westbank, British Columbia, Canada by J.U. Gellatly. JAYNES; A91{PL}, B99{PL}, N24M, N24M{PL}

Caloka: Small to medium-sized nut, averages 76 per pound; kernel averages 36% of nut. Originated in Westbank, British Columbia, Canada by J.U. Gellatly. A91{PL}, I60{PL}

Campbell CW3: Relatively new cultivar that is highly rated for overall performance. Medium-sized nut of good quality; cracks out

very well. Vigorous, productive tree, very handy. Originated from the Etter strain. Selected by R.D. Campbell of Niagara-on-the-Lake, Ontario, Canada. B99{PL}, E62{PL}, E62{DF}, E62{SC}, E91M, E91M{PL}

Canoka: Medium to large nut, averages 50 to 76 per pound; kernel averages 26% of nut. Tree an annual, heavy bearer; requires a relatively long growing season to mature kernels properly. One or two weeks later in vegetating than other cultivars, and thus able to escape spring freeze damage which often seriously shortens the crop of other cultivars. Originated in Westbank, British Columbia, Canada by J.U. Gellatly. JAYNES; 140

Etter: Small to medium-sized nut, about 78 per pound; kernel weight 33% of nut; flavor very good; cracks out very well. Tree exceptionally hardy; productive. Produces high quality seedlings for breeding and selection. Originated in Lemasters, Pennsylvania by Fayette Etter. B99{PL}, E91M, E91M{PL}

Fodermaier: One of the highest rated heartnuts. Large nut, averages 55 per pound; cracks well; kernel of good quality, averages 37% of nut; fine flavor. Tree vigorous; hardy; has withstood temperatures of  $-20^{\circ}$  F. and below. Originated in Dover Plains, New York by John J. Fodermaier. Introduced about 1942. BROOKS 1972; B99{PL}, E91M, I60{PL}

Frank: Medium to large nut that cracks well. Tree later vegetating than other cultivars with the exception of Canoka. A good producer. Originated in Kentucky in 1980. 140

Imshu: Relatively new cultivar with good potential. Medium-sized, flattened heart-shaped nut, about 60 or 65 per pound; kernel percentage good; excellent cracking qualities, readily splitting into halves. Overall quality good. Generally adapted from Zones 5 to 7. B99{PL}, E62{PL}, E62{DF}, E62{SC}, E91M, N24M, N24M{PL}

Marvel: Nut medium to large; cracks well; quality good; resembles Wright. Tree somewhat harder than Fodermaier; will pollinate Wright and is pollinated by that cultivar; bears well. Fodermaier x Wright. Originated in Wassaic, Dutchess County, New York by Gilbert L. Smith. Introduced in 1948. BROOKS 1972; 140

Rhodes: Medium to large nut, about 65 per pound; shell thin; kernel weight 28% of nut; cracks easily; flavor and quality excellent. Tree moderately hardy; bears heavily; flowers late, probably self-fruitful. Originated in Covington, Tennessee by George Rhodes. Introduced in the 1940's. 140

Schubert: Nut relatively large, about 53 per pound; kernel weight 33% of nut; cracks out well; flavor excellent. Tree bears heavily and vegetates early. A select seedling of Rhodes. Originated in Millstadt, Illinois by Kenneth Schubert. Introduced in the 1960's by Louis Gerardi. E62{PL}, E62{SC}, E91M, 140

Wright: Medium to large nut, about 54 per pound; kernel weight 31% of nut; very free cracking; flavor very pleasant, resembles butternut. Tree heavy bearing; not resistant to broom disease; very hardy; will pollinate Fodermaier, Marvel and Rival. Originated in Westfield, New York by P.D. Wright and R.P. Wright. Introduced in the 1930's. BROOKS 1972; 140,186{SC}

## HERBS

See Basil, Mint, Parsley and Thyme in Part II: Major Crops. See also Part I: Botanical Listings, especially Apiaceae, Asteraceae, Geraniaceae and Lamiaceae, and Flavorings, Tea Substitutes, Rennets and other appropriate headings in Appendix A: Usage and Edible Parts.

## HICAN {GR}

### CARYA X NUSSBAUMERI

### CARYA X SP.

Bixby: (C. x nussbaumeri) Pecan x shellbark hickory. Very large nut of good quality. Vigorous tree, produces heavy crops of nuts. Requires early pollen and good fertilization to fill well. Major pecan recommended as a pollinizer. Originated in Illinois. The first hican cultivar to be selected and propagated. 140

Burlington: (C. x nussbaumeri) Large nut, averaging 55 nuts per pound; quality good; ripens early. Tree productive; self-pollinating; comes into bearing slowly. Performs well in the Ohio Valley. Originated in Des Moines County, Iowa. Introduced in 1940 by Benton and Smith Nut Tree Nuisery, Millerton, New York. BROOKS 1972; B99{PL}, 140

Burton: (C. x sp.) Medium-sized nut; shell thin; cracking quality excellent, high kernel percentage; flavor excellent; early maturing. Tree productive; self-pollinating; comes into bearing in 5 to 7 years. Does well in the Midwest, South and Northwest, but not the Northeast. Originated in Kentucky around 1880. JAYNES; B99{PL}, I25M{SC}, 140

Country Club: (C. x sp.) Pecan x shagbark hickory. Medium-sized nut with more the flavor of hickory. Tree a very heavy producer. Attractive red-tinted buds. Originated in Indiana. Introduced in 1980. Original tree grows 100 feet from the Hartmann hican which is probably a good pollinator. 140

Des Moines: (C. x nussbaumeri) Pecan x shellbark hickory. Moderate producer of fertile nuts, resembling Burlington. Tree grows satisfactorily in southern Illinois. Originated in Burlington, Iowa, near the Des Moines River. Introduced in 1924. BROOKS 1972; B99{PL}

Dooley Burton: Seedling of Burton which has good potential. Apparently a cross of Burton and a shagbark pollen parent. Good quality nuts with more the character of hickory than pecan. Ornamental tree, grows 50 to 70 feet tall. Originated in Indiana. Introduced in 1980. E91M, 140, N24M

Hartmann: (Adkins) (C. x sp.) Pecan x shagbark hickory. Medium-sized, thin-shelled nut; very good hickory-like flavor. Tree a good producer; has red-tinted buds; grows 50 to 70 feet tall. Originated near and probably pollinated by Country Club. Originated in Indiana. Introduced in 1980. 140

Henke: (C. x sp.) Nut small; kernel of high quality, fills shell well; ripens early. Good flavor and cracking quality. Small, ornamental tree; self-pollinating; bears precociously and well. Originated in southern Iowa by a Mr. Henke. Introduced in 1932. BROOKS 1972; B99{PL}, E62, E62{SC}, I25M{SC}, 140,160{PL}

Hershey: (C. x sp.) Pecan x shagbark hickory. Medium-sized nut; borne in clusters of three or four; fills shell well. Kernel of high quality, has more the flavor of hickory than pecan. Vigorous tree, grows 50 to 70 feet tall. Originated in Pennsylvania. Introduced in 1980. 140

Jackson: (C. x sp.) Pecan x shagbark hickory. Medium-sized nut; kernel quite tasty, more reminiscent of hickory than pecan. Ornamental tree, grows about 60 feet tall; with pollen, should set heavy crops. Generally more productive than pecan x shellbark hybrids. Originated in Kentucky. Introduced in 1985. 140

James: Nut large, averages 36 per pound; shell thin, cracking quality very good, 52%; kernel flavorful, of high quality; ripens in late September in Zone 6; keeping quality similar to pecan. Tree hardy; productive; self-pollinating; disease resistant; comes into bearing in 5 to 6 years. For Zones 6 to 8 and warmer areas of Zone 5. Originated in Brunswick, Missouri by George James. 174

McCallister: (C. x nussbaumeri) Pecan x shellbark hickory. Very large nuts, seldom well-filled; excellent flavor, resembles hickory more than pecan. Generally produces larger nuts than pecan x shagbark hybrids. Vigorous, ornamental tree; grows about 60 feet tall; needs an early pollen source to fill well. 140

Underwood: (Jay Underwood) (C. x nussbaumeri) Nut large; shell thin; kernel plump, with a fine flavor. Tree protogynous; ornamental. Originated in Fort Scott, Kansas by Jay S. Underwood. Introduced in 1956 by Louis Gerardi Nursery. Native seedling; named by J.C. McDaniel, Illinois Agricultural Experiment Station. BROOKS 1972; B99{PL}, 140

## HICKORY {GR}

### CARYA LACINIOSA

### CARYA OVATA

#### SHAGBARK HICKORIES

Except for the bitternut, this is the hardiest of the hickory species, its range extending from southern Quebec through southern Ontario to Minnesota, south to Florida and Texas. The shagbark fruit is distinguished from the shellbark in that the latter has much larger fruits, 1 3/4 to 2 1/2 inches long. JAYNES. (C. ovata)

Abundance: Shellbark x shagbark hybrid. Nut resembles a shagbark hickory; size medium to large, weight about 7 grams; kernel white, cracks out readily; kernel averages 36% of nut; shell thin. Tree bears annually; topworked trees often bear second year after grafting. Originated in Franklin County, Pennsylvania by Fayette Etter. Introduced in 1947. BROOKS 1972; 140

Bridgewater: Very large nut, weighing up to 8.5 grams; kernel averages 46.6% of nut. Susceptible to scab in the South. Recommended by the late Carl Weschcke for the far north, where it also serves as a pollinator for the Weschcke hickory. Originated in Connecticut. 140

Cedar Rapids: Large nut, weight about 6.9 grams; matures early. Very good flavor. Slow growing tree, grows 70 to 80 feet tall; bears very well when pollinated by another variety. A good northern cultivar; susceptible to scab in the South. Originated in Iowa. 140

Davis: Medium-sized nut; kernel plump, bright, quality high; cracking quality excellent; ripens at point of origin a little later than Fox; resembles Wilcox. Tree vigorous. Originated in Duchess County, New York by Gilbert L. Smith. Introduced in 1934. Won first prize in the New York and New England Nut Contest of 1934. BROOKS 1972; E62{SC}, E91M, 140

Felger: Superior in nut qualities, with kernels averaging 30% of nut. Not precocious, nor heavy bearing. Large, slow-growing tree; begins bearing in 8 to 12 years. Originated in Smithfield, Ohio by Emmet Yoder. 140

Fox: Kernel light in color, of fine flavor; large percentage crack out whole; ripens early. Tree bears consistently. Originated in Fonda, New York by Roland Fox. Introduced in the late 1930's. First prize winner in the Northern Nutgrowers Association contest of 1934. BROOKS 1972; B99{PL}, E62{SC}, 140

Grainger: Large nut; shell thin; kernel averages high percentage of nut; cracks well; ripens late in the season. Tree vigorous. Originated on the form of J.N. Stapleton, Washburn, Grainger County, Tennessee by the Tennessee Valley Authority. Introduced in 1935. BROOKS 1972; 140

J. Yoder Na 1: (Yoder) Regular producer of very large (8.5 grams), thin-shelled nuts that crack out whole halves. Flavor and kernel filling very good. Tree precocious, hardy, bears heavy crops. Originated in Smithfield, Ohio by Emmet Yoder. E62{SC}, E91M, 140

Neilson: Large nut with good flavor and good kernel filling; matures early. Tree hardy; precocious; bears very heavily. Should be planted with another variety for best production. B99{PL}, E91M, E91M{PL}, N24M

Porter: Nut large; shell thin; yields high percentage of kernel (46.7%); cracking quality excellent. Originated in Mackeyville, Clinton County, Pennsylvania, on the farm of Ralph R. Porter. Introduced in 1960. BROOKS 1972; E62{SC}, 140

Sauber: Shellbark x shagbark hybrid, with a nut resembling a large shagbark. A productive cultivar with medium shell thickness and good cracking qualities. Originated in northern Ohio by Paul Sauber. 140

Silvis 303: Large, round nut, to 8 grams; shell thin; kernel averages 45% of nut; quality good. Tree self-pollinating and a good producer. Originated in West Richfield, Ohio by Ray Silvis. 140

Stratford: Shell thin, smooth, nearly white; cracks easily, resembling bitternut hickory; kernel hard, quite smooth, keeps very well; quality high, no bitter taste; oil content quite high, typically shagbark hickory. Tree productive; buds, flaking bark, and leaves typically shagbark hickory. Originated in Stratford, Iowa. Introduced about 1926. BROOKS 1972; I60{PL}

Weschcke: Nut papershell; kernel full and rich, cracking out in entire halves; matures September 1 to 15. Tree grafts well on wild bitternut hickory; produces consistently. Originated in Fayette, Iowa by Carl Weschcke. Introduced in 1936. BROOKS 1972; E62, E62{PL}, E62{DF}, E62{SC}, E91M, E91M{PL}, 140, K63G{S}

Wilcox: Medium-sized nut, to 4.9 grams; flavor good; cracking quality excellent, cracks out in whole halves; kernel averages 41% of nut; keeps well. Tree one of the best producers; bears early; protogynous. Originated in Geneva, Ohio by GF. Walker, H.L. Jacobs, and W.R. Fickes. Introduced about 1936. BROOKS 1972; 140

Wilmoth: Produces high quality, thin-shelled nuts. Kernel large, light-colored, flavorful. A consistent winner at the Kentucky State Fair. Originated in Glendale, Kentucky by Leslie Wilmoth. Introduced in 1978. 140

Wurth: Large, thin-shelled nut, pointed at one end; cracks out whole halves. A strong vegetative grower, with scab resistance. Original tree produces 2 to 3 bushels of nuts annually. Originated in Paducah, Kentucky on the form of Hillary and Vincent Wurth. Introduced in 1978. 140

#### SHELLBARK HICKORIES

Characterized by a shaggy trunk with even coarser plates than those of the shagbark hickory. It typically grows in lowlands and river bottoms as contrasted with the shagbark hickory which grows on upland soil for the most part. JAYNES. (C. lacinososa)

Big Cypress: Highly regarded clone discovered by Charles Spurgeon in southwestern Indiana. Winner of a second place prize in a contest sponsored by the Northern Nutgrowers Association. Introduced in 1985. 140

Bradley: Large nut; kernel large, never tight in shell; cracking quality excellent; shell thickness medium. Tree bears annually; bears precociously after grafting; requires good soil. Originated in Franklin County, Pennsylvania by Fayette Etter. Introduced in 1932. BROOKS 1972; 140

Daulton: Relatively new cultivar with good potential. Very large nuts with good flavor. Extremely vigorous growing tree producing extra large twigs and leaves. Originated in Kentucky. Introduced in 1987. 140

Dewey Moore: Moderate producer of thin-shelled nuts with 33% kernel. Very good flavor. Large, vigorous tree with good resistance to scab. Originated in southern Ohio by A.M. Cox. Introduced in 1987. 140

Fayette: Nut large; shell thin, being one of the thinnest of all cultivars; kernels crack out well, flavor good. Tree bears annually. Originated in Fanklin County, Pennsylvania by Fayette Etter. Introduced in 1932. Open-pollinated seedling of a native shellbark hickory. BROOKS 1972; B99{PL}, E62, E62{PL}, E62{DF}, E62{SC}, E91M, 140

Henry: Very large nut; relatively thick shell; flavor and kernel filling very good. Tree hardy and productive, grows 70 to 80 feet tall; resistant to scab. A vigorous growing far northern selection. B99{PL}, E62, E62{DF}, E62{SC}, E91M

Hoffeditz: Medium-sized nut, shape not always uniform; kernel of good flavor; cracking quality good. Tree bears annually. Originated in Faystte County, Pennsylvania by Fayette Etter. Introduced in 1930. BROOKS 1972; B99{PL}

Keystone: Long, thin-shelled nut. The best cracking shellbark ever found by Etter, as kernel always falls free from the shell. Tree bears annually. Originated in Franklin County, Pennsylvania by Fayette Etter. Introduced in 1955. BROOKS 1972; B99{PL}, 140

Lindauer: Very heavy producer of large nuts which crack out whole halves. Medium shell thickness. Tree reported to be precocious and resistant to weevils. Foliage has good resistance to scab. Originated in Illinois. 140

Nieman: Heavy producer of very large nuts. Shell fairly thick, but the nut cracks out well. Very good flavor. Slow growing tree, height 70 to 80 feet; begins bearing in 8 to 10 years. A good producer as far north as Iowa. Originated in Illinois. 140

Stephens: An old cultivar that produces very large nuts. Relatively thick shells, typically thicker than those of most shagbark hickories. Ripens late. Tall, ornamental tree. Originated in Kansas. 140, 160{PL}

## KALE {S}

BRASSICA NAPUS

BRASSICA OLERACEA

### CULINARY KALES

#### HYBRID

Blue Knight: 45-55 days. Hybrid Vates type. Earlier, stronger, more uniform and higher yielding. Deep blue-green, firm, curly leaves have less tendency to yellow and hold up well when cut. Uniform, strong grower; yields 7 to 8 inch plants in just 45 days; larger plants in 55 days will outyield open-pollinated types by 50%. Suited to spring or fall planting. *AI, C20M, M29*

Redbor:<sup>1</sup> 50-55 days. A completely red kale, not merely red on the midribs like other red kales. Attractive, finely curled leaves, deep mahogany red throughout in cold weather. Makes a striking salad garnish when picked young. Turns green when cooked. Vigorous, cold resistant plant, 18 to 24 inches tall. Developed in Holland. C85M, D11M, D11M{PL}, F70, F70{PL}, K50, K66, L89

Winterbor: 60 days. A tybrid Vates type, with thicker well-curved, dark bluish-green leaves. Plants are taller and more vigorous than Vates, growing to 2 or 3 feet, with much greater yield and better cold hardiness. Also yields a much higher percentage of well-curved and ruffled leaves, is slower bolting and more uniform. Excellent for market, shipping or processing. *A87M, C28, C53, D68, G6, G93M, H61,177,191, K10, K50, K73, L42, L89, N52, etc.*

#### OPEN-POLLINATED

Blue Siberian: (*B. napus*) Vigorous, very spreading plant. Large, coarse leaves; plain at the center with cut and frilled edges of a deep

bluish-green color. Grows 12 to 16 inches tall with a spread of 24 to 36 inches. Very hardy. *K49M*

Cottager's:<sup>1</sup> Ribs and leaf veins tinted with pink and purple. Excellent flavor; also produces an abundance of delicious broccoli-like sprouts in the spring. Vigorous, prolific, 3 foot tall plant; long-standing; very handy. Good for flower arrangements. Introduced prior to 1877. *S55, S61*

Dwarf Green Curled: (Dwarf Curled Scotch, Dwarf Curlies, Bloomsdale Kale) 55 days. Dwarf, low-growing plant; 12 to 18 inches tall with a spread of 24 to 28 inches. Densely curled, yellow-green leaves; tender and delicate, especially after having been exposed to frost. Very cold handy. Well suited to light soils and unsheltered sights. Heavy yields in both spring and autumn. Introduced prior to 1865. *BURR; A25, B49, C85M, C97, D27, E38, F73D, F92, G57M, G87, K27M, L42*

Dwarf Siberian: (German Sprouts) (*B. napus*) 60-70 days. A vigorous, sprawling plant, growing 12 to 15 inches high and bearing large, coarse, blue-green leaves with frilled edges Very cold handy. *AI, C92, F44, G1M, G57M, K27M*

Flanders:<sup>12</sup> (Flanders Purple Borecole, Chou Caulet de Flandre) A large cattle-feeding kale. Similar to, but somewhat smaller than the Walking Stick kale. Also distinguished by the violet-red color of its leaves and stems. Extremely cold handy. *VILMORIN; U15, X54, Z91*

Greenpeace:<sup>1</sup> (*B. napus*) A rare Russian kale from the Greenpeace Experimental Farm in British Columbia. Has purple stems and highly variegated purple and green leaves. An unusual and attractive plant which grows 2 1/2 feet tall. Has survived a winter low temperature of -20°. *K49Z*

Hanover Salad: (*B. napus*) 30 days. An extra early, fast-growing cultivar with large, smooth leaves. When used fresh, it has a strong but good flavor; mild when steamed. Harvest leaves when small and tender. Best for early spring salads before other cultivars mature. *L7M, M95M*

Harvester: 68 days. Very deeply curled leaves; hold their color without yellowing after a heavy frost. Short-stemmed, spreading plant; height 15 inches. Dwarf growth habit protects the stem from heavy frost and keeps plants healthy well into cold fall weather and snow. Hardier than Konserva but not as high yielding. *E24*

I.D. Scope:<sup>3</sup> Overwintering kale grown for the broccoli-like shoots that form in the spring, and for a harvest of leaves in fall and winter. Mixed gene pool of different leaf shapes and colors including greens, whites, reds, pinks, purples and yellows. Developed by Tim Peters of Peters Seed & Research. *J9M*

Konserva: 60 days. Broad dark-green foliage; at first medium-curved, becoming well-curved with the onset of cool fall weather. Tall, very high-yielding plant; grows to 24 or 30 inches Very cold hardy. First class Danish strain. *D68, E24, G6,177, J9M, J20*

Laciniato: (Black Cabbage, Cavolo Nero, Nero di Toscana) 100 days. A rather primitive, open kale with very dark green, serrated leaves, 2 to 3 inches wide and 10 inches long. Height 2 feet. Useful for culinary purposes as well as being ornamental. Extremely winter hardy, freezing temperatures tenderize it and bring out its full flavor (a cross between sweet cabbage and kale). Popular in Tuscany and central Italy, where it is used in soups and stews. *BIANCHINI, BUGIALLI [Re], KASPER [Re]; A2, G44M, H73{PR}, I18M, 177, K66, L13M, 089, Q34, 577, S55, S75M*

Large-Leaved Jersey:<sup>2</sup> (Sarthe Cow Cabbage, De la Sarthe) Resembles Walking Stick, but is usually not as tall. Remarkable for its very large leaves, often more than 3 feet long and 12 to 14 inches broad. Succeeds best in rich soil in a temperate climate, as it is not perfectly hardy. *VILMORIN; U15, X54*

Maris Kestrel:<sup>2</sup> A forage kale that resembles Marrow Stem. Shorter and thicker in the stem and less prone to lodging. Very

uniform plants with high dry matter and good palatability which insures almost complete utilization of the stem when grazed. B13

**Marrow Stem:**<sup>2</sup> (Chou Moellier) Tall, unbranched, very stout and thick stem; grows 5 feet or more high, 3 to 4 inches in diameter at its thickest part; swollen in the upper two-thirds of its length and filled with a sort of marrow or tender flesh. Thought to be the progenitor of kohlrabi, the flesh is preferred by some for its milder flavor. Should be cut when 2 or 3 inches in diameter. BURR, VILMORIN; C95, E83T, N81, N84, PIG

**Mosbacher:** (Mosbach Winter Kale) Resembles a cross between the Tall Green Curled kale and Portuguese cabbage. The leaves especially resemble the latter, with very stout stalks, midribs and veins; pale, almost yellowish-green in color. Stem of medium height, 2 to 2 1/3 feet tall; the leaves growing in tiers along its length and bent upwards, not downwards, from their middle. Useful as a table vegetable, and also has merit as an ornamental. VILMORIN; X54

**Palm Tree:** (Palm Tree Cabbage) Stem straight, or slightly curved; height 6 1/2 feet or more; bears a cluster of leaves at the top. Leaves entire, 2 to 2 1/2 feet long, 3 to 4 inches broad; of a dark, almost blackish, green color; finely crimped like those of Savoy cabbage; spread outward as they grow giving the plant a very elegant, palm-like appearance. Flavor excellent when picked young. Similar to Laciniato. VILMORIN; J73

**Pentland Brig:** 75 days. Medium-sized plant; 18 to 24 inches tall, 24 inches across. Produces tender, finely curled leaves from early winter through April, then broccoli-like spring sprouts. Good flavor. Very hardy and productive. Excellent for home gardens. Bred in Scotland; a cross between Thousand Headed and a curled-leaf type. B49, R32, R47, S55

**Premier:** (Early Hanover) (B. napus) 68 days. Produces thick, deep-green, serrated leaves with slightly frilled margins; more serrated than Smooth Long Standing. Main stems of over-wintered plants remain short while developing many growing points. Substantially higher yielding than most other cultivars when seeded in fall for a spring harvest. Also excellent for early spring planting. A1, A27M, C28, G1M, G57M, G93M, H54, L7M, L10, M95M

**Purple Rapini:**<sup>1</sup> (B. napus) Flatleaf form with purple stems and midribs. Overwintered plants produce an abundance of very sweet, dark purple rapini-like shoots in mid-spring. The first of these flowering shoots may be 12 to 18 inches long with a crisp, asparagus-like texture. Subsequent shoots become smaller with each picking. Smaller shoots are excellent in salads. F80, N7G

**Ragged Jack:**<sup>1</sup> An old-fashioned ornamental kale. Short, often branching stem. Long, irregularly cut oak-like leaves, variously colored with purple and blue-green. Productive, but unlike most kales, it will not withstand very low temperatures. Introduced prior to 1885. LARKCOM 1984, VILMORIN; F24G, K17M, K49M, Q34

**Red Ursa:**<sup>1</sup> (B. napus) 60 days. Heavily ribbed, broadly curled strain with extra frills and a deep reddish-purple color. Central leaves of well grown plants have excellent flavor and texture in fall and winter salads. Very vigorous, can be cut back repeatedly for continuous harvests. Developed by Frank Morton of Shoulder to Shoulder Farm. E24, K49T, N7G

**Russian Red:**<sup>1</sup> (Canadian Broccoli) (B. napus) 60 days. Lightly crinkled, oak-like leaves with an unusual purple venation. Flavor and texture very good before a frost. Height 2 1/2 to 3 feet. Not as winter hardy as Konserva. Called Canadian broccoli in reference to its early spring flower buds. Attractive specialty item. A2, B49, E24, F13, F80, G6, G6{SP}, G33, 177, J97M, K10, K23{PL}, K49T, K66, L13M, L91M, R47, etc.

**Siberian:** (Siberian Curled) (B. napus) 60-70 days. Vigorous, fast-growing plant; grows 12 to 18 inches tall; leafy and sprawling with large, blue-green leaves with frilly edges. Can withstand frost,

which actually improves the texture and flavor. The leading cultivar in the southern part of the United States. Will stand the entire winter in much of the South. Widely used as cooked greens or chopped for use in sandwiches and salads. A2, A16, C95, G79, I59M, I11, K10, K71, L10, L89, M46, M95M

**Siberian Improved:** (Improved Dwarf Siberian) (B. napus) 65 days. Hairy, spreading plant with broad, thick, grayish-green plume-like leaves that are plain at the center and slightly frilled at the edges. Stands cold especially well. Grows 12 to 16 inches tall with a spread of 24 to 36 inches. A75, A87M, C28, DIT, D12, N16

**Smooth Long Standing:** (Slow Seeding, Long Seasons, Late Hanover, Hanover Long Standing) (B. napus) 32-75 days. Slow-growing, large-leaved cultivar that stands well. Can also be used raw or as a steamed vegetable before other cultivars mature. Fresh flavor is strong with a trace of hotness; milder when steamed. Smooth, blue-green leaves. Grows 12 to 14 inches tall. Produces over a long harvest season. A2, G57M

**Spring:** (Smooth, Early Hanover Salad) (B. napus) 35 days. Large, round, smooth, thick leaves; dark green in color; mild, sweet flavor. Very fast-growing and hairy. Grows 10 to 12 inches tall. Produces an abundance of foliage in a short time. Usually sown in early spring but can be overwintered. G1M, J73, L10, M95M

**Tall Green Curled:** (Tall Green Scotch, Tall Scotch Curled) Stem stout and straight, 2 to 3 feet tall. Leaves rather narrow, 16 to 20 inches in length; clear-green; deeply curled and frilled; very tender and flavorsome after having been exposed to the action of frost. Very hardy. Tall form of Dwarf Green Curled; introduced prior to 1865. VILMORIN; C20M, K71, S61

**Thousand Headed:**<sup>2</sup> (Branching Borecole) A large forage kale, distinguished from the Walking Stick kale by the numerous side-branches emanating from the main stem. Somewhat shorter, it is generally considered more productive but not as hardy. Originated in western France, prior to 1865. BURR, VILMORIN; A2, F73D, G44M, L13M, K49M, S61

**Thousandhead Dwarf:** A dwarf low-branching strain of Thousand Headed, which develops prolific side shoots earlier and lower on the stem. Exceptionally hardy. Harvest the tender young shoots as they are produced during winter and early spring. S55

**Vates:** (Dwarf Blue Curled Scotch, Blue Curled Scotch, Dwarf Blue Vates) 55 days. Low-growing, compact, short-stemmed plants; 15 inches tall, with a spread of 24 inches; slow bolting. Finely curled, bluish-green leaves which resist yellowing. Standard dwarf cultivar. Originated in Virginia Beach, Virginia at the Virginia Truck Experiment Station, hence the name. Introduced in 1950. A75, A87M, B6, D76, E59Z, G16, G71, G93M, 139, 191, J14{PL}, K49M, K71, K73, L24G{SP}, M46, etc.

**Verdura:** 60 days. Westlandse Winter type, widely grown in that area of Holland and relished by the Dutch. Compact, vigorous, highly productive plant. Produces thick, curled, dark blue-green leaves that are very tender and sweet. Provides extended harvests throughout the winter. K66

**Walking Stick:**<sup>2</sup> (Walking Stick Cabbage, Tree Cabbage, Jersey Kale, Chou Cavalier) Stem straight, stiff and strong, comparatively slender; height 3 to 4 feet the first year, up to 12 feet after 3 years. Leaves oval-rounded, often over 2 1/2 feet long; can be picked when young and stuffed like Greek dolmas. Also used as forage. In the Channel Islands, the stems are dried and made into walking sticks. PARKER, VILMORIN; C82, C95, F80, 139, L91M, N84, 053M, PIG, Q11M, R88, S17

**Westlandse Winter:** 60 days. Deeply curled and frilled dark-green leaves; sweet, with only a hint of a cabbage-like flavor. Tall, thick stalks; can reach 24 inches in height. At the growing point the new leaves form an attractive pale-yellow rosette. C85M, L89C

**Winter Red:**<sup>1</sup> (B. napus) Dark-green leaves; irregularly cut and lobed like an oak leaf; turn to various hues of red and purple after

the fall frosts. Good raw; tender and sweet when cooked. Becomes a rich, dark-green color when cooled. Very disease resistant. Developed by Territorial Seed Company; the result of breeding work to confirm the origin of such kales. J9M, L89, N7G

#### ORNAMENTAL KALES

Also called *salad savoy*, these are grown mainly for their ornamental rather than edible qualities although they are quite palatable, especially after having been exposed to frost. Popular with chefs as a garnish or as a salad ingredient, they can also be cooked like regular kale. GESSERT [Cu], HARRINGTON, G. [Cu, Cul], LARKCOM 1984 [Cu, Cul], SCHNEIDER 1986 [Cul]; E13G{PR}, N40{PR}, Q34

**FLOWERING CABBAGE** These are the oldest forms of ornamental kales. Most have a more mounded habit than the flowering kales and the leaves are generally rounded not feathery or fringed. DI 1M, FI, F70, G87, H61,167M, K64{PL}, M95M

#### Hybrid

**Color-Up Series:** Compact, uniformly mounded plant; grows 10 inches tall, with a spread of 12 inches Very clear, intense colors. Color and habit hold up through hard winter freezes, continuing into spring. Withstands variable weather well; resists warm spells and sudden frost alike. Available in red, pink and white. 191

**Osaka Series:** Attractive wavy edged leaves form bright colored central heads extremely early. Far superior to open-pollinated strains. Vigorous, uniform growth habit; height 12 to 14 inches. Outer leaves green. Available in pink, red and white. C92, D68, E53M, E91G, G71, G82, H49, H57M, I50G, J20, K10, K57{PL}, L42, TIM

**Pink Beauty:** Attractive, round-leaved flowering cabbage with a distinctive color combination. The medium rose-pink centers contrast nicely with the bright white outer foliage for outstanding color. Outer leaves on the lower part of the plant are tipped with green. Upright plant, 10 to 12 inches in height. F13

**Tokyo Series:** Round leaf type. Uniform and more heat resistant than other strains. Grows 8 to 10 inches tall, with a spread of 15 inches. Smooth, flat, wavy edged leaves. Extremely cold tolerant. Available in red, pink and white. Colored inner leaves become more intense during cold weather. B75, C44, C92, D11M, E53M, E75{PL}, E91G, F70,139, 750G, L79, M29, TIM

#### Open-Pollinated

**Miniature:** (Miniature Japanese) 65 days. Tiny plants that look like giant roses, with lovely deep red shades on green. Needs cold weather to bring out the color. Makes an attractive, colorful addition to salads. 139

**FLOWERING KALE** Generally characterized by feathery or fringed leaves as opposed to the rounded leaves of the flowering cabbages. The leaves are also thinner which makes them more suitable for culinary purposes. C53, D11M, E24, FI, F70, F82, F92, G71, H61,167M, 184, K49M, M95M

#### Hybrid

**Chidori Series:** Heavy, dense, multi-leaved rosettes about 12 to 15 inches across. Dark-green, fringed outer leaves with ruffled edges. Tightly bunched, double savoyed centers which color up in warmer temperatures than other types. Dwarf plant habit, uniform and slow bolting. Available in red or white. D68, E53M, E91G, 177, J20, L42, N52

**Feather Red:** Long, deeply serrated and fringed leaves; the inner area solid red and the outer part dark green with red veining. Height 18 inches. Excellent for fall color. Grow with Feather White for a striking appearance. D26D, F13, E91G, 177

**Feather White:** Long, deeply serrated and fringed leaves; the inner area solid white and the outer part medium-green with white

veining. Height 18 inches. Grow with Feather Red for a striking appearance. D26D, F13, E91G, 177

**Nagoya Series:** Heavily fringed leaves develop outstanding, brilliant colors with the onset of cool weather. Height 18 inches. Excellent uniformity not found in open-pollinated cultivars. Available in red, rose, and white. Excellent for garden, container or mass plantings. A1, B75, E53M, E91G, F13, G6, H49, H57M, 750G, 191, J84, K10, K16M, K57{PL}, K73, L42, L79, etc.

**Peacock Series:** A striking new type of flowering kale. Produces deeply cut, fringed, feathery leaves on compact, robust, frost hardy plants. Height 12 inches. The leaves begin to turn colors from the plants center, with extended colored areas developing "like webs" as the winter advances, enriching their tones. Available in red and white. B6, D68, E53M, E75{PL}, £97G, G71, G82, H57M, H95, /50G, 191, J20, L42, L91M, M29, Q34, R47, etc.

**Sparrow Series:** The most dwarf of all ornamental kales. Very dense, compact plant, only 6 inches tall and 8 inches across; excellent uniformity. Deep green, fringed leaves with colored centers. Ideal for growing in pots and containers. Resembles the Chidori Series. Available in red and white. E75{PL}, £97G, G82, L42, N84

#### Open-Pollinated

**Red on Green:** Reddish-purple interior leaves with contrasting green edges; rich bluish green outer leaves. Height 15 inches. Planted in late summer, leaves begin to color at lower fall and winter temperatures. G93M, H95

**White on Green:** Green, heavily fringed leaves; creamy white centers. Height 15 inches. High temperatures and excessive amounts of fertilizer will affect the speed and degree of coloration of the leaves. C20M

**Willy's:** A distinctive ornamental, with centers of deep red fringed by curled green. Light frost improves the flavor. Used for adding color to salads or in place of cabbage in soups and stir-fries. Harvest all winter, removing the leaves. F73D, J25M

#### CODES FOR SPECIAL TYPES

1. Purple-Leaved
2. Forage
3. Multi-Colored

## KIDNEY BEAN {S}

### PHASEOLUS VULGARIS

#### DRY BEANS

Also called *field beans*, these are the principal beans of commerce. They are harvested after the pods have dried and the seeds inside have shrunk. A good dry bean is especially suited for baking, stewing or use in soups.

#### BLACK-SEEDED

##### Bush

**Black Coco:** 98 Days. First pods form early and make fine snap beans; later, fast developing shell beans form; and finally, plump, black, quick-cooking dry beans. New Mexico favorite for making *frijoles refritos*. Tall growing and productive. Heirloom with pink flowers. VILMORIN; A2, F73D, G6,199M, J39, K17M, K49T, L89

**Black Delgado:** Bushy plants bearing small black beans. A very ancient cultivar, widely used by the Zapotecs for soups, on tortillas, etc. Withstands considerable cold and drought. Also used to dye the famous black rebozos of Oaxaca. Classic staple of Mexican cuisine. F80, K46T

Black Mexican: (Frijol Negro) Small, oval black bean; tender, with a distinctive flavor; good for making a thick, rich, dark soup. Later maturing than pinto. After the pinto, the most popular bean among the Mexican Indians in California. A2, J73, L11, N84

Black Turtle Soup: (Turtle Soup) 90 days. Small, flattened, jet black seeds; 7 or 8 seeds per pod. Widely used for soups, to which they impart a distinctive flavor and a greenish color, somewhat similar to that of the green turtle soup so popular along southern sea coasts. Very old cultivar that originated in northern South America or Chile HAWKES [Re], HEDRICK 1931, ORTIZ 1973 [Re]; A90M{DF}, A90M{PD}, C94M{DF}, E56{DF}, E60P{PD}, G79, 191, J11M{DF}, J20, K10, K49M, L24G{SP}, L24M{SP}, M46

Hopi Black: (Kumvimore) 110 days. Small, glos<sup>^</sup>, tasty black seeds. Excellent for chili. Also good as a snap bean. Ripens consistently and dries quickly. Prolific, rampant bushes. Adapted to the high semi-desert, where it is planted in the spring. Prolific at oak elevation with irrigation, but dry or run-off farmed by the Hopi. Can also be used as a dye KAVASCH [Re]; A2, C95, K17M, K46T, L88J

Midnight Black Turtle Soup: 104 days. An improved, upright growing, black bean stain. Tall bush does not sprawl, keeping pods off the ground for cleaner beans and fewer problems in wet weather. Small black beans, about the size of pea beans. Good for soups, stews and refrying. Developed by Cornell Univeisity. E24, G6, K17M, K23, K66, N84

Mitla Black: 110 days. Small, slightly flattened black seeds, 3 to 5 per short pod. Excellent for black bean soup. Can also be used as a snap bean. Compact plant; produces short runners but support required; high yielding. Pre-Columbian cultivar from the Mitla Valley of Oaxaca, Mexico. 116, J25M, K46T, N84

Tarahumara Chokame: Small, round, shiny black seed. Originally collected from Jose Torres at the bottom of Batopilas Canyon in the Sierra Madres of Chihuahua, Mexico where it is planted in August and harvested in November. Has grown well in Tucson, Arizona and Madison, Wisconsin. 116, N84

#### BROWN-SEEDED

##### *Bush*

Brown Dutch: A traditional golden-brown drying bean from Holland. Floury texture and an excellent flavor. Popular for baking, boiling, soups and stews. Easy to shell. The flat, light green pods can also be used as snap beans. Very productive. B49, C85M, J39, K17M, K49M, M46, R32, S55

Ireland Creek Annie's: 80 days. Long, oval light-brown seed with white eye; pods 5 inches long, 5 seeds per pod; excellent flavor, makes its own sauce. Easy to shell. Small but prolific plant; highly resistant to mold and mildew. Does well in short season areas. Heirloom from Ireland Creek Farm in British Columbia, Canada. Introduced from England in the 1920's. A2, F73D, K17M, N84

Marfax: 85-90 days. Medium-sized, plump round seed; golden-brown color. Resembles Swedish Brown, but earlier and higher yielding. A richly flavored bean that is good for soup Very adaptable to cool climates. Heirloom originally from New England. A2, D68, F73D, K17M

Swedish Brown: (Bruna Bonor) 85 days. Seed medium to small, oblong-oval, plump; color light brown, marked with darker brown; small white eye; 4 to 5 seeds per pod; nutty flavor. Very hardy; well adapted to northern climates but will grow well in most areas. Brought by Swedish immigrants settling in the upper Mississippi Valley. Still popular in parts of northern Michigan, Wisconsin and Minnesota. HEDRICK 1931; A2, A7M{DF}, A90M{DF}, C94M{DF}, E5T, E97, J11M{DF}, J66M{DF}, K49T, K71, M46, N34{DF}

#### GREEN-SEEDED

##### *Bush*

Hutterite Soup: 100 days. Round, very plump, light-green seed; very distinctive, resembles an English rugby ball; two small, dark half-circles around the hilum. Excellent for soup, quickly dissolving into a creamy white delicacy. Early maturing. Compact, true bush-type plant; productive; easy to grow. Heirloom from the Upper Great Plains. A2, A66, D68, F24G, F73D, H15P, K17M, K46T, K49M, K49T, K49Z, L77D, N34{DF}

#### MOTTLED

##### *Bush*

Agate Pinto: 92 days. Medium-sized, broad oval, buff-mottled seeds; spicy flavor. Relatively short cooking time. Bush-type plant, without the sprawling habit of other pinto strains. Resistant to bean rust and common bean mosaic virus. Developed by Rogers Brothers Seed Company. Introduced in 1982. D68, J39, K17M

Anasazi: (Anasazi-Analog) {DF} 90-95 days. Strain of Jacob's cattle, identified as one of the few cultivated crops grown by the ancient Anasazi cliff dwellers. White seed, prominently mottled and splashed with maroon. Excellent baked, having a sweet flavor and meaty texture. In Navajo, the word anasazi translates as "the ancient ones". Recently rediscovered by the natural foods industry. COX [Re]; A2{S}, A90M, C73P, F73D{S}, F97M, I8M, 116, J11M, J25M{S}, K49Z{S}, L11{S}, L24G{SP}

Ankole: Medium large bean with a speckled, reddish russet color reminiscent of Ankole cattle, an enormously large-horned breed of northern Central Africa. Tender-skinned, nutty-flavored beans with a fluffy texture; hold their color well when cooked. Original seeds found in an archeological dig in Kenya. C60D{DF}

Appaloosa: {DF} 90-110 days. Attractive sibling of the Anasazi bean. Small, narrow, kidney-shaped seed; white with maroon-and-black mottling, like the rump of an appaloosa horse. Bush-type plant with short runners that do not require staking, but will climb a fence or cornstalk. Widely used in Southwestern cuisine. From Velarde, in northern New Mexico. A2{S}, A90M, B31, C94M, E23T, F80{S}, F86T, J25M{S}, J39{S}, K17M{S}, K18M, K46T{S}, K71{S}, N40, N55, etc.

Bolita: (Boleta, New Mexico Bolitas) 100 days. A treasured staple of the Hispanics of northern New Mexico. Pale yellow-green to light brown, veined seed, with squared ends. Cooks more quickly than Pinto beans, especially at high altitudes Very productive low bush; short runners that do not need staking. Originally grown in the highlands of Spain, and said to be the progenitor of the Pinto bean. MAYES; A90M{DF}, 116,163T{DF}, J25M, J11M{DF}, K17M, K49M, N84

Calypso: (Black Calypso) {DF} Thick, oval seeds, about 3/8 inch long; white with striking black markings on the top and sides. Has a smooth texture that is ideal for purees, and a distinctive nutty flavor. Good in salads, stuffings, soups, and stews. Popular specialty market item. MAYES; A2{S}, A7, A90M, B31, C94M, D68, D93M, E23T, E24{S}, E31, F86T, J11M, K18M, L7M{S}, M46{S}, N40, N55, etc.

Jacob's Cattle: (Trout) 85 days. Heirloom New England bean of unknown origin, but very similar to the Anasazi bean. Kidney-shaped seed; white, with deep maroon mottling and speckles; uniquely attractive. Excellent for baking, especially the traditional New England festival dish *beans-in-the-hole*; also good as a green shell bean. Does well in short season areas of the United States and Canada. GUNST [Re]; A2, A25, A90M{DF}, C94M{DF}, D68, E23T{DF}, E24, F24D, G6, J73, K17M, K49M, M46, M49, N40{DF}, N34{DF}, etc.

Jacob's Cattle Gasless: 90 days. Jacob's Cattle x Black Turtle. Developed by Sumner and Radcliffe B. Pike of Lubec, Maine at the University of New Hampshire, in the 1950's. Coloring identical to

Jacob's Cattle. Scientific tests indicate that it causes less than half the flatulence of other beans. Used primarily as a baking bean. K49M

Jumbo Pinto: Large, plump succulent bean, about 7/8 inch long; buff-colored with dark brown markings. Firm, solid texture; particularly fine flavor. Good in soups or chile. Excellent when cooked and served cold in salads. Developed by Tom Phipps MAYES; J11M{DF}

Kenearly: 95 days. A baking bean selection made at the Kentville Research Station, Nova Scotia, from the well-known Yellow Eye. White seeds with yellow-brown eye. Excellent flavor and quality. Good yields. Early maturity; well adapted to most areas of Atlantic Canada and New England. C95, M46, M49

Maine Yellow Eye: (Old-Fashioned Yellow Eye) 92 days. Medium-sized, oval, plump seed; white, blotched with a yellow-gold "eye" near the hilum. Excellent for baking and stewing. Widely grown in Maine and Vermont where it is claimed that it bakes much better and has a better flavor than other strains of yellow eye. HEDRICK 1931; A2, A90M{DF}, C94M{DF}, D68, G6, H73{DF}, K17M, L13M, L77D, M46, N34{DF}

Pebble: (Chimera) {DF} Unique sport producing a different color of seed in each pod. Pods produce uniform-sized beans in colors of white, black, russet, striped, red and brown. Planting any one of the colors produces the same effect. Tender-skinned beans that cook uniformly and maintain their color to a high degree. Excellent when cooked and used in salads. A90M, C60D, F86T

Peregion: 80 days. Highly-regarded Scotia type. Small, slightly oblong seed; tan, with black stripes and speckles; very attractive. Can also be used as a snap bean when very young. Compact, bush-type plant; very prolific. Originated in eastern Oregon. A2

Pinto: 85 days. Medium-sized, broad oval seed; pinkish buff, blotched with medium dark-brown; 5 to 6 seeds per pod; rich, spicy flavor. Essential for Mexican and Southwestern cuisine, especially chile con carne. Vine semi-trailing, spreading. Primarily grown in dry western climates. A52M{DF}, A90M{DF}, A90M{PD}, B73M, D76, E60P{PD}, G71, G79, H85M, I64, J11M{DF}, K71, M46, M95M, N16, etc.

Red Calypso: {DF} 75-85 days. Plump, creamy-white seeds, nearly half covered with a deep burgundy blotch, and with burgundy specks on the white portion. Selected from the Seed Savers Exchange's bean collection by Indian Harvest Specialties. Selected for its attractive appearance and good flavor. E56, F86T, K47{S}

Soldier: (Johnson Bean, European Soldier) 85 days. Attractive New England heirloom. Long, slender, kidney-shaped seed; white, with a reddish-brown "soldier" pattern near the hilum; soft texture, fine flavor; 6 seeds per pod. Very popular for baking and stewing. Hardy, high-yielding plant, 18 inches tall; drought resistant. Does well in cool areas. HEDRICK 1931; A2, A25, A90M{DF}, C94M{DF}, D68, E5T, F24D, F42M{DF}, G6, H73{DF}, J73, K18M{DF}, K49M, K71, L24G{SP}, M46, M49, etc.

Spanish Tolosana: (Prince) {DF} Attractive, rich reddish purple and brown seeds, 1/2 to 3/4 inch long; long, slender kidney-shaped. Excellent when cooked and served cold in salads with olive oil. Also very good for chili. Often sold in gourmet specialty food stores. Named after a village in the Basque country of Spain. MAYES; A7, A90M, C94M, E23T, F73D{S}, J11M, K17M{S}, L13P, N55

Steuben Yellow Eye: (Yellow Calypso, Butterscotch Calypso) {DF} Medium-sized, plump seeds; white with mustard-yellow markings on the keel. Has more of a solid yellow mark than other beans of this type. Holds its shape and color after cooking. Popular specialty market bean. MAYES; A7, A90M, C94M, E56, F1{S}, F86T, G44M, J11M, K17M{S}, M46

Yellow Eye: (Dot Eye, Molasses Face; Yellow-Eyed China) {DF} Medium to large, broad plump seeds, about 1/2 inch long; clear white with prominent yellow markings. Mild flavor. Mealy texture. Retains its color when cooked. Traditional New England baking

bean. Also popular in certain areas of the South for making *Hoppin' John*. HEDRICK 1931, MAYES; A7M, A90M, B31, C53{S}, E23T, E31, H86, I16, J39{S}, K17M{S}, K18M, K49M{S}, K71{S}, N40, N55, etc.

### Pole

Boy: 90 days. Striking purple-on-white cultivar from England. Medium-sized, nearly round seed, distinctively marked with sharply defined color areas of reddish-purple and off white; flat light-green pod with dark green sutures, 4 inches long, 3/4 inch in diameter. Vigorous, highly productive vine. A2

Good Mother Stallard: {DF} 97 days. Large, plump, attractive seeds; cranberry red, splashed with creamy white; excellent meaty, granular texture; very mild, almost sweet flavor. Retains color and design even after cooking. Selected for commercial production by Indian Harvest Specialties, from among 4,000 beans in the collection of the Seed Savers Exchange. B49{S}, E56, F86T, K47{S}

New Mexico Cave: 100 days. Large, flat, kidney-shaped beans; maroon splashed with white. Excellent dried or as a snap bean. Very vigorous vine, about 10 feet long, bears heavily late in the season. Southwestern heirloom reportedly discovered by archaeologists searching for pygmy elephants. Said to have been carbon-dated to about 500 AD. A2, C95, E5T, E56{DF}, F86T{DF}, K46T, N24M

Snowcap: {DF} 110 days. Large, kidney-shaped seeds, about 5/8 inch long; white splashed with pink and cream. Mottled colors are retained after cooking. Said to have a somewhat tart, tomato-like flavor. Excellent in salads; also good in minestrone and other vegetable soups. Sometimes available in specialty food stores. MAYES; A7, A90M, B31, C94M, E5T{S}, E23T, F73D{S}, F86T, H73, J11M, J39{S}, L24G{SP}, M46{S}, N40

### PINK-SEEDED

#### Bush

Pink: {DF} 85 days. Medium-sized seed, light salmon pink with a white hilum; long, narrow pod, 4 inches in length; 4 to 5 seeds per pod. Ideal chili or soup bean, holding its shape well when cooked. Also good as a green shell bean at 60 days. Highly productive. Widely grown in California, the Southwest and in Mexico. Probably originated with the Spanish conquistadors. HEDRICK 1931, ORTIZ 1973 [Re]; A52M, A90M, B31, J11M, M46{S}, M67

Santa Maria Pinquito: 90 days. Very small, square-shaped, pink bean that is low in starch and does not break up when cooked. Only grown commercially on the mesas above Santa Maria, California. Primary ingredient of the Santa Maria style barbecue, which is also unique to this area. According to Pappy's Restaurant of Santa Maria, they are traditionally simmered for 1 1/2 hours with bacon, onion, garlic and chili salsa. A90M{DF}, B75, D7{DF}, F73D, I39, J11M{DF}, J73, K17M, K49M, L94, N40{DF}, N84

### RED-SEEDED

#### Bush

Montezuma Red: 95 days. A strain of red bean that was being grown by Indians when Cortez arrived in Mexico. Identical beans have been found in pre-historic tombs, estimated to be more than 3,000 years old. Small maroon seed. Excellent for baking and chili. Tolerates a wide range of soils and growing conditions. A2, I39, J39, K17M, K46T, K49T, L3J, N24M

Red Kidney: (Chilian) 95 days. Medium to large seeds, long and broad; color ranges from pinkish crimson and reddish brown to a deep mahogany; pod 5 to 6 inches long; 4 to 5 seeds per pod. Widely used in Mexican dishes, bean salads, baked, etc. Large, runnerless plant, 14 to 16 inches tall. HEDRICK 1931; A25, B78, C44, C85M, D11M, D82, E24, E38, F70, G71, K27M, M46

Red Mexican: (Small Red Chili, Frijol Rojo) {DF} 85 days. Small to medium-sized, reddish-purple seed. Good baking bean; does not become mushy when cooked. A classic chili bean, but also provides a rich flavor for soups, salads and Creole dishes. Small plant, to 14 inches tall, with early runners. Grown and prized as a dry-land crop in California since 1855. Originated with the Indians of northern Mexico. HEDRICK 1931, MAYES; A7, A7M, A90M, B31, D26D, E31, G57M{S}, J11M, J73{S}, M46{S}

Red Peanut: 65 days. Small red seed, resembles a Spanish peanut; pod 4 inches long, green, turning red at maturity. Used both as a green shell bean and as a dry bean. True bush-type plant, 14 inches tall; very prolific; does well in dry weather. Quick maturing; plant often for a continuous yield. J39, K17M, M46

Redkloud: (Redkloud Kidney) 80 days. Heavy yielder of light red seeds. Matures one to two weeks earlier than other red kidney strains, allowing it to be grown as far north as Nova Scotia. Tolerant to halo blight. Resistant to two strains of common bean mosaic and the alpha race of anthracnose. Developed at Cornell University. D68, K50

#### WHITE-SEEDED

##### *Bush*

Duane Baptiste Potato Bean: An old Six Nations Indian bean traditionally used as a thickener in Native Canadian com soup. Large, white seeds; excellent flavor when baked. Should not be soaked as this toughens the skin. Highly adaptable; germinates well; consistently produces good crops even in cool weather. F73D, K17M, L88J

French Navy: {DF} Plump, slightly globular seeds, about 3/8 inch long, white with a green undertone. Has an outstanding texture and a unique, bacon-like flavor. Excellent in soups, salads or simply tossed with olive oil and salt. Often found in gourmet specialty food stores. MAYES; A90M, B31, C94M, E23T, E56, I8M, HIM, K18M, K49M{S}, N40, N55, S55{S}

Great Northern: 85 days. Similar to Navy, but enlarged and rather lengthened; pods 3 to 4 inches long; excellent flavor. Also used as a green shell bean at 65 days. Hardier, earlier, more productive than Navy. Originated with the Mandan Indians of North Dakota. Seed of it has been found in mounds known to be centuries old. HEDRICK 1931; A90M{DF}, B73M, B75, D65, D76, E31{DF}, E97, F97M{DF}, G16, H85M, J11M{DF}, J97M, K49M, K71, L24G{SP}, M46, etc.

Michelite: 85 days. An improved Navy type resistant to blight. Small, roundish, pearly white seeds. Excellent for pork and beans. Uniform and high yielding, ripens early and evenly. Pods are carried well off the ground for easy harvesting. Developed at Michigan State University. D11M, E38, F70

Navy: (Navy Pea, Boston Pea, White Navy) 100 days. Small, oval white seed, quite plump to somewhat flattened; short narrow pods; 6 to 7 seeds per pod. Popular for baking and stewing. Dwarf plant, 14 to 16 inches tall. Principal field bean in the United States; used extensively for the commercial canned baked bean. HAWKES [Re], HEDRICK 1931; A7M{DF}, A90M{DF}, C44, E31{DF}, G71, G79, G82, H85M, J11M{DF}, K10, K27M, L24G{SP}, M46

Rice Bean: {DF} Tiny, creamy white, kidney-shaped seeds; 1/4 to 3/8 inch long and about 1/8 inch wide. Reminiscent of a large, plump grain of rice. Quick cooking, tender and slightly sweet. Excellent in soups, casseroles, salads and side dishes. Reportedly originated in the Caribbean. A7, A90M, B31, F24D{S}, H73, J11M, K17M{S}, N40

Sanilac: 90 days. Highly improved strain of Navy, resistant to mosaic and bacterial wilt. Heavy yields of glossy white beans. Pods set high on the bush for easy harvesting, and prevent discoloration caused by contact with the ground. Developed by the Michigan Agricultural Experiment Station. B6, I59M

Seafarer: (Seafarer Navy) 92 days. Earliest strain of Navy pea beans. Small, nearly round, shiny white seed; good texture and flavor. Excellent for baking and making bean soup; also good as a green shell bean. Vigorous, highly productive plant; tolerant to halo blight, mosaic, and anthracnose. G57M

Walchese: (Walchese White, Ruckle) 95 days. Large, round white seed, much larger than Navy beans; outstanding flavor. Excellent for baking and soups, Very prolific. Popular on Salt Spring Island, British Columbia, where it has become known as Ruckle Bean. C85M, K17M

White Kidney: (Cannellini) 100 days. Large, white, kidney shaped seeds; fairly plump to somewhat flattened. Excellent for baking and in dishes where the color of red kidneys is undesirable. Vigorous, spreading plants; height 18 to 24 inches; very productive. Beans of the white kidney type appeared in U.S. catalogs as early as 1822. HAWKES [Re], HEDRICK 1931; A90M{DF}, C53, C94M{DF}, E5T, E56{DF}, F86T{DF}, G6, G57M, G82, H19M{DF}, I67M, I91, J11M{DF}, J20, J66M{DF}, L24G{SP}, L50M{DF}, L89, etc.

White Marrow: (White Marrowfat) 100 days. Rather short, plump-ovate white seeds, larger than Navy; flat, straight pods, 5 inches long or more; 5 or 6 seeds per pod. Excellent for baking and soups. Large, very spreading plant, with many long, trailing runners. HEDRICK 1931; A90M{DF}, B31{DF}, E5T, E13G{DF}, E23T{DF}, F73D, G57M, K10, L42, N40{DF}, N55{DF}

##### *Pole*

Judion de El Barco: Plump white seeds, 3/4 inch long when dry, swelling to 1 1/4 inch when soaked overnight in water. Expensive, gourmet type bean. Originates in El Barco de Avila, a district of Specific Denomination for bean culture between Avila and Salamanca, northwest of Madrid, Spain. L13P{DF}

#### YELLOW-SEEDED

##### *Bush*

Adventist: 80 days. Small, attractive, amber-colored seed; short pods; 3 to 5 seeds per pod; ripens over a long period of time. Excellent for baking or stewing. Small, compact plant with short runners; does not require support; heavy bearing. Originally from the mountains of northern Idaho. C95, K17M, L13M, L77D, N84

Ankara Yellow: Medium-sized, somewhat flattened seeds, yellow ocher to tawny over the entire surface. Excellent for baking. Dwarf, very erect plant, to 18 inches tall. Hardy and drought resistant. Introduced by Oscar H. Will from seed obtained from the Arikara Indians of the Missouri River region. HEDRICK 1931; A2, C82, J39, K17M, K46T

Sinaloa Azufrado: A bright yellow, tasty staple from irrigated farms in Sinaloa, Mexico. Makes excellent *frijoles refritos*. Adapted to low hot desert areas, where it is planted in early July. In temperate regions, plant in spring when danger of frost is passed and the soil has warmed up some. 116, N84

Sonoran Canario: Large, yellow-tan, kidney-shaped bean; quick cooking. Grown with irrigation in winter in frost-free, low hot desert areas. Good potential as a winter crop in Yuma, Arizona and San Diego, California. Originally from Mexico. 116

Squaw "fellow: 60 days. Small, golden yellow seed, about the size of the Navy bean. Good for soup. Pods are not used for snap beans. Very early maturing. Short, high-yielding plant. Does well in short season areas. A2, D82

Sulphur: (Brimstone, China Yellow) Small to medium-sized, very plump seed; cream to light sulphur yellow in color, with a faint green to brown eye-ring; pods 4 to 4 1/2 inches long; 5 seeds per pod. Distinctive flavor when baked. Also good as a snap bean. Spreading plant, 12 to 15 inches tall; very few or no runners. Popular in high elevation areas of North Carolina, Virginia and Tennessee.

see. A7{DF}, C94M{DF}, E5T, G57M, H73{DF}, /59M, K49M, L7M

Tarahumara Azufrado: Yellow, beige or ocher seed. Tender pods, 4 to 6 inches long. Tasty staple from the bottom and rim of Copper Canyon, Chihuahua, Mexico. Makes excellent refried beans. Semi-climbing bush. Adapted to low hot desert areas, where it is planted in early July. 116, K46T

#### POPPING BEANS

Also known as *nuhas* and *popbeans*, from Ecuador to northern Bolivia where they are native, they have hard-shelled seeds which are popped in a hot skillet like popcorn, rather than being boiled in hot water. The resulting product is soft and tastes somewhat like roasted peanuts. Traditionally served at main meals as a side dish, or eaten as a snack. Their culture appears limited to cool mountain climates with short daylengths. NATIONAL RESEARCH COUNCIL 1989; G47G{DF}

#### SHELL BEANS

Also called *shelly beans*, these are superior when harvested in the green, immature state when the seeds have swollen and the shell has passed the tender, fleshy state, to the point of being thin and rubbery.

#### COMMON

##### Bush

Bert Goodwin's: 75 days. New Hampshire heirloom. Large, attractive, mottled-brown seed; pods 7 inches long. Exceptionally rich flavor; excellent with butter or cream; also freezes well. Best shelled when the pod softens and begins to lighten in color. Large, vigorous bush, with some half-runners. J20, K17M

Buttergreen: 45 days. Grown for its green shell beans which have a distinctive flavor and mature 2 to 3 weeks earlier than limas. Can also be eaten young as a snap bean. Good for short season areas where other shell beans or limas can't mature. Small, spreading plant. Resistant to common bean mosaic virus. M95M

Limelight: 60 days. Small, flat white seeds; 6 seeds per pod. Excellent for shelling when greenish-white, resembling baby lima beans. Broad, flat, Italian-style pods may be picked for snap beans when 3 to 4 inches long. Also used as a dry shell bean. Short, compact, very hardy plant. Developed by Canada Agricultural Research Station, Lethbridge, Alberta. D68, D82, K17M

Low's Champion: (Dwarf Red Cranberry) 65 days. Medium to large, plump, broad-oval seed; dark reddish-maroon when dry; excellent for shelling when green, also used as a dry shell bean; 4 to 5 seeds per pod. Broad, flat pod; very tender and fleshy; good as a snap bean when young. Introduced in 1884. Still popular in New England. HEDRICK 1931; A2, F73D, G6, J39, K17M, K66, L77D, M46, PIG

##### Pole

Lazy Wife: (Hoffer Lazy Wife) 80 days. Small, very plump seed; ivory-white when mature, marked with a distinct, grayish, vein-like pattern; 5 to 7 seeds per pod. Broad, slender pod, 5 1/2 to 6 inches long; stringless. Quality below average as a snap bean; excellent for shelling. Probably brought to Bucks County, Pennsylvania by German immigrants, prior to 1810. HEDRICK 1931; D29P, F24G, K71, 089, PIG

Ohio Pole: 85 days. Large, dark-maroon seeds, frosted with white on one end. Used as a shell bean, either in the green shell or dry shell stage. Also good as a snap bean. A good producer, yielding 6 to 8 beans per pod. Indian heirloom from the Midwest. F73D, L7M

**FLAGEOLETS** {DF} Gourmet French shell beans, generally considered superior to other shell beans although their production is much lower. Indispensable for *cassoulet* dishes. B31, B91T{PD}, C3M, C94M, E23T, E31, E38M{PD}, E56, H15T, J39, J66M, K18M, L24G{SP}, N40, N55

##### Bush

Canadian Wonder: (Flageolet Red) Broad, flat pod; 5 to 6 inches long; 5 to 6 seeds per pod. Large, flattened, dark-red seeds. Should be harvested when extremely young for snap bean use. Also used as a dry shelling bean. Popular in England, Australia and New Zealand. Similar to Flageolet Rouge. Originated in Canada, sometime prior to 1873. HEDRICK 1931; B49, F73D, R32, R83, S55

Chevrier: (Chevrier Vert, Flageolet Green) Distinguished from other flageolet types by the intense green color that extends to all parts of the plant. The seeds have a very pronounced green tinge, which is maintained after cooking, and is not merely confined to the surface, but extends through the interior of the seed. Originated about 1878 at Bretigiy, France. HEDRICK 1931, VILMORIN; A90M{DF}, C20M, C53, E63D, F86T{DF}, I8M{DF}, K49M, K66, J11M{DF}, L3J, L13P{DF}, M46, S55

Flageolet Rouge: Straight or slightly kidney-shaped seed; 3/4 inches long, 1/4 inch broad, about 1/4 inch thick; wine-les red in color; highly prized as a green shell bean in France. Long, straight pods; very good as snap beans. Vigorous plant, about 18 inches tall; hardy and very productive. HEDRICK 1931, VILMORIN; A90M{DF}, G68, J11M{DF}

Flambeau: 76 days. Long, slender pods; well-filled with 8 to 10 beans; easily shelled. Small, vivid mint-green beans; tender but firm; of excellent flavor, reminiscent of fresh limas. Excellent frozen, retaining their texture and flavor well. Of gourmet quality, yet surprisingly easy to grow. G6, I18M, K17M

Flaveol: 85 days. Improved green flageolet type, developed from Chevrier. Small, mint-green seeds; tender and delicately flavored. Recommended for use as a green or dry shelling bean. Can also be used as a snap bean when young. Vigorous, highly productive plant. B75, C20M

Masterpiece: (Flagpolet Yellow) 55 days. Slender pods, 6 to 7 inches long, almost wholly stringless; fleshy and tender. Large, long-reniform, yellow-buff seeds. Excellent as a green shelling bean or dried for use in soups. Can also be used as a *filet bean* when young. Introduced as a novelty in 1910 by Sutton and Sons. HEDRICK 1931; A90M{DF}, J11M{DF}, K49M, Q45M, R50, R83, S55

Vernel: 60 days. Improved green flageolet type developed by Vilmorin of France. Long, well-filled pods; up to 6 small green seeds per pod; quality excellent. Can be used for snap, green shell and dried beans. Very productive plant; resistant to anthracnose and mosaic. Introduced in 1976. C92, G68, K49Z, S95M

**HALF RUNNERS** Intermediate between pole beans and dwarf beans, with short runners. Most are dual purpose types that can be used as snap beans when young and as dry or shell beans when older. Popular in the South.

Mountaineer Half Runner: (Old Dutch Half Runner) 60 days. Round, light-green pod, 4 to 5 inches long; tender and flavorful; becomes stringy as it matures. Small, oval white seeds. Also good as a dry shell bean for baking. High-yielding plant, with 3 foot runners that require no staking; resistant to common bean mosaic virus. Popular home garden cultivar. A 75, D12, E5T, F24M, F63, G1M, G57M, H54, I59M, 164, 191, K10, L10, M95M

Parker Half Runner: 52 days. Plump, oval, stringless pod; 5 inches long, 3/8 inch in diameter; tender and flavorful; matures over an extended harvest period. Seeds are excellent for baking, freezing and canning. Harvest snap beans in 52 days, dry shell beans in 90 days. Vigorous, bushy plant with medium length runners. I59M

Pink Half Runner: (Peanut) 60 days. Dual purpose bean, can be used as a snap bean when young and later for green and dry shelled beans. Especially good for baking or in chili. Bright red pods, 4 1/2 inches long when mature. Seeds resemble pink shelled peanuts. An old favorite in central Virginia. F73D, K27M, L7M, L10

State Half Runner: (State White Half Runner) 60 days. A strain of White Half Runner. Slightly longer and larger pod and larger seed than regular White Half Runner. Oval, slightly curved pod, 5 to 6 inches long; not stringless, but of excellent quality. Vigorous plant, with 3-foot runners that do not require staking. Resistant to common bean mosaic virus and nematodes. A75, D12, D26D, G1M, G57M, I59M, K10, K27M, L10

White Half Runner: (Mississippi Skip Bean) 60 days. Very popular in the South as a snap bean or a green or dry shelling bean. White-seeded. Round, medium light-green pods, 4 to 5 inches long; stringless if picked young. Vigorous, bushy plant, with short 3-foot runners; resists heat and drought. Not recommended for northern climates. A75, B75, D76, G27M, G57M, G82, H49, H61, J84, K27M, K71, K73, M46, M95M, N16, etc.

**HORTICULTURAL** Also called *cranberry beans*, *October beans*, or *borloto beans*, these cultivars are characterized by pods that are brilliantly splashed with carmine or red in the green shell stage, and by large white or buff-colored seeds more or less splashed and streaked with dark red. CUSUMANO [Cul, Re], GRAY, P. [Cul, Re]; A7M{DF}, A52M{DF}, B31{DF}, C94M{DF}, E5T, E23T{DF}, J66M{DF}, K66, J11M{DF}, L89, N40{PR}, N55{DF}

### Bush

Coco Rubico: Large, very attractive pods, strongly striped and splashed with bright carmine. Each pod contains 6 large seeds, striped with dark red. Suitable for use as both a green shell and dry bean. Excellent quality both fresh and frozen. Resistant to bean mosaic virus. Introduced in 1976 by Vilmorin of France. G16, J39, K49M, M29, M46, S95M

Dwarf Horticultural: (Dwarf Cranberry, Dwarf Wren's Egg) 60 days. Medium to large seed; pinkish-buff, streaked with bright red. Broad, plump pod; white, splashed with carmine in the green shell stage. Primarily used as a green shell bean, being preferred for *succotash* in many areas. Also used as a snap and dry shell bean. Of unknown origin; grown in the United States for over 150 years. HEDRICK 1931; A2, B6, B75, C85M, D76, D82, F24M, G57M, J20, J97M, K27M, K71

French Horticultural: (French's Dwarf Horticultural) 65 days. Plumb, red-speckled seed. Excellent as a green or dry shell bean; freezes and cans well. Flat, round pod; 6 to 7 inches long; turning greenish-yellow, heavily splashed or speckled with bright red; easy to shell. Vigorous plant; with semi-runners; hardy; disease resistant. Selected from Dwarf Horticultural. HEDRICK 1931; A25, A90M{DF}, F13, F65, G79, H85M, /64, J11M{DF}, J84, K10, K50, K73, L42, M46

Lingua di Fuoco Nano: 65 days. Large, straight pods; 1/2 inch in diameter, 4 1/2 to 5 inches long; striped and splashed with deep red. Large, salmon colored seeds, striped with white. Excellent fresh, frozen or canned. For home gardens or fresh market. B8, Q11M, S17

Madeira: Very large, plump, kidney-shaped cranberry type bean, about 3/4 inch long. Beige mottled with pink, but turns paler after soaking and cooking. Sometimes available at gourmet specialty food stores. Grown commercially in California. MAYES; A90M{DF}

Scarlet Beauty Elite: (Scarlet Beauty Elite 7 Pod) 70 days. Pods 7 inches long, produced in bunches of 7 per branch. Elongated seeds with attractive shades of purplish-brown and beige. Excellent cooking qualities as a shell bean, also used dried. Superior flavor and productivity compared to Jacob's Cattle. Developed by Professor E.M. Meader. F73D, J20, J39, K17M

Stregonta Nano: High-yielding, early maturing type. Very long, slightly curved pods, prominently striped and splashed with bright red; cream-colored seeds, marbled with red. Harvested when pods are still tender. One of the most popular fiesh shell beans in Italy. Q11M, S17

Taylor's Dwarf Horticultural: (Shelley Bean, Taylor Horticultural Improved) 62 days. Large, oval seed; buff-colored, splashed with red. Excellent for shelling; often used in *succotash*. Thick, flat, oval pod; 5 inches long; light green, turning cream-colored splashed with red at maturity; stringy and fibrous. Semi-running plant, 14 to 18 inches tall. A1, A2, A27M, B49, E24, E97, H33M, H54, J84, K10, K49M, K73, L7M, M46, N16, etc.

Tongue of Fire: (Tierra del Fuego, Horto) 70 days. Large, round seed; buff-colored, splashed with reddish-purple; pods 6 to 7 inches long, ivory-tan, streaked with red. Green shelled beans have excellent flavor and texture, either fresh, frozen or canned. Bicolor lavender flowers. Originally from Tierra del Fuego, Argentina, at the southern tip of South America. A2, A7{DF}, A75, A90M{DF}, B31{DF}, B49, B75, D93M{DF}, F82, G6, H73{DF}, 139, J11M{DF}, K17M, K23, K46T, K49M, K50, M46, R47, etc.

Vermont Cranberry: 60 days. Very popular heirloom bean from New England. Medium-sized, oval-shaped seed; cranberry-colored, mottled and striped with maroon; pod 5 inches long, streaked with red; 5 to 6 seeds per pod; sweet, succulent flavor; easy to shell. High-yielding plant; hardy; disease and drought resistant. Introduced prior to 1876. A90M{DF}, C53, C73P{DF}, D68, E5T, G6, J11M{DF}, J20, J39, J73, L88J, M46, N34{DF}

### Pole

King Horticultural: (Worcester Horticultural, Mammoth Podded Horticultural) Largest-podded and largest-seeded of the horticultural beans, also the most attractively colored and most showy in pod. Long, plump seeds, colored like those of Wren's Egg. Excellent for shelling. Pods 6 to 7 inches long, 7 seeds per pod. Originated near Worcester, Massachusetts. Introduced in 1894. HEDRICK 1931; A25, G93M, I59M, K49M

Lingua di Fuoco: Large, straight to slightly curved, roundish pods; 1/2 inch in diameter, 4 1/2 to 5 inches long; striped and splashed with bright red. Large, roundish, salmon colored seeds, striped with white. Fresh beans may be harvested in about 80 days, dry beans after 125 days. Excellent fresh, frozen or canned. B8, Q11M, S77, S55

Stregonta: (Sciabola Rossa) 130 days. Long, slightly curved pods, prominently striped and splashed with bright red; large bright red, marbled seeds. Vigorous, highly productive vine. Highly esteemed in Italy for fresh market and home garden use. Q11M, S17

Vermont Cranberry Pole: 60 days. Nearly identical to Vermont Cranberry, except for the climbing habit. Widely adapted plant; produces an abundant supply of tender, flavorful beans. Recommended as a green shelling bean; also very good as a dry baking bean. Very popular in Vermont. M46

Wren's Egg: (Speckled Canberry, London Horticultural, Bird's Egg) 75 days. Large, broad-oval, very plump seed; light buff, streaked with dark led. Very mealy and flavorful as a green shell bean; also good for baking and stewing when dry. Flat, carmine-streaked pod; of fair quality as a snap bean. Introduced into the United States from England, about 1825. BURR, HEDRICK 1931; A2, A90M{DF}, E5T, F24G, J11M{DF}, J39, K46T, K49M, M46

### SNAPBEANS

Also called *string beans*, although most modern cultivars are stringless or nearly so. Grown for the pods which are cooked when young or at the stage of maturity when they can rightly be called string beans.

### GREEN-PODDED

#### Bush

Baccicia: 52 days. Italian style snap bean. Semi-flat pod; 6 1/2 inches long, 3/8 inch in diameter; tender, stringless, flavor distinct. Seed dull-red, speckled with white. Good for fresh home garden use; not recommended for freezing. Also good as a dry bean, the seeds

being sold in specialty stores. Height 18 to 21 inches MAYES; A90M{DF}, C20M, G93M, K49T

**Black Valentine:** (Strigless Black Valentine) 50 days. Slender, nearly straight, light-green pod; 5 to 6 1/2 inches long; distinctive flavor. Glossy, jet black seeds. Good for shipping; not recommended for canning. Also used as a dry shell bean for soup. Very hardy plant; height 12 to 14 inches. Introduced in 1897. HEDRICK 1931; A2, A90M{DF}, E23T{DF}, F24M, F73D, F80, G1M, G57M, G71, J25M, K49M, L7M, M46

**Blue Lake Bush:** 55 days. Round, slightly curved, dark-green pod; 5 1/2 to 6 1/2 inches long; excellent texture and flavor. Seed white, slow to develop. Especially good for freezing. Popular with commercial canners and packers. Vigorous, upright plant; highly productive over a long period; sets well under adverse weather conditions. A16, A25, B75M, C44, D3M{PR}, D11M, D82, F15{PR}, F70, F82, F92, K5M, 089

**Bountiful:** 50 days. Broad, medium-round, yellowish-green pod; 6 to 7 inches long; stringless, brittle, fine-textured, of excellent quality. Good for shipping. Dull straw-yellow seeds. High yielding, dwarf plant; height 15 to 18 inches. Introduced in 1898 by Peter Henderson & Company. HEDRICK 1931; A25, A75, B73M, C44, G57M, G71, H54, J20, K49M, K71, M46, M95M, N16

**Commodore:** (Bush Kentucky Wonder) 60 days. Very similar to Kentucky Wonder, but requires no staking. Nearly round, stringless, dark-green pods; 7 to 8 inches long; brittle, meaty, flavorful. Good for canning and freezing. Brilliant, carmine-colored seeds. Upright, high-yielding plant. All America Selections Winner in 1938. A75, B6, D76, F24M, G57M, G79, 191, K27M, K49M, K71, N16

**Contender:** (Early Contender) 50 days. Oval, slightly curved, medium-green pod; 6 to 7 inches long; tender and stringless. Seed buff-colored, mottled with brown. Matures over a short period of time; ideal for canning and freezing. Vigorous, erect plant; tolerant to hot weather, mosaic and mildew. B49, B75M, E38, E59Z, F82, G71, H33M, H61, J73, K73, L7M, LIO, M95M, N16

**Daisy:**<sup>1</sup> 55 days. "Cascade" or "teepee" type. Medium-green, round pod, 6 to 7 inches long; almost completely stringless; very meaty and flavorful. White-seeded. Seeds develop slowly for an extra-long harvest season. Vigorous, high yielding plant; sets pods well above the foliage for easy picking; resistant to common bean mosaic virus. G68

**Dandy:**<sup>3</sup> 54 days. Gourmet French type "mini bean". Round, slender, straight medium dark-green pod; only 4 inches long; stringless, very tender and flavorful. Small white seed, slow to develop. Erect, compact plant; high yielding; resistant to anthracnose and bean mosaic viruses. Introduced in 1982 by Rogers Brothers Seed Company. A16, C92, FI, 139, L79, M29, N24M

**Derby:**<sup>2</sup> 57 days. Slender, attractive green pods, up to 7 inches long. Retains good flavor and texture at maximum pod length due to slow seed development. Very upright, bushy plants, height 14 to 20 inches; resistant to common bean mosaic virus. Pods slip easily from stems without the pedicels, making picking easier. All America Selections winner for 1990. B6, B8M, D11M, E97, F70, G16, G82, 139, 191, K10, K50, K71, L42, L91M, M29, M49, M95M, N16, N52, etc.

**Deuil Fin Precoc:**<sup>5</sup> (Petit Gris) An old European favorite. Steel-grey-green pod, heavily streaked with purple, of very fine flavor. Large, buff-colored seeds, mottled with purple. Compact, bush-type plant; very high yielding. Ideal for growing under frames, poly tunnels or cloches. B49, J39, N84, R32, S55

**Earliserve:** 45 days. Very early Blue Lake type. Straight, slender, dark-green pods; 4 inches long. Should be picked often for best quality. Ideal for French style beans. Sturdy, upright plant, height 18 inches. Tolerant to common bean mosaic virus. Recommended for home gardens, fresh markets and pick-your-own operations. A75,

B75M, C20M, D26D, E5T, F13, F44, F63, G82, I39M, M46, M95M

**E-Z Pick:**<sup>2</sup> 55 days. Round, straight, dark-green pods; 6 to 6 1/2 inches long. Very good flavor and texture, fresh, frozen or canned. Unique growth habit, with most of the crop set on top of the plant, on stiff upright stems. Pods hang freely, stay straight, and are easily separated from the plant. Tolerant to common bean mosaic virus. B73M, E5T, J39

**Frenchie:**<sup>3</sup> (Frenchy) 43 days. Gourmet European "mini bean"; much milder and sweeter than American types. Slender, round dark-green pod; only 3 3/4 inches long; unusually crisp and tender. Small, white seed. Compact, highly productive plant, to 12 inches high; tolerant to common bean mosaic. Featured as a special dish in 4 Star Hotels. B6, G82, K17M, PIG

**Green Ruler:** 52 days. High quality bush Romano type. Thick, flat, medium-green pods; 5 to 6 inches long; very meaty, slow to develop any toughness or fiber; distinctive "beany" flavor. Can also be used as a green shell bean. Freezes and cans well. Upright plant, 18 inches tall, highly productive. Resistant to common bean mosaic viruses. Developed by Shigemi Honma of Michigan State University. Introduced in 1977. F63, G57M, G82, S63M

**Greencrop:** 50 days. Broad, flattened, medium-green pod; 6 to 8 inches long; tender and stringless; holds up well on the vine; matures over a short harvest season. White-seeded. Vigorous, upright plant. Bred for northern areas; does not perform well in heat or drought. All America Selections winner in 1957. A27M, A75, C85M, D68, E5T, E24, G57M, K49M, K73, L42, M46, N16

**Harvester:** Medium-green, round, straight pod; 5 to 6 inches long; white-seeded. Excellent for canning and shipping. Tall, upright plant; high yielding; suitable for mechanical harvesting; resistant to common bean mosaic and the New York 15 strain of bean virus. A75, B75M, D12, G1M, G27M, G57M, M95M, N16

**Jade:** 55-60 days. Very attractive, extra long snapbean. Carries the "persistent green" gene for exceptionally rich, dark-green color. Straight, slender, round pods; 6 to 7 inches long. Very sweet and tender, flavor excellent. Pale whitish-green seeds. Strong, upright plant, multiple disease resistant. B75M, C85M, D26D, D68, G71, G71M, G6, G13M, G16, G93M, H61, H95, 191, K50, K73, L89, M46, N16, etc.

**Jumbo:** 55 days. Bush Romano type Very large, flattened, dark-green pod; strong, rich, beany flavor; of gourmet quality. Best picked when 6 to 7 inches long, but still stringless at 10 inches or longer. Excellent for freezing. Vigorous plant; tends to lodge with the weight of the pods. Romano x Kentucky Wonder. D82, E97, F13, G6, G71M, G82, 164, 191, J9M, J20, K71, L89, L91M, M46, N16, etc.

**Mini Green:**<sup>3</sup> 52 days. Gourmet "mini" or "baby bean". Produces slender, dark-green beans, only 4 inches long; very tender and flavorful; requires no snapping. Excellent fresh, frozen, canned or pickled. For longest harvests and best quality, pods should be picked just as they mature. 191

**Provider:** 50 days. Straight, round, medium-green pods; 5 to 6 inches long; tender, low in fiber, slow to wilt. Vigorous, productive plant, bears a concentrated set. Resistant to common bean mosaic virus and the N.Y. 15 stain; tolerant of powdery mildew. Germinates well in cool spring soils. Standard early market cultivar. A75, D12, E24, F13, G6, G57M, H54, H61, H85M, J20, J84, J97M, K27M, M49, M95M, etc.

**Regal Salad:**<sup>4</sup> 52 days. Unique salad bean, without the slightly fuzzy texture present in most beans. Curved pod, 5 to 6 inches long, an unusual bronze in color; excellent flavor raw, superior when cooked. Erect, productive plant. Developed by Professor Elwyn Meader. J20

**Remus:**<sup>1</sup> 45 days. Produces clusters of pods well above the foliage, making harvesting easy and providing protection from dirt. Long,

straight, round pods; up to 10 inches in length; fiberless, tender and flavorful. Vigorous plant, 18 to 20 inches tall; resistant to common bean mosaic virus. 191, K17M

Roma: (Romano) 59 days. Broad, flat, straight medium-green pod; 5 to 5 1/2 inches long; stringless, fleshy, strong distinctive flavor; holds its quality well on the vine. White-seeded. Excellent for French-style sliced beans. Upright plant; productive over a long season; tolerant to bean rust. A25, A75, B6, D76, E97, G79, 167M

Roma II: 59 days. Bush Romano type; more uniform and higher yielding than other cultivars. Broad, flat, very straight pod; 5 inches long, 3/4 inch in diameter; same distinctive flavor as the traditional pole Romano; holds its quality well. Upright plant, with a concentrated pod set; tolerant to common bean mosaic and several races of bean rust. Introduced in 1979. A16, B8M, B75, C44, D11M, E38, F1, F70, G16, G71, G93M, H61, K66, K71, K73, L79, M29, M49, N16, etc.

Romanette: 60 days. Bush Romano strain with straighter pods than most Romano types. Broad, flat, medium-green pods, 5 to 6 inches long; crisp and tender with a rich, distinctive flavor. Sturdy, upright plant, 16 to 18 inches tall. Resistant to common bean mosaic viruses. C69, C92, D27, G57M, L10, M95M

Slenderette: 53 days. Slender, straight, glossy dark-green pod; 5 inches long; stringless, tender and flavorful. Small white seed; slow to develop. Vigorous plant, to 20 inches tall; highly productive over a long period; resistant to common bean mosaic, pod mottle, and curly top virus. B6, G87, H33M, H85M, H95, 164, 167M, 184, 191, J25M, J97M, K10, K66, K71, M46, M95M, etc.

Spartan Arrow: 52 days. Straight, slender, medium-green pods; 5 1/2 to 6 1/2 inches long; meaty, tender, stringless. Excellent for freezing and French style beans. Vigorous, upright plant, height 22 to 24 inches; produces a heavy, concentrated set. Resistant to common bean mosaic virus and the N.Y. 15 strain. Developed at Michigan State University. F63, G13M, G57M, J84

Stringless Green Pod: (Burpee's Stringless Green Pod) 50 days. Broad, slightly curved, medium dark-green pod; 5 to 6 inches long; fleshy, very brittle, of excellent flavor and quality. Light coffee-brown seed. High yielding plant; height 12 to 15 inches. Introduced in 1894 as the first entirely stringless green podded bean. HEDRICK 1931; A16, A25, B75, D65, G57M, G79, H33M, H42, K71, M46, M95M, N16

Tendercrop: 55 days. Round, medium-green, stringless pod; 5 to 6 inches long. Seed purple, mottled with tan, slow to develop. For fresh use, canning and freezing. Adapted to mechanical harvesting; also good for home gardens. Upright plant, 18 to 21 inches tall; yields up to 5 tons per acre; resistant to powdery mildew and bean mosaic virus. A75, B73M, D76, F82, G57M, G79, H85M, 139, 191, K10, K71, M46

Tendergreen: Round, slightly curved, dark-green pod; 4 1/2 to 6 1/2 inches long; stringless, fleshy, tender, brittle, fine-textured, of excellent quality. Seeds brownish-purple, mottled with buff. Good home garden cultivar. Very erect, compact plant, 14 to 18 inches tall; highly productive over a short season; resistant to bean mosaic virus. Introduced in 1922. HEDRICK 1931; A16, A25, B6, B49, B78, C44, C69, D11M, E38, F70, F92, G57M, G71, J20, N16, etc.

Tennessee Green Pod: 50 days. Broad, fairly plump, medium dark-green pod; 5 1/2 to 7 inches long; very good flavor. Should be harvested early as mature pods tend to become coarse and fibrous. Medium brown seed. Very dwarf plant, rarely over 1 foot tall. Introduced to the trade in 1904, but grown in the South for many years prior to this date. HEDRICK 1931; A75, 159M, K71, L10, M46, M95M

The Prince: 55 days. Broad, flat, straight medium-green pod; 6 1/2 inches long; fleshy, very flavorful, stringless if picked young. Seed buff-colored, mottled with reddish-brown. Excellent for freezing. Vigorous, heavy yielding plant. Very popular in England. Highly

commended by the Royal Horticultural Society in 1982. Introduced by Sutton and Sons in 1927. HEDRICK 1931; B49, G55M, F73D, 053M, R32, R83

Top Crop: 52 days. Round, straight, light medium-green pod; 6 to 7 inches long; stringiest meaty, tender. Seed buff-colored, mottled with brown, develops rapidly. Excellent for canning and freezing. High yielding plant; resistant to powdery mildew and bean mosaic virus. Developed for home garden use. All America Selections winner in 1950. A16, A75, B6, B73M, B75M, D82, G16, G57M, G79, H33M, H61, 164, L7M, M46, N16, etc.

### Pole

Berner Landfrauen:<sup>5</sup> 55-60 days. Heirloom from Switzerland that resembles Selma Zebra, but with more oval pods and more intense mottling. Long, wavy, curved pods, 5 to 7 inches in length; splashed with purple; stringless. Meaty, tender and delicious, especially when the seeds are still small. Excellent fresh, frozen or dried. I91, K17M, M46

Blue Lake Pole: 65 days. Straight, round, dark-green pod; 5 1/2 to 6 inches long, 3/8 inch in diameter; stringless, tender, fleshy, fiberless, distinct flavor. Excellent for canning and freezing. Strong climbing vine; height 5 to 6 feet; heavy yielding over a long period. Widely grown in the Pacific Northwest. A25, A75, C85M, D82, E24, F82, F92, G79, L89, M46, M49, R47

Blue Lake Stringless: 65 days. Round, slightly curved pods, 6 inches long; tender, fleshy, entirely stringless and fiberless; notable fresh, sweet, "beany" flavor. Excellent for fresh eating, canning or freezing. High yielding vine; height 5 to 6 feet; bears continuously throughout the summer. D27, F80, G57M, K5M, M95M

Caseknife: 60 days. One of the oldest cultivars in America, the name Caseknife, and its many strains or synonyms having been noted in the literature since 1820. Slender, flattened, straight, medium-green pod; 7 1/2 to 9 inches long; stringless when young. White-seeded. Strong climbing plant; height 4 to 4 1/2 feet tall; productive over a relatively long period. HEDRICK 1931; D29P, L88J

Cherokee Trail of Tears:<sup>5</sup> (Black Cherokee) 85-95 days. Cultivated by the Cherokee Nation, and taken with them over the Trail of Tears when forcibly removed from their lands by the United States Army in the 1800's. Pods 6 to 7 inches long; dark-green striped with purple, turning red when mature. Black-seeded. Also used as a green or dry shell bean. Very productive vine; requires strong support; attractive light-purple flower. A2, A66, C95, D29P, E5T, F73D, H15P, J39, K46T, L94

Garrafal Oro: (Spanish Gigantic Romano) 65 days. Broad, flattened, light medium-green pod; 9 inches long; juicy, thick-walled, excellent distinct flavor. Pale reddish-brown seed. For home gardens or market. Short vine, rarely exceeding 4 feet; needs less support than other pole types; highly prolific. J20, S61

Genuine Cornfield: (Scotia) 75 days. Round, plump, straight pod; 6 to 7 inches long; medium dark-green, shaded with purple-brown at later stages; quite stringy, fleshy, fairly brittle, of very fine texture. Seed buff-colored, mottled with pinkish-brown. Large, vigorous vine; good climbing habit, to 4 1/2 feet tall. Traditionally grown among corn plants. Introduced in 1892 by Joseph Harris Company. HEDRICK 1931; C95, F73D, G57M, 159M, J20, J26M, J73, K27M, K49M, K71, L7M, M46, M95M

Green Anellino: (Gancetto Verde) Unusual, crescent shaped pods; 1/4 to 1/2 inch in diameter, 3 1/2 to 4 1/2 inches long; rounded in form, fleshy, free of strings, rich Romano-like flavor. First harvests in about 85 days, continuing for 50 to 60 days. Italian heirloom, much in demand by American chefs due to its flavor and unique shape. C53, Q11M

Jeminez:<sup>5</sup> (Idaho Wonder) 66 days. Long, broad, straight flat-oval pod; 8 to 10 inches in length; light-green, with numerous purple-red

stripes and splashes; stringless of high quality; resembles Oregon Giant. Seed buff-colored, striped with brown. Vigorous vine; productive over an extended period. Potential specialty market item. A75, L77D, N52

Kentucky Blue: 51 days. All America Selections Winner in 1991. Combines the characteristics of Kentucky Wonder and Blue Lake, two all time favorites. Round, straight, smooth, medium-green pods; 7 to 10 inches long. Has the flavor of Kentucky Wonder, but sweeter. Excellent for fresh use, canning and freezing. Vigorous, highly productive, disease resistant vines. B49, D65, D74B, E33, E97, F82, G16, B75, F13, G71, G82, 191, J9M, J20, J97M, L91M, M29, etc.

Kentucky Wonder: (Old Homestead, Texas Pole) 70 days. Broad, curved, wrinkled light silver-green pod; 7 to 9 inches long; brittle, tender, slightly stringy, of very good quality and flavor. Buff-brown seed. Medium-sized plant; height 4 1/2 feet; productive over a relatively short period. Most popular pole bean in the United States. Introduced prior to 1864. HEDRICK 1931; A16, B73M, B75M, B78, C44, E5T, E24, E59Z, F24M, G57M, H33M, H61, K73, L7M, M46, etc.

McCaslan: 65 days. Flat, irregularly curved, dark-green pod; 7 to 8 inches long; fleshy, lairly brittle and tender, somewhat stringy, of very good flavor. White seeded. Also used as a green or dry shell bean. Highly productive over a long season. Popular in the South. Originated with the McCaslan family of Georgia. Introduced in 1912 by Hastings Seed Company. HEDRICK 1931; D12, E5T, F63, G1M, G27M, I59M, K10, K27M, K71, L7M, L10, M46, M95M

Missouri Wonder: 65 days. Round, plump, slightly curved, medium-green pod; 5 1/2 to 6 inches long; medium-fine in texture, stringless when quite young. Seed mottled tan, striped with brown. Also used as a shell bean. Large, vigorous vine; very reliable yields. Good for planting among corn. Introduced about 1931. HEDRICK 1931; A75, E5T, F73D, I59M, K10, K27M, K71, L10, M46

Mostoller Wild Goose: Reportedly grown by the Complanter Indians along the Upper Allegheny River. Eventually found in the crew of a Canadian goose shot in Somerset County, Pennsylvania by John Mostoller, in 1864. Excellent flavor when used young as a snap bean. Oval, white seeds speckled with reddish and orange-brown spots near the eye. D29P, F24G, J39, K49M

Morse's Pole No. 191: 63 days. High-yielding, white-seeded Kentucky Wonder type, resistant to certain strains of rust. Oval, attractive, straight dark-green pod; 8 to 9 inches long; stringless at marketable stage. Vigorous, productive vine with dark green leaves. For home gardens or market. G27M

Neckarkonigin: 65-70 days. An improved Phenomeen type from Germany. Very long, slender, firm green pod; to 9 inches in length; very fleshy, of excellent flavor, stringless. White-seeded. Can also be used for French-style slicing. C85M, N81

Oregon Giant:<sup>5</sup> (Paul Bunyon) 75 days. Large, broad pod; curved in an S-shape; 8 1/2 to 9 1/2 inches long; light waxy-green, strikingly marked with brownish-purple; meaty, flavorful, stringless when young. Also used as a shell bean. Vigorous climber; highly productive. Very popular in the Pacific Northwest. A2, D82, J39, K46T, K49T, L13M

Phenomeen: (Phenomenon, Phenomene) 68 days. Extra long, flat-round, nearly straight medium-green pod; 7 1/2 to 9 1/2 inches in length; very fleshy, of excellent flavor, more or less stringy when old, but not fibrous. White-seeded. Originated in Germany about 1905; introduced into the United States in 1913. HEDRICK 1931; S66M

Rattlesnake:<sup>5</sup> 75 days. Round, firm pod; 7 inches long; dark-green, streaked with purple; rich, full-flavored, stringless when small to medium-sized. Seeds light-buff, splashed with brown. Also used as a dry bean, and sold as such in gourmet specialty food stores. Strong climbing vine, to 10 feet tall; very productive; tolerant to heat

and drought. A7{DF}, A75<sub>f</sub>, A90M{DF}, C94M{DF}, D68, E5T, E31{DF}, E56{DF}, J11M{DF}, J25M, K18M{DF}, L7M, L24G{SP}

Romano: (Romano Italian Pole) 65 days. Broad, flat, thick medium-green pod; 5 1/2 to 6 inches long; stringless but slightly fibrous, meaty, rich distinctive flavor; excellent for canning and freezing. Seed buff-colored, with a white eye. Also used as a green shell bean. For home gardens and fresh market. Weak climber. A75, B73M, C44, C85M, D65, G57M, G71, 139, 164, K71, M46

Ruth Bible: 52 days. Small pods, about 3 1/2 inches long. Brownish-tan seeds. Best picked when tender and small, as larger pods may have slight strings. Vigorous, trailing vine; bears heavily. A good cornfield bean that does very well in drought. Family heirloom from Kentucky, where it has been grown since at least 1832. F73D, L7M

Selma Zebra:<sup>5</sup> 51 days. Blue-striped pole bean from Switzerland. Matures as early as a bush bean, grows only to a height of 6 feet. Round, slender light green pod, striped and splashed with purple; stringless, tender, fleshy, highly aromatic and flavorful. Turns green when cooked. Excellent fresh, dried or frozen. C20M, M46

Sultans Emerald Moon: (Sultan's Emerald Crescent) During the last century of the Ottoman Empire, strains of pole beans were developed whose pods mimicked the Crescent, the royal symbol of the Sultans. Thought to have been lost, they were recently re-discovered in the kitchen garden of a wealthy tobacco merchant in Izmir, Turkey. Delicious, subtle flavor. Vigorous and disease resistant. K49M

Turkey Crow: (Turkey Gizzard) Southeastern heirloom from Virginia, the Carolinas and Tennessee. According to folklore, it was first cultivated in 1802 by a hunter who removed a bean from the gizzard of a turkey he shot, hence the name. Pod grows 3 1/2 to 4 inches long and clings to the vine. Stringless, of excellent fresh quality; also good for drying ("leather britches on a shuck"). Often used as a cornfield bean. F73D, L4, L7M

White & Green Hull: Vigorous pole bean that has the unusual characteristic of producing two different colored pods adjacent on the same stem — a typical green one, and one that is pale yellow to white with a pink tint along the midrib. Originated in the garden of Mrs. Lonnie Davis of Sparta, North Carolina. L4

**GREEN-POPPED FILET** Called *haricot verts* in France, *filet beans* are special green-podded beans bred so that the seeds develop more slowly than in regular beans. Therefore the pods have exceptional flavor and texture; since the flavor, which researchers believe comes from the seed, has time to develop without affecting texture. D3M{PR}, E13G{PR}, N40{PR}

### Bush

Aiguille Vert: 49-57 days. Round, slender, medium dark-green pod; 7 to 8 inches long; meaty, excellent flavor, stringless when young. Best harvested immature, as gourmet "filet" bean & Yellow-buff seed. For home gardens or market. G68

Aiguillon: 55 days. An improved strain of Fin de Bagnols. Slender, dark-green pod; 7 to 8 inches long; excellent flavor, stringless when young; should be picked every 2 to 3 days. Strong, compact plant; highly productive over a long season. Easier to grow than traditional cultivars. C20M

Aramis:<sup>5</sup> 70 days. Uniform, round, very slender pods; 5 to 6 inches long; medium-green, slightly streaked with purple. Excellent flavor and texture, both raw and cooked. Rated highest in flavor in a taste test conducted by Organic Gardening magazine. Vigorous, erect, high-yielding plant; adapted to mechanical harvesting; resistant to mosaic and anthracnose. E24, G53M, J39, L91M

Bahalores: 58 days. Round, very slender, medium dark-green pod; 5 1/2 to 6 1/2 inches long; tender, fleshy, extremely flavorful, stringless when immature. Small, white seeds. Best harvested when

4 to 5 inches in length. Resistant to haloblight, anthracnose and bean Common mosaic virus 1 & 2. K49M, S61M

Decibel:<sup>3</sup> 50-55 days. Improved "baby" filet type Very slender, straight, dark-green pods; 4 to 4 1/2 inches long and 1/4 inch in diameter; tender and flavorful, completely stringless. White seeds. Resistant to bean mosaic virus and anthracnose. Recommended for home gardens and specialty markets. C20M, E63D, F63, G13M, G68, G93M, 177, K10, L42, M29

Delinel: 54 days. An improved strain of Fin de Bagnols. Very slender, straight, medium dark-green pod; 7 to 8 inches long; stringless, tender and flavorful; holds well on the vine. Small-seeded. Best picked when 1/3 inch in diameter or less. Black-seeded. Good fresh canned or frozen. Vigorous, erect, highly productive plant; resistant to common bean mosaic and anthracnose. C85M, D11M, D74B, E5T, E97, F70, H42, 164, J39, J73, K10, M46, M49, N81, S95M, etc.

Fin de Bagnols: 55 days. Traditional French "filet" bean. Round, straight, very slender, medium dark-green pod; 7 to 8 inches long, 3/8 inch in diameter; tender, sweet, delicate "beany" flavor. Buff-red mottled seed. High yielding plant; resistant to black root. Bagnols is not far from Paris, and it appears that this bean was a specialty of that region during the 19th century. C20M, C53, E63D, G68, J39, N84, Q34, 577, S55

Finaud: A true "filet" bean that is no more difficult to grow than common snap beans. Very slim, straight pods, 6 to 8 inches long. Holds well on the plant without loss of quality. Produces over 75% beans that rated grade A in taste and texture, compared to only 15 to 25% for the standard cultivars Fin de Bagnols and Triomphe de Farcy, even when picked every 3 days. Developed in Holland. K49Z

Label:<sup>3</sup> 50 days. "Mini" or "baby" filet bean. Straight, very slender pods; only 3 to 4 1/2 inches long and 1/4 inch in diameter when mature; tender and juicy, of excellent flavor. Should be harvested every other day. Sturdy, compact plant, height 2 to 2 1/2 feet; bears heavily. A favorite in upscale Continental markets. C20M, F63, 139, S95M

Marbel:<sup>5</sup> 54 days. New filet bean from Franca Very straight, slender, round pod; 7 inches long, 1/4 inch in diameter; dark-green, prominently streaked with violet; very attractive and flavorful. Seed tan, streaked with dark purple. Compact, upright plant; continuous flowering habit allows for 4 or 5 additional harvests; resistant to common mosaic and anthracnose. S95M

Masai: 60 days. Extra slender filet bean of supreme quality. Only reaches 1/4 inch in diameter. Very fine-textured; distinctive, gourmet flavor. Sturdy, upright plant, early and very high yielding. Resistant to cold weather extremes. Good disease tolerance. The variety grown in places like Kenya to supply the international restaurant trade. L91M

Maxibel: 50-60 days. Hgh quality, extra-long, stringless filet bean. Very attractive, slender, round, dark-green pods; 7 to 8 inches long; firm-textured, tender, very flavorful. Brown mottled seeds. Sturdy, upright plant, high yielding. Highly recommended for home gardens and specialty markets. B6, C20M, D68, F63, G6, G13M, G16, G93M, 177, J20, K10, K50, K71, L89, M46, S95M, etc.

Morgane: 54 days. Extra-long, smooth, solid medium-green pod; length 7 to 7 1/2 inches; slightly more slender than Marbel; very good flavor, excellent quality. Brown-seeded. Semi-concentrated harvest. Resistant to common mosaic and anthracnose. Very promising for commercial production. L94, P59M

Nerina: Filet-mangetout type, bred for both "filet" and whole bean use. Slender, glossy dark-green pod; 4 1/2 to 5 inches long; excellent flavor and quality. Should be harvested daily, before they reach 1 inch in diameter. Uniform pod set; high on the plant. K17M, P59M, Q11M

Nickel:<sup>3</sup> 50-60 days. High quality "baby" filet type. Slender, straight, dark-green pods; 4 to 4 1/2 inches long and 1/4 inch wide; stringless, tender and delicious. Slow to develop seeds. Strong, erect plant, tolerant of hot and cold temperature extremes. Resistant to foliar disease and root rot. Developed by Vilmorin. C53, F63, G13M, I18M, I67M, 177, K10, L89, M46, M49, N16, S95M

Regalfin:<sup>5</sup> Excellent French cultivar. Very long and straight, round, narrow, filet type pods; attractively marbled with violet; of fine quality. Violet-striped seeds. High yielding, produces numerous pods in clusters. Introduced by Vilmorin. C95, G68

Royalnel: Medium early, filet type. Pods exceptionally long, up to 8 inches in length, perfectly round, very slender; flesh meaty, of excellent quality. Black seeded. High yielding plant; resistant to anthracnose and bean mosaic virus; not subject to lodging. May be sown over a long season. G68, S95M

Triomphe de Farcy:<sup>5</sup> 55 days. Traditional standard in France. Round, slender, straight pod; 5 to 6 inches long, 1/4 inch in diameter; rich bright-green, feintly striped with purplish-blue; tender, extremely flavorful, of excellent quality. Seed dark-brown, mottled with purple. Highly productive plant; resistant to black root. A2, B75, C53, E63D, G6, G53M, G68, J39, K71, R47, S55

Vernandon: 55 days. Filet-mangetout type, a cross between a "filet" bean and a conventional snap bean. Round, pencil-thin, straight deep-green pod; 6 inches long; brittle, tender and flavorful. Should be harvested every 2 to 3 days, when pods are less than 1/4 inch in diameter. Vigorous, high yielding plant; resistant to common bean mosaic and anthracnose. K66

#### Pole

Emerite: 55-60 days. Smooth, pencil-thin, very straight, medium-green pods; 7 to 7 1/2 inches long; completely stringless, fleshy, tender, of excellent flavor. Black seeds. Harvest at 4 or 5 inches for best quality. Heavy bearing vine, yields about 20 pounds per square yard. Resistant to common bean mosaic virus. C53, C85M, D68, E63D, H42, I18M, J20, K49Z, K66, L42, M46, N16, S95M

Fortex: 60 days. Round, extra-long, dark green pod; up to 11 inches in length or more; firm-textured, very flavorful, completely stringless at all stages. Walnut brown seed. May be picked when 7 inches long for extra-fine grade "filet" beans. For home fresh use and freezing, and premium markets. Early and very productive. G6, H42, L89, N84, S95M

**PURPLE-PODDED** Sometimes referred to as *magic beans*, purple-podded beans have excellent flavor and turn dark green when cooked. The plants are especially resistant to cool weather conditions early in the growing season. E13G{PR}, N40{PR}

#### Bush

Purple Queen: 52 days. Round, straight, very evenly colored pod; dark purple, fairly glossy; 6 to 7 inches long; stringless, very flavorful. Seed light brown, shaded with purple. Turns dark green when cooked. Very productive plant; dark purple leaves and flowers; tolerant to bean common mosaic virus and cold soil conditions. A75, B8M, C85M, D74B, D76, F82, G13M, G93M, 177, M32, M46, N84, R47, S17

Purple Teepee:<sup>1</sup> 51 days. Round, slightly curved, smooth, dark purple pod; 5 to 6 inches long; stringless, tender and flavorful. Light brown seed. Turns an attractive deep forest-green when cooked. Good fresh, canned or frozen. Compact, high yielding plant; bears pods well above the foliage; resistant to mosaic and white and gray molds. A75, F44, 191, J39, L91M, N81, S55

Royal Burgundy: 55 days. Round, slightly curved, dark-purple pod; 5 to 6 inches long; stringless, tender, very rich flavored. Buff-colored seed. Turns bright green after 2 minutes of boiling, providing a built-in blanching indicator for home freezing. Vigorous, upright plant; height 18 to 20 inches. Developed at the University of

New Hampshire. A16, C44, C53, C85M, C92, D11M, F70, G16, G82, H42, I39, J20, K66, K71, L89, M46, etc.

Royalty: 55 days. Round, variably curved, bright-purple pod; 5 inches long; stringless, tender, brittle; quality good, both fresh and frozen. Buff-colored seed. Can be used raw to add color to salads; turns green when cooked. Purple-tinged, purple-flowered plant; produces short runners that do not require staking; germinates in cold, wet soil; resists bean beetles. Developed by Professor E.M. Meader at the University of New Hampshire. A25, B73M, D65, E24, F80, G6, G57M, G79, G82, K17M, L7M, L79, N16

Sequoia: 53 days. Bush Romano type. Attractive, flat deep purple pods, with typical Romano flavor and meatiness. Turns a deep green when cooked. Purple color makes harvesting easier. High yielding, ornamental plant with purple stems, flowers and leaves; tolerant of cool-weather conditions early in the season. A75, B75, C53, D76, G6, G16, I91, J9M, J20, K17M, K49T, M46

### **Pole**

Blue Coco: (Purple King) 55-60 days. Bluish-purple pods; 6 to 8 inches long; 7 seeds per pod. Retains its crisp texture when pickled; excellent for dill beans. Light-cocoa-colored seed, rich and meaty. Very productive plant; produces well under high temperature conditions. Known in France as early as 1775. WEAVER 1997; L7M, O89, PIG, R47

Dow Purple Pod: 85 days. Flat, deep-purple pod; 7 to 8 inches long; good "beany" flavor. Tan, kidney-shaped seeds; 5 seeds per pod. Vigorous, productive vine, requires strong support; purple-tinged leaves, purple stems and flowers. Heirloom from Illinois. A2, K49T, N84

Louisiana Purple Pod: 67 days. Attractive southern heirloom. Rounded, bright deep-purple pod; 7 to 7 1/2 inches long; stringless when young, very flavorful. Small, light to medium brown seeds. Very productive plant, with bright purple stems and flowers; tolerant to heat and drought. Does well in the North. A2, F73D, L7M

Purple Peacock: 68 days. Round, reddish-purple pod; tender, stringless, of very good quality. Turns an attractive dark-green after 2 minutes of cooking. Can also be used as a shell bean. Extremely productive vine; purple leaves and flowers. Makes an attractive, quick-growing summer screen. A75, B49, D26D, I39, J20

Purple Podded Pole: 68 days. Large, meaty, reddish-purple pods of high quality; stringless and meaty. Blanches to a light green color when cooked. Climbing plant that grows 6 feet or more and yields good crops. European heirloom discovered in the 1930's by Henry Field in an Ozark garden. Favorite of the Seed Savers Exchange. EST, J39, K47, K71

Trionfo Violetto: 62 days. Large, straight pods; 1/2 inch in diameter, 9 to 10 inches long; an attractive, deep purple color; excellent rich flavor; free of strings. Turns bright green when cooked. Straw colored seeds. Vigorous, disease resistant, highly productive vines; widely adapted. Germinates in cooler than normal soil conditions. Good for small gardens. B49, C53, F44, G6, K17M, K23, K46T, LII, L13M, Q11M, S17

Viola Cornetti: A traditional purple-podded climbing bean from Italy. Produces abundant crops of tender, stringless violet-colored pods, of excellent flavor and quality. Turns green when cooked. B49{OR}, R32, S55

Violet Podded Stringless: 67 days. Round, violet-purple pod; 7 inches long; highly refined, tender, stringless pods. Light brown seed. Retains its flavor and high quality even after it becomes very long. High yielding plant; occasionally sets pods that are not completely purple. Germinates well in cool soil; flowers early; tolerant to cool weather. L89

### **WAX-PODDED**

#### **Bush**

Beurre de Rocquencourt: (Golden Rocky) 55 days. Very attractive traditional French cultivar. Round-oval, slender, straight, dark golden-yellow pod; 5 to 6 inches long; stringless, fleshy, flavorful. Black-seeded. Excellent for home gardens and local markets. Upright, very prolific plant; resistant to cold and wet growing conditions early in the season. A2, A75, D68, E24, E63D, H42, J20, K46T, K49M, K49T, L89, M27, M46, Q11M, S55, etc.

Brittle Wax: (Round Pod Kidney Wax, Burpee's Brittle Wax) 55 days. Round, plump, slightly curved, light golden-yellow pod; 6 to 7 inches long; stringless, brittle, fleshy, fiberless, of excellent quality. Seed chalky white with a black-eye, slow to develop. Used as a cut bean and for canning whole. Height 14 to 16 inches. Introduced in 1900 as Round Pod Kidney Wax. HEDRICK 1931; A75, B75, D27, D65, F80, G57M, G87, I67M

Cherokee Wax: 50 days. Thick, oval, straight, golden-yellow pod; 6 to 7 inches long; entirely stringless at all stages, tender, flavorful. Black-seeded. Good shipper. Vigorous, productive plant; produces well during adverse weather conditions; resistant to mosaic virus. All America Selections winner in 1948. A2, C44, C69, D65, D76, G13M, G57M, G71, H33M, H61, I64, J84, K71, M46

Dorabel:<sup>3</sup> 55-60 days. Unique, French filet wax bean. Round, straight, golden-yellow pods; about 4 1/2 inches long; stringless, tender and very flavorful. Attractive and of high quality. White seeds. Resistant to bean mosaic virus, anthracnose and halo blight. Ideal for the "baby vegetable" market. B6, C53, F63, G16, G68, G93M, J20, K10, L42, M29, M46, N16, S95M

Dragon Langerie:<sup>5</sup> (Dragon Tongue, Horticultural Wax Bean, Marveille de Piemonte) 57 days. Long, flat pod; light-yellow, striped with purple, turning red when mature; 7 to 8 inches long; stringless, very flavorful. Light purple-brown seeds, striped with blue. Excellent for French-style sliced beans at the purple-striped stage. Stripes disappear during blanching, indicating freezer readiness. Also good for shelling when the pod turns red. High yielding. A2, A75, B49, B75, C53, D68, E13G{PR}, E24, G13M, H73{PR}, I77, J20, K46T, K49M, L89, M32, M46, N40{PR}, O89, etc.

Earliwax: (Earlywax Golden Yellow) 50 days. Round, straight, golden-yellow pod; 5 to 6 inches long; stringless, tender, fleshy, very flavorful; retains its high quality long after picking. White-seeded. Excellent for canning and freezing. High yielding plant; resistant to bean common mosaic virus. Popular with market gardeners and truck farmers. G79, M46

Eastern Butterwax: 55 days. Slightly curved, plump, round-oval, golden-yellow pod; 6 1/2 to 7 1/2 inches long; stringless, fleshy, brittle, tender, very flavorful. Black-seeded. Excellent for canning and freezing. Compact, high yielding plant; height 14 to 16 inches. M49

Gold Crop: 52 days. Round, slender, straight, deep golden-yellow pod; 6 to 6 1/2 inches in diameter; stringless, fiberless, of excellent quality and flavor. White seeded. Tolerant to mosaic and curly top viruses, and to blossom drop in hot weather. All America Selections winner in 1974. Developed by the USDA and Washington State University. B75, D65, F63, G13M, G16, G82, H85M, L42, L91M

Golden Wax: (Stringless Golden Wax) 50 days. Straight, narrow, oval to flat, golden-yellow pod; 5 to 5 1/2 inches long; stringless, very brittle, of very good flavor and quality. Seed white, with a brownish-purple eye. Good fresh, canned or frozen. Compact, productive plant; height 10 to 14 inches. Popular home garden cultivar. A16, B3M, B73M, C20M, D76, D82, E38, F92, G71, H49, I67M, N16

Goldkist: 50-60 days. Improved Slenderwax type. Round, medium-slender, bright yellow pods; 5 1/2 to 6 inches long; tender, stringless and flavorful. Slow to develop seeds. White seeded.

Suitable for fresh use and freezing. Erect, vigorous, heavy yielding plant. Resistant to rust and common bean mosaic virus. A16, B6, B8M, B73M, D26D, *E91G*, FI, F13, *F63*, F82, G6, G75M, G71, J97M, K10, K73, L42, M49, etc.

Kinghorn Wax: (Resistant Kinghorn Wax) 53 days. Round, nearly straight, bright golden-yellow pod; 6 inches long, 3/8 inch in diameter; stringless, tender, flavorful. White-seeded. Good for processing, canning and freezing. Vigorous, highly prolific plant; height 19 to 22 inches; resistant to bean mosaic virus. 475, C69, C85M, E97, G79, G93M, H95, 167M, K49M

Mini<sup>1</sup>ellow:<sup>3</sup> 52 days. Gourmet "mini" or "baby bean". Produces slender yellow pods, only 4 inches long; very tender and flavorful; requires no snapping. Excellent fresh, frozen, canned or pickled. For longest harvests and best quality, pods should be picked just as they mature. 191

Mont d'Or: (Golden Butter) 57 days. Slightly curved, flat, pale yellow pod; 5 to 6 inches long; entirely stringless when young, fleshy, tender, very flavorful, of excellent quality. Black-seeded. High yielding plant, 12 to 16 inches tall; resistant to mosaic and anthracnose. Originated in France prior to 1885. VILMORIN; B49, *G53M*, R32, R83, S55

Pencil Pod: (Pencil R) d Black Wax) 55 days. Round, narrow, curved, clear yellow pod; 6 to 7 inches long; stringless, very brittle, fiberless, of excellent flavor and quality. Black-seeded. Vigorous, productive, widely adapted plant; height 12 to 15 inches. Very popular traditional cultivar. Introduced in 1900. HEDRICK 1931; A16, A25, 475, C44, C69, C85M, D65, FI, F92, G57M, G79, J20, L7M, M46, M95M, etc.

Roc d'Or: (Rocdor) 55 days. Gourmet French type. Rounded, very slender, straight, bright golden-yellow pod; 6 1/2 to 7 inches long, 1/3 inch in diameter; stringless, of superior texture and flavor. Black-seeded. Excellent fresh, frozen or canned. Upright, highly productive plant; resistant to anthracnose and mosaic virus; tolerant to cool, wet conditions. C85M, D76, E24, *E91G*, E97, G6, 139, 177, J73, K49T, K66, K71, L42, M46, *S95M*, etc.

Roma Gold: 55 days. Yellow-podded Roma type. Long, flat, golden-yellow pod; stringless, fleshy, tender, of excellent flavor; retains its quality and flavor even when large and plump. Upright, bush-type plant; easy to pick; very productive over a long season. 191, L79

Slenderwax: 56 days. Uniform, straight, medium-round pods; 5 inches long; stringless, fiber less, of very good flavor. Contains the "instant wax" gene, which turns the pod from green to golden-yellow very early in its development. White-seeded. High yielding plant; height 20 inches; resistant to mosaic, tolerant to heat and white mold. Released by Cornell University. *C20M*, F13, G57M, G87, *H33M*, K71, *L10*, M29, M46

Sungold: 55 days. Straight, round, bright yellow pods; 5 to 6 inches long; tender, rich in flavor, stringless, quality excellent. Attains good color early. White seeds that develop slowly. Upright, compact plant; height 18 to 20 inches. Resistant to common bean mosaic and the N. Y. 15 strain. *C20M*, *G13M*, G57M

Topnotch Golden Wax: (Improved Golden Wax) 50 days. Straight, semi-round to flattened pods, 5 1/2 inches in length; pale yellow in color; very meaty, brittle, with a rich buttery flavor; stringless. White-seeded. Compact, productive plant; very disease resistant. Improved strain of Golden Wax. 475, D65, FI, G57M, G79, H54, J9M, K27M, M46, M95M

Wax Romano 264: 55-60 days. Yellow podded version of Roma II. Broad, flat, light golden-yellow pods; 5 1/2 to 6 inches long. Very crisp and succulent. Has a meatier texture and is more flavorful than other wax beans. White seeds. Vigorous and productive, resistant to bean mosaic virus. E97, F13, G6, G16, G82, G93M, *I64*, 167M, J20, J97M, K10, L42

White Hull Bunch:<sup>5</sup> Distinctive creamy yellow, almost white pods that develop a rich pink color along the midrib when mature. Suitable for both fresh consumption and for canning or freezing. Originated in the garden of Mrs. Lonnie Davis of Sparta, North Carolina. L4

### Pole

Burro d'Ingegnoli: Large, slightly curved, flat pods; 1/2 to 1 inch in diameter, 7 to 8 inches long; deep golden-yellow in color; fleshy and stringless with a rich, sweet, delicious flavor. First harvests in about 78 days, continuing for 50 to 60 days. Very famous in Italy. Q11M, S55

Goldmarie: 55 days. Very attractive golden Romano type. Large, slightly curved, flat, bright golden-yellow pods; 8 to 10 inches long and 3/4 inch wide; tender, crisp and delicious, quality excellent. White seeds. Vigorous plant, very high yielding, produces over a long season. Suitable for outdoor or greenhouse production. C85M, E33, F73D, G6, J9M, J39, L89, N81

Kentucky Wonder Wax: (Kentucky Wonder Yellow Wax) 68 days. Slightly curved, round-oval, light-yellow pod; 7 to 9 inches long; stringless when young, very brittle and fleshy, fiberless, of good quality and flavor. Brown-seeded. Also used as a green shell bean. Very popular traditional cultivar. Introduced in 1901. HEDRICK 1931; A25, 475, B73M, C44, D26D, D76, G16, G57M, *I64*, K49M, L42, M46, M95M

Marvel of Venice: (Wonder of Venice, Meneille de Venise, Meravigliadi Venezia) 70 days. An old traditional Italian cultivar. Yellow Romano type. Broad, flattened, medium-yellow pod; 7 to 7 1/2 inches long; brittle flesh, excellent distinct flavor. Black-seeded. Can also be used as a green shell bean. Moderately productive plant; resistant to mosaic virus. B8, Q11M, R32, *S17*, S55

Neckargold: 75 days. Similar to Neckarkonigin green-podded pole bean. Very long, round, crease-backed, deep butter-yellow pod; 7 to 8 inches in length; stringless, of excellent quality. White-seeded. Should be harvested when young. Vigorous, high yielding vine; height 8 feet; somewhat heat tolerant. C85M, N81, Q11M, S61M

Paille d'Or: (Gold Straw) 60-68 days. Long, flat, golden-yellow pods; 6 to 8 inches in length; stringless, of excellent quality. Higher yielding than Kentucky Wonder Wax. DI 1M, F70

Yellow Anellino: (Yellow Gancetto) Unique, crescent shaped, bright pale-yellow pods; 1/4 to 1/2 inch in diameter, 3 1/2 to 4 1/2 inches long; rounded in cross-section, fleshy, free of strings, rich in flavor. First harvests in about 80 days. Italian heirloom, becoming popular with American chefs. C53, G44M, L13M, Q11M, *S17*

## KIWI {GR}

### ACTINIDIA SPP.

#### FUZZY KIWIS

The common kiwi, introduced into cultivation by Alexander Allison of New Zealand prior to 1910 and now marketed worldwide. Unlike the hardy kiwis, the skin must be peeled before consumption. Keeps extremely well, up to four months in cool storage. (A. deliciosa)

**FEMALE**

Abbott: Small to medium-sized, oblong fruit; skin brownish, with especially dense, long, coarse hairs; flesh light-green, flavor good; ripens in early M<sup>^</sup>, keeps well. Resembles Allison. Vine vigorous and productive; precocious; early flowering; produces small fruit unless thinned. Medium chilling requirement. Originated in New Zealand. Introduced in the 1930's. MORTON 1987a, SALE; H4, H53M{SC}, J51P{SC}, *M81M*, 097

Allison: Fruit oblong, slightly broader than Abbott; of medium size, with densely hairy, brownish-skin; flesh light-green, of good flavor; ripens in early May; keeps well. Vine very vigorous, prolific; blooms later than Abbott. Formerly very popular but has lost ground to Hayward. Originated in New Zealand. Introduced in the early 1930's. MORTON 1987a; H4, H53M{SC}

Bruno: Fruit large; elongated cylindrical, broadest at apex; skin darker brown than other cultivars with dense, short, bristly hairs; flesh light-green, of good flavor; ripens in early May. Vine vigorous and productive, blooms with or slightly after Allison. Preferred by some processors because a large number of even slices can be obtained from each long fruit. Relatively low chilling requirement. Also used as a rootstock. MORTON 1987a, SALE; H4, H53M{SC}, *H71{S}*, *M81M*, N84{S}, 093{S}, P17M{S}, *Q32{S}*

Chico Hayward: (Chico) Large, broad oval fruit; skin pale greenish-brown with fine, silky hairs; quality excellent; ripens late. Similar, if not identical to Hayward. Vine bears moderate crops, doesn't require as much thinning as others. Tends to produce some odd-shaped fruit. High chilling requirement. Preferred commercial cultivar in California. Originated in Chico, California by R.L. Smith, Chico Plant Introduction Station. *B58M*, D34M{PR}, E74{PR}, I83M

Dexter: Fruit similar to Hayward, only slightly more elongated; skin hairs stiff and generally come off readily during commercial packing operations. Relatively low chilling requirement; adapted to warm-winter areas. Originated in Queensland, Australia by John Dexter as a seedling of Hayward. H4, H53M{SC}

Elmwood:<sup>1</sup> Extra large fruit, many up to 9 1/2 ounces each as compared to those of Hayward which average 3 to 3 1/2 ounces each; somewhat cylindrical with a very slight narrowing at the midpoint. Vine precocious, usually bears the first year after being grafted; produces few doubles or fens; wood an unusual off-white color. Highly recommended for southern California. H4, H53M, H53M{SC}, I49M, *I49P*, I66T, J51P{SC}

Grade: Fruit elongated, tapers distinctly towards the stem end; similar to Bruno, but with more width and substance. Ripens two weeks before Hayward. Low to medium chilling requirements. A selection made by Auckland, New Zealand nurseryman John Grade. SALE; H4, H53M{SC}, J51P{SC}, 097

Hayward: Very large fruit; broad oval, with slightly flattened sides; skin light greenish-brown with dense, fine, silky hairs; flesh light-green, of superior flavor; ripens in early May; keeps better than any other current cultivar. Vine moderately vigorous and productive; blooms very late. Standard commercial cultivar in New Zealand, California, Italy and other areas. MORTON 1987a, SALE; A88M, B74, B93M, G17, H4, H53M{SC}, I49M, I83M, J51P{SC}, N84{S}, 093{S}

Koryoku: (Japan-86) An excellent new cultivar developed in Japan. The fruit is reportedly better tasting and larger than any cultivar presently marketed. It also ripens 10 days before Hayward. One of the sweetest of the true kiwis, measuring 23 to 24% brix. Has produced annually in southern California. H53M{SC}

Kramer: Large, Hayward type fruit; more solid in the shoulders; of excellent quality. Vine prolific; produces few doubles or fans. Originated in Te Puke, New Zealand by John Kramer as a selection of Hayward. Seems to have lower chilling requirements. H4, H53M{SC}, S59

Monty: Fruit small to medium-sized; oblong, tapering slightly at the stem end; skin brownish with dense hairs; flesh light-green, of indifferent quality; ripens in early M<sup>^</sup>. Vine highly vigorous and productive; has a tendency to overcrop, which can adversely affect fruit size; very late blooming. Medium chilling requirement. Originated in New Zealand. Introduced about 1957. MORTON 1987a, SALE; H4, H53M{SC}, J51P{SC}

Saanichton 12: Grown on Vancouver Island, British Columbia, Canada for over 13 years. The fruit is large and sweet and the plant has not been injured by winter temperatures that have damaged other cultivars. Recommended for the backyard grower and small orchardist. Also being tested by the Saanichton Agriculture Canada Research Station for commercial production and as breeding material. B74, C34, H53M{SC}, I49M, *I49P*, I66T, 174, J51P{SC}, J61M, NO

Tewi:<sup>1</sup> (Tenerife Kiwi) Medium-sized, oblong fruit, similar to Hayward but somewhat smaller; flesh brilliant green, of good flavor. Vine moderately vigorous; precocious; prolific, produces up to 80 pounds of fruit under ideal conditions; has a very low chilling requirement; blooms very early. Originated in the Canary Islands as a seedling of Hayward. Introduced into the United States in 1980 by Horace Whittaker of Carpenteria, California. H4, H53M{SC}, I83M

Vincent:<sup>1</sup> Medium-sized fruit; resembles Abbott and Allison; flesh sweet, flavor very good. Vine very prolific, sometimes to the point of negatively affecting fruit size. Very low chilling requirement, 200 hours or less compared with the 600 or more needed by most cultivars. Suited to warm winter areas. Originated in Yorba Linda, California by Judge Raymond Vincent. A88M, D57, E87, *G49*, H4, H53M{SC}, *H78*, I83M, LI, N20

**MALE**

California: The male most commonly used in California for pollinating the Hayward and Chico Hayward cultivars. Pollinates up to 8 females. Also suitable for pollinating Monty. Originated in Chico, California probably from seeds collected in China by E.H. Wilson. *B58M*, C34, J51P{SC}

Early CC: Several early selections which might show promise for the warmest winter sites such as southern Florida. Begins blooming in February in southern California. The early budding of these strains makes them susceptible to any spring frost, but the plant recovers and reblooming takes place as usual in May. H53M{SC}

M Series: Including clones M51, M52 and M56. Selected flowering clones of an established long-flowering ability and high pollen potential suitable for the pollination of female cultivars available at the present time. Particularly useful for pollinating Hayward. For optimum results under various climatic conditions, a small number of all three M Series clones should be planted. H53M{SC}, 097, S59

Male: (All Purpose) Non-fruiting, all purpose male used as a pollinator for female vines. Generally, one male plant is recommended for every 8 female vines. Can also be used as a pollinator for *A. arguta* hardy kiwis. A88M, I49M, *I49P*, I66T, *M81M*, NO, N20, 097

Matua:<sup>1</sup> Long-flowering type, flowers prolifically over a long period. Along with other long-flowering types, Matua is generally regarded as the best pollinator for all commercial cultivars, including Hayward. Flowers produced in groups of 1 to 5, usually 3; peduncles short-haired. Low chilling requirement, 100 hours or less. MORTON 1987a, SALE; G17, H4, H53M{SC}, I83M, J51P{SC}, J61M, P68M

Tomuri: Late-flowering type, with a relatively small number of flowers that bloom late in the season. Flowers in groups of 1 to 7, usually 5; peduncles long-haired. Originally selected as a pollinator for Hayward. The standard late season pollinizer. Low chilling requirement, 100 hours or less. MORTON 1987a, SALE; A88M,

B74, B93M, E87, *G49*, H4, H53M{SC}, H78,183M, J51P{SC}, LL, N20, N84, R77

#### SELF-FERTILE

Blake: Fruit relatively small, tends to taper near the blossom end; ripens to a 6.5 brix 6 to 8 weeks before Hayward thus substantially extending the fresh kiwifruit season for the backyard grower. Vine precocious, can produce a crop in as little as one year after being grafted; blooms very early, but is reliably pollinated by Matua; reportedly self-fertile; prolific. Originated in the San Francisco Bay area. H4, H53M{SC}, J51P{SC}, J61M, *M81M*

Jenny: The first reliably self-fertile fuzzy kiwi. Produces small fruits, about the size of a medium-sized nut, much smaller than standard cultivars. Begins ripening in November. Moderately vigorous vines. P68M

#### HARDY KIWIS

Small fruited kiwis that have the advantage of growing in areas too cold for the common kiwi. The fruit is smooth-skinned and can be eaten out of hand like a grape, without any peeling. It is also much sweeter than the common kiwi but does not keep nearly as long in storage. Sometimes called "baby" kiwis.

ARGUTA This is the Actinidia species most commonly called the hardy kiwi. It is winter hardy to Zone 4 if the vine is properly hardened off. However it has a bad habit of leafing out much too early in the spring and the whole plant is sensitive to spring frosts. This early breaking dormancy problem seems to exist in Zones 4 through 7. (*A. arguta*)

#### *Female*

74-8: Short, elliptical fruit, above average in size; flesh firm, sweet, of very good flavor and quality. Vigorous, productive vine; hardy and adaptable. One of the best of the 74 series originating at the USDA Chico Plant Introduction Station in California. M16

74-49: (Fortyniner) Large, flat attractive fruits, as short as they are wide; skin smooth; flesh aromatic with a distinctive sweet flavor; ripens in mid-season. Vine vigorous; a reliable and heavy bearer of long fruit clusters. Originated in Chico, California. Selected for productivity and high fruit quality. D37, E87, F16, H53M, H53M{SC}, *I49P*, I66T, M16

74-55: (Fifty Five) Medium to large, round, smooth fruits; flavor sweet; ripens somewhat before 74-49. Quality very good. Vine vigorous and productive. Originated at the USDA Chico Plant Introduction Station in California. D37, F16, M16

74-62: Exceptionally long, cylindrical fruits with very smooth, clear-green skin. One of the 74 series selected at the now defunct Chico, California Plant Introduction Station. Recommended for its vigor, productivity and flavor. B74

Ananasnaya: (Michurin Ananasnaya, Michurin's Pineapple, Anna) Medium-sized, oval fruit, 1 1/2 inches long and 1 inch in diameter; skin dark green, smooth; flesh light-green, juicy, sweet, has a distinct pineapple-like aroma and flavor. Vine very hardy, will tolerate temperatures of -30° F.; a reliable bearer, often produces fruit in bunches similar to grapes. Believed to be a hybrid of *A. arguta* and *A. kolomikta*. Developed by the noted Soviet plant breeder I. V. Michurin. MICHURIN; A91, B73M, B74, C34, D37, E87, F16, F43M, H53M, 146, I49M, 174, 178, 183M, J51P{SC}, K67, M16, etc.

Arbor-Eat-Um: (National Arboretum #1) Large, elongated fruit with a fine sweet flavor. Ripens in midseason. Vigorous and productive. Original plant found growing at the National Arboretum in Washington, D.C., apparently a seedling of unknown parentage. D37

Dumbarton Oaks: Originally from an old planting found in a garden in the Georgetown area of Washington, D.C. Has been growing there since 1940: The fruit has an excellent sweet flavor and

is above average in size. Early ripening. Moderately productive. C58, D37, F16, M16

Geneva #1: Small to medium-sized fruit of high quality, about 1 inch long, similar to Meader Female; ripens late. Strong, vigorous vine with good cold tolerance. Originally from the Nov York Experiment Station in Geneva, New York. E87, H4, H53M{SC}

Geneva 02: Small to medium-sized fruit of high quality, about 1 inch long, similar to Geneva #1; ripens late, in late September and October. Very vigorous and productive vine. Good cold tolerance. Originated at the Geneva, Nov York Agricultural Experiment Station, by George Slate. H4, H53M{SC}, J51P{SC}, M16

Jumbo: One of the largest-fruited of the hardy kiwi varieties. Attractive, elongated fruit, weighing up to 1 ounce; sweet and flavorful. Preferred by some for its mild flavor, milder than that of Anna. Productive vine. Has potential as a commercial variety. Originated in Italy. E87, I49M, *I49P*, I66T, 174

Langer: (Hood River) Bears medium-sized fruit of fine quality. Strong, vigorous grower. Has endured summer drought, deep snow, severe cold and wind, and other adverse conditions. Original tree is from an old homestead high in the Cascade mountains. H4,183M

Meader Female: Medium-sized fruit; sweet and flavorsome; ripens very early, at the end of August in New Hampshire. Hardy to -25° F. Introduced by Professor E.M. Meader of Rochester, New Hampshire after 20 years of selection and testing. Selected for productivity and high fruit quality. C58, F16, H53M{SC}, M16

Michigan State: (MSU) Medium to large, ribbed fruit, 1 1/2 inches long and 1 inch in diameter; flavor excellent when ripe, good even when not fully ripe. Vine vigorous; perfect flowered; reported to be partially self-fertile, but produces best when planted with a male. Originally from Michigan State University. Possibly a hybrid between *A. arguta* and *A. kolomikta*. D37, F16, H53M{SC}, 146, M16

Rosy:<sup>2</sup> New red-fruited kiwi which originated in Italy. Very large fruit, weighing up to 20 grams. Attractive reddish-green skin and flesh. Sweet and flavorful. Ready for harvesting in mid to late September. Vigorous and productive plant. Easy to grow and free of pest and disease problems. I66T

#### *Male*

74-32: One of the males selected at Chico, California to pollinate females in the 74 series. Similar to 74-8; possibly a seedling of common origin. Prolific, early bloomer. Vigorous growing vine. Prefers moist, well-drained soil and full to partial sun. Also pollinates other types, like Ken's Red and *A. arguta* var. *cordifolia*. F16, I49M

74-46: Male used to pollinate females in the 74 series. Selected for its exceptionally large number of flowers, an advantage for males because it extends the flowering season. Originated at Chico, California. F16

Kiev: Selected strain that is useful as an all-purpose pollinator. Blooms at a young age and the bloom time overlaps that of many female cultivars. Originated in Kiev, Ukraine. I66T

Male: Non-fruiting, all purpose male used a pollinator for female vines. One male can pollinate up to 8 females. Will also pollinate Hayward and other fuzzy female kiwis. B74, C34, C58, D37, F43M, H4, H53M{SC}, 146, I46{PO}, I49M, *I49P*, 174, 178, J51P{SC}, J61M, K67, *M81M*, etc.

Pacific: Male *arguta* with a long flowering period. Good pollinator for female *argutas*. Has become quite popular along the Pacific Coast where it is used in the newly developing, commercial hardy kiwi plantings. H4,183M

*Self-Fertile*

119-40-B: Self-fertile cultivar originally from the Arnold Arboretum in Massachusetts. Vigorous grower with large, waxy leaves. Will pollinate other cultivars of *A. arguta*. When using this cultivar for fruiting, it is best to have a male pollinator to extend the crop. F16, H4, H53M{SC}, 146, J51P{SC}, M16

Issai: Fruit long, up to 1 3/4 inches; sweet, of very good flavor, quality high; seedless when not pollinated. Vine short and compact; bears fruit without a male pollinator, often the first year after grafting, however planting with a male will increase yields. Ideal for the gardener with limited space. Originated in Japan. A88M, B75, D37, D76, E87, E97, F16, H4, H53M{SC}, 146, 149M, 174, 183M, L33, M16, NO, etc.

**KOLOMIKTA** Also called *arctic beauty kiwi*, this species is reportedly hardier than *A. arguta*, to Zone 3. It is also a striking ornamental, the growing tip and young leaves being covered with magenta hairs and the leaves of the adult male plant variegated with red, white and green. Growing to only 10 feet it is easier to protect in very cold climates and may be suitable for indoor culture. (*A. kolomikta*)

*Female*

Arnold Arboretum: (A/O) Small to medium-sized fruit of fine quality; very sweet; ripens early. Vigorous, early bearing and productive. Originally from the Arnold Arboretum in Massachusetts. C58, E87

Aromatnaya: Medium-sized, very sweet fruit; sugar content 20% when ripe, medium high vitamin C content; ripens early to mid-August. Vigorous and exceptionally productive vine. Selected in the former Soviet Union for good fruit characteristics. J51P{SC}, I66T, M16

Krupnoplodnaya: (Krupnaya Michurinskaya, Large Fruited, Michurin's Large) Very large, smooth-skinned fruit; sugar content 14% when ripe, high in vitamin C; flavor excellent; ripens in late August. Vine moderately vigorous, very productive; ornamental; cold hardy to -35° F. Originated in Leningrad, Russia ty I.V. Michurin. B74, C58, D37, I49M, I66T, 174, J51P{SC}, M16, N24M

Matovaya: Small to medium-sized, very sweet fruit; sugar content 16% when ripe, very high in vitamin C; ripens very early, in early to mid-August. Selected in the former Soviet Union for good fruit characteristics. I66T

Nahodka: Medium to large fruit with sweet, tender flesh; sugar content 15 1/2% when ripe, medium high in vitamin C; ripens in mid-August. Vigorous and productive vine. Selected in the former Soviet Union for good fruit characteristics. I66T

Pautske: Reportedly a large, high-quality fruit. Vine very vigorous. Originated in Lithuania by plant breeder V. Pautske. One of the most vigorous growing of the kolomikta cultivars. I49M, M16

Pozdnaya: (Leningrad Late) Medium to large fruit, of a pleasant flavor; ripens mid to late September. Bears very abundant crops. Originated in the East Siberian taiga. Introduced ty I.V. Michurin. Selected for fruit size and taste. H53M{SC}, N24M

Rannaya: (Leningrad Early) Fruit of pleasant flavor, ripens in the middle of August. Vine produces abundantly; pollinates Urozhnaya, Pozdnaya and Oluyhckos. Originated in the East Siberian taiga. Introduced ty I.V. Michurin. MICHURIN; H53M{SC}

Sentyabraskaya: (September) Medium to large fruit, very sweet and flavorful; sugar content 18% when ripe, medium high in vitamin C; ripens in late-August. Productive vine; notable for its extensive variegation. Selected in the former Soviet Union for good fruit characteristics. I49M, I66T, J51P{SC}, M16, N24M

Urozhnaya: (High-Yielding) Medium to large fruit with an excellent sweet flavor; contains 18 1/2% sugar when ripe; also high in vitamin C. Ripens early, beginning in the middle of August. Vine bears a very abundant and regular annual crop. Originated in the East Siberian taiga. Selected for fruit size and early fruiting ty I.V. Michurin. MICHURIN; U7G{SC}

*Male*

All Purpose: Non-fruiting, all purpose male used a pollinator for female vines. Pollinates up to 8 female vines. Also a fine ornamental with striking pink, white and green variegated leaves. B74, C34, C58, D37, E87, H4, H65, 146, 149M, I49P, I66T, J61M, M16

**OTHERS**

Hardy Red:<sup>2</sup> (*A. purpurea*) Striking cranberry-red fruit with a delicious sweet-tart flavor. Good sized fruit. Highly rated in taste tests. Ripens in October with *A. arguta* varieties. Vigorous and productive. Very handy, has withstood temperatures cf -25° F. Pollinated by *A. arguta* males. C34, E87, 146, 166T

Ken's Red:<sup>2</sup> (*A. arguta* var. *cordifolia* x *A. melanandra*) Unique red-fleshed kiwi. Small, oval fruit; thin, palatable red skin; mild, very sweet red flesh. Only turns red during the latter stages of maturity, indicating ripeness. Vine moderately vigorous; productive; resembles *A. arguta* var. *cordifolia*. Originated in New Zealand by Ken J. Nobbs. Good specialty market potential. B74, D37, F16, H53M{SC}, I49M, I49P, I66T, 174, J51P{SC}, J61M, K67, LI, N24M

Red Princess:<sup>2</sup> Sibling of Ken's Red developed by Ken J. Nobbs of New Zealand, by crossing an *A. arguta* var. *cordifolia* female with an *A. melanandra* male. The fruits are generally smaller than Ken's Red and have a less pronounced kiwi flavor. Tends to have a mixture of both red and green coloration, both on the skin and within the fruit. H53M{SC}, 146

**SOFTHAIR KIWIS**

A unique class of kiwi, often with distinctive colored flesh.

The fruits resemble fuzzy kiwis in outward appearance but have much finer hairs. Blooms earlier in the spring, and the fruits mature earlier in the fall. More susceptible to bud damage caused by late winter cold snaps Yellow, orange and red forms would appear to have good potential for specialty markets. (*A. chinensis*)

Canton:<sup>1 2</sup> Fuzzless fruit of typical kiwi shape, somewhat smaller than First Emperor; yellow-fleshed when ripe. Imported into the United States from Japan where it is claimed that some red colored cells can appear within the flesh. To date, this has not been observed in fruits grown in California. Low chilling requirements. H53M{SC}, H53M{S}, J51P{SC}

Ding: Excellent female cultivar. Use Dong as a pollinator. In field tests in North Carolina the plants were unharmed by temperatures just below 0° F, while the regular kiwi was killed. Originated in China. B96

Dong: Male vine used as a pollinator for Ding. In field tests in North Carolina the plants were unharmed by temperatures just below 0° F, while the regular kiwi was killed. Originated in China. B96

First Emperor:<sup>13</sup> Fuzzless fruit of typical kiwi shape; completely yellow-fleshed when ripe with a brix reading of 16 to 18. The largest fruiting of the colored *chinensis* clones, often weighing 4 ounces or more. Blooms several weeks before Hayward, and ripens about one month sooner. Low chilling requirements. H53M{SC}, H53M{S}, J51P{SC}

Male: Non-fruiting, all purpose male used a pollinator for female vines. Will generally pollinate up to 8 female vines. Will also pollinate Hayward and other fuzzy female kiwis. H53M{SC}

Mandarin:<sup>14</sup> Large fruit, sometimes with a pronounced bulge in the center. Sweeter than Canton or First Emperor, with sugar levels near 20 brix. Must be thinned by two thirds or more to reach accept-

able size. Extremely prolific, much more so than Canton or First Emperor. Low chilling requirements. H53M{SC}, H53M{S}, J51P{SC}

## KOHLRABI {S}

### BRASSICA OLERACEA GONGYLODES GROUP

---

#### HYBRID

**Express Forcer:** 43 days. Extra early forcing type. Smooth, flattened, globe-shaped bulbs; up to 4 inches in diameter; light green skin and crisp white flesh; excellent quality. Short green tops, suitable for steaming or stir-frying. Very slow bolting. Recommended for fresh market. Very popular in Europe, where it's the market leader in its class. C20M, 191, M29, N81, S63M

**Grand Duke:** 48 days. Smooth, uniform, round bulbs; can grow to 4 inches in diameter without becoming woody. Vigorous, upright plants withstand cold soils, light frost, adverse weather conditions and are tolerant to black rot. Good vigor and uniformity. Late in bolting. Will produce a larger crop in less space than Early White Vienna. All America Selections winner in 1979. A87M, C44, D11M, D65, F13, F70, G16, G71, H33M, H61, J14{PL}, K10, K73, M46

**Kolibri:** 45 -50 days. Refined purple hybrid type. Large, flattened globe-shaped bulbs with uniformly deep-purple skin; nearly fiberless, crisp, clear white flesh. Medium-sized tops. Matures to a large size without loss of interior quality. Excellent for fresh market. Very high yielding. Developed in the Netherlands. D68, G6, 118M, J20, K50, K66, N81

**Kolpak:** 38-44 days. An excellent white hybrid noted for its earliness, uniformity and sweet flavor. Tender flesh does not become pithy or fibrous. Fine-stemmed foliage; flattened-globe shape. Best harvested when 2 to 3 inches in diameter. Suitable for both transplanting and direct seeding. Tolerates dense planting. J20, L89C

**Purple Danube:** 46 days. Smooth, refined round bulbs with fine-stemmed foliage. Superior tenderness and freedom from fiber. Excellent quality. Good uniformity in plant habit, bulb shape and maturity. More vigorous and easier to grow than Early Purple Vienna with deeper and more attractive color. A87M, G13M, 191, K16M, K73

**White Danube:** 45-50 days. Early, uniform, refined hybrid type. Smooth, flat-round bulbs, pale whitish green skin; slender, upright petioles. Sweet, bright white flesh, virtually free from fibrous and pithy tissue. Interior quality holds up well as bulb matures. Slow to bolt. AI, A87M, C20M, G13M, K16M, K73, L42, N81, N84, R32

**Winner:** 60 days. Vigorous plants produce large, perfectly uniform, semi-globular pale green bulbs with few leaves and mild, tender, sweet flesh. Excellent quality and yields. Remains tender until reaching a diameter of at least 3 inches. Resists becoming woody for many months after maturity in the fall. E75{PL}, G6, G13M, G82, J20, K10, K50, S63M

#### OPEN-POLLINATED

**Early Purple Vienna:** 60 days. Globe-shaped bulbs with a purplish-red color and attractive greenish-white interior flesh. Leaves are smooth and few in number. Similar to Early White Vienna except for the color of the skin. Standard purple-skinned cultivar. Known prior to 1865. BURR; A16, A87M, B78, C44,

C85M, E24, E38, FI, F80, F82, G16, G71, H33M, 184, K49M, L7M, M49, etc.

**Early White Vienna:** 55 days. An early dwarf cultivar with short tops and glos<sup>^</sup>, white to very pale green, medium-sized bulbs. Crisp, tender, succulent white flesh with a mild turnip-like taste. Should be harvested at about 2 1/2 inches in diameter for best quality. Standard white-skinned cultivar. Known prior to 1865. BURR; A16, B75M, C44, D82, E24, E38, FI, G16, G71, G93M, H33M, H61, 139, 184, K49M, etc.

**Gigante:** \* 4 \* 1 (Gigant Winter) 130 days. Very large root, typically grows 8 to 10 inches in diameter; average weight 15 to 20 pounds, yet it remains fine-grained and is of good quality throughout. Can be used fresh or cooked at any size, from small to large. Traditionally used for sauerkraut in central Europe. Resistant to root maggots. Excellent for winter storage. Selected from a Czechoslovakian family heirloom by Professor E.M. Meader. D65, E24, F73D, 139, 181, J9M, L7M, Q34

**Granlibakken:** 45-50 days. Medium-sized, uniform, medium-green bulbs. Tender, very smooth, creamy white flesh; mild, sweet flavor. Holds its quality longer than other types when left in the ground. Does not become tough and hot. Large leaves are excellent for greens. Originally from northern Europe. C85M, D26D, D76, G87, 139, M46

**King of the Market:** 50-60 days. Produces very large, greenish bulbs of good quality. Long leaves which can be used for greens. Though slightly late in maturing, it is a very heavy bearer. One of the most popular cultivars in India. N91, Q18, R0, Q45M, R50

**Peking:** (Beijing) 50-55 days. Medium-sized bulbs with pale green skin. Very crisp, pure white flesh, low in fiber; of fine quality and mild, delicious flavor. Medium in maturity. Rare cultivar from China, where it is very popular. Suitable for growing in tropical areas, from spring through fall. D55, F80, L59, S70

**Rapid:** 45 Days. High quality early kohlrabi. Plants grow 15 to 18 inches tall and produce reddish-purple bulbs, 3 inches in diameter, with smooth, crisp, sweet white flesh. Attractive raw, for dips and salads, or cooked like turnips. Resistant to bolting and becoming woody early in the season. L89

**Superschmelz:** Very large, round, green bulb; 6 to 10 inches in diameter; up to 10 pounds, yet is long-standing, remaining tender and not becoming woody. Excellent mild, sweet flavor fresh; fair frozen. Better tasting than other very large cultivars such as Purple Speck. H42, L89, N24M

#### CODES FOR SPECIAL TYPES

1. Winter

---

## LEEK {S}

### ALLIUM AMPELOPRASUM PORRUM GROUP

---

**Albinstar:**<sup>2</sup> 110 days. Developed in Holland for the French "baby" leek market. Tender, succulent young leeks are harvested when they reach the thickness of a marker pen. Easy to clean as young leeks do not form bulbs. Quick growing, vigorous, strong germinating. May also be left to form mature leeks. K66, R32

**American Flag:** 130 days. Large, thick stalks; 7 to 9 inches long, 1 to 2 inches in diameter, blanching to a clear white; leaves medium blue-green. Fine, mild flavor. Strong grower; 15 to 18 inches tall; very hardy and cold resistant. Standard local market and home garden cultivar. B73M, C20M, FI, F82, G16, G71, H21, H54, 164, 177, J84, K23{PL}

**Arkansas:** 110 days. Improved late maturing, winter storage type with a high tolerance of frost. Large white shafts, about six inches

long, virtually non-bulbing; semi-upright, deep blue-green foliage. Excellent color. Very productive and has good disease tolerance. C85M, F63, 191, K10, K50, K73, L42, N52

Blue Solaise: (Bleu de Solaise) 140 days. A 19th century French heirloom with 4 to 6 inch long stems and tops that turn almost violet with cold autumn temperatures. Attractive as well as flavorsome; excellent in soups. Very hardy and cold resistant. Perfect for harvesting in early winter. C53, E63D, F73D, G68, G68{PL}, K49M, P59M, S95M

Carentan: (De Carentan, Carentan Winter) 95 days. Long, thick, tender, creamy-white stalks, 2 inches in diameter, topped by deep blue-green foliage. Mild flavor, delicate enough to be enjoyed raw in salads and garnishes. Vigorous; fast-growing; very productive and adaptable. For fall and winter use. A66, C20M, C95, G57M, Q11M

Carina: Large, cold-hardy, late fall and winter leek, developed especially for longer stalks. Rather narrow, semi-erect leaves of an attractive blue-green color. Long, tender, non-bulbous stalks of high quality. Matures in autumn and will stand in the ground through winter. Heavy yielding and tolerant of black spot and virus. *Al*, C20M, K50, K73, M29

Durabel: Non-bulbous stalks; five inches long to the first joint. Has a much milder flavor and is more tender than other winter-hardy cultivars, which are bred to endure harsh weather. Slow-growing and vigorous; exceptionally late-bolting, remaining in good condition in the garden until late April. J9M, L89

Electra: 145 days. Long, thick white stalks of fine quality. Attractive, broad, dark-green foliage. Can be harvested early, yet is one of the best for fall and winter crops. Very good for freezing. Will also store nearly all winter. Fast-growing, cold resistant, dependable and very adaptable. Of French origin. F13, P59M

Elephant: (Elefant) 85 days. A large, vigorous, fairly early cultivar with extra thick, smooth, medium length stalks without bulbous ends. Light green foliage. Recommended for late summer and fall harvest, or may be stored for winter use. Of French origin. D11M, F70, K49M, 089

Gennevilliers: (Gennevilliers Splendid) A strain of an old French cultivar selected for its long, relatively slender shaft which grows to 10 inches and is free of bulbing. Attractive, upright, dark blue-green foliage. Recommended for mild climates, where it may be left in the ground for winter use if temperatures remain above 30° F. G68, N84, S55, S95M

Giant Carentan: (Monstrueux de Carentan) 140 days. Stem short, very thick, seldom exceeding 6 to 8 inches in length, with a diameter of 3 inches or more in well-grown plants, and occasionally even larger. Leaves very dark bluish-green. Very hardy, suitable for fall and winter crops. An old traditional French cultivar, known prior to 1885. VILMORIN; A2, E24, N84, P59M, S17, S55

Kilima: 80 days. Rapid-growing early leek with medium blue-green foliage. Long, straight 10 to 12 inch stems of good thickness; free from bulbing. Mild onion-like flavor; well suited for use in salads. Excellent for summer and fall use. No winter hardiness and not suitable for storing. C20M, C85M, J84, K49T, K73, N52

King Richard: 75 days. High-yielding summer and fall cultivar. Upright, medium green leaves. Long white stems; will reach one foot or more to the first leaf under optimal conditions. Mild flavor. Not hardy enough for overwintering, but will stand heavy frosts of 32° F. to 20° F. without losing its healthy appearance. C53, D68, D82, E24, E63D, E75{PL}, F35M{PL}, F44, G6, G93M, J20, K10, L89, L91M, R32, S55, etc.

Large American Flag: (Broad London) 120 days. Stems 7 to 10 inches long, 1 to 1 1/2 inches in diameter, blanching to a clear white. Hardy, vigorous plant; 15 to 18 inches tall with medium bluish-green, semi-upright leaves. Standard shipping, fresh market and home garden cultivar. A16, B75M, F92, G68, G68{PL}, G93M, H49, J20, K10, K71, L79

Long d'Hiver de Paris: (Long Winter) Long, slender white stalks; about 12 inches long and 1 inch in diameter. Pale gray-green leaves, longer and narrower than those of other types. Withstands the winter well, and is particularly suited for planting in late autumn. An old French cultivar, popular with market gardeners for bunching. Known prior to 1885. VILMORIN; G68

Long de Mezieres: (De Mezieres Race Danube) Long, white stalks, of good quality. Semi-late in maturity. Very resistant to frost; recommended for harvesting in autumn and winter. Introduced by Vilmorin. G68

Musselburgh: (Scotch Flag, Giant Musselburgh) 130 days. Large, thick white stem, 8 1/2 to 9 inches long and 2 inches in diameter. Broad, tall, medium-green leaves, spreading in a fan-like manner. Vigorous and very hardy. Popular, widely-adapted local market and home garden cultivar. Originally selected near Edinburgh, Scotland. Introduced in 1834. B49, B75, C92, G27M, H61, 139, M49, R32, R47, TIM

Pancho: 75 days. An extra long-shafted type for summer and fall crops. Early, very uniform and of top quality. Produces a high percentage of white shafts, 12 to 15 inches long. Medium to dark green leaves. Very upright growth habit. Stores very well for an early variety. Developed in Europe. K10, K49T, K57{PL}, L94, RUM, R47, S61M, S75M, TIM

Primor: 135 days. Long, straight, non-bulbing shanks with good thickness. Attractive, deep blue-green foliage. Excellent flavor comparable to heirloom varieties. For summer and fall harvests. Well suited to short-season areas. Recommended for home gardens and fresh markets. *Al*, C20M, F63, G68, 177, J14{PL}, K49Z, M29, S61M, S95M

Schnittporree:<sup>1</sup> (Cutting Leek) 55 days. Grown for the leaves and young stems which are cut and used like chives or scallions. Good dark green color. Usually harvested in autumn and winter. N81

St. Victor: 145 days. A traditional French cultivar which is very decorative as well as being of excellent quality and flavor. Deep blue-green foliage has a purplish tinge which deepens to violet in cold weather. Thick, tender, mildly pungent stalks. Very hardy and productive. Widely adapted. Selected from Blue Solaise. A2, B49, C95, H21, K66, L3J, R32, S55, S95M

The Lyon: (Prizetaker) 135 days. Very long, thick, tender pure-white stems, free from any coarseness. Grows to a large size, yet retains its mild flavor. Very cold hardy. An old, widely adapted English cultivar introduced around 1886. B49, C95, N84, R32, S61

Titan: 70 days. Extra long early type, of uniform, vigorous growth. Medium-thick white stems; 6 to 8 inches long, 1 3/4 to 2 inches in diameter with a slightly bulbous base. Dark green leaves. Recommended for summer and early fall harvests. Not cold hardy. B75, D27, G80{PL}, K10, K49M, L42, L77D

Unique: 100 days. Combines outstanding length of 7 to 8 inches with unusual 2 inch thickness. Leaves are dark blue-green. Tolerates extreme cold. Stores very well. Usually sown from April until June. K49M, L42

Varna:<sup>2</sup> 70 days. Slender, extra-tall summer leek with upright, light-green leaves. Can reach 18 inches in length to the first leaf. Developed in Europe for processing, Varna has possibilities in U.S. specialty markets bunched like onions for "baby" leeks. May be grown with transplants or by direct seeding at higher than normal densities. A2, G6, L89, N52

Winter Giant: (Winterreuzen, Giant Winter) Very cold hardy, overwintering type. Tall, vigorous plant with long, thick white stems and dark-green leaves. Good flavor. Matures October to January. Excellent for overwintering, after which it will produce over a long period in early spring. Introduced around 1905. B49, 199M, J97M, K49M, K49T, N84, Q11M, R32, S75M

## CODES FOR SPECIAL TYPES

1. Cutting
2. Baby

## LEMON {GR}

## CITRUS XLIMON

Bears: (Sicilian) Large fruit with up to 6 seeds per fruit. Ripens between July and December; does not keep well. Susceptible to peel injury when harvested early in the season. A large part of the crop is processed for its rind. Very vigorous, thorny tree, very cold sensitive. The only lemon recommended for Florida. Originated at Bears Grove, near Lutz, Florida. SAUNT; J17

Eureka: Fruit medium-small, elliptical to oblong, commonly with a short neck. Seeds usually few to none. Color yellow at maturity. Rind medium-thick, tightly adherent. Flesh greenish-yellow, fine-grained, tender, juicy; flavor highly acid. Crop well distributed throughout the year, but mainly in late winter, spring, and early summer. Tree medium in vigor and size, spreading and open, virtually thornless. REUTHER; A63, B93M, B93M{DW}, D23M, D23M{ES}, E3M{DW}, F53M, G49, I83M, J22, N18{SC}, Q93

Femminello Ovale: (Femminello Comune) Medium-sized, short elliptical fruit; rind medium-thick, yellow, tightly adherent; flesh tender, juicy, very highly acid. Crop well distributed throughout the year but mostly in late winter and spring. Tree of medium vigor and size, nearly thornless, highly productive. Especially responsive to the forcing or "verdelli" treatment of culture. REUTHER; 04

Femminello Sfusato: (Femminello Siracusano) Medium-sized, elliptical to oblong fruit; rind medium-thick, tightly adherent, yellow; flesh firm, juicy, highly acid. Crop well distributed throughout the year but mostly in late winter and spring. Tree very vigorous and productive. Due to its pronounced everbearing, everblooming habit it responds very well to the forcing or "verdelli" treatment so distinctive of Sicilian lemon culture. REUTHER; 04

Improved Meyer: Medium-sized, juicy fruit; slightly sweet when mature, of excellent flavor; holds well on the tree. Tree small to medium, moderately vigorous, spreading; nearly thornless. Hardy, productive; nearly everblooming but with many fruit in mid-winter. Good for hedges and containers. A virus-free selection of Meyer lemon recently developed and introduced by the University of California. A71, D3M{PR}, D23M, D23M{ES}, E3M{DW}, F43M, F53M, G49, I49M{DW}, I83M, J22, J61M{DW}, N18{SC}, N40{PR}

Interdonato: (Speciale) Large, oblong fruit; rind thin, very smooth and glossy, yellow at maturity; flesh greenish-yellow, crisp and juicy, seeds very few; flavor highly acid with slight bitterness. Crop produced mainly in fall and early winter. Tree vigorous, usually thornless. Resistant to mal secco disease. Does not respond well to forcing treatment and hence grown primarily for early fruit. Probably a lemon-citron hybrid. REUTHER; 04

Lemonade: (Lemonade Fruit) Hybrid. Lemon-shaped fruits of medium size. Pale lemon-yellow skin of medium thickness, peels easily. Flesh lemon-like in texture and appearance; very juicy with a mild, grapefruit-like flavor. Excellent for eating fresh from the tree or juiced as a tangy fruit drink. Tree productive, ornamental. N84, O97, Q93, R77, S59

Lisbon: Medium-sized, elliptical to oblong fruit. Seed content usually few to none. Rind medium-thick, tightly adherent. Flesh pale greenish-yellow, fine-grained, tender, juicy; flavor very acid. Crop comes mainly in winter and early spring. Tree vigorous, upright-spreading, large, thorny. In California, the cultivar most resistant to adverse conditions such as frost, heat, wind, and neglect.

REUTHER; B93M, D75, E3M{DW}, G49, H4, I77G, N18{SC}, Q93, R77, S59

Lunario: (Amalfitano, Quatre Saisons) Distinctive, long elliptical fruit; rind medium-thin, smooth; flesh greenish-yellow, not very juicy, only moderately acid, seedy. Tree of medium vigor and size, strongly overbearing, thornless. Very responsive to forcing but the "verdelli" fruit is smaller in size, and the following winter crop is markedly reduced in size. REUTHER; 04, R77

Meyer: (Meyer Lemon) Fruit medium in size, oblong to short elliptical, sometimes faintly ribbed. Rind thin, soft; surface very smooth; tightly adherent; color yellowish-orange to orange. Flesh light orange-yellow, tender, very juicy; lemon-flavored and mildly acid. Moderately seedy. Crop distributed somewhat throughout the year but mainly in winter. Tree small to medium, spreading, nearly thornless, hardy and productive. A very good marmalade fruit when ripe. The flowers have a pleasant lemon taste. Probably a hybrid. REUTHER, STURROCK; A63, B93M{DW}, C89M, D37{DW}, G17, G96{DW}, H4, K67, L47, M82{DW}, Q93

Monachello: Fruit medium-small, elliptical but tapering at both ends; rind thin and smooth, yellow at maturity; flesh tender, somewhat lacking in juice, acid content lower than most; seeds few or none. Crop well distributed throughout the year but mostly in winter and spring. Tree slow growing, nearly thornless, moderately productive. Well adapted to forcing but with a markedly reduced winter crop. REUTHER; 04

Pink Lemonade:<sup>1 2</sup> (Spanish Pink) Medium-sized fruit; rind striped when immature, solid yellow when ripe, thick; flesh pinkish, very juicy, tart; seeds few. Attractive tri-colored foliage, with two shades of green and white variegation. Everbearing. Somewhat cold sensitive. Suitable for growing in containers. A63, D23M, D23M{ES}, D37, G2M, G17, G49, I77G, I83M

Pomona Sweet:<sup>3</sup> True sweet lemon, much sweeter than the insipid limettas. Sweet but slightly acidic flesh can be used for fresh juice. Also excellent with seafood and in salsas. Open, upright tree with attractive, pink-blushed flowers. Originated at a turn of the century orchard in Pomona, California. G49

Ponderosa: (Ponderosa Lemon, American Wonder, Wonder) Probably C. x limon x C. medica. Very large, obovoid fruit; color lemon-yellow; seedy. Rind medium-thick and fleshy; surface smooth, but slightly bumpy and indistinctly ribbed. Flesh pale green, juicy, flavor acid. Fruits mature throughout the year. Tree small, round-topped, productive. Grown mainly as a novelty and ornamental, although the fruit can be used as a lemon substitute. REUTHER; A63, D23M, D23M{ES}, G17, G49, G96{DW}, H4, I77G, I78{DW}, I83M, K22, M82{DW}, N24M{DW}

Seedless Lisbon: Seedless form of Lisbon selected in South Australia. Smooth, ellipsoid deep-yellow fruit, about 3 inches long and 2 1/2 inches in diameter; usually with a small neck at the base; segments about 10; seedless yellow flesh and juice. Moderately vigorous, spreading tree. Very tolerant of heat, cold and wind. C29M{SC}, H78, N18{SC}

Sungold:<sup>2</sup> (Sungold Variegated) Medium-sized, oblong fruit; skin moderately thick, striped with green and yellow when immature, turning solid yellow when ripe; flesh yellow, tender, juicy, very acid; seeds relatively few; resembles Eureka. In season March to September, holds well on the tree. Attractive tri-colored foliage, two shades of green splashed with yellow-gold variegation; new growth burgundy red. A63, G49, H78, I83M

Variegated Eureka:<sup>12</sup> Immature fruits green, abundantly streaked with white; slightly ridged and bright yellow when mature; pink flesh. Very ornamental tree, variegated with pink, creamy-white and green. Pink flowers and pink-tinged new growth. Produces market-quality fruits year round. Ideal home garden variety. Excellent patio or container plant. Bud mutation of Eureka. A71, C29M{SC}, H4, H78, N18{SC}

Villa Franca: Fruit medium to large, oval in shape; rind slightly rough in texture, medium-thick, yellow when ripe. Flesh very juicy, greenish-yellow, tangy and acid in flavor; few or no seeds. Tree medium-sized, lightly branched and open in character, generally thornless. Bears in midseason or continuously over a long period. A63, C29M{SC}, N84, 097, Q93, R77

#### CODES FOR SPECIAL TYPES

1. Pink-Fleshed
2. Variegated
3. Sweet

## LETTUCE{S}

### LACTUCA SATIVA

#### HEADING LETTUCE

**BATAVIAN** Very distinct French lettuces, hard to classify by American standards. Very crisp, like Romaine or Iceberg types, but sweet and juicy and without bitterness. The plants are at first open, like looseleaf lettuce, becoming more compact and heavy until the heads are densely packed at full maturity. Becoming increasingly popular in North America. Also known as Summer Crisp or French Crisp lettuces.

#### *Green/Yellow*

Batavian Loura: (Blond Batavian, White Silesian) Heads very large, but not very firm, roundish or slightly flattened; mature plant 12 to 14 inches in diameter. Outer leaves curled, undulated and broadly toothed at the edges, pale green slightly tinged with red on the margins. VILMORIN; A2, K49T, L13M, N84

Doree de Printemps: A French Batavian lettuce that produces a full, light green head with tender leaves. Similar to Red Grenoble, but without the red tinges. Can be planted in both spring and fall. P59M, Q52, RUM, S95M

Nevada: 45-50 days. High quality, bright green version of Sierra. Extra-crisp, bright, glossy green leaves; compact, medium-sized, upright head; tender, juicy, sweet and buttery, flavor excellent. Suitable for harvesting at all stages of maturity. Resists tipburn, bottom rot and bolting. Resistant to downy mildew and lettuce mosaic virus. Hardy and productive. B75, C85M, E63D, G6, G16, H61, 177, 191, J20, K10, K66, K73, L7M, M49, S95M, etc.

Victoria: 52 days. An all-green Canasta type lettuce. Forms a heavy, upright, open head of crisp leaves with a rich, deep green color. Quality excellent; crisp, juicy and notably sweet. Has a long harvest period and ability to produce in hot weather without bolting or bottom rot. Suitable for spring through fall crops. Recommended for the home garden and for specialty and quality conscious markets. L77D

#### *Red/Brown*

Batavia a Bord Rouge: 59 days. Very attractive French lettuce. Large rosettes of crumpled, dark-green leaves, uniformly tinged with deep-red along the edges; flavor initially seems bitter but mellows to a nut-like fineness. Stands for about 45 days without bolting. G68

Canasta: 50 days. An attractive French lettuce with shiry, puckered, bright green, red tinged leaves. As Canasta matures, the outer leaves form a whirl around a tall oval head with a cream-colored crisp heart. Tipburn, bottom rot, and bolt resistant. For spring, summer or fall crops. L77D, L94, SI 7

Cardinale:<sup>2</sup> 60 days. Attractive, high quality new batavian lettuce. More colorful than Sierra. Large, open, upright heads, about 12 inches tall; frilly, rich green leaves, edged with buigundy, thick and glossy; crisp, sweet, juicy, excellent flavor. Resistant to tipburn,

bottom rot, and bolting. Long shelf life. Forms more of a head under cooler growing conditions. Intense red-purple color at "baby" stage; recommended for packaged salad mixes. 177, K66, L89, S95M

Maravilla de Veiano: (Vonny) 62 days. Medium early, compact Batavia type. Crisp, deeply indented, undulated reddish-green outer leaves; firm, compact hearts Very slow bolting. Very good market grower selection for spring and early summer cropping methods. Can also be used as a cutting lettuce after the first harvest. K49Z, Q52, S95M

Red Grenoble: (Grenobloise Rouge) A very handy, red-tinted Batavian. The color of the glossy leaves ranges from light green to magenta, and can vary from plant to plant. Does equally well in warm and cold weather; exceptionally resistant to cold, and is also slow to bolt during summer heat. Excellent flavor. B49, C53, E24, E63D, 177, J20, K49M, K49T, L3J, Q52, S95M

Sierra: 45-50 days Very attractive French cultivar. Glossy, slightly wavy and puckered, bright green leaves, tinged with burgundy; forms an oval, upright head with a crisp, cream-colored heart; very sweet and flavorful; quality excellent. Resists tipburn, bottom rot and bolting; disease tolerant. Suitable for spring, summer or fall sowings. Popular specialty market item. B6, B75, C53, C85M, D68, E24, E75{PL}, F63, G6, G16, H61, 139, J9M, J20, K10, L89, M32, M49, N16, S95M, etc.

**BUTTERHEAD/BIBB** Characterized by small, round heads with loosely packed leaves that are soft and tender with a buttery texture and flavor, and a delicate, cream-colored blanched heart. The type of lettuce most prized in Europe. Almost as easy to grow as looseleaf lettuce, and much less demanding than crispheads.

#### *Green/Yellow*

Akcel:<sup>12</sup> French forcing lettuce; bred especially for growing in greenhouses, tunnels and frames in the early spring. Deep-green, compact, heavy heads. Early; should perform well for the early "baby" lettuce market. C53, M27

Australian Yellow: 54 days. Very early Butterhead lettuce, resembles loose leaf Simpson types when young. Eventually forms a loose head; 12 to 16 inches in diameter. Tender, wrinkled, light yellow-green leaves; very good, slightly sweet flavor. Suitable for growing during any season. K47, L7M, 089, SI 7

Ben Shemen: 70 days. Large, compact head, weighing 1 to 1 1/4 pounds; medium dark-green, sweet, crispy leaves. Suitable for long distance shipping. Bred for resistance to heat and bolting. Good for late spring planting and southern gardeners. Developed in Israel. F73D

Bibb: (Limestone) 60 days. A distinct butterhead type of fine table quality. Small heads with delicately flavored inner leaves that are blanched yellowish-green. Outer leaves smooth, thick, tender, deep-green tinged with brown. Should be planted early, as it bolts in hot weather. Used for greenhouse production, early local market and home gardens. A25, 475, C53, D74B, E5T, G71, G71M, G79, G83M, H49, H85M, 139, 184, N16

Big Boston: 70 days. Large Butterhead type. Solid, tightly folded heads, up to 12 inches in diameter; broad, wavy edged, bright green outer leaves slightly tinged with reddish brown; brittle, tender, buttery heart, blanching to a rich creamy yellow. Stands a great deal of cold without injury. Good for shipping and forcing. Introduced prior to 1894. C44, D12, E53M, F44, G57M

Butter King: 70 days. Improved White Boston type; selected for maturity, uniformity, disease resistance, slowness to bolt and tipburn resistance. Height 7 inches; large, loose head, 5 1/2 inches in diameter; weight 3/4 of a pound. Outstanding eating qualities; does not become bitter. Vigorous even in hot weather. All America Selections winner in 1966. G44M, K23{PL}, K49T, L13M, N84

Buttercrunch: 67 days. A highly refined, long standing Bibb type lettuce developed at Cornell University. Medium-sized, dark green

heads; smooth, soft, tender leaves; creamy yellow hearts. Plants reach 12 inches tall when mature; are slow bolting and heat resistant. All America Selections winner in 1963. Very popular for home gardens and local markets. A16, B75M, B78, C44, C53, D11M, E24, F70, G6, G16, H33M, H61, K10, L7M, L89, M46, etc.

Dark Green Boston: 75 days. Improved White Boston type with deep dark-green leaves. Larger and more solid head than other Boston types; smooth, thick, tender outer leaves; creamy yellow heart; excellent texture and flavor. Resistant to tipburn. Very popular with both home gardeners and commercial growers. *DIT*, D11M, D72, E5T, F63, F70, G82, G93M, H54, J84, K10, K50, K73

Gotte Jaune d'Or: (Golden Tennis Ball) Small, Tennis Ball type, about 8 inches in diameter. Forms a loose, wavy head, upright in the center; tender, crinkled, bright yellow-green leaves. An 18th Century heirloom, once popular as a forcing lettuce in the north of France. Thought to be a Dutch cultivar developed for wilted salads. VILMORIN, WEAVER 1997; F24D, P59M

Green Mignonette: (Manoa) 65 days. Small, round heads; deep-green, frilled leaves; firm heart, blanches almost white, very crisp, tender and sweet. Slow to bolt; very heat resistant; does well in warm, semi-tropical areas where other lettuces are not successful. Widely grown in the Manoa area of Hawaii. JOSSELIN; C20M, *DIT*, E5T, G57M, 177, K49M, M32M, PIG, R47, S63M

Grosse Blonde Paresseuse: (White Stone, Nonpareil) Mature head large and tall, flattened on the top; very light pale green, almost the color of butter or wax; outer leaves large, very much rounded, slightly crimped, not as pale-colored as the head; quality excellent. Mature plant about 12 inches in diameter. Resistant to bolting. Introduced prior to 1885. VILMORIN; G68, P59M, S66M

Kagriner Summer: (Orfeo Kagriner Summer) 60 days. French butterhead developed especially for summer crops. Mid-size, medium green heads; rather thick-leaved, with a somewhat open, firm heart. Very slow to bolt or tipburn. Good quality during the toughest season for butterhead lettuce production. Named for Kagriner, a borough of Vienna. A16, C20M, *DIT*, D12, D68, G57M, G68, J20, J25M, J82, N81, Q11M

Kinemontepas: Medium to large heads; grayish-green leaves, of excellent quality and flavor. Black-seeded. Very slow bolting; quality is maintained even under hot and dry conditions. A standard summer lettuce in France. B49, C53, G68

Kwiek:<sup>1</sup> Large, quick-growing butterhead. For winter cropping in a cold or unheated greenhouse or poly tunnel. Sow late August for a harvest in November and December. Can also be sown in October. A2, F73D, R32, S61

May Queen: (Reine de Mai, Regina di Maggio) 60 days. Quick-maturing butterhead for earliest spring sowings outdoors. Medium-sized, pale green heads tinged with reddish brown; creamy yellow hearts blushed with rouge-pink. Also good for growing in cold frames and greenhouses, and fall or late winter sowing in mild winter areas. Nineteenth century heirloom. B8, D12, F73D, J73, N84, P59M, Q11M, S17

Mescher: (Schweitzer's Mescher Bibb) 50 days. Dates back to the 1700's. Introduced to the United States from Austria in the early 1900's and maintained as a Schweitzer family heirloom. Forms small, tight, crisp heads of green leaves ringed with red. Excellent appearance and flavor. Best grown in cool weather; has survived temperatures of 28° F. A2, F24D, F24G, F73D, J39, L7M

Ostinata:<sup>1</sup> 60 days. High quality Boston type with exceptionally long shelf life. Heavy, very attractive head. Compact plant allows for close spacing, yet still yields well. Stands high temperatures in mid summer as well as short day conditions. Excellent resistance to bolting and tipburn. Can be grown under glass, tunnels, in soil or in the open. Responds well to hydroponic culture. F85G

Perella Green: A very small, open-leaf Butterhead type of good flavor and attractive appearance. Quick-growing; cold-tolerant; usually sown broadcast. Good for fall, spring and early summer plantings. Also suitable for growing in a cool greenhouse. A favorite of Joy Larkcom, author of "The Salad Garden". C20M, 111, S55

Summer Bibb: (Summer Baby Bibb) 62 days. Improved Bibb strain. Small to medium heads, more compact than Bibb; creamy white hearts; thick, tender, medium-green leaves. Slow to bolt, 2 to 3 weeks later than regular Bibb; can be grown all summer. Grows well on upland or muck soils. Also recommended for hotbed and greenhouse use. B6, FI, G93M, I18M, J84, J97M, K73

Tennis Ball: 70 days. Small to medium-sized head, very solid if grown in cool weather, often loose and open if grown during the summer months; outer leaves deep dark-green, slightly curled, broadly blistered; inner heart white and tender. Resistant to bolting. Extremely hardy. One of the oldest lettuces on record. BURR, VILMORIN; F24D, L7M, L90M

Tom Thumb:<sup>2</sup> (Wheeler's Tom Thumb) 65 days. A "baby" butterhead well suited for smaller home gardens and window boxes. Very small, solid compact heads, about the size of an apple; light to medium green, crumpled leaves; tender, sweet and of very good flavor. Ideal for serving whole as an individual salad. Introduced prior to 1885. VILMORIN; A75, B49, C44, D12, D68, D82, K23{PL}, K66, L7M, M46

Unrivalled: (Attractive) A hardy, quick-growing early cultivar. Compact 6 ounce heads; medium-sized, firm, golden-yellow hearts; few outside leaves; superb flavor. Slow to bolt; very hardy. Sow outdoors in spring and summer. Can also be sown in autumn to heart in the spring in milder climates. Introduced around 1905. B49, 053M, R32, S61

Val d'Orge: Large, vigorous, very attractive fall and overwintering butterhead with pale translucent green coloring and a soft, buttery texture. Round, smooth-edged leaves. Fine for an early fall crop, or in suitable climates it can be planted in September for a harvest in April and May. K49T, N84

White Boston: 65-70 days. Medium to large, loose, light-green heads; about 12 inches in diameter, slightly crinkled; buttery, light golden-yellow hearts; very tender and sweet, flavor excellent, of gourmet quality. Very popular heirloom cultivar. Recommended for home gardens and fresh markets. B8, B8M, C85M, C69, *DIT*, D12, D26D, E5T, F24M, G27M, G57M, G71, 167M, 184, K49M, M32, etc.

#### Red/Brown

Bon Jardinier: (Du Bon Jardinier) 55-60 days. Attractive medium to large, smooth, undulated heads; thick, medium green leaves lightly tinged with red. Very vigorous and productive. Harvested in summer and autumn. Recommended for home gardens and fresh market; also ships well. F73D, G68

Bronze Mignonette: 55-65 days. Attractive, loose, medium-sized heads; glossy, frilled, chartreuse to emerald green leaves, splashed with garnet and bronze; firm, nearly white hearts; crisp, tender and sweet. Hardy and somewhat drought resistant; slow to bolt. Adapted to hot, humid conditions. Heirloom from the late 19th Century. *DIT*, D12, D68, E5T, F73D, G57M, G68, 118M, 139, 167M, 177, K23{PL}, K49M, K49T

Bruna di Germania: (Brown German) Small, reddish-brown French lettuce for overwintering in mild climates. However, it does better with some protection, i.e. a cold frame or poly tunnel. Large, firm flavorful hearts; grows to 8 inches. Noted for its vigorous spring growth. S17, S55

Brune d'Hiver: (Brown Winter) Compact, rather thick-set plant; head medium-sized, green, overlaid with brownish-red; outer leaves coarsely crimped, much wrinkled; the whole plant seldom exceeds 7 or 8 inches in diameter. Quality excellent. Very hardy; well-

adapted to winter culture; bolts readily in hot weather. Introduced prior to 1865. BURR, VILMORIN; A2, C53, E63D, J20, K49M, K49T, K49Z, N84, P59M, S95M

Merveille des Quatre Saisons: (Marvel of Four Seasons, Meraviglia Delle Quattro Stagioni, Red Besson) 65 days. Head roundish, slightly flattened on top; forms very quickly and stays firm for a long time, even in very hot weather. Leaves short, almost round, the edges turned up in a kind of spoon-shape; tinged all over with brownish-red. Can be grown nearly all year round, but does best in spring and summer. Introduced prior to 1885. VILMORIN; B8, C53, C92, D74B, E24, E63D, G68, J20, J73, K23{PL}, K49M, K66, L13M, M32, R32, S55, etc.

Perella Red: One of the hardiest winter lettuces grown in the mountainous region of northern Italy. Has survived a temperature of 4° F. Very small, compact plant; forms a small heart or rosette. Decorative red strain of Perella Green. Sow in spring or autumn; harvest whole plant or use cut-and-come-again method. C20M, F73D, G93M, I18M, 177, J97M, K66, Q34, S55

Pirat: (Brauner Trotzkopf) 55 days. Medium-green, gently crinkled leaves, overlaid with a soft brick red. Medium large, well folded, tender hearts blanch to a creamy yellow. Reliable and well adapted to growing throughout the season, even the middle of the summer. Similar to Merveille des Quatre Saisons, but more uniform, bolt resistant and compact. D68, F73D, F80, J39, K23, K23{PL}, K49T, K57{PL}, L13M, N7G

Red Boston: 68 days. Medium frame Boston type with rose-red tinged leaves and medium green hearts. Popular novelty lettuce for hydroponic or outdoor growers for the salad bar trade. F80, N52, N84

Red Riding Hood: 65 days. A red Boston type, similar to Merveille des Quatre Saisons but with better color and bolt resistance. Very large, attractive heads with red savoyed leaves. Best harvested when 8 to 12 ounces. Stands heat and drought well. C53, D68, E5T, K49T

Rougette du Midi:<sup>2</sup> (Red Montpellier) Small French lettuce with glossy, bronze-red leaves. Very crisp and flavorful. Spring and summer sowings produce a small, unheated "baby" lettuce very quickly but they are equally quick to run to flower. Also suitable for autumn sowings to overwinter under cloches, or outdoors in mild climates. Attractive enough for the ornamental garden. C53, 177, S55

Sangria: 58 days. Medium-sized, uniform heads with large, well-folded hearts of pale yellow leaves; average weight 16 ounces. Outer leaves smooth, somewhat wavy, very thick, medium dark-green prominently tinted with a warm, rosy red color. Excellent flavor. Grows well in spring, fall and winter. Good resistant to bolting and tipburn. Tolerant to downy mildew. C20M, C85M, E33, G6, G93M, H61, 177, K17M, L42, L94, M46, N16, N81, Q34, S61M, S95M, etc.

Yugoslavian Red: 58 days. Heirloom from a peasant family in Marburg, the former Yugoslavia. Introduced by Southern Exposure Seed Exchange in 1987. Red heads, 10 inches in diameter; inner leaves an attractive creamy yellow-green dappled with red. Succulent, buttery and flavorful. Ideal for garnishes. K47, L7M

**CRISPHEAD** The most popular form of lettuce in the United States, the Iceberg lettuces being typical. Characterized by solid heads of tightly-wrapped, very crisp leaves. They take about ten days longer than butterheads to mature but stand up to hot weather better without bolting. Considered to have more flavor than butterhead types.

#### Green/Yellow

All-the-Year-Round: 65 days. Round, compact, very solid head; of a very pale, almost whitish, green color; outer leaves short, roundish, finely crimped and slightly undulated. Tender and crisp, of fine quality. Hardy and very productive; grows well in almost any

soil. Suitable for successional sowings any time of year. Introduced prior to 1885. VILMORIN; A2, B49, D12, D65, K49M, K71, 053M, R32

Anuenue: 50 days. Resembles a small iceberg lettuce, only much more heat resistant and easier to grow. Large, well-packed heart; bright glossy green outer leaves, thick, crisp, mild and juicy. Spring, summer and fall crop. Developed by the University of Hawaii. Anuenue means rainbow in Hawaiian. D33, F73D, G6, L7M, L77D, L94, M32M

Avondefiance: Medium to large, dark green heads; solid, tender hearts; semi-crisp texture. Highly resistant to mildew, making it useful for summer sowing (June through early August). Also highly resistant to root aphids, tipburn and bolting. Does well in warm climates. B49, N84, R32, S55, S61

Chou de Naples: (Couve de Napoles, Cavolo di Napoli, Neapolitan) Head large, depressed, sometimes almost flat, very pale whitish green; mature plant 12 to 14 inches in diameter. Outer leaves dark green, spreading on the ground, very much curled and undulated at the edges. Keeps the head exceptionally well. One of the original "iceberg" types, and still considered one of the finest heading lettuces in Europe. VILMORIN; Q11M, S17

Great Lakes: 80 days. A sure heading summer lettuce of the iceberg type. Medium large heads; solid even before they attain full size; dark-green fringed leaves, fold completely over the head. Widely adapted; cold hardy; resistant to tipburn and bolting. Fine for the home garden and excellent for shipping. All America Selections winner in 1944. A16, A25, E38, E53M, F82, G57M, K49M, K71, L10

Hanson: (Improved Hanson) 75 days. Very large, yellow-green heads; creamy white hearts; texture crisp and tender, flavor sweet. Relatively tolerant to heat and tipburn. Widely adapted to different growing regions. Unsuitable for overwintering or forcing. Introduced prior to 1885. A16, D1T, D12, E59Z, K49M, M95M

Iceberg: 85 days. Quite different from the shipping cultivar New York, which is commonly called Iceberg by produce shippers and green grocers. Large compact, crumpled heads, white inside, crisp and sweet; wavy, fringed light green leaves tinged with brown at the edges. Well-suited to home gardens and local markets; will not stand long distance shipping. A16, A25, B75, C85M, D12, G68, G71, G79, H21, H85M, K27M, N16

Imperial Winter: 90 days. Very hardy lettuce. One of the largest and best cultivars for sowing in the open in autumn. Very large hearts; medium green leaves of fine quality. Not recommended for spring or summer sowing, as it will bolt to seed. B49, C95, F73D, N84, R32

Ithaca: 75 days. Large, firm heads; well wrapped for good protection; attractive, dark-green, ruffled leaves. High yielding; dependable and uniform-heading. Resistant to heat, bolting, tip burn, and brown rib. Most widely grown lettuce in the Northeast and Mid Atlantic states. A1, B6, D76, E24, E38, E97, F13, F44, F63, G57M, G79, J97M, K73, L42, M29, etc.

Mini Green:<sup>2</sup> 75 days. Unusual, miniature Iceberg type. About half the size of Ithaca, or grapefruit-sized. Perfect for individual servings. Solid, very dark-green heads; small, creamy-yellow hearts. Good tolerance to bolting. Developed as a novelty for the bedding plant trade. Ideal for growing in containers on balcony or rooftop gardens. B75, C85M, C92, D65, G71, G83M, H57M, J97M, L42, M29, M49, 053M, R32, S55, S75M, etc.

Montello: 75 days. Iceberg type, widely used for shipping. Large, dark-green heads; crisp, bright green leaves. Highly tolerant to heat, splitting, tipburn, rib blight and corky root rot. Vigorous, widely adapted; does well in the North, South and West. Released by the Wisconsin Agricultural Experiment Station. A1, B6, D33, F85G, K73, M29

New York: (New York Iceberg, Wonderful) 80 days. Large, very dark-green heads; often weighing 3 to 4 pounds, nearly as solid as cabbage; crisp, tender, greenish-white hearts; of good quality. Forms good-sized heads even in hot weather. Introduced prior to 1888. C95, F92, G44M, G83M, G87, K49T, L13M, M46

New York #12: 75 days. Earlier, sure-heading strain of New York. Very large, solid globular heads, up to 12 inches in diameter, often weighing 3 pounds; crisp, yellow heart, buttery flavor; outer leaves medium-green, slightly curled at the edges and formed tightly around the head. Does well in well-drained soil, but is unsuitable for low lying muck lands. Popular with home and market gardeners. 7)72, E38, H95

Reine des Glaces: (Ice Queen, Regina dei Ghiaccia, Frisee de Beaugard) 62 days. An unusual crisphead type with very deeply cut, pointed, almost lacy leaves similar to the Cornet endives. Deep-green, crisp heads; small heart; slow bolting. Very attractive. For spring and summer sowings. Introduced prior to 1885. VILMORIN; B8, C53, D68, G68, K49T, N84, Q11M, 577, S55

Summertime: 65-70 days. High quality lettuce with unusually good heat tolerance. Medium-sized, light green heads; deep-green, coarsely frilled wrapper leaves, provide good protection from the sun. Very slow to become bitter, even when grown in mid-summer. Resistant to tipburn and rib discoloration. Good for home gardens. Developed by Dr. James Baggett at Oregon State University. A2, B6, B8M, B75, C53, D65, D68, E75{PL}, F13, G16, G71, G82, 139,191, J97M, K50, L89, M29, M49, etc.

Trocadero: (Trocadero Improved) Distinct, light green heads, tinged with red on the upper part; forms quickly and keeps its shape well; dull green leaves, margined with red. Very good for summer culture, but may be equally well grown in winter or spring. Well adapted for both field culture and the kitchen garden. Introduced prior to 1885. VILMORIN; Q11M, S77, S55

Valdor: 65 days. An excellent winter lettuce, larger and more compact than Imperial Winter. Attractive, solid-green heads; few outer leaves. Used mostly in greenhouses, but can be sown in the open for an early spring cutting. Very cold hardy; good resistance to grey mold. B49, F73D, N84, R32, S55, S61

Webb's Wonderful: 75 days. Large, solid crisp hearts, of excellent quality; outer leaves dark-green and well curled; distinctive flavor. Stands well in hot weather; recommended for southern gardens. Extremely popular home garden cultivar in Europe. B49, 7)72, E33, G53M, N84, 053M, PIG, R32, R47, S55, TIM

Winter Marvel: Large heads; clear pale-green, smooth, slightly wavy leaves; of fine quality and flavor. Very winter hardy, to 18° F. without protection. Can be sown in fall for an early spring harvest in many areas. Good for home and market gardens. An old European heirloom. A2, A66, C53, 7)72, 577

### Red/Brown

Cerise: 60 days. Medium green outer leaves, heavily overspread with warm, glossy red; typical mild, crisp, blanched interior leaves. Young, large-leaved plants can be harvested before or after heading for "red iceberg". Also excellent when harvested at the 4 week stage for adding to salad mixes. Good specialty market lettuce. G6

Continuity: 70 days. Extra early crisphead type. Compact, solid, crisp hearts; thick dark-green outside leaves, distinctly tinged with reddish-brown; of excellent flavor; very long standing. Suitable only for spring and summer sowing. Does well on dry, light soils. B49, D68, 139, K10, K49T, L13M, L89, L94, N84, R32

Rosa: 75 days. Distinctive and colorful Iceberg type. Medium-sized, firm heads, 6 inches in diameter; attractive red in color where exposed to the sun; crisp and sweet. Resistant to tipburn. For home gardens and local markets. Developed by Peters Seed & Research. J9M

Rosy: 60-75 days. A small iceberg type, similar in form to Ithaca, but with attractive red to burgundy coloring. Tolerant of adverse conditions and slow to bolt. Highly recommended for market gardens. C53

**ROMAINE** Also known as *cos lettuce*, this type has long, broad, upright leaves that form heads. The leaves are tender and green on the upper portions, and thick, crisp, and juicy near the base. They take longer to mature than other types, but stand hot and dry conditions well without going to seed. Prized for their distinctive flavor, especially in a *Caesar salad*.

### Green/Yellow

Balloon: (Ballon) Large, very vigorous plant; large, broad, roundish head, slightly flattened at the top, full and firm; outer leaves not as crimped as Paris White Cos, but greener and more rounded at the ends. Seldom runs to seed. Hardier than Paris White Cos; very suitable for autumn sowing. Introduced prior to 1885. VILMORIN; B49, C53, F73D, Q11M, 577, S55

Craquante d'Avignon: (Craquerelle du Midi) An open hearted, semi-romaine type that is especially suited to warm climates, the firm heads being harvested into early June in Florida. Deep green leaves; crisp and crunchy. Resistant to cold and also slow to bolt, making it an ideal choice for the home gardener. Can be planted January through August. C53, C95, K49T

Little Gem:<sup>2</sup> (Sugar Cos) 70 days. Intermediate in shape between a cos and a heading lettuce. Small to medium-sized, erect plant; very dark green outer leaves. Forms a very compact creamy-yellow heart, with no waste. Brittle, crisp, very sweet, superb flavor. For spring and summer sowing. Also good for forcing. B49, E24, G57M, J9M, K49Z, K66, L13M, L89, L91M, R32, S55

Lobjot's Green Cos: 65 days. Large, compact, firm hearts, closely self-folded. Tall, upright outer leaves, to 12 inches, dark-green in color. Crisp and sweet, of excellent quality. Very bolt resistant. Can be sown for successional sowing throughout the summer, or in mild climates, in the autumn for early spring cutting. B49, G44M, L13M, N84, R32, S55, S61, S75M

Paris Green Cos: 66 days. Compact, elongated head, pointed or slightly blunt; outer leaves erect, comparatively narrow, dark green; midribs very white; sweet and crisp. Blanches well without having to be tied. For spring, summer or autumn sowing; also good for forcing. Introduced prior to 1865. BURR, VILMORIN; J73

Paris White Cos: (Blonde Maraichere) 70 days. Long, cylindrical head; outer leaves large and luxuriant, of a light-green color, slightly crinkled; inner leaves very pale-green, always folded, midrib white and very prominent. Less hardy and a few days later than Paris Green Cos. Very widely adapted. Introduced prior to 1865. BURR, VILMORIN; B75, C85M, 7)72, E5T, E97, F24M, F92, G57M, H85M, K49M, M95M, Q34

Parris Island Cos: Very uniform, tall, cylindrical plants; thick, slightly crinkled, dark grayish-green outer leaves; pale green to creamy white hearts. Heads exceptionally well. Medium slow bolting. Mosaic tolerant. Developed for coastal regions of the Southeast, but widely adapted and used for shipping, local markets and home gardens. A16, A75, B75, C44, E24, F82, G57M, H33M, H61, K23{PL}, K73, M46, M49, N16

Romance: 50 days. Large uniform heads, up to 1 pound each. Upright, very smooth dark-green leaves, pale blonde at the center; crisp, sweet, tender. Fast growing. Slow to bolt. Resistant to mosaic virus and mildew. Award of Merit winner, Royal Horticultural Society, 1982. E24, K66

St. Blaise:<sup>1</sup> A special Romaine type, adapted to early spring planting under row covers. Also does well in outdoor plantings right through the summer. Small, upright, light bright-green heads with few outer leaves Very heat tolerant. Ideal for intensive gardens. Potential specialty market item. C53, L77D, M27

Sucriner: Semi-romaine type with a more or less upright growth habit. Slightly loose head; thick, medium-length green leaves. Crisp, sweet, of excellent flavor. Resistant to cold; sow in fall and winter. Very popular among European home gardeners and market growers and has found ready acceptance in many California specialty restaurants. Often used for *mesclun*. ANDREWS, C. 1996; B49, C44, G68,177, J20, K23{PL}, K49T, L94, N84, PIG, P59M, R47

Valmaine: (Valmaine Savoy) 70 days. Large self-folding type for spring and summer use. Slightly taller and more open-headed than Parris Island Cos and able to stand more adverse weather. Mildly crinkled, dark green leaves, 10 to 12 inches long, of very good flavor. Resistant to downy mildew. Heat tolerant. B49, B75M, C20M, F63, K49M, K73, L3J, L89, M46, R32, S55, S75M

Vaux's Self Folding: The first self-folding cos lettuce. Compact, erect growth habit; self-folding medium-sized, firm heart. Broad, dark-green outer leaves protect the heart. Very popular with market growers for spring and autumn sowing. Introduced around 1873. J39, R32

Verte Maraicheie: (Verte Mar) 50 days Very early French romaine. Has already become a standard for producers of *mesclun*. Tall, upright, tight heads; smooth, vibrant dark-green leaves; crisp, very sweet, flavor excellent. Can be harvested at baby size or after full maturity. Widely adapted. Recommended for commercial or specialty markets. Developed by Vilmorin. E24, E63D, I18M, 177, J20, N16, S95M

Winter Density: 65 days. Distinct type, somewhat intermediate in form between a cos and a heading lettuce. Produces large, compact, very solid hearts; outer leaves very dark-green. Crisp, sweet, of excellent flavor. Slow to bolt and also tolerates light frost. Widely used for autumn sowing. A2, B49, C53, D12, D68, E75{PL}, G6, K49M, L7M, L89, L94, O53M, R32, S75M

#### Red/Brown

Brown Golding: 70 days. Medium-sized heads; small, red tinged leaves. Very sweet and crunchy. Develops best color in cooler weather. In a test conducted by the Henry Doubleday Research Association it was found to contain 3 times the vitamin C of typical summer lettuces. C95, F73D, G44M, L3J, L13M, N84

Cimarron: 60 days. Unique bronze-red romaine. Tall, elongated leaves, about 10 inches high; deeply colored and heavily shaded; crisp, juicy and flavorful; creamy-yellow hearts Very resistant to bolting, can be harvested over an extended period. Recommended for home gardens and local markets. Reportedly dates back to the 18th Century. C44, C85M, D12, E5T, E24, F44, G13M, G57M, 139,177, J20, K10, K57{PL}, M32, N24M, etc.

Freckles: (Trout Back) Very attractive, lime-green, oblong leaves flecked with delicate, wine-red markings Tender and delicious. Ideal for adding to cut-and-come-again salad mixes. Best harvested when 4 to 6 inches tall. A specialty item that is often served at some of the best restaurants in the country. C53, E75{PL}, F13, 177, K49M, K57{PL}, L77D, Q34, S75M

Majestic Red: 60 days. Compact, very erect plant; medium-sized, tall cylindrical head; distinct, medium dark red color; crisp and sweet with excellent flavor. Adds a unique color to salads. For home gardens and fresh market; also ships well. Shows good resistance to heat and drought. Developed by Sunseeds. D68,177, J9M, L89

Red Leprechaun:<sup>2</sup> (Little Leprechaun) Savoy red romaine type, resembling Little Gem. Slightly larger, growing 8 to 12 inches tall, with mature heads that may weigh one pound or more; blanched hearts cream colored, overspread with pale pink. Succulent, puckered leaves, burgundy colored on exposed surfaces. Should be harvested at the three-quarter pound stage. F73D, L13M, L89, R32, S55

Rosalita: 62 days. Medium-large, upright plants; heads average 14 to 16 ounces in weight with a semi-firm heart of creamy yellow

leaves. Outer leaves an attractive burgundy color, fading to an emerald green at the base, crisp, sweet and juicy. Not tolerant of hot weather, recommended for spring or fall culture only. Resistant to frost and tipburn. Widely adapted. Developed by Rob Johnston Jr. C53, G6, G93M, I18M, 177, J39, K57{PL}, Q34, S55

Rouge d'Hiver: (Red Winter) Young plant deeply tinged with brownish-red; head tall, long, entirely green, with the exception of a brownish-red tinge on the top; outer leaves long, round, deeply colored with reddish brown. Heads well without being tied. Hardy; productive; remarkably slow in running to seed. Introduced prior to 1885. VILMORIN; A2, A66, B75, C53, D68, E63D, 177,199M, K46T, K49M, K49T, K66, N7G, 089

Ruben's Dwarf: (Ruben's Red) 58 days. Semi-dwarf type Very full, 12-inch heads of open upright leaves. Outer leaves an attractive and unusual deep clear cranberry-red that contrasts with the lime-green hearts. Crisp, juicy, full sweet flavor. Colors are most intense in cool spring and fall weather. A2, D11M, F70, 177, K17M, K23{PL}, K49T, K66, L94

#### LOOSELEAF LETTUCE

#### GREEN/YELLOW

Biondo a Foglie Lisce:<sup>3</sup> 25 days. Quick growing cutting lettuce. Smooth, tender leaves. Broadcast the seed thinly and cut when 2 inches high, or about a month after seeding. Can be cut several times over a long season. B8, C53, Q11M, S17, S55

Black Seeded Simpson: 45 days. Large, upright plant; broad, crumpled, light green leaves, slightly frilled at the margins. Very tolerant of hot weather. Produces a high quality crop under a wide range of conditions. Longtime home garden and local market favorite. Introduced prior to 1888. B73M, B75M, B78, C44, C53, E24, E59Z, G6, G16, H61, K23{PL}, L7M, M49, M46

Catalogna:<sup>3</sup> (Radichetta) An Italian cut-and-come-again lettuce adapted to growing in all seasons. Elongated, deeply lobed brighter green leaves; lighter green, tender, crunchy ribs. Should be planted closely and cut when about 2 or 3 inches tall. Will regrow very quickly for continuous harvests. Very hardy and rustic. B49, Q11M, R32, S17, S55

Deer Tongue: (Matchless) 55 days. Loose, upright, medium-sized heads; light-green leaves, distinctively pointed; creamy heart; tender, sweet, of very good quality and flavor. Heat resistant; slow to bolt. Sow in spring through early summer. An old heirloom cultivar that is excellent for home gardens. A2, B6, C53, D68, E24, E59Z, F24D, F24G, G6,139, J97M, K23, K23{PL}, K66, L7M, etc.

Early Curled Simpson: (Early Curled Silesian, Silica Curled) A very old cultivar that is still popular. Large, pale yellowish-green leaves, very much undulated at the margins, curled and ruffled; crisp, sweet and flavorful. Produces a cluster of leaves in the center. White seed. Slow to bolt in hot weather. Introduced prior to 1885. VILMORIN; D12, D76, F24M, G57M, G71, H33M

Feuille de Chene:<sup>3</sup> (Curly Oakleaf, Ricciolina di Quercia) Used almost exclusively as a cutting lettuce. Light green, deeply indented and curled leaves; mild and tender. Easy to grow and harvest; cut entire plant when about 2 inches high, leave to resprout. Slow bolting and heat resistant; sow in succession from early spring into autumn. Will form a loose head at maturity if thinned. C53, P59M, S17

Grand Rapids: 50 days. Large, upright, compact plants form an attractive cluster of broad, fringed and curled light-green leaves. Of high quality; crisp, tender, sweet, flavorful. Resistant to bolting and rot. Very popular for greenhouse forcing and early outdoor culture. A16, C85M, D11M, E38, FI, F70, G16, G57M, H33M, H42,164, 184, J97M, K49M, K71, etc.

Green Ice: (Burpee's Green Ice) 45 days. A fast maturing cultivar that produces large thick bunches of dark glossy green leaves,

heavily blistered with wavy, fringed leaf margins Very crisp texture, tender and mild, of excellent quality. Exceptionally uniform. One of the slowest cultivars to bolt, so it can be used longer. A25, B6, B75, C44, D11M, D68, F70, G16, G57M, G71, G87, H33M, H42,191, L79, etc.

Lingue de Canarino: Pale green leaves resemble round oak leaves and form a tight bunch. Very mild and flavorful in the spring; retains its high quality right through the summer; very resistant to bolting. Attractive shape and color. Italian name means canary tongues or canary-colored tongues, which suggests the shape and color. U63

Lollo Bionda:<sup>3</sup> (Lollo Green) A popular cutting lettuce; vigorous enough to resprout from a cut stem without loss of leaf quality. Bright yellow-green, very ruffled leaves. Cut leaf by leaf rather than using entire head. Decorative as well as useful. Sow in spring or fall. B8M, C20M, C53, L91M, N84, 089, PIG, Q34, R32, S55, S75M, TIM

Oakleaf: 45 days. Forms a compact rosette of thin, tender, light green oakleaf-shaped leaves. Excellent quality; does not become bitter with age. Stands heat well and resists bolting. Popular old-fashioned lettuce that has been rediscovered as a gourmet specialty. A25, B73M, B78, D11M, D26D, D82, E63D, F70, F80, G57M, G71, G79, K23, K23{PL}, K27M, K73, etc.

Royal Oak Leaf: Improved, high quality Oakleaf type with a much more uniform and clearly defined oakleaf shape. Also more heat tolerant and with darker green leaves. Large, deep green rosettes with thick, succulent midribs; tender, sweet and flavorful, non-bitter even in hot weather. Resistant to rib discoloration. B75, C53, C85M, D27, D68, G16, I18M, 177,191, K17M, K50, K66, 089, PIG, Q34

Salad Bowl: 50 days. Large, attractive rosette. Long, medium-green, deeply notched and curled leaves; crisp, tender, sweet. Very slow to bolt; resists heat and tipburn well. High quality home garden cultivar, sometimes used for roadside stands and local markets. All America Selections winner for 1952. A16, A25, B49, B78, C44, C53, D82, E38, E59Z, G6, G16, G93M, H85M, K27M, L89, etc.

Simpson Elite: 48 days. Improved, very slow bolting Grand Rapids type. Attractive, medium light-green leaves, broad and crumpled with curled outer leaf margins. Crisp and juicy; delicate, sweet flavor. Quick growing yet able to be harvested over a long season. Not derived from Black Seeded Simpson. Developed by Peto Seeds. A25, B6, B75, C92, D65, D68, G6, G16, G71,139, 191, J20, J97M, K71, L89, L91M, M29, M46, M49, etc.

Slobolt: (Harris' Slobolt) 48 days. Similar to Grand Rapids in appearance, but holds 2 to 3 weeks longer without bolting. Light-green, crumpled and frilled leaves; crisp, mild sweet flavor. Remains dwarf and compact even in hot weather; keeps its high quality over a long period. For greenhouse growing as well as outdoors. D11M, D68, F13, F70, H61, J84, K10, K73, L7M, L42, L89

Tango: 45 days. Uniform, attractive plants form tight, erect rosettes. Deeply cut and curled leaves; resemble endive in appearance; darker green than most cultivars; tender, tangy, vitamin rich. Cut young during warm weather as it is not very heat tolerant and will run to seed. C20M, C53, F63, H73{PR}, 139,177, K50, L7M, Q34

Waldmann's: (Waldmann's Dark Green) 50 days. Popular, high quality Grand Rapids selection. Larger, slightly heavier leaves and darker green color. Attractive, finely fringed, ruffled leaves. Vigorous, uniform, productive plants; widely adapted. Recommended for home gardens and local markets. A1, A2, DIT, D68, E24, F63, G13M, G93M, H61, J20, K10, K50, K73, L13M, L42, M29, etc.

#### RED/BROWN

Biscia Rossa:<sup>3</sup> Very attractive, smooth-leaved, red tinged cutting lettuce from Italy. Will give several cuttings when grown as a cut-and-come-again crop, or may be allowed to reach maturity. B8, G53M, Q11M, 577, S55

Bronze Arrow: (Bronze Arrowhead) Very attractive California heirloom. Large, oakleaf-shaped leaves tipped with reddish-brown. Mild flavor. Long-standing—will stay fresh and flavorful at marketable size for about 3 weeks in hot weather without going to seed. Can be sown year-round in mild climates, with September sowings lasting into May. B49, F73D, K49T

Brunia: 75 days. Large, attractive oakleaf type. Heavy, upright heads; distinctive, deeply-lobed leaves with wide midribs; dark green, tinged with reddish-bronze at the tips and edges; crisp and sweet. Develops its best color in cooler weather. Slow to bolt and tolerant of mosaic. Highly recommended for gourmet and specialty markets. C53, C92, D68, E63D, E91G, F13, G16, H61,139,191, J9M, K10, K49M, K49Z, K57{PL}, K73, L42, L89, etc.

Chadwick's Rodan: 58 days. A European heritage cultivar selected by Alan Chadwick. Medium-sized leaf lettuce that forms a loose head. Upright, paddle-shaped leaves tinged with bronze. Heat resistant. Attractive as well as flavorful. Heads produce very little seed. B49, F73D, K17M, L94

Cocarde: 46 days. A "giant red Oakleaf" type. Large, heavy, upright heads; delicate, lobed, dark-green leaves with a rusty red overlay; large pale yellow-blanching heart. Excellent flavor. Sow in spring, summer or fall. An unusual heirloom French lettuce of very good quality. G6, K23, K23{PL}, L94, Q11M, R32, S55, S75M

Grandpa Admire's: 60 days. Large, loose heads, tinged with bronze; fine, mild flavor. Slow to bolt, and stays tender longer than most others, even in extreme heat. Favorite of the Seed Savers Exchange. Given to them in 1977 by Cloe Lowrey, granddaughter of Grandpa Admire; a Civil War veteran born in 1822. E5T, F73D, K47, K49M

Lollo Rossa:<sup>3</sup> (Lollo Red) 52 days. Very attractive red strain of Lollo Bionda; especially well suited to garnishing. Small, circular rosette formed of heavily-frilled, medium green leaves tipped with a strong, warm red. Mild flavor. Very heat tolerant. Used as a cut-and-come-again lettuce, or left to head up for a single serving. For spring or fall sowings. B8M, C53, D68, E5T, F13, G6, H73{PR}, 177, J97M, K23, K23{PL}, K49M, K73, M46, 053M, Q11M, Q34, R32, S55, etc.

Mascara: 65 days Very uniform, dark purple-red oakleaf type. Retains its red color during the hottest part of summer when others tend to fade. Forms rosettes of thick, curly leaves. Mild, non-bitter flavor. Very bolt resistant. Tolerant of poor soil, neglect and unfavorable growing conditions. Excellent for mesclun. Developed in Holland. F80, L89, N7G, Q52

New Red Fire: 50-55 days. Attractive, red-leaved Grand Rapids type. Medium-large, heavy, very uniform heads; ruffled, heavily tinged leaves with wavy margins, excellent deep red color; sweet, mild flavor. Slow to bolt and widely adapted. Recommended for home gardens and specialty markets. A1, A2, D68, E24, F13, F63, G6, G82, G93M, H61, J20, K50, K57{PL}, K73, L42, L89, L91M, M29, etc.

Prizehead: 50 days. Large, upright plant; broad, crumpled, slightly frilled leaves; outer leaves moderately tinged with reddish brown, inner leaves medium green; attractive. Crisp, sweet and tender. Medium slow bolting. Resistant to mosaic virus Very popular home garden and local market cultivar. A16, D26D, D82, FI, F92, G16, G57M, H85M, H95,184, K23{PL}, K27M, M46

Red Deer Tongue: 48 days. Red-leaved strain of a popular heirloom variety. Medium-sized rosettes with distinctive, pointed leaves and thick midribs; tender and juicy; excellent, rich yet mild flavor Slow to bolt and cold resistant. Selected by an amateur seed saver in Washington state. A2, D68, E24, F73D, K17M, K49T, L7M, L13M

Red Fire: 45 days. Large, intense red leaves; crinkled and frilled at the edges, crisp and tender. Very uniform and productive. Easy to

grow; withstands heat as well as cold. Very decorative. Popular with market growers. K10, M46, N52, Q34, R32

**Red Oak Leaf:** 50 days. Deeply indented leaves, green shaded with hues of burgundy, maroon, crimson or cranberry, depending on climate and conditions. Deepest red colors are obtained when grown in full sun. Sweet and delicate in texture. Resistant to heat and bolting; also grows well in cool weather. Popular with market growers who serve the gourmet restaurant trade. Selected from Red Salad Bowl. C20M, D11M, F70,177,199M, K66, R47

**Red Sails:** 45 days. Attractive, compact, fringed heads have a bright green background heavily overlaid with deep burgundy red. Mild, non-bitter flavor. Slow bolting. Has 6 times more vitamin A and 3 times more vitamin C than other lettuces. Deep red color intensifies as the lettuce matures. All America Selections winner in 1985. A25, B75M, C53, D11M, F70, G6, G16, G57M, G93M, H95,164, K10, L7M, L89

**Red Salad Bowl:** 46 days. A wine red strain of Salad Bowl. Radiant burgundy red, deeply lobed leaves form a full rosette; leaf shape resembles Oak Leaf lettuce. Mild, non-bitter flavor. Slow to bolt; holds its quality for a long time. Color is most spectacular during cool weather but grows well in spring, summer and fall. B75, B78, C53, E24, F44, G6, G57M, H49, H85M, J20, K27M, K71, K73, M49, R32, S55, etc.

**Redina:** 45-55 days. Intensely red Grand Rapids type Very attractive and flavorful. Deeply curled, open, leafy rosettes; deep burgundy with speckled green throats; crisp, non-brittle ribs. Stays upright and open for an appealing fresh look. Suitable for spring and fall plantings. Slower growing and lighter in weight than others in its class. G6,177, J20, K66, N24M, N81

**Rossa d'Amerique:**<sup>3</sup> Pale green leaves tipped with a sparkling rose-red. Primarily used as a cutting lettuce when 4 to 6 inches tall, but will form a loose head if thinned. Imported from Italy, where this type of lettuce is known as lattughino da taglio. C53, K17M, L77D, P59M, Q11M

**Rossa di Trento:**<sup>3</sup> A broad, crinkled, red-tipped cutting lettuce imported from Milan, Italy. Can be grown nearly year round in mild climates. This type of lettuce is called lattughino da taglio in Italy. Will form a large, round, open but tightly bunched head if left to mature. C53, Q11M, S17, S55

**Ruby:** Bright green, heavily crinkled and frilled leaves, prominently shaded with intense red. Crisp, sweet, succulent. Heat resistant; will stand for a long period of time without bolting to seed. Very decorative. All America Selections winner in 1958. A16, C44, C85M, E38, F80, G13M, G68, G71, G82, H85M, 164,167M, J20, L42, N16, etc.

**Valeria:**<sup>3</sup> Improved, very attractive Lollo Rossa type. More cold tolerant and with more intense red coloration. Thick, wide, heavy leaves; extremely frilly, finely cut margins; intensely red on exposed portions; yellow-white hearts. Very popular with mesclun growers, regrowing nicely for repeated harvests. Also suitable for growing in a winter greenhouse. C53, F80, L77D, N7G, Q52

**Winter Sun:** 60 days. Remarkable red lettuce that does well in winter, a time of year when other red types normally cannot photosynthesize efficiently enough to grow well. Attractive red and green heads with a fine flavor. Easy to grow. Cold haidv. Grows well in unheated greenhouses at temperatures as low as 20° F. Developed by Bountiful Gardens. B49

### PHASEOLUS LUNATUS

#### BUSH LIMA BEANS

**Baby Fordhook:** 70 days. Earliest of all the Fordhook types. Slightly curved pods, 2 3/4 to 3 inches long, filled with 3 to 4 seeds. Small, plump bright-green seeds with excellent flavor. Very good for canning or freezing. Grows about 16 inches tall. Resistant to downy mildew. Heirloom. E5T, G13M, G57M, K71

**Burpee Improved:** (Burpee's Improved Bush) 75 days. Medium dark green pods, long, broad and moderately thick; 3 to 5 1/2 inches long, produced in clusters; 4 to 5 seeds per pod; seeds large, fairly plump; seed color pale creamy white. Medium to large, erect plant. Introduced in 1907. HEDRICK 1931; A25, A75, B6, B75, B75M, D65, G16, G71, H49, H85M, J97M, K10, K27M, K71, M46, etc.

**Dixie Speckled Butterpea:**<sup>1</sup> 76 days. Slightly curved, oval pods, 3 to 3 1/2 inches long; 3 to 4 seeds per pod; seed small, nearly round; seed color red, speckled with dark carmine. Similar to Dixie White Butterpea except for seed color, and more productive under hot, dry conditions. Good for home and market gardens, either fresh or when dried. A75, E5T, G1M, G57M, G71, H73{DF}, 164,191, K10, K49M, K71, M46, N16

**Dixie White Butterpea:** 70-75 days. Pods medium-sized, broad, oval, 3 1/2 inches long; seeds small, pea-shaped; seed color white; quality very good, tender, has a rich meaty flavor. Strong, vigorous plant; productive; produces well under hot weather conditions. Recommended for home and market gardens. A75, D26D, E5T, G1M, G27M, G57M, 164,191, K10, K71, L10, M46, M95M

**Early Giant:** 65 days. Large pods, 5 to 6 inches long; 4 to 5 flat, oval seeds per pod; quality very good, tender, rich and butter-flavored; a good freezer. Rugged, upright plant; height about 18 inches; will bear from July until frost. K71

**Eastland:** 75 days. Medium-sized pods, 3 to 4 inches long; 3 small, semi-flat seeds per pod; seed color greenish-white; quality excellent. Strong upright plants have excellent yield potential. Resistant to downy mildew races A, B, C and D. Does well in short season areas, the seeds having good tolerance to cold soil. F13,191, L10, L42, L91M

**Excel:** Fordhook 242 type that has not failed to produce a crop in New Hampshire for 30 years. Broad flat pods, each containing 3 to 4 large, plump greenish-white seeds. Large, spreading plant, about 20 to 24 inches tall. Highly recommended for northern regions. Does not set pods well under high heat. Developed by Professor Elwyn Meader. C95, L7M, N84

**Fordhook:** 75 days. Broad, plump pods, 3 to 4 1/2 inches long, produced in clusters; 3 to 4 large, plump seeds per pod, packed closely together for easy shelling; seed color pale creamy white with a tinge of green; quality excellent, tender and buttery. Decidedly upright, erect plant; productive. Introduced in 1907. HEDRICK 1931; A90M{DF}, B75, C20M, C44, C85M, I67M, K71, M46, M95M

**Fordhook 242:** 75 days. Uniformly curved pods, 3 to 4 inches long; 3 to 4 thick, plump seeds per pod; seed color greenish tinged with cream. Higher yielding, more heat tolerant and easier to shell than regular Fordhook. All America Selections winner in 1945. A75, B6, B73M, B75M, E38, G16, G27M, G71, G79, H61, H85M, 164, K73, M46, N16, etc.

**Geneva:** 85 days. A baby bush lima with cool soil tolerance; germinates in soil 10° cooler than limas usually require, adding about 2 weeks to the growing season. The fresh, shelled beans are

light green, flavorful and good for freezing. Also good as a dry bean. K17M

Henderson: 60 to 70 days. Pods dark green; short, broad and slender, 3 to 3 1/2 inches long; 3 to 4 small seeds per pod; seed color pale creamy white; quality good to excellent. Small plant, 12 inches or less; very early; productive over a long period. Introduced about 1883. HEDRICK 1931; A25, A75, B6, B73M, G57M, G79, H33M, H61, I64, LIO, M46, N16, N84

Hopi Beige:<sup>1</sup> (Hopi Gray, Hopi Tan) 110 days. Beige or tan seeds, mottled with black variations. Good dried or shelled fresh. Medium-sized bushy plant. Adapted to southwestern dryland culture with intermittent summer rains. Shows good resistance to Mexican bean beetle. Sometimes sprouted and used in ceremonies. C95, L3J, N84

Hopi Yellow:<sup>1</sup> (Hopi Orange) Beautiful yellow-orange and black mottled bean. Good dried or shelled fresh. During spring ceremonies, seeds are sprouted, attached to kachina dolls, rattles and bows and given to children. The sprouts are then chopped, boiled and cooked in soup for feasting. Medium bush, 3 feet tall. Adapted to southwestern dryland culture. 116, N84

Jackson Wonder:<sup>1 2</sup> (Calico) 65 days. Pods dark-green, broad and slender, 3 inches long; 3 to 4 small seeds per pod; seed color light buff, mottled purplish-black. Upright, spreading plant, 12 to 18 inches tall. Resembles Henderson, but more heat and drought tolerant. Very young pods may be used as a snap bean. Popular in the South for home and market gardens. Introduced in 1888. HEDRICK 1931; A90M{DF}, E97, G93M, H73{DF}, 191, J11M{DF}, K10, K71, K73, L7M, M46, M95M, N16, N40{DF}

Nemagreen: 68 days. A good quality home garden and fresh local market lima with very good resistance to nematodes. Medium-sized pods, 3 inches long; small, flat, pale-green seeds. Good when cooked, frozen or dried. G1M

Red Calico:<sup>1</sup> Beautiful family heirloom from South Carolina. Medium-small seeds, bright dark-red splashed with black streaks and speckles, very attractive. Plants are drought and heat resistant. Probably a sport of the Red Calico pole lima. F73D

Thorogreen: (Early Thorogreen, Allgreen, Cangreen, Green-Seeded Henderson) 65 days. Pods are 3 inches long and are set high off the ground for easy picking; 3 to 4 small, bright-green seeds per pod. Excellent for canning and freezing. Vigorous, upright plant, to 18 inches tall; bears continuously till frost. Similar to Henderson except seeds are greener. A75, B6, D65, D76, E97, G16, G71, H54, I39, K71, K73, LIO, M46, M95M, N16

Wood's Prolific: 65 days. Broad, slender pods, 3 1/2 to 4 inches long and containing 3 to 4 seeds. Small to medium-sized, pale creamy white seeds of good quality. Bears until frost. Introduced in 1899 by T.W. Wood, originator of the Henderson lima. Similar to Henderson, but with larger pods and seeds, along with increased vigor and quality. HEDRICK 1931; G1M, L10, M95M

#### POLE LIMA BEANS

Black: 80 days. Small to medium-sized beans are dark-violet at green shell stage, black when dry; 4 to 6 beans per pod; easy to shell; flavor very good. Very tall plant; prolific, produces until frost; drought resistant. F73D

Burpee's Best: 92 days. Large, straight pods, 4 to 4 3/4 inches long; 3 to 5 large, plump, tender "potato" type seeds per pod. Excellent fresh or frozen. Strong climber may grow 10 to 12 feet tall. Combines the best features of Fordhook bush, with higher yields. B75, H54

Christmas:<sup>1</sup> (Large Speckled Calico, Chestnut) 85-90 days. Broad, flat pods, 5 to 6 inches long; 3 very large, very flat seeds per pod; seed color buff with deep crimson blotches. Unique chestnut-like flavor. Swells in size and retains its colorful markings even after soaking and cooking. Excellent fresh, canned or frozen. Grows 7 to 9 feet tall; yields heavily. Popular with specialty markets. MAYES;

A75, A90M{DF}, D76, F86T{DF}, G93M, 139,191, J11M{DF}, J84, K18M{DF}, K49M, K71, L7M, M46, N16, etc.

Dr. Martin: 90 days. Produces very large seeds, with an average weight of 2.3 grams; 3 to 4 seeds per pod; quality and flavor very good to excellent. Vigorous plant, 15 to 20 feet tall; very productive-average yield 19.5 pounds of shelled beans per 25-foot row. Developed by Dr. Harold E. Martin of Philadelphia. WEAVER 1997; D71, F24G, J97M

Florida Butter:<sup>1</sup> (Florida Speckled Butter) 90 days. Medium dark-green pods, fairly broad and quite slender, 3 inches long; 3 small seeds per pod; seed color light buff, blotched and irregularly spotted with reddish-brown. Vigorous plant, 5 to 8 feet tall; a large yielder over a comparatively long bearing season. Most suitable for the southern states. HEDRICK 1931; A75, A90M{DF}, F73D, G27M, G93M, I64, J11M{DF}, K27M, K71, L10, M46

Gigantes: {DF} Extremely large, thick, oblong, whitish seeds. Commonly baked in a spicy tomato sauce, a typical Greek dish served as a main course during Lent and as an appetizer year-round. In northern Greece, they are more often flavored with dill and garlic sauce. Widely available in Greek and Mediterranean markets. KREMEZI1993 [Re]; A7M, A90M, J11M

Illinois Giant: 86 days. Hybrid of Christmas and Dr. Martin. Large, very attractive seeds, lime-green speckled and splashed with maroon-red. Very easy to shell by hand. Combines the drought and heat resistance of Christmas with the large seed size and heavy yields of Dr. Martin. Developed by Merlyn and Mary Ann Niedens. L7M

King of the Garden: 88 days. Medium green pods, broad, quite slender, 6 inches long; 4 to 6 seeds per pod; seeds large, flat; seed color cream-white to very pale green; quality excellent. Vigorous plant, grows 8 to 10 feet tall; heavily productive over a moderately long season. Introduced by Frank S. Platt in 1883. HEDRICK 1931; A75, C44, D11M, F13, F70, G16, G27M, G71, G82, H85M, I64, I91, K71, L7M, M46, M95M, etc.

Prizetaker: 90 days. Pods 6 inches or more long, 1 1/2 inches wide, borne in clusters; easy to harvest; 3 to 5 very large seeds per pod. Quality and flavor excellent both fresh and frozen. Good for home or market gardens. Also recommended for exhibiting at county fairs. B75, M95M

Sieva: (Carolina) 78 days. Small, slightly curved pods, 3 to 3 1/2 inches long; 3 to 4 small, flat, smooth seeds per pod; seed color medium green when shelled, dull white when dried. Vines productive; reliable; precocious. Excellent for home and market gardens, either fresh, shelled or dried. A75, B73M, D26D, D76, G27M, G57M, H54, I64, J20, K5M, K71, M46, M95M, N16

Willow-Leaved: (Willow Leaf) 65 days. Ornamental plant with dark glossy green leaves and long, narrow, willow-like leaflets. Pods very dark green, short, 3 inches long; 3 or 4 seeds per pod; seed color chalky white; quality fair to good, best when grown in southern states. Introduced in 1891. HEDRICK 1931; F73D, G1M, K71, L4, L7M, M46

Worcester Indian Red Pole: (Red Sabas) Medium-sized, dull red to dull maroon-red seeds. Heat and drought resistant, yielding prolific crops under adverse conditions. Will occasionally produce pods that shatter when completely dry. Introduced in 1570 from South America by Spanish or Portuguese coastal traders, between Florida and the Chesapeake. Preserved by the Nanticoke Indians of Eastern Shore, Maryland. F24D, L7M

#### TROPICAL LIMA BEANS

Also known as *Madagascar beans*, these unselected, viney type limas are well adapted to the lowland tropics, especially the highly leached, infertile soils of the more humid regions. Some little-known cultivars have given extraordinarily high yields in tropical rainforest regions. NATIONAL RESEARCH COUNCIL 1979; PIG

## CODES FOR SPECIAL TYPES

1. Mottled
2. Edible-Podded

---

**LOQUAT {GR}**

---

**ERIOBOTRYA JAPONICA**

---

**WHITE-FLESHED**

Advance: Medium to large, pear-shaped to elliptic-round fruit; deep yellow in color; borne in large, compact clusters. Skin downy, thick and tough; flesh whitish, translucent, melting and very juicy; flavor subacid, very pleasant; quality good; ripens in midseason. Seeds commonly 4 or 5, the seed cavity not large. Tree a natural dwarf; height 5 feet; highly resistant to pear blight. Self-infertile, pollinate with Gold Nugget; a good pollinator for other cultivars. MORTON 1987a, POPENOE, W. 1920; G49,174,183M

Benlehr: Fruit oval to oblong; size medium, 1 1/2 to 1 3/4 inches long; skin thin, peels very well; flesh white and juicy, flavor sweet; quality excellent. Seeds 3 or 4. Originated as a seedling on the property of Reverend Charles E. Benlehr of Encinitas, California and is the best of the great many seedlings he grew beginning in 1941. U7D{SC}

Champagne: Fruit medium to large, oval to pyriform; fruit cluster large, loose. Surface deep yellow in color with a grayish bloom; skin thick, tough, somewhat astringent; flesh whitish, translucent, melting and very juicy; flavor mildly subacid, sprightly and pleasant; quality very good. Ripens late. Seeds 3 or 4, the seed cavity not large. Perishable; good for preserving. Tree self-infertile, prolific. MORTON 1987a; G49,174,183M, J61M, Q93

Premier: Large, oval to oblong-pyriform fruits; skin downy, medium thick, tough, yellowish-orange to salmon-orange with large white dots; flesh whitish, juicy, melting; flavor agreeably subacid; 4 or 5 seeds per fruit. Ripens late, does keep or ship well. Recommended for backyard orchards. Originated in Orange, California by C.P. Taft, in 1899. MORTON 1987a; I53M

Yista White: Small to medium-sized, roundish fruit with blunt calyx end; skin light yellow; flesh pure white, very high in sugar content; ripens 1 to 3 weeks later than Gold Nugget. Excellent for dessert. Originated in Vista, California. D57

---

**YELLOW/ORANGE-FLESHED**

Bessell Brown: Large to very large fruit with a correspondingly large seed. Thick, orange skin, resistant to bruising; firm, solid orange flesh, very sweet. Ripens very late in the season. Originated in Victoria, Australia. Considered a potential commercial fruit in northern New South Wales. GLOWINSKY; Q93

Big Jim: Large, roundish to oblong fruit, 1 1/4 to 1 1/2 inches in diameter; skin pale orange-yellow, medium-thick, easy to peel; flesh orange-yellow, very sweet but with some acidity, of excellent flavor; ripens midseason, March to April. Tree vigorous, upright, highly productive. Originated in San Diego, California by Jim Neitzel. E8M, G49,183M

Early Red: Medium-large, pear shaped fruit, borne in compact clusters; skin orange-red with white dots, tough, acid; flesh orange, very juicy, sweet, of fair to excellent flavor; seeds usually 2 or 3. Ripens very early, late January or early February in California. Originated by C.P. Taft in 1909. MORTON 1987a; S97M

Gold Nugget: (Thales, Placentia) Large, round to oblong-obovate fruit; surface yellow-orange to orange in color; skin not thick, tender; flesh orange-colored, firm and meaty, juicy; flavor sweet, somewhat reminiscent of apricot; quality good. Seeds 4 to 5, the seed cavity not large. Ripens late. Fruits borne only a few to a

cluster; keep and ship well. Tree vigorous, upright, self-fertile. D23M, D57, E29, G49, H4,174,183M, J22, N84, S97M

MacBeth: Very large, ovoid fruit, 1 1/2 to 2 inches in diameter; smooth, tough, saffron yellow skin; flesh cream-colored, streaked with yellow, peach-like in texture, juicy, low in acid; flavor pleasant and mild; seeds small, 2 to 4 per fruit. Spreading tree, about 20 feet in width, bears fruit in clusters of 3 to 8. Originated in Carlsbad, California by A.R. MacBeth. BROOKS 1972; G49,183M

Mogi: Small, elliptical fruit, weight 40-50 grams; skin light yellow; flesh relatively sweet; ripens in early spring. Tree cold-sensitive; self-fertile. Constitutes 60% of the Japanese crop of loquats. Easier to peel than Tanaka, matures earlier, but is more susceptible to bruising and to cold injury. Selected from numerous seedlings planted at Mogi, Japan. Named in 1925. MORTON 1987a; E8M

Oliver: Very large fruits, 2 1/2 inches long and 1 1/2 inches in diameter, ovoid to slightly pyriform; firm, orange skin; thick, juicy, firm, orange flesh; flavor excellent; 4 to 6 seeds per fruit. Ripens February through April in Florida. Vigorous, dense rounded tree, up to 30 feet tall. Originated in Miami, Florida by George W. Oliver, about 1910. BROOKS 1997; I53M, G2M

Tanaka: Fruit very large, usually obovoid; weight 2 to 3 ounces; skin orange-yellow, attractive; flesh firm, rich orange, aromatic, slightly acidic to sweet, of excellent flavor; seeds 2 to 4; ripens very late, the beginning of May in California. Keeps unusually long, if left for a week it wrinkles and dries but does not rot. Tree vigorous and productive. Originated in Japan in the late 1800's. Named after Dr. Yoshio Tanaka. MORTON 1987a; R77, S97M

---

**MACADAMIA {GR}**

---

**MACADAMIA INTEGRIFOLIA  
MACADAMIA TETRAPHYLLA**
**MACADAMIA X SP.**

Beaumont: (Dr. Beaumont) (M. x sp.) Round, medium to large nut, 65 to 80 per pound; shell medium-thick; kernel 40% of nut, with a high percentage of grade A kernels; texture and flavor very good. Tree upright; ornamental; new leaves reddish; flowers bright pink, borne on long racemes. Nuts drop over a long period. Recommended for home gardens. Originated in Australia. Introduced in 1965 by the California Macadamia Society. Discovered by Dr. J.H. Beaumont. BROOKS 1972; A63, D23M, G2M, G49, I83M, J65{OR}, J65{DF}, N84{S}

Burdick: (M. tetraphylla) Large nut, averaging 40 nuts per pound; shell thin, about 1/16 inch thick, well-filled; kernel averages about 34% of total nut weight, quality good; matures in October. Tree bears annually. A good choice for certain problem climatic areas. Also used as a rootstock. Originated in Encinitas, California. BROOKS 1972, JAYNES; A63, J65{OR}, J65{DF}

Cannon: (M x sp.) Very large nuts, 1 to 2 inches in diameter; shell 1/8 inch thick; kernel weight 35 to 38% of nut; oil content 75%. Richer, nuttier flavor than most. Well suited to special candy applications and packaging. Productive, pyramidal tree, about 20 feet tall; begins bearing after 4 or 5 years; good resistance to frost. J65{OR}

Cate: (M. tetraphylla) Nuts medium to large; shell moderately thick; kernels 40% of nut, cream colored, crisp in texture, flavor good to very good; ripens in late October and November, continuing over a period of 6 to 8 weeks. Tree precocious, moderately handy, shows no alternate bearing tendencies. The most widely adapted cultivar for commercial use in California. Originated on the property of William R. Cate, Malibu, California. A63, H12{DF}, I83M, J65{OR}, J65{DF}, S97M

Cooper: Small nuts, 3/4 to 1 inch in diameter; shell 1/8 inch thick; kernel weight 38% of nut; oil content 75%. Must be hand harvested.

Attractive, compact tree, produces large clusters of nuts at each fruit stem which resemble grape clusters. Pink flowers. Begins bearing after 2 or 3 years. Selected by Thompson H. Cooper from a Beaumont hybrid. J65{OR}

Dorado: (*M. integrifolia*) Medium-sized, uniform nuts, 7/8 to 1 inch in diameter; kernel averages 35% of nut, oil content 75%. Tree medium-tall, upright, attractive; begins to bear after 5 years; self-harvesting; cold resistant. Very productive, often yielding 65 or more pounds of nuts per year. Originated in Hawaii. Introduced by Rancho Nuez Nursery. J65{OR}

Elimbah: (*M. tetraphylla*) Medium to large nut; shell medium brown, rough, thick; kernel averages about 40% of nut, quality high, flavor excellent; ripens late, harvested over a 6 to 8 month period. Tree vigorous, upright; bears well, especially in interior areas of California. Originated in Caboolture, Queensland, Australia. BROOKS 1972, JAYNES; J65{OR}, J65{DE}, S97M

Fenton: (*M. tetraphylla*) Large nut of excellent quality. Has a distinct hairline fissure in the shell, making it easier to crack than most other cultivars. Ripens over a longer period than Cate, November to March. Regularly sets good crops, about 50 pounds per year. Recommended for homeowners and commercial plantings. Originated in Chula Vista, California by Fenton Smith. I83M

James: (*M. integrifolia*) Medium-sized, uniform nuts, about 1 inch in diameter; kernel averages 40 to 42% of nut, flavor very good, oil content 75%. Tree very tall, columnar; precocious, often producing after 2 or 3 years; self-harvesting. Yields more per acre than any other California cultivar, 60 or more pounds per tree when mature. Originated in La Habra Heights, California. J65{OR}

Kau: (*M. integrifolia*) Medium-sized nut, 60 to 70 per pound; kernel weight 36 to 40%, 95% grade 1. Ripens from September to December in Hawaii. Strong, upright tree with well-formed ascending branches. Better adapted to dry, windy areas than other cultivars. Originated from a seedling found at the Hawaiian Macadamia Co. orchard. Selected in 1936. Released in 1971. BROOKS 1997; E8M, Q93

Keaau: (*M. integrifolia*) Medium-sized nut, averaging about 80 nuts per pound; shell smooth, medium brown, thin; kernel 42 to 46% of nut, color light cream; quality very good; season August to November. Tree moderately vigorous, upright; very productive. Originated in Lawai Valley, Kalaheo, Kauai, Hawaii. BROOKS 1972; J65{OR}, J65{DF}

Keauhou: (*M. integrifolia*) Medium to large nut, averaging about 54 nuts per pound; shell very slightly pebbled, medium-thick; kernel 37 to 40% of nut, quality tends to vary in different locations. Harvest season relatively short, with most of the crop maturing within about 3 months. Tree vigorous, yields well, extremely resistant to anthracnose. Originated in Kona, Hawaii by W.B. Storey. BROOKS 1972, JAYNES; J65{OR}, J65{DF}, Q93

Makai: (*M. integrifolia*) A consistent bearer of large, uniform nuts with high-quality kernels. Nuts average 59 per pound with 40% kernel and 98% grade 1. Kernel quality excellent after cooking. Broad, spreading tree; highly resistant to anthracnose. Better adapted to lower elevations than most cultivars. Seedling selected at the University of Hawaii. BROOKS 1997; E8M, Q93

Stephenson: (*M. tetraphylla*) Nut round, of high quality. Thin shells often split upon drying, allowing entry of fungi. Tree large, open, vigorous, a good producer. Originated in Queensland, Australia. Introduced in 1961. Fairly widely distributed in California. BROOKS 1972; J65{OR}

Vista: (*M. x sp.*) Small to medium-sized nut, 3/4 to 7/8 inch in diameter; kernel averages 46% of weight of nut, flavor excellent, oil content 75%. Shell very thin, can be cracked in an ordinary hand cracker. Tree medium-sized, pyramidal; begins to bear after 3 years; self-harvesting; flowers pink. Recommended for both home garden

and commercial plantings. Originated in Rancho Santa Fe, California by Cliff Tanner. J65{OR}

Waimanalo: (*M. integrifolia*) Large nuts, occasionally with twin halves; shell relatively thick; kernel 38 1/2% of nut, flavor good, oil content 75%. Tree medium-sized, pyramidal; productive, begins to bear after 5 years; produces nuts in large clusters; resistant to frost and disease. Grows well in cooler climates, particularly near the ocean; also yields good crops inland. Originated at the Hawaiian Agricultural Experiment Station, Waimanalo, Hawaii. J65{OR}

## MANDARIN {GR}

### CITRUS RETICULATA

#### SATSUMAS

A distinctive type considered to have originated in Japan sometime prior to 1600 A.D. Highly important there where it is called Unshu mikan. The most cold-tolerant of the commercially important citrus fruits, mature dormant trees having survived minimum temperatures of 15 to 18° F. without serious injury. Some cultivars also ripen earlier than any of the oranges or other mandarins. REUTHER; R5SM{SC}, D3M{PR}, D23M{ES}, E29, G17, I77G, J22, K67

Brown's Select: Early bearing satsuma strain. Medium to large, uniform fruits; thin, easily peeled rind; sweet, melting, flavorful flesh; quality very high; only 1 or 2 seeds per fruit. Ripens just before Owari. Tall, vigorous, upright tree. Released by Louisiana State University. H4

Changsha: Small to medium-sized fruit; skin brilliant orange-red, very loose, easily peeled; flesh juicy, sweet but somewhat insipid, segments easily separated, seedy; matures early; resembles Satsuma. Tree highly cold resistance, 10 year old seedlings having survived a temperature of 4° F. in Arlington, Texas. Bearing trees will produce crops of fruit after 7° F. temperatures even though the leaves may fall. MORTON 1987a; G17,174, K67, N37M

Dobashi-Beni Unshu: Satsuma type, distinctive only because of its deep orange-ied color. Fruit of good quality, ripening in late November or early December. Tree of medium vigor. Originated as a limb sport of Owari in the orchard of K. Dobashi in Shizuoka Prefecture, Japan and was noted about 1940. REUTHER; A63, A71, C29M{SC}, N18{OR}

Kimbrough: Satsuma type, somewhat more cold hardy than Owari; holds better on the tree. Medium to large, seedless fruit. Has very thin skin that peels readily. Quality very good. Tree larger and 40% more productive than Owari. Very popular in southern Louisiana. Seedling of Owari. Developed at the Louisiana Agricultural Experiment Station. H4

Miyagawa: (Miyagawa Wase) Fruit large for a satsuma, moderately oblate; rind thin, smooth; juice abundant, sugars and acid well-blended, quality excellent; seedless. Matures early and stores well for Wase Unshu. Tree more vigorous than most old Wase clones; productive. Named and introduced by Dr. Tyozaburo Tanaka in 1923. REUTHER; 04

Okitsu: (Okitsu Wase) Fruit somewhat more oblate than Miyagawa, but averages higher in sugar content and matures a week or so earlier. Tree also more vigorous. An early (Wase) type, and since satsumas are characterized by early fruit maturity, the Wase cultivars are very early ripening, in late September and October. REUTHER; A63,A71,183M, N18{SC}

Owari: (Owari Satsuma) Fruit oblate to rounded or becoming pear-shaped with age, of medium size. Rind orange, slightly rough, thin, tough, easily separable. Pulp orange, tender and melting; of rich, subacid flavor; segments 10 to 12, loosely separable; nearly seedless, sometimes 1 to 4 seeds. Of ancient and unknown Japanese origin. MORTON 1987a, REUTHER; A63, A71, D37{DW},

E3M{DW}, G49, H4, H78, I49M{DW}, I74{DW}, I83M, N18{SC}

Silverhill: (Silverhill Owari) Medium-sized fruit, slightly more oblate than most; rind relatively thin and smooth; seedless. Juice abundant; high in sugars and low in acid, hence very sweet; quality excellent; stores well. Season of maturity early. Tree very vigorous for a satsuma; markedly cold-resistant. REUTHER; N84, 097, R77

Variegated:<sup>2</sup> Very ornamental variegated satsuma, apparently a sport of the Owari cultivar. Sweet fruits with thin, easily peeled rinds. Dwarf to semi-dwarf habit. Ideal for growing in pots, where space is limited, or as a patio tree. Hardier than other variegated Citrus, being adapted to Zones 8 through 10. H4

#### OTHERS

Beauty of Glen: (Beauty of Glen Retreat) Medium-sized, oblate fruit; rind thin, firm but easily removed, orange-red at maturity; segments 9 to 13, easily separated; flesh orange-colored, tender, juicy, sprightly flavored; moderately seedy. Midseason in maturity. Originated about 1888 near Brisbane, Australia. Highly popular in Queensland. Q93

Choa Chou Tien Chieh Kat: Small, somewhat oblate fruit; rind light orange, thin, easily peeled; flesh light orange, juicy, very aromatic; flavor delicate but sprightly, distinct; moderately seedy. Tree vigorous, upright; very productive, bears in 3 to 5 years from seed; cold hardy, having survived 7° F. in Texas. One of the earliest of the Kat group of mandarins. K67

Clementine: (Algerian) Medium-small to medium fruit, round to elliptical; peel deep orange-red, smooth, glossy, thick, loose but scarcely puffy; pulp deep orange-red with 8 to 12 segments; juicy and of fine quality and flavor; 3 to 6 seeds of medium size; season early but long, extending into the summer. Most important early-ripening mandarin of the Mediterranean basin. MORTON 1987a, RAY, R., REUTHER, SCHNEIDER 1986 [Cui, Re]; A63, A71, B58MISC, B93M{DW}, D13, D23M, E3M{DW}, E9{PD}, E99G{PR}, G17, G49, I83M, J21M{PR}, J22, K46, N18{SC}, N40{PR}, etc.

Dancy: Oblate to pear-shaped fruit, of medium-size; peel deep orange-red to red, smooth, thin, leathery, tough; pulp dark-orange with 10 to 14 segments, of fine quality, richly flavored; 6 to 20 small seeds. Leading tangerine in the U.S., mainly grown in Florida, secondarily in California, and to a small extent, Arizona. MORTON 1987a; A63, J75EM{SC}, B73M{DW}, D3M{PR}, D23M, E3M{DW}, E97{DW}, G49, G96{DW}, H4, H49{DW}, I83M, J17, J22, N18{SC}, etc.

Ellendale: Medium-large to large fruit, oblate to subglobose; rind orange-red, medium-thin, relatively adherent though peelable at maturity; flesh bright orange, very juicy; flavor rich and pleasantly subacid; moderately seedy. Late midseason in maturity. Originated about 1878 at Burrum, Queensland, Australia. Possibly a natural tangor. REUTHER; C29M{SC}, Q93, S59

Encore: Fairly large, oblate fruit; rind yellow-orange with darker orange spots, thin, nearly smooth, peels easily; flesh deep orange, juicy; flavor rich and sprightly; seeds numerous; unusually late ripening and late holding on tree. Tree upright, spreading; somewhat alternate bearing. RAY, R., REUTHER; A63, G49, I83M, N84, 097, R77

Fairchild: Medium-sized, oblate fruit; rind dark orange, smooth, peels freely; flesh orange-colored, firm yet tender, juicy; flavor rich and sweet; retains good quality through December; seeds 20 to 30. Best suited as fresh fruit. Tree heat tolerant; adapted especially to Coachella and Imperial Valleys of California. BROOKS 1972; A63, A71, D13, G49, N18{SC}

Fallglo: Large, flattened fruit; thin, smooth, reddish-orange rind, easily peeled; high juice content, 65.8%; sweet, relatively rich flavor; ripens early to midseason. Vigorous, thornless tree, more

upright than Temple; moderately cold handy. Complex hybrid involving a mandarin, tangelo and Temple tangor. BROOKS 1997; I77G, L60M{PR}, N18{SC}

Fina: (Fina Clementina) Very small fruit; rind particularly smooth; strong, pleasant aroma; very tender, sweet and juicy; excellent flavor, quality and acid to sugar ratio. Matures as much as 4 weeks later than early Clementine clones; holds well on the tree. The standard of excellence in the Spanish Clementine industry. Large, vigorous trees with good productivity. SAUNT; C29M{SC}, Q93

Fremont: Fruit medium in size, oblate in form; rind medium-thick, of moderate adherence but easily peelable, bright reddish-orange. Flesh deep orange, tender and juicy; flavor rich and sprightly. Seeds moderately numerous. Early ripening, but fruit retains quality well past maturity. E3M{DW}, E8M, J22, N18{OR}

Honey: Small, oblate fruit; rind light yellowish-orange, faintly pebbled, peels readily; pulp deep orange, flavor exceptionally rich and sweet; seedy; ripens early. Tree vigorous; tends strongly to alternate bearing. Sometimes confused with the Murcott tangor of Florida. RAY, R., REUTHER; A63, G49, I83M, J22, N18{SC}

Imperial: (Early Imperial) Medium-small to medium fruit; rind very thin, leathery, smooth and glossy, yellowish to pale orange at maturity. Segments 9 to 11, easily separable. Flavor pleasantly subacid with an attractive aroma. Comparatively few seeds. Originated about 1890 at Emu Plains, Australia. REUTHER; Q93, S59

Kara: Fruit large, up to 3 inches in diameter; skin deep orange, somewhat wrinkled and bumpy; rind thin, peels easily and cleanly, rather tough; pulp deep, rich yellowish-orange, tender, very juicy with a unique aroma, sugar high; flavor rich, excellent, tart until fully mature; ripens very late; not tolerant of cold winters. BROOKS 1972; A63, E3M{DW}, G49, H49{DW}, H78, I83M, N18{OR}, N24M{DW}, Q93

Kinnow: Large fruit, up to 3 inches in diameter; skin yellow-orange; rind thin, smooth, peels poorly, rather tough; pulp with 9 to 12 segments, separating airily easily, deep yellowish-orange, moderately tender, very juicy with a unique and very pleasant aroma, sugar very high; flavor very rich, excellent. BROOKS 1972; A63, D13, E3M{DW}, G49, I74{DW}, I83M, N18{SC}, N24M{DW}

Lee: Medium-sized, round fruit, resembles a tangelo. Rind thin, leathery, moderately adherent but readily peelable; color deep yellowish-orange at maturity. Flesh orange; segments 9 to 10, readily separable; tender and melting; juice abundant; flavor rich and sweet. Medium-early in maturity. Clementine mandarin x Orlando tangelo. REUTHER; D57, I83M, N18{OR}

Long Huang Kat: Small, oblate, slightly irregular fruit; about 2 inches by 1 1/4 inches; smooth, glossy, yellowish-orange rind; medium orange flesh, melting and juicy, sprightly sweet-tart; segments usually 10; seedy. Ripens in early midseason. Upright tree, fairly handy. Popular in Texas and the Gulf Coast. NAGLE; K67

Mediterranean: (Willowleaf) Fruit of medium size, oblate to rounded; peel orange, smooth, glossy, thin; pulp orange, with 10 to 12 segments; very juicy, of sweet rich flavor; seeds 15 to 20; matures early. Tree small to medium; reproduces true from seed; produces best fruit in hot, dry climates. MORION 1987a, RAY, R.; A63, C29M{SC}, N18{OR}

Nova: Medium-large, oblate to subglobose fruit; rind thin, leathery, moderately adherent but easily peelable, deep yellowish-orange at maturity; segments about 11, easily separable; flesh deep orange, firm, juicy, flavor more pleasant and sweeter than Orlando. Seeds numerous in mixed plantings. Ripens early, reaching its prime in November in Florida. Clementine mandarin x Orlando tangelo. BROOKS 1972; A63, A71, E8M, E13G{PR}, E99G{PR}, J21M{PR}, N18{SC}, Q93

Page: Fruit of medium size, broadly oblate to subglobose. Rind medium-thin, leathery, moderately adherent but easily peelable, reddish-orange at maturity. Flesh deep orange, with about 10 segments; tender and juicy; flavor rich and sweet. Seeds moderately numerous. Early in maturity. Clementine mandarin x Minneola tangelo. REUTHER; A71, E8M, G17, G49, 183M, N18{SC}, Q93

Pixie: Small to medium-sized fruit, variable in shape; rind yellow-orange, peels easily without dripping of juice; flesh medium orange; flavor mild and pleasant; essentially seedless, regardless of exposure to other pollen sources; matures late. Tree somewhat alternate bearing; not successfully grown in the hot dessert. BROOKS 1972; A63, B58M{SC}, G49, 183M, N18{SC}

Ponkan: Fruit large for a mandarin, globose to moderately oblate; rind medium-thick, fairly loosely adherent, orange; flesh orange, tender and melting, juicy; flavor mild, pleasant, aromatic; segments about 10; seeds few; ripens in early midseason. Tree vigorous; distinctive in appearance due to pronounced upright growth habit. One of the most tropical mandarins, the fruit attaining maximum size and quality under such conditions. REUTHER; G17, H4, I77G, J22, K67, N18{OR}

Robinson: Medium-large oblate fruit; rind thin, tough and leathery, moderately adherent but easily peelable; color deep yellowish-orange at maturity. Flesh deep orange, with 12 to 14 segments; juicy, flavor rich and sweet; seeds moderately numerous; matures early. Tree very vigorous; bears regularly. Clementine mandarin x Orlando tangelo. REUTHER; C29M{SC}, E99G{PR}, G2M

Sunburst: Medium-sized, oblate fruit; rind orange to scarlet; pulp in 11 to 15 segments, with abundant colorful juice; seeds 10 to 20 according to degree of pollination. Matures in a favorable season (mid-November to mid-December). Tree vigorous; thornless; early-bearing; self-infertile, needs cross-pollination for good fruit set. MORTON 1987a; A63, G2M, I77G, N18{OR}

Wilking: Fruit large, up to 3 1/8 inches in diameter; skin deep yellowish-orange; rind thin to medium, peels fairly well; flesh rich yellow-orange, with 9 to 13 easily separating segments, firm, moderately tender, very juicy; aroma of juice unique; sugar content high; flavor rich and very good, being very sweet late in the season. C29M{SC}

#### CODES FOR SPECIAL TYPES

1. Cold-Hardy
2. Variegated

## MANGO {GR}

### MANGIFERA INDICA

Alphonso: (Alphonse) Medium-sized, oblong-ovate fruit; skin yellowish-green to bright yellow blushed scarlet; flesh orange, free from fiber, flavor very rich, quality excellent; seed monoembryonic. Tree broad and spreading, not heavy bearing. Supposedly named for Alphonse d'Albuquerque, one of the early governors of the Portuguese possessions in India. PARMAR, P. [Re], POPENOE, W. 1920; R0, R50

Ataulfo: Gourmet mango from Mexico. Small to medium, oval fruit, slightly tapered at one end; weight 6 to 12 ounces; yellow-orange skin; golden, fiberless flesh, sweet and melting, aromatic, slightly firmer than Kent. Produces, excellent polyembryonic seedlings. Upright tree; has proven to be productive in southern California. D57

Brahm Kai Mea: A variety that originated in Thailand where it is eaten both green or when ripe, and is considered delicious either way. Long, green fruit with deep-orange flesh; average Brix reading 19. Produces good quality fruits on a regular basis. Introduced into Hawaii where it has become popular with home orchardists. E8M

Brooks: Fruit quality fair; not particularly attractive, but late in season (August to October). Tree weak-growing; heavy-bearing. Open-pollinated seedling of Sandersha. Originated in Miami, Florida by the Charles Deering Estate. Introduced in 1924. BROOKS 1972; J22, Q93

Carabao: Long, slender fruit; thin, greenish to bright yellow skin; soft, tender, melting, juicy lemon-yellow flesh; flavor mild, spicy subacid; fiberless; quality good to excellent. Ripens in June and July, does not store well. Not a good producer in Florida. Very popular in the Philippines, accounting for about two thirds of the crop. Introduced into Florida by David Fairchild. CAMPBELL; E8M

Carrie: Medium-sized fruit, to 4 inches long, averaging 12 ounces in weight; easily bruised; skin greenish-yellow; flesh very juicy, very rich, aromatic, fiberless, quality excellent; ripens June to July. Tree semi-dwarf, with dense crown. Resistant to anthracnose. Considered to be one of the best of all mango cultivars for home gardens. Originated in Delray Beach, Florida by Lawrence Zill. Introduced about 1949. BROOKS 1972; A41G, E29, G2M, I77G, 183M, N53M, N84

Edgehill: Small to medium-sized, oblong fruit; average weight 12 ounces, individual fruits to 1 1/2 pounds; skin dark-green, with a rose blush on the side exposed to the sun, tough, does not peel well; flesh orange in color, sweet and fiberless except for a few short fibers on the ventral suture of the seed. Quality very good to excellent. Seed size medium. Bearing season Thanksgiving to end of April some years. Tree upright, productive, susceptible to anthracnose. Originated in Vista, California. Introduced in 1970. I83M

Edward: Large fruit; skin yellow, with a bright red blush where exposed to the sun; flesh firm, fiberless, juicy, rich, melting, smooth; flavor excellent; high in food value; seed small; ripens June to July. Spreading, low yielding tree. Resistant to anthracnose. Considered to be one of the best of all mango cultivars for home gardens. Originated in Coconut Grove, Florida by Edward Simmons. Introduced about 1942. BROOKS 1972; G2M, I83M, N53M

Fairchild: Medium-sized fruit, average weight about 3/4 pound; skin bright yellow; flesh golden yellow, entirely free from fiber, flavor delicious; seed small, polyembryonic; ripens in July. Tree spreading, bears lightly. Highly resistant to anthracnose. Originated in Balboa Heights, Canal Zone from seeds introduced from Saigon by David Fairchild. E8M, J22

Florigon: (Florida Saigon) Medium-sized fruit, to 5 inches and 1 pound; skin deep yellow; flesh fiberless, juicy, sweet, rich, quality excellent; season May and June. Tree small, upright, vigorous; moderately resistant to anthracnose. Probably an open-pollinated seedling of Saigon. Originated in Ft. Lauderdale, Florida by John Kaiser. Introduced about 1947. BROOKS 1972; Q93

Glenn: Fruit oval to somewhat oblong; medium to large; skin yellow with an orange-red blush, smooth, thin, tough; separates easily from flesh, many yellow and white dots. Flesh deep-yellow, fiberless, firm, juicy, rich, aromatic, spicy, quality excellent; aroma strong but pleasant, suggesting pineapple; monoembryonic. Season June and July, about 7-10 days before Haden. Excellent for yards. Originated in Miami, Florida by Roscoe E. Glenn. Introduced about 1950. BROOKS 1972; E8M, G2M, I83M, J22, N53M, Q93

Gouveia: *High* quality, attractively colored fruits with very sweet, juicy, richly flavored pulp; almost fiberless; seed small. Ripens late, in July and August. Medium-sized, upright tree, moderately productive. Grown successfully in Hawaii but requires a warm, sunny, dry climate for the development of best quality fruit. Originated by Mrs. Ruth P. Gouveia. E8M

Haden: Fruit oval to ovate, plump; size large to very large, length 4 to 5 1/2 inches, weight up to 24 ounces. Surface smooth, light to deep apricot-yellow in color, overspread with crimson-scarlet; skin very thick and tough; flesh yellowish-orange, firm, very juicy, fibrous only close to the seed, and of a rich, moderately piquant

flavor; quality good. Season July and August. Alternate bearing. Originated at Coconut Grove, Florida, as a seedling of Mulgoba. First propagated in 1910. POPENOE, W. 1920; A41G, D57, G2M, I83M, J22, N53M, Q93, S97M

Irwin: Medium-sized, oblong-ovate fruit; skin orange to pink with extensive bright-red blush and small white lenticels; flesh yellow, almost fiberless, with a mild sweet flavor; quality good to very good; ships well; seed small; season June and July. Tree semi-dwarf, bears heavy crops of fruit in clusters; susceptible to anthracnose. Originated in Miami, Florida by F.D. Irwin. Introduced in 1946. BROOKS 1972, MORTON 1987a; N53M, Q93, S97M

Jakarta: Attractive mango that shows promise as a commercial cultivar for Tropical America. Medium to large, roundish fruit; skin orange-yellow blushed with reddish-orange; tender, juicy deep-yellow flesh with a rich, spicy flavor, slightly resinous; nearly fiberless. Ripens from June to August. Produces heavy crops in Florida. Originated in Boynton Beach, Florida by Lawrence H. Zill. CAMPBELL; I83M, N53M

Julie: Fruit somewhat flattened on one side, of medium size, greenish-yellow with slight pink blush; fiber very slight; flavor sweet, creamy, excellent; ripens in July in Florida. Tree somewhat dwarf, has 30% to 50% hermaphrodite flowers; bears well and regularly. Adaptable to humid environments and resistant to disease. Fruit is resistant to the fruit fly. Introduced to Florida from Trinidad but has long been popular in Jamaica. The main mango exported from the West Indies to Europe. Originated in Mauritius. MORTON 1987a; A41G, D57, E8M, E29, G2M, I77G, I83M, N53M, N84

Keitt: Large to very large, rounded-oval to ovate fruit; skin bright-yellow with light-pink blush and lavender bloom, surface smooth, thick, fairly tough, not separating easily from flesh; flesh deep yellow, fairly firm but tender, melting, juicy, some fiber near the seed; flavor rich and sweet, quality very good; monoembryonic; season late July to October. Moderately resistant to anthracnose. Considered to be an excellent late-maturing mango cultivar. Originated in Homestead, Florida by Mrs. J.N. Keitt. Introduced about 1946. BROOKS 1972, MORTON 1987a; A41G, D57, E8M, G2M, I77G, I83M, L33M{PR}, L54{PR}, N53M, Q93, S97M

Kensington Pride: Fruit distinctly beaked when immature, medium-large; skin bright orange-yellow with a red-pink blush overlying areas exposed to the sun. Flesh orange, thick, nearly fiberless, juicy, aromatic, of rich flavor. Polyembryonic. The fruits ship well but the tree is not a dependable nor heavy bearer. The leading commercial cultivar in drier areas of Queensland, Australia. In humid regions it is anthracnose-prone and requires spraying. MORTON 1987a; Q93

Kent: Large, thick, ovate fruit; skin greenish-yellow with a dark-red blush and gray bloom; many small yellow lenticels; flesh fiberless, juicy, sweet; very good to excellent; seed small; season July and August and often into September. Tree of erect, slender habit; of moderate size; precocious; bears very well; susceptible to anthracnose. Fruit ships well, but for the market, needs ethylene treatment to enrich color. Originated in Miami, Florida by Leith D. Kent. Introduced in 1944. BROOKS 1972, MORTON 1987a; D57, G2M, I83M, L33M{PR}, L54{PR}, N53M, Q93, S97M

Manila: (Filipino) Small to medium-sized, long pointed fruits; weight 8 to 10 ounces; skin bright yellow-orange, smooth, thin and tender; flesh golden, juicy, non-fibrous, sweet, quality very good; seed small, polyembryonic; ripens October to December. Can be eaten when slightly green. Tree bushy, bears regularly, susceptible to anthracnose. D57, G2M, G49{PL}, I74, I83M, N53M, S97M

Mulgoba: Medium-sized, oblong-ovate fruit; skin deep yellow to apricot-yellow, sometimes overspread with scarlet, thick and tough; flesh bright orange-yellow, very juicy, free of fiber, of a rich piquant flavor, quality excellent; seed monoembryonic. Season July to September in Florida. The name Mulgoba is taken from that of a

native Indian dish, and means "makes the mouth water". POPENOE, W. 1920; R0, R50

Nam Dok Mai: (Nam Dawg Mai, Nectar of Flowers) Greenish-yellow fruit with a slight pink blush; average weight 375 grams; virtually stringless; firm, juicy, orange flesh; excellent, sweet, aromatic flavor; seed very thin, polyembryonic. Susceptible to anthracnose and powdery mildew. Bears regularly in cooler climates, in late mid-season. Highly prized in Thailand. LOHA-UNCHIT; G2M, I83M, N53M, Q93

Ok Rong: (Ohg Rawng, Dented Breast) Small, Saigon type mango. It is thought to have the highest sugar content of any Florida grown mango. Ok means breast in Thai. Rong means dented, or depression, because the ventral part of the fruit has a Rong or depressed line running along that part of the fruit. Excellent with coconut-flavored sticky rice. Originated in Thailand. LOHA-UNCHIT; E8M, E29, N53M, N84

Ono: Small, ovate fruit, weight 5 to 8 ounces; skin yellow, tinged with pink on side exposed to the sun; flesh yellow, juicy, melting, fiberless; flavor rich and spicy; ripens in July. Tree upright, susceptible to anthracnose. Primarily for home gardens. Originated in Makiki Heights, Honolulu, Hawaii by R.W. Smith. Introduced in 1958. BROOKS 1972; Q93

Pairi: (Pirie) Small to medium-sized, ovate fruit, weight 7 to 10 ounces; skin moderately thick, yellow-green, suffused scarlet around the base; flesh bright yellow-orange, firm but juicy, free of fiber, of pronounced and pleasant aroma and sweet, rich, spicy flavor; quality excellent. Season in south Florida July and August. Tree spreading, bears lightly, susceptible to anthracnose POPENOE, W. 1920; D57, J22, R0, R50

Palmer: Large, elongated oval fruit; weight 1 1/4 pounds; skin brightly colored with purple and red; flesh apricot-colored, smooth, nearly fiberless, very sweet; quality good; less aromatic than some; good storage characteristics; ripens July to August. Tree produces well most years; very upright in growth; susceptible to anthracnose. Originated in Miami, Florida by Charles I. Brooks. Introduced in 1946. BROOKS 1972; N53M, Q93

Pina: (Pineapple) Medium-sized, roundish fruit; weight 8 ounces; skin light yellow to orange; flesh yellow, slightly fibrous but juicy and sweet, has a distinct pineapple-like flavor; seed polyembryonic; ripens November to December. Tree upright, susceptible to anthracnose. Originated in Mexico. D57

Rapoza: Very fine-textured, fiberless pulp with a sweet, delicate flavor; small seed; ripens in July. Produces good quality fruits on a regular basis. An anthracnose resistant cultivar that can be grown in relatively humid areas. Seedling of Irwin selected at the University of Hawaii by Richard Hamilton. E8M

Sensation: Medium-sized, oval fruit, weight about 12 ounces; skin bright yellow with a dark plum-red blush, thin, adherent; flesh pale yellow, firm, slightly sweet with a distinctive mild flavor, fibers scanty, quality good; season August and September; seed monoembryonic. Tree vigorous, upright; produces heavy crops but tends toward alternate bearing; susceptible to anthracnose. Originated in North Miami, Florida. Introduced in 1949. BROOKS 1972, MORTON 1987a; Q93

Southern Blush: Very attractive, medium to large, oblong fruit; weight 1 to 2 1/4 pounds; skin yellow, heavily blushed with red; flesh nearly fiberless, firm, juicy, sweet yet tart, of good flavor. Ripens in midseason, July in Florida, has a long shelf life. Resistant to anthracnose. Tree exceptionally vigorous. Shows good commercial potential. Originated at Zill Nursery. G2M, N53M

Tommy Atkins: Medium to large, oblong-oval fruit; weight 16 to 25 ounces; skin thick, orange-yellow, with a bright to dark-red blush and purplish bloom; flesh medium to dark-yellow, firm, juicy, with medium to high fiber, of fair to good quality. Harvest season June and July; ships very well, shelf life of 2 weeks. Moderately resistant

to anthracnose. Tree vigorous, upright. Originated by Thomas N. Atkins of Ft. Lauderdale, Florida. Introduced in 1948. BROOKS 1972, MORTON 1987a; L33M{PR}, N53M, Q93, S97M

Valencia Pride: Very attractive, medium to large, roundish to ovate fruit weighing 1 to 2 pounds; skin yellow-red; flesh sweet, juicy, slightly fibrous, of good flavor; ripens in midseason, July in Florida, ships very well. Tree vigorous, very upright, consistently productive. A good shade and ornamental tree. Seedling of Haden. Recommended for home gardens in Florida. G2M, N53M, Q93

Van Dyke: Medium-sized fruit, average weight 280 grams; skin yellow-orange with bright red blush, attractive; fiber moderate. Flavor good, sweet, slightly turpentine; quality variable in some areas. Can be significantly affected by "jelly seed". Seed mono-embryonic. Ripens July to August. High resistance to anthracnose and black spot. Cropping regular. Originated in Florida. N53M

Winters: (20222) Small to medium-sized, elongated fruit; skin smooth, free of blemishes, attractively colored red and yellow; flesh yellow-orange, fiberless, flavor sweet, very good to excellent; seed small, polyembryonic; ripens October to November. Matures early but with inconsistent yields. Has the ability to ripen all of its fruits off the tree, evenly and completely once they are mature. Originated in Miami, Florida but has proven well adapted to southern California. U7T{SC}

Zill: Medium-sized, oval fruit; skin greenish-yellow, blushed with dark red or crimson; soft, juicy flesh, fiber slight; flavor mild and sweet with a strong, pleasant aroma; quality good to excellent. Ripens June to early-July. Large, vigorous, spreading tree; a regular producer. Seedling of Haden planted in 1922. Named and described in 1945. CAMPBELL; N53M

## MELON {S}

### CUCUMIS MELO

#### CANTALOUPE MELONS

The true cantaloupe melons, considered by many to be the finest flavored of all melons. Usually with a hard rind and a rough, warty, or scaly surface, but not netted. Generally they do not "slip" from the vine, and must be cut when ripe. Rarely grown commercially in the United States. Also called *rock melons*. The cantaloupe melons grown near Cavaillon in the south of France are considered among the finest in the world. H25M{PR}

#### HYBRID

Alienor: 75 days. High quality Charentais type. A popular favorite in Europe, where it is featured in gourmet restaurants. Small, roundish to oval fruit weighing about 2 pounds; light gray-green rind, slightly ribbed and with medium netting; thick, dark-orange flesh, very rich and sweet, highly aromatic. Very uniform and high yielding. Resistant to fusarium wilt. C53, G82, I18M, 177, K23{PL}, L42, L79, L89, S95M

Chaca: (Early Chaca, Flyer) 67 days. Exceptionally early Charentais type. Round fruit, 4 inches in diameter, weight 2 to 2 1/2 pounds; rind thin, grayish-green, lightly netted. Firm, thick, deep-orange flesh; very sweet and flavorful; small seed cavity. Highly productive. Ripens most of its crop as picking begins on the later cultivars. Does well in cool or short season areas. D68, J20

Charmel: 78 days. Smooth, grey-green fruit; weight 2 to 3 pounds. Aromatic deep-orange flesh, very sweet and rich, small seed cavity. Traditionally served with prosciutto. Very vigorous and productive. Good crack resistance. Tolerant to fusarium wilt and powdery mildew. C92, K66

Savor: 78 days. Medium-sized, faintly ribbed fruit; weight 1 1/2 to 2 1/2 pounds; smooth grey-green rind, dark-green sutures. Very sweet and aromatic deep-orange flesh, of excellent quality. High

yielding. Tolerant to fusarium wilt and powdery mildew. Does not slip when ripe. Harvest when color changes to straw and fruit becomes aromatic. C53, E75{PL}, G6, G68,139,177, M29, M46, N16, N84, R47, S95M

Sweetheart: 70 days. A gourmet charantais melon, specially developed for the North and short season areas. Round-oval fruit, 4 to 5 inches in diameter; smooth, pale grey-green rind. Salmon-red flesh, very sweet and aromatic. Must be harvested at full maturity. Does well in frames or under cloches. Used extensively in England and France. M46, N84, R32, S55, S61

#### OPEN-POLLINATED

Charantais: 85 days. The true cantaloupe melon of France, legendary in Provence. Medium-sized, globe-shaped fruit; 3 1/2 inches in diameter; weight 2 1/2 to 3 pounds; smooth, furrowed, grey-green rind. Aromatic, thick, deep-orange flesh; extremely sweet and flavorful. Excellent as a dessert filled with a sweet wine such as Barsac, Marsala, Port or Madeira. C20M, C53, E63D, G68, H99M{PR}, I18M, 139, 089, Q11M, Q34, S75M

Large White Prescott: Large, flattened fruits with broad ribs, very wrinkled and warty; weight 5 1/2 to 9 pounds; skin whitish-green, variegated with dark and pale green; flesh orange, aromatic, very thick, juicy, melting, of very fine flavor. Usually only 1 fruit per vine is allowed to grow. French heirloom from the 19th Century, once very popular with Paris market gardeners. VILMORIN; F80, N84

Noir des Carmes: (Des Carmes, Early Black Rock) Fruit nearly spherical, but slightly flattened at the ends; 6 to 7 inches in diameter, weight 2 1/2 to 3 1/2 pounds; ribs clearly but not very deeply marked. Rind smooth, very dark green, almost black turning orange when ripe. Flesh orange, thick, sweet, perfumed, of excellent quality. Introduced prior to 1885. VILMORIN; F73D, F80, J39, N84

Vedrantais: 92 days. Excellent charantais melon from France. Globe-shaped fruit; weight 1 to 1 1/2 pounds; rind smooth, light grayish-green, slightly ribbed. Aromatic deep-orange flesh, very sweet and flavorful. Will not slip when ripe; best grown on a trellis or in a greenhouse. Tolerant to fusarium wilt race 1. B49, B75, D74B, K49M, S95M

#### MUSKMELONS

Also called *netted melons* or *nutmeg melons*, these are the principal commercial melons grown in the United States. They are not cantaloupes as they are so often erroneously called. The surface is more or less strongly netted. Most are ripe when the stem begins to separate or "slip" from the fruit. B65{PD}

#### GREEN-FLESHED

##### Hybrid

Arava: (Hybrid 820) Galia type, with slightly larger fruit and heavier netting. Round, slightly flattened fruit; weight 2 1/2 to 3 pounds; rind yellow, netted. Flesh light green, sweet and aromatic; small seed cavity. Very early, concentrated yield. Resistant to powdery mildew race 1. Suitable for early production in tunnels and in the open field. Especially adapted to hot climates. P75M, T27M

Galia: (Gaylia) 65 days. An Ogen type melon, but larger and more vigorous than others of this type. Round fruit; weight 2 to 2 1/2 pounds; rind yellow, heavily netted; flesh light green, very sweet and aromatic; small seed cavity. Resistant to powdery mildew. Suitable for growing in frames, greenhouses or in the open field. Recommended for home gardens and local markets. F15{PR}, K60M, K66, K73, P75M, T27M

Gallicum: 80 days. Very attractive, high quality Haogen type. Small, round fruit, 5 inches in diameter and weighing 2 to 3 pounds; rind golden-orange when ripe, lightly netted; flesh lime green, melting, rich, very sweet and aromatic. Uniform and productive. Resistant to powdery mildew race 1. Very popular in the Mediterra-

nean region. C20M, C92, D26D, F13, F63, G1M, G27M, 139,191, K10, K50, K73, N52, Q11M

Passport: 75-80 days. High quality Galia type melon. Large, roundish fruits; 6 to 7 inches in diameter and weighing 5 to 6 pounds; skin orange-yellow, netted; flesh dark green, whitish green near the seed cavity, very thick, smooth, sweet; flavor rich and exotic, suggestive of tropical fruit. Vigorous, disease resistant, and widely adapted. Developed by Brent Loy of the University of New Hampshire. A16, D68, E63D, F60, G6, G13M, J20, K10, K73, L42, L89, M29, M46, M49, Q34

Rocky Sweet: 85 days. Medium-sized, round fruit; weight 3 to 4 pounds; moderately netted, with light sutures; rind dark green, turning yellow, then yellow-orange when ripe. Thick, lime-green flesh; tender, sweet and delicious, without a musky flavor. Stems will "slip" when very ripe. Ships well. Vines very vigorous and prolific. F60, F63, G16, G71, H95, K10, K73, N16

#### *Open-Pollinated*

Anne Arundel: Medium large, nutmeg-shaped fruit, weight 3 to 4 pounds; rind yellow when ripe, slightly mottled with green, moderately ribbed and netted; flesh light green, sweet, mildly flavored; quality moderately good. Unripe fruits were pickled, and ripe fruits sliced like apples and baked in pies. Maryland heirloom of the 18th Century. Often depicted in the paintings of Raphaelle Peale. TAPLEY 1937, WEAVER 1997; D29P, K20M

Boule d'Or: (Golden Perfection, Honey Ball) 120 days. Spherical to slightly oblong fruit; 5 1/2 inches in diameter, weight 2 to 3 pounds. Rind strong and tough, loosely netted; golden-yellow when ripe. Flesh pale green, rather thick, very sweet and agreeably perfumed. Stores well. Introduced prior to 1885. TAPLEY 1937, VILMORIN; C20M, H99M{PR}

Extra Early Hackensack: (Early Hackensack) Medium-sized, oblate fruit; skin golden-yellow, mottled profusely with green; flesh light green blending into yellowish green near the cavity, very fibrous, sweet and very highly flavored, mildly aromatic; quality fair to good. Originated in Hackensack, New Jersey about 1884. TAPLEY 1937; U8D

Green Climbing: Small, oblong fruits, slightly ribbed; 4 to 5 inches long and weighing 1 to 1 1/2 pounds; skin deep green, somewhat dotted with pale green; flesh green, melting, very sweet and juicy, highly perfumed. Vigorous, branching vine. Ideal for growing on trellises, espalier stakes or walls. French heirloom from the 19th Century. VILMORIN; F80, N84

Green Nutmeg: (Early Green Flesh Nutmeg, Nutmeg) 63 days. Slightly oval fruit; heavily netted, shallowly ribbed; 3 1/2 inches in diameter, weight 2 to 3 pounds. Flesh light green with a salmon center, aromatic, very sweet and sprightly. Best harvested at half slip. Heirloom. A2, D68, E5T, F73D, G57M, K20M, K49M, R47

Haogen: (Ogen, Israel) 80 days. Round fruit; 5 to 6 inches in diameter, weight 3 pounds; smooth green rinds, slightly tinged yellow when ripe; wide green sutures. Pale greenish-white flesh, tinted salmon around the small seed cavity; thick, tender, juicy, very sweet and rich. Vigorous, prolific vines. A2, B49, G71M, G93M, I99M, J9M, K49T, L11, L13M, L91M, N16, O89

Jenny Lind: 75 days. Small, oblate fruit, flattened at both ends; often with a small knob on the blossom end; 5 to 6 inches in diameter, weight 1 1/2 to 2 pounds. Skin dull brownish-orange, profusely mottled with green. Flesh light green, soft and juicy, very sweet, mildly flavored and lacking in aroma. At one time a popular home garden and local market cultivar. Introduced about 1846. TAPLEY 1937; A2, D29P, E5T, F24M, G71, J20, K49M, K71, L91M, M32

Navajo: (Branco) 85 days. Very unusual and interesting melon. Originally from Portugal, it has become the favorite melon of the Navajos. Very large, tear-drop shaped fruits, 20 inches long and 10 inches across; light yellow skin, ridged and waisted; flesh thick,

green, honeydew-like but with more flavor and texture Very perishable, must be eaten within a day or two of ripening. J73

Rocky Ford: (Eden Gem, Netted Gem, Nutmeg) 91 days. Nearly round fruit; 4 to 5 inches in diameter, weight 2 to 2 1/2 pounds; heavily netted, slightly ribbed. Flesh green with a narrow gold border near the cavity; very sweet and sprightly. Well-known and popular home garden and short distance shipping cultivar. Introduced about 1885. TAPLEY 1937; A75, B75, B75M, F24G, F60, I84, K5M, K71, L7M, M95M, N16

Tiger: 110-120 days. Very large, elongated fruits, the size of small to medium watermelons; skin yellow, mottled and streaked with green, lightly ribbed. Crisp, light-green flesh, juicy and succulent. High sugar content. Developed by Hill Luz of Bonanza Seeds from seed originally collected in Afghanistan. B49

#### SALMON-FLESHED

#### *Hybrid*

Ambrosia: 86 days. Medium-sized, very uniform, nearly round fruit; 6 inches in diameter, weight 4 1/2 to 5 pounds; heavily netted, not ribbed. Flesh salmon, juicy, extremely thick and firm right down to the rind; very sweet, with a unique distinctive flavor. Seed cavity small, with seeds in a tight mass. Vines prolific; resistant to powdery and downy mildew. B6, B75, E53M, E75{PL}, G1M, G71, G82, G93M, H85M, 139,164,191, M29, M95M

Burpee Hybrid: 82 days. Round to slightly oval fruit; heavily netted, distinctly ribbed; 6 inches in diameter, weight 4 to 4 1/2 pounds. Flesh deep-orange, thick, firm, juicy, sweet and flavorful, of excellent quality. High-yielding vine; produces very well in northern areas. Popular with home gardeners and market farmers. B6, B75, C85M, E24, E91G, G71, G79, H33M, H54, H61, H85M, I64, J97M, K50, L42, etc.

Hami Sweet: 85 days. Improved hybrid form of the famous Hami melons from Xinxiang in western China. Uniform, oblong fruits weighing 3 to 4 pounds. Very crisp and sweet orange flesh. Grows very well in milder climates. Resistant to powdery mildew. Recommended for home gardens, roadside farms, and specialty markets. D55, H49, N84

Pancha: 80 days. Hybrid between a Charantais melon and an American muskmelon. Fruit netted, with slight green ribs; 6 inches in diameter, weight about 2 pounds. Solid, deep-orange flesh, very aromatic; flavor very sweet and intense. Vine vigorous; resistant to powdery mildew and fusarium wilt. J97M, K66

Seika: Improved hybrid form of the famous Hami-gua melons from China's Xinxiang province. Oblong fruits weighing about 3 1/2 pounds; light, yellow-green skin with slight netting; thick, light-orange flesh, tender, crisp, very delicious, brix content 14%. Stores very well. Vigorous, high yielding plant; disease resistant. S70

#### *Open-Pollinated*

Ananas d'Amerique: (Red-Fleshed Pineapple) Small, globe-shaped fruit, 3 to 4 inches in diameter and weighing 10 ounces to over a pound; skin thin, light green dotted with blackish-green, slightly netted; furrows shallow, clear green; flesh red, firm, juicy, sweet, very aromatic; seed cavity tiny. Vigorous, branching vine. Heirloom from the 19th Century. VILMORIN; G68

Banana: 90 days. Long, cylindrical, tapered fruit; 15 to 18 inches in length, 4 to 4 1/2 inches in diameter; weight 3 1/2 to 4 pounds; netting very sparse, ribs prominent; skin creamy yellow when ripe. Flesh salmon orange to orange, juicy, very sweet, mildly aromatic. Introduced prior to 1883. TAPLEY 1937; B73M, C92, D76, E97, F60, H85M, K27M, K71, M46, N16

Blenheim Orange: Medium-sized, short-oval fruit; skin thin, finely netted. Thick, very succulent, scarlet flesh; very highly perfumed, of fine flavor. High yielding and extremely reliable. Traditionally grown in greenhouses in England. First raised in 1881

in the gardens of Blenheim Palace. VILMORIN; B49, K49T, N84, R32, R47, S61

Delicious 51: (Golden Delicious 51) 83 days. Nearly round fruit, 6 inches in diameter, weight 3 to 4 pounds; skin yellow when ripe, with medium to sparse netting and distinct sutures. Thick, firm, orange flesh, of excellent quality. Resistant to fusarium wilt. Excellent for home gardens and nearby markets. A25, B6, B75M, C85M, G57M, G71, G79, H33M, I64, K10, K50, L4, L7M

Early Hanover: (Extra Early Hanover) 80 days. Globe-shaped, slightly flattened fruit; 6 inches in diameter, weight 3 to 3 1/2 pounds; rind light green with slight netting, ribbing shallow, but definite. Sweet, juicy, salmon-orange flesh. Grows well under adverse conditions. Good for home gardens. A2, C95

Far North: 65 days. Hearts of Gold type. Globe-shaped fruit, 4 to 5 inches in diameter; rind sparsely netted, turns yellow when ripe. Flesh deep-salmon to orange, very firm and sweet. Small, compact vine. Successful in areas throughout Canada, where other cultivars fail to mature. D27, K20M

Garmak: 65-70 days. Very early Persian melon, often ripens in April. Small, oblate fruit, about 4 inches long and 5 inches in diameter; orange, netted rind; sweet, salmon flesh. Susceptible to powdery mildew, nematodes and wilts. Introduced into the United States in 1958 from Isfahan, Iran. SHAIDA; U14

Giant Perfection: 95 days. Extra large, round fruit; 8 to 10 inches in diameter, weight 14 to 15 pounds; heavily netted, distinctly ribbed. Firm, rich, deep-orange flesh; sweet and flavorful; large seed cavity. Selected from the old Perfection cultivar. Productive and reliable. F73D, K49M

Golden Champlain: 85 days. Moderately small, globular fruit, 5 to 6 inches in diameter; weight 3 to 4 pounds; skin yellowish-brown, profusely mottled with green; flesh pale orange, medium thick, slightly fibrous, moderately soft and juicy; flavor sweet, medium; quality moderately good. Introduced in 1923. TAPLEY 1937; K71

Golden Gopher: (Pop-Open Melon) Unusual heirloom from the 1930's. Golden yellow, round-oval fruit; netted on the stem end but free of netting on the blossom end, except for a "belly button" at the tip; flesh intense orange, aromatic, fine-textured, sweet to the rind; flavor not as complex and full-bodied as other melons. Resistant to fusarium, bacterial wilt, and drought. Known as Pop-Open melon because the fruits have a tendency to split when fully ripe. D68, K20M, K49M, L88J

Hale's Best Jumbo: 83 days. Large, oval fruit, 6 to 7 inches in diameter and weighing 5 or 6 pounds; rind yellow-green, slightly ribbed, heavily netted; flesh thick, deep salmon-orange, sweet, flavor very good. Popular standard cultivar. Good for local markets, roadside stands, and short distance shipping. B8M, B73M, B78, C69, D74B, E5T, G27M, G71, G93M, H57M, H85M, H95, K5M, K10, K49M, K71, M95M, N16, etc.

Harvest Queen: 92 days. Medium-sized, roundish fruits, 5 1/2 to 6 1/2 inches in diameter and weighing about 3 1/2 pounds; rind golden-yellow when ripe, coarsely netted, ribs shallow; flesh deep orange, thick, firm, fine-textured; flavor sweet, rich, musky; quality very good. Resistant to powdery mildew and fusarium wilt. Good for home garden and local market use. C92, G79, I59M, K23{PL}, K27M, K49M, K49T, L3J, L55J

Hearts of Gold: (Hoodoo) 90 days. Nearly round fruit, 5 1/2 to 6 inches in diameter, weight 3 to 4 pounds; rind dark green with fine gray netting, distinctly ribbed. Firm salmon flesh, sweet, somewhat sprightly, quality very good. Popular with home gardeners and local markets. Originated in Benton Harbor, Michigan by Roland Morrill. Patented in 1914. TAPLEY 1937; A75, B6, B75M, C92, G83M, G93M, H33M, H95, J73, J97M, K10, K49M, M95M

Honey Rock: (Sugar Rock) Globular fruit, 6 inches in diameter, weight 2 1/2 to 3 1/2 pounds; rind very strong, grayish-green turning yellow at maturity; netting abundant, coarsely interlaced, ribs

obscure. Medium-thick, deep-salmon flesh; juicy, sweet, slightly coarse in texture. Good for home gardens. Introduced in 1925. TAPLEY 1937; A75, C69, C85M, D76, G79, H49, I59M, I64, K10, K71, K73, M95M

Iroquois: 87 days. Nearly round fruit; 6 1/2 inches in diameter, weight 4 to 6 pounds; grayish-green rind, well netted, with prominent ribbing. Thick, sweet deep-orange flesh; of excellent quality and fine texture. Excellent for short distance shipping. Resistant to fusarium wilt. Standard main crop cultivar for northern areas. B6, B8M, B49, C44, C92, C95, D65, D76, E97, H49, H61, J9M, K71, K73, L13M, L89, N16, etc.

Kansas: An heirloom muskmelon with excellent flavor. Ridged, oval-shaped fruit, moderately netted; weight about 4 pounds. Orange flesh; ripens close to the rind. Vigorous, hardy vine; particularly resistant to sap beetles which destroy fruit of other cultivars. L7M

Minnesota Midget:<sup>1</sup> 65 days. Small, globe-shaped fruit; 3 1/2 to 4 inches in diameter; rind deeply lobed, with sparse netting. Thick, golden-yellow flesh, sweet right to the rind; small seed cavity. Dwarf vine, grows only 3 feet long; resistant to fusarium wilt. Ideal for small gardens. Released by the University of Wisconsin. A2, B73M, D76, E24, E97, G13M, G83M, J20, K10, K49M, L91M

Montana Gold: 60 days. One of the earliest maturing muskmelons. Developed by Fisher's Garden Store of Belgrade, Montana to ripen in areas with very short growing seasons. Round, netted fruit; sweet and flavorful. Fruit starts to set with the first blossoms. D82

Musketeer:<sup>1</sup> (Bush Musketeer) 90 days. An improved bush-type melon. Round, heavily netted fruit, 5 1/2 to 6 inches in diameter; weight 2 to 3 pounds. Sweet, fragrant, light-orange flesh; firm and tender. Short-vined plant, spreads only 2 1/2 to 3 feet; sets 4 to 6 fruits. Ideal for small gardens and container culture. Introduced in 1982. E91G, G27M, H54, H57M, H95, M95M

Old Time Tennessee: 100 days. Large, elliptical fruit, 12 to 16 inches long; weight 12 pounds; rind deeply creased. Sweet, very fragrant, salmon flesh. Flavor excellent, but must be picked exactly at peak ripeness. Will not keep. C20M, F73D, L7M, N16, N84

Pennsweet: 65 days. Small to medium-sized, slightly ribbed, oval fruit, 6 inches long; weight 1 1/2 to 2 pounds; well-netted rind; flesh salmon, thick, juicy and sweet, of high quality, seed cavity very small. Perfect for individual servings. For home garden and local market use. All America Selections winner in 1955. U8D

Persian: (Small Persian) 110 days. Nearly round fruit; 6 to 7 inches in diameter, weight 6 to 7 pounds. Rind dark-green, turning yellow-orange when ripe; uniformly covered with a fine netting, no ribbing. Flesh very thick, bright-orange; sweet, with a distinctly pleasant flavor and aroma. Excellent shipping qualities. Adapted to areas of long, warm growing seasons. TAPLEY 1937; B75M, C20M, F60, G93M, K60M

Schoon's Hardshell: (Illinois Hardshell) 90 days. Large, oval fruit; 8 to 9 inches in diameter, weight 5 to 7 pounds; rind heavy, hard, deeply ribbed, with coarse yellow netting. Flesh salmon pink, thick and solid, spicy with a good musky flavor. Resistant to growth cracking. Excellent for home gardens and shipping. B75M, C92, G1M, G71, G79, N16, N52

Sierra Gold: (Sierra Gold Early Shipper) 85 days. Slightly oval fruit; 6 inches in diameter, weight 3 1/2 pounds; rind yellow-green, slightly netted, almost no rib. Flesh salmon; thick, firm, sweet, of very good flavor. Good for home gardens and commercial use. Resistant to powdery mildew. D74B, G71M, K27M

Spear: 90 days. Large, elongated fruit; weight 3 to 6 pounds; rind grayish-green, moderately netted. Flesh yellow-orange, sweet. Good for home gardens and local markets. Long popular in the maritime Northwest. Known prior to 1929. Origin unknown, but possibly a hybrid of the Banana muskmelon. TAPLEY 1937; A2,139, K49M, N24M

Sweet Granite: 70 days. Oblong, lightly netted fruit; weight 2 1/2 to 3 1/2 pounds. Does well in difficult, cool weather areas. Sweet bright-orange flesh. Flavor and texture remain good if vines stay healthy and fruit is picked promptly at maturity. Moderately vigorous vine; tolerant to fusarium wilt. Developed by Professor E.M. Meader at the University of New Hampshire. A2, E59Z, G6, K49M, L13M, N24M, 089, R47

Tang Thai: Medium-sized, cylindrical, dense fruit; rind slightly pubescent when young, medium-green with lighter green stripes, reminiscent of a watermelon; flesh salmon, orange near the seed cavity, slightly sweet; has a strong distinctive aroma when ripe. Easy to grow but not suitable for trellising; grown during the rainy season in the tropics. Young fruits are canned, older ones are used for making refreshing desserts. Occasionally available in ethnic markets. 053

Tip Top: 90 days. Large, globular, moderately ribbed fruit; 6 1/2 inches long; weight 5 to 6 pounds; skin pale yellowish-cream, netting moderately abundant; flesh orange, moderately thick, rather coarse, juicy, sweet; quality very good. Does well in northern areas. Introduced in 1892 by Livingston Seed Co. TAPLEY 1937; F73D

Weeks North Carolina Giant: 85 days. Extremely large fruit, average weight 20 to 25 pounds when grown on proper soil in a normal season. Sweet, juicy flesh. Produced the world's largest melon of 39 pounds in 1977. Developed by Edwaid E. Weeks of Greenville, North Carolina. B73M, D65,181, L79

#### WHITE-FLESHED

##### *Hybrid*

Golden Crispy:<sup>2</sup> 75 days. Small, very uniform, oval fruit; 4 to 5 inches long, weight 10 to 12 ounces; skin smooth, bright golden-yellow. Flesh white, very sweet and aromatic. Rind extremely thin, edible. Whole fruit can be eaten like an apple, no peeling necessary. Vine prolific, often sets more than 10 fruits; resistant to heat. COOK [Cu]; A79M, C92,139, M46, N24M

Honey Gold Sweet:<sup>2</sup> 90 days. Small, elongated-oval fruit; weight about 10 ounces; skin golden-yellow, smooth and glossy. Flesh white, crisp, sweet and very aromatic. Rind extremely thin, edible. A good keeper. F73D, L59

##### *Open-Pollinated*

Ananas (Sharlyn) 105 days. Oval-shaped fruit, 6 inches in diameter, weight 4 1/2 to 6 1/2 pounds; rind thin, yellow-orange at maturity; uniformly netted, no ribs or sutures. Flesh white, with gold lining and seed cavity; juicy, very sweet and perfumed. Vigorous vine; tolerant to powdery mildew and crown blight. Long popular overseas. A2, F60, G93M, K49M, K49T, L11, L13M, N16, N40{PR}

Cob Melon: 85 days. Medium to large, globe-shaped fruit; skin soft, mottled with light and dark green, ribbed. Slightly grainy, creamy white flesh; very sweet and melting. Unique, cob-like seed cavity that is easily removed. Large, productive vines. Popular for over a century in old-fashioned home gardens throughout the West. F73D, N84

Early Silver Line: 76 days. A unique and very attractive oriental melon of elongated shape. Small, oblong-oval fruit; yellow skin lined with silver sutures, so thin it can be peeled like an apple. Crisp, white flesh; very sweet and fragrant. Very popular in Korean markets. B75, E75{PL}, Q3

Ein Dor: An older Ananas type still popular in Israel. Short-oval fruit; weight 2 1/2 to 4 1/2 pounds; rind light yellowish-orange, with fine netting. Flesh creamy white, very sweet and aromatic; quality very good. Ripens in midseason. Resistant to powdery mildew race 1. P75M, T27M

Hero of Lockinge: Medium-sized, roundish fruit; skin bright yellow, slightly netted; flesh white, very tender, melting, rich, of

excellent quality. Traditionally grown in cool greenhouses or frames in England. Introduced about 1884. VILMORIN; S61

Israeli: (Old Original Israeli) 90-95 days. Ananas type. Large, oval fruit; weight 4 to 5 pounds; rind yellow-orange when mature, netting sparse, no ribs or sutures. Flesh white, with a gold seed cavity; very sweet and aromatic. Vigorous, productive vines. F24M, F73D, N16, N84

Jharbezeh Mashadi: Native to northern Persia, near the town of Mashad. Considered by some to be the original form of melon. Oblong-shaped fruit, 18 inches long, 8 inches in diameter; skin mottled green and yellow, becoming split when ripe. Very sweet, honeydew-like white flesh with a crispness similar to watermelon. So sweet it has to be eaten in small amounts. U14

#### WINTER MELONS

Late ripening melons that can be stored longer than other types, some into the winter months. Generally lacking in the musky odor of the muskmelons. Most require a very long growing season. Some prefer a period of cool weather to ripen properly.

CASABA MELONS Usually with rough skins, whereas the Honeydew types are smooth-skinned. The name is derived from the town Kassabah near Smyrna (now Izmir), Turkey.

##### *Hybrid*

St. Nick: 84 day & Very attractive, hybrid Santa Claus type. Long-oval fruit, weighing about 6 pounds; very hard rind, gray-green with dark green mottling, slightly netted; flesh creamy white, firm, juicy, very sweet, refreshing; seed cavity small. Excellent keeper, will store for up to 3 months after harvest. Vigorous, productive plant. Bred from Spanish melon stock. D76, E97, 164, J97M, K66, L91M, M46

##### *Open-Pollinated*

Golden Beauty: 110 days. Long-oval fruit, 7 inches in diameter, weight 7 to 8 pounds; rind very hard, wrinkled, a rich golden color when ripe. Thick white flesh; juicy, sweet, spicy, without aroma; small seed cavity. Excellent for shipping and storage. Needs a long, warm, dry climate. Resistant to crown blight. TAPLEY 1937; B75, B75M, D1T, F60, G13M, G57M, G83M, G93M, H95, K5M, K49M, N40{PR}, N52

Marygold: 80-85 days. Premium quality, early casaba type. Medium-sized, oval fruit, 6 1/2 inches in diameter and weighing 3 to 4 pounds; rind bright yellow, slightly wrinkled, tough; flesh pale greenish-white, thick, very sweet, refreshing. Vigorous, very productive vine, resistant to fusarium and powdery mildew. Originated at the University of Maryland. J9M, K10, L10, L42, L89C

O'odham Kuri Basho: (Ke:li Ba:so) Casaba type fruit with light green flesh. A favorite of Tohono O'odham (Papago) and Pima farmers. Vines produce abundant crops. Adapted to low hot desert areas. In temperate areas, plant in spring when danger of frost is past. 116, N84

Santa Claus: (Christmas Melon) 110 days. Long-oval fruit; 12 inches long, 6 inches in diameter; weight 8 to 9 pounds; rind very hard, wrinkled, golden-yellow with dark green mottling. Thick, white to pale green flesh; juicy, sweet, spicy. Excellent for shipping and storage. Resistant to crown blight. Best adapted to long, warm, dry growing regions. B75M, C20M, F60, G57M, G93M, K60M, N40{PR}, N52

Santo Domingo: 100 days. Santo Domingo Pueblo strain. Large, round, basketball-size fruit. Aromatic, pale green flesh, sweet and juicy. Yields 5 to 6 fruits per vine. From the New Mexico Pueblo near Santa Fe. Adapted to the high semi-desert. Sown in spring after danger of frost. L3J

Sungold: 85 days. Medium-sized, nearly round fruit, weight 5 to 7 pounds; attractive, golden-yellow skin; thick rind, distinctly ribbed, slightly wrinkled at the stem end. Flesh greenish-white,

juicy, very sweet, of excellent quality; keeps well. Short vines; can be planted on closer spacing. Ripens successfully in northern areas. Developed at the University of New Hampshire by Professor E.M. Meader. J9M, K49T, L7M

Tam Mayan Sweet: Large, round fruit; rind hard, slightly wrinkled, ivory-white at maturity. Thick white flesh, very mild, of good flavor; seed cavity small and dry. Will not slip unless overly ripe. Highly resistant to downy mildew; immune to known races of powdery mildew. C92, L4, L89G

Turkish Leopard: Long yellow fruits, striped and blotched with green, weight 6 to 7 pounds; sweet, delicious flavor. Stores very well. Has proven to be well adapted to the climate in Victoria, Australia where it produces good crops of fruit. Discovered in the markets of Istanbul. 089

**HONEYDEW MELONS** Usually with smooth skins, as opposed to the Casaba types which have rough skins. The original Honeydew melon was named in 1915 and is believed to be identical to the French cultivar, White Antibes. B65{PD}, K19{DF}

#### Hybrid

Earli-Dew: (Early Honeydew) 80 days. Nearly round fruit; 5 to 6 inches in diameter, weight 2 1/2 to 3 pounds; rind smooth, green-gold at full maturity. Thick, rich lime-green flesh; very sweet and tender. Will slip when ripe. Excellent for home gardens. Well suited to most northern areas. Vigorous, productive vine; resistant to fusarium wilt. B73M, C44, C85M, D65, F13, G16, G71, H61, H95, K73, L79, M46, N16

Morning Dew: 96 days. Very large, oblong fruit; average weight 10 to 12 pounds; flesh green, thick, very sweet. Vigorous vine; tolerant to fusarium wilt race 2, and powdery and downy mildews. Should be started indoors in northern areas and transplanted through plastic mulch. F13

Orange Blossom: 80 days. Hybrid orange-fleshed honeydew. Medium-sized, nearly round fruits weighing about 3 pounds; very smooth, creamy-white rind, extra thin; flesh deep-orange, very sweet, melting, rich and aromatic. Vigorous, compact, productive vines. Recommended for home gardens, local markets and specialty markets. C92, D26D, E75{PL}, E97, G16, G82, J20, K49Z, L79, M29

Venus: 88 days. Medium-sized, oval fruit, about 5 1/2 inches in diameter; rind medium-thick, light golden-yellow, slightly netted. Flesh bright green, extremely thick and juicy, sweet and aromatic. Slips easily from the stem when ripe; harvest at full slip. Stores and ships very well. Vines produce heavy crops. B75, K50

#### Open-Pollinated

Golden Honeymoon: (Gold Rind Honeymoon, Gold Rind Honeydew) 95 days. Uniform, nearly round fruit; 6 1/2 inches in diameter, weight 5 1/2 pounds; rind smooth, creamy white turning an attractive golden color when ripe. Thick, emerald-green flesh; juicy, sweet and spicy. Resistant to sunburn. Ships and stores well. A2, G57M, H33M, H95, K5M, N16

Green Fleshed: (Honeydew) 110 days. Round-oval fruit, 7 inches in diameter, weight 6 pounds; rind smooth, hard, creamy white when ripe. Flesh emerald green; very sweet and juicy, with a distinct, spicy flavor; medium-sized seed cavity. Excellent for shipping. Resistant to crown blight. Adapted to long season areas. A75, A87M, B75M, F60, G93M, H42, H85M, I39, K49M, K71, R47

Honeyloupe: (U.C. Honeyloupe) 92 days. Short-oval fruit; 5 to 6 1/2 inches in diameter, weight 3 to 5 pounds; rind creamy white, tinted with pale salmon at maturity. Thick, sweet, salmon-orange flesh; distinct flavor; small seed cavity. Slips from vine when ripe. Resistant to verticillium wilt and crown blight; tolerant to sulphur. Honeydew-cantaloupe cross; developed at the University of California, Davis. C20M, C95, F15{PR}, J9M, K23{PL}, N16, N52

Orange Fleshed: 110 days. Nearly round fruit, 6 inches in diameter, weight 5 to 6 pounds; rind smooth, creamy white when ripe. Thick, sweet, light-orange flesh; flavor intermediate between Honeydew and Crenshaw; small seed cavity. Excellent for market and shipping. Resistant to crown blight. ^475, B75M, C20M, G57M, G93M, H85M, H95, K5M, M32, N52

Tam Dew: 100 days. Medium-large, oval fruit; 6 inches in diameter, weight 5 to 6 1/2 pounds; rind smooth, creamy white at maturity. Thick, light-green flesh; sweet and juicy; small seed cavity. Resistant to downy and powdery mildews. Developed by Texas A & M University. C20M, L4, N16

Tam Dew Improved: 95 days. Round fruit; 6 1/2 inches in diameter, weight 5 to 5 1/2 pounds; rind smooth, creamy white, sometimes with a yellow spot where exposed to the sun. Flesh green, lighter towards the seed cavity, which is small; high sugar content. Resistant to downy mildew and races 1 and 2 of powdery mildew. AI, A87M, F60, G13M, K5M

#### OTHERS

#### Hybrid

Early Crenshaw: (Burpee Early Hybrid Crenshaw) 90 days. Large oval fruit, slightly pointed at the stem end; weight 14 pounds; smooth dark-green skin, yellowish-green when ripe. Thick, firm, salmon-pink flesh; juicy, sweet and flavorful. Early enough to ripen in northern areas. Vigorous, prolific vine. B75, F63, G79, H49, H95, K50, M29, M95M

Gold King: 90 days. Hybrid Yellow Canary type that can be grown in northern areas. Large, smooth oval fruit; weight 3 1/2 to 4 pounds; attractive, very thick yellow rind. Sweet, aromatic, flavorful, nearly white flesh. Can be stored for several weeks without refrigeration. Popular in Europe. K10, K73

Honeyslow: 85 days. Very early hybrid Crenshaw type. Oval-shaped fruit, tapering slightly towards the stem end; 7 to 8 inches in diameter, weight 8 to 9 pounds; rind mottled green, turning yellow at maturity. Thick, tender, pastel pink to orange flesh; sweet and juicy, with a distinctive aromatic flavor. Will ripen in short season areas. C20M, D11M, F63, F70, G27M, K50

#### Open-Pollinated

Crenshaw: 110 days. Oval-shaped fruit, slightly tapered towards the stem end; 6 to 6 1/2 inches in diameter, weight 5 to 7 pounds; rind rough, dark green turning mottled yellow when ripe. Thick salmon-pink flesh; very tender and juicy, sweet, of a rich distinctive flavor. Requires a long, warm season. C92, G83M, G93M, H33M, H85M, J84, K5M, K49M, K71, N40{PR}

Crenshaw Blanco: (White Crenshaw) 110 days. An improvement on the original Crenshaw. Large, oval fruit, weight about 5 pounds; rind corrugated, becomes creamy white when ripe; flesh salmon-pink, very sweet. Excellent for long distance shipping, specialty markets and home gardens. B8M, C20M, F60, G57M

Escondido Gold: Large, elongated fruit; 6 inches in diameter, weight 8 to 10 pounds; skin smooth, light yellow-gold, with streaks of orange or light green. Flesh yellowish-orange; tender, juicy, very sweet and flavorful; of excellent quality. Resistant to drought. Originated in Escondido, California by Stanley Grabinski. The result of 16 years of breeding. LI 1, L77D

Indian Cream: (Cobra Melon) An unusual type, with drier flesh than common melons. Has a very distinct flavor and aroma. Splits when ripe. Usually served sweetened with honey or ice cream. PIG

Napoletano Giallo: Small to medium-sized, oval fruit; skin yellow; flesh whitish, sugary, of excellent flavor. Harvested the end of August, ready for eating the end of September into winter. Keeps and ships very well. Becomes sweeter and more melting as it ripens in storage. N84, Q11M

Napoletano Verde Precoce: Small to medium-sized, oval fruit; skin green, slightly ribbed, resists bruising; flesh whitish, sugary, savory. Harvested in August, stores well into the winter always becoming sweeter and juicier. Ships very well. N84, Q11M

Pinyonet de Valencia: (Pele de Sapo, Pinonet Piel de Sapo, Toad Skin) 105 days. Oval-shaped, 8 inch long fruit; skin mottled with green and yellow, reminiscent of a frog's skin; netting and sutures absent; flesh white, very sweet, flavor very agreeable. Ripens very early for a winter melon. G57M, K60M, K73, M46, N84, Q11M

Stutz Supreme: 90 days. Heirloom melon, developed over a 20 year period by Joe Stutz of Chico, California. Large, round fruit, weight 5 to 10 pounds; skin beige, non-netted. Delicious orange flesh. Won't slip when ripe. Ripens midseason; bears well until frost. Requires heat to develop full flavor. L77D, N84

Sweet Freckles: 100 days. Early Crenshaw-type melon with unusual dark green "freckles" that dot the light green skin. About 1/2 to 2/3 the size of regular Crenshaw. Light orange flesh; sweet, juicy and tender with a sweet aroma reminiscent of roses. Handles well due to the tough rind. Should be harvested when the "freckles" on the underside turn yellow-orange. J9M

Tam Canary: Round-oval fruit; rind hard, slightly wrinkled; skin color light-green, turning yellow-orange at maturity. Flesh white, crisp, flavorful; with a small, dry seed cavity. Will not separate or slip from the vine; should be harvested when yellow. Highly resistant to downy mildew; immune to known races of powdery mildew. L89G

Valencia Espanhol: 80 days. Oval-shaped fruit, with pointed ends; 6 inches in diameter, weight 5 to 6 1/2 pounds. Rind very dark green, appearing black from a distance, very hard, furrowed. Thick, crisp flesh; pale yellow with an orange seed cavity lining, very sweet and juicy. May be stored for 4 months while retaining high sugar content. Adapted to arid, long season areas. J73, N84

Verte de Treste: Origin unknown. Apparently brought to Toulon in southern France by American soldiers landing from North Africa in 1944, hence its market name, l'Americain. Football-shaped fruit, with dark green skin and sweet pale green flesh, slightly tinged with orange around the seed cavity. Excellent keeper. C20M

Yellow Canary: (Jaune des Canaries) 110 days. Elongated fruit, 5 1/2 inches in diameter, weight 4 to 6 pounds; rind smooth but slightly wrinkled, bright yellow. Flesh white, with an orange cavity lining at maturity; 2 inches thick; crisp, sweet and aromatic. Requires a long growing season to mature properly. Long popular in the Mediterranean area. B75M, C95, E5T, F60, G57M, G93M, K49T, K73, L3J, L59G, N16, N40{PR}, N52

#### CODES FOR SPECIAL TYPES

1. Short-Vined
2. Edible-Rinded

## MINT {PL}

#### MENTHA SPP.

Banana: Distinctive new mint with interesting culinary possibilities. Well-shaped, light green leaves with a pleasant, fruity scent and hints of banana. Not reliably hardy in New Jersey. K57, M82

Black Mitcham: Dark green foliage on purple stems. Strong peppermint flavor. Makes a soothing, fragrant tea. Grown from disease resistant Black Mitcham stock. Widely grown commercially due to its high yields, hardiness and fine flavor. Grows about 28 inches tall. K57, L90J

Blackstem Peppermint: (Black Peppermint) Tall, upright growth habit. Thick stems of bronze-purple blended with green. Dark green

leaves tinged with purple. Reddish-purple flower clusters. Excellent strong peppermint flavor and aroma. Makes a delicious tea. High oil content. C43M, C81M, F32D, G96, H29M, K22, J66, J76, L94M, R49

Blue Balsam: (Blue Balsam Tea Mint) Shiry, dark-green leaves with a purplish tint. Height 2 to 3 feet. Has an excellent aroma and flavor, more pungent than peppermint, with a hint of pennyroyal. Excellent for tea. Prefers a shaded location. C9, C43M, C67M, E61, F37T, H51M, 139, J66, J66{DF}, J76, K22, K57, K85, M82, N19M, N42, etc.

Candy: (Candy Peppermint) Strong sweet scent, reminiscent of Pep-O-Mint Lifesavers. Round, glossy leaves with reddish stems. Grows to 2 feet tall. Very attractive. Said to be a cross between peppermint and spearmint. C9, C43M, C81M, F32D, F35M, F37T, H29M, H94M, I77M, J76, K57, L56

Chocolate Peppermint: (Chocolate Mint) Dark green leaves and stems. Height 12 to 18 inches. Has an attractive peppermint odor and flavor with a rich, aromatic chocolate overtone. Reminiscent of a chocolate peppermint patty. Very good for fruit desserts and ices; also excellent for candying. WILLIAMS, J.; A97, C9, C67M, G96, H4, H94M, 139,191, J37M, J66, J82, K22, K66, L90J, M53, N42, etc.

Curly Spearmint: (Curly-Leafed Spearmint, Curly Mint) Stems long and weak, to 2 feet high; hairy; sprawls in late summer. Broad, dull, crinkled leaves with a heavily veined undersurface. Pale purple flower spikes. Scent and flavor similar to spearmint but stronger. Also a stronger grower. C43M, C81M, E61, F15M, F32D, H94M, J82, K57, L56, L90J, M82, N42

Doublemint: Combines the qualities of both spearmint and peppermint in one plant. When first tasted, there is a definite flavor of spearmint followed by an aftertaste of peppermint. Interesting and flavorful. Height 2 feet. Hardy in Zones 4 to 9. C9, C43M, F37T, F93G, L90J, N42

Emerald 'n' Gold: (Gieen and Gold, Variegated Spearmint) (M. spicata) An unusual form of spearmint with dark-green and golden-yellow variegations forming on the leaves in cool spring weather. Same flavor and aroma as spearmint. Height 2 feet. Plant in sun or semi-shade. A97, C9, C43M, C67M, C81M, F32D, G80, H29M, L90J, N42

Grapefruit: Strong, upright growth habit. Good form; less scraggly than many mints. Large, light grayish-green, ruffled leaves tinged with purple in juvenile stage. Has a spearmint scent and flavor with a strong, distinct grapefruit-like overtone. Height 12 to 18 inches. Rust resistant. Can be used for tea, jellies and potpourri. Developed by the University of Oregon. A97, C43M, C67M, C81M, E61, F32D, F37T, J66, J66{DF}, J82, K22, K85, L56, L90J, M82, etc.

Hillary's Sweet Lemon: Hybrid of apple and lime mints. Combines the sweet, fruity, spearmint-like aroma of apple mint with the distinct citrus overtones of lime mint. Fast growing, female plant with ruffled leaves and lavender flower spikes. Developed by Jim Westerfield. Named after Hillary Clinton, First Lady and herb enthusiast. E7, F35M, J82, K22, M82, N84

Kentucky Colonel: (Improved Spearmint) (M. x villosa) Vigorous, 30 inch tall plant with large, broad, rugose leaves. Has a delightful, extra pungent, fruity spearmint flavor and aroma. The Kentucky Derby classic; great for mint juleps. One of the best flavored of all the spearmints. A hybrid of spearmint and pineapple mint. Plant in sun or semi-shade. A97, C9, C43M, C67M, C81M, F15M, G96, H4, H46{DF}, H51M, J66, J82, K22, K57, L56, L90J, N42, etc.

Lebanese: (Lebanese Mint) Compact leaves and dark, reddish stems. Fresh, sharp peppermint flavor and fragrance. Suitable for fresh use or drying. Grows about 15 inches tall. F37T, K57, M53

**Menthol:** (*M. spicata*) A seed-propagated cultivar commonly sold as peppermint or spearmint. The flavor and odor is pungent, not sweet like the true root-propagated strains. Useful for tea, especially for medicinal purposes. J82{S}

**Mint the Best:** (*M. spicata*) Narrow, dark green foliage with an excellent crisp spearmint aroma and flavor. Very popular spearmint type. Excellent for tea, mint juleps and jellies. Vigorous plant; height 2 to 3 feet. F32D, H51M, H94M, 139,191,199P, K2, L90J, M15T, M53

**Moroccan:** (*M. spicata*) An extremely fragrant strain of spearmint grown in Morocco for the making of mint tea. Add a drop of honey, if you wish, for one of the most refreshing herbal teas. In parts of Morocco, they often add wormwood or mugwort to mint tea. Grows to about 2 feet tall. F35M, H94M, N84, R53M, S55

**Narrow-Leaved Spearmint:** (*M. spicata*) Similar to spearmint, but leaves are narrow and tinged purple. Same flavor and aroma as spearmint. An heirloom cultivar, carried by settlers from place to place. Height 12 to 24 inches. K22, K85

**Roberts Mitcham:** (*M. x piperita*) Select, wilt resistant strain of true black peppermint. Dark-green leaves on purplish stems. Strong, cool peppermint flavor and aroma. Tall, upright-growing plants, height about 24 inches. Fresh or dried leaves are excellent for tea. G6

**Todd Mifcham:** Very flavorful strain of blackstem peppermint grown commercially for the flavor industry. Dark-green leaves and purplish stems. Strong, cool, classic peppermint aroma and taste. Vigorous, upright plant, grows 20 to 36 inches tall. Hardy in Zones 3 through 10. F32D, M82

**Variegated Peppermint:** (*M. x piperita*) Attractive leaves touched with patches and stripes of white. Strong peppermint flavor. Ornamental as well as good for culinary usage. Quickly reverts to green form unless green branches are rogued out. Grows about 24 inches tall. F32D, F35M, G96, H51M, J82, K2, K57, M15T, M82

**Wrigley's Spearmint:** (*M. spicata*) This is said to be the mint which was originally used for flavoring the famous Wrigley's spearmint gum. Has a very strong spearmint aroma and flavor. Excellent quality. Grows about 2 feet tall. Hardy in Zones 4 through 9. C9, J66, N42

---

## MULBERRY {GR}

### MORUS ALBA MORUS RUBRA

### MORUS NIGRA

**Bachus Noir:** Sweet, black fruit with a distinctive flavor; best when eaten directly from the tree or made into pies; ripens early, after strawberry season ends. No spraying or pruning is necessary. Adapted to Zones 7 through 10. I53M

**Beautiful Day:**<sup>1</sup> (*M. alba*) Fruit medium to large; pure-white in color; flesh sweet; very good for eating fresh, excellent for drying. Imported white mulberries that are dried like raisins are sold in many food stores and are one of the better dried fruits. Tree medium-sized, spreading; very productive; requires little care and no spraying. Original tree from Maryland. D37

**Boysenberry Black:** The mother tree of this cultivar was discovered at an old homestead in Wakulla County, Florida. It is well over 100 years old and bears abundant crops of very large, seedless black mulberries. The flavor is distinct, somewhat reminiscent of boysenberry, sweet and rich with just the right amount of tartness. Makes excellent jams. Ripens early to late May. G17

**Chelsea:** (*M. nigra*) Large, dark mulberry-red fruit of fine flavor. Excellent eaten fresh, in pies and preserves, or made into wine or "mulberry gin". Will fruit within 2 to 3 years of planting. The

original tree was planted by King James II at the Chelsea Physic Garden, but was destroyed during World War II. R77

**Collier:** (*M. alba* x *M. rubra*) Medium-sized, purplish-black fruit, 1 1/8 inches long and 3/8 inch in diameter; flavor sweet, with just a trace of tartness, quality very good, on a par with Illinois Everbearing. Ripens over a long period, beginning about 2 weeks before Illinois Everbearing. Tree of medium size, spreading, relatively hardy, very productive. D37, M16

**Downing:** (*M. alba*) Fruit medium-sized; 1 1/8 inches long, 1/2 inch in diameter; pink; sweet, with no tartness. Tree wide-spreading; hardy and productive; appears to be mostly *M. alba*. This is not the cultivar which has been widely sold under the name Downing in the past. E91M

**East Coast:** Large, glossy black fruit, about 2 inches long; sweet, juicy flesh, with a zestful balance of sweet and sour. Vigorous tree, often grows 6 feet per year; very cold hardy. Yields of 40 gallons per tree have been reported. Adapted in Zones 8 through 10. I53M

**Florida Giant:** Long, narrow fruit, 2 to 2 1/2 inches in length; light purple in color; sweet and juicy, flavor mild. Tall, vigorous tree, to 50 feet or more. Large heart-shaped leaves, 12 inches wide, very attractive. Despite the name, it is reportedly hardy in Zone 5. D57, M16

**Hunza Seedless:**<sup>1</sup> (*M. alba*) Medium-sized, pure white, seedless fruits. Usually dried and stored by the people of Hunza who use the fruits as a staple part of their diet. Imported Hunza Seedless mulberries sell for \$4.25 per 8 ounce package in health food stores. Selected by Dr. Thompson of the USDA on a six month plant collecting expedition to Pakistan. D37, I19M{DF}

**Illinois Everbearing:** (*M. alba* x *M. rubra*) Fruit large and very long, average 12 per ounce; skin black; nearly seedless; flavor good to very good, very sweet, considered best by many; matures over a long season. Tree extremely hardy; very productive; young grafts extremely vigorous. Originated in White County, Illinois on the bottom-lands of the Wabash River. Introduced in 1958. BROOKS 1972; B74, C27T{SC}, D37, E62{SC}, E91M, F43M, H4,149M, J61M, K67, M16, NO, N24M, N33

**Kaester:** (*M. nigra*) Large, elongated fruit, 1 1/2 inches long and 1/2 inch in diameter; deep purple or black when ripe; juice bright red; flavor very sweet, with good balance between sweetness and acidity. Tree bears heavily, is easily propagated from cuttings. Originated in Los Angeles, California. Introduced in 1971 by Nelson Westree. I83M

**Middleton:** (*M. alba* x *M. nigra*) Medium to very large, dark purple-black fruit of excellent quality; very sweet. Large, vigorous tree. Has a strong tendency to double crop in areas with long growing seasons. Previously listed as Sullivan. I66T, I83M

**Noire of Spain:** (*M. nigra*) Medium-sized, purplish-black fruits with an excellent sweet tart flavor; quality very good. Tall, vigorous tree, very productive. One of the most commonly grown Persian mulberries. Very popular on the Pacific Coast. Only adapted in warmer climates, such as Zones 7 through 10. F43M, 174, NO

**Northrop:** (*M. alba*) One of the hardiest mulberries available. Has survived temperatures of -50° F. May show some winter dieback when young due to extremely rapid growth. Can begin fruiting after 3 to 5 years. The parent tree was planted on the Northrop farm in Potsdam, New York, in the 1850's. I49G{SC}, L27M

**Oscar's:** (*M. alba*) Medium to large, blackish-purple fruit, resembles a large blackberry. When fully ripened the fruit has a full rich flavor and is considered one of the best of the hardy varieties. May also be eaten at the red stage, when it has the flavor of raspberries. Ripens in late spring and early summer. Very cold hardy and drought tolerant. Originated in Riverside, California by Oscar Clarke. C34,174

Pakistan: Extremely large fruit; 2 1/2 to 3 1/2 inches long and 3/8 inch in diameter; purplish-black when fully ripe, but sweet even at the ruby-red stage; flesh firmer than that of most named cultivars; excellent, finely balanced flavor. Spreading tree with large heart-shaped leaves. Recommended for the deep South and mild winter areas such as southern California. Originally from Islamabad, Pakistan. C54, H4,174

Paradise:<sup>2</sup> Medium-sized, lavender fruit, 1 1/8 inches long and 3/8 inch in diameter; flesh exceptionally sweet, seeds few; good fresh and out of hand, also dries well. Tree dwarf, 7 feet tall and 6 feet wide at maturity; attractive, with heart-shaped leaves; perfect for gardeners with limited space. D37

Riviera: Elongated, deep purple-black fruits; 1 to 1 1/2 inches in length, 1/2 inch in diameter; flesh slightly juicy and very sweet, dessert quality very good; ripens over a long period, from April to June. Originated in Vista, California. D57

Russian: (Tatarica) (M. alba) {PL} Fruit reddish-black; of good quality when completely ripe. Useful for jelly, wine, etc. Tree bushy; to 35 feet tall; very hardy and drought resistant; widely planted for windbreaks, wildlife food and chicken forage. Introduced into Europe from China about 1500 years ago. Brought to America by Russian Mennonites. VOTH; A82, A91, G66, G66{S}, H49, I49M, K38{S}, K89, M69M, P38{S}

Scott's Jumbo: Medium to large, blocky, light purple fruit, about 1 1/4 inches long; flavor sweet, good, somewhat lacking in tartness. Ripens over a period of 2 to 3 weeks. Medium-sized, spreading tree; bears heavily. Originated in Kansas by Les Scott. M16

Shangri La: Large black fruit of good quality. Tree with very large, heart-shaped leaves; early bearing. Good for the deep South, but may be cultivated in other areas; has fruited well 6 of 8 years in Maryland. Original tree was discovered near Naples, Florida. D37

Silk Hope: (M. alba x M. rubra) Thick, black fruit, about 1 1/2 inches long; very sweet. Ripens over a two month period during late spring and early summer. Dates back to the 1800's when silk worm production was attempted in North Carolina. Discovered by A.J. Bullard. H4

Stearns: Small to medium-sized, dark black fruit, 3/4 to 1 3/8 inches long and 1/2 inch in diameter; good flavor. Original tree in central New York state bears fruit from early July until hard frost (around the end of September), and still has green fruit when frost hits. Good for home gardeners because it ripens over a long period. I49G{SC}, M16

Tehama:<sup>1</sup> (Giant White) (M. alba) Very large, plump fruit, 2 3/4 inches in length and 1/2 inch wide; very sweet, succulent, melting flesh. Attractive, large-leaved tree; hardiness undetermined, but probably adapted in Zones 7, 8, and 9. Originated in Tehama County, California. D37,174

Tiger Red: Berries large and very long, up to 1 1/2 inches in length; an attractive raspberry-red in color; virtually seedless. Flavor excellent, rich and sweet, reminiscent of real raspberries. Ripens late May to mid June in Florida. Vigorous and productive tree. G17

Weeping: Small, black fruit; sweet and pleasant. Tree umbrella-shaped, weeps to the ground; semi-dwarf; about 12 feet tall, 12 to 14 feet wide when mature; long-lived; highly productive; very ornamental. Original tree from northwest of Baltimore, Maryland. D37

Wellington: Fruit medium-sized, 1 1/4 inches long, 3/8 inch in diameter; form long, slender and cylindrical; skin reddish-black; flesh soft, of good flavor; ripens over a period of several weeks. Tree a heavy producer. Originated in Geneva, New York on the property of noted fruit breeder Richard Wellington. May be the old cultivar New American, which was also sold many years ago as Downing. D95, F43M, I49G{SC}, 174, J61M, M16, NO

White:<sup>1</sup> Small to medium-sized, pure white fruit. Flavor very sweet, with no tartness, however not as sweet as Illinois Ever-bearing. Like other pure white types it is valued because it does not stain and for its excellent qualities when dried. Tree medium-sized, spreading, productive. C54, D95, F43M, H4, M16

#### CODES FOR SPECIAL TYPES

1. Pure White
2. Genetic Dwarf

## MUSCADINE {GR}

### VITIS ROTUNDIFOLIA

#### PISTILLATE MUSCADINES

Pistillate, or female muscadines bear fruit but are self-sterile unless pollinated by a self-fertile cultivar. For best production, female cultivars should be planted within fifty feet of a pollinating cultivar. The source of pollen will not affect the color, shape or flavor of the grape.

#### BLACK/PURPLE-SKINNED

African Queen: Large fruit, about 1 1/8 inches in diameter; skin black, medium thin; very sweet, sugar content approximately 16%; ripens in mid-season. Good for fresh eating, jelly or juice Very vigorous and productive. Excellent cold hardiness. F93

Black Beauty: Large fruit, 1 1/4 inches in diameter, dry scar; skin black, edible; clusters large; quality very good, sugar content 23-24.5%; ripens uniformly mid to late-season. Suitable for fresh fruit, jelly and wine. Vine very vigorous. Excellent disease resistance. One of the best black muscadines ever developed, and rated tops for flavor. F93, K67

Black Fry: Large fruit, up to 1 1/4 inches in diameter; skin black; quality very good, comparable with Fry; sugar content 19-20%; ripens uniformly, mid to late-season. Suitable for fresh fruit, jelly and juice. Vine very productive; disease resistant. Clusters large. F93

Farrer: Large fruit with a dry berry stem scar, about 1 1/4 inches in diameter; skin black; quality excellent, 18-23% sugar content; ripens early. Good for fresh fruit, juice and jelly. Vine vigorous; very high yielding. Clusters large. Some years up to one-half of crop is seedless. F93

Hunt: Medium to large fruit; skin medium, dull black, with abundant pigment prized by manufacturers of wine and frozen pulp; quality excellent; ripens early. Very even in ripening, unusual in muscadine grapes. Clusters large. One of the best all-purpose cultivars; excellent for wine, fermented juice, jelly and hull preserves. BROOKS 1972; B45M, B73M, E3, F93, G8, G72, I41P, I53M, K28, K75T, L90, M69M, M83

Jumbo: Large fruit, largest of any muscadine cultivar so far introduced; skin black; quality good; ripens mid-season to late. The fruit ripens irregularly over several weeks making it an excellent cultivar for home use. Vine productive, disease resistant. Clusters large. B22, B45M, C30M, D77M, F93, G17, H4, I41P, I53M, K75T, L90, M83, M95T

Loomis: Large fruit; skin medium, burgundy colored; quality excellent, taste panels have rated Loomis the best of all cultivars for fresh eating. Ripens mid-September to October 1st. Vine very vigorous; consistently productive; very disease resistant; winter hardy. Clusters medium to large. Recommended for the fresh fruit market. B45M, F93, I53M

Pride: Very large fruit; skin medium to thick, purplish-black; quality good; ripens mid-season, and over a 3 to 4 week period. Vine vigorous, winter hardy; production heavy; disease resistance medium to good. Clusters medium to large. Recommended for home

use. B45M

Sugargate: Fruit very large; skin dark; flavor excellent, sugar in individual berries up to 21 %. Rated one of the top 5 muscadines for flavor. Vine very vigorous; production very good. Clusters large. Fruit ripens earliest of all cultivars. Very good for home and commercial use, and fresh fruit sales. Not recommended for Gulf Coast use. F93

Supreme: Very large fruit, about 1 1/2 inches in diameter, dry scar; skin black, edible; sugar content 22-23%; ripens mid-season to late; quality excellent. Rated just below Black Beauty for best tasting muscadine. Very vigorous and productive vine with excellent disease resistance; clusters large. F93

Thomas: Small fruit; skin thin, reddish-black; quality excellent; ripens mid-season. Vine vigorous. Clusters medium, compact. One of the best cultivars for making unfermented juice, because of its distinctive flavor. 14 IP

#### BRONZE-SKINNED

Darlene: (Darling) Fruit 1 1/2 inches in diameter, consistently large throughout vine; not erratic in size like Fry or Farrer; skin reddish-bronze; quality excellent, pulp melting, sugar content 22-24%. Rated in the top 5 of all muscadines for flavor. Very vigorous, productive vine. An early ripening type suitable for fresh fruit and jelly. F93

Fry: Very large fruit, up to 1 3/8 inches in diameter; skin bronze; quality excellent even before fully ripe, sugar content high; ripens mid-season. Rated in the top 10 for flavor. Vines moderately vigorous; production good; susceptible to black rot. Clusters very large. Very highly recommended for home use, local sales, and commercial plantings. B22, B45M, B73M, C30M, D77M, E3, F93, G17, H4, 14IP, I53M, K75T, K76, M95T

Janet: Very large fruit, about 1 1/8 inches in diameter, wet scar; sugar content 21%, quality excellent for eating out of hand. Rated one of the top 5 muscadines for flavor. Very vigorous and productive vine with large clusters, cold hardy. Latest ripening of all the bronze female cultivars. F93

Scuppernong: Medium to large fruit; skin medium to thin, bronze; flesh sweet, with an excellent and distinctive flavor; quality excellent; ripens early. Can be used for wine. Vines vigorous; production good. Clusters medium. Best known and most widely grown muscadine grape; the oldest cultivar but still one of the best. B45M, C30M, F74M{PD}, F93, F93{PR}, G65M, I53M, J24M{PD}, K67, L33, L90

Sugar Pop: Medium to large fruit, 1 to 1 1/4 inches in diameter; skin bronze; sugar content 17-21 %. Pops open when you eat it. Very good for eating out of hand. Ripens mid to late-season. Very vigorous and productive, high production being an outstanding characteristic. F93

Sweet Jenny: Very large fruit, up to 1 1/2 inches in diameter; skin bronze; quality very good, sugar content 23-24%; ripens early to mid-season. Excellent for eating out of hand. Rated one of the top 10 muscadines for flavor. Vine vigorous; very productive; disease resistant. Clusters large. F93

Watergate: Large fruit, up to 1 1/2 inches in diameter; skin bronze; pulp juicy, melting; sugar content 16%, flavor excellent; ripens early to mid-season. Good for eating out of hand. Vine very vigorous; production good. Recommended highly for home and commercial planting. F93

#### RED-SKINNED

Higgins: Fruit very large; skin pink to reddish-bronze, moderately thick yet tender, edible; quality good when fully ripe; ripens mid to late-season. Suitable for winemaking. Vine moderately vigorous; production heavy to overproductive. Clusters large; compact. Very

good for commercial or roadside sales. B45M, B73M, D77M, E3, F93, G17, H4, I53M, L90, M69M, M83

Rosa: Large fruit, up to 1 1/8 inches in diameter; skin pinkish-red; quality good; ripens mid to late season. Very sweet, rated excellent by taste panels. Vine very vigorous with good disease resistance and cold hardiness. Best of the red grapes. Very good for home use and pick-your-own. F93

Scarlett: Newly released cultivar with good quality. Large, reddish fruit; flavor excellent; ripens in midseason. Vigorous, productive vines, resistant to most major diseases. Recommended for fresh market. Developed by Dr. Ronald Lane of the University of Georgia Experiment Station. B45M, F93, G8

Summit: Large fruit, about 1 inch in diameter; skin medium (thinnest of any large-fruited cultivar), red; sugar content 20%; quality very good to excellent; ripens mid-season. Vine vigorous; very productive. One of the best red cultivars for home and commercial use and rated in the top 10 for flavor. B45M, F93, 14IP

#### SELF-FERTILE MUSCADINES

Perfect-flowered, or self-fertile muscadines produce both fruit and pollen. They will pollinate themselves as well as pistillate plants. The pollen of individual self-fertile cultivars is more viable on any other cultivar than on its own blooms, therefore it is better to plant more than one cultivar of self-fertile muscadine grape in large plantings.

#### BLACK/PURPLE-SKINNED

Albemarle: Medium to large fruit; skin blue-black, medium, smooth; flesh sweet, flavor very good; ripens about mid-season. Vine vigorous; very productive; resistant to leaf diseases. Clusters medium. Recommended for home use where a single vine is desired. BROOKS 1972; B45M

Cowart: Fruit very large, one of the largest self-fertile cultivars; skin black; quality good, best of any of the large-fruited cultivars; ripens medium early. Vine vigorous; productive; disease resistance good. Clusters very large. Originated in Experiment, Georgia by B.O. Ry. BROOKS 1972; B22, B45M, C30M, D77M, F93, H4, 14IP, I53M, K75T, L33, L90, M83, N33

Ison: Large fruit, up to 1 1/8 inches in diameter, dry scar; skin black; quality good, sugar content 19-20%; ripens uniformly, early to mid-season. Suitable for flesh fruit, jelly, juice and wine. Vine very vigorous and productive; disease resistance excellent. Clusters large. Considered the best black pollinator. D37, F93

Nesbitt: Large fruit, up to 1 1/8 inches in diameter; skin black; quality very good; ripens over a period of 4 or 5 weeks beginning in early September. Vine vigor medium; production very good. Clusters medium to large. Recommended for pick-your-own, dooryard plantings and fresh fruit sales. Released by North Carolina State University. B45M, F93, G17, I53M, K67

Noble: Medium-sized fruit; skin medium, black; quality good; ripens early to mid-season. Vine vigor medium; very productive; persistence good; disease resistance good, except for powdery mildew. Clusters large. Excellent for making a red table wine. B45M, B73M, E3, F93, G17, I53M, L90, M83, M95T

Regale: Medium-sized fruit; skin black; quality good, high acid taste; ripens late mid-season. Vine vigorous; production good; winter hardy. Clusters medium. Recommended for red wine, juice or jelly. B45M, I53M

Southern Home: Ornamental dooryard muscadine with a unique leaf pattern resembling a maple leaf. Loose clusters of oblong black fruit. Good disease resistance; self pollinating. Recommended for ornamental trellises and fences. B45M

Southland: Fruit medium to large; skin purplish-black, non-glossy; quality excellent, flavor very sweet; ripens mid-season. Vine vigorous; disease resistant; persistence good. Recommended for

home use and commercial plantings. Originated in Meridian, Mississippi. BROOKS 1972; B45M, F93, G8, 141P, K76, M95T

#### BRONZE-gKINNED

Carlos: Small fruit, 1/2 inch in diameter; skin medium, bronze, attractive; flavor pleasing, similar to Scuppernong; ripens mid-season. Vine vigorous; very productive; hardy. Cluster intermediate. One of the best bronze muscadines for wine making. Originated in Raleigh, North Carolina. BROOKS 1972; B22, B45M, B73M, E3, F93, H4, 141P, I53M, K76, L90, M83

Chowan: Large fruit; skin medium, light brown to bronze, appearance attractive; flesh subacid, aromatic, flavor good; ripens in early mid-season, about 1 week before Scuppernong, which it resembles. Vine vigorous; very productive. Clusters large. Suitable for home use. BROOKS 1972; B45M, H4, L90, M83

Dixieland: Fruit large, one of the largest self-fertile cultivars, wet scar; skin bronze; flavor excellent; sugar content 22%; ripens medium-early. Similar to Fry in flavor, color and size. Rated one of the top 10 muscadines for flavor. Vine vigorous; productive. Recommended for home and commercial planting. F93

Doreen: Medium to large fruit; skin bronze; quality good to excellent; ripens late mid-season. Makes excellent light golden wine. Also used for jelly and juice. Vine vigorous; winter hardy; production very heavy. Clusters medium to large. Recommended for pick-your-own operations. B45M, F93

Golden Isles: Large, bronze to brownish fruit; medium thin skin; excellent quality; ripens in late September. Produces an exceptionally high quality white wine. Moderately vigorous and productive vine; medium clusters. B45M

Granny Val: Large fruit, up to 1 1/8 inches in diameter, dry scar; skin bronze; sugar content 16%; quality very good to excellent; ripens late to very late. Suitable for eating out of hand. Vine productive, with extra high yields; disease resistant. Clusters extra large. F93

Janebell: Large fruit, up to 1 1/8 inches in diameter, dry scar; skin bronze; quality good, sugar content 16-22%; ripens mid to late-season. Suitable for eating out of hand. Vine very productive; disease resistant. Clusters large. F93

Pineapple: Fruit large, 1 1/8 inches in diameter; skin bronze; quality good, has the flavor of pineapples; sugar content 16%. Ripens mid to late-season. Suitable for fresh fruit, jelly and juice. Vine very vigorous and productive; disease resistant. Clusters large. F93

Triumph: Fruit large, one of the largest of the bronze self-fertile cultivars, dry scar; skin greenish-bronze, thin; sugar content 18%; quality good. Ripens early to mid-season. Vine moderately productive; winter hardy; an excellent pollinator. Recommended for home or commercial use. B45M, F93, G17, G65M, M95T

Welder: Medium-sized fruit; skin bronze; quality excellent; ripens early to mid-season. Makes an excellent wine grape. Vine vigorous; productive. Proven to be the best cultivar for partial shade. Recommended for home and commercial planting, both for wine and fresh fruit sales. F93, G17

#### GREEN-SKINNED

Dearing: Medium to small fruit; skin translucent green, thin; quality excellent, flesh crisper than most other muscadine cultivars, flavor sweet; ripens in late mid-season. Vine productive. Clusters medium. BROOKS 1972; K76, M69M

#### RED-SKINNED

Dixie Red: Large fruit, similar to Cowart in size, wet scar; skin light red; quality very good, sugar content 17 to 19%; ripens in mid-season. Good for fresh fruit, juice and jelly. Vine vigorous; high

yielding. Clusters very large, containing 12 to 30 berries. Recommended for home and commercial planting. F93

Fry Seedless:<sup>1</sup> Small to medium-sized, red fruit, similar in color to Redgate, wet scar; sugar content 18-20%. Ripens early to mid-season. Vigorous vine; self-fertile, yet needs to be pollinated by another self-fertile cultivar; tolerant to disease. Erratic yields. F93

Redgate: Medium-sized fruit; skin light to dark red; quality very good; ripens late to mid-season; does not shatter. Uniform ripening of clusters, very attractive when displayed in baskets. Clusters very large, up to 40 berries per cluster. Recommended highly for home and commercial planting, and fresh fruit sales. U7G{SC}

Senoia: Medium-sized fruit, about 3/4 inch in diameter, wet scar; skin pinkish-bronze, dry scar; quality high, sugar content 20 to 22%; ripens evenly in mid-season. Produces an excellent light red wine. Vine vigorous and productive; disease resistant. Clusters large. F93

#### WHITE-SKINNED

Magnolia: Small to medium-sized fruit; skin white, smooth, attractive in appearance; quality excellent; ripens in late mid-season, about 1 week later than Scuppernong. Excellent for wine making. Vine vigorous; very productive. Clusters medium to large. Good for commercial and home use. BROOKS 1972; B45M, F93, G8, G17

#### MUSTARD GREENS

ORIENTAL Cultivated since the earliest times in China where it is called *Gai choi*, and in India where it is called *Lai*. In China especially, numerous cultivars have been selected for various purposes, such as pickling, drying, preserving in salt, and stir-frying. (B. juncea). N40{PR}

Aka Taka-Na:<sup>2</sup> (Aka Chirimen, Red Broad-Leaf Mustard) Large, wavy, dark purplish-red leaves on a green base; wide, somewhat thick, pale green to white ribs; very nice pungent, mustard flavor. Eaten fresh, cooked or pickled. Tolerant of cold; also very slow to bolt. G20M{PD}, G33

Ao Taka-Na: (Ao Chirimen, Green Broad-Leaf Mustard) Broad, aromatic bright green leaves with very succulent, crunchy, white midribs. Pungent leaves become pleasantly spicy when cooked. Midribs are excellent raw in salads or cooked. Grows about 12 inches tall. For summer and early fall sowing. E83T, F73D, G33

Chao Chow: 70 days. Broad-leaved, semi-heading type, similar to Wrapped Heart but the stalks are slightly narrower and longer. Dark green leaves with thick stems. Grows about 15 inches tall. Very popular for pickling in China and Southern Asian countries. N84

Dai Gai Choi: (Broad-Leaf Mustard, Big-Stem Mustard) 65 days. Large, quick-growing leaves; broadly obovate or oval; more or less hairy when young; about 12 inches long. Broad, thick petioles. Widely grown in south China as an autumn crop. The swollen flowering stems of some cultivars, known as *tsoi sum*, are used,

peeled, in the preparation of pickles. HERKLOTS; A79M, C20M, D55, E83T, L79G, N84

Green-in-Snow: (Red-in-Snow, Hsueh Li Hung, Shia-Li-Hon, Snow Cabbage, Serifon) 50 days. Small plant with pale-green leaves and red roots. Used in stir-fry dishes, especially those containing lima beans or bamboo shoots. The pickled form is used as a delicious seasoning for fried rice or meat dishes. Can withstand temperatures of 20° F. and will make abundant growth in cold frames during the winter. The Chinese name translates as snow inside red, or luxuriant in the snow. CHANG, W. [Re], COST 1988 [Cul], HERKLOTS, SO [Re], VON WELANETZ; C20M, C27G{PD}, D55, F73D, G33, I39, K49M, L59, R32, S55, S63M, S70

Horned: (China Taka-Na, Kobu Taka-Na) Semi-heading plant with bright green frilled leaves. Each stem flares into a horn, opening the plant into a leafy bush. In cooking, used as a stir-fried vegetable, pickling, or for surrounding meat dishes. Makes excellent sweet mild flowering shoots, up to 16 inches long. Grow in warm weather but not during times of intense heat. Easy to grow. A2, C95, G33, N7G, N84, Q34, S63M, TIM

Hsueh Li Hung Na 2: Very vigorous, well-branched plants; slow-bolting and resistant to soft rot and virus. Can be harvested after reaching 2.8 pounds in weight, or as early as 20 days after planting. Suitable for making Chinese-style pickles. Grown year-round in Taiwan. Q39

Miike Giant:<sup>2</sup> (Miike Purple Giant) 80 days. Very large, broad, undulate, coarsely crinkled leaves with very striking purple veins and thick mid-ribs. The flavor, though strong and pungent, also has a powerful sweetness to it. Can be sown in early spring, or late summer for autumn and winter use. Very cold hardy. C20M, D55, F73D, G13M, K49T, K50, K57{PL}, K73, Q34, S55, S63M, S70, TIM

Miike Long Shoot: Attractive, sweetly pungent leaves with red veins and broad, often undulant midribs. Selected for its very long undulant flowering shoots, up to 18 inches, which are excellent for stir frying in late spring. Best planted for a fall harvest, as colder weather enhances sweetness, succulence and color. N7G

Nan Foon Non-Heading: (Nam Fong, Nam Fong Loose Leaf) 45 days. Upright, vigorous, fast-growing plant. White leaf-stalks, which are an important part of this vegetable, are white and fleshy, straight, 1 1/2 inches at the widest point. Leaves are dark green in color; not large; thin, but a little coarser than South China Heading. Both the leaves and stems are very tender and mild. D55, N84

Osaka Purple-Leaved:<sup>2</sup> 80 days. Spreading plant, 12 to 14 inches tall; comparatively early; stands well until late in the spring. Leaves very large, 20 to 26 inches in length; round, undulated, slightly serrate; tinged purplish-red overall when young, darkening gradually towards maturity. Ribs wide and white. Mild flavor for light cooking and salads. C53, F73D, G6, J73, K49T, L3J, L13M, L77D, N7G, N84, PIG

Peacock Tail: 40 days. Small, fast-growing, leafy mustard; reaches 12 to 18 inches tall when mature. Should be harvested when young as it will be very tender and less pungent. Excellent for stir-frying and pickling. A2, D55, F73D, N84

Red Giant:<sup>1 2</sup> (Red-Leaved Giant, Giant Red) 90 days. Attractive, large, dark-red, crinkled leaves with light green undersides and white mid-ribs. Harvest at 6 inch "baby" size for salads, or allow to grow to mature height of 16 to 18 inches for steaming or stir-frying. Older stems are very good pickled. Plant in early spring or late summer. Winter hardy and slow to bolt. A2, C53, D55, E24, E63D, F13, G6, I77, I91, J9M, J97M, K66, M29, M46, O53M, Q34, S63M, etc.

San-Ho Giant: Very large plants, up to 5 pounds in weight, may form a head in cold climates; dark-green leaves with broad, thick, crisp petioles. Very tender and flavorful, with just the right pungency. Very popular in Chinese cooking. Can be grown from late

summer through early winter. D55

Sarepta: (Mooi Ts'oi, Amsoi) A cultivar with very prominently lyrate-lobed basal leaves. The main shoot is very expensive. It is reserved in salt and sold dry, not damp or wet, and then costs about 6 a pound. The leaves and upper part of the stem may be salted and are sold very cheaply. Grown in Hong Kong as a winter crop. HERKLOTS, LARKCOM 1991. C27G{PE}, S55

Swatow: (Leaf Heading, Chiu Chow Dai Gai Choi) 43 days. Large, light-green leaves; succulent, tender and sweet. Forms a solid, tight head in cold fall weather; may not head in hot summer weather. The solid heart is disproportionately small and is a very expensive vegetable in Hong Kong. It can be eaten fresh, or it may be salted or made into sour-salt mustard (*ifiaam suen choi*). DAHLEN [Cul, Re], HERKLOTS; L59, Q34

Swollen-Stem: (Pressed Mustard, Cha Choy) 45 days. The peculiar feature of this cultivar is the swollen stem with 7 to 9 protuberances or bulges representing enlarged rudimentary lower petioles. Requires a cool, moist climate for this stem development, such as that of the lower Yangtze river in the Szechuan province of China. The swollen stems are preserved in salt, pressed in tubs so that much of the liquid inside the stem is squeezed out, then pickled with a fine red chili powder. This product is commonly known as *Szechuan preserved vegetable*. COST 1988, HERKLOTS, SO; C20M, C27G{PD}, C34G{PD}, I76T{PD}, L3J, L42

Turnip-Rooted: (Tai Tau Choy) A very distinct form grown for the fine sty, tuberous roots which are similar to white turnips in appearance, texture and flavor. The swollen root-tubers are sliced and preserved in salt or pickled. Cultivated as a winter vegetable near Hong Kong. BAILEY, L. 1894, HERKLOTS, TANAKA, UPHOF; E83T

Wrapped Heart: (Bau Sin, Paau Sum) 60 days. Large, 16 inch tall plant which develops a heart in cool weather. Leaves dark green; petiole thick and glabrous, the veins nearly white on the inner surface of the blade protected from the light. The whole plant is preserved in salt and vinegar. Also good for frying. The heart is not as hard and compact as that of the Swatow mustard and is not eaten fresh. HERKLOTS, ROSS [Cul, Re]; C20M, D55, F73D, L3J, N84, Q39, S70

**AMERICAN** Newer cultivars developed in the United States where they are very popular in the southern states. Traditionally steamed or boiled as "greens", or stewed with pork and eaten with combread to sop up the "pot likker". The curled and frilled types are commonly referred to as *mustard lettuce* in Auckland, New Zealand. (B. juncea)

Florida Broadleaf: 50 days. Vigorous, semi-upright plant with a spread of 16 to 22 inches. Smooth, deep green, broad-oval, thick leaves, slightly serrated and with a distinctive flattened, pale green midrib. Moderately slow-bolting. Popular in the South for local markets, processing and home gardens. A27M, A75, A87M, B75M, C44, E38, G68, G79, G93M, I64, I84, K49M, K73, M46, N16, etc.

Fordhook Fancy: (Burpee's Fordhook Fancy) 40 days. Deeply curled and fringed, dark-green leaves that curve backward like ostrich plumes. Will stand for a long time without bolting. The feathery leaves make an attractive addition to salads, and have a pleasantly mild flavor when cooked. HALPIN; G57M, K49M

Green Wave: (Green Wave Long Standing) 50 days. Large, upright plant; large, broad, medium dark-green leaves with curled and ruffled edges. Similar to Southern Giant Curled, but slower growing and bolting, with more finely frilled leaves, slightly darker in color, and more upright in growth habit. C44, F24M, G6, G79, G93M, J20, K49T, L3J, L10, L13M, L42, M46, N7G

Magma: Exceptionally attractive mustard with plenty of fire. Resembles a purple Green Wave Very textured, savoyed leaves; deep purple on top with extremely frilly margins showing the green

underside in dramatic contrast. Excellent in salads when young, or for steaming and stir frying at any age. F80, N7G

Old Fashion: (Old Fashion Ragged Edge, Hen Peck) 40 days. An old favorite which produces long, ruffled leaves that make very fine salad greens. Easy to grow and very hardy. Can be planted in spring or fall. Adapted to cut-and-come-again techniques. Fine quality accounts for its long lasting popularity. A2, D12, G1M, L7M, L10, M95M

Southern Giant Curled: (Giant Southern Curled Longstanding) 45 days. Large, upright plant with a spread of 18 to 24 inches. Large, bright green, long-oval leaves with a crumpled, heavily curled and fringed margin. Slew to bolt. Very popular in the South for greens. Attractive for bunching. A27M, A75, A87M, B3M, B75M, G16, G71, G79, I64, I84, J97M, K73, L7M, N16

#### MUSTARD SEED

Brown: (Black) (*B. juncea*) {DF} Dark reddish-brown seeds with a strong, pungent flavor. The mustard preferred for making Dijon-style mustards, and also some German mustards. *Oriental mustard seeds* are a form of brown mustard. The names brown and black are often used interchangeably. True black mustard, *B. nigra*, is not used in commercial mustard preparations. NORMAN; C92{S}, GO, G44M, H86, H90G, J58, K49M{S}, K66{S}, L16, L16{DF}, L94M{S}, M15M, N7D, N7D{DF}

Burgonde: (*B. juncea*) 85 days. Small brown seed used for the many different hot brown, stone-ground, and French mustards. Burgonde is the standard cultivar for this usage. Seeds average 9900 per ounce. Prolific plants, about 3 feet tall. May also be used as a green manure. L88J

Tilney: (*S. alba*) 95 days. Large yellow seed used in American hotdog mustards and in the English and German yellow mustards or white mustards. Seeds average 4500 per ounce. Tilney is the leading yellow cultivar, developed by the famous mustard producer, Colman Foods Ltd. of Norwich, England. H90G{PD}

Yellow: (White) (*S. alba*) {DF} Light tan to sandy-brown seeds, larger than those of brown mustard. Milder than brown mustard seeds, and often moistened with water to bring out the flavor. Widely used in the production of American style mustards and some English mustards. Also used in pickling and sausage making. The most commonly sold mustard seeds. NORMAN; C92{S}, GO, G44M, H86, H90G, J58, K49M{S}, L16, L94M{S}, M15M, N7D

## NECTARINE {GR}

### AMYGDALUS PERSICA NUCIPERSICA GROUP

#### WHITE-FLESHED

Arctic Rose: Large, globose fruit; chalk-white skin, mottled with red; flesh white, streaked with red near the pit, firm, dense, very sweet and rich when fully ripe; clingstone. Ripens in early to mid July in Central California. Excellent for drying. Highly recommended for home orchards. Requires 600 to 700 hours of chilling. Developed by Floyd Zaiger and colleagues. BROOKS 1997; A5, A88M, E4, I99M, N20

Elruge: Medium-sized, round to oval fruit; skin pale greenish-white, blushed with dark purplish-red; flesh greenish-white, red near the stone, very soft, aromatic, quality high; stone free; ripens the end of August. Tree very hardy; productive. Grown in many parts of the world. SIMMONS 1978; 081, R77

Gold Mine:<sup>1</sup> Medium-large fruit; skin white with a red blush; flesh white, juicy, flavor very good to excellent; freestone; ripens late mid-season. Tree vigorous and productive. Low chilling requirement. Originated in New Zealand. STEBBINS; A63, B93M, B93M{DW}, C54, D23M, E4, G49, H4, H63M, I68, 765{ES}, K76, K88T, L47, N20

Heavenly White: Fruit large; skin creamy white, with beautiful dark-red blush; flesh firm, very sweet, aromatic; flavor excellent; freestone; ripens late July to August. Self-fertile. One of the best white-fleshed nectarines. Originated in Modesto, California by Floyd Zaiger. A88M, E4, I49M, I99M, N20

John Rivers: Fruit medium to large; skin white with a crimson blush; flesh greenish-white, tender and juicy, semi-freestone; ripens early. Tree medium-sized; vigorous; ornamental when in bloom. Severely affected by insufficient winter chilling. Originated in England. STEBBINS; A88M{OR}, F91T{SC}, K88T, L47, N20, R77

Karla Rose: Medium-sized, roundish fruit; skin predominantly an attractive red, with some white blotches; flesh white, juicy, very sweet, flavor and quality excellent; freestone; ripens late-May to mid-June. Tree moderately vigorous and productive; requires 700 hours of chilling. C30M, C75M, E99M, F61M, F93

Lola: White-fleshed nectarine that should not be confused with the Lola peach, an old American white peach. Recently introduced by the USDA from the former Soviet Central Asia, where it is highly esteemed for its quality. Apparently has a very high chilling requirement. MARIANI; T49M{SC}

Lord Napier: Large, oval fruit; skin pale yellow, practically covered by a crimson and brownish flush; flesh very pale green, slightly subacid, tender, melting and juicy; flavor good; stone long-oval, free. Tree a regular and heavy bearer. Raised from Early Albert by Rivers and introduced in 1869. SIMMONS 1978, WICKSON; 081, Q30{SC}, R77

Morton: Medium-sized fruit, about 2 inches in diameter, spherical; skin thick, white, about 80% red blushed; flesh greenish-white, juicy, melting; semi-clingstone; quality very good; ripens in early mid-season; often escapes brown rot infection. Tree vigorous; hardy; flower shewy, self-fertile. Originated in Geneva, Nov York by H.O. Bennett and R.C. Lamb. Introduced in 1965. BROOKS 1972; L12

Quetta: An old heirloom nectarine brought to the United States from India. White-skinned fruit, highly blushed with red; very firm and meaty, well flavored; quality good. One of the parents of Le Grand, along with J.H. Hale peach. Named after the town in western Pakistan. MARIANI 1994; F91T{SC}, K88T

Red Chief: Fruit about 2 inches in diameter and length, nearly round with halves tending to be unequal; skin bright red with an attractive finish; flesh white, moderately firm; flavor mild; quality good; freestone; resistant to brown rot. Originated in Blacksburg, Virginia. Introduced in 1952. BROOKS 1972; E45, E99M, F93, H49{DW}, I41P

Rose: (White Rose) Large, freestone fruit with excellent flavor; resembles John Rivers, but is larger, firmer and has more attractive red skin; ripens during John Rivers season. Tree moderately vigorous; a heavier and more regular producer than John Rivers. Also has a lower chilling requirement. Good backyard cultivar. Originated in Le Grand, California by F.W. Anderson. BROOKS 1972; B71M, K88T, N20

Silver Lode:<sup>1</sup> Medium-sized fruit; skin creamy yellow, about 75% red-blushed with numerous red dots; flesh white, juicy, fine-grained, sweet; freestone; ripens early to midseason, and over a long period. Tree vigorous; chilling requirement low. Originated in Ontario, California by Herbert C. Swim, Armstrong Nurseries. Introduced in 1951. BROOKS 1972, STEBBINS; A63, C54, F91T{SC}, H4, I68, K88T, L47

Snow Queen:<sup>1</sup> High quality freestone. Slightly oblong fruit, about 3 inches in diameter; creamy white skin blushed with red; rich, dense, melting white flesh, very sweet and juicy, flavor excellent. Ripens in mid to late June, 2 to 3 weeks ahead of Babcock peach. Very vigorous and productive. Low chilling requirement, 250 to 300 hours. Highly rated by members of the California Rare Fruit Growers. *N20*

Stanwick:<sup>3</sup> Fruit medium-large, roundish oval, slightly heart-shaped at base; skin pale, greenish-white, shaded into deep, rich violet in the sun; flesh white, tender, juicy; semi-freestone; flavor very rich and vinous; ripens late. Has a sweet kernel. Tree tends to drop fruit before fully ripe. Originated in England from seed brought from Syria. STEBBINS, WICKSON; *C54, K88T*

Violette Hative: Round, slightly tapered fruit; skin pale greenish yellow with a dark crimson blush; flesh nearly white, red near the stone, very soft, sweet, quality very good; stone free; ripens the end of August. Tree vigorous, fairly handy, productive. A very old French nectarine, known in 1659. SIMMONS 1978; *T49M{SC}*

White Tiger: Medium-sized, uniform fruit; skin pale colored, blushed with red; flesh white, aromatic, juicy, melting, very sweet; dessert quality excellent. Chilling requirement 600 hours or lower. Ripens late. Similar to Tiger, a yellow-fleshed nectarine. Originally from the preservation orchard of Emil Linquist. *LI*

#### YELLOW-FLESHED

Cherokee: Fruit about 2 1/4 inches in diameter; ovate, symmetrical; skin highly colored with a fine finish; flesh yellow, texture noticeably stringy, flavor rich and above average quality, semi-freestone; ripens 13 days before Lexington. Tree moderately vigorous; productive; has an above average tolerance to brown rot and spring frost. BROOKS 1972; *E45, E99M, F91T{SC}*, *I41P*

Desert Delight:<sup>1</sup> Medium-sized, globose fruit; skin bright red; flesh light yellow, firm, juicy and sweet with a rich, vinous flavor; clingstone. Ripens early in subtropical desert climates. Large, vigorous, upright tree; large, showy pink blossoms. Low chilling requirements, only 100 to 200 hundred hours. *A88M, I68, I83M, N20*

Double Delight: Attractive dark-red fruit; flesh yellow, flavor rich and sweet, freestone; quality very high; ripens mid-season, about with Heavenly White. Showy pink double blossoms. Originated in Modesto, California by Floyd Zaiger. *A88M, D23M, I99M, N20*

Durbin: Medium to large fruit; flesh yellow, firm but melting, flavor good, texture medium, semi-freestone; matures early, ripening ahead of Redhaven peach. Tree disease resistant; widely adapted. *A82, C75M, E99M, F61M, F93*

Early Rivers: Large, round, somewhat flattened fruit; skin greenish-yellow, almost covered with a scarlet flush and darker stripes; flesh pale yellow, without red near the stone, very soft, juicy, flavor excellent; stone free; ripens early. Tree hardy; productive. Introduced in 1893. SIMMONS 1978; *R77, R83*

Erliscarlet: Large fruit; skin golden yellow, with 80% scarlet red blush; flesh yellow, firm. Tree vigorous and productive. Originated in Kearneysville, West Virginia by the USDA-Appalachian Fruit Research Station. Introduced in 1985. *A5, C75M, E99M, F91T{SC}*

Fairlane: Large, oval fruit; skin yellow with a red blush; flesh yellow, firm, smooth textured, flavorful, clingstone; ripens late August to early September. Tree vigorous and productive; flowers large and showy; medium chilling requirement. Originated in Fresno, California. *B71M, F91T{SC}*, *K88T, L47*

Fantasia: Large, ovate fruit; skin bright yellow with one-third to two-thirds covered with a bright-red blush, more highly colored than Le Grand; flesh yellow, firm, texture smooth, quality good, freestone; ripens immediately after Flavortop; shipping quality good.

Very good for drying. Tree vigorous; productive; self-fertile. Introduced in 1969. BROOKS 1972; *A5, A9, A88M, B53, B83, C30M, C75M, E4, E99M, F53, K73M, K88T, LI, M11M{PR}*, *M39M*, etc.

Firebright: Medium to large, ovate fruit; skin golden, blushed with bright cherry-red, highly attractive; flesh yellow, firm, smooth textured, flavor excellent, semi-freestone; ripens early, just after Redhaven peach. Tree moderately vigorous and productive; only medium hardy; has good resistance to bacterial spot. Fruit should be thinned early for optimum size. *A9, B71M, B83, F91T{SC}*, *K88T, M11M{PR}*, *M39M*

Flamekist: Large, ovate fruit; skin attractive yellow, blushed with red; flesh yellow, firm, texture smooth, quality excellent; clingstone; ripens 3 weeks after Elberta; ships well. Tree productive; flower large, self-fertile; moderately low chilling requirement. Recommended for areas of low rainfall. BROOKS 1972; *A9, B71M, E4, F91T{SC}*, *K88T, N20*

Flavortop: Large, ovate fruit; skin mostly red, with an attractive yellow-spotted undercolor; flesh golden-yellow streaked with red, firm, texture smooth, quality excellent, freestone; shipping quality good; ripens just after Independences Very good for drying. Tree vigorous; productive; self-fertile. BROOKS 1972; *A5, A63, B53, B71M, B83, C54, E4, E99M, F53, F61M, L47, M11M{PR}*, *M39M, M99G*

Garden Beauty:<sup>1 2</sup> Fruit large, to 3 inches in diameter when properly thinned; skin yellow with a bright-red blush; flesh yellow, flavorful, clingstone; ripens late, in early September. Tree a genetic dwarf, grows only 5 to 6 feet tall; highly ornamental, with showy dark-pink double blossoms. Low chilling requirement. STEBBINS; *G49, H65, I68, N20*

Garden Delight:<sup>1 2</sup> Large fruit, to 3 inches in diameter; skin yellow with a bright red blush; flesh yellow, melting, rich and flavorful, freestone; ripens late, in mid-August. Tree a genetic dwarf, grows only 5 to 6 feet high; self-fertile; has unusually dense foliage and showy pink blossoms. Low chilling requirement. STEBBINS; *A88M, I68, N20*

Garden State: Large, round oval fruit; skin with greenish-yellow ground color, almost completely covered with red; flesh yellow, firm, juicy, freestone; ripens in late August. Tree vigorous; medium-spreading; flowers large, showy, light pink, self-fertile. Originated in New Brunswick, New Jersey by M.A. Blake. Introduced in 1934. BROOKS 1972; *A82, G72, G72{DW}*, *H49, H49{DW}*, *K28, K28{DW}*, *M25M, M69M*

Gold: (Giulla di Padova) Fruit large; skin and flesh clear golden yellow. Well-ripened fruit is melting, juicy and sweet with an apricot-like flavor. Probably needs high heat to ripen properly. Originated in Padova, Italy. Introduced into the United States in 1926. Renamed Gold in 1932. BROOKS 1972; *LI, 071M*

Gulf Pride:<sup>1</sup> (Stark Gulf Pride) Medium-sized fruit, 2 to 2 1/2 inches in diameter; skin covered with 50% red blush; flesh yellow, very firm, flavor excellent; ripens in early May, has good handling and shipping qualities. Very low chilling requirement, about 150 hours. Originated in Modesto, California by Floyd Zaiger. Introduced in 1983. *I83M*

Hardired: Average sized fruit, 2 1/4 inches in diameter; skin yellow, with 90% brilliant red blush; flesh yellow, medium-firm, texture and flavor good, freestone; ripens uniformly. Tree very hardy, hardness comparable to Reliance peach; tolerant to brown rot and bacterial spot; self-pollinating. Originated in Harrow, Ontario, Canada. *A91, A91{SC}*, *C45M, D69, D76, D76{DW}*, *F53, G23, M11M{PR}*

Harko: Fruit medium, averages 2 1/2 inches in diameter; skin yellow with 90% bright-red blush; flesh yellow, medium-firm, melting; flavor and texture good; almost freestone; uniform ripening, ripens mid-August, or 4 days after Redhaven peach. Tree

medium-sized; spreading; hardy; somewhat resistant to brown rot and bacterial spot; self-fruitful. C34, F53, F91T{SC}, I49M, M11M{PR}

Independence: Medium-sized, ovate fruit; skin brilliant cherry-red, attractive; flesh yellow, firm, of good texture and flavor, freestone; suitable for long-distance shipments; ripens early, in late June or early July. Tree productive; moderately vigorous; self-fruitful. BROOKS 1972; B93M, C41M, C54, E4, H89M, H89M{DW}, I68, K88T, L47, M39M, N20

June Gio: Medium to large fruit; skin yellow with a red blush; flesh yellow, firm, flavor and aroma excellent, freestone. Tree blooms late, but ripens in June, up to 4 weeks before Fantasia. Excellent tree and bud cold tolerance; good for late frost areas; some resistance to bacterial spot. Originated in Modesto, California by Floyd Zaiger. B71M, C34, E4, F53, J61M, L33, M11M{PR}, N20

Le Grand: (Pot of Gold) Very large fruit; skin yellow with a bright-red blush; flesh yellow, firm, rubbery, clingstone; flavor delicate, semi-acid; ripens late; holds well on the tree. Tree large, spreading; productive; flowers large, showy, pink. Originated in Le Grand, California by F.W. Anderson. Introduced in 1942. BROOKS 1972, STEBBINS; C54, I68, K88T, L47

Mericrest: Medium-sized fruit; skin solid dark-red; flesh golden-yellow, flavor excellent, freestone; ripens in Glohaven peach season, or early August in Zone 6. Tree very hardy, withstands winter temperatures of -20° F; resistant to brown rot and bacterial leaf spot; self-fruitful. Originated by E.M. Meader of New Hampshire. A88M, A91, A91{SC}, B74, C45M, D76, D76{DW}, E97, F53, H65, L12, L33, L33{DW}, N20

Necta Zee:<sup>2</sup> Large, attractive fruit; skin dark red; flesh yellow, firm, flavorful, clingstone; ripens early to mid-June in central California, 1 month before Nectar Babe. Tree strong, vigorous; a genetic dwarf, growing only 6 feet tall; self-fruitful; needs approximately 500 chilling hours. Developed by Floyd Zaiger. A88M, C34, I49M, I68, J61M, N20

Nectar Babe:<sup>2</sup> Skin bright-red; flesh yellow, sweet, rich and flavorful, freestone; ripens in mid-summer, one month earlier than Garden Delight. Tree a genetic dwarf; requires another peach or nectarine for pollinization; produces heavy crops when pollinized with Honey Babe peach. A88M, G49, I68, N20

Panamint:<sup>1</sup> Medium to large fruit; skin bright red; flesh yellow, freestone; ripens during third week of July. Tree vigorous; productive; has a very short chilling requirement, being adapted to southern California growing conditions. Originated in Ontario, California by Herbert C. Swim, Armstrong Nurseries. Introduced in 1952. BROOKS 1972; A63, A88M, C54, D23M, G49, I68, I83M, K88T, LI, L47, N20

Peento:<sup>4\*\*7\*\*\*\*</sup> (A34-160) Very distinct type with fruits that are compressed and oblate, similar to the peaches known as pen-tao, doughnut or saucer peaches. Small fruits, 2 to 2 1/2 inches wide; yellowish-orange skin, blushed with red; firm, juicy, melting yellow flesh, honey sweet; excellent, distinctive flavor reminiscent of mango. Susceptible to brown rot. Should have good potential as a specialty market fruit. U30{SC}

Pineapple: Fruit round, fairly large, slightly tapering; skin yellow green but almost covered with bright crimson; flesh golden yellow, faintly red near stone, very soft; flavor distinctive and good; stone small, free. One of the best yellow-fleshed nectarines. Raised by Rivers from Pitmaston Orange and introduced before 1870. SIMMONS 1978; 081, R77

Pocahontas: Fruit medium large, 2 1/8 inches in diameter; ovate; skin highly colored; flesh yellow, slightly stringy, quality good, semi-freestone; ripens 19 days before Lexington. Tree vigorous; productive; resistant to brown rot and spring frosts. Originated in Blacksburg, Virginia. Introduced in 1965. BROOKS 1972; E45, E99M, F91T{SC}, I41P, L90

Red Gold: Large to medium fruit; form symmetrical, globose; skin smooth, yellow, overspread with red, medium to thick; flesh yellow, streaked with red near pit, firm, meaty, flavor subacid, eating quality good to best; freestone; ripens evenly, immediately after Sun Grand. BROOKS 1972; A5, A9, A82, B53, B83, C41M, C75M, E99M, F53, F61M, H49{DW}, K73M, L33, M11M{PR}, M39M, etc.

Southern Belle:<sup>12</sup> Fruit large; skin yellow overspread with red; flesh yellow, freestone; ripens in early August. Tree a genetic dwarf, growing only 5 feet tall at maturity; very productive; blooms very early. Low chilling requirement, approximately 300 hours at or below Ay F. Originated in Le Grand, California by F.W. Anderson. Introduced in 1975. C54, D23M, I83M

Sun Glo: Large fruit, 3 inches in diameter; skin golden yellow, with 75% red blush; flesh yellow, juicy, firm, quality very good; ripens in midseason, or early August in Zone 6. Tree hardy; productive; thrives in Zones 5 to 8. A5, B53, B83, C30M, C75M, E99M, F61M, H89M, K73M, L33, L33{DW}, L90, M99G

Sun Grand: Fruit large, about 2 1/2 inches in diameter; skin yellow with a red blush; flesh yellow, firm, freestone; ripens after John Rivers, about July 5th. Tree large, spreading; productive; flowers large. Very good for drying. Originated in Merced, California by F.W. Anderson. Introduced in 1950. BROOKS 1972; A9, B93M, E4, K88T

Sungem: Medium to large, round fruit; skin yellow, 90 to 100% blushed with deep ruby red; flesh bright yellow, firm, melting, very sweet; semi-freestone; ripens extremely early, early to mid-May. Tree vigorous, semi-spreading; self-fruitful, productive; extremely disease resistant; flowers large, showy, fragrant. Released by the University of Florida. C75M, E99M, F61M, G17

Sunred:<sup>1</sup> Small to medium-sized, round fruit; skin bright red over 90 to 100% of surface; flesh yellow, firm, dessert quality excellent, semi-freestone when fully ripe; ripens early to mid-May in central Florida. Tree requires about 300 hours of winter chilling at or below 45° F. to break dormancy. BROOKS 1972, RUCK; C54, F61M, I41P, I53M, J59, K76, K76{IM}, M83

Surecrop: Large, roundish fruit; skin attractive bright red over a yellowish-white undercolor; flesh yellow, firm but tender, juicy, sweet and flavorful, freestone; quality good; ripens mid-August. Tree vigorous; productive; self-pollinating. A82, D76, G23, G72, G72{DW}, G79M{DW}, I41P, K28, K28{DW}, L90, M25M, M83

## OKRA {S}

ABELMOSCHUS ESCULENTUS

#### GREEN-SKINNED

##### HYBRID

Annie Oakley: 45 days. Medium-green, slender, five-angled pods; 7 to 9 inches long; spineless; remain tender as they grow to a large size. Earlier than open-pollinated types. Compact, uniform, heavy-yielding plants; height 3 to 4 feet; can be planted at high densities. Excellent for local markets, home gardens and processing. Does well in the North. B75M, C20M, C85M, D26D, E97, F13, G57M, G71, G79, K50, N16

Cajun Delight: 49 days. Hybrid Clemson Spineless type with attractive, darker green pods that remain tender longer with less fiber build up. Slightly curved pods, 3 to 5 inches long. Vigorous,

exceptionally productive, compact plants. Recommended for fresh markets and home gardens. All America Selections Winner in 1997. B73M, C92, D68, E75{PL}, E97, F13, G6, G16, G27M, G82, H61, H95, I39, I50G, J91, J20, K71, L42, M29, M46, M49, etc.

#### OPEN-POLLINATED

Blondy: (White Blondy) 48 days. A short-season okra for Northern gardeners; has performed well in trials as far north as Canada. Spineless, ribbed pods; attractive creamy-lime in color; best picked when about 3 inches long; crisp and firm, yet tender and not stringy. Short, compact plant; only 3 feet tall yet very productive. All America Selections winner for 1986. A21, F73D, G27M, H49, H85M, K71, L4, M95M

Burmese: 58 days. Somewhat curved, virtually spineless pods, 9 to 12 inches long; creamy yellow green when mature. Tender, sweet and spineless enough to be eaten raw or added to salads, even at 10 inches long. Less mucilaginous than other okras. A favorite in local restaurants of southern middle Tennessee. Heirloom from Burma. L7M

Cajun Jewell: Tender pods, 1 inch in diameter and up to 7 inches long; excellent flavor. Dwarf, spineless plant, 2 to 4 feet tall; produces early and continues to bear good crops all season if pods are kept cut. A local favorite in Cajun country since the 1950's. F73D, L7M

Clemson Spineless: 55 days. An abundant producer of rich-green, slightly ribbed, straight, pointed, spineless pods; 6 to 7 inches long; of high quality; best picked when 2 1/2 to 3 inches long. Height 4 feet. Standard cultivar for processing, fresh market, and home garden use. All America Selections winner in 1939. Developed by the South Carolina Experiment Station. A27M, A75, B75M, C44, F80, G57M, G79, G93M, H61, I64, I84, K50, L7M, M46, N16, etc.

Cowhorn: 55-60 days. Very large curved pods, up to 10 inches in length, ribbed with light green. Most tender when about 6 inches long. Tall, robust plant, produces prolific amounts of pods. An old traditional variety no longer generally available in the seed trade. A27M, K71

Dwarf Green Long Pod: (Prolific Long Pod Green) 55 days. Sturdy, compact, well-branched, productive plants; height 2 1/2 to 3 feet; easier to pick than tall types. Dark-green, moderately ridged pods; slightly more slender and longer than Clemson Spineless; 7 to 8 inches in length; spineless; of excellent quality. For best flavor, harvest when 1 to 2 inches long. A25, A27M, 475, C44, C69, D11M, F70, G57M, G71, H85M, K10, K49M, M95M, N16

Emerald: (Emerald Green Velvet) 55 days. A round-podded cultivar popular for processing. High quality dark-green pods are smooth, spineless, slender and thick-walled; 8 to 9 inches long; can be snapped like green beans. Extra length and perfectly round slices are valued for canning and freezing, but best flavor is obtained if pods are picked when 2 to 4 inches long. Vigorous, thrifty plants. Height 5 feet. C20M, D1T, D12, F63, G57M, G71, G93M, N16

Evertender: 50 days. Slightly ridged, medium-green pods; average 5 to 7 inches in length when mature. Quality very good; stays tender much longer than others. Medium-sized, unbranched plants; height 4 to 5 feet; have a tendency to lodge. Easy to harvest and has good tolerance to disease and drought. Imported from India. K20M, L7M

Gold Coast: 75 days. Vigorous producer of smooth (nearly unfluted), light-green pods. Small, bushy plant with an open growth habit, height 4 to 5 feet. Highly drought-tolerant and heat-resistant. Sometimes called "the lost okra of New Orleans". Introduced in 1960 by the Louisiana A.E.S. L7M

Guarijio Nescafe: Seeds are roasted, ground and used as a substitute for coffee. Young pods are fried, boiled or added to stews and gumbos. The very large, mature pods are good for dried arrangements. Attractive yellow flowers with red throats. Originally from Sonora, Mexico. 116, N84

Lee: (Dwarf Lee) 50 days. Bright-green, firm, tender, spineless pods; 6 to 7 inches long. Compact, bushy plant; height 3 feet; of open habit which makes harvesting easier; shorter stems permit closer planting in limited-space gardens. Dependable producer of uniform pods over a long season. Developed at the University of Arkansas. C20M, D12, D76, I91, N16

Longhorn: Unique heirloom from southwestern Louisiana. Very large pods, 12 inches or more long. Never commercially available, but grown locally by the Cajuns for at least 75 years. Traditionally considered the best okra for gumbo. Very large plants, 8 to 10 feet tall. F73D

Louisiana Green Velvet: (Louisiana Velvet) 60 days. Medium-green, slender, round, smooth pods; 6 to 7 inches long; spineless and very tender; retain their color when processed. Well-adapted to canning. Large, vigorous, branching, heavy-yielding plant; height 6 feet; produces all season. Very similar to Emerald. D12, F73D, N16

Pentagreen: 55 days. An early and high-yielding cultivar from Japan. Medium-green, five-angled, upright, slightly spiny pod; 6 inches long. For best quality, harvest when about 3 inches long. Sturdy, compact plant; 18 to 30 inches tall. Very productive, even in areas usually too cool for okra. C20M, J9M, K16M

Perkins Mammoth: (Perkins Mammoth Long Pod) 55 days. Pods long and slender, straight, slightly grooved, intensely green in color; length 6 to 8 inches; diameter 1 1/8 inches; fleshy and tender over a long period. Excellent for canning. Strong growing, highly-productive plant; height 4 to 5 feet. F24M, G57M, I99M, K23{PL}, K27M, K49M, K49T, K71, M95M

Star of David: 60 days. An Israeli cultivar with a distinctive flavor; recommended for okra lovers who would like to try something different. Short, blunt pods; about 5 inches long and 2 inches in diameter; with 8 to 9 deep grooves. Unbranched stalks grow 8 to 10 feet tall. Highly productive throughout the season. C95, K20M, K49T, L7M, L77D, N84

White Velvet: (Creole) 60 days. Very large, round, velvety smooth pods; greenish-white in color; long and tapering; not prickly to the touch; stay tender longer than other types. Excellent for frying. Height 3 to 5 feet. A standard, traditional cultivar. Introduced prior to 1894. C92

#### RED-SKINNED

Artist: Very uniform, brilliant purplish-red pods; 2 1/2 to 3 1/4 inches long; pentagonal in form; curved slightly and tapering at die end. Ripens early in the season. Turns an attractive deep green color after cooking. Excellent in soups and gumbos. Vigorous and productive. C20M, E97, S63M

Burgundy:<sup>1</sup> 60 days. Deep-red "baby" pods (2-3 inches long) make very attractive menu additions; older pods remain tender even at 8 inches in length; keep their red color when cooked. Attractive, deep-red stems and branches; red-veined green leaves. High yielding. Ornamental as well as tasty. All America Selections winner for 1988. B75, G6, G27M, G57M, G71, H21, H49, H85M, I64, I91, M46, M95M, R47

Hill Country Red: Attractive plant with bronze-red fruit. The slender pods can be sliced and eaten raw in salads. Produces very well in the heat of summer. Grows approximately 5 or 6 feet tall. Adapted to the low desert. F73D, I16, N84

Red: 60 days. Tasty pods are rich scarlet; 6 to 7 inches long; hold their color when fresh, but turn green once cooked. Recommended for fresh market, home gardens and processing. Vigorous, medium-sized plants; 3 to 3 1/2 feet tall. Leaves, stems and pods have a reddish tinge. Pods are also ideal for dried arrangements. A21, C92, C95, K49M

Red Velvet: 60 days. Long, slender, slightly ribbed, deep-red pods; will retain their color as long as they remain fresh but turn

green when cooked; add raw to salads for best use of bright color. Cut when very small before ribs become striggy. Tall, red stalks; height 4 to 5 feet; red-tinged foliage. An old cultivar. C20M, J97M, K23{PL}, K49T

Red Wonder: Long, red pods, with 7 distinct ridges; longer than other red strains; remain tender until almost mature. Upright plant; height 4 to 5 feet; very ornamental. Excellent quality combined with an attractive appearance. F85, R50

#### CODES FOR SPECIAL TYPES

1. Baby

### OLIVE {PD}

#### OLEA EUROPAEA

Alfonso: Very large, oval fruits. Usually salt-brine cured, packed in wine or wine vinegar, then bottled with the addition of olive oil. Cured olives are pale-brown to bright purple, soft-textured, and mildly bitter. Easy to pit. Excellent marinated in oregano and chopped garlic. Widely grown in South American countries, especially Chile and Peru. KLEIN, ROGERS [Re]; I64M, L50M, L99

Amfissa: (Amphissa) Large, roundish fruits. Brine-cured, sometimes with the addition of vinegar. Cured olives are rich-purple, smooth, moderately tender, and mild in flavor. They hold their texture and flavor well when pitted. Excellent in olive pies. From central mainland Greece. KREMEZI 1993 [Re], SCHNEIDER 1993; H15T, I58P

Arbequina: Tiny, roundish to oval fruits. Excellent for both pickling and oil extraction. Brine-cured olives are grayish-brown, aromatic, and have an intense, distinctive flavor. Very popular in tapas bars. Yields a smooth, rich, fruity oil considered by many to be the best in Spain. Named after the village of La Arbeca in Catalonia. ANDREWS, C. 1998, DOMINGO; L13P, L13P{PD}

Ascolano: (White Olive of Ascoli) Very large, ellipsoidal fruit; skin color very light even when perfectly ripe; pit relatively small. Excellent for pickles, but needs proper aeration during pickling to develop acceptable color. Also yields a complex, very fruity oil. Ripens very early. Widely adapted tree, tends toward alternate bearing when older. HARTMANN, KLEIN; I83M{GR}, 194, K39M{PD}

Atalanti: Medium to large, roundish fruits. Brine-cured and often packed in vinegar. Cured olives are greenish-tan to purple-brown, smooth, soft-textured, and moderately salty. One of the few European olives commonly sold already pitted. From central mainland Greece. ROGERS [Re], SCHNEIDER 1993; H15T

Barne'a: Small, almond-shaped, pointed fruits. Brine-cured, then packed in olive oil with native Middle Eastern seasonings. Cured olives are an attractive green, delicate, very fresh and herbal tasting, with pleasant bitter overtones. A selection from rootstock recently discovered in the Sinai Desert. SCHNEIDER 1993; E69

Barouni: (Baruni) Large, oval fruit, reddish-black when ripe. The variety usually shipped to the East Coast for makers of home-cured olives. Also produces a flavorful oil. Tree spreading and easy to harvest; a very consistent bearer. Withstands extremely high temperatures. Originally from Tunisia. HARTMANN, KLEIN; K39M{ED}, S59{GR}

El Greco: {GR} Selected for its heavy and reliable cropping and good oil content. One of the earliest bearing olives, producing good sized, small stoned fruit. Originated in New Zealand. N84, 097, R77

Elitses: High-quality Greek olive resembling Nigoise. Tiny, oval, pointed fruits with a high pit-to-flesh ratio. Suitable for pickling or

oil extraction. Brine-cured olives are brown to greenish-black, slightly bitter, oil-rich, fairly mild and wood<sup>^</sup>. Ideal for nibbling. SCHNEIDER 1993; H15T

Farga Aragon: Small to medium-sized, oval fruits with relatively high pit-to-flesh ratio. Picked ripe and then brine-cured. Cured olives are deep-brown to purple, soft and tender, with an intense, slightly smoky flavor. Excellent blended with extra virgin olive oil and made into olive pate. Produced in Spain, often by organic methods. E56, L13P{PD}

Frantoio: {GR} Small, long-oval to oblong fruits; black when ripe, with a prominent bloom. Ripens early, by October 15. An important oil producing olive in Tuscany and Umbria, in central Italy. Yields an oil with a fruity, herbal, nutty aroma and an occasional peppery bite. Vigorous, spreading tree; susceptible to cold; tends to bear in alternate years. DOMINfi, HARTMANN, KLEIN; 071M, R77

Gaeta: Small to medium, roundish fruits. Usually dry-salt cured, then rubbed with oil, but sometimes brine-cured. Salt-cured olives are black, wrinkled, and meaty. Brine-cured olives are mahogaiy, smooth, and slightly more soft and chewy. Both types are surprisingly mild. Often flavored with rosemary and other herbs. Can be hard to pit. KLEIN [Re], ROGERS [Re]; B71G, E23M, L99

Gigante di Cerignola: (Bella di Cerignola) Very large, prune-shaped fruits. Brine-cured in ash which produces attractive, bright-green olives with a light, fresh, sweet flavor. Distinctive, firm, fleshy texture. Low in salt. Difficult to pit. Also available in a black form. Tree a shy bearer; susceptible to cold injury and peacock spot. From the small town of Cerignola in Apulia. HARTMANN, ROGERS, SCHNEIDER 1993; A76, C94M, L50M, L99, N54

Hojiblanca: Medium to large, roundish fruit; yields 17 to 19% oil; ripens late November to late December in Spain. Often used for table olives because of its firm texture, as well as for oil. The oil is ideal for pastries and baking, yielding exceptionally workable and light doughs. Moderately vigorous tree; withstands cold well. Difficult to harvest. A7{PD}

Kalamata: (Calamata) Famous Greek olive from the town of Kalamata in the southern part of the Peloponnese. Medium-sized, slightly curved, pointed fruits; an attractive purple when cured. Brine-cured with the addition of red wine vinegar, producing the characteristic spicy flavor. Excellent seasoned with oregano and chopped garlic. KLEIN [Re], KREMEZI 1993; A7, A7M, A52M, B71G, C94M{PD}, E23M, H15T, I58P, I64M, J66M, L50M, L99, N54, S59{GR}

Ligurian: (San Remo, Olivette) Small, oval fruit with a high pit-to-flesh ratio, resembles Nigoise. Salt-brine cured, then frequently packed in herb-infused oil. Cured olives are glos<sup>^</sup>, brownish-black to purple-black, juicy, robustly flavored. Excellent blended with extra virgin olive oil and made into olive pate. From the Italian Riviera. KLEIN [Re], ROGERS [Re]; 194, 194{PD}, L99

Lucques: (Crescent) Medium-sized, oblong, variably curved fruit; glossy, velvet black when ripe. Cured green olives are fleshy, fine-grained and richly flavored. Also produces a robust, intensely fruity oil. Ripens in December. Strong-growing tree with a spreading top; bears fairly regularly. Originated in France. Named after the Italian province of Lucca. HARTMANN, SCHNEIDER 1993, WICKSON; A7, I58P, K39M{PD}, N84{GR}

Manzanillo: Large, rounded-oval fruit; skin brilliant purple, changing to deep blue-black when mature, resists bruising. Ripens early, several weeks earlier than Mission. The pulp parts readily with its bitterness and is exceedingly rich when pickled. Excellent for oil and pickles. Tree spreading, vigorous, a prolific bearer. Introduced to California from Spain. WICKSON; B93MIGR, G17{GR}, H15T, H40M{GR}, I64M, I83M{GR}, K39M{PD}, Q93{GR}, S59{GR}

Mission: Medium-sized, oval fruit; skin deep purple changing to jet-black when ripe; flesh very bitter but firm, freestone; ripens

rather late. Good for pickling and oil, especially ripe pickles. Average oil content. Most widely used for cold-pressed olive oil in California. Tree vigorous, heavy-bearing. More cold resistant than other cultivars. Grown at the old missions in California. C60D{PD}, D3M{PD}, D7{PD}, E48{GR}, H40M{GR}, I64M{PD}, I83M{GR}, K39M{PD}, S59{GR}

Nabali: Medium to large, plump, roundish fruits. Suitable for both pickling and oil production. Relatively high oil content, 27 to 33%. Small, easily removed pits. Available in both green-cracked and tree-ripe forms, usually brine-cured and seasoned with herbs and spices. Tree somewhat of an alternate bearer. Widely grown in the Galilee region of Israel. HARTMANN, SCHNEIDER 1993; E69{ED}

Naphlion: (Naphlion) Famous Greek olive from the town of Naphlion in the northeastern part of the Peloponnese. Small to medium, elongated fruits. Brine-cured, then packed in olive oil. Cured olives are dark khaki-green, crisp and meaty, and have a sharp, fresh, fruity flavor. Often dressed with garlic or herbs. In Greek markets, olives called *tsakistes* or the "cracked ones" are usually Naphlion. LAMBERT-G6CS, ROGER [Re]; A52M, H15T

Nevadillo: Medium-sized, long-oval fruits; glos<sup>^</sup>, velvet-black when ripe. Ripens in October. Grown on a small scale in California for oil production. Yields a very versatile oil with a rich, robust flavor. Vigorous, spreading tree; somewhat alternate bearing. Imported into the United States from Spain about 1885. HARTMANN; K39M{PD}, N54{PD}

Ni<sup>o</sup>ise: Small, oval fruits with a high pit-to-meat ratio. Brine-cured, then packed in olive oil with *herbes de Provence*. Cured olives are glos<sup>^</sup>, brown to brownish-purple, smooth, tender, rich and flavorful. Difficult to pit. Essential for *salade Nigoise*, a classic dish of the French Riviera. ANDREWS 1996 [Re], KLEIN [Re], ROGERS [Re]; C34G, H15T, I8M, I64M, J66M, L99, N51M

Nyons: Hearty olive from the Provencal region of France. Small to medium, roundish fruits. Mostly dry-salt cured, then rubbed with oil, but occasionally brine-cured. Cured black olives are slightly wrinkled, melting and pleasantly bitter. Easy to separate and pit. Excellent in *pissaladiere* and *tapenades*. Also suitable for oil extraction. KLEIN [Re], ROGERS [Re]; A7,158P, L99

Picholine: Small, elongated fruit; skin light green, changing to wine red, then to red-black when ripe; pulp fleshy, firm-textured. Cured olives have a delicate, subtle, lightly salty, nut-like flavor. Usually salt-brine cured. Widely grown in certain parts of Provence, France where it used for *olives farcies* (variously stuffed olives). Popular in gourmet and specialty markets. Tree vigorous, medium-sized, bears heavy crops regularly. A7, I8M, I58P, K39M{PD}, L99, 071M{GR}

Pical: Medium to large fruit, pointed at the tip; yields 22% oil on average; ripens in November and December. Produces excellent quality oil which is traditionally used for frying, stews, meat dishes, salads and gazpachos. Very vigorous tree; precocious and high yielding. Plantings of Pical amount to 50% of Spanish olives, and therefore about 20% of the world's olives. Grown mostly in Andalusia. DOMINE; U7G{SC}

Santa Catarina: (Santa Katherina) Medium to large, long-oval fruit, slightly smaller than Ascolano. Ripens in November. Cured, green-cracked olives are meaty, juicy and flavorful. Usually brine-cured, those from Israel often flavored with lemon rind. Grown throughout central Italy and in the Galilee area of Israel. Bears good crops regularly. HARTMANN, SCHNEIDER 1993; E69, 071M{GR}

Sevillano: (Gordal) Very large fruit, bluish-black when ripe; stone large, clingy; ripens early. Little oil content, mostly used for pickling. Used for making Sicilian style salt-brine cured olives and the largest *Queen olives* of Spain; also the leading canning cultivar. Tree a strong grower and regular bearer; requires deep, rich, well-drained soil; will not stand much cold. KLEIN, WICKSON;

D81{PO}, H15T{PD}, I64M{ED}, I83M{GR}, L13P{ED}, K39M{PD}, Q93{GR}, S59{GR}

Souri: Small to medium, elongated fruits. Used for both pickling and oil extraction. High oil content, 33 to 44%. Yields an oil with a foil, delicate, fruity flavor. Both cracked-green and ripe brine-cured forms are available. Large, vigorous tree; yields heavy crops but tends toward alternate bearing. The oldest and most popular variety grown in the Galilee region of Israel. HARTMANN, SCHNEIDER 1993; A7{PD}, E69{PD}

Taggiasca: An important olive in the Ligurian region of the Italian Riviera, both for table olives as well as oil production. Small, oval fruits. Brine-cured olives are brownish-purple and have a mild but distinctive flavor. Yields an exceptional, very light, thin oil with a delicate almond-like flavor. Introduced to Taggia by Benedictine monks. Possibly a clone of Frantoio. ANDREWS, C. 1996, DOMINE; C60D, C60D{PD}

Thasos: Medium-sized, oval fruits. Dry-salt cured, then often coated in oil. Fudge-brown to licorice-black when cured; wrinkled; chewy, prune-like flesh; subtle, earthy, concentrated flavor; usually quite salty. Regional olive from Greece, only occasionally available at ethnic markets. SCHNEIDER 1993; H15T

Verdale: {GR} Medium to large, almost round fruit; skin very green till nearly ripe, then vinous red, finally deep black, somewhat dull; pulp fleshy, dry; stone very large; ripens early. Flavor and texture when pickled very good. Primarily used for green olives. Tree dwarf, lacking in vigor; a regular, moderately heavy bearer. Originated in France. Q93, S59

## ONION {S}

ALLIUM CEPA  
ALLIUM X PROLIFERUM

ALLIUM FISTULOSUM

---

### BUNCHING ONIONS

Also called *Welsh onions*, *green onions*, *salad onions*, *spring onions* and *scallions*. Grown for the green tops and the long, usually white stalks or slightly swollen base. Mostly *A. fistulosum*.

### RED-STALKED

Benizome: A unique cultivar with dark violet stalks. The violet color develops well under low temperature conditions. Usually produces 3 to 4 stalks. Useful raw or cooked. Excellent for the fresh gourmet market and bedding sales. Matures late for a bunching onion. TIM

Deep Purple: 60 days. A new development in red bunching onions. The first cultivar that is highly colored at any temperature or age. Deep reddish-purple color. Develops and retains its color throughout its growth period and under high and low temperature extremes. Suitable for spring or summer sowings. G6, K49M, L7M

Get Set Red: Perennial scallion-like bunching onion. Reddish colored for a length of 2 inches along the bottom of the stalks. Forms large bulbs the second year; continues multiplying at the base. Over-winters and sets seed, while producing more onions. Grows about 18 inches tall. Harvestable from spring to early winter. H15P

Redmate: Easy to grow, scallion-like, red bunching onion. Crispy, mild and sweet; delicious whether picked at the thin, pencil-size stage or after the bulb has just begun to swell. The flavor will be somewhat stronger if picked at the latter stage. Developed in Europe. E33

Red Beard: 60 days. Attractive, red-colored stalk, 12 inches long; crisp, mild and flavorful. Best quality is obtained when harvested just as the bulbs begin to swell. Delicious brushed with oil and grilled over charcoal until soft and sweet. Vigorous plant; height 2 1/2 feet. Bright coloration develops in cool weather; should be

planted in late summer for a fall harvest. D68, F80,177, K23{PL}, L3J, L42, M49, N84, R32, S55, S70

**Red Bunching:** (Bed Welsh Bunching) Red non-bulbing onion. Grows in clusters of 3 to 4 stalks. Stalk 10 to 12 inches long, bright-red over nearly the entire length, free of bulbing. Mild flavor; good in soups, stews and salads Very hardy and prolific. Usually grown as an annual. K85{PL}, Q34

**Red Welsh:** (Early Red, Ciboule Commune Rouge) 65-70 days. An old form of perennial bunching onion, similar to the true wild Welsh onion. Grows in clusters of 2 to 3 stalks, each stalk 12 to 14 inches long; coppery-red in color. Light green leaves. Strong flavor; use leaves and small bulbs. Can be maintained from season to season by division. Very hardy. C53, N84, 048, P59M, S55

**Santa Clause:** 56 days Very fine Ishikura type with rose-red stalks. Can be harvested as "spring onions" 6 to 8 weeks after sowing; remains tender and flavorful for 2 to 3 weeks afterwards. Excellent lightly grilled until soft and sweet. Unique color improves with earthing up and intensifies with the onset of cold weather. L91M

#### WHITE-STALKED

**Beltsville Bunching:** (*A. cepa* x *A. fistulosum*) 65 days. Long, smooth white stalk with a slight swelling, resists bulbing; crisp, very mild and flavorful. Widely adapted; produces well where others may fail. Will stand hot, dry weather better than most cultivars; also very hardy. Resistant to pink root, smut and thrips. Released by the USDA. D12, G13M, G57M, K49M, L42

**Evergreen White Bunching:** (Evergreen Hardy Long White, Nebuka) 65 days. Long, slender stalk; 4 to 9 inches to the first leaf; little or no bulbing; tender and mildly pungent. Resistant to thrips, smut and pink root. Extremely winter hardy. Sow in spring or fall. Can also be treated as a perennial by dividing the clumps the second summer to produce a new crop. C97, C85M, D55, D82, F44, F80, F82, G6, G13M, G33,164, L59, L79, N16

**He-Shi-Ko:** 65 days. Semi-splitting type; produces clusters of stalks when not planted too closely. Long, silver-white stalk, 8 to 10 inches to the first leaf; tender and mildly pungent. Tolerant to both heat and cold; can be over-wintered for an early spring crop. Resistant to pink root, smut and thrips. A16, C44, D12, D65, D76, E97, G13M, G83M, 139, J20, K85{PL}, M46

**Hikari:** Grows in clusters of approximately 6 stalks. Strong, erect, dark-green foliage. Both leaves and stems are tender, mild and flavorful. Resistant to bulbing. For summer and fall harvests. Can also be sown in the fall for over-wintering. N84, R32, S55

**Ishikura:** (Ishikura Long White) 65 days. Single stalk type. Thick, cylindrical, non-bulbing stalk; up to 12 inches long to the first leaf; tender and mildly pungent. Tall, upright, pale blue-green leaves; resist breaking. Good shipping qualities. Winter-hardy plant; grows 18 to 24 inches tall. A75, C85M, F63, G13M, G33, H61, J9M, K10, K49T, K73, L42, L91M, N52, Q3, R32, S63M, etc.

**Kincho:** (Kincho III) 75 days. Single stalk type, similar to Tokyo Long White. Long, slender, pure-white stalks with much better uniformity than Ishikura. For late summer and fall harvests, or for over-wintering. Winter hardy in southern Ontario, New York, Ohio and New Jersey. F13, H54, K73, L42, L89, N52

**Kujo Multistalk:** (Kujo Green Multistalk) 70 days. Grows in clusters of 3 to 4 stalks. Slender white stalk, 6 inches long to the first leaf. Both leaves and stalks are very tender and flavorful. Height of plant 20 to 24 inches. Can be sown spring through late summer or treated as a perennial. C95, D1T, D55, K49M, N84, 053M, S70

**Kuronobori:** 60 days. Single stalk type. Slender white stalk, 16 inches long; mildly pungent and flavorful. Dark green leaves; 14 inches long. Grown mainly for the long white stalks, which are mildly pungent and well-flavored. Suitable for planting at any time of the year. Very popular in Japan and China. D55, N84, S70

**Multi-Stalk 9:** (Iwatsuki) 80 days. Grows in clusters of 8 to 10 stalks. White stalks; 7 inches long. Leaves green, about 12 inches long; moderately thick, soft and sweet. Suitable for sowing at any time of the year. E83T, L59

**Naga Negi:** (Tokyo Negi) Very long, white, single stalk type. Famous for the length of its stalk which may reach 2 feet or more. Has a pleasant, mildly pungent flavor. Traditionally the most popular onion in Tokyo and surrounding areas. Available year round in Japan, but develops its best flavor in the autumn. Often grilled on skewers, or used for flavoring vinegar and beef dishes. TSUJI; G20M{PR}

**Tokyo Bunching:** 110 days. Resembles Evergreen White Bunching, but has more upright, stiffer tops and grows with single stems. Little or no bulbing, especially in the fall. For summer and fall harvests; not recommended for over-wintering. AI, M29

**Tokyo Long White:** 68 days. Single stalk type. Long, slender white stalk; 14 to 18 inches long, 3/4 to 1 1/2 inches in diameter; little or no bulb; tender and mildly pungent. Upright, stiff, dark blue-green leaves; about 6 inches long. Excellent for fall and summer bunching; not winter-hardy. Resistant to pink root, smut and thrips. A75, D1T, D12, FI, G13M, G33, G82, H61, H95, J84, K73, L42, L59, M49, 053M, etc.

**Tokyo Natsuguro:** Dark green leaves with long white stalks, very tender and mildly pungent. Vigorous growing plant, to 3 feet tall. Similar to Kuronobori. One of the most popular single-stalk bunching onions in Japan. D55, N84, Q28, S70

**White Javelot:** 65-70 days. Beltsville Bunching type. Of better appearance, with longer white stalks and less tendency to bulb. Very uniform. Resistant to hot weather and cold. Finer, bluish-green foliage. Less sensitive to diseases than traditional bunching types. D11M, F70

**White Knight:** Long white stalks, with relatively little bulbing. Erect, medium tall, medium dark-green tops. Good tolerance to some strains of pink root. A refined and widely adapted cultivar. Grows well on a variety of different soil types and under diverse climatic conditions. 118M

**White Spear:** 85 days. Short white stalks, 4 to 5 inches long; very slow to bulb even in hot, dry weather. Tall, upright, blue-green leaves; weather tolerant, stand up well to stress and heat without falling. Very vigorous and reliable. Resistant to pink root. AI, A2, A75, G16, G57M, G82, H61, J84, K49Z, K50, K63G, K73, L7M, L94, M32, etc.

**Yakko Summer:** 100 days. A specialty in Osaka, Japan. Leaves slender but numerous. Stands heat better than other cultivars without falling over. Good for late spring sowing. J73

**Zhang Qiu:** Large, tall plants, over 3 feet tall and weighing more than 2 pounds; white part of stem 20 to 24 inches long, tender, crisp and sweet. One of the most famous scallion cultivars in China where it is considered superior to all others for brushing thick *hoisin sauce* onto the Mandarin pancakes used for wrapping *Beijing duck*. Adapted to the climate of northern China. 054

#### LARGE BULBING ONIONS

Some types of bulbing onions are grown for fresh use, others for storage. They are grown from seed or from *onion sets*, which are small, specially grown bulbs. Raising them from sets is easier than from seed, especially in areas with short summers or where spring sowing conditions are likely to be difficult. Sets mature earlier and largely avoid the problem of onion fly, however only a few cultivars are available as sets. LARKCOM 1984. (*A. cepa*)

#### RED/PURPLE-SKINNED

##### *Hybrid*

**Red Burgermaster:** (Burgermaster) 110 days. Long-day type. Large to very large, globe-shaped bulbs, up to 3 1/2 inches in

diameter; bright reddish-purple skin; crisp, very attractive, red and white flesh. Excellent, sweet and spicy flavor. Perfect for slicing. Very good storage qualities. Good vigor and uniformity. A16, D8M{PL}, D26D, D65, F13{PL}, F63, G16, G71, G83M, G87, H57M, 139,191, J20, J99G{PL}, L89, L89{PL}, M49, etc.

Red Granex: 165 days. Short-day type. Large, flattened globe-shaped bulb; skin thin, dark red; flesh red, firm, mild. Stores moderately well. Some tolerance to bolting and doubling under good growing conditions. Protect from strong sunlight to prevent bleaching. Resistant to pink root. Standard short-day red onion in the Granex class. C20M, G93M, 191

#### *Open-Pollinated*

Benny's Red: (Bennie's Red) 112 days. Long-day type. An improved Southport Red Globe. Medium to large, deep globe-shaped bulbs; attractive bright red skin; soft, moderately pungent, pink to white flesh. Not for long-term storage. Standard commercial red onion; also good for home gardens. C20M, D12, F13, G79, G82, K10, M27, N52

Burgundy: (Red Hamburger, Red Buigundy) 120 days. Short-day type. Large, flattened globe-shaped bulb, 3 to 4 inches in diameter; glossy, dark red skin; flesh white, with red ringing; very sweet and fine-textured. Ideal for slicing. Not a good keeper. Resistant to pink root. D65{PL}, E97, H33M, H95, I50G, I65M{PL}, K5M, K27M, K49M, N16

Early Red Burger: 172 days. Intermediate-day type. Medium-large, thick-flat bulb; skin deep dark-red; flesh white with light-red ringing, soft, mildly pungent. Developed as an early fresh market cultivar with good color. Highly non-bolting with good tolerance to pink root. Widely adapted. B49, C20M, G93M, H61

Italian Blood Red Bottle:<sup>1</sup> 120 days. Large, spindle-shaped, blood-red bulb. Has a spky, tangy flavor. Ideal shape for slicing. Can be used in salads or for cooking. Often employed in center-piece arrangements. 139

Ramata Rossa di Milano: 110 days. Very large, blocky, top-shaped bulb; copper-red skin; sweet, pungent, flavorful white flesh. Sown February through April for harvesting in the summer. Very long storage ability for a red-skinned onion. Excellent for braiding. C53, K49T, Q11M

Red Bermuda: 95 days. Short-day type; similar to Yellow Bermuda and Crystal Wax except for its red color. Medium to large, semi-flat bulb, about 3 inches in diameter; thin red skin; crisp, very mild, pinkish flesh. Excellent in salads and sandwiches. Does not keep well. DIT, E5T, G57M

Red Brunswick: (Braunschweiger, Rouge de Brunswick) 105 days. Small, very flat bulb, seldom exceeding 2 1/2 inches in diameter; skin intense violet-red, verging on black; flesh white, hard and firm, juicy, mildly pungent. Can be used for green onions. Stores extremely well. Introduced prior to 1865. BURR, VILMORIN; D24{ST}, P59M, R83{ST}, S55, S61

Red Creole: (Red Creole C-5, Creole C-5) 110 days. Short-day type. Small to medium-sized, thick-flat bulb; skin reddish-buff; flesh reddish-purple, fine-grained, solid, very pungent and flavorful. Stores moderately well. Grows well under hot, humid conditions. C20M, DIT, D12, E5T, G27M, G93M, J59M, K49M, K63G, S66M

Red Grano: 90-100 days. Short-day type. Medium to large, top-shaped bulb; deep red skin; crisp, fine-grained flesh of mild flavor. Will store well for 2 to 3 months if kept dry. Resistant to pink root rot. C20M, DU, D82,177

Red Torpedo:<sup>1</sup> (Italian Red Torpedo) 100 days. Intermediate-day type. Large, spindle-shaped bulb, often weighs 1 pound or more; skin thin, dry, light purplish-red; flesh very light-red, soft, sweet, mildly pungent. Ideal shape for slicing. Stores moderately well. For home gardens and local markets. Highly productive and non-bolting.

Good tolerance to pink root. B49, C20M, C53, DIT, G93M, I18M, 177,199M{PL}, J20, K49T, 053M

Red Wethersfield:<sup>5</sup> (Large Red Wethersfield) 105 days. Long-day type. Large, comparatively flat bulb, 5 inches in diameter; skin deep purplish-red; flesh medium-firm, pungent, purplish-white. Widely used for the production of red onion sets. Widely adapted. Keeps fairly well. Introduced prior to 1865. BURR, VILMORIN; A25, C44, C61{ST}, C95, D12, F92,163Z, 184, J99G{ST}, K49M, K71, M46

Rossa di Bassano: (Di Genova) Medium-day type. Large, flattened bulb with violet-red skin and rose colored flesh. Sown in August and September or February through April. Harvested in spring and summer. An early maturing onion for the fresh market. Does not store well. N84, 053M, Q11M

Rouge de Florence:<sup>1</sup> (Red Florence) Very long, spindle-shaped root, about 6 inches long; bronze pink-red in color. Very mild and sweet. Attractive red color blends well with the pale green stem. Ideal shape for salads and pickling. Relatively insensitive to daylength; may be sown in spring or fall. C53, G68, N84, S55

Ruby: 105 days. Long-day type. An attractive, refined selection of Southport Red Globe. Medium to large, deep globe-shaped bulb; thick, deep red skin; pink, firm, pungent flesh. Tight, relatively heavy, well-retained scales. Well suited to prolonged storage when properly cured. C20M, C95, G93M

Southport Red Globe: 110 days. Long-day type. Medium to large, globe-shaped bulb; thick, glossy, purple-red skin; flesh firm, strongly pungent, white tinged with pink. Heavy, deep red scales are well retained during handling and storage. Well-adapted to northern areas. Standard hard red market and storage onion. B49, B75, E53M, G93M, H21, H95, I64, J14{PL}, J20, K49T

Stockton Early Red: 180 days. Intermediate-day type. Large, thick-flat bulb; skin thin, dark red; flesh white with light-red ringing, mildly pungent. Short storage period. Very productive and vigorous. Highly non-bolting; tolerant to pink root. Well adapted to central California. C20M, C53, G93M, H61, I99M{PL}, J9M, K49T, K66{PL}, L89, L89{PL}

Sweet Flat Red: Long day type similar to Red Hamburger. Large, flat bulb, 3 to 4 inches in diameter; skin red; flesh white, with light-red ringing. Very mild, as mild as Bermudas but better adapted to the Midwest. Excellent for summer salads and hamburgers. Does not store well. G16{PL}, I49M{PL}

#### WHITE-SKINNED

##### *Hybrid*

White Granex: (Miss Society) 170 days. Short-day type. Large, thick-flat bulb; white skin; fairly firm, mild white flesh. Resistant to pink root. Standard white Granex type, very widely grown and popular in onion-producing areas of the South. Released by the USDA and the Texas Agricultural Experiment Station. C20M, D8M{PL}, DIT, G27M, H33M{PL}, I50G, J99G{PL}, N16{PL}

White Keeper: 106 days. White Sweet Spanish type. Uniform, globe-shaped bulbs, 3 inches tall, 3 1/2 inches wide; average weight 12 ounces; pure white throughout and resistant to greening on both interior and exterior. Centers are firm, generally multiple but not dividing in any way. Excellent storage capabilities, particularly for a sweet white onion. Tolerant to various strains of pink root. Introduced in 1980. C20M, C68M, G57M, J20, J84

##### *Open-Pollinated*

Blanco Duro: 120 days. Long-day type. Large; blocky, globe-shaped bulbs; about 3 inches in diameter; attractive, ivory-white skin; firm, spicy, pungent white flesh. Less prone to greening and developing thick necks than Southport White Globa Very good storage qualities. Good production and uniformity. Tolerant to pink root. A1, B75M, C20M, G93M, J9M, J20, L59G, L89

Dehydrator 86:<sup>7</sup> Short-day type specially developed for dehydrating. Slightly elongated, white bulbs; very firm, 18-20% dry matter; stores for a long time. Suitable for mechanical harvesting. Also recommended for use as a bunching onion. *P75M*

Fresno White: 194 days. Intermediate-day type. Large, thick-flat to flattened globe; thin white skin; soft, white, moderately pungent flesh. For fresh market use; does not store well. Highly productive and non-bolting with good tolerance to pink root. Well adapted to the Central Valley of California. *C20M, G93M*

Odorless Plain Leaf:<sup>2</sup> Excellent salad onion. Flat, light brown bulb; creamy white flesh, very mild in flavor. Keeps fairly well. Used for early crops sown in autumn and winter. Available since 1932 in Australia. *PIG*

Ringmaster:<sup>3</sup> (White Sweet Spanish Ringmaster) 115 days. Long-day type. Selected for a high percentage of single centers, ideal for onion rings. Very large, globe-shaped bulb; glossy white skin; medium firm, mildly pungent white flesh. Stores moderately well. Produces a high percentage of jumbo size bulbs. Resistant to pink root. *C20M, D1T, D12, G13M, G57M, K73, M32*

Southport White Globe:<sup>4</sup> 65-120 days. Long-day type. Medium-sized, globe-shaped bulb; thin pure-white skin; very firm, close-grained, pungent white flesh. Stores very well if cured properly. Good for home gardens. Standard storage cultivar in long-day regions; also used for green bunching onions in the spring. 475, B49, B75, C92, D11M, F13, F70, G57M, G71, H61, J84, K73, L42, N52

White Bermuda: 90-100 days. Short-day type. Medium-large, semi-flat bulb, 2 1/2 to 3 1/2 inches in diameter; thin white skin; very mild, crisp, waxy white flesh. Excellent in salads and sandwiches. Not a good keeper. Widely adapted in southern areas. *C61{ST}, D8M{PL}, H33M, H33M{PL}, H85M{PL}, K10, K27M, K27M{PL}, L89{PL}, N16{PL}*

White Ebenezer:<sup>5</sup> 100 days. Long-day type. Medium to large, flattened bulb; white skin; firm, mild, clear white flesh. Good keeping qualities. Used for mature onions or small pickling onions; also widely grown for the production of white onion sets. 475, C44, *D12, E5T, G57M, H49, J20{ST}, J99G{ST}, M95M*

White Lisbon:<sup>4</sup> (White Lisbon Bunching) 60-110 days. Bulb round, more or less flattened, 3 to 4 inches in diameter when well grown; skin smooth, thin, clear and white; flesh mild, moderately firm. Widely grown as an early bunching onion. Does not keep well. Introduced prior to 1865. *BURR, VILMORIN; B49, C69, C85M, C92, D65, G79, H61, I50G, 184, K10, K49M, K66, L42, TIM*

White Sweet Spanish:<sup>4</sup> 75-120 days. Long-day type. Large, globe-shaped bulb; skin white, medium-thick, glossy; flesh white, moderately firm, mildly pungent. Stores fairly well. Also used as a green bunching onion. Standard late white cultivar for long-day regions. *C85M, D8M{PL}, D82, E38, G71, I64, I65M{PL}, J14{PL}, K71, L79, L89{PL}, N16*

White Sweet Spanish Bunching:<sup>4</sup> 70 days. Special strain used for bunching or stripping. Uniform, long white stems; slender blue-green tops. Very mild and sweet. Slow to form bulbs, but will reach 5 1/2 inches in diameter if planted as a Spanish onion. Harvested from early spring until fall. *B75M, E53M, F63, G82, L42*

White Sweet Spanish Jumbo: (White Sweet Spanish Utah Jumbo) 125 days. Long-day type. Very large, globe to deep globe-shaped bulb; white skin; moderately firm, mildly pungent white flesh. Keeps fairly well. High yielding; produces a high percentage of jumbos. Tolerant to thrips. *F63, G93M, H61, I59M, K5M*

#### YELLOW/BROWN-SKINNED

##### Hybrid

Candy: 105 days. Large, jumbo Spanish type with intermediate daylength requirements. Globe-shaped bulbs with small necks;

golden-yellow skin; very sweet, mild white flesh. Only suitable for short term storage. Very popular near the Mason-Dixon line, where it is direct seeded in early spring. Produces jumbo sizes when grown from transplants in the North. *A87M, C20M, D8M{PL}, E97, G13M, G82, G93M, 139, J14{PL}, J84, J99G{PL}, K10, K50, K73, M46, etc.*

Copra: 105-110 days. Long-day type. Medium-sized, very hard, blocky round bulbs; thin necks that dry quickly; thick, deep copper-yellow skin; mildly pungent white flesh. Highest in sugar of the storage onions. Excellent uniformity and production. One of the longest storing onions, remains firm and sound after other varieties have sprouted. Tolerant to fusarium wilt. *C20M, C28, C85M, D68, D76, E24, E75{PL}, E97, F13{PL}, F63, G6, G87, K50, L42, L89, L89{PL}, N81, etc.*

Mau: 6 Short-day Yellow Granex type hybrid. When grown on the slopes of Haleakala volcano on the island of Maui, the volcanic soil and cool climate produce a delicious onion that is high in sugar and moisture and low in bite. SCHNEIDER 1986 [Cul, Re]; *A94M{PD}, E13G{PR}, E13G{PD}, F85M{PR}, G33, H90G{PQ}, K17J{PD}, L11, N40{PR}*

Sweet Sandwich: 110 days. Long-day type. Large, slightly top-shaped bulb; light-brown skin; tender, light-yellow flesh. Moderately pungent at harvest, mellowing considerably and becoming sweet after about 2 months in storage. Will keep until April or May. High yielding; tolerant of drought. Developed by Clinton Peterson of the University of Wisconsin. *C53, E24, E91G, G13M, G16, J14{PL}, M95M, R32*

Vidalia:<sup>6</sup> (Vidalia Sweet, Vidalia Granex) Short-day, Yellow Granex type. Large, slightly flattened globes with rounded shoulders; yellow skin; crisp, firm white flesh, extremely sweet and mild; large-ringed. Excellent for onion sandwiches, pickles and onion relish. Resists bolting. Widely grown near Vidalia, Georgia where it is claimed to be "the sweetest onion in the world". SCHNEIDER 1986 [Cul, Re], THOMPSON, P. [Re]; *B21M{PD}, D76, D76{PL}, E97{PL}, F85D{PD}, H35{PD}, H49, H90G{PD}, I65M{PL}, J49{PE}, K71{PL}, L35{PL}, M50{PD}*

Yellow Granex: 165 days. Short-day type. Large, thick flat-shaped bulb; skin light yellow, thin; flesh yellowish-white, moderately firm, very mild and sweet. Keeps fairly well. Resistant to bolting when grown where adapted. Tolerant to pink root. Very widely grown and popular in onion-growing areas of the South. *D8M{PL}, D12, G93M, I50G, J14{PL}, N16{PL}*

##### Open-Pollinated

Ailsa Craig: 110 days. Sweet Spanish type from England where it is a traditional exhibition onion. Very large, globe-shaped bulb, weight 2 pounds or more; rich, golden straw-colored skin; firm, sweet mild flesh. Good keeping qualities. For spring or early fall sowing. Introduced about 1899. *B49, D68, E33, G6, G53M, J9M, J14{PL}, J20, M46, N84, 053M, R32, S55*

Bedfordshire Champion: Medium to large, globe-shaped bulb; light-brown skin; firm, mildly pungent white flesh. Excellent storage qualities; keeps well into winter. Consistently heavy yields. Very susceptible to downy mildew. An old traditional English cultivar, still very popular. Introduced prior to 1885. *VILMORIN; B49, N84, 053M, R32, S55, S61*

Early Yellow Globe: 100 days. Long-day type. Medium-sized, globe-shaped bulb; light bronze skin; moderately firm, mildly pungent white flesh. Good shipping and storage qualities. Widely adapted; but particularly well suited to the Northwest and upper Midwest. Introduced in 1980 by Joseph Harris. *A2, C20M, C85M, D68, F82, I39M, J20, L7M, L89C*

First Edition: 100-105 days. Long-day type. Medium-sized, very firm, globe-shaped bulbs; 2 to 3 inches in diameter; bright, brownish-skins; rich, pungent, creamy-yellow flesh. Especially good for cooking and roasting. Excellent keeping qualities. Adapted to a

wide range of temperatures in storages Tolerant to pink root. D8M{PL}, D76, E97, G16, G57M, G71, G82, G87, J99G{PL}, K66{PL}, L89, L91M, N16{PL}

Giant Zittau: Large, flattened globe-shaped bulb, 4 to 5 inches in diameter; skin attractive, very smooth, almost silky, pale salmon-colored; small neck. Also used for medium-sized pickled onions. Keeps exceptionally well. Highly productive. Suitable for spring or autumn sowing. Introduced prior to 1885. VILMORIN; B49, P59M, R32, S75M

Golden Globe:<sup>5</sup> Long-day type. Medium-sized, oblong globe-shaped bulb; deep golden-yellow skin; firm, mildly pungent flesh. Widely used for the production of yellow onion sets. Can also be harvested as early green onions. Moderately good keeper. D12, E38

Imai Early Yellow: Early maturing selection from Senshyu Semi-Globe. Thick, flattened globe-shaped bulb, weighing about 10 ounces; skin pale yellow, thin; flesh firm, pure-white, mildly pungent; quality excellent. Adapted to overwinter culture in mild climates. Bridges the gap between the stored onions from the previous year's crop, and the current crop, not yet ready for use. C20M, S63M, S70

James Long Keeping: (James Keeping) Small to medium-sized, pear-shaped bulb, seldom over 2 inches in length; skin coppery red; very fine neck. Excellent storage qualities. Still popular in England, with both home gardeners and commercial growers. Introduced about 1834. VILMORIN; C95

Kelsae Sweet Giant: 110 days. Long-day type. Extremely large, top-shaped bulb, average weight 4 to 5 pounds; dense, solid, very mild flesh; unique sweet flavor. Matures easily in northeastern United States and Canada on sandy soils by mid-September. Excellent for storage. Produced the World Record onion of 7 pounds 7 ounces. D11M, D27, D76, E75{PL}, E97, F70, H42, L42, L79, N84, Q34

New Merico Yellow Grano: 167 days. Short-day type used for early markets. Medium to large, top-shaped bulb; thin, light yellow skin; medium-firm, mild flesh. Short storage period. Resistant to pink root; somewhat tolerant to thrips. For autumn, winter or very early spring plantings in southern areas. AI, C20M, K5M

New York Early: 95-100 days. Long-day type. Medium to large, firm, blocky to roundish-oval bulbs; attractive, copper-yellow skin; tender, sweet, mildly pungent flesh. Medium-term storage capabilities. Early Yellow Globe strain, selected and maintained by onion farmers of Orange County, New York. The type of onion known to gourmets as *black dirt onions*, as they were once shipped down the Hudson River still covered in rich black soil. MALOUF [Re]; D68, E24, G6, K50, K73, L42, L59G, M27

Oakey: Large, flat bulb, up to 5 pounds; skin light brown; flesh firm, very pungent and flavorful. Excellent with bread and "real ale". Keeps up to 9 months. Very popular for exhibitions. Heavy yielding. Rare English cultivar, grown in Soham, Cambridgeshire since the 1880's. S55

Pukekohe Longkeeper: (M & R Pukekohe Longkeeper) 200 days. Intermediate-day type. Medium to large, globe-shaped bulb; skin amber to golden-brown; flesh white, firm, pungent. Very productive and extremely long keeping. Originated in New Zealand. TIM

Ramata di Milano: (Giallo di Milano) Large, blocky, top-shaped bulb; copper yellow-brown skin; flavorful white flesh. Sown February through April for harvesting in the summer. Very compact bulbs make this cultivar suitable for long term storage. Excellent for braiding. C53, Q11M, S17

Ringer:<sup>3</sup> (Ringer Grano) 168 days. Short-day type. Large, top-shaped bulb; yellow-brown skin; soft, mild, sweet flesh; very thick rings. Produces a high percentage of single centers, making it ideal for onion rings. Excellent in salads and sandwiches. Also good for fresh market use. High yielding. Resistant to pink root. AI, A87M, C20M, K73

Senshyu Semi-Globe: (Senshyu Yellow) Heavy yielding Japanese cultivar bred for over-wintering in mild climates. Medium to large, flattened globe-shaped bulb; deep straw-colored skin; firm, mildly pungent flesh. Excellent keeping qualities. Sown late summer to autumn; ready for harvesting mid-June to July. N84, Q3, R32, R32{ST}, S63M, S70, S75M

Sturon:<sup>5</sup> Long-day type. Medium-sized, flattened globe-shaped bulb with a thin neck; skin yellowish-brown, moderately thick; flesh firm, juicy, pungent; quality very good. Keeps extremely well. High yielding Stuttgarter type, widely grown in Europe for sets. P59M{ST}, R83{ST}, S61M

Stuttgarter:<sup>5</sup> (Yellow Stuttgarter, Stuttgarter Riesen) {ST} Long-day type. Medium-sized, flattened globe-shaped bulb; skin light yellow-brown, glossy; flesh firm, white, mildly pungent. Keeps very well. Primarily used for the production of sets. Sets hold very well in storage without sprouting; will not produce seed-stalks when set out in unfavorable weather. /175{S}, C61, C85M, D72, D24, D68, F13, G16, G57M, J20, J97M, K95M, M49

Sweet Winter: 340 days. Over-wintering onion developed to withstand bolting in sub-zero northern climates. Produces a Stuttgarter shaped set onion from a late summer planting. Matures by the end of June the following spring. Large, thick-flat bulb; skin light yellow; flesh mild and sweet, 50% sweeter than regular set onions. Short storage period. Introduced in 1980. C20M

Texas Early Grano: (Texas Early Grano 502) 175 days. Short-day type. Large, uniform, top-shaped bulbs; skin thin, dry, straw-yellow; flesh white, soft, mild and sweet, thick-ringed. Short storage period. Good resistance to bolting and splitting. Tolerant to pink root. Widely used in southern Texas as an early shipper. AI, A2, A87M, DIT, D12, G1M, G27M, G71M, G93M, K49M. S70

Texas Supersweet:<sup>6</sup> (Texas Grano 1015Y) 175 days. Short-day type. Yellow Grano strain, with improved tolerance to pink root. Large, globe-shaped bulb, weight about 1 pound; yellow skin; mild, very sweet flesh. Better storage and handling qualities than other grano types. High yielding. Released by Texas A & M University. Winner of the raw onion category of the National Sweet Onion Challenge. AI, A87M, D8M{PL}, D81P{PD}, E97, G16{PL}, G82, H33M{PL}, I49M{PL}, I65M{PL}, J21M{PR}, J21M{PD}, L50G{PR}, L89G, N16, N16{PL}, etc.

Turbo:<sup>5</sup> 85-100 days. Long-day type. Developed in Holland for sets. Compared to the previous Dutch standard Sturon, Turbo is higher yielding and keeps longer. Produces large, globe-shaped bulbs with deep amber skin and very good flavor. Highly resistant to running to seed, even under conditions of stress. B49{OR}, R32{ST}, R83{ST}

Wadmalaw Sweet:<sup>6</sup> Yellow Granex type said to be sweeter than Vidalia and other very sweet onions. Large, yellow bulbs with thin skin and a sweet, mild flavor. Delicious eaten raw; also excellent for making onion rings, and are very tasty when grilled. Grown on Wadmalaw Island, off the southern coast of South Carolina. MILLER, J24M{PR}, J24M{PD}

Walla Walla Sweet:<sup>6</sup> 110 days. Large, flattened globe-shaped bulb; light brown skin; white, ultra-mild flesh. Considered one of the sweetest onions, along with Texas Supersweet, Vidalia and Maui. Not for storage. Brought to Walla Walla, Washington from Corsica at the turn of the century by Peter Pieri, a member of the French army once stationed on the island. SCHNEIDER 1986 [Cul, Re]; B75{PL}, C53, D8M{PL}, D82, F82, F92, G6, G83M, G93M, H95, I65M{PL}, I99M{PL}, J20, J89{PL}, J89{PR}, K71{PL}, M62{PR}, etc.

Yellow Bermuda: 100 days. Short-day type. Medium-sized, flattened bulb; skin thin, loose, light straw colored; flesh nearly white, juicy, very mild and sweet. A popular market type grown primarily as a winter crop in the South; also good for home gardens. Highly resistant to pink root. B8M, C20M, E5T, G57M, 184, K27M, K27M{PL}

Yellow Dutch: {ST} Excellent onion sets from Holland. Produces green onions soon after planting, or if left in the ground will grow into large mature onions for winter storages Very good texture and flavor. A16, D27, FI, H42

Yellow Ebenezer:<sup>5</sup> 105 days. Long-day type. Medium-sized, slightly flattened bulb; skin brownish-yellow; flesh off-white, very firm, mildly pungent. Highly productive. Good keeping qualities. Widely used for the production of yellow onion sets. Introduced about 1900 from Japan. A75, D12, E5T, E97{ST}, G1M, G57M, G71{ST}, H54,139, K71, L7M, M95M

Yellow Globe Danvers:<sup>5</sup> 110 days. Long-day type. Medium-large, globe-shaped bulb; copper-yellow skin; firm, moderately pungent, clear white flesh; small neck. Excellent keeping qualities. High yielding; also grown for sets. Popular home garden and market cultivar. Introduced prior to 1865. BURR; A25, D27, G87, J97M{ST}

Yellow Rock:<sup>5</sup> 100 days. Flattened globe-shaped bulb; attractive bronze-yellow skin. Good light tan wrapper leaves. Excellent keeping qualities. High yielding. Used extensively for the production of yellow onion sets Earlier and much firmer than Yellow Ebenezer. Developed by Martin Rispens and Son. D12, D82{ST}, E24{ST}, J99G{ST}

Yellow Sweet Spanish: 110 days. Long-day type. Large, globe-shaped bulb, weight often 1 pound or more; skin dark brownish-yellow; flesh medium-firm, pure-white, mild and sweet with a good flavor; small neck. Moderately good keeper. Popular home garden cultivar. A25, B78, C44, C85M{ST}, D8M{PL}, D82, E38, G71, H21, I64, I65M{PL}, J14{PL}, N16, N16{PL}

Yellow Sweet Spanish Utah: (Utah Sweet Spanish, Yellow Valencia Sweet) 115 days. Long-day type. Large, globe to deep globe-shaped bulb; skin dark yellowish-brown; flesh white, moderately firm, mildly pungent; medium small neck. Keeps fairly well if thick neck is properly dry-cured. Resistant to mildew; somewhat tolerant to thrips. A16, B75M, C69, C85M, D27, E53M, FI, G79, G87, H95,139, K49T, K50

#### MULTIPLIER ONIONS {ST}

Hardy perennial onions that produce a cluster of bulbs at ground level from a single planted bulb. The larger bulbs are saved for eating, and the medium and small sized bulbs are stored and replanted. They can be grown in pots for forcing *green onions* during the winter. Some types are in demand as gourmet items. A. cepa Aggregatum Group unless otherwise noted.

**POTATO ONIONS** Also called *hill onions*, *pregnant onions*, *nest onions*, and *mother onions*. Potato onions enjoyed widespread popularity before the turn of the century, and are still a local favorite in some areas of Virginia. When a small bulb (3/4 inch) is planted, it will usually produce one or two larger bulbs. When a large bulb (3 to 4 inches) is planted, it will produce approximately 10 to 12 small bulbs per cluster.

Potato Onion: (Multiplier Onion) Each large bulb divides underground to form 8 to 12 smaller ones; when planted, these produce 1 or 2 large bulbs. Can also be left in the ground for mild cooking onions later in the season. Slightly more pungent than standard onions. A16, D11M, D27, F70, G87, H24, H42, I67M, K49M, K95M, M16

White Potato Onion: (White Multiplier Onion) Grows much like other potato onions but produces smaller bulbs, only 1/2 to 1 inch in diameter. Divides underground to form clusters of up to 15 onions. Used for green bunching onions in the spring and fall, or bulbs are prepared as pearl onions. Stores well all winter. Flavor becomes stronger with hot weather. Popular winter onion in the South; also does well in the North. F40M

Yellow Potato Onion: (Yellow Multiplier Onion) Divides underground to produce clusters of up to 15 onions. Medium-sized bulbs, 3 to 4 inches in diameter depending on growing conditions. Flavorful, yet not strong. Keeps well for 8 to 12 months. Resistant to

drought and pink root. Widely adapted; hardy. An heirloom strain dating from 1886. C85M, D65, F40M, F73D, J99G, L7M, L89, M32

**SHALLOTS** Mostly compact, medium-sized bulbs with a mild, distinct flavor. Some cultivars are especially valued in gourmet cooking and are very good pickled. Also used for *scallions*. Planted and harvested in essentially the same manner as potato onions. They mature rapidly and will keep longer than bulbing onions, often remaining sound until the following summer. C81M, E13G{PR}, E13G{PQ}, E14T{DF}, J89{PR}, K85, L16{DF}, N40{PR}, R47{S}

Atlas: {S} 75 days. High quality true shallot grown from seeds. Produces 1 or 2 bulbs per seed depending on plant spacing. Large, dark reddish-brown bulbs with pale violet flesh and an excellent flavor. Direct seeded like large bulbing onions in early spring. Ready for harvesting in August and September. D11M, F70, G53M, J82, N84, R32

Creation:(F, {S} 105 days. Hybrid seed-grown shallot with superior storage capabilities. Large, round bulbs; bright, straw-yellow skin and firm, pure-white flesh; very pungent flavor. Direct sown in early spring. Matures about one month later than shallots planted from bulbs. Well-grown bulbs will keep from fall harvest into the following spring or early summer. E33, G6, J20, L91M

Drittler White: (Nest Onion) Family heirloom brought to the United States by German pioneers who settled in north central Arkansas, on Colony Mountain. The term nest onion originated with these settlers. Maintained by the Drittler family since 1885. Bulbs are variable in size. The leaves can be used like chives. Widely adapted north to south, and especially well-suited to south Florida and Texas. F40M, F73D

Dutch Yellow: (Yellow) Bulbs average 1 1/2 inches in diameter, 2 inches when well grown; yellow-brown bulb scales; yellow to cream-colored flesh. Keeps very well. High yielding; each bulb will grow into a cluster of 8 to 12 shallots. Widely adapted, but only recommended for spring planting from Virginia northward. D8M, D68, F11, J82, J99G, L89, M32

French Red: (Red) Reddish-pink bulb scales; pale purple-pink flesh; mild, distinctive flavor. Prolific; each bulb multiplies to produce up to 30 additional bulbs. Widely adapted, but does not keep as well as other shallots. Valued in gourmet cooking. E63D, E97, F11, F73D, I81T{PR}, I99M, L7M, M32

Frog's Leg: (Pear, Brittany, Chicken's Leg) Large, elongated bulb, resembles a bull frog's legs; dark orange-brown skin; purple-white flesh. One of the mildest shallots, with an excellent sweet flavor. Large size and elongated shape makes them easier to peel and dice. Very productive; each bulb produces up to 15 shallots. C53, G68, J82, J99G, P59M

Golden Gourmet: Large, uniform, round golden-brown bulbs, up to 2 inches in diameter. Crisp flesh with an excellent distinctive flavor. Produces a cluster of 8 to 12 bulbs in only 77 days. Very good winter storage capabilities when kept cool. Tall tops are suitable for use in salads. D24, F40M, L91M, P59M, R32, R83, S17, S55, S61M

Gray: (French Gray) In France, gray shallots are considered the best of all shallots and bring premium prices. Large elongated bulb, about four inches long; bulb scales fairly firm, dull grayish brown; purple-white flesh; strong, distinctive flavor. Does not store well. Prolific; each bulb will multiply to produce 20 additional bulbs. C53, E34M, F11, F40M, G16, G68,139, J82, J99G, L89

Hative de Niort: Large, flask-shaped bulbs with fine deep-brown skin and reddish flesh; produced in clusters of 3 to 4 shallots. Recognized in Europe as the outstanding exhibition shallot. Also excellent for pickling. S61

Odetta's White: Pure-white bulbs, about 7/8 inch in diameter. Delicate flavor. Can be used as a source of scallions, green tops, and

pearl onions. Bulbs are especially good pickled. Keeps well, though the bulbs tend to dry out more readily than others. Rare heirloom, carefully tended by a family for three generations. L7M

Prince de Bretagne: Good-sized bulbs, some 3 ounces or more; light reddish-brown skin; white flesh with a purple tinge. Should be planted in spring only. An old reselected grower's strain from Brittany, France where it is a local favorite. F73D

Shallot: (French Shallot) Each bulb divides during the growing season to form a cluster of 6 or more shallots. Can also be harvested for green onions early in the season. Dark orange-brown skin with a pink cast; purple-white flesh; delicate garlic-like flavor. Widely used for flavoring soups, salad dressings, omelettes, etc. Stores well; hardy. B75, D11M, E63D, FI, F35M, F70, G16, J20, J89, L89

Golden Snow Shoe: Long, torpedo-shaped bulbs, about 3 inches long and 3/4 inch in diameter; golden-yellow skin. Grows in clusters of about 20 shallots. Excellent for adding zest to roasts or casseroles, or they can be used for any recipe calling for onions. Extremely winter hardy. Originated in Russia. F40M

Tohono O'odham Pitoi's: From the Boboquivari Mountains of southern Arizona where the O'odham Papago deity I'toi is said to reside. Probably an early introduction from the Old World. Strong, distinct flavor. Produces offshoot scallions most of the year, even when other onions go dormant. Adapted to both high and low desert areas. F40M, F73D, 116, N84

TOPSET ONIONS Commonly known as *Egyptian onions*, these produce several small bulbs below ground level as well as clusters of tiny aerial bulbils at the top of the flower stalk. The bulbs are strong flavored but the leaves are relished in salads through much of the year and provide a dependable source of *green onions* even in cold climates. The bulbils are sometimes used for flavoring in pickling recipes. (A. x prolifera)

Catawissa: (Catawissa Onion) Very hardy cultivar of Canadian origin, distinguished by its vigorous growth and the rapidity with which the bulbils commence to grow without being detached from the top of the stem. The bulbils divide into tiers, the second set of bulbils producing green shoots, leaves or barren stems to bring the height of the plant to over 2 1/2 feet. Large, hollow green stems are excellent for stuffing with cream cheese. VILMORIN [Cu], WEAVER 1993 [Re]; F40M, J99G, L89

Heritage Sweet White: Produces clumps of 50 or more scallions per year that can be harvested from late summer until late spring or early summer, when the plant becomes dormant. Dormant bulbs can be harvested for cooking or pickling. Grows to about 2 feet tall. Very winter handy, can even be harvested during the winter if the ground thaws enough to allow digging. Old family heirloom from Florida. F40M

McCullar's White Topset: An heirloom from Mississippi. Similar to the highly esteemed and well known cultivar Pran, from Kashmir and Pakistan, but white-fleshed instead of yellow. Produces a number of 1-inch or larger white bulbs below ground level, plus pea-sized bulbils at the top of the flower stalk. Larger bulbs are used for eating; topsets for replanting. Used primarily as a source of greens when other onions are dormant. F73D

Moritz Egyptian: Heirloom from Missouri, grown by several families in a one block area since 1940. Similar to the typical Egyptian onion, but the bulbs are a deeper color (red-purple) and topsets are slightly larger than most strains. An unusual strain that will sometimes produce sets in the middle of the stalk. L7M

West Virginia Purple: Old family heirloom that is notable for its high production of topsets. Topset bulbils form an unusually large tight cluster and average more than 1/2 inch in diameter, a perfect size for pickling. Also produces table ready scallions from late summer until the following late spring or early summer. Grows to 2 feet or more in height. Very winter hardy. F40M

## PEARL ONIONS

Also called *pickling onions*, *boilers*, and *mini* or *baby onions*, these are bulbing onions that are planted thickly and harvested when very small. They are especially suitable for pickling because they don't develop papery outer skins. Most will grow in poorer, drier and less fertile soil than the larger bulbing onions. Flat, Italian types are often called *cippolini*. A *Gibson* is a Martini cocktail garnished with a pearl onion instead of an olive HAWKES [Re], HERBST, S., LARKCOM 1984. (A. cepa). E13G{PR}, N40{PR}

### RED/PURPLE-SKINNEP

Boretano: 110 days. Italian heirloom of the *cippolini* type. Flattened, spherical bulbs; glossy, rosy-bronze color. Firm, fine-grained flesh, well-developed flavor. Usually harvested when 2 inches in diameter and 1 inch thick. Traditionally served whole, pickled, or braised in a sweet and sour sauce Very productive, long day type with exceptional keeping qualities. 177, K23{PL}, K66, K66{PL}, Q34

Jon: 65 days. Purple-red skinned mini onion similar to Purplette, but not quite as early. Reddish-purple, turning an attractive pastel pink when cooked or pickled. Matures early and holds well. Can be harvested at golf ball size, or when very small as baby bunching onions with purplish bases. Gourmet specialty market item. G6

Purplette: 60 days. The first red-purple skinned mini onion. Glossy, rich burgundy color, turning pastel pink when cooked or pickled. An attractive specialty item either topped or bunched. Can be harvested at golf ball size or very young as "baby" onions with purple pearl ends. Matures early and holds well. A2, F44, G6, K49M, N84, Q34, R32, S55

### WHITE-SKINNED

Aviv: 62 days. Small, flattened globe-shaped bulb; skin thin, delicate, silver-white; flesh mild, flavor very good. Very well suited for pickling. When planted at a suitable depth and density, no thinning is required. Very quick to mature. Sow in spring to early summer. Developed by Hazera Seeds. K66, P75M, S61, T27M

Barletta: (White Barletta, Early White Pearl, St. Jans) 70 days. High quality cocktail onion from Europe. Small, nearly round bulb, slightly flattened at top and bottom; silky-white in color; flesh crisp and mild, of fine quality. Very uniform in size and shape. Excellent for pickling. C85M, D11M, F70, G68, L42, 089, P59M, P75M, Q11M, RUM, S55, S95M, T27M

Crystal Wax: (Crystal Wax Bermuda) 95 days. Very attractive White Bermuda strain. Flattened globe-shaped bulb; skin white, thin and waxy; flesh white, coarse, crisp and juicy; very mild flavor. Widely used for bunching and pickling when young. Not a good keeper. Resistant to pink root. A16, A87M, D68, D76, G27M, H61, H95, 165M{PL}, K5M, K49M, K73, M49, N16

Marzatica: Small, pure white bulbs. Not as quick maturing as Barletta but the bulbs are somewhat larger. Should be sown thickly from August to October for continuous harvests beginning in early winter. Italian *cippolini* type. Q11M

Pacific Pearl: 50 days. New pearl onion developed in Oregon. More day neutral than other types, can be planted in spring, summer or fall and still produce bulbs. Perfect for salads, garnishing or pickling. L89

Paris Silverskin: (Early Paris Silverskin, Blanc Hatif de Paris) Medium-sized, flattened bulb, 2 to 3 inches in diameter; silver-white skin; firm, flavorful white flesh; small neck. Widely used for pickling. Introduced prior to 1885. VILMORIN; N84, R32, S61, S95M

Pompeii: (Pompeii Perla Prima) 65 days. Similar to the Barletta type but smaller. Typical, thin-necked, flattened globe-shaped bulb; very thin, pure-white skin; mild flavor. Widely used for the cocktail

onion trade. Can also be harvested when young for scallions. *D12*, *F44*, *L42*, *P75M*, *RUM*, *T27M*

White Pearl: 75 days. An improved rounder version of the popular standard cultivar Silver Queen. Round, clear white bulbs, slightly waxy in appearance. Attractive European strain that meets the highest demands of the cocktail onion trade. Slightly earlier than Silver Queen or White Queen. *D82*

White Portugal: (Silverskin, American Silverskin) 100 days. Excellent multi-purpose cultivar. May be used for green or bunching onions when young, "pearl" onions when bulbs form, sets, or mature bulbs. Mature bulbs large, thick-flat; skin clear silver-white; flesh firm, fine-grained, flavorful, mild and sweet. Good storage qualities. Introduced prior to 1865. *BURR*; *C20M*, *D12*, *E5T*, *E24{ST}*, *G82*, *163Z*

Wonder of Pompeii: 100 days. Small, flattened globe-shaped bulb; silver-white skin; of good quality. Excellent for pickling. Also used whole in soups and stews. Should be sown thickly to produce small, uniform bulbs. *139*, *K49M*

#### YELLOW/BROWN-SKINNED

Gold Coin: 80 days, Very flat, yellow *cippolini* type. Medium-small bulbs, 1 1/2 to 3 inches in diameter, 3/4 to 1 inch tall; very firm, pungent, sweet. Stores very well. Excellent for braiding or storing in a basket in the kitchen. Recommended for latitudes 38° to 60°, as necks may be too thick at lower latitudes. *G6*

Yellow Borettano: 110 days. Gourmet *cippolini* type. Flattened globe-shaped bulb, slightly larger than typical pearl onions, 1 1/2 to 2 inches in diameter and 1 inch high; golden-tan skins; fine-textured white flesh; sweet, delicate flavor. Holds up well in storage. Adapted to long day conditions, Very popular in Italian cuisine. *I18M*, *111*

## ORANGE{GR}

### CITRUS X SINENSIS

#### BLOOD ORANGES

Blood oranges are considered the connoisseur's or gourmet's citrus. Their flavor is distinctive and refreshing. It is often described as a rich orange flavor with overtones of raspberries or strawberries. The fruit is a bit hard to peel but excellent for juicing. The juice can be used in mixed drinks or as a base for sauces. Fruit sections can be added to fruit salads, used as a garnish, or made into marmalade. *RAY*, *R.*, *SCHNEIDER* 1986 [Re]; *B71G{PD}*, *C94M{PD}*, *D3M{PR}*, *E13G{PR}*, *G17*, *J61M{PD}*, *N40{PR}*

Doblefina: (Oval Sangre) Fruit medium-small to small, oval to oblong; rind difficult to peel, yellowish orange blushed with rose-colored flecks; flesh firm and moderately juicy, with a distinctive fragrance and a mild, pleasant flavor; virtually seedless; ripens late; hangs poorly but ships and stores unusually well. *REUTHER*; *N18{OR}*

Maltaise Sanguine: (Malta Blood, Portugaise) Medium-sized, oblong fruit; rind peels easily, external blood coloration well developed under favorable conditions; flesh tender, melting, very juicy, with good blood coloration under favorable conditions; seeds few to none. Flavor and aroma excellent. Late midseason in maturity. The

first blood orange to be planted in California. *REUTHER*; *N84*, *R77*

Moro: Fruit medium to medium-large, subglobose, round, or obovoid; seeds few or none; rind medium-thick, moderately adherent, and somewhat pebbled. Orange-colored at maturity with light pink blush or red streaks at advanced maturity. Flesh deeply pigmented (almost violet-red), juicy, flavor pleasant. Very early in maturity, but holds well on the tree and stores and ships well. A distinctive aroma develops with advanced maturity. *REUTHER*; *A63*, *A71*, *B93M{DW}*, *D23M*, *D23M{ES}*, *D37{DW}*, *E3M{DW}*, *G49*, *I49M{DW}*, *I74{DW}*, *H78*, *I83M*, *J22*, *J61M{DW}*, *N18{SC}*, etc.

Ruby: Medium-sized, globose to slightly oblong fruit; rind medium-thick, well-colored, with reddish flush under favorable conditions; flesh orange, streaked (rather than flecked) with red under favorable conditions, tender and juicy; flavor rich; seeds relatively few. Midseason in maturity. Tree moderately vigorous, compact, medium-large, productive. *C29M{SC}*, *N18{OR}*, *N84*, *Q93*, *R77*

Sanguinelli: Fruit similar to Doblefina, but larger, seedier, and often asymmetrical; blood coloration of both rind and flesh much more intense and constant. External red pigmentation rarely equalled by other blood oranges and excelled by none, making the fruit most attractive. Holds on the tree well; also stores and ships well. Tree small to medium, spineless; foliage light-green; productive. *REUTHER*; *A63*, *G49*, *I83M*, *N84*, *R77*

Sanguinello: (Sanguinello Commune) Medium-sized, obovoid to oblong fruit; rind medium-thick, moderately tough and adherent, orange-colored at maturity washed with red; flesh rather deeply red pigmented at maturity (more so and earlier than rind), juicy, pleasantly flavored; seeds few or none. Midseason in maturity. Stores and ships moderately well. *REUTHER*; *B93M{DW}*, *E3M{DW}*, *I74{DW}*, *N24M{DW}*

Sanguinello Moscato: (Paterno) Medium-large fruit of variable shape; rind orange, strongly blushed with red at the apex, moderately adherent; flesh well-colored, very juicy, aromatic, flavor excellent; seeds few or none; ripens in midseason. Holds well on the tree and ships well. One of the most highly reputed blood oranges. The principal cultivar in the Mount Etna region of Sicily. *REUTHER*; *04*

Tarocco: Medium-large to large fruit, variable in form from broadly obovate to globose; rind medium to medium-thick, moderately tightly adherent, yellowish-orange blushed with red at maturity; flesh somewhat firm but juicy, usually well pigmented; flavor rich and sprightly; few or no seeds. Midseason in maturity. Loses quality if left on tree much past maturity and drops badly, but stores and ships well. *REUTHER*; *B93M{DW}*, *G49*, *N18{SC}*

#### COMMON ORANGES

#### VALENCIAS

Campbell: Fruit indistinguishable from Valencia, but the tree is consistently more vigorous, thornier, larger, broad-topped, and slower to come into bearing than Valencia. The fruit is slightly lower in juice content in coastal regions and has a greater tendency to regreen in interior districts. A nucellar budline. Originated in the Early Campbell orchard, Santa Ana, California. Introduced in 1942. *BROOKS* 1972, *REUTHER*; *A71*, *C29M{SC}*, *H78*, *H78{DW}*, *N18{SC}*

Cutter: Fruit large, slightly more round than standard cultivars. Tree initially free of recognized virus diseases; exceptionally vigorous; slightly slower coming into bearing than standard cultivars. A nucellar seedling. Originated in Riverside, California by H.S. Fawcett, California Citrus Experiment Station. Introduced in 1952. *BROOKS* 1972; *A63*, *A71*, *C29M{SC}*, *N18{SC}*

Frost Valencia: fruit typical Valencia, but has greater vigor and better yield than its seed parent. Tree initially free of psorosis virus

carried by seed parent tree. Nucellar seedling of Valencia. Originated in Riverside, California by H.B. Frost, California Citrus Experiment Station. Introduced in 1952. BROOKS 1972; C29M{SC}, N18{OR}

Olinda: Large fruit; skin thin; flesh sweet, quality good. Valencia type but matures slightly earlier than standard cultivars. Tree vigorous, productive; free of recognized virus diseases. Originated in Olinda, Orange County, California, in the garden of Ollie Smith. Introduced in 1957. BROOKS 1972; A63, A71, B58M{SC}, C29M{SC}, N18{SC}

Seedless Valencia: A bud variation of Valencia that differs from it in that the fruit is more oblong or oval in form, less seedy (occasionally one or two seeds), and matures earlier (late midseason). Tree vigorous and upright with large leaves that tend to be bunched, giving it a distinctive appearance, and strongly alternate-bearing. Said to have been discovered in the orchard of W. Eathers at North Richmond, New South Wales, Australia, between 1920 and 1925. REUTHER; G49, I83M

Valencia: Medium-large, oblong to spherical fruit; seeds few or none. Well-colored at maturity, but regreens thereafter under certain conditions. Rind medium-thick, tough, and leathery. Juice abundant and flavor good but commonly somewhat acid. Fruit holds exceptionally well on tree with little deterioration in quality and ships and stores well. Excellent for processing. Latest maturing of all commercial cultivars. Tree vigorous, prolific, but with alternate-bearing tendency. Very wide range of adaptation. REUTHER; D23M, D23M{ES}, D34M{PR}, E3M{DW}, F53M, G49, G96{DW}, H4, H55{PD}, I83M, J22, J22{DW}, L33M{PR}, Q93

Variiegated Valencia:<sup>1</sup> New selection with attractive, tri-colored foliage and fruit. Leaves are 2 shades of green and yellow. The fruit is striped yellowish-orange and green when immature, coloring to a solid orange when ripe. Season of fruiting and flavor are the same as those of standard Valencia. A63, I83M

#### others

Ambersweet: Medium-sized, slightly pyriform fruit; rind moderately thick, easily peeled, bright orange; very tender, deep orange, rag-free flesh; flavor slightly similar to Clementine. Ripens from mid October through December in Florida. Moderately vigorous, upright tree, somewhat cold tolerant. Complex hybrid of Clementine, Orlando tangelo and a seedling orange. SAUNT; G17, I77G

Cadenera: Medium-sized, globose to slightly oval fruit; rind medium-thin, moderately well-colored; flesh very juicy, flavor and aroma excellent; seeds few or none. Medium-early in maturity. Holds well on the tree and retains its quality. The principal common orange of Spain. REUTHER; C29M{SC}

Calabrese: (Ovale) Medium-large, oval fruit; rind very tightly adherent, well-colored at maturity but regreens if held on the tree long thereafter; flesh juicy and well-flavored at maturity; quality excellent; ripens late. Holds especially well on the tree. Stores and ships well. Tree slow growing; sensitive to cold, heat and desert winds. The principal common orange of Italy. REUTHER; O4

Hamlin: Medium-small, globose to slightly oblate fruit; rind thin, well-colored at maturity; flesh well-colored, tender, juicy, lacking in acid; flavor sweet; seeds very few or none. One of the earliest to mature. Tree moderately vigorous, medium-large, productive, more cold-tolerant than most. Discovered in 1879 near Glenwood, Florida, in a grove later owned by A.G. Hamlin. MORTON 1987a, REUTHER; D13, G2M, H4, J17, L33M{PR}, L50G{PR}, N18{OR}, Q93

Joppa: Medium-sized, globose to slightly oblong fruit; rind medium-thin, well-colored under favorable conditions; flesh light orange, medium-tender, juicy; flavor rich; seeds comparatively few. Midseason in maturity. Originated in 1877 from seed imported from

Joppa, Palestine by A.B. Chapman of San Gabriel, California. REUTHER; Q93

Marrs: Medium-large, round to slightly oblate fruit; rind medium-thick, well-colored under favorable conditions; flesh well-colored, juicy, lacking in acid; flavor sweet; moderately seedy (depending on pollination). Holds well on tree with little loss in quality. Originated in Donna, Texas by O.F. Marrs. Introduced in 1940. REUTHER; C29M{SC}, F97G{PR}, N18{OR}

Mediterranean Sweet: (Maltese Ovale) Medium-sized, spherical to oval fruit; rind medium-thick, pale in color at maturity with some tendency to regreen, peels readily; flesh pale-colored, moderately juicy; flavor mild; seeds relatively few. Medium-late in maturity. Tree vigorous, large, spreading, drooping; distinctive in appearance. REUTHER; S59

Parson Brown: Medium-large, globose fruit, well-colored under favorable conditions; rind medium-thick; flesh firm, very juicy, of good flavor; seedy. One of the earliest ripening oranges. Discovered in Webster, Florida in a grove owned by Reverend N.L. Brown. First propagated and distributed between 1870 and 1878. Still relatively popular. MORTON 1987a, REUTHER; G17, Q93, N84, R77

Pineapple: Medium-sized, spherical to slightly obovate fruit; rind highly colored, especially after cold spells; flesh light orange, tender, juicy; flavor rich though sweet; pineapple-scented; moderately seedy. Midseason in maturity. Does not hold on tree as well as some, but is excellent for processing. If the crop is allowed to remain too long on the tree, it may induce alternate-bearing. MORTON 1987a, REUTHER; A63, F97G{PR}, I77G, L33M{PR}, N18{OR}, Q93

Republic of Texas: An old seedling planted by early settlers near Angleton, Texas during the time of the Republic of Texas. Has proven to be a reliable producer of high quality fruit. Very sweet and flavorful, only slightly more seedy than Hamlin but decidedly better tasting. The tree from which this clone is being propagated still exists at the original site. NAGLE; K67

Salustiana: Medium-large, subglobose to spherical fruit; rind medium-thick, unusually well-colored at maturity; flesh melting, juicy; flavor rich and sweet; virtually seedless. Early in maturity; said to hold especially well on tree without much loss of quality. Originated near Enova, Valencia, Spain. Introduced about 1950. REUTHER; C29M{SC}, N18{OR}

Shamouti: (Jaffa) Medium-large to large, oval to ellipsoid fruit; rind thick, tough, leathery, well-colored under favorable conditions; flesh light orange, firm, tender, juicy, fragrant, pleasantly sweet-flavored; seedless or nearly so. Fruit peels and segments separate readily. Ships and stores unusually well but does not process well. Originated some time prior to 1844 in an orchard near Jaffa, Israel. REUTHER; E3M{DW}, I83M, J22, J22{DW}, N18{OR}, N84, R77

Trovita: Fruit medium-small, navel structure usually absent or rudimentary; flesh somewhat more tender and juicy than Washington navel, which it resembles, pleasantly flavored; usually has 2 to 6 seeds. Tree vigorous, upright growing; productive, but with a tendency to alternate bearing. Thought to be a seedling of Washington navel. Originated in Riverside, California by Howard B. Frost. Introduced in 1935. BROOKS 1972, REUTHER; A63, D13, E3M{DW}, G49, H78, I74{DW}, I83M, N18{SC}

#### NAVEL ORANGES

Atwood: Fruit deep orange-red, of a more intense color than that of Washington, which it resembles; matures earlier, remaining firm very late in the season. Stores on the tree especially well without appreciable loss of quality. Bud mutation of Washington navel. Originated in Lemon Cove, California by Frank Atwood. Introduced in 1945. BROOKS 1972, REUTHER; A63, A71, C29M{SC}, H40M, N18{SC}

Cara Cara:<sup>2</sup> (Scarlet Navel) Unique pink-fleshed sport of Washington. Medium-sized fruit, resembles Washington but navel usually small; rind lacking pigmentation; flesh pinkish-red, juicy, subacid, flavor and quality very good to excellent. Vigorous tree, occasionally with faint variegation on young leaves. Originated at Hacienda Cara Cam, Valencia Province; Venezuela. BROOKS 1997; *A63*, *A71*, *D23M*, *D23M{ES}*, *E8M*, *E99G{PR}*, *F85D{PR}*, *G49*, *H4*, *H78*, *I77G*, *I83M*, *J21M{PR}*, *L60M{PR}*, *N18{SC}*, etc.

Cluster Navel: Medium-sized fruit, similar to Valencia but more variable—large, small, and mini-fruit may occur in the same cluster. Flesh sweet, tender and juicy. Matures in January and maintains good eating quality as late as September. Compared to the standard Washington navel, the trees are genetically dwarfed, more dense and compact. Originated as a sport on a Washington navel tree at the Citrus Research Center of the University of California at Riverside. It appeared as a single cluster of 21 oranges resembling a bunch of grapes. *A63*, *C29M{SC}*, *N18{OR}*

Fisher: Very early maturing, but rind color break is not early. High sugar/acid ratio early in the season fits well in early districts. Quality good. Good production and fruit size and holds well on the tree. Most common cultivar planted in Kern County, California. *A71*, *G49*, *H40M*, *I83M*, *J22*, *N18{SC}*

Frost Washington: The first, and one of the most important nucellar budlines of Washington navel. Widely planted in California, Arizona and Morocco. Originated at the University of California Citrus Research Center, Riverside by H.B. Frost. REUTHER; *C29M{SC}*, *N18{OR}*

Lane Late: Late maturing introduction from Australia. Fruit quality, size, and production are good. Excellent sweet flavor; seedless. Holds on the tree as late as June. Offers good opportunity for higher returns in late marketing season for navels. *A63*, *A71*, *B58M{SC}*, *D23M*, *D23M{ES}*, *E3M{DW}*, *G49*, *H78*, *I83M*, *J22*, *N18{SC}*, *Q93*, *S59*

Leng: Fruit medium-small to medium in size, globose; navel uniformly small though well developed; seedless. Color bright orange. Flesh well-colored, juicy, texture medium, flavor only fair. Very early in maturity (a week or 10 days earlier than Washington), but holds fruit well on tree without loss of quality. Originated as a limb sport of Washington at Irymple, New South Wales, Australia. REUTHER; *C29M{SC}*, *N18{OR}*, *Q93*, *S59*

Newhall: Oblong to ellipsoid fruit, slightly smaller than Washington; color reddish-orange, deeper than Washington; flavor excellent; ripens earlier than Washington. Tree somewhat less vigorous than Washington. Originated as a limb sport near Duarte, California. REUTHER; *C29M{SC}*, *N18{SC}*, *N84*, *Q93*, *R77*

Rico W2: Nucellar seedling of Washington that originated in Puerto Rico. Appears to do well in tropical areas and is recommended by the University of Hawaii. Under Hawaiian growing conditions, the fruits develop good flavor and a high sugar content. Bears good crops of fruit that resemble Washington navel. *E8M*

Robertson: Fruit virtually indistinguishable from Washington except for medium-large size, slightly lower quality, and earlier maturity, which is usually 10 days to 2 weeks. Tree precocious in bearing habit, but somewhat lacking in vigor on sweet and sour orange rootstock. Bud mutation of Washington navel; discovered in 1925. Originated in Redlands, California by Roy Robertson. Introduced in 1936. BROOKS 1972, REUTHER; *A63*, *B93M*, *E3M{DW}*, *G49*, *I74{DW}*, *I83M*, *J22*, *N18{OR}*

Skaggs Bonanza: Fruit resembles Washington, but colors and matures about 2 weeks earlier. Tree precocious; very productive; has a smaller, more dense growth habit than Washington. Budline apparently free of psoriasis, exocortis, stubborn, and cachexia. Bud mutation of Washington navel. Originated in Strathmore, California by Everett Skaggs. Introduced in 1964. BROOKS 1972, RAY, R.; *C29M{SC}*, *N18{SC}*

Summernavel: Large, roundish fruit, 3 to 3 1/4 inches in diameter; rind smooth to slightly pebbled, separates easily from flesh; 8 to 12 segments, juicy, seedless; ripens later than its parent which it resembles. Holds on tree especially well with little loss in internal quality. Bud mutation of Washington; discovered about 1934. Originated in Riverside, California by John Albert Workman. Introduced in 1942. BROOKS 1972, REUTHER; *B58M{SC}*, *I83M*

Thomson: (Thomson Improved) Medium-large, globose fruit; less well-colored than Washington; flesh firm, well-colored, moderately juicy, flavor good. Ripens very early, 10 days sooner than Washington; holds on the tree poorly. Tree less vigorous and more compact than Washington. Originated as a limb sport of Washington in Duarte, California. Introduced about 1891. REUTHER; *A71*, *N18{SC}*, *N84*, *R77*

Washington: Large, spherical to obovoid or ellipsoid fruit; navel medium to large and sometimes protruding; rind medium-thick, somewhat tender, easily removed, especially well-colored (deep orange); flesh deep orange, of firm texture, moderately juicy; flavor rich; seedless. Fruit holds on tree well but processes poorly. Originated, perhaps as a mutant, in Bahia, Brazil, before 1820. The most popular orange in the world for eating out of hand. MORTON 1987a, REUTHER; *A63*, *A71*, *B23M{PR}*, *B93M*, *D23M*, *D23M{ES}*, *E3M{DW}*, *F53M*, *G49*, *G96{DW}*, *I83M*, *J22*, *J61M{DW}*, *N18{SC}*, etc.

#### SUGAR ORANGES

Also known as *acidless oranges*, the sugar oranges have a very low acid content and are insipidly sweet. They correspond to the sweet lemons, limettas and sweet limes. Because of the extremely low acidity of the flesh, they attain edibility early, as soon as the juice content is moderately well developed. REUTHER.

Vainiglia: (Vaniglia Biondo Apireno, Maltese) Medium-small to medium fruit, subglobose to spherical; rind medium thick, well-colored at maturity; seedy. Juicy and sweet flavored but lacking in acid and with slight bitterness, though eating quality generally improves with age. Tree vigorous, medium-sized, very productive. A very old Italian cultivar. REUTHER; *O4*

Vainiglia Sanguigno:<sup>2</sup> (Mango Orange) An old Italian acidless orange with unique, pink-colored flesh. The pink coloration is caused by a carotenoid pigment called lycopene, rather than anthocyanin as in the blood oranges. Sweet, aromatic flavor, not bitter or insipid; quality very good. Becoming popular in specialty markets in the United States. Apparently derived from Vainiglia. REUTHER; *A63*, *C29M{SC}*

## PAPAYA {S}

#### CARICA PAPAYA

---

CO-1: Medium-sized fruit, weight 3.3 to 5.5 pounds; flesh yellow, sweet, of good quality for eating fresh. Developed at the Tamil Nadu Agricultural University, Coimbatore, India. Plant dioecious; dwarf; first fruits are borne 3 feet from the ground. MORTON 1987a; *Q45M*, *R0*, *R50*

CO-2: Large, obovate fruit with yellowish-green skin and orange flesh; soft and moderately juicy. Good for eating out of hand. Also a high papain-yielding type. Medium-tall plant. Pure line selection of a local type. Developed at the Tamil Nadu Agricultural University, Coimbatore. BOSE 1990; R0, R50

Coorg Honey Dew: Long to oval fruit, average weight 4.4 to 7.7 pounds; flesh firm, yellow, very sweet; cavity large, has fewer seeds than Honey Dew; keeps well. Low-bearing, prolific plant; produces no male plants, female and bisexual plants occurring in equal proportions. A selection from Honey Dew originated at the Chethalli Station of the Indian Institute of Horticultural Research. MORTON 1987a; N84, S59M

Ekstotika: Small fruits, weight about 1 1/2 pounds; flesh reddish pink; flavor pleasant. Produces 100% bearing plants, about 2/3 being bisexual and 1/3 female. Fruit from bisexual trees are oblong while those from female trees are round. Yields 45 tons per hectare, per year at 18 months of age. Originated in Malaysia by Y.K. Chan, by crossing Sunrise Solo with disease resistant local strains. BROOKS 1997; D33, E8M{PL}

Honey Dew: Large, oval-shaped fruit; sweet, yellow-orange, solid flesh; relatively few seeds. Very good flavor. Bears good crops of fruit. One of the most popular cultivars in India, where it is better suited to the northern parts of the country. P5, Q32, Q45M, R0, R50, S36, S59M

Know-You No. 1: (F.) Large, oblong-elongated fruit; weight 3 1/2 to 6 1/2 pounds; yellow skin and flesh; sweet and flavorful with 12% Brix; ripens early. Thick, sturdy plant; early and heavy yielding; tolerant to papaya ring spot virus. Q39

Mexican: A very sweet and flavorful hybrid papaya from Mexico. Medium to large fruit, weight 2 to 4 pounds; yellowish-orange flesh. Large, vigorous plant, often grows to 12 feet tall; very productive. Generally not as sweet as the Hawaiian Solo types. A79M

Pusa Dwarf: Medium-sized, oval fruit weighing 2 1/4 to 4 1/2 pounds. Dioecious plant, very precocious, begins bearing when 10 to 12 inches tall. Very dwarf in stature. Recommended for high density orchard planting, kitchen gardens and nutrition gardens. Developed at the LARI Regional Station, Pusa, Bihar, India. BOSE 1990; Q45M

Ranchi: Very large, oblong fruits; deep orange-red inside and out; solid flesh; excellent sweet flavor. Compact, Solo type plant; commences to bear fruit when 3 1/2 to 5 feet high. One of the parents of the CO-1 cultivar. Originated in India. N84, N91, 093, Q45M, R0, R50, S36, S59M

Solo: Fruit round and shallowly furrowed in female plants; pear-shaped in bisexual plants; weighs 1.1 to 2.2 pounds; skin orange-yellow when fully ripe; flesh golden-orange, very sweet, of excellent quality. Produces no male plants, only bisexual and female in a 2 to 1 ratio. Introduced into Hawaii from Barbados in 1911. Named Solo in 1919. MORTON 1987a; A28{PL}, A41G{PL}, C9M, D56M, F85, G49{PL}, I83M{PL}, K8, N40M, N84, 053M, 093

Sunrise: (Sunrise Solo, Strawberry) Pear-shaped fruit with a slight neck; averages 22 to 26 ounces depending on location; skin smooth; flesh firm, reddish-orange, sweet, sugar content high; quality and flavor similar to Solo; seed cavity not as deeply indented as other Solo strains, making seed removal easier. Plant precocious, maturing fruit about 9 months after transplanting, at a height of about 3 feet. BROOKS 1972; A79M, B60M{PR}, C20M, D33, E13G{PR}, F15{PR}, I77G, K8, M32M, N40{PR}, N84, 093, Q39, S70

Sunset: (Sunset Solo) Solo type; similar to Sunrise but the pulp is not as deeply colored. Small to medium-sized, pyriform fruit, average weight about 1 pound; orange-ied skin and flesh. Very sweet. Dwarf, high yielding plant. Originated at the University of Hawaii. A79M, M32M, N84, 093

Tainung No. 1: (F.) Oblong to nearly round fruit; weight about 2 1/2 pounds; fragrant, red flesh with 11 to 12% Brix; ripens medium

early. Vigorous, medium dwarf, prolific plant; easy to grow. Good for shipping. Developed at the Fengshan Tropical Horticultural Experiment Station. Q39, S70

Tainung No. 2: (F.) Large, nearly round to oblong fruit with a pointed blossom end; weight about 2 1/2 pounds; tender, orange-red flesh with good flavor and 13 to 14% Brix; ripens early. Suitable for local markets. Medium dwarf plant. Developed at the Fengshan Tropical Horticultural Experiment Station. Q39, S70

Waimanalo: (Waimanalo Solo) Fruit round with a short neck, average weight 16 to 39 ounces; skin smooth and glossy; cavity star-shaped; flesh thick, firm, orange-yellow in color; flavor and quality high; keeps well. Recommended for fresh market and processing. Fruits of female plants are rough in appearance: Average height to the first flower is 32 inches. A79M, D33, D56M, N40M, N84, 093

Washington: Medium to large, oval fruit; excellent, sweet flavor. Heavy yielding. Has dark-red petioles and yellow flowers. Popular in Bombay. MORTON 1987a; N84, 093, Q32, Q45M, R0, R50, S36, S59M

X-77: (Kaymia) Solo type. Small to medium-sized fruit; distinct, blocky shape, very short neck; deep yellow orange skin and flesh; firm, juicy, very sweet flesh. Dwarf, high-yielding plant. Fairly new release from the University of Hawaii. D57{PL}, M32M

### PETROSELINUM CRISPUM

---

#### LEAF PARSLEY

Afro: 80 days. Tightly-curved, frilly, rich dark-green leaves; held upright on long, strong stems which helps to eliminate soil splash. Very sweet flavor for a curled parsley. Will not become grey or moldy when the weather gets cold. Royal Horticultural Society Award of Merit winner for 1984. Moss Curled selection, developed to be vigorous and productive. L91M

Banquet: 75 days. Attractive, deep-green leaves; finely and tightly-curved; strong, erect stems. Rich green color is particularly fine when grown in cooler seasons. Produces well throughout the season. Good cold weather tolerance for wintering over. Ideal for garnishing and flavoring. Developed in Denmark. E91G, F13, N52

Bravour: 75 days. Large, closely-packed, very finely-curved, dark green leaves; long stems. Heavy heads provide excellent yields. Good cold weather tolerance. A leading European cultivar that is a real improvement over older sorts. L42, N84, P59M, S61M, S75M

Champion Moss Curled: 80 days. Deep green leaves, finely cut and curled; almost entirely free from plain leaves; produced in abundance. Compact, vigorous growth habit; to 15 inches tall. Excellent for growing under glass. Very popular with home gardeners. Introduced in 1894. E97, H42, K27M, K71, L42, N84, 053M, S75M

Curlina: 72 days. An early, dwarf, triple-curved strain. Extremely finely-curved, compact leaves; keep their dark green color in hot weather. Globe-shaped, 6 1/2 inch tall plants on very stiff, short stems. An excellent mini parsley for balcony planters or pots. L42, N84, 089, P59M

Dark Green Curled: 80 days. A French Perfection type with finely cut and tightly curled dark-green leaves. Rigid, upright stems. Recovery is rapid, offering multiple harvests throughout the summer and fall. Well adapted for summer crops because the foliage does not "yellow out", even under hot, humid growing conditions. Suitable for over-wintering. K50

**Darki:** 75 days. Leaves very dark-green, closely placed, heavy and intensely curled; short internodes. Excellent cold weather tolerance. Holds its fine qualities longer than other types when cut. Vigorous and widely adapted. Upright growth habit keeps leaves clean in inclement weather. Gold Medal European strain. B49, DI 1M, F70, J9M, L42, L89, N24M, N84, S61M

**Decora:** (Decora Triple Curled) 90 days. Large, well-curved, heavy, dark green leaves; remain curled in hot weather; more resistant to wilting after being cut than others. Compact, vigorous plants with thick stems. Best suited for growing in warm climates as hot weather does not slow growth. *AI, A87M, C20M, G33, G93M, K16M, N84*

**Egyptian:** One of the sweetest large-leaved varieties. Large, dark-green leaves. Used extensively in the Mediterranean and Middle Eastern salad dish known as *tabouli*. Extremely resistant to both heat and drought. **PIG**

**Evergreen:** 75 days. Large, dense, dark-green foliage; rather coarsely cut but closely curled. Very uniform. Vigorous, compact plants; tolerant to extremes of hot or cold; definitely more frost resistant than other cultivars. Recommended for both market and home gardens; for dehydrating, flavoring and garnishing. All America Selections winner in 1940. *B75M, C20M, C28, G93M*

**Exotica:** A selection of Moss Curled developed for winter harvesting in mild winter areas. Dark green, well-curved leaves with long stems. Strong, compact plants with good uniformity. Fresh leaves are continuously produced even under cool weather conditions. *F35M{PL}, K16M, N84*

**Forest Green:** 75 days. A special combination double and triple-curved market cultivar. Dark-green leaves. Long, stiff, upright stems help keep the crop clean and bunch easily. Holds its fresh appearance and deep color over a long season without bleaching or browning. Better flavor than most curled types. Good regrowth ability. Popular among Eastern market growers. *F13, F82, G6, G79, H54, H61, I64, K23{PL}, K73, L7M, L89, M46, M49*

**Garland:** 70-75 days. Improved Forest Green type with a slightly heavier curl. Very uniform, dark emerald-green leaves, double and triple curled. Vigorous and durable plant. Resists discoloration between multiple harvests and adverse weather conditions. *G82, K73, L42, N52*

**Green River:** 65 days. High quality early double-curved type. Finely cut, medium-green leaves with longer stems better suited to bunching. Especially good for bedding plant production as excellent early branching assures plants always look bushy in packs. Withstands repeated harvest without bolting. Cold and heat tolerant; resistant to diseases. *C20M, C85M, D26D, E53M, G13M, G57M, G71, G79, I39, J82, K10, K50, N84*

**Moss Curled:** (Triple Curled, Dark Moss Curled) 80 days. Dark green leaves, extremely finely-cut and deeply-curved, resembling tufts of moss. Vigorous compact plants; 7 to 10 inches tall. Very decorative; especially useful for garnishing. Standard curled-leaf strain. Productive and widely adapted. *B75M, C44, C85M, D82, E24, F92, G16, H61, K49M, K49T, M46, N16*

**Neapolitan:** (Gigante d'Italia, Giant Catalogna, Catalogno, Celery-Leaved, Prezzemolo di Spagna) 90 days. Large, flat leaves that are extremely spicy and flavorful; produced in abundance: Very large leaf-stalks, thick and stout in proportion to their length. Large, bushy, vigorous plants; to 3 feet tall. Prized by Italian cooks for all types of seasoning. Can be grown just like common parsley, or the stalks may be blanched and used like celery. *BURR, VILMORIN; C43M, C43M{PL}, C53, G6, I39, I77, J20, J73, K49M, K66, M82{PL}, Q11M, Q34, S55*

**Plain Leaved:** (Italian Dark Green, Single Leaf, Flat Leaf, Celery Leaf, Common Single, French) 75 days. Flat, glossy, deeply-cut, dark-green leaves on long stems. Vigorous, erect plant. Excellent, strong, aromatic flavor; preferred by many over that of the curled

types. Standard strain for flavoring. Introduced prior to 1806. *B75M, C44, D82, E24, F80, G6, H61, K22, K49T, K66, K73, L7M, S55*

**Sherwood:** 75 days. Relatively coarse, double to triple-curved leaves; rich dark-green appearance. Vigorous, very uniform plants; 10 to 12 inches tall. Stays brighter green than European strains in extreme heat and even after multiple harvests. Excellent for local markets and home gardens. An earlier, brighter green version of Darki for early summer and early fall cutting. *A87M, B49, C20M, D26D, G71, I18M, I77, K10*

**Unicurl:** 73 days. A breeding breakthrough. The finely-curved, dark green leaves curl in instead of out. Foliage readily shakes free of dust and dirt, making it easier to clean than any other strain. The only parsley with a tolerance to fall rust. **L42**

#### HAMBURG PARSLEY

Grown for the thick, parsnip-like roots as well as the flavorful tops. Those which have been subjected to frost usually have a higher sugar content than those harvested during the summer months. Very popular in some parts of Europe, especially Germany. (*P. crispum Radicosum* Group)

**Bartowich Long:** 95 days. Long, narrow-shouldered type with superior taste. Slender white roots, 7 to 8 inches long. Has a very good, distinctive nutty flavor. Excellent eaten raw in salads or used as a soup ingredient. Flat, dark-green leaves. Grown for fall, winter and spring harvests. **G6**

**Berliner Halblange:** (Berlin Half Long) 140 days. Medium-sized, uniform roots of excellent quality. Short and stocky, with wide shoulders and only slight tapering at the base. Only half the length of extra long types, about 4 1/2 inches. Originated in Germai. Introduced in 1908. *N81, S61M*

**Early Sugar:** 78 days. Miniature version of Hamburg Half Long. Small, wedge-shaped roots resemble Chantenay carrots and are very high in sugar content. Roots average only 3 inches in length. Used on heavy soils where longer types can become misshapen easily. **L42**

**Extralange Starke Oberlaaer:** 180 days. A high quality German root parsley with exceptionally long, tapered, sturdy white roots, 7 1/2 to 8 1/2 inches or more in length. Narrow-shoulders. Later maturing than some other cultivars. Named after Oberlaa, a borough of Vienna. **N81**

**Fakir:** 85 days. High quality half long type. Medium-long, smooth, tapered white roots; about 6 1/2 inches in length; fairly wide shoulders; creamy white flesh. Broad, flat, dark-green tops. Excellent sweet, musky flavor. Well suited for dehydrating. Very high yielding. Originated in Europe. *J20, K50, N81, P59M*

**Hamburg Half Long:** 85 days. Refined Berliner type. Half-long, wedge shaped roots with heavy shoulders, resemble Chantenay carrots. Roots average 6 inches in length and are the conical-shaped type preferred in North American. **L42**

**Hamburg Long:** 87 days. Unique, long, slim rooted strain which resembles Harris Model parsnip in shape. Roots average 9 to 10 inches in length and are the long, narrow-shouldered type preferred in Western European. **L42**

**Omega:** 90 days. Long, cylindrical, thick white roots with a very good flavor reminiscent of celeriac. Broad, flat, dark-green parsley-like foliage that can be used for flavoring. Delicious grated raw in salads, added to soups, or cooked as a vegetable. **L91M**

---

## PARSNIP {S}

PASTINACA SATIVA

---

## HYBRID

Gladiator: 100-105 days. World's first hybrid parsnip. Bred to be more vigorous and consequently a little larger than Cobham Improved Marrow, while retaining the refined shape, smooth white skin, and canker resistance. "True" sweet parsnip flavor. Early maturing. Consistent high quality. Excellent for sowings under adverse conditions because of extra seedling vigor. *G53M*, L89, L91M, N84, R32, S55, *S75M*, TIM

## OPEN-POLLINATED

All American: (All America) 110 days. Smooth, slender white roots, quite free of rootlets; broad and thick at the shoulders, tapering to a length of 12 inches or more; hollow crowned; very sugary, tender, fine-grained white flesh, small core; attains thickness comparatively early. Excellent keeper; will store well for months. Similar to Hollow Crown, but earlier. C92, D76, D82, E97, *H33M*, H85M, 139, K10, K50, L3J

Andover: 110-120 days. Long, smooth, narrow roots with rounded shoulders; 10 to 12 inches in length; more gradually tapered than Harris' Model; firm, bright white flesh, very sweet and flavorful, unusually high brix content of 12%. Superior storage ability. Very high yielding. Tolerant to brown canker disease. A16, *C20M*, D11M, D68, F70, H61, J84, K50, L42, L89, M49, N24M, N52

Avonresister: 100 days. Small, conical, round-shouldered roots; more uniform in size and shape than other cultivars; easy to dig. Has the most resistance to canker at the root tops. Uses less space; thin plants to only 3 inches apart. Suitable for pre-packing. Bred at the National Vegetable Research Station, Wellesbourne, England. B49{OR}, N84, R32, S55

Cobham Improved Marrow: 120 days. Half-long, tapered, smooth white roots with a very high sugar content. Outstanding flavor and appearance. Selected for its smooth white skin, refined shape, and resistance to canker. Award of Merit winner in Royal Horticultural Society trials. I39M, L94, M27, N52, R47, *S75M*

Guernsey: (Long de Guernesey, Demi-Long de Guernesey) 95 days. Long to half-long, tapered roots; relatively flat crown; fine, very clean and smooth, creamy-white skin; quality very good. Excellent flavor, particularly after a frost or even after over-wintering in the ground. D29P, E63D, G68, P59M

Harris' Model: 120 days. Well-shaped, moderately tapered root; 12 inches long, 2 1/2 inches in diameter; almost no hollow crown; skin whiter than others; very tender, sweet, fine-grained white flesh, medium-sized core. Refined and attractive in appearance. The preferred cultivar for packaging because of its uniform shape and remarkable freedom from side roots. A16, A75, D68, E24, F13, F82, G16, H61, H95, J20, K10, K49M, L42, M49

Hollow Crown: (Long Jersey, Hollow-Crowned Guernsey) 125 days. Long, smooth, tapered roots; up to 18 inches long and 4 inches in diameter at the shoulder. The crown is short, and sunk into the shoulder, so as to form a hollow ring around the insertion of the leaf-stalks. Good for general cultivation; does not require as deep a soil as the Common or Guernsey parsnip. Introduced prior to 1852. BURR: A16, A25, A75, B78, C44, E38, F92, H42, H61, H95, I64, K10, L7M, M46

Improved Hollow Crown: 110 days. Moderately tapered root, with very few side roots; 10 to 12 inches long, 3 inches in diameter at the shoulder; hollow crowned; smooth, white skin; tender, fine-grained white flesh, small core. Stores well. Selected for whiter skin color and slightly longer roots. Standard cultivar for home gardeners. B6, FI, *G13M*, G71, G79, H54, I67M, L42, 089

Lancer: 120 days. Refined Harris' Model type. Long, slender, bayonet-shaped roots; smooth, clean bright white skin; very sweet white flesh, sweeter than that of Harris' Model. Has been recommended by some for harvesting early as a "baby" vegetable. More uniform and with better tolerance to canker than Harris' Model. Developed by A.L. Tozer of England. G6, I77, J9M, K20M, *S75M*

Offenham: 100 days. An early cultivar adapted to a wide range of soil conditions, but most useful on thin, shallow soils. Half-long roots with broad, thick shoulders and tender, sweet flesh of good flavor and quality. Reaches 6 to 8 inches in length when mature. Good for freezing. Very heavy yielding. B49, L3J

Tender and True: 100 days. Long, uniform, heavily-tapered roots; at least 3 inches in diameter at the shoulder; smooth, white skin; fine-grained flesh, of excellent quality, tender and very sweet; very little core. Good resistance to canker. Does especially well on deep soils. Excellent for both home garden use and exhibition. Named after a popular song. Introduced in 1897. B49, L3J, L91M, N84, R32, S55, S61

The Student: (Sutton's Student) 95 days. Thick, tapering root; varying in length from 15 to 30 inches, depending on soil and culture; hollow crowned, 3 inches in diameter. The flavor is peculiarly sweet, mild and pleasant, perhaps the best of any parsnip. Thrives in dry summers on sandy soils. Originally selected from the wild parsnip by Professor Buckman of the Royal Agricultural College at Cirencester, England. Introduced in the 1860's. BURR: A2, B49, N24M, N81, R32

White Gem: 120 days. A much improved Offenham type bred for increased resistance to canker. Medium-length, wedge-shaped roots with broad, rounded shoulders; very uniform; smooth, exceptionally white skin; of good quality and very sweet flavor. Early maturing and heavy cropping. Good for all soil types, especially clay; very easy to lift. Ideal for home gardens. C95, N81, S55, S61, S61M

White Model: 115 days. Medium length, perfectly straight roots; 6 1/2 to 8 inches long, 2 to 2 1/2 inches in diameter at the shoulder; hollow crowned and with very few side roots; smooth, pure-white skin; tender, sweet, fine-grained white flesh. Well adapted to muck land. J20

## PEA {S}

## PISUM SATIVUM

## GARDEN PEAS

## COMMON

*Large-Seeded*

Alaska: (Earliest of All) 55 days. Smooth, round light-green pods, 2 to 2 1/2 inches long; 5 to 7 peas per pod; smooth, round light green to whitish-green peas, quality fair to good fresh. Light-green vines, to 30 inches tall; heavy bearing; wilt resistant. Popular with home gardeners; the standard among canners. Also used as a dry pea and for sprouting. Introduced prior to 1880. HEDRICK 1928; A75, B6, B75M, B78, E60P{SP}, F82, G57M, H85M, I64, J20, K10, M46, N16

Blue Bantam: 64 days. Broad, moderately plump pods, about 3 1/2 inches long; 6 to 8 peas per pod; large deep blue-green peas, sweet, of very good quality. Short, stout vines, 15 to 18 inches tall; very productive. Introduced by Burpee Seed Company in 1902. HEDRICK 1928; E5T, F73D, G57M

Burpeeana Early: 63 days. Pods straight, slightly curved at the tip, about 3 inches long; tightly filled with 8 to 10 medium to large, sweet tender peas of excellent quality. Retain color and flavor when quick-frozen. Short, vigorous vines; 18 to 24 inches tall; prolific. B6, B75

Daisy: (Dwarf Telephone) Broad, straight, paired pods, about 4 1/2 inches long; 8 to 10 seeds per pod; large, smooth, light-green peas, of excellent quality but slightly thick-skinned. Seeds moderately wrinkled. Vine grows 1 1/2 to 2 feet tall; bears heavily. Introduced in 1892. HEDRICK 1928; E5T, FI, G57M, K71, Q11M

Early Frosty: 64 days. An improved Little Marvel type with twice the yield. Blunt-ended pods, 3 1/2 to 4 inches long; 7 or 8 peas per pod; very uniform, dark green peas, sweet, of very good quality. Excellent for freezing. Vigorous vine, to 28 inches tall; resistant to wilt; produces numerous double pods. A25, B6, B78, D11M, D68, FI, F70, G57M, G83M, H33M, H85M, H95, J97M, K71, M46, etc.

Early Onward: 62 days. Blunt-nosed, deep green pods, about 3 inches long; well-filled with 6 medium green peas, of excellent sweet flavor. Vigorous, compact vine, 2 to 2 1/2 feet tall; very prolific. For spring sowings. Introduced in 1908. Still one of the most popular cultivars in England. J39, 053M, R32, R83, S61, S75M

Feltham First: 58 days. Large pointed pods, about 4 inches long; well-filled with sweet, deep-green peas. Excellent for freezing. Vigorous vine, grows 18 inches tall; bears heavy crops; very haidy. Suitable for spring and autumn sowing, or growing under cloches. Popular with market growers in England. B49, N81, R32, R83, S55, S61, S75M

Freezonian: 63 days. Blunt-ended, dark green pods, 3 1/2 inches long; 7 to 8 large, well-flavored peas per pod. Dark green vines, to 30 inches tall; resistant to wilt. Excellent for home gardens and quick-freezing. All America Selections winner in 1948. B6, B73M, B75M, D65, F63, G57M, G71, H49, K10, K50, K71, M46, M95M

Gradus: 60 days. Large, pointed, dark-green pods, about 4 inches long; 5 to 8 very sweet peas per pod, of fine quality. Vigorous vines, 4 to 4 1/2 feet tall; moderately heavy bearing; requires a trellis. Originated in England about 1890. HEDRICK 1928; R32, R83, S61

Green Arrow: 65 days. Long pointed pods, average 4 to 4 1/2 inches in length; set in pairs near the top of the plant for easy picking; 8 to 11 small, sweet, bright green peas per pod. Vines grow 28 inches tall; resist downy mildew and wilt; can be grown with or without a trellis; are high yielding. Very popular maincrop cultivar. A16, A25, C44, D11M, D82, E24, E38, F13, F70, G16, K10, K73, M46, M49, M95M, etc.

Hundredfold: (Laxtonian) 64 days. Broad, straight dark-green pods, about 4 1/2 inches long; 8 or 9 peas per pod; large dark-green peas, tender and sweet. Vigorous, dwarf vines, to 18 inches tall; never need staking. Withstands heat and adverse weather conditions well. G57M

Hurst Beagle: 55 days. One of the earliest wrinkle-seeded peas. Blunt-ended pods, 3 to 3 1/2 inches long; 7 or 8 peas to the pod; excellent sweet flavor. Good for freezing. Vine grows 18 inches high; produces heavily; resists wilt and mosaic viruses. For spring or fall sowings. K17M, R83

Hurst Green Shaft: (Greenshaft) 70 days. Large, pointed pods, 4 to 4 1/2 inches long; 9 to 10 peas per pod; very sweet, of excellent flavor. Very good for freezing. Wrinkled seed. Vine grows 2 1/2 feet tall; produces double pods, all at the top for easy picking; resists downy mildew and fusarium wilt; bears heavily. B49, E33, 053M, R32, R83, S55, S61, S61M, S75M

Kelvedon Wonder: (Kelvedon) 65 days. Medium sized, dark-green pointed pods, to 3 inches long; well-filled with medium green, very sweet peas. Excellent for quick-freezing. Dwarf vine, to 18 inches tall; heavy yielding; resistant to mildew. For early spring and successive sowings. Very popular in England. B49, N81, 053M, R32, R83, S55, S61, S75M

Knight: 60 days. Large, broad pods, 3 1/2 to 4 inches long; 9 to 10 peas per pod; medium-sized, bright green, flavorful peas. Vigorous, large-leaved vine, 24 inches tall; bears a single and double set of pods; resists mosaic viruses, powdery mildew and wilt. One of the earliest large-podded peas. For home gardens and local markets. E24, FI, F13, G1M, G6, G13M, G71, H54, H61, J97M, K73, L79, L89, M49, M95M, etc.

Lacy Lady:<sup>3</sup> 60 days. Semi-leafless type. Produces strong tendrils that intertwine and act as a self-support system to hold pods above the soil. Well-filled, 2 1/2 inch long pods are produced in pairs at the top of the plant for easy picking. Fewer leaves allows for greater air movement and more light, reducing the chances of disease and insect infestation. Can be used fresh, canned or frozen. M46

Laxton's Progress #9: 60 days. Broad, moderately curved pods, about 4 inches long; 7 to 9 peas per pod; large, oval, dark-green peas, of very sweet flavor. Vigorous, compact vines, 14 to 16 inches tall; resistant to wilt; productive, with mostly single pod set. Standard early market and home garden cultivar. A16, A25, A75, C85M, FI, G16, G57M, G71, H61, K73, M46, N16, N52

Lincoln: (Homesteader) 67 days. Medium-sized pointed pods, about 3 1/2 inches long; well-filled with 8 or 9 medium-green, small succulent peas. Excellent for freezing. Compact vine, to 28 inches tall; produces well in hot weather; resistant to wilt. Long time favorite of home gardeners. A16, A25, B75M, C53, C85M, D11M, D65, D82, E24, E38, F70, F92, G57M, H42, H95, K49M, M46, etc.

Little Marvel: 65 days. Blunt-ended, straight pods, about 3 inches long; 7 or 8 peas per pod; medium-sized, dark green peas, of exceptional quality. Dwarf vine, to 18 inches tall; resistant to wilt; high yielding. An old standard cultivar, popular with home gardeners. Introduced in 1908. HEDRICK 1928; A16, A25, B75M, D11M, E38, F70, F82, H61, H85M, K10, K49M, L7M, M46, M95M, N16, etc.

Maestro: 60 days. Slender, attractive pod, 3 1/2 to 4 inches long; bears well over an extended picking period; 8 to 10 large, dark-green peas per pod. Vigorous vine, 24 to 36 inches tall; can be grown with or without support; produces a high number of double pods; resists mosaic viruses, powdery mildew and common wilt. B6, B75, D11M, D76, D82, E24, F44, F70, G6, G16, G79, H33M, H85M, I64, K71, L89, etc.

Novella:<sup>3</sup> (Bikini) 65 days. Semi-leafless or "affilia" type. Produces a profusion of tendrils which interlock and support each other in row spacings of 12 inches or less, forming a "hedge" for easy picking. Sweet, tender peas hold well over a long harvest period; freeze well. Tendrils are tender and fiberless; can be steamed or boiled. Bushy vines; productive, with mostly double pod set; resistant to wilt. B6, C53, C85M, D11M, D27, D82, E97, FI, F70, G57M, H42, K71

Olympia: (Early Olympia) 62 days. Improved Progress #9 type. Large pods, averaging 4 to 4 1/2 inches in length, containing approximately 9 peas per pod. Excellent flavor and tenderness. Vine reaches 16 to 18 inches tall, with very vigorous early growth; produces a high percentage of double pods; does not require trellising. Highly disease resistant. C85M, D65, F63, F82, 167M, K10, L42, L89C

Onward: 70 days. Blunt-nosed, dark green pods, about 3 inches long; 8 or 9 large, very sweet peas per pod. Wrinkle-seeded. Vigorous, short-jointed, dark green vine; height 2 feet; extremely productive, producing pods in pairs; resists wilt. Excellent for successional sowing. The most popular cultivar in the United Kingdom. B49, 053M, R32, R83, S61, S75M, TIM

Patriot: 65 days. Large, compact pods, 4 inches long; tightly packed with 8 to 10 peas. Dark green, medium-sized peas; tender but firm, with an excellent sweet flavor; retain their texture and flavor after freezing. Medium-sized, double-podded vines, 20 to 22 inches tall; high yielding even under stressful growing conditions. B6, D68, 191, K71, L42, M46, M95M

Perfection: (Perfection Dark Green, Dark Skin Perfection) 65 days. Medium-sized, dark green pods, about 3 1/2 inches long; 7 to 9 bright green peas per pod, sweet and tender. Vine grows 30 inches tall; benefits from staking; tolerant of heat and drought; can be planted late in the season. A75, D12, D26D, F24M, F46, F63, G57M, H95, M32

Prussian Blue:<sup>1</sup> 75-95 days. Small, round pods, 2 1/2 inches long; smooth, attractive, dark bluish-green to gray seeds, about 7 or 8 per pod. Excellent for shelling or split peas. Ripens very late. Tall, narrow, highly branched vines, around 3 1/2 feet long. At one time very popular in England and colonial America. Originated in Germany. WEAVER 1997; D29P, F24G, F73D

Purple Podded:<sup>1</sup> Ornamental, purple colored pods containing well-flavored green peas. Tall, climbing plant, grows approximately 5 feet in height. Attractive, purple flowers. Should be planted from March through May. H21, S61

Sole di Sicilia: Very rustic dwarf pea from Italy. Attractive, very straight, bright-green pods; 8 or 9 peas per pod; quality excellent. Produces over a long period. Widely adapted to early cultivation in Sicily, Sardinia and especially Puglia. Q11M

Sparkle: 55 days. Blunt medium-green pods, 3 inches long; well-filled with medium-sized, tender, sweet peas. Good for fresh use or processing. Vine grows 18 to 24 inches tall; requires no support; sets a concentrated crop. Resistant to wilt. Standard early, short-vined cultivar for freezing. B6, C44, D65, FI, F73D, G57M, G71

Sweet Parsley:<sup>4</sup> (Parsley) 68 days. Unique dual-purpose pea. Both the peas and leafy tendrils are sweet and tender. Strong lateral branches carry the peas at the top for easy picking. Leafy tendrils are high in nutrition and resemble curled parsley; can be used fresh or dried; ideal as a garnish for salads or adding flavor to soups or stews; also good stir-fried. C95, N84

Tall Telephone: (Alderman) 75 days. Broad, curved, dark-green pods, 4 to 5 inches long; 8 to 10 peas per pod; very large, bright dark-green peas, tender and sweet, of excellent quality. Large, heavy, dark green vines, 5 to 6 feet tall. Popular for growing on trellises. Introduced about 1878. HEDRICK 1928; A25, B49, C44, C85M, D11M, E38, FI, F70, F73D, F82, G57M, G71, M46, M49, R32, etc.

The Pilot: 60 days. Large, deep-green pointed pods, 2 1/2 to 4 inches long; 4 to 6 large medium-green peas per pod; quality very good. Also good for drying. Extremely hardy vine; grows 3 1/2 to 4 feet tall. Well suited to spring or autumn sowing. Originated in England prior to 1903. HEDRICK 1928; B49, J39, K17M, R32, R83, S61

Thomas Laxton: 60 days. Blunt, dark-green pods, about 3 1/2 inches long; 7 or 8 peas per pod; very large, medium-green peas, sweet and tender. Excellent for canning and freezing. Vine grows 2 1/2 to 3 feet tall; yields heavily; resists wilt. Introduced in 1898. HEDRICK 1928; A25, A27M, A75, D12, G57M, G79, 167M, K10, K71, M49, M95M, N16

Tom Thumb:<sup>2</sup> 58 days. Smooth-seeded heirloom pea. True dwarf-type plant, grows 6 to 8 inches tall. Traditionally planted between rows of other crops, otherwise rows are spaced 10 inches apart. Very productive in relation to the size of the vines. Well adapted to cold frames. Excellent drought and cold tolerance. Introduced in the 1850's by D. Landreth and Sons. WEAVER 1997; B49

Whndo: 70 days. Straight, dark-green pods, about 3 inches long; 7 to 9 medium-sized, dark green peas per pod. Vine grows 24 to 30 inches tall; pollinates well under cold as well as warm growing conditions. Resistant to heat; can be planted later in the season than most cultivars. A25, A75, B6, B73M, C44, E24, G16, G57M, G71, G79, K49M, L7M, N16

Willet Wonder: 70 days. Smooth-seeded pea with better cold tolerance than most other peas. Bushier and shorter than Alaska, and similar to Thomas Laxton in disease resistance. Grown primarily in the Deep South for fresh peas. Also freezes well. G57M

World Record: 60 days. Broad, plump, round to oval pods, 3 1/2 to 5 inches long; 5 to 7 peas per pod; peas round to slightly indented, oval, light green in color, of excellent quality. Slender, productive plant, height 2 1/4 to 2 1/2 feet. Originated by Sutton and Sons before 1907. HEDRICK 1928; A25

### Small-Seeded

Known as *petit pois* in France, these are considered the finest flavored of all peas. They are bred never to grow very large. Very sweet and delicate, it is best to harvest them no more than an hour before cooking. The traditional French method is to cook them in their pods and then shell them. Not as productive as other peas. KRAFT [Cul, Re].

Darvon: 58 days. Wrinkled-seeded *petit pois* type, Very small, tender, bright-green seeds; very sweet, delicate flavor. Somewhat more difficult to shell than other varieties. Excellent for fresh use, canning or freezing. Grows to about 20 inches tall and does well in most climates. M46

Giroy: 65 days. Straight, plump pods, about 3 inches long, each filled with 9 to 10 seeds. Tiny, extra sweet seeds, tender and delicate, of excellent flavor. Vigorous, bushy plant, height at maturity about 36 inches; very productive. Resistant to Fusarium Wilt and Top Yellows. 191

Petit Pois: 58 days. True small-seeded French pea widely used in gourmet dishes. Small pods, about 2 inches long; well-filled with sweet, tender peas of excellent quality. Retains color and flavor when frozen or canned. Very prolific vine; height 20 inches; very hardy; produces double pods. E9{PD}

Petit Provençal: (Meteor) 60 days. *Petit pois* type from France; one of the best for early production. Small, curved, pointed pods; 7 or 8 very sweet peas to the pod. Should be harvested when young for the best quality. Small, compact vine, 16 to 18 inches tall; should be trellised. Very hardy; can be sown from fall through winter in mild climates. B75, E63D, R32, R83, S17, S55, S61

Precovil: 60 days. Small, medium-green pods, 2 1/2 inches long; very small peas, tender and sweet. Bush-type vine, 18 to 24 inches tall; very early and productive; requires support; resistant to wilt and top yellows. Does well in hot summer areas as well as short season areas. D74B, G68, S95M

Proval: An improved *Petit Provençal*. One of the best of the early dwarf peas. Small pods, about 2 1/2 inches long; 6 to 8 peas per pod. Very good for freezing. Vine grows 16 to 24 inches tall; produces abundantly. Good for field or cold frame production. P59M

Serpette: (Serpette Guilloteaux) Very large, attractive, light green pods; resemble a curved pruning knife in form; each pod contains 10 to 12 small, sweet peas. Smooth seeded type. Ripens in midseason. Tall, upright vine; highly productive. G68, P59M, S17

Waverex: Small, straight, blunt-ended pods; 7 or 8 very small, very sweet, tender peas per pod. Excellent raw, cooked or frozen. For best quality pick when only 1/6 inch in diameter. Semi-climbing vine, 18 inches tall; requires staking; produces a heavy crop; grows well in any cool climate. Developed in Germany for the European market. B49, C53, 053M, R32, R83, S55, S61

### EDIBLE-PODDED

#### Sugar Peas

Also called *snow peas* or *Chinese peas*, these lack the parchment-like inner lining of common garden peas. They can be eaten whole and remain sweet and tender until quite large. Widely used in oriental cuisine, especially stir-fried dishes. E13G{PR}

Carouby de Maussane: (Roi de Carouby) 65 days. Thin, flat pods, distinctively shaped; 5 inches long, up to 1 inch wide; very sweet and tender. Should be harvested when the peas are barely visible. Vigorous vines; height 3 to 5 feet. Very attractive purple flowers, suitable for ornamental as well as culinary plantings. Originated near Avignon, France in the village of Maussane. C53, E63D, F73D, G68, P59M, Q11M, R32, R47, R83, S77, S55

Dwarf Gray Sugar: 65 days. Broad, slightly curved, light-green pod; 3 inches long, 1/2 inch in diameter; sweet and tender. Can be

used as a shell pea when past the edible-pod stage. Young leaves and shoots are also commonly eaten. Slender, determinate vines; height 26 to 30 inches; heat and cold tolerant; resists wilt. Standard mid-season cultivar. A16, A75, B49, C44, C85M, D82, E59Z, F80, F92, G79, H73{DF}, K71, L59, M46

**Dwarf Sweet Green:** Small flat, deep green pods, 2 1/2 to 3 inches long; very sweet and tender; excellent flavor. Best picked when 2 inches long. Dwarf vine, grows 1 1/2 to 2 feet tall; extremely prolific. True French green mangetout. R32, R83, S55, S75M

**Dwarf White Sugar:** 50 days. Thick, succulent pods, 2 to 2 1/2 inches long; sweet, tender and stringless. Retains high quality even if picked over-mature. Vine grows 30 inches tall; remains vigorous and productive longer if pods are picked when peas are one-third to one-half developed. D27, D68, F63, G57M, 184

**Golden Sweet:**<sup>5</sup> 75 days. Unusual yellow-podded sugar pea from India. Large lemon-yellow pods, 3 inches long, set in pairs; tender, sweet, mild in flavor, of very good quality. Easy to pick as their bright yellow color stands out among the green foliage. Vigorous vine, 3 1/2 to 4 feet tall; drought resistant; high-yielding; has attractive bi-color purple flowers. Potential specialty market item. C95, F73D, J39, K17M, K49M, L77D, L88J, N24M, N84

**Kosaya Endo:** (Chinese Small Pod) Oriental cultivar with small, somewhat curved pods; crisp, sweet, and tender. Red-flowering, dwarf vine, 24 to 30 inches tall; highly productive, requires no support. Resistant to fusarium wilt. G33

**Mammoth Melting Sugar:** 75 days. Thick, succulent light-green pods; 4 to 4 1/2 inches long, 3/4 inch wide. Distinct, sweet flavor. Uniform, productive vine; height 4 to 5 feet; requires support; resistant to wilt; hardy and vigorous. Bears over a long period, making it ideal for home gardens. Occasionally used for *pea shoots*. A75, C44, E38, G57M, G93M, H42,177, J73, K10, K27M, K49M, K71, M46, N16

**Norli:** 55 days. Thin, succulent pods, 2 1/2 inches long; very sweet and flavorful. Perfect for using whole in salads and stir-fries. Excellent for freezing. Dwarf, white-flowered vine, grows only 18 inches tall; high yielding. Very early maturing; ideal for small-space gardens. C85M, J39, K66, P59M

**Oregon Giant:** 60 days. The first large-podded snow pea with a sweet flavor. Extra large, flat, sweet, medium-green pods; 4 1/2 to 5 inches long by 1 inch wide; mild, sweet seeds. Uniform, highly productive plants, about 2 1/2 feet tall; can be grown with or without support. Tolerant to powdery mildew, common wilt, and enation mosaic virus. A2, B8M, B49, D55, E24, G6, G16, G82,139, J9M, K10, K27M, K49T, K66, L4, L42, M32, M49, etc.

**Oregon Sugar Pod:** 65 days. Smooth, light green pod; 4 inches long, 3/4 inch in diameter; mild flavor, good for freezing. Vigorous, hardy vine; height 24 to 30 inches; widely adapted; very productive over a long period; sets double pods. Resistant to viruses and fusarium wilt. A16, C97, G71, G71M, H85M, J97M, K49M, L59, N84, S55{SP}

**Oregon Sugar Pod II:** Smooth, bright green pods, 4 to 5 inches long; frequent double pods; tender, mild and sweet. Excellent fresh or frozen. Vigorous, very productive plant, non-climbing, does not require support. Resistant to common wilt, powdery mildew and viruses. Recommended for fresh markets and home gardens. A1, A2, B75, C92, D55, D74B, E24, E97, F13, F82,139, J97M, K49T, K50, K71, L89, L91M, M29, etc.

**Osaya Endo:** Oriental cultivar with medium to large, straight bright green pods, sweet and tender. Suitable for eating raw, as tempura, or stir-fried. Vigorous, climbing, white-flowered vine, grows 6 to 7 feet tall. Can be sown in spring and fall. D68, G33, M27

**Schweizer Riesen:** (Swiss Giant) Large, tender pods with very good flavor. Vigorous vines, grow to 5 feet tall, require trellising. Attractive purple flowers. An old heirloom from Switzerland. M27

**Snowbird:** 58 days. Very early maturing cultivar. Heavy yields of 3-inch pods, usually borne in double or triple clusters. Dwarf, erect plant, 16 to 18 inches tall; needs no support; widely adapted. Resembles Dwarf White Sugar. Ideal for short season areas or where space is limited. Also good for fall crops. Introduced in 1978. B75

**Snowflake:** 65 days. Short-vined type with extra-large pods. Large, dark-green flat pods; 4 inches long, 1 inch in diameter; remain straight. Vine grows 2 to 3 feet tall; resists powdery mildew. May be grown with or without support. D11M, D26D, E5T, F63, F70, G13M, G57M, G71, G87, H85M, J25M, K10, M95M, Q34

**Super Sugar Pod:** 70 days. High quality snow pea grown especially for the Chinese restaurant trade in San Francisco. Large, flat pods, 4 1/2 inches long and 3/4 inch wide. Must be picked before peas are visible to avoid excessive stringiness. Extra long, climbing vines, spreading to 4 feet. Resistant to wilt but not powdery mildew. L42

### Snap Peas

A distinct type that produces both thick, crisp, succulent pods and a row of sweet, full-sized peas. When the pod is bent it will snap like a fresh snap bean pod. Pods and peas can be eaten together, or the peas can be shelled out and used alone. Developed by Calvin Lamborn of Gallatin Valley Seed Co. A prototype was described by Vilmorin and called *butter pea*. FELL 1982b, SCHNEIDER 1986 [Cul, Re], VILMORIN; B91T{PD}, E13G{PR}, F15{PR}, N40{PR}

**Cascadia:** 58 days. Dwarf, Sugar Ann type with sweet pods and peas. Larger, darker green pods, 3 to 3 1/2 inches long; thick and juicy, very sweet and flavorful. Short, compact vine, yields abundantly. Resistant to pea enation virus; more tolerant of powdery mildew. Developed by Dr. James Baggett. C53, C95, D1T, D12, F44, F46, G6, G57M, G93M, 139,177, J9M, K10, K27M, K49T, L42, L89, etc.

**Early Snap:** 62 days. Thick, fleshy pods, 3 to 3 1/4 inches long. Eating quality and yields comparable to Sugar Snap, but matures 10 to 14 days earlier. Compact vine, 18 to 22 inches tall; requires little or no trellising; resists bean yellow mosaic. Suitable for fresh market and U-pick operations. Released by the Nov York Agricultural Experiment Station. C20M, C44, D65, G57M, G79, K50, N16

**Honey Pod:** 70 days. Medium-green, round pod, 3 inches long; thick-walled, very crisp and sweet, nearly stringless; 6 pods per plant; 5 to 7 sweet, tender peas per pod. Uniform in shape and appearance. Compact vine, 20 to 28 inches tall, requires support; very prolific, produces 2 pods per node. Resistant to fusarium race 1. Introduced in 1983. D76, H49, L79, L91M

**Sugar Ann:** 56 days. Round, bright green pods, 2 1/2 inches long; crisp and sweet. Very good for freezing. Dwarf vine, 16 to 24 inches tall; does not require support; widely adapted; prolific. Ideal for limited-space gardens. All America Selections winner in 1984. A25, B73M, C44, C85M, D65, D82, E24, E38, E59Z, G6, G16, G71,139, K73, M46, M49, etc.

**Sugar Bon:** 60 days. Round, slightly curved pod; 2 1/2 to 3 inches long; crisp, tender, sweet. Large, medium-green peas, 6 or 7 to a pod. Compact vine, only 18 to 24 inches tall; requires no support; very productive; heat tolerant; resistant to powdery mildew. B75, D26D, D76, G13M, G57M, G93M, /59M, 191, M29, N24M, TIM

**Sugar Daddy:** 75 days. The first snap pea with stringless pods. Attractive, dark-green pods, 2 1/2 to 3 inches long; slender and stringless; borne in pairs at each fruiting node; will not split during freezing or cooking. Medium-green peas, 6 or 7 per pod. Dwarf vine, 24 to 30 inches tall; resistant to powdery mildew and pea leafroll. A2, A16, B49, D65, D76, E97, G16, G71, H85M, H95, 191, K10, K71, L42, L89, M46, etc.

**Sugar Gem:** 60 days. Thick, medium-sized pods, about 3 inches long, completely stringless; sweet, crisp and succulent; quality excellent. Short, compact plant, grows 24 to 26 inches tall; very productive; resistant to powdery mildew. Can be sown in succession throughout the summer for harvesting in the fall. E33, L91M

**Sugar Mel:** (Super Sugar Mel) 68 days. Thick, round pods, up to 4 inches long or more; borne in pairs; 7 or 8 peas per pod. Vigorous vine, 3 to 4 feet tall, requires support; resistant to powdery mildew; high yielding. Rated highest in yield and eating quality of 7 cultivars tested by Organic Gardening magazine. B75M, E24, F13, G13M, G71M, G93M, 191, J20, K66, K73, L7M, M95M, N24M

**Sugar Pop:** 60 days. Stringless snap pea with early yield, up to 2 weeks earlier than Sugar Daddy or Sugar Snap. Round, thick pods, 2 1/2 to 3 inches long; crisp and sweet. Excellent for freezing. Dwarf vine, only 18 inches tall; needs little support; can be planted closer for higher yields; resists powdery mildew and pea leafroll. 191, J39, N24M

**Sugar Rae:** 70 days. Round, dark green pods, 3 to 3 1/2 inches long; borne in pairs; crisp and sweet. Produces 7 or 8 sweet peas per pod. Vigorous dwarf vine, 2 1/2 feet tall; resistant to powdery mildew. Unique in that the plants "stool" at the base, producing up to 5 vines per plant. All vines blossom and bear pods over a long harvest period. J39, N24M, R32, S55

**Sugar Snap:** 70 days. Round, plump, slightly curved pod; 2 1/2 to 3 1/2 inches long; crisp, sweet, juicy; requires stringing. Medium-green peas, 6 or 7 per pod. Freezes well, but not recommended for canning. Vigorous vine, 6 feet or more tall; needs strong support; resistant to wilt; productive over a long season. All America Selections winner in 1979. A25, B75M, B78, C44, E24, E38, G6, G16, H33M, H61, H85M, 184, L7M, L59, M49, etc.

**Super Sugar Snap:** 65 days. Improved earlier maturing Sugar Snap with plumper pods and increased yield potential. Crisp, sweet and juicy. Excellent fresh or frozen. Vigorous vine, 55 to 65 inches tall; requires support; produces double pods at each node. Resistant to powdery mildew; tolerant to bean leaf roll virus. B49, B75, C85M, E97, F13, F82, G13M, G16, 139, 191, J20, K10, K66, K71, M29, M46, M49, etc.

**Sweet Snap:** 65 days. Medium-green pods, 2 to 3 inches long; crisp and tender; free of fiber. Good for cooking and freezing, not recommended for canning. Semi-climbing vine, 34 inches tall; requires support; high yielding; tolerant to powdery mildew and bean yellow mosaic. C92, G87, H42

#### FIELD PEAS

Also called *soup pea*, *dry pea*, *gray pea* and *dun pea*, this type is grown almost exclusively for the dried seeds which are used in soups and stews or other cooked dishes, and are also sprouted. D68, J99G, K95M, N81, P17M, P83M. (see also Sprouting Seeds, page 524)

**Amplissimo Victoria:** Round, medium to large, light-colored seeds; very rich flavor. Excellent in soups. Climbing vine, about 6 feet tall; white flowers. Staking required for best results. K17M

**Australian:** Small, brown, rectangular seeds speckled with white; delicious, very rich, full flavor. Excellent for soups and dais. Luxuriant, very prolific climber, 5 to 8 feet tall; small leaves; pink and purple flowers. K17M

**Austrian Winter:** Small, grayish-brown seeds. Very good as a dry soup pea, keeping its firm texture when cooked. Also good for sprouting. Widely sold as a green manure seed. Germinates and grows in cooler soils than most legumes. Occasionally used for the production of Japanese *an* (sweet bean paste). LUMPKIN; A91, B49, D47M, E24, E53, F11, G1M, I99M, J99G, K49T, L89, M25, M95M

**Bill Jump's:** 80 days. Old time soup pea of good quality. Doesn't break up when cooked. Also excellent for sprouting. Produces 4 to 6 very small, speckled, gray-brown seeds per pod. Tall growing

vine, up to 5 or 6 feet. Very attractive purple flowers. Heirloom from Washington state. A2, K17M

**Blue Pod Capucijners:** 85 days. Bluish-purple pod, 3 to 4 inches long. Large, grayish-brown seed; makes its own rich, dark-brown gravy. Semi-climbing vine, to 4 feet tall, requires support; has attractive purplish-red flowers. Originally developed by Capuchin monks in Fiance or Holland in the 17th century. C85M, E5T, F73D, J39, 089

**Blue Pod Desiree:** Similar to Holland Brown, but the pods dry to a deep vibrant purple. Large, rectangular seeds. Very good in soup. Bush type plant, staking helpful but not necessary if rows are planted side by side. K17M

**Carlin:** (Carling) Short pods; dark colored, semi-shriveled peas. Has a distinctive flavor. Seeds are soaked for 24 hours and are then at their best when sprinkled with brown sugar and cooked slowly. Tall growing vine, to 6 or 7 feet; needs support; resists rust and mildew; has purple, sweet-scented flowers. The name Carlin is derived from Carlin Sunday, a Medieval feast day still observed in northeastern England. GENDERS 1975, WEAVER 1997; J39, K17M

**Holland Brown:** Heirloom dry pea, brought from Holland by the first settlers of the Gallatin Valley, Montana. Large, rectangular green and brown seeds. Fine texture and flavor. Not for shelling green. Leave to ripen on the vines and then thresh. Cook and serve like dry beans. Pink and scarlet flowers. Very good producer. K17M

**Holland Capucy'ners:** (Grey Pea, Monk Pea) 85 days. A traditional dry pea, unique to the farm communities of northern Holland. The name Capucijner is derived from the peas markings, said to resemble the ancient cowls of Capuchin friars. Large, wrinkled brown-grey peas are cooked whole and make their own rich brown gravy. Also eaten fresh, although not particularly sweet. Ornamental vines, profusely covered with violet-red and pink flowers. A45{DF}, A45{PD}, C95, D68, E5T, E23T{DF}, F73D, I39M, K17M, L3J, L77D, N84, R47

**Mexican Soup:** 80 days. Round, yellow peas are dried and used in soups. Very productive plant; keeps producing far into the summer, long after other peas have succumbed to the heat. Should be planted further apart than normal, as plants become large and bushy. Originally from Zacatecas, Mexico. F73D, J25M

**Raisin Capucijners:** 65 days. Large flat seeds, mottled with brown and buff; excellent flavor, makes delicious and distinctive pea soup. Can also be used as a green shell pea. Dwarf vine, 24 inches tall; high yielding. Selected by Capuchin monks in Holland. C85M, C95, F73D, J39, N84

**Tall Capucijners:** Excellent soup pea from Holland. Vibrant, purple pods. Large, rectangular seeds. One of the best flavored dry peas. Robust vine, climbs 6 to 8 feet; fragrant pink and purple blossoms. K17M

**Trapper:** Grown mainly as a cover crop or for green manure but it can also be used for producing small, yellow peas that are good for soup because they don't become musty. Reaches 3 to 4 feet in height. Sow 200 pounds per acre in the spring. A15Z, E24, G6, G19T, G50, 193M

#### PEA SHOOTS

Also called *seedling pea*, *hoh loan tau* or *dau miu*, these are grown for their young shoots which are used in noodle or chow mein dishes. Plants are grown prostrate on the ground. They are not allowed to develop pods and the flowers are removed as they appear, forcing the sweet pea flavor into the leaves and tender stems. Harvested when 4 to 5 inches tall. Sold in bunches in the markets of Hong Kong and Taiwan. Very popular in Shanghai. COST 1988 [Cul], DAHLEN [Cul, Re], HERKLOTS, PASSMORE; D3M{PR}, D55, F80, H24, H73{PR}, K17M, L59, L79G, N84

Meguro Usui: Primarily grown for the young shoots, which are used in Chinese stir fry dishes. Pods grow 3/12 to 4 inches long and contain 6 to 8 large, round, green peas. Mature seeds are white with a black eye. *S70*

#### CODES FOR SPECIAL TYPES

1. Blue-Podded
2. Dwarf
3. Semi-Leafless
4. Edible-Leaved
5. Yellow-Podded

## PEACH {GR}

AMYGDALUS DAVIDIANA

AMYGDALUS PERSICA

### CLINGSTONE PEACHES

Most clingstone peaches are more suitable for canning and processing than other types because the firm flesh retains its shape, the juice remains clearer and the color of the flesh remains brighter. Generally more disease resistant than freestones.

#### RED-FLESHED

Indian Blood: (Indian Cling, Red Indian, Blood Cling) Irregularly shaped, somewhat compressed fruit; skin dull greenish-white, mottled with pink and dark red; flesh red, lighter colored near the stone, juicy, coarse, stringy; quality fair; ripens very late. Widely used for pickling and preserving. Tree large, vigorous; hardy; unproductive. Low chilling requirement. Introduced prior to 1871. HEDRICK 1917; *A63, A82, A82{DW}, C30M, D76, E97, E99M, F61M, F93, G8, G65M, I53M, L90, M83, N33, etc.*

Strawberry Cling: Fruit medium to large; skin creamy white, blushed with red; flesh white, marbled with strawberry-red, firm, juicy, richly flavored; ripens late. Excellent for home canning. Tree vigorous; spreading; susceptible to insects and disease. Medium chilling requirement. *B93M, C54, F91T{SC}, K88T, L47*

#### WHIIE-FLEgHED

Arctic Supreme: Large, round white fruit; flesh firm, perfect for slicing, clingstone; flavor sweet, tangy, excellent for dessert; ripens in late July. Tree self-fruitful; requires approximately 700 hours of chilling. Originated in Modesto, California by Floyd Zaiger. *A88M, N20*

Chinese Cling: (Shanghai) Small to medium-sized, round-oval fruit; skin tough, adherent, creamy-white blushed on one side with lively red; flesh white, tender, juicy, aromatic; flavor excellent, being finely balanced between sweetness and sourness, with a distinct, pleasant taste of almond; ripens late. Tree rather weak in growth, upright-spreading, not very hardy, moderately productive. Introduced into England from Shanghai, China by Robert Fortune, in 1844. HEDRICK 1917; *F91T{SC}*

Mayflower: Medium to large fruit; oval, pointed at the apex; skin greenish-white with a dark red blush; flesh greenish-white, juicy, tender, subacid; quality fair; ripens wry early. Tree productive; relatively resistant to leaf curl. Originated prior to 1909. HEDRICK 1917; *E84, F91T{SC}, I41P*

White Heath: (White English, Heath Cling) Medium to large, round-oval fruit; skin creamy white blushed with red; flesh white, juicy, firm but tender, sweet or somewhat sprightly vinous-flavored; very good in quality; ripens 6 days after Elberta. Susceptible to brown rot. Popular for home canning. Tree vigorous; upright-spreading; hardy; unproductive. Medium chilling requirement. Origin unknown; first raised prior to the Revolutionary War. HEDRICK 1917; *A88M{OR}, C54, K88T, L47, N20*

#### YELLOW-FLESHED

Corona: Fruit large, up to 3 1/3 inches in diameter, nearly round; skin golden-yellow, blushed or streaked with red; flesh yellow, red next to the pit, fine-grained, firm; flavor very good; ripens late. Commercial canning clingstone. Tree vigorous, productive. BROOKS 1972; *A9, B71M, E4*

Dixired: Medium-sized, round fruit; skin bright red, attractive; flesh yellow, medium-firm, clingstone; ripens early, about 10 to 12 days before Redhaven, 5 to 6 weeks before Elberta. Quality good for very early shipping and local markets. Tree moderately vigorous; blooms late; tolerant to leaf curl. BROOKS 1972; *A82, C75M, E99M, F61M, G72, G72{DW}, I9M, I41P, K28, K28{DW}, M25M, N33*

Dixon: Early season clingstone with very good flavor. Developed for canning, but dessert quality also excellent. Flesh yellow, turning red if overripe. Ripens in early August in central California. Very high yielding. Requires 800 hours of chilling. Recommended for backyard plantings. Originated in Linden, California by F.A. Dixon. Introduced in 1956. *N20*

EarlGrande:<sup>1</sup> Medium to large fruit; skin yellow, 25 to 75% blushed with red; flesh yellow, slightly red next to the pit, firm, of good flavor; clingstone; ripens wry early, 55 days before Elberta. Tree very vigorous. Low chilling requirement, 250 hours or less, particularly well adapted to the south Texas area. *A9, A63, C54, E99M, F61M, G49, H4, I68, J59, L47, M83, N20, N33*

Empress:<sup>3</sup> Medium-sized fruit, about 2 1/4 inches in diameter; skin yellow, blushed with bright red, attractive; flesh yellow, firm, juicy, melting, subacid to mild, of very good flavor; clingstone; ripens ewnly, about 3 weeks before Golden Glory; resembles Golden Glory and Rio Oso Gem. Tree genetically dwarf; mature height only 5 to 8 feet; self-fruitful, productive; ornamental. BROOKS 1972; *C30M, C54, C75M, E99M, F61M*

Everts: Fruit medium to large; skin yellow, with a medium blush, very attractive; flesh clear yellow, with a pink pit; flavor outstanding when canned; ripens with Halford. Tree productive. Commercial canning clingstone. Named for Major W.S. Everts, for many years manager, California Cling Peach Advisory Board. BROOKS 1972; *B71M, K88T*

Flordaking:<sup>1</sup> Medium to large fruit, 2 to 2 1/2 inches in diameter; skin yellow, blushed with red; flesh firm, sweet, golden-yellow, clingstone; ripens wry early, 57 days before Elberta. Chilling requirement low, 450 hours. Adapted to the warmer areas of the Deep South. Introduced by the University of Florida. *A85M, C75M, D37, E45, E99M, F61M, F93, G17, I53M, I68, K76, M69M{DW}, M83, N20, N33, Q93, etc.*

Halford: Large, uniform fruit; skin yellow; flesh yellow, non-melting, clingstone; canning quality excellent; ripens late. Tree a heavy producer. Medium chilling requirement. Traditional commercial canning cultivar in California. Also widely used as a seedling rootstock. Originated in Modesto, California by John Halford. Introduced in 1921. BROOKS 1972; *A9, B71M, B93M, D18, E4, K73M, K88T, L47, N20*

Klamt: Medium to large fruit; skin yellow, with a medium blush; flesh clear yellow; pit brown; flavor superior when canned; maintains its high quality well. Tree consistently sets good crops. Originated in Davis, California. Introduced in 1964. BROOKS 1972; *B71M, E4, K73M, K88T*

Lemon Cling: Fruit large; oval, resembling a lemon; apex terminating in a large nipple; skin deep yellow, brownish-red where exposed; flesh firm, deep lemon-yellow with red at the stone, juicy, sprightly, vinous, with an agreeable acidity; quality very good when perfectly ripe; ripens in September. Excellent for home canning. Tree vigorous; highly productive; bears regularly. Dates back to before the Rewlutionary War. HEDRICK 1917; *T49M{SC}, U7G{SC}*

Loadel: Uniformly large fruit; flesh clear yellow, firm, with a small pit; ripens in mid-lily. Tree vigorous and productive. One of the most widely planted early-ripening commercial clingstones. Originated in Yuba City, California. Introduced about 1950. BROOKS 1972; A9, B71M, D18, E4, K73M, K88T

Orange Cling: Fruit large, round; skin clear golden-orange, blushed with red; flesh dark golden-yellow, very firm, juicy, with a vinous flavor; clingstone; ripens midseason to late. Very popular for home canning. Tree vigorous and productive. Medium chilling requirement. Originated prior to 1832. HEDRICK 1917; A88M{OR}, F91T{SC}, K88T, L47, N20

Tuskena: (Tuscan Cling) Very large fruit; flesh firm but melting, acidic until fully ripe when it has a good flavor; ripens wry early, with Early Crawford. Suitable for both dessert and canning. Possibly a clingstone version of the Crawford type. At one time valued as an early shipping peach. Originated in Mississippi prior to 1873. WICKSON; T49M{SC}, U7G{SC}

#### FLAT PEACHES

A very distinct type with fruit that is very compressed and oblate. Most have holes in the flesh below the pit. Also called *ping-tzu-t'ao*, *pen-tao*, *doughnut peach* or *saucer peach*. Genemlly, they have low chilling requirements. A88M, N20, N40{PR}, R77. (A. persica Compressa Group)

Australian Saucer: Small to medium-sized, vertically compressed fruit; skin white, blushed with red on the exposed side; flesh white, cloyingly sweet offset by a pronounced bitter almond flavor; ripens late June to early July. Tree blooms wry early, nearly evergreen in mild climates. Relatively low chilling requirement, approximately 300 to 400 hours. Good in warm winter areas, especially hot interior parts of California. T49M{SC}

Peento: Flattened, saucer-shaped fruit; skin creamy yellow, mottled and delicately pencilled with red; flesh white, stained red at the stone, juicy, strirgy, tender and melting, sweet, mild, with a slight bitter almond-like flavor; quality very good; clingstone; ripens early. Susceptible to blossom end decay. Tree vigorous, open-topped. Adapted to Florida and the warmest parts of the Gulf States. Introduced prior to 1877. HEDRICK 1917; G8

Stark Saturn: Fruit vertically compressed and oblate; skin creamy yellow, highly blushed with red; flesh white, melting, tender, mild and very sweet; freestone; ripens approximately with Redhaven. Unlike most flat peaches, it has a small, tight scar and flesh covering the pit rather than holes in the flesh below the pit. Tree large, vigorous; very productive; resistant to bacterial spot. Considered the best of the flat peaches. E13G{PR}, I49P, 168, J61M

#### FREESTONE PEACHES

##### RED-FLESHED

Indian Free: (Indian Blood Freestone, Blood Free) Similar to Indian Blood, but freestone. Medium-sized fruit; skin greenish-white, overspread with splashes and stripes of dark red; flesh blood-red throughout, juicy, course, tough and meaty; quality fair; ripens very late. Tree vigorous, haidy. Introduced prior to 1869. HEDRICK 1917; A88M, B93M, C54, I68, LI, N20

Strawberry Free: Medium-sized fruit; skin white, blushed with pink; flesh white marbled with strawberry-red, firm, very sweet and rich, of excellent flavor; freestone; ripens early. Tree vigorous, spreading. Relatively low chilling requirement. Very popular in parts of California. A88M, B93M, C54, E23Z, F91T{SC}, I68, K88T, LI, N20

##### WHITE-FLESHED

Amsden: (Amsden June) Medium-sized, nearly round fruit; skin greenish-white, blushed with dark red on the side exposed to the sun; flesh yellowish-white, very soft, flavor good; stone large, partially clinging until fully ripe; ripens early. Tree moderately vigorous;

bears regularly; haidy. Introduced about 1868. SIMMONS 1978; LI, O81, R77

Babcock:<sup>1</sup> Small to medium-sized fruit; skin light pink, blushed with light and deep red, attractive; flesh nearly pure-white, red near pit, tender, very juicy, mild, very sweet; quality good; pit small, free; ripens 2 weeks before Elberta. Tree medium to large; vigorous, spreading; very productive. Low chilling requirement, less than 200 hours. BROOKS 1972, RUCK; A63, A88M, C54, D23M, E4, G49, I50D{DF}, I68, I83M, K88T, L47, N20

Belle of Georgia: Large, roundish-oval fruit; skin creamy white, blushed with red, very attractive; flesh white, tinged with red at the pit, juicy, strirgy, tender, sweet and mild, quality good; stone semi-free to free; matures in midseason. Tree large, vigorous; hardy; very productive. Originated in Marshallville, Georgia from seed planted in 1870. HEDRICK 1917; A39, A82, B53, C75M, D37, E99M, F53, G8, G79M{DW}, I9M, L33\*M11M{PR}, M39M, M83, N33, etc.

Carolina Belle: New release from North Carolina State University. Developed to fill the need for a firm, white-fleshed peach intended for local markets. Fruit 2 1/2 to 3 inches in diameter; skin brilliant bright red over creamy-white; ripens about 10 days after Redhaven. Requires approximately 750 chilling hours. E99M, F61M, F91T{SC}, L33

Champagne: Large fruits; skin creamy-white blushed with light red; sweet, white flesh, low in acid; mild, pleasant flavor; quality very good. Ripens late, in early August in Central California. Moderate chilling requirements, approximately 500 hours. A good home garden variety. Origin unknown. Introduced by Armstrong Nurseries. N20

Champion: Small to medium-sized fruit; skin creamy white, blushed with light and dark red; flesh white, tinged red at the stone, very juicy, exceedingly tender, sweet, of excellent flavor; stone semi-free to free; matures in early midseason. Tree large, vigorous; very productive. Originated in Nokomis, Illinois by I.G. Hubbard. Introduced in 1890. HEDRICK 1917; D76, G72, H49, H65, I9M, K28, LI, L12, M11M{PR}, M25M

Cumberland: Medium to large, oval-pointed fruit; skin greenish-white, overspread with dull red, fuzzy; flesh white, red at the pit, soft, melting, texture coarse; semi-freestone; ripens 3 weeks before Elberta, hangs well on the tree. Tree vigorous; moderately productive; resistant to bacterial spot; flower large, showy, light pink. Chilling requirement 850 hours. BROOKS 1972; F91T{SC}

Early White Giant: (Stark Early White Giant) Fruit very large; skin white, highly blushed with bright red, attractive; flesh white, juicy, sweet, flavorful; ripens in early Jdly. Tree vigorous and productive; tolerant to bacterial spot. Adapted to Zones 5 through 8. L33, L33{DW}

Eden: Large, roundish fruit; skin creamy white, 60% overspread with red; flesh thick, firm, juicy, sweet and rich; oxidizes slowly for a white-fleshed peach; freestone; ripens in midseason. Good for canning as well as fresh eating. Tree vigorous, very productive, as hardy as Redhaven. Introduced in 1972. C76M, F91T{SC}

El Dulce:<sup>1</sup> Medium-sized fruit, weight about 5 ounces; skin light pink to red; flesh white, rather dry, very sweet; seed small; ripens 7 days later than Babcock. Excellent for eating out of hand, drying or canning. Tree vigorous, spreading, has a low chilling requirement. Seedling of Babcock. Originated in Escondido, California by Orton Englehart. T49M{SC}

Erly-Red-Fre: Fruit large, round; skin attractive red, thick; flesh white, greenish near pit, firm, melting; pit small, mostly freestone; ripens 5 to 6 weeks before Elberta. Tree vigorous; hardy; moderately productive. High chilling requirement. BROOKS 1972; A5, B53, D37, I61M{SC}

Flordahome: (A. davidiana x) Medium to large, oval fruit; skin yellowish-white, 50% blushed with red; flesh white, soft, of fair

quality; ripens early. Tree ornamental, flower about 2 inches in diameter; fairly resistant to root-knot nematode. Relatively low chilling requirement, about 400 hours. BROOKS 1972; *E45, K76, M83*

Flory:<sup>3</sup> Small, white fruit; flesh tender, aromatic, freestone; flavor bland; cans well; ripens in late July. Tree a genetic dwarf, growing only 3 to 5 feet tall at maturity; very large, showy, double red blossoms. Requires approximately 400 hours of chilling. Primarily a home garden ornamental. Originated in Modesto, California by C.R. Flory. Introduced in 1945. *C54, G49,168, L47*

Four Star:<sup>1</sup> (4-Star Daily News) Medium-sized fruit, 2 1/2 inches in diameter; skin color high; flesh white, quality high, freestone; ripens middle of June. Tree vigorous; flowers large, 2 inches in diameter, double, light pink, abundant. Low chilling requirement. *A63, C54, H4*

George IV: Small to medium-sized fruit; skin creamy white, blushed with pink; flesh whitish, deeply tinged with red near the pit, juicy, stringy, tender, mild, pleasantly flavored; quality good; stone semi-free to free; matures in midseason. Tree large, vigorous; hardy; unproductive. Originated about 1821, in the garden (J a Mr. Gill, Broad Street, New York City. HEDRICK 1917; *LI, L12*

Giant Babcock:<sup>1</sup> Fruit large; skin predominantly red; flesh ivory yellow, streaked outwardly from the stone with shades of red; freestone; resembles Babcock but larger; matures about 12 to 14 days after Babcock. Tree medium to large; vigorous; productive; flowers large, more colorful than Babcock. Low chilling requirement. BROOKS 1972; *C54,168, K88T, N20*

Greensboro: Medium-sized, oblong-oval fruit; skin rather tough, creamy-white blushed with red, pubescence heavy; flesh white, very juicy, tender and melting, mild, sweet, sprightly, freestone when fully ripe; ripens early, keeps and ships well. Tree very large, spreading, very productive, widely adapted. Originated in Greensboro, North Carolina by W.G. Balsey, about 1891. HEDRICK 1917; *F91T{SC}*

Honey Dew Hale:<sup>2</sup> Large, roundish fruit; skin white with a pink blush; flesh white, marbled with yellow, with a thin yellow segment from the pit through to the skin along the suture; freestone; ships well. Tree medium in vigor, open, spreading. Bud mutation of J.H. Hale. Originated in New Cumberland, Pennsylvania. Introduced in 1949. BROOKS 1972; *C75M*

Iron Mountain: Medium-sized, highly pubescent fruit; pale greenish or creamy-white; flesh white, juicy, tender, sweet and mild; quality very good. Matures very late, in October. Large, vigorous, upright-spreading tree; hardy; somewhat of a shy bearer. Introduced by J.H. Lindley of Whitehouse, New Jersey. Local favorite in New York and New Jersey. Sold at New York City farmers' markets. HEDRICK 1917; *U13{SC}*

J.M. Mack: Fruit medium to large; round, one-half bulging, unequal; skin cream-colored, lightly streaked and mottled with pink, attractive, smooth, pubescence very short; flesh pure creamy-white right to the stone, firm but very tender, very juicy, with a distinctive aroma and flavor, quality very good; stone free, extremely small; ripens a few days after Champion. Origin unknown, but believed to be Australian. Introduced into the United States in 1926. BROOKS 1972; *L12*

Lady Nancy: White-fleshed sport of Jerseyqueen. Large to very large, non-symmetrical fruit; skin greenish white, 75% blushed with scarlet red; flesh white, streaked with yellow, firm, subacid; quality excellent. Ripens with Jerseyqueen. Large, very vigorous, spreading tree; regularly productive. Originated near Hammonton, New Jersey by Medio DeMarco. BROOKS 1997; *A5*

La White: Large, very attractive fruit; skin white, blushed with rose-pink and red; flesh white flecked throughout with rosy red, juicy, very sweet, low in acid, flavor excellent; freestone; cans well; ripens mid to late June, about 27 days before Elberta. Tree vigorous

and productive; requires 650 hours of chilling. Originated in Calhoun, Louisiana. *A85M, C75M, E99M, F61M, F91T{SC}, G17*

Lola Queen: Fruit medium-sized; skin pale greenish-white, blushed with pink and red, attractive; flesh white, very juicy, tender and melting, sweet, sprightly; quality very good; stone free; ripens a few days after Champion. Originated in Fayetteville, Arkansas by Professor J.R. Cooper, from a cross made in 1920 of Lola and an old North Carolina peach called Wine. *L12*

Nectar: Fruit large to very large; round-ovate, apex pointed; skin blushed pink to red; flesh white tinged with red, juicy, soft-melting, sweet, aromatic, of very good quality; pit medium-sized, free, with some split pits; ripens 3 weeks before Elberta; susceptible to brown rot. Tree vigorous; flower non-showy. Considered to be an open pollinated seedling of Stanwick nectarine. BROOKS 1972; *A88M{OR}, B93M, C54, C75M, E4, E99M, F61M, H15T{ED}, K88T, M63M{ED}, N20*

Okubo: Very productive freestone peach that is excellent for canning. Milk white skin, heavily blushed with red. Firm white flesh. Exceptional, highly distinctive aroma. Ripens in late July and early August. Originated in Okayama, Japan by Shigegorou Okubo. Introduced in 1928. *C60D{PD}*

Oldmixon Free: Medium-sized fruit; skin creamy white blushed with red, pubescence coarse, thick; flesh white, deeply tinted with red near the pit, juicy, stringy, tender and melting, sweet and sprightly, quality very good; stone free or nearly free; matures late. Tree very large, vigorous; hardy; rather unproductive. Introduced prior to 1817. HEDRICK 1917; *L12*

Peregrine: Medium to large, round fruit; skin bright crimson, nearly as smooth as a nectarine; flesh white, firm, melting, very juicy, flavor excellent; ripens in early August. Originated by Thomas Rivers as a seedling of Spencer nectarine. Introduced in 1906. Still a popular commercial cultivar in England. SIMMONS 1978; *F91T{SC}, LI, L12, 081, Q30{SC}, R77, R83*

Polly: Fruit small to medium-sized; skin white, blushed with red; flesh white, juicy, aromatic, of high quality; ripens in midseason; resembles Champion. Tree very cold-hardy. Well adapted for home orchards in Iowa. Originated in Glenwood, Iowa by S.A. Beach. Introduced in 1934. BROOKS 1972; *A88M{OR}, C54, D76, D76{DW}, F91T{SC}, L12, N20*

Raritan Rose: Medium to large, round fruit; skin attractive red; flesh white streaked with red, fine-textured, soft, melting, watery; quality good; freestone; ripens 4 weeks before Elberta. Tree vigorous, spreading; hardy; productive; tolerant to bacteriosis. High chilling requirement. *A5, B53, E99M, F53, F91T{SC}, I49M, L12, M11M{PR}, M99G*

Red Ceylon:<sup>1</sup> Medium-sized, oval fruit with a protruding knob at the apex; skin greenish, blushed with deep-red when ripe; flesh white, a rich strawberry-red near the pit, tender, juicy; flavor excellent, sweet-acid with a hint of bitter-almond; seed free, relatively small; ripens in April and May. Tree dwarf, slender; requires no more than 50 hours of chilling. Introduced into Florida in the late 1880's. MORTON 1987a; *T73M{SC}*

Silver Logan: Little-known white peach of great merit. Large, highly blushed, greenish-white fruit, very attractive; firm but melting flesh with an excellent balance of acid and sugar. Ripens in late August. Moderately vigorous and productive tree. Originated in Cedar Ridge, California by Mabel A. Logan. Introduced in 1965. *E4,199M, LI*

Springtime: Small to medium-sized fruit, globose with a distinct point; skin yellow, highly blushed with red, pubescence short and abundant; flesh white, tender, soft and juicy; semi-freestone; ripens early. Flowers small to medium, pink, non-showy. Moderately low chilling requirement. Originated in Ontario, California. Introduced in 1953. BROOKS 1972; *K88T, 081, R77*

Stump-the-World: (Stump, Stump-of-the-World) Medium-sized fruit; skin creamy white, blushed, mottled and splashed with red; flesh white, strongly stained with red near the pit, juicy, tender and melting, sweet, richly flavored, aromatic; quality very good; ripens late. Tree vigorous and productive. Originated in New Jersey prior to 1840. HEDRICK 1917; LI

Sugar Lady: New white-fleshed freestone, already a favorite at fruit stands. Skin cream-colored with an attractive, dark red blush. Very firm flesh, sweet and rich, slightly taqgy. Ripens in early July. Tree self-fruitful; needs approximately 700 hours of chilling. Originated in Modesto, California by Floyd Zaiger. 168, N20

Tropic Snow:<sup>1</sup> Large, white fruits, about 25% blushed with brilliant red; medium firm, melting white flesh; distinctive lemon-peach flavor. Ripens 18 to 20 days after Flordaprince. Showy blossoms. Resistant to bacterial leaf spot. Very low chilling requirements, only 200 hours. Originated in Gainesville, Florida. Introduced in 1988. BROOKS 1997; A9, B71M, C54, E99M, F61M, 168,183M, J59, N20, Q93

White Hale: Fruit large; round, uniform, slightly pointed; skin greenish-white to cream, overspread with red, fairly attractive, hairs short; flesh white, red around the pit, firm, melting, juicy; quality good; ripens with J.H. Hale. Tree vigorous, upright; very productive; self-fruitful. Originated in New Brunswick, New Jersey by M.A. Blake. Introduced in 1932. BROOKS 1972; A5, C75M, E99M, F61M, F91T{SC}, L12, M99G

White Lady: Medium to large fruits; skin highly blushed with red, pubescence medium; flesh white, very firm, low in acid; mild, sweet flavor; quality excellent. Ripens 5 days after Redhaven. Vigorous, upright-spreading tree. Chilling requirement 800 hours. Scores highly in blind tastings. Originated in Modesto, California by Floyd Zaiger and colleagues. A5, E4, F53,168, N20

Wildrose: Medium to large, round-ovate fruit; skin yellow-green, prominently mottled with dull red, pubescence light; flesh white, red at pit, firm, melting, quality good; pit small, free; ripens 3 weeks before Elberta. Tree vigorous; moderately productive; self-fruitful. Chilling requirement 750 hours at or below 45° F. BROOKS 1972; B53, C75M, F61M, F91T{SC}, H65

#### mLQW-FLESHEP

Admiral Dewey: Small to medium-sized, round-oblate fruit; skin thin and tender, adherent, deep orange-yellow blushed with dark red; flesh yellow, juicy, striqgy, tender and melting, sweet but sprightly, very good in quality; stone semi-free to free; ripens early. Tree large, vigorous, upright-spreading, haidy, very productive. Originated in Vineyard, Georgia in the latter part of the 19th century. HEDRICK 1917; F91T{SC}

August Etter: Medium-sized fruit; skin yellow; flesh yellow, somewhat fibrous, of good flavor; ripens in late August. Good fresh and for jam; excellent for freezing; not recommended for canning. Tree resistant to leaf curl. Originated in Mendocino County, California by August Etter. E84

August Pride:<sup>1</sup> Large, round fruit; skin yellav, blushed with red, tart; flesh yellow, fine-grained, sweet, aromatic, richly flavored, of very good quality; ripens in midseason, 3 to 4 weeks after Mid Pride. Tree vigorous, upright; productive; blooms early; low chilling requirement, 300 hours or less. Adapted to most mild-winter areas of California. Developed by Floyd Zaiger. A88M, I83M, N20

Baby Crawford: (Phil Adrian) Small, sweet, intensely flavored yellow freestone. Rated very highly for flavor by the Santa Clara Valley Chapter of the California Rare Fruit Growers. Golden orange skin with a slight red blush. Texture and quality excellent. Ripens in late July in Central California, about 1 week before Elberta. Requires 800 hours of chilling. A88M, LI, N20

Biscoe: Medium-sized, round fruit; skin deep yellow, 50 to 75% covered with a bright red blush, attractive; flesh yellow, firm, melting, fine-textured, of good flavor; ripens about with Redhaven.

Tree moderately vigorous; hardy; productive; very resistant to bacterial spot. B53, C75M, E99M, F53, F61M, I41P, M11M{PR}

Blake: (M.A. Blake) Large, round fruit; skin an attractive red, pubescence slight; flesh yellow, red near the pit, firm-melting, quality good, sometimes too acid, freestone; freezing quality good; excellent for home canning; ripens 1 week before Elberta; resembles J.H. Hale. Tree vigorous; productive; susceptible to bacteriosis. BROOKS 1972; A5, B53, B83, E99M, F61M, M39M

Bonanza:<sup>13</sup> Medium to large fruit; skin moderately blushed with red; flesh sweet, low in acid, mild and refreshing. Ripens a few days after June Gold. Tree a genetic dwarf, bushy, 5 to 6 feet tall. Showy, pink, semi-double blossoms. Chilling requirement 250 hours or less. Very popular in California. Introduced in 1962 by Armstrong Nurseries. A88M, C54, H63M, 168, M83, N20, R77

Bonita:<sup>1</sup> Medium to large fruit; skin light yellow with a deep red blush, attractive; flesh yellow, dark pink near the pit, somewhat fibrous, firm, sweet to subacid, quality good; freestone; ripens in midseason. Tree vigorous, upright; productive. Low chilling requirement. Originated in Riverside, California. Introduced in 1943. BROOKS 1972; A63, A88M, C54,168, K88T, N20

Canadian Harmony: Large, round fruit, 2 3/4 to 3 inches in diameter; skin yellow, 80% covered with a red blush, pubescence scant; flesh yellow, slightly red at pit, firm but melting, quality good; ripens 2 weeks before Elberta. Tree very vigorous; hardy; moderately tolerant to bacterial leaf and fruit spot. Recommended for southwestern Ontario. BROOKS 1972; A5, B83, C45M, C75M, E45M{PR}, E99M, F53, G23, M39M, N20

Candor: Uniformly round fruit; skin rich-yellow, 75% covered with a bright red blush, very attractive; flesh yellow, texture very fine, flavor unusually good, highly resistant to browning; semi-freestone; ripens just before Dixired. Tree moderately vigorous; self-fruitful; foliage somewhat resistant to bacterial spot. BROOKS 1972; A5, A39, C75M, E99M, F53, F61M, F91T{SC}

Cresthaven: Medium to large, nearly round fruit; skin bright red over gold, very attractive; flesh clear yellow, firm, very resistant to browning; satisfactory for home canning, freezes unusually well; easily pitted by mechanical means; ripens about 1 week before Elberta. Tree vigorous; productive; self-fruitful; above average in hardiness. BROOKS 1972; A5, B53, B83, C75M, C76M, E45M{PR}, E99M, F53, F61M, K73M, M39M

Desertgold:<sup>1</sup> Medium-sized, round fruit; skin yellow blushed with red, attractive; flesh yellow, moderately firm, semi-clingstone; quality good; ripens early midseason. Tree moderately vigorous; productive; self-fertile. Low chilling requirement, 350 to 400 hours. Recommended for warm winter areas. BROOKS 1972, RUCK; C54,168, /6S{ES}, I83M, L47, N20

Duke of York: High quality English peach comparable to Peregrine. Large, round fruit; skin cream-colored, blushed with bright red; flesh pale greenish-yellow, juicy, very soft, subacid, flavor very good to excellent. Ripens in late July and early August. Hardy and productive. Introduced in 1902 by Thomas Rivers. SIMMONS 1978; 081, Q30{SC}, R77

Earlired: Medium-sized, round fruit; skin yellow, 85% covered with a bright red blush, pubescence very light; flesh yellow, firm but melting, medium in texture, of good flavor; clingstone when firm ripe, semi-cling at the soft ripe stage; ripens 19 days before Redhaven. Tree vigorous and productive; requires heavy early thinning for best size. A5, B53, F61M, F91T{SC}

Early Crawford: Medium-sized fruit; round-oval, bulged near the apex, with unequal halves; skin golden-yellow blushed with dark red, attractive, pubescence thick; flesh deep yellow, rayed with red near the pit, juicy, tender, sprightly, highly flavored, quality very good; ripens in early midseason. Tree large, vigorous; often unproductive. Originated in Middletown, New Jersey by William Crawford, early in the 19th century. HEDRICK 1917; E84,

## F91T{SC}, K88T

Elberta: Fruit large; skin orange-yellow blushed with red, pubescence thick and coarse; flesh yellow stained with red near the pit, juicy, striqgy, firm but tender, sweet to subacid, quality good; resistant to browning; matures in midseason. Tree large, vigorous; very productive; widely adapted to soil and climate. Originated in Marshallville, Georgia from a seed planted in 1870. HEDRICK 1917; A88M, B53, B73M, B73M{DW}, B83, C75M, E45<sub>o</sub>, G79M{DW}, I9M, I53M, J83, J83{DW}, M39M, M99G, N33, etc.

Eldorado:<sup>3</sup> Round fruit, 2 1/2 to 3 inches in diameter; attractive, red-blushed skin; firm, yellow flesh, richly flavored; quality very good to excellent. Ripens in early to mid-June. Tree a genetic dwarf, 3 to 5 feet tall, vigorous and productive. Semi-double blossoms. Requires 500 hours of chilling. Introduced in 1980 by Jackson & Perkins. BROOKS 1997; A88M, J61M, N20

Emery: Medium-sized, round fruit; skin dull yellow, 50% covered with a red blush; flesh yellow, with less red pigment than Redskin, firm, melting, fine-grained, less juicy than Elberta, flavor excellent; fully freestone; ripens 5 to 7 days later than Elberta. Tree vigorous, productive; resistant to bacterial spot; flower large, showy, self-fertile. BROOKS 1972; F91T{SC}

Encore: (Stark Encore) Medium to large fruit; skin yellow, blushed with red; flesh yellow, firm, juicy, sweet and flavorful; ripens very late. Good fresh or for canning. Tree productive; resistant to blossom-season frost; very tolerant to bacterial leaf spot. Adapted to Zones 5 through 8. A5, E45M{PR}, L33

Fairtime: Large, round fruit; skin yellow, 20 to 25% covered by a bright red blush; flesh yellow, with considerable red near the pit, firm but melting, texture smooth, flavor good; suitable for fresh market and freezing; ripens 7 days after Summerset. Tree vigorous and productive; self-fertile. BROOKS 1972; A9, B71M, C30M, C75M, E45M{PR}, E99M, F61M, K88T, L47<sub>o</sub>, N20, N33

Fay Elberta: (Late Elberta) Fruit large; skin yellow blushed with red, attractive; flesh yellow, firm but melting, sweet, fine-grained, of very good flavor; ripens midseason to late; resembles Elberta, but more colorful. Excellent for eating fresh, canning, or freezing. Tree productive, requires heavy thinning; flowers pink, showy. Medium chilling requirement. B71M, B93M, C54<sub>o</sub>, C75M, E4<sub>o</sub>, E99M, F61M, G49, I68, 199M, K73M, K88T, LI, L47<sub>o</sub>, N20<sub>o</sub>, etc.

Flavorcrest: Medium to large, round fruit; skin yellow, 80% covered with a red blush; flesh yellow, very firm, smooth-textured, flavor rich, quality excellent; stone semi-cling to free; ripens early to midseason. Tree moderately vigorous; productive. Medium chilling requirement. Released by the USDA. A9, B71M, B83, C75M, E4, E99M, F61M, K73M

Flordagrande:<sup>1</sup> Fruit medium-sized but large for its season; skin bright yellow, 60% blushed with red; flesh yellow, firm, freestone; ripens 103 days from bloom. Tree hardy; tolerant to bacterial spot; flower large, showy, self-fertile. Exceptionally low chilling requirement, only 50 hours. Originated in Gainesville, Florida. Introduced in 1984. B71M, E99M, F61M, J59

Flordaprince:<sup>1</sup> Medium-large, round fruit; skin yellow, blushed and striped with red; flesh yellow, firm, quality good; clingstone to semi-free; ripens 7 to 10 days earlier than Desert Gold. Tree very vigorous and productive; more tolerant of desert heat than Desert Gold. Very low chilling requirement, only 150 hours. Widely planted as an early commercial peach in southern California and Arizona. A9, B71M, C54<sub>o</sub>, D23M, E99M, F61M, G49, I68<sub>o</sub>, 183M, J59, K76, N20<sub>o</sub>, Q93

Fortyniner: (Merrill 49'er) Fruit large; skin yellow, blushed with bright red, very attractive; flesh yellow, firm, quality excellent; ripens 1 week before J.H. Hale and Elberta; resembles J.H. Hale. Tree vigorous; productive; susceptible to bacterial spot. Medium-high chilling requirement. Originated in Red Bluff, California by Grant Merrill. BROOKS 1972; C54, E4, K73M, K88T, L47, N20

Frost: Medium to large fruit; skin fuzzy, green-shouldered; flesh pale yellow, soft, sweet, juicy, mostly freestone; quality good for dessert and drying, fair for canning; ripens in mid-August. Tree self-fertile; bears very heavily, must be thinned for best results. Strongly resistant to leaf curl, though not immune. Discovered in Washington by Herb Frost. A88M, B74, C34, C54<sub>o</sub>, D28J, D95, E87, H49, H89M, H89M{DW}, I49M, 174, 199M, J61M, N20<sub>o</sub>, etc.

Garden Gold:<sup>3</sup> Fruit large, up to 3 inches in diameter; skin yellow, slightly blushed with red; flesh yellow, red near the pit, soft, melting, of good flavor; ripens 2 to 3 weeks after Elberta. Tree genetically dwarf; mature height only 5 to 6 feet; productive; blooms a week later than other miniature peaches and nectarines; self-fruitful; ornamental. A88M, H65, I68<sub>o</sub>, N20

Garden Sun:<sup>3</sup> Large full-sized fruit; skin yellow-orange, blushed with red; flesh yellow, sweet, mild, low in acid; freestone; ripens 1 week after Elberta. Tree a genetic dwarf, growing only 4 to 6 feet tall; self-fruitful; flowers large, showy. Needs approximately 500 hours of chilling. Ideal for container growing. Originated in Modesto, California by Floyd Zaiger. G23, N20

Garnet Beauty: Medium to large, oval fruit; skin yellow, overlaid with bright red; flesh yellow, streaked with red, firm, melting, flavor excellent; semi-freestone; ripens 8 to 10 days earlier than Redhaven; hangs on tree well until over-ripe. Tree vigorous and productive; slightly susceptible to bacterial spot. BROOKS 1972; A5, B53, C75M, D37, E45M{PR}, E99M, F53, F61M, K36, K73M

Glohaven: Large, nearly round fruit; skin mostly red over deep yellow, attractive, pubescence light; flesh clear yellow, nearly free of red at pit, firm, very resistant to browning; freestone; easily pitted by mechanical means; ships unusually well; cans and freezes well; ripens about 2 weeks before Elberta. Tree vigorous and productive; self-fruitful. BROOKS 1972; A5, B53, B83, C75M, C76M, D37, E99M, F53, F61M, G8, 161M{SC}, K73M, M39M

Gold Dust: Small to medium-sized fruit; skin yellow, mottled and streaked with red, smooth; flesh yellow, firm, fine-grained, non-acid but flavorful, of excellent quality; ripens 14 days earlier than Redhaven. Tree large, vigorous; hardy; productive. Relatively low chilling requirement. BROOKS 1972; A88M, L47<sub>o</sub>, N20

Golden Glory:<sup>3</sup> Large fruit, averaging 2 3/8 inches in diameter; skin yellow, partially mottled with orange-red; flesh yellow, red next to the stone, soft, melting, subacid to mild, quality fair to good; ripens late. Tree genetically dwarf, spreading; mature height 6 to 8 feet; vigorous and productive; self-fruitful; ornamental. BROOKS 1972; C54

Golden Jubilee: Fruit medium to large; oval to oblong, flattened; skin mottled bright red over 1/3 of surface; flesh yellow, red at pit, firm, melting, texture coarse, of very good quality; ripens 3 weeks before Elberta; drops early from tree. Tree sets heavily but is self-thinning. BROOKS 1972; A82, G72, G72{DW}, G79M{DW}, H49, H65, 19M, I53M, K28, K28{DW}, M39M, M99G, N20

Halehaven: Medium to large, round fruit; skin dark red over most of surface, very sweet; flesh yellow, red at pit, firm, melting, quality excellent, freestone; ripens 2 weeks before Elberta. Tree vigorous and productive. Excellent home garden cultivar. BROOKS 1972, STEBBINS; A82, B73M, E99M, H65, 19M, I68<sub>o</sub>, J16, K28, L90, M39M, M83, N33

Halloween: Large fruit; flesh yellow, firm, freestone; ripens extremely late, about 70 days after Elberta or about October 10 at place of origin. Tree medium-sized, moderately vigorous, productive. Originated in Red Bluff, California by Grant Merrill. Introduced in 1954. BROOKS 1972; C54<sub>o</sub>, K88T

Harbelle: Round fruit, 2 3/4 inches in diameter; skin yellow, 60% covered with a bright red blush, pubescence short; flesh yellow, melting, firm, quality good, freestone; ripens early. Tree small, moderately vigorous; hardy; tolerant to bacterial spot. Originated in

Harrow, Ontario, Canada. BROOKS 1972; B53, E99M, F53, F91T{SC}

Harbrite: Fruit ovate, 2 1/2 inches in diameter; skin yellow, 80% covered with a brilliant red blush, attractive; flesh yellow, tinged red at the pit, firm, melting, quality good, freestone; ripens 4 weeks before Elberta. Tree hardy; exceptionally productive; highly tolerant to bacterial spot. Recommended for southwestern Ontario. BROOKS 1972; A5, B53, E99M, F53, 161M{SC}, M11M{PR}

Harken: Fruit large; skin yellow, about 80% covered with a dark red blush, attractive; flesh yellow, medium firm, juicy, fine-textured, sweet and rich; quality good; very resistant to browning; ripens just after Redhaven. Good for canning and freezing. Tree moderately vigorous; productive; moderately hardy; resistant to bacterial spot. B53, E99M, F61M, I49M, 161M{SC}, J61M, N20, R77

Honey Babe:<sup>3</sup> Fruit large, up to 3 inches in diameter; skin yellow, blushed with deep red, attractive; flesh yellow-orange flecked with bright red, firm, sweet and flavorful, highly aromatic, of excellent quality; ripens just before Redhaven. Tree genetically dwarf; productive; ornamental. Chilling requirement 500 to 600 hours. Developed by Floyd Zaiger. A88M, C34, G49, I49M, 168, N20

J.H. Hale: Very large, round fruit; skin lemon-yellow blushed with dark red, pubescence light; flesh yellow, red at pit, juicy, fine-grained, sweet or somewhat sprightly, of good quality; matures in mid-season. Tree vigorous and productive. Originated in South Glastonbury, Connecticut by J.H. Hale. Introduced in 1912. HEDRICK 1917; A5, A82, B53, B83, C75M, E99M, G72, G72{DW}, H63M{DW}, I9M, K73M, LI, L90, M39M, M83

Jefferson: Fruit large; skin bright red; flesh yellow, very firm, fine-textured, of good flavor; fully freestone; ripens 3 days after Elberta; resembles J.H. Hale. Cans and freezes well. Tree vigorous; reliably productive; buds and flowers tolerant to blossoming-season frost. BROOKS 1972; C30M, C75M, E99M, F61M, F93, M83, N33, R77

Jerseyqueen: Large, oval fruit; skin yellow blushed with bright red, attractive; flesh yellow, firm, mild but flavorful, of excellent dessert quality; ripens about with Elberta; resembles Blake. Tree vigorous, moderately productive; flower large, showy; buds tender, subject to winter kill. BROOKS 1972; A5, C75M, E99M, F61M, F91T{SC}, L12

July Elberta: (Kim Elberta, Early Elberta) Medium-sized, round fruit; skin greenish-yellow, blushed and streaked with dull red, pubescence heavy and dense; flesh yellow, only slightly red at pit, firm, melting, of very good quality; pit small, free; ripens about 2 weeks before Elberta. Tree vigorous; highly fruitful; susceptible to bacteriosis. Originated in Sebastopol, California by Luther Burbank. Introduced in 1930. BROOKS 1972; B93M, B93M{DW}, C41M, C54, E45, G49, H89M, H89M{DW}, 168, K76, K88T, L33, L33{DW}, L47, L90, M83, N20, etc.

June Gold: Fruit very large; skin highly colored red; flesh yellow, firm, semi-freestone; ripens early, 15 to 20 days before Redhaven; J.H. Hale type. Suitable for shipping. Tree very productive; flowers showy. Relatively low chilling requirement, 650 hours at or below 45° F. Ideal for South Texas planting. BROOKS 1972; A85M, C54, C75M, E45M{PR}, E99M, F61M, K76, L90, M69M, M83, N20, N33

Kalamazoo: Medium-sized, roundish-oval fruit; skin thin, tough, greenish-yellow becoming yellow; flesh light yellow, stained with red near the pit, juicy, tender, sweet, mild in flavor, of high quality for either dessert or culinary purposes; stone free or nearly so; ripens late. Tree large, spreading, vigorous, very productive. Originated in Kalamazoo, Michigan about 1869. HEDRICK 1917; F91T{SC}

La Feliciana: Medium to large fruit, 2 1/2 to 2 3/4 inches in diameter; skin yellow, blushed with red; flesh yellow, juicy, sweet,

of high quality; ripens in late June or early July. Good fresh or frozen. Tree highly productive\* disease resistant. Chilling requirement 550 hours at or below 45° F. Excellent home garden cultivar for the lower South. A85M, C54, C75M, E99M, F61M, H4, J59, K76, L90, M83, N20, N33

La Premier: Fruit large, up to 2 3/4 inches in diameter; round, with unequal halves; skin yellow, highly blushed with red, very attractive; flesh clear yellow, firm, fine-grained, quality very good; cans and freezes very well; ripens about 12 days before Elberta. Tree vigorous; very productive; resistant to bacteriosis and brown rot. Originated in Calhoun, Louisiana. BROOKS 1972; C75M, E99M, F61M

Late Crawford: Medium to large fruit; roundish-oval, with unequal halves; skin deep yellow, blushed and splashed with light and dark red; flesh yellow, red at the pit, juicy, firm but tender, sweet but sprightly, richly flavored, quality excellent; ripens late. Tree large, vigorous; not very productive; comes into bearing late. Originated in Middletown, New Jersey by William Crawford, early in the 19th century. HEDRICK 1917; L12

Loring: Fruit large; round to ovate; skin yellow, highly blushed with red, very attractive; flesh yellow, red at pit, firm, melting, of medium texture, quality very good; ripens 10 days before Elberta. Tree very vigorous; productive; tolerant to bacteriosis. Originated in Mountain Grove, Missouri. Introduced in 1946. BROOKS 1972; A5, A82, B53, B83, C75M, D37, E45, E45M{PR}, E99M, F53, F61M, F93, L90, M11M{PR}, M39M, M83, N33, etc.

Lovell: Uniformly large, almost perfectly round fruit; skin yellow with a slight blush; flesh fine-grained, firm, solid, clear yellow to the pit; freestone. Superior for canning and shipping; also dries well. Tree high yielding, produces vigorous rootstocks for grafting. Originated in Winters, California by G.W. Thissell. Named in 1882. WICKSON; F91T{SC}, G66{PL}, K73M, K88T

Madison: Medium to large fruit; skin bright orange-yellow, blushed with bright red, very attractive; flesh orange-yellow, bright red next to pit, exceedingly firm, fine-textured, flavor mild and rich, quality very good; ripens 7 days before Elberta. Tree moderately vigorous; very tolerant to blossom-season frost; self-fruitful. Adapted to mountainous areas of Virginia. BROOKS 1972; A5, A39, C75M, E99M, F53, G16{DW}, G23, G23{DW}, K36, L33, L33{DW}, M39M, M99G

Mid Pride:<sup>1</sup> Medium to large fruit; skin yellow, blushed with red; flesh yellow, firm, sweet, very flavorful, quality excellent; ripens in midseason. Good fresh or for canning. Tree very vigorous and productive; blooms early; low chilling requirement, less than 300 hours. Adapted to most mild-winter areas of California. Developed by Floyd Zaiger. A88M, D23M, I83M, LI, N20

Monroe: Fruit large, 2 1/2 to 3 inches in diameter; skin rich orange-yellow, with 60% bright medium-red blush, attractive; flesh orange-yellow, pinkish-red near the pit, firm, smooth, flavor mild, quality very good for its season; ripens about 11 days after Elberta. Tree very vigorous; moderately productive; self-fruitful. BROOKS 1972; B83, C75M, E99M, F61M, N33

Muir: Large to very large fruit; flesh clear yellow, dense, rich and sweet; stone small, perfectly free. Good for canning and shipping; peculiarly adapted to drying because of exceptional sweetness and density of flesh. Once the standard dried peach of California. Tree vigorous and productive if grown on rich soil. Originated as a chance seedling on the place of John Muir, near Silvey ville, California, about 1880. WICKSON; A88M, K88T, LI, L97G{DF}, N20

Norman: Round, medium to large fruit, skin medium yellow, prominently blushed with dark red; flesh deep yellow, slightly tinged with red, very firm, fine-textured, melting, flavor good when ripe; very resistant to browning; ripens 3 to 5 earlier than Ranger. Tree productive; moderately resistant to bacterial spot. BROOKS 1972; C75M, E99M, F61M, F91T{SC}

O'Henry: Medium to large fruit, 2 1/2 to 3 inches in diameter; skin brightly colored, pubescence short; flesh yellow streaked with red, very firm, quality good, freestone; ships well; ripens about with Rio Oso Gem. Tree moderately vigorous; productive; flower pink, large, showy. Originated in Red Bluff, California. BROOKS 1972; A9, A63, A88M, B71M, B83, C54, C75M, E4, F61M, I99M, K73M, K88T, LI, L47, M39M, N20, etc.

Parade: Fruit large, averaging 2 5/8 inches in diameter or more; skin bright yellow, blushed with red; flesh yellow, light red near pit, moderately juicy, firm, flavor mild, subacid, vinous, non-browning; quality good; mostly freestone; ripens very late, 30 days after J.H. Hale. Tree medium-sized, productive; self-fruitful. BROOKS 1972; A5, A9, B71M, C75M, E45M{PR}, E99M, F61M

Peacot: Fruit of good size if thinned early; skin nearly glabrous; flesh yellow, very juicy, somewhat fibrous, rich in flavor; resembles a nectarine. Tree very productive, has a relatively low chilling requirement. Accidental cross of a seedling peach and an experimental nectarine, discovered at Armstrong Nurseries. T49M{SC}

Pekin: Medium-sized fruit; skin light yellow, 75 to 85 % covered with a bright red blush, pubescence short; flesh yellow, melting, flavor pleasant, more resistant to browning than Redhaven; freestone when soft-ripe; ripens 2 to 3 days earlier than Redhaven. Tree vigorous and productive; self-fruitful; highly resistant to bacterial spot. BROOKS 1972; F91T{SC}

Pix Zee:<sup>3</sup> Fruit orange blushed with red, attractive; flesh firm, yellow, flavor very good, freestone when fully ripe; ripens very early, 3 weeks before Honey Babe. Tree a genetic dwarf, growing only 5 to 7 feet tall; self-fruitful. Needs approximately 500 hours of chilling. Ripens in short season areas where others fail. Originated in Modesto, California by Floyd Zaiger. A88M, I49M, I68, N20

Ranger: Medium to large, nearly round fruit; skin greenish-yellow to yellow, mottled and striped with red; flesh yellow, red at pit, medium firm, melting, medium textured, flavor good; ripens 3 to 4 weeks before Elberta. Tree productive, moderately vigorous; self-fruitful; resistant to bacterial spot. BROOKS 1972; C30M, C54, C75M, E45, E99M, F61M, F93, I41P, I68, L47, L90, M69M, M83, N20, N33, etc.

Red Baron:<sup>1</sup> Ornamental peach with surprisingly good eating qualities. Large, round fruit, about 3 inches in diameter; lightly blushed; flesh firm, juicy, melting, richly flavored. Ripens in early to mid-July. Profuse, showy, double red blossoms. Requires 250 to 300 hours of chilling. Very popular in southern California. Introduced in 1977 by Armstrong Nurseries. C54, D23M, G49, N20, N33

Redhaven: Medium-sized, round fruit; skin yellow, overlaid with red to deep red, attractive; flesh yellow, red at pit, very firm, melting, quality good; non-browning; pit large, usually free when ripe; ripens early, 30 days before Elberta. Tree vigorous; hardy; highly productive, nearly always requiring thinning; self-fruitful. Most widely planted cultivar in the United States. BROOKS 1972; A5, A38M{PD}, A88M, B73M, B83, C75M, G23, G23{DW}, G79M{DW}, K73M, L12, M11M{PR}, M39M, M99G, N33, etc.

Redskin: Medium to large, nearly round fruit; skin deep red over yellow, attractive; flesh yellow, red at pit, melting, of fine flavor, quality somewhat better than Elberta, non-browning; ripens with or slightly ahead of Elberta. Tree vigorous; very productive; self-fruitful; resistant to bacteriosis. BROOKS 1972; A82, B53, B83, C75M, E45M{PR}, E99M, F53, F93, G79M{DW}, I41P, L12, M11M{PR}, M39M, M83, N33, etc.

Reliance: Medium-sized, round fruit; skin yellow, splashed with dull red; flesh bright yellow, moderately firm, slightly stringy, of good flavor; ripens evenly, about with Golden Jubilee. Tree productive; extremely winter-hardy. Originated in Durham, New Hampshire by E.M. Meader. Introduced in 1964. BROOKS 1972; C75M, C76M, D69, F53, G16{DW}, G23, G23{DW}, H42, H65, M39M, M99G, N24M

Rio Oso Gem: Fruit large, averaging 2 3/4 to 3 3/4 inches in diameter; round to slightly elongated; skin bright red, very attractive; flesh yellow, firm, fine-grained, melting, of good quality; ripens 1 week after Elberta, about 2 weeks after J.H. Hale which it resembles. Tree productive; self-fruitful; susceptible to bacterial spot. BROOKS 1972; A5, A88M, B53, B71M, E4, E99M, F61M, I68, I68{ES}, LI, L47, M39M, N20

Rochester: Medium to large fruit; skin orange-yellow, blushed with deep dark-red; flesh yellow, stained with red near the pit, very juicy, tender and melting, sweet, highly flavored, very good in quality; matures in early midseason. Tree large, vigorous; productive. Originated near Rochester, New York. Introduced in 1912. HEDRICK 1917; H65, 081, Q30{SC}, R77

Salway: (Salwey) Large, roundish-oblate fruit; skin dowry, creamy yellow blushed with crimson, attractive; flesh deep yellow, stained with red at the pit, juicy, vinous, rich and sweet; freestone; ripens very late. Of good dessert quality; excellent for canning, preserving and evaporating. Tree vigorous, hardy, very productive. Originated in England about 1844. HEDRICK 1917, WICKSON; K88T

Sam Houston: Medium to large fruit; skin red, attractive; flesh yellow, fine-grained, firm, low in acid, flavor mild; pit unusually small, freestone; ripens with Sunhigh. Tree productive, requires heavy thinning; susceptible to bacterial spot. Relatively low chilling requirement. Originated in College Station, Texas. BROOKS 1972; A85M, C54, E45, E99M, K76, K88T, L90, M83, N33

Slappey: Medium-sized, roundish to conic fruit; skin golden-yellow blushed with red and crimson, extremely thin, pubescence slight; flesh yellow, somewhat mealy, sweet, flavor distinctive, quality good; ripens just before Champion. Popular for home canning. Tree productive. Origin unknown. Introduced prior to 1903. HEDRICK 1917; B53, F91T{SC}

Southern Rose:<sup>1 3</sup> Large, yellow fruit blushed with red; flesh yellow, firm, freestone; dessert quality good; ripens late, in early August. Compares favorably with commercial peaches. Tree a genetic dwarf, with mature height only 5 feet; blooms early. Relatively low chilling requirement, approximately 300 hours. C54, D23M, I83M

Southern Sweet:<sup>3</sup> Medium-sized fruit; skin yellow, slightly blushed with red, attractive; flesh yellow, flavorful; freestone; ripens early to mid-June. Tree genetically dwarf; mature height 4 to 5 feet; productive. Chilling requirement about 500 hours at or below 45° F. Originated in Le Grand, California by F.W. Anderson. Introduced in 1975. C54

Southland: Medium to large, round fruit; skin yellow, blushed and striped with red, attractive; flesh yellow, red near the pit, firm, melting, non-browning, quality very good to excellent; ripens 18 days before Elberta; resembles Halehaven. Tree vigorous; quite susceptible to bacteriosis; flower large, showy, self-fruitful. BROOKS 1972; C75M, F61M, F91T{SC}, I41P

St. John: Medium to large, round-oblate fruit; skin thick and tough, orange-yellow blushed with deep, dark red; flesh yellow, very juicy, tender, melting, sweet and rich, sprightly, very good in quality; ripens in early midseason. Tree medium to large, vigorous, upright-spreading, unproductive. Reproduces itself from seed. Originated in the South prior to 1869. HEDRICK 1917; F91T{SC}

Summergold: Medium to large, round fruit; skin yellow, 60% covered with a bright red blush, attractive; flesh yellow, firm but melting, of fine texture, flavor good; freestone; ripens with Loring. Excellent for processing. Tree moderately vigorous; somewhat resistant to bacterial spot; self-fertile. BROOKS 1972; C75M, E99M, F61M, F91T{SC}

Summerset: Large, round fruit; skin yellow, 25 to 30% blushed with bright red, attractive, pubescence light; flesh yellow, firm but melting, of good texture and flavor; quality high; freestone; ripens

5 to 6 weeks after Rio Oso Gem. Good for canning and freezing. Tree vigorous and productive. BROOKS 1972; A88M, B71M, B93M, E4, F91T{SC}, K88T, LI, N20

Suncrest: Large, round fruit; skin yellow, two-thirds covered with bright red, attractive; flesh yellow, firm but melting, texture and flavor very good; ripens about 10 days before Elberta; suitable for distant shipping. Tree vigorous and productive; self-fruitful; susceptible to bacterial spot disease. Highly rated at fruit tastings. BROOKS 1972; B71M, B83, E4, E99M, F53, G92{DF}, H89M, I49M, K73M, K88T, M39M, N20

Sunhigh: Fruit medium to large; oval to round, ribbed, apex pointed; skin very attractive, golden-yellow, blushed with bright red, pubescence very short and soft; flesh yellow, flecked with red, fine-textured, flavor very good to excellent, very resistant to browning; freestone when fully ripe; ripens 10 days before Redhaven. Tree vigorous and productive; self-fertile. BROOKS 1972; B53, C75M, D37, E99M, F61M, J16, L12, M99G

Suwanee: Large, round fruit; skin yellow, about 80% covered with a red blush, attractive; flesh yellow, firm, melting, texture medium fine, flavor good; freestone; ripens with Golden Jubilee. Tree moderately vigorous; productive; self-fruitful. Chilling requirement 650 hours. Originated in R>rt Valley, Georgia. BROOKS 1972; E45, E99M, F61M, F93, G17, I53M, K76, K76{DW}

Topaz: Large, round fruit; skin 100% red over a bright yellow background, attractive, pubescence light; flesh yellow, very firm, fine-textured, of high quality, non-browning; ripens 20 days before Elberta. Tree vigorous, upright; resistant to bacterial spot; tender to winter cold. Chilling requirement 850 hours at or below 45° F. A5, C75M, E99M, F53, F61M, K73M, M39M

Trio gem: Fruit medium to large; round to oval; skin yellow, overlaid with dull red, attractive; flesh yellow, streaked with red, firm, melting, of high quality; stone large, free; ripens slowly and early, 19 days before Elberta; ships well. Tree vigorous, upright; self-fruitful; sets good crops, requires thinning. BROOKS 1972; A5, F91T{SC}, M99G

Ventura:<sup>1</sup> Small, oblate fruit; skin yellow, blushed with wine-red, attractive; flesh yellow, firmer than Babcock, subacid, quality fairly good, freestone; ripens midseason, or in early July in southern California. Tree vigorous, upright; productive. Low chilling requirement, less than Babcock. BROOKS 1972; A63, B93M, C54, G49, I68, L47

Veteran: Medium to large, round-oblate fruit; skin yellow splashed with red, attractive; flesh yellow, melting, soft, quality good, low in tannin; semi-freestone to freestone; matures 8 to 10 days before Elberta. Tree vigorous; highly productive; self-fruitful. Originated in Vineland Station, Ontario, Canada. Introduced in 1928. BROOKS 1972; A91, A91{SC}, B74, B83, D28J, I49M, I61M{SC}, M39M, N20, N33

Washington: Fruit large; skin an attractive red; flesh yellow, firm, quality above average; freestone; ripens about 3 weeks before Elberta; superior to Elberta for canning and freezing; resembles Sunhigh. Tree vigorous and productive; somewhat resistant to bacteriosis; flowers showy. Originated in Blacksburg, Virginia. BROOKS 1972; A5, E99M, F91T{SC}, I41P

#### HONEY PEACHES

A unique class of peaches from southern China with oval, long-pointed, white-fleshed fruit. Regarded by many as the finest flavored of all peaches, they have a very sweet honey-like flavor offset by a hint of bitter almond. The fruit has a tendency to drop prematurely. Relatively low chilling requirements.

Eagle Beak: Small, oblong fruit with a pronounced beak; skin greenish-white blushed with carmine; flesh greenish-white, very juicy, low in acid, exceedingly sweet with a slight bitter almond-like flavor; freestone; ripens the last of July in Zone 7. Tree an annual and heavy bearer. T49M{SC}, U7G{SC}

Melba: (Improved Pallas) Large fruit; skin pale yellow, blushed with red; flesh white, juicy, honey-sweet; stone small, free; ripens over a long period, early June to mid-July. Tree bears regularly; stands low freezing weather during blooming season. Originated in San Antonio, Texas. Renamed Melba since parentage is unknown and Improved Pallas was misleading. BROOKS 1972; C54, N33

Pallas: Small to medium-sized, oval fruit; skin thick and tough, pale white or greenish-white, occasionally blushed with bright red; flesh white, aromatic, very juicy, tender and melting, honey-sweet, rich in flavor, of excellent quality; freestone; ripens in early mid-season. Tree medium in vigor, upright-spreading; a regular, heavy bearer. Chilling requirement approximately 750 hours. Originated in Augusta, Georgia in 1878. HEDRICK 1917; U7G{SC}

#### CODES FOR SPECIAL TYPES

1. Low-Chill
2. Marble-Fleshed
3. Genetic Dwarf

## PEANUT {S}

### ARACHIS HYPOGAEA

Early Spanish: 105 days. Small, sweet kernels of fine quality and flavor. Small, solid, well-filled pods; 2 to 3 kernels per pod. Upright, compact, heavy yielding plants. Easy to grow and very early maturing. Can be grown reliably as far north as Canada. E97, G16

Ecuadorian Purple: Heavy producer of dark purple-skinned peanuts with a mild, sweet flavor. Bushy plant that grows to 2 feet tall; produces numerous yellow flowers. Requires a long, warm growing season of approximately five months. Occasionally available in Latin American markets. F73D

Florunner: 135 days. Leading commercial runner type, popular in the extreme Southeast. Selected for high percentage of sound mature seed, flavor, quality and yield. Prostrate growth habit with the sequential branching pattern typical of runner and Virginia types. Sixty percent of runner type peanuts are used for peanut butter, and runners account for 72% of the total U.S. production. Released by the Florida Agricultural Experiment Station in 1969. G27M, L89G

Garoy: 100 days. A cultivar developed in Canada, Garoy is 7 to 10 days earlier than older types and is also much more productive. Slightly smaller pods than regular varieties, but each pod is very well filled. Each pod contains 3 good-sized kernels of excellent quality. D11M, F70

Improved Virginia: 120 days. A productive, large-podded Virginia type. Large, rich-flavored kernels; 1 to 2 kernels per pod. Bush type plant; grows only 18 inches tall which makes cultivation and harvesting easier. Hardy; does well in the North. D76

Jumbo: (Mammoth Jumbo) 125 days. Extra-large, sweet kernels; 2 to 3 kernels per pod; shells easily. Heavy yielding and early maturing. With ordinary growing conditions will produce a crop as far north as Wisconsin. Easy to grow and harvest. G71, H54

Langley: 120 days. Runner type, released by the Texas Agricultural Station in 1986. Selected for its early maturity and high yield potential. In comparison with the commercial standard Florunner, Langley matures about 2 weeks earlier; yields are comparable; seedling vigor is much better, and shelling and processing qualities are equivalent. L89G

McConnell Giant: Heirloom developed by Dr. 'Pete' McConnell of Pendleton, South Carolina. Unusually large seeds, often 3 per pod. Excellent for roasting and peanut butter. Ready for harvesting in mid October. Vigorous growing vine, about 4 feet wide, relatively free of pests. L4

North Carolina 7: (NC-7, Carolina Jumbo) Very large-seeded Virginia type with excellent yield potential. Produces a high percentage of fancy size and jumbo nuts with superior flavor. Early maturing. Intermediate in growth habit. Less susceptible to early leafspot than other popular cultivars. Released by the North Carolina Agricultural Research Service. 164, J97M, L4

Spanish: 110 days. Small, sweet, reddish-brown kernel; 2 to 3 kernels per well-filled pod. Compact, upright growth habit. Rapid-growing and heavy bearing; will produce nuts in northern areas if grown in light, sandy soil with a southern exposure. Spanish type peanuts are used for peanut candies, peanut butter and peanut oil, account for 11% of total U.S. production, and are primarily grown in Oklahoma and Texas. A86{DF}, C20M, F73D, K71

Starr: (Starr Spanish) 110-115 days. Pods and seeds are larger than those of the small Spanish types. Pods are thick and therefore percentage of kernels is generally low. Shelling tests have shown that Starr generally yields fewer split kernels than other commercial cultivars. Spanish type developed at the West Cross Timbers Experiment Station, Stephenville, Texas. Introduced in 1961. L89G

Tennessee Red: (Tennessee Red Valencia) 120 days. Small, red-skinned kernels; 3 to 4 kernels per pod; flavor very sweet and mild. Upright plant, to 2 feet high; produces high yielding, easily harvested underground clusters. Will grow as far north as New York if planted by the end of May. C92, H85M, 191, J73, N84

Texas Red and White: Distinctive heirloom strain with bright red skins, streaked with bright white Very attractive and sweet tasting. Dwarfish plants that grow about 12 inches tall; early and productive. F73D

Valencia: (Valencia Early Spanish) 115 days. Small, high-quality kernels; very rich and sweet; 3 or more kernels per well-filled pod. Large, productive plants; adapted to a wide range of soils Valencia type peanuts are in demand for roasting in the shell, account for only 1% of the total U.S. production, and are grown primarily in New Mexico. C85M, D27, G27M, G44M{DF}, I66M{DF}, I66M{PD}, I67M, M63M{DF}, M63M{PD}

Virginia: (Virginia Bunch, Early Bunch) 120 days. Large, tan-skinned kernels of high quality; 1 to 2 kernels per pod; matures about a week earlier than Virginia Jumbo. Upright growth habit. Commercially, Virginia type peanuts account for most of the roasted, salted, and inshell or "ball park" peanuts, about 16% of the total U.S. production, and are grown mostly in Virginia and the Carolinas. A86{DF}, E97, H42, I66M{PD}, 089

Virginia Jumbo: (Mammoth Virginia) 120 days. A special, select strain of the Virginia type. Extra large, rich-flavored kernels; 1 or 2 kernels per pod; produces fewer imperfect pods than most other cultivars. Runner type; vines grow 18 inches tall with a spread of 3 1/2 feet. Dependable and productive; well adapted to the North. B6, B75, C20M, G57M, H49, H85M, 191, K71, M95M

## PEAR {GR}

PYRUS COMMUNIS  
PYRUS USSURIENSIS

PYRUS X LECONTEI

---

### EUROPEAN PEARS

**COOKING** While most dessert pears can be used for culinary purposes, they need to be picked before they are fully ripe and cooked very slowly in syrup. True culinary pears are hardy and prolific and the fruits possess long-keeping qualities. They are not acid but are hard and generally lacking in flavor and juice.

### *Green/Yellow-Skinned*

Belle Angevine: (Pound, Uvedale's St. Germain) Large to very large, handsomely-shaped fruit, often 3 pounds in weight; skin brilliant in color, very attractive; ripens very late. Dessert quality poor, only fair for cooking. Originated prior to 1867. HEDRICK 1921; F88G, L12, M22, Q30{SC}

Bellisime d'Hiver: Large, oval fruit; skin pale yellow with red flush and conspicuous dots; flesh white and soft; keeps well from November to April. One of the best cooking pears; considered superior to Catillac although it does not turn the same dark red when stewed. A French pear of unknown parentage, known since the 17th century. SIMMONS 1978; Y83{SC}

Catillac: Very large, roundish fruit; skin dull green to yellow, blushed with brownish-red; flesh hard, rough, white, turning deep-red when cooked; ripens very late; will keep until spring. Usually considered to be the best culinary pear. Tree spreading, vigorous; productive; very haidy. A very old French pear, first described in 1665. HEDRICK 1921, SIMMONS 1978; Q30{SC}, R83

Vicar of Winkfield: (Viker) Fruit very large; oblong-pyriform, with a long, tapering neck; skin pale green, shading to pale yellow; flesh pale yellow, firm, dry, more or less astringent, with a sprightly muskiness; quality inferior for dessert, but excellent for all culinary purposes; ripens very late; keeps well. Tree large, vigorous, very productive. Discovered in France in 1760. HEDRICK 1921, SIMMONS 1978; E84, L12, 081, Q30{SC}

### *Red/Purple-Skinned*

Belle Picarde: Large to very large fruit; skin orange-red, often speckled on the side exposed to the sun; flesh white, melting, very sugary; juice rather abundant, sweet and of a pleasant flavor; ripens very late, and must be carefully ripened off the tree. Good for dessert, but highly recommended for cooking, turning a light pink color. Originated in the village of Charmes, Aisne, France in the middle of the 19th century. HEDRICK 1921; L12, M11M{PR}

Black Worcester: (Black Pear of Worcester) Very distinctive cooking pear from England. Small to medium-sized, knobby, irregular fruit; deep dark-purple, nearly black, heavily russet skin; firm, grainy, very dense flesh, cooks to a superb flavor. The cooking pear that appears on the Worcester coat of arms. BISSELL; 081

### DESSERT

### *Green/Yellow-Skinned*

Abbe Fetel: (Abate) Fruit large to very large, more or less elongated; skin rather thin, pale yellowish-green, bright red on the side exposed to the sun; flesh whitish, melting, very juicy, sugary, aromatic, of excellent quality; ripens late. Originated in France prior to 1889. HEDRICK 1921; E4, F88G, F91T{SC}, L12, M11M{PR}

Atlantic Queen: Very large fruit, up to 1 1/2 pounds; skin yellow-green; flesh fine-grained, melting, very juicy, sweet, very aromatic; ripens in September. Tree highly prolific; resistant to fireblight; grows well under adverse conditions, including poor soils and close proximity to the seashore. G79M, G79M{DW}

Aurora: Large, pyriform fruit; skin bright yellow, slightly russet, very attractive; flesh melting, smooth, juicy, sweet, aromatic, of high dessert quality; ripens with or just after Bartlett; keeps well in cold storage until December. Very well suited for the home garden and fresh fruit market. Tree vigorous, spreading; productive. BROOKS 1972; F88G, F91T{SC}, J93{SC}, L12

Bartlett: (Williams\* Bon Chretien) Medium to large fruit; skin pale green, turning to golden-yellow; flesh white, fine-grained, juicy, sweet, slightly subacid with a strong musky flavor; ripens early; keeps for only 2 to 3 weeks in natural storage. Tree moderately vigorous, spreading; very productive. Leading cultivar in the United States. Originated in England about 1770. HEDRICK 1921, SIM-

MONS 1978; B83, B93M, C75M, D81{PO}, D81M{PO}, E4<sub>y</sub>, G16, G16{DW}, G23, G23{DW}, G92{DF}, I23M{PD}, I58P{PD}, J83, L97G{DF}, M39M, M89G{PD}, etc.

Beierschmitt: Medium to large, oval-pyriform fruit; skin thin and tender, greenish-yellow to clear pale yellow when ripened, with slight russet; flesh firm, tender, free of stone cells, very juicy, highly aromatic, non-browning when cut; quality excellent; matures in midseason, and ripens well on the tree. Tree somewhat resistant to fireblight. Originated in Fairbanks, Iowa. Introduced in 1927. BROOKS 1972; D37, E84, J93, J93{SC}

Belle Lucrative: (Fondante d'Automne) Medium-sized, round-conical fruit; skin dull greenish-yellow; flesh tinged with yellow, firm, fine-grained, crisp, buttery, juicy, sweet, quality very good; ripens in midseason. Should be picked when still green; will ripen in 7 to 14 days. Tree vigorous; hardy; productive. Originated in Belgium about 1827. HEDRICK 1921; F88G, F91T{SC}, G79M{DW}, L12, Q30{SC}

Bergamotte d'Esperen: Medium-sized, round to conical fruit; skin greenish-yellow with dark russet patches; flesh pale yellow, very smooth, of soft texture, pleasantly aromatic, quality excellent; ready for use during December, keeps well until March. Tree upright-spreading, bears well in the right climate, self-fertile. Not suitable for wet or cold areas. Originated in Belgium about 1830. SIMMONS 1978; Q30{SC}

Bergamotte d'Pentacote: (Easter Beurre) Medium-sized, pyriform fruit; skin thick and tough, yellow often with a dull brownish-red blush; flesh tinged with yellow, very aromatic, melting, juicy, sweet, with a rich pleasant flavor; quality very good; in season late December to February. Tree medium in size, vigorous, upright-spreading. Grows well only in comparatively warm climates and on light, warm, limy soils. Originated at Louvain, Belgium, about 1823. HEDRICK 1921; Q30{SC}

Beurre Clairegeau: Large, roundish-pyriform fruit; skin yellow, blushed with bright red; flesh white, quite granular, tender and melting, very juicy, sweet, aromatic, with a rich, vinous flavor; quality good; ripens late. Tree vigorous, unusually upright; hardy; reliably productive. Originated in Nantes, France, about 1830. HEDRICK 1921; E84, F88G, G79M{DW}, LI, M22, Q30{SC}

Beurre Giffard: Medium-sized fruit; skin dull greenish-yellow, blushed with pinkish-red; flesh tinged with yellow, granular at the center, melting, very juicy, vinous, highly aromatic; quality very good; ripens early. Tree spreading, vigorous; hardy; productive. Discovered in France in 1825. HEDRICK 1921; A91, F88G, G79M{DW}, LI, L12

Beurre Hardy: (Hardy) Fruit large, obtuse-pyriform, with a rather long neck; skin dull greenish-yellow, with heavy bronze russet; flesh granular, melting, buttery, very juicy, sweet, richly aromatic and somewhat vinous; quality very good to excellent; ripens in mid-season. Tree upright, very vigorous. Originated in France, about 1820. HEDRICK 1921; F91T{SC}, I61M{SC}, LI, M22, 081, Q30{SC}, R77, R83

Beurre Superfin: Medium-sized, round to conical fruit; skin yellow, netted and streaked with light russet; flesh pale yellow, granular, melting, buttery, very juicy, sweet yet with a rich, brisk, vinous flavor, aromatic; quality very good; ripens in October. Tree moderately vigorous and productive. Originated in Angers, France from seed planted in 1837. HEDRICK 1921; F91T{SC}, J93{SC}, LI, L12, Q30{SC}, R77

Bose: (Beurre Bose) Fruit large; very long, with a tapering neck; skin dark yellow, russet; flesh yellowish-white, tender, juicy, sweet, with a rich, aromatic flavor; quality very good to excellent; ripens late. Tree large, upright; vigorous; very susceptible to fireblight. Originated in Belgium from seed planted in 1807. HEDRICK 1921; A5, B74, B83, D81{PO}, D81M{PO}, E4<sub>y</sub>, E84, G23, G23{DW}, G79M{DW}, H65, I23M{£D}, K73M<sub>y</sub>, LI, M39M, etc.

Butirra Precoce Morettini: (Early Morettini) Medium to large fruit; skin greenish-yellow blushed with red, smooth; flesh white, juicy, flavor excellent; ripens 2 to 3 weeks before Bartlett; drops readily as it approaches maturity. Tree very vigorous; self-compatible; susceptible to fireblight. Originated in Firenze, Italy by Alessandro Morettini. B74, D28J, E4, F88G, J61M, L12, M11M{PR}, 081

Chapin: Small to medium-sized, round-oval fruit; skin greenish-yellow, with considerable russet; flesh juicy, melting, richly aromatic, very sweet, of high quality; ripens with Clapp's Favorite; resembles Seckel, but larger. Tree vase-shaped, moderately vigorous; productive. Originated in Geneva, New York by U.P. Hedrick. Introduced in 1945. BROOKS 1972; F88G, J93{SC}, L12, M11M{PR}, M22

Clapp's Favorite: Medium to large fruit; skin pale lemon-yellow, mottled with bright red; flesh tinged with yellow, granular at the center, very juicy, melting, sweet, rich; quality very good; ripens in August and September. Tree large, upright; very productive. Originated in Dorchester, Massachusetts by Thaddeus Clapp, prior to 1860. HEDRICK 1921; A5, D76, G16, G16{DW}, G79M{DW}, H49{DW}, H65, J16, J89M

Colette: Medium to large fruit; skin golden-yellow, blushed with pink; flesh firm, melting, juicy, aromatic, sweet, of fine flavor; ripens in August and September, and over a long period of time; resembles Bartlett. Tree spreading; hardy; blooms over a long period of time. Originated in Freeport, Illinois. Introduced in 1953. BROOKS 1972; D76, H65, H90M{SC}, J93, J93{SC}, M99G

Comice: (Doyenne du Comice) Fruit large; oval-pyriform, with unequal sides; skin greenish-yellow, blushed with red, russet; flesh tinged strongly with yellow, melting, tender, buttery, very juicy, sweet and vinous, aromatic; quality excellent; ripens late. Tree upright, vigorous; usually productive. Widely used in Holiday gift packs, where they are sometimes called Royal Riviera. Originated in Angers, France in 1849. HEDRICK 1921; B23P{PR}, B74, B83, B93M, E4, E84, F15{PR}, H69{DF}, J21M{PR}, J61M, K73M<sub>y</sub>, LI, L33{DW}, L47<sub>y</sub>, M39M, etc.

Concorde: Conference x Comice. Medium to large, long-pyriform fruit; skin yellowish-green, less russet than Conference; tender, juicy, white flesh, flavor excellent. Ripens in mid-September, 2 weeks after Conference. Moderately vigorous, spreading tree; precocious. Pollinate with Bartlett, Comice or Conference. Originated in England. BROOKS 1997; B83, C41M, E4<sub>y</sub>, I61M{SC}, M39M, 081, Q30{SC}, R77, R83

Conference: Medium to large fruit; calabash-shaped; skin greenish-yellow, with some golden-brown russet; flesh creamy white with a slight salmon-pink tinge, melting, very juicy, sweet, flavor pleasant; ripens in October and November. Tree moderately vigorous; very productive. Leading commercial cultivar in England. Originated there in 1894. HEDRICK 1921, SIMMONS 1978; C34, F88G, H90M{SC}, I49M, I61M{SC}, J61M, LI, 081, R77, R83

D'Ai\jou: (Beurre D'Anjou) Fruit large, elongated-oval; skin light green at harvest, cream to green after ripening; flesh yellowish-white, firm, but slightly granular, tender, very juicy, with a rich, aromatic flavor; ripens late. Tree large, vigorous; slow to come into bearing. Standard market cultivar for fall and winter. An old French pear of unknown origin. HEDRICK 1921; A5, B83, D81{PO}, D81M{PO}, E4<sub>y</sub>, G79M{DW}, H65, K73M, L47<sub>y</sub>, M39M, M99G

Dana Hovey: Small to medium-sized fruit; skin golden-yellow, covered with a thin russet; flesh tinged with yellow, melting, juicy, sweet, highly perfumed, of excellent quality; ripens late. Tree large, upright-spreading; vigorous; productive. Originated in Rcxbury, Massachusetts by Francis Dana. Introduced about 1854. HEDRICK 1921; LI, L12, M11M{PR}

David: (P. ussuriensis x) Medium-sized fruit; 2 3/4 inches long, 2 1/4 inches in diameter under non-irrigated field conditions; skin thin; flesh quality good, not breaking down quickly. Tree extremely

hardy. Originated in Saskatoon, Saskatchewan, Canada by CF. Patterson. Introduced in 1960 for home gardens. I49G, I49G{SC}, L27M, M35M

Des Urbanistes: (Urbaniste) Fruit medium-sized, roundish-pyriform; skin pale yellow, often with a faint russet-red blush; flesh tinged with yellow, granular especially around the core, tender and melting, buttery, juicy, sweet, pleasantly aromatic; quality very good; ripens late. Tree vigorous; productive with age. Originated in the gardens of the religious order of Urbanistes, Mechlin, Belgium about 1783. HEDRICK 1921; L12

Docteur Jules Guyot: (Jules Guyot) Medium to medium small fruit, oval-pyriform in shape; skin somewhat rough, pale yellow with a faint blush and russet dots or patches; flesh white, fine-grained, flavor lair, slightly musky; ripens just before Bartlett, which it resembles. Tree upright, becoming slightly spreading; very productive but tends to be biennial. Originated in France in 1870. SIMMONS 1978; F91T{SC}, LI, Q30{SC}

Doyenne d'Ete: (Doyenne de Juillet) Small, conical fruit, 1 1/2 inches long; skin pale yellow, blushed with brownish-red, thin and smooth; flesh white, fine-grained, sweet, very juicy; flavor very good for an early pear; ripens in late July and early August. Tree small, weak growing; a heavy and regular bearer. Good pollinators are Conference, Beurre Hardy and Bartlett. First raised about 1700 by Capuchin monks, at Mons, Belgium. SIMMONS 1978; A91, B74, J61M, Q30{SC}, R77

Doyenne Gris: Medium to large, globular fruit; skin yellow-ocher, nearly covered with cinnamon-colored russet, smooth, unblemished; flesh white, tender, melting, very buttery, rich and delicious; of excellent quality; ripens in October. Originated in the garden of the Chartreux Monastery at Paris around 1750. HEDRICK 1921; L12

Duchesse d'Angouleme: Large to very large fruit; skin dull yellow, russet; flesh white, firm becoming somewhat melting and quite tender when fully mature, juicy, sweet, richly flavored; quality good to very good; ripens late. Tree upright, vigorous; hardy; productive. Originated near Angers, France, early in the 19th century. HEDRICK 1921; A74, D76, D76{DW}, E97, F91T{SC}, G79M{DW}, LI, Q30{SC}

Duchesse d'Angouleme Bronzee: Sport of Duchesse d'Angouleme with bronze or reddish-brown skin. Large to very large fruit; fine, melting, juicy, sugary; dessert quality slightly superior; ripens October to December. Originated in the garden of M. Weber, Dijon, France. Introduced in 1873. HEDRICK 1921; LI, L12, M11M{PR}

Dumont: Medium to large, obtuse pyriform fruit; skin attractive yellow, slightly blushed; flesh firm, juicy, flavor rich and sweet; quality very good; ripens late, stores until the end of December. Tree productive; tends toward alternate bearing when older; moderately susceptible to fire blight. An old European cultivar that has not been widely tested in America. L12, M11M{PR}

Flemish Beauty: Large, roundish fruit; skin clear yellow, blushed with red; flesh yellowish-white, firm, becoming melting and tender, juicy, sweet, aromatic, with a slightly musky flavor; quality very good; ripens in midseason. Tree spreading, vigorous; hardy; productive. Originated near Alost, East Flanders, Belgium, about the beginning of the 19th century. HEDRICK 1921; A91, A91{SC}, C58, J89M, LI, L12, L27M, M39M

Forelle: (Trout Pear) Small to medium, shortened pyriform fruit; skin greenish-yellow, with a brilliant red blush and many conspicuous dots; flesh white, fine-grained, with a delicate sweet flavor; ripens late, November to January. Tree vigorous, spreading; moderately productive. Commonly exported from Europe, and popular in specialty markets. Known since 1670. SIMMONS 1978; B53M, E4, F88G, F91T{SC}, LI, Q30{SC}, R77

Glou Morceau: Medium to large, oval-pyriform fruit; skin greenish-yellow, smooth; flesh white, very smooth in texture, with

an excellent very sweet flavor. In season December to January, but ripens in succession over a long period, a number of pickings being recommended. Tree spreading, of moderate to vigorous growth, bears good crops regularly. Originated in the 18th century. SIMMONS 1978; F88G, 081, Q30{SC}, R83

Golden Spice: Fruit small; skin clear yellow, blushed with red; flesh light yellow, juicy, aromatic, flavor pleasant, tart, spicy; ripens in midseason; resembles Seckel in size, but not as sweet. Excellent for canning. Tree very hardy; productive; a good parent for further breeding. Originated in Excelsior, Minnesota. BROOKS 1972; A65, A74, B15M, D69, H85, I49G, I49G{SC}, J89M, K64, L27M

Gorham: Fruit large; skin bright yellow, slightly russet; flesh juicy, melting, sweet and vinous, of excellent quality; ripens 10 days later than Bartlett, which it resembles; keeps 6 to 8 weeks longer than Bartlett. Tree upright, dense; vigorous and productive. Originated in Geneva, New York by Richard Wellington. Introduced in 1923. BROOKS 1972; B53, F88G, F91T{SC}, L12, Q30{SC}

Harrow Delight: Medium-sized, pyriform fruit; skin yellow blushed with red, attractive; flesh very smooth, free of stone cells, juicy, flavor and quality very good; ripens 2 weeks before Bartlett. Tree hardy; very resistant to fireblight. Released by the Harrow Research Station, Harrow, Ontario, Canada. A39, A91, C27T{SC}, C30M, C45M, E84, F53, F88G, J61M, J93{SC}, L33, M11M{PR}, M99G, 081

Harvest Queen: Ovate-pyriform fruit, slightly smaller than Bartlett which it resembles; flesh quality high, equal to that of Bartlett but less gritty. Ripens about 1 week before Bartlett. Upright, moderately vigorous tree, strongly resistant to fire blight. Pollen compatible with Harrow Delight. Originated in Harrow, Ontario, Canada. Introduced in 1982. A91, C27T{SC}, C30M, C45M, E84, F16, F43M, F53, I49G, I61M{SC}, J93{SC}, M11M{PR}, 081

Highland: Large, pyriform fruit; skin smooth, greenish-yellow covered with a thin russet; flesh melting, juicy, sweet, richly flavored; ripens late, keeps well in refrigerated storage until January. Develops better quality if stored about a month before ripening. Tree moderately vigorous; productive; as susceptible to fireblight as Bartlett. Bartlett x Cornice. B74, F53, F88G, H90M{SC}, J61M, J93, L12, Q30{SC}

Jargonelle: (English Jargonelle) Medium-sized, very long conical fruit; skin greenish-yellow, faintly blushed with brownish-red; flesh pale yellow, sweet, very tender and juicy, flavor somewhat musky; ripens in August. Spreading tree, needs careful summer pruning. Beurre Superfin recommended as a pollinizer. Known in France before 1600. SIMMONS 1978; G79M{DW}, LI, 081, Q30{SC}, R83

John: (P. ussuriensis x) Medium to large fruit; 3 inches long, 2 1/2 inches in diameter under non-irrigated field conditions; skin thin, yellowing well before flesh becomes soft; quality good; ripens in late September. Tree hardy. Originated in Saskatoon, Saskatchewan, Canada by CF. Patterson. Introduced in 1960 for home gardens. BROOKS 1972; A65, A91, A91{SC}, B47, K64, L27M, M35M

Josephine de Malines: Small to medium, short conical fruit; skin pale green shading to pale yellow; flesh pinkish at the center when fully mature, very smooth, sweet, perfumed; should be picked as late as possible, preferably the second half of November. At its best for eating during February. Tree moderately vigorous, somewhat weeping; bears heavy crops regularly. One of the best-keeping late pears for a small garden. SIMMONS 1978; M22, 081, Q30{SC}

June Sugar: Fruit of excellent quality; ripens very early, the end of June in Georgia. Good to eat out of hand or for canning. Tree resistant to fire blight; blooms relatively late; somewhat slow to come into bearing. An heirloom cultivar from Georgia. E84, G65M

Luscious: Small to medium-sized fruit; skin bright yellow blushed with red; flesh firm, very juicy, sweet and flavorful, of very good

quality; ripens in early midseason. Not recommended for canning. Tree vigorous; very hardy; productive; resistant, but not immune to fireblight; ornamental. Released by South Dakota State University. A91, A91{SC}, D65{DW}, D69, F53, F88G, G66, H90{DW}, I49G, L27M, M11M{PR}, M35M, N24M

Madeleine: (Citron des Carmes) Small, roundish-pyriform fruit; skin thin, very tender, dull green, occasionally with a faint brownish blush; flesh slightly tinged yellow, granular at the center, tender and melting, very juicy, sweet, vinous; quality good to very good; ripens in early August. Tree large, vigorous, upright; tender to cold; productive but short-lived. Of ancient and somewhat uncertain origin. HEDRICK 1915; L12

Magness: Medium-sized, oval fruit; skin greenish-yellow, lightly covered with russet; flesh soft, very juicy, almost free of grit cells, sweet, highly perfumed; of very good quality; ripens a week later than Bartlett. Tree very vigorous and spreading; very resistant to fireblight. BROOKS 1972; A5, A39, A82, C27T{SC}, D2{PR}, E84, E99M, F88G, G79M{DW}, J93, J93{SC}, LI, L12, N33

Marguerite Marillat: Fruit large, pyriform-turbinate; skin golden-yellow, blushed with brilliant red, slightly russet; flesh yellowish-white, semi-fine, extremely juicy, aromatic, slightly musky, very rich; ripens in September. Tree very upright, highly productive. Originated near Lyons, France in 1874. HEDRICK 1921, SIMMONS 1978; M22, 081

Mericourt: Fruit medium-sized; short-pyriform; skin greenish-yellow, occasionally blushed with dark red; flesh creamy white, buttery, nearly free of stone cells, very juicy; flavor sweet, sprightly subacid; quality excellent; ripens in early midseason. Tree vigorous; hardy; tolerant to fireblight and leaf spot. BROOKS 1972; J93{SC}, L12

Merton Pride: Large, conical to pyriform fruit; skin golden yellow, almost covered with brown russet; flesh creamy, fine-grained, flavor excellent; ripens during the second half of September. Tree moderately vigorous; not very productive; requires two other cultivars for good fruit set. SIMMONS 1978; F88G, 081, Q30{SC}

Moonglow: Medium to large fruit; skin yellow, blushed with red; flesh white, rather soft, moderately juicy, nearly free of grit cells, flavor mild, subacid; quality good; ripens about 7 days earlier than Bartlett. Tree very upright; vigorous; fruits heavily at an early age; very resistant to fireblight. BROOKS 1972; A82, A82{DW}, C27T{SC}, C75M, E99M, F93, G8, G79M{DW}, H65, L33, L90, M11M{PR}, M22, N33

Olivier de Serres: Medium-sized, round fruit; skin deep olive with patches of fawn, rough; flesh white, fairly smooth, sweet and juicy, flavor good, musky; in season February to April. Tree small, rather weak growing, an irregular bearer. Does best in the long summers of southern France and Italy. First fruited in 1861. SIMMONS 1978; Q30{SC}

Orcas: Fruit large; skin yellow, blushed with carmine, very attractive; flavorful; good for canning, drying or eating fresh; ripens in midseason. Tree vigorous, spreading, open; a consistently heavy producer; resistant to scab. A regional favorite; discovered by Joe Long on Ocas Island, Washington. C34, F88G, F91T{SC}, H90M{SC}, I49P, J61M

Packham's Triumph:<sup>2</sup> Medium to large, conical-pyriform fruit; skin thin, lemon-yellow when ripe, russet, sometimes with an orange blush; flesh fine-grained, very juicy, melting, flavor particularly rich and pleasing; ripens about 30 days after Bartlett. Tree upright, moderately vigorous; reliably productive. Chilling requirement relatively low, 250 to 500 hours. Originated in Molong, New South Wales, Australia. Introduced at the turn of the century. BROOKS 1972, RUCK; A91, A91{SC}, B83, D81M{PO}, E4, LI, M22, 081, R83

Parker: Fruit medium to large; pyriform, rounded; skin yellow, blushed with red; flesh whitish, juicy, sweet, of pleasant flavor; quality good; ripens in late September. Tree upright, vigorous; fairly hardy; susceptible to fireblight. Originated in Excelsior, Minnesota. Introduced in 1934. BROOKS 1972; 474{DW}, D65{DW}, F91T{SC}, G4, L70

Passe Crassane: Large, round-oval fruit; skin dull pale green, somewhat russet, yellow on the exposed side; flesh white, smooth, very juicy, aromatic, sweet, agreeably sprightly; quality very good; ripens in winter. Very popular in specialty stores. Tree compact and bushy; moderately vigorous and productive. Originated in Rouen, France, in 1855. HEDRICK 1921, SIMMONS 1978; F91T{SC}, LI, L12, M11M{PR}, Q30{SC}

Patten: Medium to large fruit; skin yellow; flesh tender and juicy, of excellent quality fresh, fair when canned. Should be picked 7 to 10 before its ripening season on the tree, and allowed to ripen normally. Tree among the hardiest of large-fruited cultivars; moderately resistant to blight. Good for home orchards and local markets. Introduced in 1922. BROOKS 1972; 474{DW}, C58, D65{DW}, F91T{SC}, I49G, I49G{SC}, L27M, L70

Precoc de Trevoux: Fruit medium-sized, pyriform-truncate; skin fine and tender, vivid yellow, very finely dotted with green and washed and streaked with carmine on the exposed side; flesh white, fine, melting, juicy, aromatic, sweet and rich; quality good to very good; ripens in August. Originated in France about 1862. HEDRICK 1921; Q30{SC}

Rescue: Large to very large, elongated-pyriform fruit; skin yellow, striped and blushed with bright orange and red, very attractive; flesh juicy, smooth, buttery, mild and sweet, of excellent quality; ripens slightly later than Aurora. Good for canning due to its small core. Tree upright, vigorous. Discovered in Canada by Knox Nomura of Sumner, Washington. F88G, H90M{SC}, I49M, I49P, J61M, LI, L12, N20

Rocha: Round, medium-sized fruit with a short neck; golden-yellow skin; light russet, but with pronounced russetting at the stem end; turns from firm and crisp to mouth-wateringly juicy. In season from the end of September to January. Originated in Portugal. RICHARDSON, J.; G65M

Rotkottig Frau Ostergotland:<sup>1</sup> Small to medium, pyriform fruit with red-streaked flesh of fair quality. Grown mostly as a novelty but may have potential in breeding a red-fleshed pear of good quality. Introduced into the United States from Sweden in 1964. C30M

Rousset de Rheims: Small to medium-sized, oval-turbinate fruit; skin greenish-yellow, blushed with reddish-brown; flesh white, fine or semi-fine, almost melting, not very juicy, highly perfumed, rich in sugar; flavor spicy or musky, causing it to be called Spice or Musk pear in colonial America; ripens in September. Very good for candying. Of very ancient, unknown origin, a favorite of Louis XIV of France. HEDRICK 1921; L12

Sanguinole:<sup>1</sup> Small to below medium, variably shaped fruit; skin rather thick and tough, green dotted with gray and red, russet, sometimes blushed with carmine on the exposed side; flesh transparent, red, juicy, sweet, acidulous, more or less musky, agreeable; ripens in August and September, decomposes rapidly. Known in Germany in 1500. HEDRICK 1921; U7D{SC}

Santa Claus: (Hn du Dixneuvieme Siecle) Very large, round-conical fruit; skin dull brown-red, practically covered with russet; flesh creamy white, melting, flavor excellent; ripens during Christmas and New Year. Tree upright, vigorous; moderately productive. Originated in France. HEDRICK 1921, SIMMONS 1978; L12, 081, Q30{SC}

Seckel: Small, round-oval fruit; skin yellowish-brown, marked with russet-red; flesh white, melting, buttery, very juicy, sweet, with a very rich, aromatic, spicy flavor; quality very good to excel-

lent; ripens in October. Tree upright; hardy; productive. Originated near Philadelphia, Pennsylvania by Dutch Jacob, early in the 19th century. HEDRICK 1921; A5, B74, B83, B93M, D69, *E4*, E84, G79M{DW}, H65, J16, LI, M11M{PR}, M39M, M99G

Sheldon: Medium to large fruit; uniform and symmetrical; skin dull greenish-yellow, with a brownish-red blush; flesh whitish, somewhat granular, tender and melting, very juicy, sweet and vinous; quality very good to excellent, ripens in October. Tree large, vigorous; hardy; moderately productive. Originated in Huron, New York, about 1815. HEDRICK 1921; L12

Sierra: Large, long-pyriform fruit; skin yellowish green when ripe, thin, very tender; flesh very fine and smooth, juicy, very sweet, quality excellent; ripens with Anjou, keeps until February at 31° F. Tree large, vigorous, spreading; hardier than Bartlett. Recommended for home gardens or commercial plantings. Originated in Summerland, British Columbia. BROOKS 1972; F88G, J93{SC}, I61M{SC}

Sirrine: Medium-sized, short-pyriform fruit; bright yellow skin, occasionally blushed with bronze; smooth, juicy, melting flesh, very rich and sweet. Ripens with Bartlett, about the first week in September. Large, vigorous and productive tree, slightly more blight tolerant than Bartlett. Originated in Riverhead, Long Island, New York. BROOKS 1997; F88G, F91T{SC}, H90M{SC}, L12, M11M{PR}

Sucree de Montlagon: Fruit medium-sized, oval-conic, uneven; skin lemon-yellow; flesh palest yellow, transparent, extremely juicy, buttery, lightly acidulous, aromatic, of excellent flavor; ripens in October. Fruit grows in clusters if not thinned. Discovered at Montlagon, France, about 1812, by M. Rochet. HEDRICK 1921; L12

Summer Blood Birne:<sup>1</sup> Unique red-fleshed pear with good quality fruit. Medium-sized fruit; greenish-yellow skin, blushed with red; red flesh and thick, red juice. Ripens in mid-July to early August. Dessert quality very good, also good for drying. Vigorous, productive tree; resistant to scab. A very old European cultivar. D28J, I49M, I66T

Summercrisp: Medium-sized, pyriform fruit; skin green with prominent red lenticels and a red blush; flesh crisp and juicy with a sweet, mild flavor. Should be refrigerated immediately after harvest while the flesh is still firm. Should not be allowed to ripen on or off the tree as grit cells and browning of the flesh around the seeds then reduce quality. Not suitable for canning. Released by the University of Minnesota in 1986. A74{DW}, B15M, C58, G4, G66, I49G, I49G{SC}, J93, L27M, L70, N24M

Triomphe de Vienne: Medium to large, oval-pyriform fruit; skin greenish-yellow, often blushed with red; flesh white, melting, juicy; flavor rich, sweet, spicy, very good; ripens in midseason. Tree vigorous; hardy; reliably productive. Originated in Vienne, France, in 1864. HEDRICK 1921, SIMMONS 1978; F88G

T<sup>^</sup>son: (Summer Seckel) Medium-sized fruit; round-pyriform, with unequal sides; skin deep yellow, usually blushed; flesh tinged with yellow, tender and melting, very juicy, sweet, aromatic, quality very good; ripens early. Tree very large; vigorous; hardy; productive. Originated in Jenkintown, Pennsylvania about 1794. HEDRICK 1921; A91, A91{SC}, C30M, G65M, L27M

Ure: Small to medium-sized, oval-conical fruit; skin greenish-yellow; flesh sweet, very juicy, aromatic; of good quality; ripens in mid-September. Excellent for canning. Tree relatively small, finely branched; very hardy; ornamental. Released by the Morden Research Station, Morden, Manitoba, Canada. A65, A74, A91, A91{SC}, B47, C58, F67, G54, H42, H85, I49G, K64, L70, L79

Vermont Beauty: Medium-sized fruit; skin pale lemon-yellow, blushed with brilliant scarlet, fading at the sides into pinkish-red dots; flesh tinged with yellow, tender and melting, very juicy, with a rich, vinous flavor; quality very good; ripens a week later than

Seckel. Tree vigorous and productive. Originated in Grande Isle, Vermont, in the late 19th century. HEDRICK 1921; F88G, F91T{SC}, J93{SC}, L12, M11M{PR}

Warren: Medium to large fruit; size and shape variable; skin dull green, with an occasional red blush, slightly russet; flesh melting, juicy, sweet, flavor and quality very good; stores very well. Tree very resistant to fire blight, even under conditions of extreme heat and humidity; widely adapted, hardy in Michigan. Discovered by T.O. Warren, Hattiesburg, Mississippi. A39, C27T{SC}, C75M, D3M{PR}, F43M, F61M, G8, H4, I49P, I53M, J61M, K67, L90, N20, N33, etc.

White Doyenne: Medium-sized fruit; skin pale yellow, with a bright-red blush on the exposed side; flesh yellowish-white, granular, melting when fully ripe, juicy, sweet, with a rich, aromatic flavor; quality very good; matures in early October. Tree large, upright; vigorous; hardy; very productive. Of ancient and unknown origin. HEDRICK 1921; LI

Winter Nelis: (Bon de Malines) Fruit small to medium-sized, round-conical; skin dull greenish-yellow, almost covered with thin dark-brown russet; flesh yellowish-white, smooth, very juicy, sweet, richly flavored, aromatic; quality very good; ripens very late; stores well. Tree spreading; hardy; productive. Originated by Jean Charles Nelis, Mechlin, Belgium, early in the 19th century. HEDRICK 1921; B93M, C54, D81M{PO}, E4, E84, H45M{PL}, L12, L47, M22, N20, 081

#### *Red-Skinned*

Canal Red: Red Bartlett x Forelle. Very attractive, medium to large fruit; skin bright reddish-orange, somewhat "freckled" like Forelle; flesh smooth, melting, mildly sweet, low in acid; quality excellent. Ripens about 5 days before Bartlett, does not keep well. Very upright, moderately vigorous tree; susceptible to fire blight. Originated in Medford, Oregon by F.C. Reimer. A5, E4

Cascade: Large, obovate-pyriform fruit; skin 60 to 90% blushed with bright red, smooth, thin; flesh white, smooth-textured, very juicy, melting, sweet; quality excellent; harvested at the end of the Bartlett season, stores well. Tree vigorous, upright, a heavy and regular bearer. Red Bartlett x Comice. Developed at the Southern Oregon Experiment Station, Medford, Oregon. Introduced in 1987. E4, M39M

Red Bartlett: (Max-Red Bartlett) Bud mutation of Bartlett. Skin dark cranberry red, changing to an attractive bright red after picking; flesh finer grained and higher in sugar than Bartlett; ripens with Bartlett. Shoots and leaves reddish. Produces some limbs that revert back to regular Bartlett; these must be pruned to maintain the red strain. BROOKS 1972; A5, A63, B53, B93M{DW}, C89{PR}, D37, G49, H65, I68, 199M, LI

Red Clapp's Favorite: (Crimson Red, Kalle, Super Red) Medium to large fruit; round-bodied, with a short, slender neck; skin bright red; flesh white, medium-firm, fine-grained, flavor very good; ripens with Clapp's Favorite. Tree vigorous; precocious, very productive; susceptible to fireblight. Cross-pollinate with D'Anjou, Bartlett and Bose. B53M, C41M, E4, I61M{SC}, J93ISC}, K73M, LI, M39M

Red Comice: (Scarlet Comice) Bud mutation of Comice discovered in Medford, Oregon. Skin an attractive red; flavor and texture similar to Comice; ripens one week after regular Comice. Tree similar to Comice, but not as vigorous; foliage tinged with red in the spring and autumn; ornamental. E4

Red D'Anjou: Bud mutation of D'Anjou. Skin deep red, turning brighter red after ripening; texture and flavor comparable to D'Anjou. Ripens in midseason; keeps well in storage. Tree similar to D'Anjou, but not as vigorous; bark and veins reddish. Produces some limbs that revert back to regular Bartlett; these must be pruned to maintain the red strain. A91, A91{SC}, B53, B53M, B83, C41M, E4, E97, F15{PR}, H65, H89M, J21M{PR}, M39M

Reimer Red: Medium-sized, short pyriform fruit, resembles Red Bartlett more than Comice; skin yellowish-green prominently blushed with red, more so on the side exposed to the sun; flesh aromatic, buttery, melting. Tree a shy bearer. Red Bartlett x Comice. Originated in Oregon. F91T{SC}, I61M{SC}, LI

Rogue Red: Fruit similar in shape to Comice; skin 60 to 80% covered with a red blush; flesh quality excellent; ripens in winter. Tree unusually upright, vigorous; moderately but reliably productive; moderately susceptible to fireblight. BROOKS 1972; F91T{SC}, J93{SC}, M22

Sensation: (Red Sensation, Sensation Red Bartlett) Large, ovate-pyriform fruit; skin yellow, 80 to 95% covered with a dark red blush; flesh creamy white, melting, tender, moderately juicy, sweet, quality good; ripens in early midseason. Tree medium-sized, upright; somewhat less vigorous than Bartlett. Originated in Australia. BROOKS 1972; A63, A88M, A91, B83, C41M, C54, D76, E4, F53, H49{DW}, L47, M11M{PR}, M39M, N20

Ubileen: Large, Bartlett-size, pyriform fruit; skin prominently blushed with attractive red; flesh sweet, buttery, flavor very good; ripens early. Best picked firm in early to mid Ally, as it ripens in 1 week or less. Appears to be very disease resistant. Originated in Bulgaria. A91, A91{SC}, B74, C30M, D28J, I49M, I49P, 174, J61M

#### SOUTHERN-CROSS PEARS

The fruit is crisp-fleshed like that of the Asian pear and is ready to eat when picked, requiring no further ripening and will remain edible for several days to several months. Some cultivars will improve in quality when stored in a cool, dark place. They can be stewed for pies, canning or eating as-is, and are also used for preserves, marmalade and relish. Southern style canned pears and pear preserves have a unique chewy, crunchy texture. Sometimes simply called hybrid pears, they are primarily grown in the southern United States. (*P. x lecontei*)

Ayres: Small to medium-sized fruit; skin golden-russet with an attractive rose tint; flesh juicy, sweet, nearly free of grit cells; good for eating fresh, average for canning; ripens in mid-August. Tree relatively resistant to fireblight. Requires 700 hours of chilling. Garber x D'Anjou. Originated in Knoxville, Tennessee. Introduced in 1954. BROOKS 1972, MCEACHERN; A82, C30M, C75M, E45, E99M, F61M, H4, J93{SC}, L90, M69M, M83, N33

Baldwin:<sup>2</sup> Medium to large, oblong fruit; skin light green lightly overlaid with russet; flesh semi-firm, quality good fresh, excellent for canning; ripens in September and October. Tree blooms early; fairly resistant to fireblight; susceptible to early leafspot, resistant to late leafspot. Low chilling requirement. A85M, F93, G17, I53M, I83M, J59, K76, M69M

Douglas: Fruit large, obovate-pyriform; skin pale yellow, heavily russet; flesh tinged with yellow, firm but tender, granular, very juicy, sweet yet with an invigorating flavor; quality good; matures in October. Tree upright, moderately vigorous; very productive. Originated in Lawrence, Kansas about 1897. HEDRICK 1921; E97, H8

Fan Stil:<sup>2</sup> Medium-sized fruit; skin yellow, blushed with red; flesh white, crisp, juicy; ripens in midseason. Tree upright, vigorous; resists fireblight and damage from extreme temperatures. Low chilling requirement. Originated in Texas. A63, A88M, C54, I83M

Flordahome:<sup>2</sup> Large fruit; skin green, thin, tender; flesh white, juicy, melting, sweet, flavor mild; ripens mid to late July, stores well. Good fresh; excellent for canning, holding its snow white color for months. Very productive. Low chilling requirement, 150 hours or less. Released by the University of Florida. A63, C54, E45, E99M, G17, I53M, I68, I83M, J59, K76, N20, Q93

Garber: Large, roundish-oblong fruit; skin pale yellow, often blushed with brownish-red; flesh white, granular, crisp but tender, juicy, neither sweet nor sour, but with a peculiar, pleasant flavor;

dessert quality fair, excellent for canning or preserves; ripens in September and October. Tree vigorous, upright-spreading; productive with age; moderately resistant to fireblight. Originated in Columbia, Pennsylvania, sometime prior to 1880. HEDRICK 1921, MCEACHERN; M83

Hood:<sup>2</sup> Large, golden yellow fruit; flesh creamy white, crisp, juicy, sweet, very good for fresh eating; ripens late July to mid August. Tree vigorous; resistant to blight; an excellent pollinator for Flordahome. Low chilling requirement, 150 hours or less. A63, A88M, C54, E45, G17, I53M, I83M, J59, K76, N20, Q93

Kieffer: Medium to large fruit; skin yellow, blushed with dull red, russet; flesh yellowish-white, very granular and coarse, crisp, juicy, not sweet, often astringent; quality poor; ripens late. Excellent for cooking and canning. Tree upright, vigorous; resistant to fireblight; very widely adapted. Originated near Philadelphia, Pennsylvania, in 1863. HEDRICK 1921; A82, A82{DW}, A85M, B73M, B73M{DW}, C75M, E45, F93, I9M, I53M, K76, L47, M83{DW}, N33

Le Conte:<sup>2</sup> Large, roundish-oval fruit; skin pale yellow, occasionally marked with russet; flesh white, firm but tender, juicy, sweet, strong-flavored; dessert quality good, excellent for preserves; ripens in September and October. Tree upright, vigorous; very productive; a regular bearer; somewhat susceptible to fireblight. Low chilling requirement, 100 to 250 hours. Originated about 1850. HEDRICK 1921, RUCK; A19, E45, K76, L90, M83

Maxine: (Starking Delicious; Century Yellow) Medium to large fruit; skin greenish-yellow, attractive; flesh white, medium-firm, moderately granular, subacid, juicy, strong-flavored; quality above average for a hybrid, good fresh, excellent canned; ripens late. Tree vigorous and productive, resistant to fireblight. A39, A91, A91{SC}, C27T{SC}, C75M, F88G, G8, G65M{DW}, J93, J93{SC}, L12, L33, N33

Monterrey:<sup>2</sup> Fruit quite large, round to pyriform; skin yellow; flesh soft, smooth, nearly free of grit cells, quality very good for fresh market and canning; ripens in late August; stores well. Tree vigorous; very resistant to fireblight. Low chilling requirement, recommended for mild winter areas. Originated in Monterrey, Nuevo Leon, Mexico. Introduced in 1952 by Aldridge Nursery. BROOKS 1972; A19, A88M, C54, H4, I83M, N33

Orient: (The Orient) Large, nearly round fruit; skin yellow, russet; flesh firm, juicy, slightly sweet, lacking in flavor; good for canning; ripens in mid-August. Tree upright-spreading, vigorous; reliably productive; very resistant to fireblight. Relatively low chilling requirement. Recommended for Tennessee and southward. BROOKS 1972; A82, C75M, D77M, E45, E99M, F93, G65M, H4, I9M, I53M, L90, M69M, M83, N33

Pineapple:<sup>2</sup> Fruit large to very large; pyriform; skin yellow, heavily russet; flesh crisp, flavor somewhat reminiscent of pineapple; good fresh, excellent for canning; ripens in August. Tree vigorous; productive; blooms early; moderately resistant to fireblight, susceptible to early and late leafspot. Low chilling requirement, 100 to 250 hours. RUCK; A85M, C54, C75M, E45, G8, G17, H63M, K76, L90, M83

#### PERRY PEARS

Comparable to cider apples, perry pears are recognized by the bitterness or astringency which comes from tannin in their juice. The juice of perry pears will ferment to produce alcohol about twenty-four hours after it is expressed. Much more difficult to make than cider, but produces a more delicately flavored drink. Perry is made into a vinegar comparable to cider vinegar. GRIGSON, S., LUCKWILL, SIMMONS 1978.

Barland: Round to turbinate fruit; skin green or yellow, slightly russet. Harvested in late September to early October; ready for milling up to 3 days after harvesting. Makes a high acid, medium to high tannin perry, astringent, fruity and of average to good quality.

Tree large, spreading. An old cultivar, well known in the 17th century. LUCKWILL; U7D{SC}

Barnet: Turbinate to elliptical fruit; skin green or yellowish-green, blushed with orange-red, russet. Harvested in October, easily shaken; ready for milling 1 to 3 weeks after harvesting. Makes a low acid, low tannin perry, pleasant and light, and of average quality. Tree medium to large, shows some tendency to biennial bearing. LUCKWILL; U7D{SC}

Blakeney Red: Fruit pyriform or turbinate; skin yellow with a heavy red blush, sometimes streaked, some russeting. Harvested in late September to early October; ready for milling up to 7 days after harvest. Makes a medium acid, medium tannin perry of pleasant average quality when milled at the correct stage <f maturity. Tree erect, spreading with age; bears regularly and heavily. LUCKWILL, SIMMONS 1978; 081

Brandy: Fruit turbinate; skin green to greenish-yellow, blushed with bright red. Harvested in October; ready for milling up to 4 weeks after harvest. Makes a medium acid, low tannin perry of bland aromatic character, rather dark in color and of average quality. Tree small to medium, spreading; bears heavily but biennially. LUCKWILL, SIMMONS 1978; LI, 081

Butt: (Norton Butt) Turbinate to pyriform fruit; skin greenish-yellow to yellow, slightly russet. Harvested the first half of November; ready for milling 4 to 10 weeks after harvesting. Makes a medium to high acid, medium to high tannin perry, astringent and often fruity, of average to good quality. Tree medium to large, spreading; produces heavily, but often biennially. Widely planted in England. LUCKWILL, SIMMONS 1978; U7D{SC}

Gelbmostler: Medium to fairly large, globular fruit; skin greenish-yellow changing to light yellow, often slightly blushed and speckled with russet; flesh yellowish-white, coarse, juicy, very astringent; ripens in September, quickly becomes overripe. Grown in Austria and northern Switzerland for perry or pear wine. HEDRICK 1921; U7D{SC}

Gin: Broad turbinate to oblate fruit; skin green, usually blushed with orange. Harvested the end of October; ready for milling 3 to 5 weeks after harvest. Makes a medium acid, medium tannin perry of average to good quality. Valuable for its long keeping qualities. Tree medium-sized; bears heavily, but often biennially; highly resistant to scab and canker. LUCKWILL, SIMMONS 1978; U7D{SC}

Hendre Huffcap: Elliptical, often irregular fruit; skin green, yellowish-green or yellow slightly blushed with orange. Harvested the first half of October, easily shaken from the tree; ready for milling up to 2 weeks after harvesting. Makes a low to medium acid, low tannin perry, pleasant and light, and always of good quality. Tree large, upright; bears heavy crops annually, the branches sometimes breaking under the weight of the crops. LUCKWILL; U7D{SC}

Normannische Qderbirne: Very small, turbinate fruit; skin greenish-yellow covered with cinnamon-russet and ashy-gray dots; flesh yellowish-white, rather dry, sweet but with some sprightliness; ripens in September. Excellent for making perry and for distillation. Found growing wild in Normandy and Upper Austria. HEDRICK 1921; U7D{SC}

Red Pear: (Black Horse) Turbinate fruit; skin yellow or greenish-yellow, almost completely blushed with red. Harvested in October; ready for milling up to 3 weeks after harvest. Tree medium-sized, upright; bears heavily but often biennially; widely adapted. Popular for over 400 years and still widely grown in Herfordshire and Worcestershire, the two principal perry growing counties of England. LUCKWILL; U7D{SC}

Taynton Squash: Oblate or turbinate fruit; skin greenish-yellow, sometimes slightly blushed. Harvested the second half of September; ready for milling up to 2 days after harvesting. Makes a medium acid, medium tannin perry of average quality. Tree medium to large,

upright; bears heavily but usually biennially. A very old cultivar. LUCKWILL; U7D{SC}

Thorn: Pyriform, sometimes turbinate fruit; skin yellow, russet. Harvested the second half of September; ready for milling up to 1 week after harvesting. Makes a medium acid, low tannin perry of average to very good quality. Tree small, upright; bears heavily. A very old cultivar, once widely planted for dessert and culinary purposes, for which it is now considered too astringent. LUCKWILL; U7D{SC}

Yellow Huffcap: Fruit elliptical; skin green, yellow or yellowish-black, somewhat russet. Harvested the first half of October; ready for milling up to 1 week after harvesting. Makes a medium to high acid, low tannin perry, fruity, well flavored and consistently of good to excellent quality. Tree large, spreading; bears heavily, but often biennially. Widely planted cultivar of high repute. LUCKWILL, SIMMONS 1978; U7D{SC}

#### CODES FOR SPECIAL TYPES

1. Red-Fleshed
2. Low-Chill

---

### PECAN {GR}

#### CARYAILLINOENSIS

---

##### EASTERN PECANS

Adapted to the humid southeastern states from Louisiana to Florida. Less susceptible to scab and various foliage diseases than are cultivars of western origin. They also generally grow well in the western pecan growing area. JAYNES.

Caddo: Nut small, football-shaped, with points projecting from base and apex; 60 to 70 nuts per pound; shell dark; kernel 58% of nut, attractive, quality good, flavor excellent; adapted to mechanical shelling; matures in midseason. Tree precocious; very productive; protandrous type, needing other cultivars for good pollination. BROOKS 1972; K76, N33

Candy: Medium-sized nut, about 65 per pound; kernel averages 50% of weight of nut; matures early in the season, in September. Tree attractive; a consistently heavy bearer, comes into production after 6 or 7 years; highly resistant to scab; protandrous type, needing other cultivars for good pollination. H4, K76, L90, L90{SC}, M83

Cape Fear: Nut resembles Stuart in size and shape but is superior in cracking quality; kernel does not break when shell is cracked; averages 52 to 62 nuts per pound; kernel percentage high, quality excellent including a light color. Tree very vigorous; precocious and heavy bearing; protandrous. Good pollinator for Wichita. BROOKS 1972; A85M, F93, I41P, I53M, K76, L33, L90, L90{SC}, M69M, M83

Choctaw: Nut size similar to that of Success, but of more symmetrical shape; averages 45 per pound; shell unusually thin, being similar to Schley; kernel averages 60% or more of nut, releases well from shell, color bright, oil content high, flavor rich; cracks out very well; matures in midseason. Fine for marketing in shell. Tree vigorous, precocious and heavy bearing; protogynous. BROOKS 1972; A85M, A88M, B93M, C54, D37, G88, K76, L90, L90{SC}, M83, N20, N33

Desirable: Nut larger than Stuart, averaging 45 to 50 per pound; kernel percentage about 52%; kernel meaty, quality very good; matures in midseason. Tree blooms early; highly resistant to scab; comes into bearing early; a very prolific and consistent bearer; protandrous. Popular, standard cultivar in the Southeast. BROOKS 1972; A85M, A85M{DF}, F93, G72, I41P, I53M, K76, K28, L56M{DF}, L90, M69M, M83, N33

Elliot: Nut small, base rounded, apex pointed; 55 to 70 nuts per pound; kernel plump, smooth, straw-colored, of excellent flavor and quality; shell medium thick, very good for cracking purposes; matures in midseason. Tree highly resistant to scab; a shy but consistent bearer; comes into bearing late; protogynous. Introduced about 1925. BROOKS 1972; A85M, F93, H4,153M, K76, L90, L90{SC}, M83

Forkert: Large nut, about 45 to 50 per pound; kernel averages 60% of nut; matures in late October. Tree precocious, productive; protogynous, sheds pollen after pistillate flowers are receptive. Recommended for new orchard plantings and coastal plantings. An older cultivar which is becoming more popular due to its scab resistance. A85M, K76, L90, L90{SC}

Gloria Grande: Very large nut, about 35 to 45 per pound; kernel averages 48% of nut, richer in flavor than Stewart; matures late, in October and November; resembles Stuart. Tree productive, comes into bearing after 8 or 9 years; resistant to scab; protogynous, a good pollinator for Stuart. Good home garden cultivar. Originated in Orangeburg, South Carolina. BROOKS 1972; F93,153M, K76

GraKing: Nut large, about 35 per pound, resembles Mahan; attractive; kernel separates easily from shell, averages about 55% of nut; matures early. Tree productive; resistant to scab; protogynous. Originated in Arlington, Texas by O.S. Gr<sup>A</sup>. Introduced in 1959. BROOKS 1972; N33

Jackson: Very large nut, about 35 per pound; kernel well-filled, averaging 52% of nut; quality high; matures late, in October and November. Tree an early but shy bearer; highly tolerant to scab; protogynous, sheds pollen after pistillate flowers are receptive. A good cultivar for home gardens. A85M, K76, L90, L90{SC}

Kiowa: Medium to large nut; shape and appearance similar to Desirable; averages 40 to 50 nuts per pound; shell medium soft; kernel 55 to 60% of nut, quality very good; matures late. Tree very precocious and prolific; protogynous. Good for high density plantings. Pollinate with Cherokee. JAYNES; B93M, G88, K76, L90, L90{SC}, M83, N33, Q93

Mahan: Very large, long nut; 35 to 50 nuts per pound; shell thin; tends toward poor filling on older trees; kernel averages 50 to 57% of nut, flavor rich; resembles Schley but about 60% larger; matures late. Tree vigorous and prolific; early bearing; protogynous; susceptible to scab. Introduced in 1927. BROOKS 1972; A88M, C54, D76, E97, G72, G88, K28, K76, L47, L90, M69M, M83, N20

Melrose: Large, oblong nuts, about 54 per pound; smooth, light to medium brown shells; kernel weight 55% of nut; plump, relatively dark kernels; ripens with Stuart. Narrow, upright tree, suited to high density plantings; very vigorous; protogynous. Highly resistant to scab. Originated in Hanna, Louisiana. SPARKS; A85M, H4, K76, L90, L90{SC}, M83

Mohawk: Nut large, similar to Mahan, averages 35 per pound; shell thin, very attractive; kernel may exceed 60% of weight of entire nut, separates easily from shell; quality high; matures early. Tree vigorous; prolific and moderately precocious; susceptible to scab; protogynous. BROOKS 1972, JAYNES; A88M, C54, E97, G49, G88,140,183M, J21M{DF}, K76, LI, L90, L90{SC}, M83, N20, N33, etc.

Moreland: Nut large, averaging 45 per pound; shell very thin; kernel high in oil content, very rich in flavor, fills out well; quality high; has good keeping qualities; similar to Stuart in size and shape. Tree upright; disease resistant; considered one of the few self-pollinating cultivars. Rated one of the top six cultivars for north and central Florida by the University of Florida. G17

Oconee: Large, oblong nuts, about 48 per pound; kernel weight 54% of nut; smooth, thin, medium-brown shell with brownish-black markings; cracking qualities exceptionally good; very attractive kernel with good flavor. Disease resistant tree; protandrous. Forkert

is recommended as a pollinizer. SPARKS; I53M, K76, L90, L90{SC}, N33

Pawnee: Nut large, 45 to 55 per pound; kernel 55 to 62% of nut, of excellent quality; matures very early, as early as September 15 at Brownwood. Tree precocious; vigorous and heavy yielding; protandrous, pollen shedding pattern similar to Cheyenne. Recommended for areas of the traditional pecan belt with shorter growing seasons. Originated in Brownwood, Texas. Introduced in 1984. A85M, A88M, C54, D37, F93, G88, 140, K76, L90, L90{SC}, M83, N20, N33

Podsednik: Extremely large nut, as little as 22 to a pound; kernel well filled, of good color; matures with Mahan. Tree has strong structure and large leaves; appears to be scab resistant; sheds pollen slightly ahead of pistil receptivity. Recommended for trial plantings. N33

Schley: Medium-sized nut, averages 50 to 65 per pound; shell very thin, fills well; attractive golden-brown kernel, firm-textured, of very fine flavor, rich and oily, cracks well; matures in midseason. Tree vigorous; slow to come into bearing; a shy bearer in many areas; susceptible to scab; protogynous. Long a standard of quality, commanding premium prices. Seedling of Stuart. JAYNES; I41P, K66M{DF}, K76, L56M{DF}, M83

Shoshoni: Medium to large nut, averages 40 to 60 per pound; kernel 52 to 58% of nut; matures in midseason. Suitable for commercial shelling. Tree very vigorous, upright growing; highly precocious and prolific; resistant to scab; protogynous, sheds pollen after pistillate flowers are receptive. Suited to high density plantings. G88, L90, L90{SC}, M83, Q93

Stuart: Nut medium-sized, averages 40 to 55 per pound; kernel 44 to 50 percent of nut, quality good; matures in midseason. Tree slow to come into bearing, but continues to yield acceptable crops for up to 45 years; moderately productive; susceptible to diseases; protogynous. Widely adapted to climate and soils. One of the standard cultivars in the Southeast. JAYNES; A82, A85M, A85M{DF}, B52, D76, F93, G72, H49, I53M, J47M{DF}, K28, L33, L90, M69M

Success: Large attractive nut, averages 40 to 55 per pound; shell soft, filling often erratic and poor; kernel 49 to 54% of nut, smooth, plump, creamy, of excellent flavor; matures in midseason, almost 10 days later than Stuart. Tree vigorous; precocious and prolific; susceptible to diseases; protandrous; partially self-fruitful. An old stand-by. C54, G88,141P, L90, L90{SC}, M83, Q93

Sumner: Medium to large nut with excellent kernel quality, 55-60 nuts per pound; matures in midseason, October 25 to November 12 in Zones 8 and 9. Tree precocious; relatively consistent and heavy yielding; disease resistant; protogynous. Good for high density plantings and home orchards. A85M, F93, H4,153M, K76, L90, L90{SC}, M83

#### FAR NORTHERN PECANS

Recent discoveries of native pecan groves near the Green Island-Dubuque, Iowa area have shown that pecans can ripen in areas much farther north than previously known. Selections from these trees and from other far northern pecan areas are being tested as far north as Ontario, Canada.

Canton: A thin-shelled pecan that deserves trial in the commercial zones of Missouri and Kansas. It is proving to be a good producer of early maturing nuts. Medium to large nuts, about 90 per pound; kernel weight 46% of nut. Ripens 2 days before Colby. Originated in Canton, Missouri. I25M{SC}

Carlson #3: Selected by R.D. Campbell for trial in Canada because of its early maturity. Nut size and quality are similar to others selected in the New Boston, Illinois area. Ripens about 16 days after Colby. Grafts flower in their third or fourth year. E91M, E91M{PL}

Devore: Nut small, averages 115 to 120 per pound; kernel 40% of nut; white kernels, exceptionally well-flavored, reminiscent of shagbark hickory; poor cracking quality. Tree a consistent producer; early maturing in central Iowa; should be tried farther north. Also selected by the USDA for breeding in Brownwood, Texas. I25M{SC}, 140

Fisher: Nut medium-sized, cracks well; flavor good. Tree produces well at original location and in the Scranton, Pennsylvania area; protandrous. Originated in New Memphis, Illinois by Jacob Fisher. Introduced in the 1930's. 140

Fritz: Medium-sized nut; matures early. Tree a strong grower; produces well but comes into bearing very late; protogynous, may be very useful as a late pollen source. At one time considered the most northern native selection, along with Witte. Originated in New Boston, Illinois by Kenneth Fritz. JAYNES; E62{SC}, 140

Gibson: Medium-sized nut with good cracking qualities; flavor very good; fills well in the far northern pecan growing region. Tree precocious, two year grafts often bear nuts; a consistent and heavy producer; protandrous. Originated in New Boston, Illinois. B99{PL}, E62{DF}, E62{SC}, I25M{SC}, 140,186{SC}

Lucas: Nut small to medium, averages 100 to 120 nuts per pound; kernel oily, of fine flavor; cracks and fills well in the far northern pecan growing areas. Tree precocious; hardy; heavy yielding; protogynous. Originated in Ohio in 1965. B99{PL}, E91M, E91M{PL}, I25M{SC}, 140

Mullahy: The largest pecan of Iowa origin yet found; cracks out in perfect halves and is of excellent quality. Tree shows some evidence of hickory hybridization; starts bearing early; flowers early, with the native hickory. Handy to at least -30° F. Early reports indicate ripening in New York, Michigan and Ontario. I25M{SC}, I60{PL}

Witte: Nut somewhat larger than Indiana, 60 to 70 nuts per pound; blocky, of good shape; kernel 44 to 50% of nut; matures early. One of the best cultivars from this latitude, at one time considered the most northern pecan area, until the more recent discoveries. Tree starts bearing very late; protandrous. Originated in Burlington, Iowa by John H. Witte. Introduced about 1925. BROOKS 1972; I25M{SC}

#### NORTHERN PECANS

These mature their nuts in a shorter growing season than eastern or western cultivars. Their earlier maturity exposes nuts to greater damage from squirrels, birds, and insects in more southern latitudes than that of Tennessee. The traditional northern pecan growing area includes Oklahoma, Kansas, Missouri, Iowa, Illinois, Indiana, Kentucky and Tennessee.

Busseron: An old time cultivar that is still popular. Nuts large for a northern type, about 74 per pound, twice as long as wide; kernel weight 48% of nut; high quality kernel. Productive tree; protandrous. Originated in a forest near Oaktown, Indiana in the early 1900's. 140

Colby: Medium-sized, long oval nut, 55 to 65 per pound; shell thickness medium; kernel averages 45 to 50% of nut, cracks out poorly, flavor good; matures in a 160 day growing season. Tree vigorous and productive; resistant to leaf fungi; retains its foliage late in the fall; protogynous; a heavy pollen producer. Originated in Fayette County, Illinois. B99{PL}, D37, D76, E97, I25M{SC}, 140,153M, K76, L33

Giles: Nut fairly large, 55 to 65 per pound; shell thin, cracking quality fair; kernel averages 48 to 50% of nut, quality very good; matures late. Tree precocious; regularly productive near the latitude of origin, not as reliable northward; protogynous. Used as a rootstock in some areas. Originated in Chetopa, Kansas. Introduced in 1930. BROOKS 1972, JAYNES; 140

Greenriver: Medium to large nut, 50 to 70 per pound; shell thin; kernel 53 to 54% of nut, plump, quality very good; matures late. Tree large, a prolific and regular bearer; protogynous. Susceptible to

frost in central Illinois and occasionally in Kentucky. Later than other northern cultivars but produces good quality nuts where the season is long enough. Originated in Henderson County, Kentucky. A88M, 140, N20

Hirschi: Nut large, averaging about 56 per pound; cracking percentage 50 to 55%; shell thin, fills well; kernel of high quality. Tree considered to be self-fertile, but will normally produce larger crops when planted with Peruche and Giles. Recommended for all parts of Zone 6 except the extreme northern areas. Original tree discovered at Rich Hill, Missouri about 1940. I25M{SC}, 140

Hodge: Nut large, one of the finest flavored of all pecans; kernel tender, probably not adapted to commercial cracking. Tree not productive at Urbana, Illinois. Useful only as a late protogynous pollen source, and for breeding purposes. One of the first northern pecans to attract attention. Originated in York, Illinois. Discovered about 1890. BROOKS 1972; I25M{SC}, 140

Indiana: Small to medium-sized nut, averages about 77 per pound; kernel 47% of nut; quality very good; cracks out poorly; matures in midseason. Tree a very consistent producer; apparently self-fertile; produces pollen at the proper time to pollinate Major and Peruche. Originated in a forest near Oaktown, Indiana in the early 1900's. 140

James: Small to medium-sized, oblong nuts, 75 to 85 per pound; kernel weight 53% of nut; smooth shells; good cracking qualities. Selected for its dark glossy-green, unusually large foliage coupled with abundant production of nuts. Considered suitable for ornamental purposes. Originated in Brunswick, Missouri. BROOKS 1997; I25M{SC}, I53M

Kentucky: Nut small to medium, averages about 70 to 80 per pound; kernel weight 47 % of nut; quality good; matures midseason to late. Tree productive; apparently self-fertile; bud break 2 days after Colly. Originated east of Owensboro, Kentucky in the early 1900's. 140

Major: Small to medium-sized, roundish nut, 60 to 80 per pound; shell thin; kernel 42 to 50% of nut, plump and sweet; matures in midseason. Unacceptable for commercial cracking. Tree bears well; protandrous. Pistillate flowers develop over a long period and require pollen from late pollen producers such as Colty, Posey and Greenriver to set a full crop. The standard non-commercial northern cultivar. BROOKS 1972, JAYNES; A88M, I25M{SC}, 140, I53M, 174, K76, N20

Norton: Nuts relatively large for a northern cultivar, about 74 per pound; shell thick; kernel percentage only 40%; kernel color fair. Ripens early, about 6 days before Colty. Vigorous, very open tree; slow to begin bearing; protogynous. Originated near Clarksville, Missouri. Introduced in 1912. SPARKS; I25M{SC}

Patrick: Small, irregular nut, averages 115 per pound; shell thin, an excellent sheller, yielding about 60% kernel; kernel elongated, light-colored, plump, smooth; flavor good; ripens about midseason. Tree produces well; bears biennially; apparently resistant to pecan scab. Originated in Rogers County, Oklahoma. BROOKS 1972; U7A{SC}

Peruche: Nut small to medium, 60 to 80 per pound; papershell; kernel 55 to 63% of nut, flavor and quality excellent; matures in midseason. Tree vigorous; precocious and prolific; protandrous; bears a heavy crop annually. Thin shell makes it vulnerable to predators in some areas. Originated in St. Charles, Missouri. Introduced in 1955. BROOKS 1972, JAYNES; D37, D76, I25M{SC}, 140,174, N20

Posey: Medium-sized nut, about 72 per pound; cracking quality very good; kernel of high quality, flavor very good; matures medium-early. Tree sturdy, symmetrical; protogynous; a good pollen producer. Needs high fertility and adequate cross-pollination to bear well. Originated in Indiana. I25M{SC}, 140

Starking Hardy Giant: Large nut, up to 1 1/2 inches in diameter; shell thin; kernel halves oblong with a short point, plump, golden-yellow, flavor distinct, quality good; matures early, the last week of September. Tree medium-sized, vigorous; moderately productive, bears better crops if pollinated with Colby; haidy. Originated in Brunswick, Missouri by George James. BROOKS 1972; I25M{SC}, 174, L33

#### WESTERN PECANS

Cultivars that are suited to the central and western part of Texas and other areas of the Southwest and West where the climate is relatively dry. They are usually very susceptible to scab and various foliage diseases that attack the pecan. Generally not recommended for planting in the eastern pecan growing areas. JAYNES.

Apache: Large, blocky nut, 40 to 60 per pound; shell thin, cracking quality good; kernel smooth, bright, deteriorates slowly in storage, averages 60% of nut; quality high; matures in midseason. Tree vigorous and productive; subject to scab under humid conditions; protogynous. Good seedling rootstock. BROOKS 1972, JAYNES; N33

Burkett: Nut medium to large, round and wide; shell thin; kernel plump, up to 55% of nut, has an excellent, rich flavor; matures in midseason. Tree a regular and heavy producer; protogynous. Does well on high ground in East Texas. Choctaw recommended as a pollinator. Very popular in western areas. Originated in Clyde, Texas. C54, L90, L90{SC}, M83, N33

Cherokee: Medium-sized nut, 50 to 60 per pound; semi-soft shell, cracks well; kernels 55 to 60% of nut, of *high* quality, color slightly too dark; matures early. Tree vigorous; extremely precocious and productive; protandrous. Well suited for temporary tree or high density plantings. C54

Cheyenne: Medium-sized nut, 55 to 60 per pound; shell attractive; kernel 57 to 61% of nut, loose in shell, brightly colored; flavor excellent; matures in midseason. Well adapted to mechanical shelling. Good for high density plantings. Tree very precocious and productive; protandrous, therefore needing a protogynous type for good pollination. BROOKS 1972; A85M, C54, F93, G88, I83M, K76, L90, M83, N33

Maramec: Nut large, 40 to 50 per pound; oblong, blocky; shell thin; kernel averages 58 to 59% of nut, of high quality; matures in midseason. Tree large, spreading; vigorous and very productive; hardy; tolerant to pecan scab; has superior foliage until fall. Originated in Maramec, Oklahoma. BROOKS 1972; M83, N33

Navaho: Large, oblong nuts, about 62 per pound; kernel weight 61% of nut; kernel golden to light brown. Ripens in mid October. Vigorous tree, very precocious and prolific; protandrous. Susceptible to scab and vein spot. Originated in Brownwood, Texas. Introduced in 1994. C54, L90, L90{SC}, N33

Prilop of Lavaca: (Steffek, Kallus) Texas State Champion native pecan selection. Medium-sized, oblong nuts, about 78 per pound; shell smooth, with few markings; kernels weight 57%; attractive, golden-colored kernels. Protandrous tree; resistant to scab. Widely planted. Originated near the Lavaca River south of Hallettsville, Lavaca County, Texas. BROOKS 1997; N33

Select: Large, roundish to obovate nuts, about 46 per pound; shell very thin, fills well; flavor very good. Vigorous, hardy tree, adapted to a wide range of climates; precocious and productive. Originated in Riverside, California. Introduced in 1943. Grown for the premium quality gift trade in Mississippi. BROOKS 1997; C54, K66M{DF}

Shawnee: Medium-sized, slightly elongated nut, about 50 per pound; shell thin, light brown with relatively few dark stripes; kernel averages 60% of nut, smooth, bright in color, flavor excellent, cracks out well; keeping quality very good. Suitable for both in-shell and shelling trade. Tree vigorous; precocious and very productive;

protogynous. Originated in Brownwood, Texas. BROOKS 1972; L90, L90{SC}, M83, N33

Sioux: Nut small, 60 to 80 per pound; shell thin, cracks well; kernel averages 60% of nut, smooth; quality, flavor and appearance excellent, color bright; oil content high, does not deteriorate rapidly in storage; matures in midseason. Tree vigorous; moderately precocious, productive; protogynous. Does well in the Southeast with a good fungicide spray program. BROOKS 1972; L90, L90{SC}, M83, N33

Tejas: Small to medium-sized nut, averages 50 to 75 nuts per pound; has superior shelling qualities; kernel 50 to 56% of nut; matures in midseason. Tree extremely vigorous; moderately precocious, very prolific; protogynous; holds its green foliage late in the season. A88M, G88, LI, L90, L90{SC}, M83, N20

Western: (Western Schley) Medium-sized nut, 45 to 65 to the pound; shell thin; kernel 54 to 59% of nut, of high quality, flavor rich; matures midseason to late. Tree vigorous; precocious and very prolific; protandrous; tolerant of zinc deficiency. The standard shelling cultivar in the western irrigated pecan areas. JAYNES; A88M, B93M, C54, D23M, G88, I83M, I99M, L47, L90, L90{SC}, M83, N20, N33, Q93

Wichita: Nut medium-sized, averaging about 60 per pound; unusually attractive because of neat, purplish-black stripes and splotches on a clear brown shell; kernel 60% of nut, well-filled, of excellent quality; matures about with Western. Tree moderately upright, vigorous; early and heavy bearing; protogynous. BROOKS 1972; B93M, C54, G88, I83M, I99T{DF}, L47, L90, L90{SC}, M83, N33, Q93

#### PEPINO DULCE {GR}

##### SOLANUM MURICATUM

Cascade Gold: Heart-shaped fruit; golden skin, striped with purple. Much sweeter than other cultivars, without the characteristic musky aftertaste. The green immature fruit, having its own unique flavor when eaten raw or baked, is marketed as *pegreenos*. Well adapted to the climate of the Pacific Northwest. Developed over a 12 year period by Ismael Gomeroff. A62, A62{PR}, A62{PD}

Ecuadorian Gold: A market cultivar in South America that produces good crops of pear-like fruits over a long growing season. The fruit has an attractive color, is well-marked, and holds well on the plant. Self-fertile, but should be thinned for better fruit size. N7J

El Camino: Medium to large, egg-shaped fruit with regular purple stripes. Sometimes produces off-flavored fruits identifiable by their brownish-green color. One of two leading commercial cultivars in New Zealand. Released there in 1982 by the Department of Scientific and Industrial Research, from material collected in Chile. I83M

Golden Splendor: A heavy bearing variety that rates somewhat poorly for flavor and aftertaste. Produces a high percentage of large fruit. Oblong, yellow fruit striped with purple. Slightly upright growth habit. Popular in Australia and New Zealand. D57, I83M

Miski Prolific: Fruit creamy white with a faint salmon glow, lightly striped with purple; flesh deep salmon; flavor rich, sweet and aromatic, with no bitter aftertaste; seeds few or none; matures early. Strong growing plant; bears well without cross pollination. Originated in San Jose, California by Nancy Garrison, as a seedling of the New Zealand cultivar Miski. 174, L90J

Rio Bamba: Medium-sized fruit, strongly striped with purple; flavor excellent. Vining growth habit; makes an excellent climber or a hanging basket plant. Dark-green leaves with reddish-purple veins; purple stems; flowers darker than normal, making an excellent

display. Originated in Vista, California by Patrick J. Worley. Named after the city in Ecuador where the original plant was collected. D57, G20,183M

Temptation: Medium-sized, oblong fruit; yellow when ripe, faintly striped with purple; good, sweet flavor; quality high. Slightly upright bush with small, pointed leaves; productive. Introduced by the Nurserymen's Association of Western Australia. D57, 174, 183M, L90J

Toma: Medium-sized, oval fruit; 4 inches long, 3 inches in diameter; apex pointed, shoulder well-rounded; skin smooth, cream-colored when ripe, prominently striped with dark purple; pulp firm, light-cream in color, very juicy; flavor sweet and refreshing, with no hint of soapiness; seeds usually present; keeping quality excellent. An important export cultivar in Chile; introduced into New Zealand in 1979, released there in 1983. D57,174,183M, Q49M

Vista: Medium-sized fruits have good flavor and aroma. Upright, fairly compact plant of great vigor; self-fertile and heavy yielding; bright green, 3 inch long leaves. Originated in Vista, California by Patrick J. Worley. A cross of Rio Bamba and a seedling from South America. G20, N7J

## PEPPER {S>

CAPSICUM ANNUUM  
CAPSICUM FRUTESCENS

CAPSICUM CHINENSE

---

## SWEET PEPPERS

### BELLSHAPED

#### *Hybrid*

Chocolate Beauty:<sup>5</sup> 75-85 days. Medium-large^ blocky, very smooth, 3 to 4-lobed fruit; thick-walled; green, ripening to an attractive chocolate brown. Very sweet and nutritious, highest in Vitamin C when fully ripe. Resistant to tobacco mosaic virus. Highly recommended for home gardens and specialty markets. B6, B73M, B73M{PL}, C53, D65, D65{PL}, E97, F37T{PL}, G71, G82,191, J20, J97M, K50, L89, M1P, M49, etc.

Chocolate Bell:<sup>5</sup> 75 days. Large, blocky, deep bell-shaped fruit; 4 1/2 inches long; about twice the size of Sweet Chocolate; turns tan, to dark brown, to red when mature. Ripens 10 days later than Sweet Chocolate. Very rare seed imported from Holland. B75, B75{PL}, C20M, D26G, K71, L42, N52

Dutch Chocolate:<sup>5</sup> (Brupa) 73 days. Very large fruited heirloom from The Netherlands. Retains taste and shelf life of a green bell pepper long after its thick outer walls have turned an attractive brown. Eventually turns a bright red when ripe. Prized by the gourmet trade for its novelty. H49,177, K23{PL}

Golden Bell:<sup>1</sup> 70 days. Medium-large, blocky, 3 to 4-lobed fruit; light green, turning bright gold at maturity; thick-walled, very sweet. Vigorous, upright plant, 21 inches tall; provides good cover. Adapted mainly for home garden use. Rated first for productivity in a test conducted by Organic Gardening magazine. A16, D11M, mi,E91G, F13, F70, H33M, H54, H61,150G, J20, L89, M1P, M46, N16, etc.

Golden Summer:<sup>1</sup> 70 days. Large, blocky, 3 to 4-lobed fruit; pale lime-green, ripening to a rich golden yellow; thick-walled, juicy, sweet. Rated highest for overall flavor in a test conducted by Organic Gardening magazine. Does not ripen yellow in short season areas. Upright plant, 24 to 28 inches tall; resistant to tobacco mosaic virus. Good fruit set; wide adaptability. B75, C53, D76, E97, E97{PL}, F63, G13M, G79, H33M, 139,191, J4, MO, M1P

Ivory:<sup>2</sup> 65-70 days. Medium-sized, blocky, 3 and 4 lobed fruits; 3 1/2 inches by 3 1/4 inches; waxy, medium thick-walled; rich creamy-white, turning lavender, and ripening to a bright red; mild, sweet flavor. Very tolerant to sunburn. High yielding, compact plant; multiple virus resistant. Ideal for specialty markets. C20M, D26D, E91G, F63, G13M, G82, H61,150G, 191, J84, K10, K50, K57{PL}, K73, L89, M1P, M46, N52, etc.

Lilac:<sup>6</sup> 65-70 days. Medium-sized, blocky fruits; 3 and 4 lobed; 4 1/2 inches by 3 1/2 inches; ivory, turning an unusual lilac-lavender, and ripening to a bright crimson; crisp and flavorful. Remains in the lavender stage for a long time. Vigorous plant with good cover, multiple disease resistant. Recommended for specialty markets. C85M, D26D, D56M, E91G, G13M, H61, 150G, 191, J4, K10, K50, K73, M0, M1P, M46, M65, N52, etc.

Luteus:<sup>1</sup> 68 days. Large, blocky, mostly 4-lobed fruit; thick-walled; uniform in size; very delicate, mild flavor; resistant to cracking. Can be harvested green or after maturing to a golden-yellow. Quick growing, with a notably high yield. Resistant to tobacco mosaic virus, Very popular in Europe. N81, N84, S55, S61M, S75M

Mandarin:<sup>4</sup> 75 days. High quality, European style orange pepper. Large, elongated, 4-lobed fruits, 5 to 6 inches long; firm, medium-thick walls; green, turning an attractive pumpkin-orange when ripe; sweet, distinctive flavor. Resistant to tobacco mosaic virus and stip. Recommended for home gardens and specialty markets. C92, D26D, D56M, D76, E97,150G, K10, M1P, M65, TIM

Orobelle:<sup>1</sup> 72 days. Medium large, thick-walled, 3 to 4-lobed fruit, 4 1/2 inches long; dark green, ripening to yellow-gold; very sweet. High quality, either green or yellow. Strong, vigorous plant, provides excellent fruit coverage; resistant to tobacco mosaic and potato Y virus; high yielding. AI, B6, C85M, D26D, D68, F63, G6, G71, G82, G93M, I18M{PL}, 139, J84, K23{PL}, K50, M0, M1P, etc.

Purple Belle:<sup>6</sup> 68 days. Blocky, 4-lobed fruit, 4 1/2 inches square; green, ripening to purple, then blood red at full maturity. Busty, compact plant, keeps the fruit well protected from the sun; resists tobacco mosaic virus, Very popular specialty market item. A21, B8M, C20M, D42M, G68, M0, N52, TIM

Quadrato d'Oro:<sup>1</sup> 63 days. Large, blocky fruit, 3 to 4 inches long; glossy green, ripening to a rich golden-yellow; thick-walled, aromatic, juicy, sweet. Rated highest for sweetness in a test conducted by Organic Gardening magazine. Vigorous plant with good leaf coverage; productive; disease resistant. Developed in Holland for Italian and French market gardeners. J4, K66

Valencia:<sup>4</sup> 68-72 days, Very attractive, high quality orange bell. Medium-large, blocky fruits, mostly 4-lobed; 4 1/2 inches by 4 1/2 inches; glossy green, ripening to an intense orange Very sweet when ripe. Well-branched plant with good coverage, sets continuous crops. Resistant to tobacco mosaic virus and stip. Ideal for specialty markets. C85M, D26D, D68, E91G, G6, G13M, G16, G82, H61, 191, K10, K50, K66, K73, M0, M1P, M46, etc.

Vidi: 65-70 days. Gourmet European type. Large, elongated fruit, mostly 4 lobed; 6 or 7 inches by 3 1/2 inches; thick-walled; glossy dark-green, ripening to an intense bright red; very sweet and succulent. Prized for stuffing, broiling, grilling or as crudites. Vigorous plant, sets well under adverse growing conditions. Multiple virus resistant. AI, C53, C92, D68, E63D, F63, G13M, G82, H61, J4, J20, K10, K49Z, K50, K66, K73, M0, M1P, N16, etc.

#### *Open-Pollinated*

Albino:<sup>2 3</sup> (Albino Bullnose) 80 days. Medium-sized fruit; stays white a long time before finally turning red; medium thick-walled, sweet. A colorful and tasty addition to salads. Dwarf bush; disease resistant; may be grown outdoors in far northern regions or in flower pots. F73D, J4, M1P

Ariane:<sup>4</sup> 70 days. Large, blocky, medium-green fruit ripens to a uniform vibrant-orange, the first true orange in a bell pepper. Heavy and solid, with thick, crunchy flesh. Sweet and flavorful in green or orange stages. Vigorous plants; resistant to tobacco mosaic virus type-O. Developed to honor the House of Orange, the Royal family of Holland. B8M, F73D, I18M{PL}, 139,177, F85G, I18M, MO, M32, N84, Q11M, R32, S61M, S75M

Bull Nose: (Large Bell) 65 days. Medium-sized, blunt-ended fruit; 3 inches long, 2 3/4 inches in diameter; deep green, ripening to scarlet red; thick-walled flesh, mild in flavor except for the ribs which are quite pungent. An old traditional cultivar. Introduced into the United States from India, in 1759. A2, L7M, M95M, Q18, R0

California Wonder: 75 days. Large, blocky, 3 to 4-lobed fruit; smooth and glossy; dark green, ripening to bright crimson; thick-walled, up to 3/8 inch; tender, juicy, sweet, without a trace of pungency. Vigorous, upright plant; provides good cover. The archetypical bell pepper; introduced in 1928. A25, C26{PL}, D11M, E59Z, E97, F70, F92, G71, G79, H21, H33M, L7M, L10, M1P, N16, etc.

Carnosissimo di Cuneo: Large, oval-pointed fruit, mostly 3 to 4-lobed; skin clear bright-yellow, attractive; flesh sweet, very bulky and exceptionally thick-walled. The principal market grower's pepper in the Piedmont region of northern Italy. Named after the market town of Cuneo. Q11M

Chinese Giant: 90 days. Large to very large, blocky fruit, up to 6 inches long and 5 inches across when thinned; distinctly ribbed and lobed; rich green, turning bright cherry-red when ripe; medium thick-walled; mild, sweet, mild flavor. Excellent for stuffing. Compact plant, about 24 inches tall. Popular standard cultivar. Introduced in 1900 by W. Atlee Burpee & Co. B75, D56M, I18M, J4, K71, M1P, M65, O89, R0

Emerald Giant: 74 days. Large, blocky, mostly 4-lobed fruit; 4 1/2 inches long, 3 3/4 inches in diameter; dark green turning red at maturity; thick-walled. Strong, upright plant, 26 to 28 inches tall; productive over a long period; resistant to tobacco mosaic virus. Excellent for fresh market, shipping and home garden use. B75M, E91G, G13M, G79, G93M, H54, H61, J4, J84, K10, K49M

Golden Calwonder: 72 days. Smooth, blocky, mostly 4-lobed fruit; 3 3/4 inches long, 3 1/2 inches in diameter; medium-green, turning golden-yellow at maturity; thick-walled, sweet, mild. Strong, upright plant, 22 to 26 inches tall; sets fruit continuously. Popular for fresh market and home garden use. C26{PL}, E53M, F80, G27M, G79, G93M, H95,164, J4, J97M, K10, K71, M1P, M95M

Golden Summit: 65 days. A family heirloom, developed over a 200 year span of intensive Yugoslavian market gardening. Attractive golden-green fruit, ripening to a bright gold, turning bright deep red at full maturity; 3 or 4 lobes; very thick-walled, crisp, juicy, sweet. Begins to bear early in the season, even if nights are cool. E91G, F24M

Jupiter: 72 days. Very large, extremely blocky, 4-lobed fruit; 4 inches deep, 4 inches wide; green, turning bright red when ripe; thick-walled. Vigorous, high yielding, widely adapted plant; with a dense canopy of leaves that provides protection from sunburn; resistant to tobacco mosaic virus. One of the best open-pollinated cultivars. B6, E91G, F13, F71M, G1M, G16, H54, H61, J4, J14{PL}, K10, K50, K73, MO, M1P, M29, etc.

Kaala: Bell pepper developed for subtropical areas which have limited production due to bacterial wilt. Fruit measures 3 inches in length and 2 1/2 inches in width. Resistance to bacterial wilts is greatly reduced at temperatures above 80° F. Developed at the University of Hawaii. L4, M32M

Kandil: Attractive bell-type pepper originating in Turkey. Blocky, 3 to 4 lobed fruit; 3 inches long, and 2 to 2 1/2 inches in diameter; light green, turning greenish-yellow and finally red when fully ripe;

thin, translucent flesh, sweet and crunchy. Can be picked when either green, yellow or red. Turkish name means lantern, referring to the translucent qualities of the fruit. J73, N84

Keystone Resistant Giant: 75 days. Large; blocky, mostly 4-lobed fruit; 4 1/2 inches long, 3 3/4 inches in diameter; attractive dark green, turning dark red when ripe; thick-walled, sweet and mild. High yielding plant; resistant to tobacco mosaic virus; has heavy foliage that reduces susceptibility to sunscald. C92, E5T, E91G, G79, G82, H95, J4, J84, K27M, L7M

King of the North: 65 days. Very large, blocky, 3 to 4-lobed fruit; 6 inches long, up to 4 inches in diameter; green, turning bright red when mature; medium thick-walled, crisp, sweet and mild. Large, somewhat spreading plant; resistant to tobacco mosaic virus. Performs well in short summer areas. C26{PL}, D26D, D68, D76, D76{PL}, E97, E97{PL}, J4, M1P

Midway: 70 days. Improved Staddon's Select type. Large, blocky, 3 to 4-lobed fruit; 4 1/2 inches deep, 4 1/2 inches wide; bright green, turning red when mature; thick-walled, very sweet, mild in flavor. Tolerant to tobacco mosaic virus. Recommended for northern areas and greenhouse production. Popular early main season cultivar. A16, B73M, C44, D27, E53M, F63, G79, J4, L42, M1P, Q11M

Mini Bell:<sup>7</sup> 55 Days. Miniature bell-type fruit, about 1 1/2 inches in diameter; ripens from waxy-green to red. Sweet fruits are perfect for pickling whole, stuffing for canapes, and livening up relish trays. Bushy, 18 inch tall plants bear dozens of fruits. C26{PL}, G13M, E5T, F73D, J4

Purple Beauty:<sup>6</sup> 70 days. Medium-sized, 4-lobed fruit, 4 inches square; dark purple; thick-walled. Compact, high yielding plant; provides good fruit protection. Sets well not only in the crown but also as limb set. Should be picked early to avoid tendency to display some green when over-mature. Developed from the hybrid Purple Bell. C53, C92, E53M, E75{PL}, E97, F13, F37T{PL}, F63, G13M, G27M, G82,139,191, J4, J97M, M0, M1P, M32, etc.

Quadrato d'Asti Giallo:<sup>1</sup> (Asti Square Yellow) Gourmet yellow-ripening Italian pepper. Large, blocky 3 to 4-lobed fruit; ripens to a bright golden-yellow; thick-walled, crisp, juicy, sweet with a hint of spiciness. Excellent for roasting, frying, salads, stuffing or pickling. Vigorous, high-yielding plant; does best in warmer climates. G53M, K46T, J4, Q11M, S17

Staddon's Select: 70 days. Large, blocky, 3 to 4-lobed fruit, somewhat uneven in shape; glossy green, turning red when ripe; medium thick, crisp and sweet. Tall, bushy plant; high yielding even under hot, dry conditions; resistant to tobacco mosaic virus. Does well in northern areas. Sets fruit reliably under cool night conditions. D68, E91G, F44, G82, J4, J25M, J25M{PL}, K49M, K50, M49

Sweet Chocolate:<sup>5</sup> 65 days. Medium-small, tapered, blunt-nosed fruit; dark glossy green, ripening to a rich chocolate brown; medium-thick walls, sweet and flavorful. The flesh below the skin is an attractive brick red, cooked or raw. Prolific plant; tolerant of cool nights. Developed by E.M. Meader at the University of New Hampshire. C20M, F44, F73D, G6, J4, J9M, K20M, K49M, K57{PL}, L4, L7M, L91M, O89, R47

World Beater: (Ruby Giant) 73 days. Very large, blocky, long-tapered fruit; 6 inches long, 4 1/2 inches in diameter; rich green, turning to cherry red at maturity; moderately thick-walled, sweet and mild. Keeps in prime condition for a long time. Ideal for stuffing. Very productive; yields as many as 32 fruits per plant. C92, J4, K490, L7M, L94

Yolo Wonder: 75 days. Blocky, 3 to 4-lobed fruit, similar to California Wonder but somewhat longer; attractive green, ripening to red; thick-walled, firm. Bushy plant; gives good protection from sunscald and hail; tolerant of adverse weather conditions; highly

resistant to tobacco mosaic virus. A21, B49, E5T, G27M, G57M, G68, G71, H49, H61, 184, J4, M1P, R32

**PIMENTOS** Thick-walled, usually heart-shaped or flattened fruits used for salads, stuffing, roasting, pickling or canning. Also dried and ground into *Spanish paprika powder (pimenton)*, used in the famous *romesco* sauces of Catalonia. Some forms are known as *squash peppers* or *cheese peppers*. Many of the sweetest peppers belong to this class. E14T{DF}, G47J{DF}, I94M{PD}. GRAY, P. [Cul]

Choco:<sup>5</sup> 75 days. Medium-sized, tomato-shaped fruit; glossy dark green, ripening to chocolate brown; thick-walled, very mild and sweet. Good for stuffing and salads. Haidy, productive plant; 2 to 3 feet tall. Does well in northern areas. D42M, E5T, J4, J84, TIM

Figaro: 68 days. Flattened, globe-shaped, thick-walled fruits with scalloped edges, 3 to 4 inches in diameter; smooth skin, crimson red when ripe; crisp, juicy flesh, rich flavor. Excellent for eating fresh in salads or as crudites. Strong, vigorous plants. Italian heirloom from the Yakima Valley of Washington. J97M, K66

Gambo: 90 days. Flattened globe-shaped, mostly 4-lobed fruit; 2 1/2 inches deep, 4 inches in diameter; glos<sup>^</sup>, rich deep-red when ripe; crisp flesh, very juicy and sweet. Excellent for stuffing and pickling. Should be harvested when fully red-ripe. Vigorous, medium-tall plant. L7M, M1P, T27M

Nora: (Nyora) Small, ruby-red, medium mild peppers. The authentic peppers used in the classic *Romesco* sauces of the Tarragona province in Catalonia, Spain. Usually dried and mixed with pulverized almonds and hazel nuts, and tomatoes. *Romesco* sauce is traditionally employed for flavoring fish soups and stews, *calgots*, salt cod, salad dressings, and a festive endive salad called *xato*. ANDREWS, C. 1988 [Re], DOMINE, DOMINGO, NORMAN; L13P{DF}

Pimento: (Red Pimento) 75 days. Medium-sized, uniform, heart-shaped fruit; 3 1/2 inches deep, 2 1/2 inches wide at the top; dark green, ripening to deep bright-red; thick-walled, juicy, very sweet; small seed cavity. Widely used for stuffing, pickling and canning. Vigorous, productive plant. A2, C44, D42M, E53M, H49, 139, I63T, J4, J25M, J25M{PL}, K49M, M81T

Pimento L: 80 days. Large, heart-shaped fruit; 4 1/2 inches long, 3 1/2 inches in diameter; dark green, turning bright red at maturity; very thick-walled, sweet and mild. Widely used for canning. Vigorous, upright plant; height 18 to 24 inches; provides good cover; resists tobacco mosaic virus. C20M, C92, DIT, G27M, G57M, G93M, H33M, H61, H95, J4, J84, K10, MO, M1P, N16, etc.

Pimento Perfection: 75 days. Very smooth, heart-shaped fruit; 3 inches long, 2 1/2 inches in diameter; green, ripening to bright crimson red; flesh unusually thick, very sweet and juicy. Should be harvested when uniformly red. Excellent for stuffing and canning. Upright plant, to 30 inches tall; resistant to tobacco mosaic virus. Z50G, /59M, J4, L7M, M95M, N52

Pimento Select: 72 days. Smooth, heart-shaped fruit; 3 1/2 inches long, 2 1/2 inches in diameter; deep green, ripening to brilliant red; thick-walled, very sweet and mild. Excellent for canning, freezing and pickling. Upright plant; height 33 inches; makes a concentrated set. D76, F80, G82, N84

Red Heart: 80 days. Large, thin-walled, thick heart-shaped fruits with a rich, concentrated flavor. Fruits are tender to sun and drought. Tall plants. Voted the best tasting sweet pepper among 25 cultivars grown by Peace Seeds in 1987 and 1988 and tested by the American Tomato Institute. A2, K23, K23{PL}, K49T, N84

Red Ruffled: 85 days. Small to medium-sized, uniquely-shaped, fluted fruits, maturing to a very dark red color. Thick walled. One of the very best sweet peppers for eating out of hand. Also good for roasting when green. Yields 8 to 10 fruits per plant. Grows 2 feet tall. Produces early and abundantly. A2, K23{PL}, K49T, L3J, L55J, N84

Sheepnose Pimento: 70 days. Flattened, cheese-shaped fruits, 4 inches in diameter and 3 inches deep; red when ripe; very meaty. Good for fresh use or canning. Grows 22 inches tall and 16 inches wide. Rather sparse foliage. Cold tolerant. Favorite of the Seed Savers Exchange. Given to them by the Family of Nick Rini, of Ohio. E5T, F24D, K47, M0

Sunnybrook: (Sweet Cheese, Burpee's Sunnybrook) 72 days. Flattened globe, tomato-shaped fruit; 2 inches deep, 3 inches in diameter; deep green, ripening to scarlet red; thick, sweet, juicy very mild flesh; small seed cavity. Excellent for stuffing and baking. Tall, upright very productive plant. DI 1M, F70, J4, M1P

Super Red Pimento: 70 days. Squash or flat-shaped type. An earlier, larger version of the standard pimento Very large fruit, 5 3/4 inches wide, 3 1/4 inches deep; green, ripening to red; extra thick flesh, sweet and mild. Resistant to tobacco mosaic virus. E75{PL}, 177, J4, L42, M0

Tangerine: 80 days. Unique, orange-colored pimento Variesly shaped, thick-walled fruits, somewhat reminiscent of tangerines when ripening. Sweet, juicy and delicious. Excellent for eating out of hand. Vigorous and productive plant; early maturing. C26{PL}, F73D, I99M, K23{PL}\ K49T, N84

Yellow Cheese: 73 days. Large, squash-shaped fruit, averages 25% larger than Sunnybrook pimento; green, ripening to yellow, then to orange-yellow at full maturity; thick-walled, sweet and mild. Contrasts well with red or green cheese types in baskets or relish. F73D, 177, J4, K49M, L42, N52

## OTHERS

### Hybrid

Gypsy: 65 days. Wedge-shaped, slightly curved fruit, 3 to 4 inches long; yellow, ripening to orange-red; medium thin walls, crisp and tender, sweet at full maturity; of excellent flavor and quality. Vigorous, spreading plant; height 12 to 20 inches; widely adapted; tolerant of tobacco mosaic virus. All America Selections winner in 1981. B6, B73M, B75{PL}, C44, C85M, D11M, F70, G16, G57M, G71, G82, H61, M0, M1P, M49, etc.

Long Green Buddha: 70 days. Long, rather conical fruit; pungent with the seeds intact, has a strong green pepper taste when the seeds are removed. Valuable for its economical size and interesting shape. Compact, bushy plant; height 2 feet; produces 12 to 20 fruit over a long period. J20, S70

### Open-Pollinated

Aconcagua: 70 days. Large Cubanella type that can weigh up to 12 ounces. Long, tapered fruit; 2 1/2 to 3 inches wide, 10 to 11 inches in length; medium thick-walled, juicy, medium-sweet. Best harvested when light green. Tall, vigorous plant; sets well early and late. Named after Mt. Aconcagua in Argentina. B75, B75{PL}, D56M, E5T, F63, F71M, J4, K10, K46T, K47, K49M, K49T, K71, M0, M1P, M65, etc.

Centinel: Narrow fruits; 5 inches long, 1/2 to 3/4 inch across. Similar in shape to Corbaci but even sweeter. Good for eating fresh, pickling, or stir-frying. In tests conducted by the University of California Extension service, Corbaci rated second in production of 28 tested, yielding 758 fruits from only 10 plants. J4, J73, N84

Chervena Chujski: 85 days. Tapered fruits, 6 inches long and 1 1/2 to 2 inches wide at the shoulder; green, turning brown, then bright red when ripe; extremely sweet and flavorful, almost candy-like. Healthy plants. Heirloom from Bulgaria. One of the most popular sweet peppers ever offered by the Seed Savers Exchange. K47

Corbaci: (Sari Tatli Sivri) Attractive ornamental pepper shaped like a Turkish scimitar. Fruit 11 inches long, 3/4 inch across; bright red when ripe; very sweet. Suitable for eating fresh, cooking whole, or pickling in a large jar. In yield tests conducted by the University

of California Extension service, Corbaci produced 650 fruits from only 7 plants. C26{PL}, F73D, J4, J4D, J73, K23{PL}, N84

Corno di Toro Giallo: (Yellow Bull's Horn) 68 days. Fruit about 8 inches long, 1 1/2 inches in diameter at the shoulder; tapered to a curved point, resembling the horn of a bull; ripens to a deep golden-yellow. Has a spicy flavor, neither hot nor very sweet. A traditional favorite in Italy. B8, B8M, C53, I18M{PL}, 177, J4, K10, K23, K23{PL}, K49T, K66, MO, M1P, Q11M, Q34, etc.

Corno di Toro Rosso: (Red Bull's Horn) 68 days. Long, tapered fruit, 8 to 10 inches long; color deep vivid red when ripe; similar to Corno di Toio Yellow but narrower and not as curved. Excellent eaten fresh or roasted, peeled, and then marinated. Vigorous, branching plant, bears heavily. A7{PD}, B8M, B49, B75, B75{PL}, C53, H49, I99M, J4, K23, K23{PL}, K49T, K66, K71, M1P, Q11M, Q34, etc.

Cubanelle: (Cuban) 65 days. Very popular frying pepper. Fruit long, tapering to a blunt end, 2 to 3-lobed; 2 1/2 inches in diameter, 5 to 6 inches in length; yellow-green, turning red-orange when ripe; medium thick-walled, waxy, of spicy flavor. Medium-tall, heavy yielding plant; sets fruit continuously. Introduced in 1958, probably from Italy. ANDREWS, J. [Re]; A21, B1M, B75M, C44, E13G{PR}, E91G, F71M, F80, G71, H61, J4, J73, K23{PL}, MO, M1P, N16, etc.

Feherozon:<sup>2</sup> Short, conical fruit, 3 1/2 to 4 1/2 inches long; borne in clusters; thin-walled; skin smooth, wax-yellow ("white"); flesh sweet. Popular for *letcho*, stuffed paprika, different kinds of pickles and deep-frozen paprika. Used for mid-season and late spring forcing and in outdoor growing for the early market. Resistant to tobacco mosaic virus. Originated in Hungary. SOMOS; J73

Fushimi Long Green: Long, thin fruit; 5 to 6 inches in length, only 1/2 inch wide; glossy, bright-green skin, wrinkled at maturity; thin-walled; sweet mild flavor. Can be sliced in cross-section for tiny rings. Tall, vigorous plant; very prolific. An old traditional Japanese cultivar. C20M, C26{PL}, D55, G33, F73D, J4, N84, S63M

Giant Szegedi: 70 days. Hungarian long, tapered yellow bell type. Extra large, top-shaped pendant fruit; 3 1/2 inches wide, 6 inches deep; changes color very uniformly, from pale green-yellow to butter-yellow, to orange-red at full maturity; very thick and sweet flesh. Tolerant to verticillium wilt. C26{PL}, J4, K49M, K49T, K57{PL}, L42

Golden Greek: 65 days. Famous pepperoncini type pepper from Greece widely used in the well-known appetizer known as a *Greek Salad*. Small fruit with an inverted tip, shorter than Italian strains; thin-walled; green, turning yellow; mildly hot. Excellent color and flavor when processed. Usually picked at the yellow ripe state for pickling in vinegar. Grown commercially to a limited extent in Louisiana and other Southern states. ANDREWS, J. [Re]; I64M{PD}, J4, J66M{PD}, K10

Italian Sweet: (Long John) 65 days. Thin-skinned fruit; 6 to 7 inches long, 2 inches wide at the shoulder, tapering to a blunt point; dark green, turning red at maturity; medium-thick flesh, has a sweet mild flavor when fully ripe. Excellent for frying. Widely adapted throughout the Northeast. C92, E24, F71M, G93M, J4, J9M, K49T

Lipstick: 53 days. Heavy, cone-shaped fruit; about 5 inches long, tapering to a blunt point; attractive dark-green, ripening to a glossy rich red; thick-walled, juicy, flavorful. Good for salads, cooking and roasting. Dependably early, heavy yields, even in cool summer areas. G6, J4, M32, PIG, R47

Lombardo: Long, thin fruit, slightly wrinkled at the stem end, tapered to a point; approximately 4 to 4 1/2 inches in length; pale green in color; sweet flesh. Excellent for preserving in olive oil or brine. Very productive plant, grows 2 to 2 1/2 feet tall. Widely used in Italy for fresh market and by the commercial canning industry. Q11M

Nardello: (Jimmy Nardello) 75 days. Heirloom Italian frying pepper. Slender, tapered fruit; 1 inch wide, 7 to 8 inches long; green, turning red when ripe; thin-walled, extremely sweet. Excellent for frying or eating raw. Medium-tall, heavy yielding plant; disease resistant. A2, B49, C26{PL}, F24D, F73D, I99M, K23{PL}, K49T, 089

Papri Mild: 78 days. Long, slender fruit; 5 to 7 inches in length, 1 1/2 inches in diameter; deep green, ripening to bright dark red; thick-walled, high in flavor but mild in pungency. Can be dried in the sun or a dehydrator, and powdered for kitchen use. Also excellent fresh or roasted. Selected for its quick drying abilities and extremely dark color at maturity. J73, K49Z, MO, N84

Paradicsomalaku Zold Szentesi: Small to medium-sized, flattened globe-shaped fruit, 2 inches in diameter; 3-4 ribbed; weight 2 1/2 to 3 1/2 ounces; medium thick-walled; dark green turning red when ripe. Sweet, pleasant flavor. Always picked at full maturity for the home fresh market and for processing. Processed into different kinds of purees, pastes, marinades, dehydrated produce and juice. SOMOS; C26{PL}

Pepperoncini: 70 days. Tapered, usually wrinkled fruit; 2 1/2 to 3 1/2 inches long, 1 1/2 inches in diameter; green, turning red when ripe; thin-walled, sweet. Excellent for pickling green — harvest when 2 to 3 inches long. Large, upright plant; height 26 to 36 inches. ANDREWS, J. [Re], DREMANN, S. 1986 [Re]; A2, A7M{PD}, A21, B8M, C26{PL}, D56M, F71M, 139, J4, J76{PL}, K49M, L89, M0, M1P, M46, etc.

Red Cherry: (Cherry Sweet) Round, slightly tapered fruit; 1 inch deep, 1 1/2 inches in diameter; dark green, turning red at maturity; medium thin walls. Popular for pickling at either green or mature red stage. Medium-sized, bushy plant; height 18 to 20 inches; sets fruit continuously. B75M, C26{PL}, E53M, F71M, G71, G82, H33M, H61, 139, J4, L7M, M0

Red Marconi: (Marconi Rosso) Traditional long red, very sweet peppers from Italy. Tri-lobed fruit, slightly curved towards the lower end; 10 to 12 inches long, 2 1/2 inches across at the shoulder. Very mild at all stages of ripeness. Excellent for salads and frying, both green and when mature. Dwarf, upright plants, very productive. A2, B8M, B73M, C53, C92, G57M, H49, J4, K10, M0, M1P, M32, Q11M, Q34, RUM, S55, etc.

Shishito: (Lion Pepper) Small, irregularly curved and wrinkled fruit; 2 1/2 to 3 inches long, about 1 inch across; thin, pale green skin; crisp and mild flavored. Suitable for tempura and chicken shish kebab. Vigorous, productive, semi-upright plant with short internodes; widely adapted; early and heat resistant. For home gardens and fresh market. ISUJI; C20M, C26{PL}, D55, F73D, J4, N84, Q28, S70

Sigaretta di Bergamo: Long, narrow fruit, slightly wrinkled at the stem end, tapered to a point; approximately 4 to 4 1/2 inches in length; very thin-walled; sweet flesh. Will turn red when ripe, but usually picked green. One of the best cultivars for pickling in vinegar. B8, C26{PL}, Q11M, S17

Slim Pim: Slim green fruit, about 4 inches long, turns red when mature. Best eaten when very young and tender. May be cooked whole in Chinese dishes or stews. Vigorous plants produce early and abundantly. Of Japanese origin. C20M, N84, R32, S55

Super Shepherd: 68 days. Very popular Italian Sweet type. Tapered, irregularly curved fruit; 7 1/2 inches long, 2 1/2 inches wide at the shoulder; dark red; unusually thick flesh, sweet and juicy, has a distinct flavor. Perfect length and flesh thickness for processing or frying. A2, B8, J4, L7M, L42

Sweet Banana: (Hungarian Yellow Sweet Wax) 70 days. Long, cylindrical fruit, tapering to a point; 1 1/2 inches in diameter, 6 inches long; waxy yellow, turning red when ripe; medium thick-walled, sweet and mild. Compact, sturdy plant; height 18 to 22 inches; produces an abundance of fruit over a long period. All-

purpose cultivar for shipping, processing and fresh market. All America Selections winner in 1941. ANDREWS, J. [Re]; A16, B63M{PD}, B78, C44, F32D{PL}, F71M, F82, G71, G79, H61, I64,, L7M, M1P, N16

Sweet Pickle:<sup>3</sup> 65 days. Dwarf plant, 12 to 15 inches tall; produces dense clusters of two inch oval fruits - yellow, orange, red and purple, all on the plant at the same time. Ideal as an ornamental bedding plant. Thick-walled fruit, sweet and flavorful, especially in the orange and red stages. Excellent pickled. F37T{PL}, 191, J4, K49M

### HOT PEPPERS

#### MEXICAN/SOUTHWESTERN

Anaheim: Long, tapered, pointed fruit; 7 to 8 inches long, 1 to 1 1/2 inches wide; light green, turning crimson red when ripe; medium thick-walled, mild to moderately hot. Very popular for stuffing when red-ripe. Vigorous, upright plant; height 28 to 30 inches. Smoked dried green pods are called *Chile Pasado*. Widely grown in California and the Southwest. Originated near Anaheim, California in 1903. ANDREWS, J. [Pre, Re], CUSUMANO [Cul, Re], SCHNEIDER 1986 [Cul, Re]; C89{PR}, D3M{PR}, E13G{PD}, F13, F37T{PL}, F71M, F80, G71M, I63T{DF}, J73, K66, K71, L89, M1P, N16, N40{PR}, N40{PD}, etc.

Ancho: (Poblano, Mulato) Large, conical fruit; up to 5 1/4 inches long, 3 3/4 inches wide; deep dark-green, turning red at full maturity and reddish-brown when dry; mildly pungent to hot. Widely used for *chilis relleños*. Plant grows 2 to 3 feet tall; requires a warm climate. Known as Poblano when fresh. Probably the most popular chili in Mexico. ANDREWS, J. [Pre, Re], CUSUMANO [Cul, Re], SCHNEIDER 1986 [Cul, Re]; A21, B75, C94M{DF}, E13G{PR}, F71M, I63T, I63T{DF}, J4, J20, J25M{PL}, J73, J76{PL}, K23, K23{PL}, L17{DF}, M81T, etc.

Cascabel: Mexican cherry type. Small, oblate fruit; 3/4 inch long, 1 inch in diameter; dark green, turning deep red at maturity and reddish-brown when dry; medium-thin walls; moderately pungent, spicy flavor. Very popular for drying. Medium-large plant, to 3 feet tall. Spanish name means "jingle" or "sleigh bells", referring to the rattle the pods make when dried. ANDREWS, J. [Re], CUSUMANO [Cul, Re], DREMANN, S. 1986 [Re], LATORRE 1977a [Re]; A7{DF}, A21, A49D{DF}, D42M, E13G{DF}, G47F{DF}, H73{DF}, I63T, I63T{DF}, J4, J25M, J25M{PL}, J76{PL}, L17{PD}, MO, N40{DF}, etc.

Cascabella: (Cascabelle) 75 days. Small, heart-shaped fruit; 1 1/2 inches long, 3/4 inch in diameter; light yellow, turning deep orange-red at maturity; medium-thick walls, mildly pungent flavor. Widely used when in the yellow state by commercial packers for hot pickled chilis. Medium-large plant, to 3 feet tall. Developed by the Clarence Brown Seed Co. of Fresno, California. ANDREWS, J.; C20M, C69D{PL}, D42M, D74B, F73D, G57M, 139, J4, K49Z, K66, MO, M1P

Chilcostle: (Chilcoxtle) {DF} Gourmet chile from Oaxaca, Mexico. Highly prized by knowledgeable chile chefs. Thin-walled; turns orange-red when ripe. Excellent, medium hot, slightly sweet, citrus-like flavor. Used in the classic red and yellow Oaxacan mole sauces. Also very good in salsas and soups. Both large and small dried forms are available. QUINTANA 1994 [Re], ZASLAVSKY; E13G, 116, 163 T

Chilhuacle Negro: {DF} Large, bell-shaped fruit; dries to a nearly black, mahogany color. Moderately pungent, extremely rich, intense flavor. Used for making the famous Oaxacan black mole sauces. Known as *siete caldos* in parts of Mexico, as one pod is enough to make seven bowls of soup. Becoming very popular with gourmet chefs. ANDREWS J., DEWITT 1996, ZASLAVSKY; C26{PL}, C34G, E13G, F73D{S}, 116,163T

Chimayo: 95 days. Legendary chili, developed by the Hispanic residents of Chimayo, New Mexico. Long, slightly curved, blunt-

ended fruit; 5 to 6 inches in length; mild when green, quite hot when red. Used for making the *ristras* found all over the Southwest. Plant grows 24 to 30 inches tall. DREMANN, S. 1989; A7{DF}, C26{PL}, C69D{PL}, D42M, 116,116{DF}, I63T, I63T{DF}, J4, J25M, J25M{PL}, J73, K17J{DF}, N84

Coban: Small, conical fruit, 3/4 inch long and 1/2 inch wide; red when ripe; quite hot but flavorful. Traditionally preserved by being smoke dried like the *Chipotle* chile. Planted in spring in the low hot desert. In temperate areas, sow in spring when the soil has warmed up some. Very popular in Guatemala, where it is sold in local markets. MARKS; C26{PL}, C69D{PL}

Costeno: Elongated, cylindrical fruits with narrow shoulders; similar to Guajillo and Miasol. Very attractive, glossy, deep orange-red when ripe. Mildly hot, spicy flavor, excellent in salsas and mole sauces. Grown mostly in the states of Guerrero^ Veracruz and Oaxaca. Both red and yellow dried forms are available. Occasionally found in Mexican and Latin American markets. ANDREWS, J.; C69D{PL}, C95, E13G{DF}, I16{DF}, I63T{DF}, K23, K23{PL}

De Arbol: (Tree Chile) 75 days. Tapered, pointed fruit; 2 1/2 inches long, 3/8 inch wide; light green, turning bright red when ripe; very thin-walled, very hot, although the hotness does not seem to irritate the stomach. Upright plant; 3 to 4 feet tall, 18 inches across; very productive; perennial in warm climates. Often used for infusing fancy bottles of oil and vinegar. ANDREWS, J. [Re], DREMANN, S. 1986 [Re]; A7{DF}, C94M{DF}, D42M, 116,163T, I63T{DF}, J4, J25M, J25M{PL}, J76{PL}, J73, K17J{PD}, K49M, L17{DF}, MO, M1P, M81T, N40{DF}, etc.

De Comida: Glossy red fruit, 4 to 6 inches long; rather hot. Traditionally used in making *mole*, a popular pre-Columbian sauce made from chilis, unsweetened chocolate, onions, tomatoes, cinnamon, etc. Fruit dries well for storage. From the state of Oaxaca, Mexico. F80, N84

Dr. Greenleaf Tabasco: (*C. frutescens*) 120 days. A virus resistant tabasco pepper developed at the University of Auburn. Produces a heavy crop of very pungent red pods; excellent for hot pepper sauce. Especially adapted to the South. Also an excellent ornamental. D42M, J4

Espanola Improved: 70 days. A special short-season chili which will turn red and become hot even in cool, northern climates. Long, tapered, medium-sized fruit; dark-green, turning red when ripe; thin-walled; extremely hot; resembles Sandia. Can be used for fresh green chile or dry red products. Developed from a cross of Sandia and an Espanola Valley native type chili. Released in 1983 by the New Mexico State Agricultural Experiment Station. C26{PL}, C69D{PL}, D42M, F71M, I63T, J4, J25M, J25M{PL}, K5M, K66, M0, Q34

Guajillo: 58 days. Large, tapered fruit; 4 1/2 to 5 1/2 inches long, 1 to 1 1/4 inches in diameter; green, turning translucent red when ripe; thin-walled, quite hot. Good for drying. Grows 3 feet tall, 1 1/2 feet wide. Very popular in parts of Mexico, where it is nicknamed *Chili Travieso* or "naughty chili" due to its fierce bite. ANDREWS, J. [Re], DREMANN, S. 1986 [Re]; A7{DF}, D42M, E14T{DF}, G47F{DF}, H73{DF}, I16{DF}, I63T, J4, J25M, J25M{PL}, J73, K18M{DF}, L34{DF}, M0, N40{DF}, Q34, etc.

Giiero: Conical fruit, 3 to 4 inches long and 1 to 1 1/4 inches wide, tapering to a point; yellow, turning orange, then red when completely mature; sweet flesh, moderately hot seed walls. Known as *largo* or *carricillo* when pickled. Classic yellow hot pepper of Mexico used for pale yellow, regional sauces. Generally considered a group name for small, yellow peppers. ZASLAVSKY; C34G{PD}

Habanero: (Orange Habanera) (*C. chinense*) Square to heart-shaped fruit, often wrinkled; 1 1/2 to 2 inches long; light-green, turning orange at maturity. Has an unusual flavor and scent when ripe. Excellent for sauce. Reportedly the hottest pepper in the world.

Available fresh, dried or pickled in specialty markets. Requires a long, hot growing season. Spanish name means "of Havana" or "from Havana". ANDREWS, J. [Re], DREMANN, S. 1986 [Re]; A7{PD}, A21, B73M{PL}, B75{PL}, C34G{PD}, D3M{PR}, E53M, F80,139,163T, I63T{DF}, J4, J25M, J73{PD}, J76{PL}, K66, M81T, R47, etc.

Jalapeno: 75 days. Sausage-shaped fruit, tapering to a blunt end; about 3 inches long, 1 to 1 1/2 inches in diameter; glossy deep-green, turning bright red when ripe; medium-thick walls, very pungent. Very common and popular cultivar; widely used in Mexican and Southwestern cuisine. Dried, smoked red-ripe Jalapeno, called *Chipotle*, has a unique smoky flavor. There are three grades of *Chipotle* peppers, which are graded by size—*Meco*, *Mora* and *Morita*. ANDREWS, J. [Pre, Re], CUSUMANO [Cul, Re], SCHNEIDER 1986 [Cul, Re], ZASLAVSKY; A7{PD}, C44, C94M{DE}, D82, F71M, G71M, H35{PD}, I34J{PD}, I63T{DF}, J73{PD}, K17J{PD}, K18M{DF}, L7M, L16{ED}

Louisiana Hot: 70 days. Elongated, tapered fruit, about 3 or 4 inches long; pale yellowish-green, turning red when mature; very hot. Bears fruit early and prolifically. Heirloom cultivar preserved by the Arledge family of Louisiana. A2, J4, L7M

Mexican Negro: (Pasilla Negro) 55 days. Unusual, sausage-shaped fruit; blunt-ended, 3 to 4-lobed, ridged along the length; dark green, changing to dark reddish-brown or black when ripe; thin-walled, with small bumps on the skin; mildly hot. Used for sauces, etc. Also excellent for drying. Grows 3 feet tall, 2 feet across, of fairly easy culture. DREMANN, C; C26{PL}, E13G{DF}, F73D, H1M{DF}, I16,163T, J73, K17J{DF}, K23, K23{PL}, L17{DF}, N40{DF}, N84

Miraso: (New Mexico Chili Improved, Mexican Improved) Fruit 5 inches long, 1 1/4 inches in diameter at the shoulder, tapering to a point; green, turning red at maturity; thick-walled, moderately hot; resembles Guajillo. Good for canning, freezing or drying. Imparts a yellow color to foods that are cooked with it. Borne mostly upright on 27 inch tall plants. Spanish name means "looking at the sun". The original form is a pre-Columbian cultivar. ANDREWS, J., DREMANN, S. 1986 [Re]; B75M, C26{PL}, C69D{PL}, F71M, F73D, H61, 116, I63T, I63T{DF}, J4, J25M, J25M{PL}, K46T, K66, MO, Q34, etc.

New Mexico: Anaheim type, mainly grown along the Rio Grande River, especially around the town of Hatch, New Mexico. Tapered fruit; 4 1/2 to 6 inches long, about 1 1/2 inches in diameter; green, turning red when ripe; mildly hot, but flavorful. Popular for drying and *ristras*. Also used for *chilis rellenos* when green. High yielding plant; 30 inches tall, 15 inches across. DREMANN, C., DREMANN, S. 1989; A7{DF}, E13G{DF}, E14T, K17J{DF}, M32, N40{DF}

NuMex Big Jim: (Big Jim) 80 days. Large to very large fruit; 7 to 9 inches long, 2 inches wide at the shoulder, tapering to a blunt end; medium-green, turning red when ripe; thick-walled, medium hot. Used fresh (roasted and dried), dried and powdered, or canned. High yielding plant; provides good leaf coverage. A21, B75M, D42M, D76, E97, F71M, H61, H95, I63T, J4, J25M, J25M{PL}, K5M, L4, MO, M1P, etc.

Pasilla: Long, slender fruit; 6 to 7 inches in length, 3/4 to 1 inch wide; dark green, turning red, then brownish-black at full maturity; flesh mild, seeds and veins quite hot. Has a distinctive rich, smoky flavor with a hint of chocolate, making it essential for *mole* sauces. Called *Chilaca* when fresh. ANDREWS, J. [Re], LATORRE 1977a [Re]; A7{DF}, A7{PD}, A21, C94M{DF}, E13G{PR}, E14T{DF}, F71M, 116, I63T{DF}, J4, J25M, J25M{PL}, J66M{DF}, K49M, K49T, N40{PR}, etc.

Pasilla de Oaxaca: (Mije) {DF} Legendary Pasilla strain from Oaxaca, Mexico. Highly prized by knowledgeable chile chefs. Long, narrow, tapered fruit; 7 inches in length by 1 inch in diameter; dark green, turning an attractive blackish-brown when ripe. Excellent, distinctive, mildly hot flavor. Most often smoked and used for

making mole sauces and *rellenos*, or pickled in pineapple vinegar. DEWITT 1996, QUINTANA 1994 [Re], ZASLAVSKY; C34G, C69D{PL}, E13G, 116, D42M{S}, I63T, L16

Pico de Gallo: Small, narrow fruit; 3 inches long, tapering to a curved point; very hot. Excellent for salsa. Very prolific, narrow-leaved plant; height about 3 feet; perennial in warm climates or where protected. From Sonora, Mexico. Spanish name means "rooster's beak". C26{PL}, F73D, 116, N84

Puya: (Pulla) Tapered, pointed fruit, resembles Guajillo; 3 to 3 1/2 inches long, 1/2 inch wide; green, turning brownish-red when ripe; thin-walled, very juicy, has a strongly pungent, slightly tart smoky flavor. High yielding plant; 3 feet tall, 2 feet wide. Widely used throughout Mexico, especially in the spicy, nonalcoholic chasers called *sangritas*. DREMANN, C., DREMANN, S. 1986 [Re], HUTSON 1995 [Re], LATORRE 1977a [Re]; A7{DF}, C26{PL}\ C69D{PL}, D29P, D42M, H73{DF}

Red Savina Habanero: (C. chinense) 90-100 days. Recently accepted into the Guinness Book of World Records as the hottest pepper known. Has recorded 350,000 to 577,000 units on the Scoville heat scale. Wrinkled, lantern-shaped fruits; 2 inches by 1 inch; bright red when ripe. Excellent, spicy, fruity flavor. Large plant, about 3 1/2 feet tall; grows best in areas with long, hot summers. Patented. DEWITT 1996; C69D{PL}, D26G, I63T, K17J, K17J{DF}, K57{PL}, K66

Rica Red Habanero: (C. chinense) Elongated, slightly wrinkled fruit; 2 1/2 inches in length and 1 1/2 inches across; green, turning bright red when ripe. Very pungent, but with a sweet, delicious, fruity flavor. Registers about 180,000 on the Scoville scale. Grown commercially to make pepper mash for the hot sauce industry. Developed in Costa Rica by Quetzal Foods from cross-bred red Habaneros. DEWITT 1996; C26{PL}, I63T{DF}, I63T{ED}, K17J{ED}

Sandia: 77 days, Tapered, flat, pointed fruit; 7 to 8 inches long, 1 1/2 to 2 inches wide; dark green, turning bright red at maturity; medium-thick walls, very hot when red-ripe. Can be used green or red, fresh or dried. Mainly roasted when green, peeled and frozen. Also very popular for *ristras*. Upright plant, 28 to 30 inches tall. DREMANN, C., DREMANN, S. 1989; C26{PL}, D1T, D42M, F73D, G57M, H61, 116, I63T, J4, J25M, J25M{PL}, J73, K5M, MO

Santa Fe Grande: 75 days. A large Floral Gem type developed to have smoother fruit without "dimpling". Conical, blunt-ended fruit; 3 1/2 inches long, 1 1/2 inches wide at the shoulder; turns yellow at market stage, ripens to orange-red at full maturity. For fresh market, canning and pickling. Vigorous, upright plant; height 25 inches; resistant to tobacco mosaic virus. SCHNEIDER 1986 [Cul, Re]; A21, A87M, B75M, D42M, F71M, G93M, H61,163T, I63T{DF}\ J4, J25M, J25M{PL}, J73, K5M, M1P, N16, etc.

Santo Domingo Pueblo: Heart-shaped fruit, 3 to 4 inches long, 1 inch in diameter; very hot, but not without a fruity flavor. Used fresh or dried. Similar to Chimayo but pointed. Treasured by the Native Americans of the Santo Domingo Pueblo of New Mexico. Traditionally made into dried *ristras*, then rehydrated or ground. C26{PL}, 116, J4, J73, N84

Serrano: 80 days. Slender, cylindrical fruit; 2 1/4 inches long, 1/2 inch in diameter, tapering to a blunt point; medium dark-green, ripening to bright red; medium-thin walls, extremely pungent. Used for fresh market, pickling and sauce. Vigorous, highly productive plant; height 30 to 36 inches. Very popular in Mexico and the Southwest. ANDREWS, J. [Pre, Re], CUSUMANO [Cul, Re], SCHNEIDER 1986 [Cul, Re]; D42M, F71M, G13M, H61, I63T{DF}, J4, J25M, J25M{PL}, J73, J76{PL}, K23{PL}, K66, M81T, N16

Tabasco: (C. frutescens) Small, slender fruit, about 1 inch long; borne upright; yellow-green, turning scarlet when ripe; extremely hot. Used to make the famous Louisiana hot sauce. First raised by

Edward McIlhenry at Avery Island, Louisiana from seeds brought from the state of Tabasco, Mexico by an American soldier returning from the Mexican War of 1846-48. ANDREWS, J. [Re], DREMANN, S. 1986 [Re], HEISER 1969; A21, B38, D42M, E13G{DF}, 116,163T, 14, J25M, J25M{PL}, J73, J76{PL}, J97M, K49M, K66, K71, MO, M1P, M81T, N40{DF}, etc.

Thbiche: 85 days. Tapered, pointed fruit; 5 inches long, 7/8 inch in diameter; glossy dark green, turning red when mature; smooth, thin-walled, crisp, very hot. Most often used while still green. Good for drying. Grows 2 feet tall, 18 inches wide. From the Zapotec Indians of the state of Oaxaca, Mexico. DREMANN, C., DREMANN, S. 1986 [Re]; D29P, F80, N84

Xcatic: (Xcatik) Long, cylindrical, waxy fruits; 5 to 7 inches in length and 3/4 to 1 inch wide; blunt-nosed, sometimes slightly twisted; pale greenish-yellow, turning orange, then light red when ripe; mildly hot flavor. Unique to the Yucatan, where it is used mostly for salsas. DEWITT 1996, GERLACH [Pe], QUINTANA 1986 [Re]; U37M

## OTHERS

### Hybrid

Mexi Belle: 70 days. Unique hot pepper with a bell-pepper shape. Medium-sized, 3 to 4-lobed fruit; 4 inches square; medium-green, turning red when ripe; medium-thick walls, mildly hot flesh, pungent ribs. Hotness can be controlled by the amount of interior ribs left on during preparation. Compact plant; tolerant to tobacco mosaic virus. A21, C20M, C26{PL}, C44, D42M, D68, F65, G79, J4, MO, M1P, M46, N52

Super Cayenne: 70 days. Attractive, slightly curved pods, 3 to 4 inches long; red when ripe; good fiery flavor. Excellent fresh or dried. Compact, spreading plant, height 2 feet; very prolific, bears 3 to 4 dozen peppers per plant; ornamental in appearance. Does well in containers. All America Selections winner for 1990. B73M, B73M{PL}, C44, D92M, G1M, G71, K10, L79, MO, M95M, N16

Super Chili: 70 days. First hybrid chili pepper. Small, elongated, cylindrical fruit; 2 to 2 1/2 inches long, 1/2 inch wide; pale-green, turning red when ripe; thin-walled, very hot. Harvest at green or mature red stage. Upright, spreading, semi-compact plant; extremely prolific; bears fruit upright; ornamental. All America Selections winner in 1988. B6, B73M{PL}, C44, C92, D11M, F32D{PL}, F70, G6, G79,191, J4, L79, MO, M1P

### Open-Pollinated

African Bird: (African Birdseye) {DF} Long, slender fruit, 2 to 3 inches long about 1/2 inch in diameter; medium green, turning bright red when ripe; excellent, spicy hot flavor; resembles De Arbol. Very thin walls, making it ideal for drying, dries quickly. Tall, upright plant; height 5 feet, 18 inches across; very prolific. Widely grown in eastern Africa for commercial cayenne. A7, C94M, E14T, F86G, GO, I63T{DF}, J58, K17J, K18M, L34, M15M

Aji Panca: (C. chinense) Medium-long, tapered fruits, 5 to 6 inches in length and about 1 inch wide; medium thick-walled; deep purplish-black, turning red when ripe. Excellent, spicy, mildly hot flavor. Can be used fresh in salsas or dried and powdered for use as a condiment. Very popular in Peru. Usually available at South American markets. C26{PL}, J4, K17J{PD}

Almapaprika:<sup>2</sup> Small, round or somewhat flattened fruit; 1 inch tall; weight 1 1/2 to 2 ounces; extraordinarily thick-fleshed; skin smooth, ivory-white turning red when mature; pungent. Fruit cavity small. Processed into pickles. The most widely-grown hot pepper in Hungary. SOMOS; J4, J73, N84

Angkor Sunrise: (C. frutescens) Small, oval fruit, tapering to a point at the blossom end; 1 inch long and 1/2 inch in diameter; borne upright; bright yellow, turning red when ripe; very hot. Grows well in containers. Collected in Cambodia by adventurer and author Richard Sterling. DEWITT 1996; C69D{PL}, I63T

Berberé: 90-100 days. Smooth, tapered fruit; 6 inches long, 3/4 inch in diameter; turns bright red when ripe; fiery hot. Very tall, highly productive plant. From Ethiopia, where *berbere* is a generic term for a curry-like paste made of paprika, chilis, and spices. MESFIN [Re], VON WELANETZ; A7{PD}, C95, H51{PD}, L90K{PD}, N84

Bishop's Crown: Unique, three and four sided pods, resemble the crown a Catholic bishop wears; green, turning orange and then red; medium hot. Late maturing. Very large plant. Highly recommended for its novelty and utility. Originally from Barbados. C69D{PL}, M81T

Bulgarian Carrot: (Shipkas) 65-68 days. Distinctive heirloom from Eastern Europe. Long-conical fruits, about 3 1/2 inches in length; green, ripening to an attractive, fluorescent orange; very pungent, with an intense fruity flavor. Excellent in pickles, salsas, chutneys and marinades. Compact plant, 18 inches tall. Reportedly smuggled out of the Iron Curtain about 20 years ago. C26{PL}, C69D{PL}, I63T, K66, K71, M1P, M46

Congo: (G chinense) Very large fruits, 2 1/2 inches long and 3 inches wide; heavily ribbed and folded; green, turning bright red when ripe; extremely pungent and aromatic. The main pepper of the eastern Caribbean. Very popular in Trinidad and Tobago where it is widely used for sauces. Grows well in containers. Congo means large in the local slang. DEWITT 1993 [Re], DEWITT 1996; C26{PL}, C69D{PL}, I63T

Datil: (C. chinense) Small, slightly undulated fruit, 1 1/2 to 2 inches long and 1/2 inch in diameter; smooth, waxy skin, green turning dark orange when ripe; relatively thin-walled, dries well; extremely hot but with a nice, full flavor, heat units 100,000 to 120,000. Tall, bushy plant, grows to 3 or 4 feet; moderately productive. Popular for relish, jelly and thick, catsup-like pepper sauces. A local favorite in St. Augustine, Florida. Introduced there about 300 years ago by Minorcan settlers. A21, C26{PL}, C69D{PL}, C87, C87{DF}, C87{PD}, F73D, J4, J76{PL}, K17J{PC}, L17{ED}, M81T

Elephant's Trunk: Extremely long, tapered fruit, about 1 inch in diameter, resembles the trunk of an elephant; deep green, changing to dark red; thick-walled, pungent. Eaten when dark-green or red ripe. Good for salads and pickles. Very popular Indian cultivar. J73, N84, Q18, Q45M, R50, S59M

Fatalii: (C. chinense) Small to medium, dagger-shaped fruit, 2 1/2 to 3 inches long and 1 1/2 inches wide; pale-green, turning bright yellow when ripe; thin-walled; extremely pungent. Prolific plant, grows well in containers. Originally from the Central African Republic. DEWITT 1996; C26{PL}, C69D{PL}, J4D, I63T

Fish: Small, conical fruit; white with green stripes, turning orange with brown stripes, and red when ripe. Ornamental plant with variegated white, gray and dark green leaves. Once popular at oyster and crab houses for seasoning various seafoods, especially terrapin dishes. Traditionally dried at the white stage for use in cream sauces. African-American heirloom from the 19th Century. Apparently originated near Baltimore as a sport of Serrano WEAVER 1997; D29P, F73D

Floral Gem: Medium-sized, blunt conical fruit, mostly three-lobed; turns a rich red on maturity. Used commercially in the yellow wax state. The pickled product is marketed by Trappey's of Louisiana as *Torrido chili peppers*. Spreading, vine-like plant, highly susceptible to tobacco mosaic virus. Introduced in 1921. ANDREWS, J.; F71M, J4, J58{ED}, K10

Fresno Grande: 75 days. Improved Fresno type. Small, conical fruit, tapering to a point; 3 inches long, 1 1/2 inches in diameter; medium green, turning bright red at maturity; medium thick-walled, very pungent. Upright plant; height 20 to 24 inches; sets fruit continuously; resists tobacco mosaic virus. Popular fresh market cultivar. Introduced in 1970. DREMANN, S. 1986 [Re], SCHNEIDER 1986 [Cui, Re]; B75M, C20M, C26{PL}, C69D{PL},

E13G{PR}, F71M, G93M, J4, K49T, N40{PR}, N52, S75M

Goat Horn: 70 days. Tapered, cylindrical fruit, often curled and twisted; 5 to 6 inches long, 1/2 to 1 inches wide; deep green, turning cherry red when mature; fiery hot. Good for drying, cooking or pickling. Short plant; height 18 to 20 inches. Very popular in Southeast Asia. D55, J4, K57{PL}, L59, L79G, M1P, N81, N84

Golden Cayenne: Slightly curved, pencil thin, sabre-shaped fruit; 6 inches long; quite smooth with few wrinkles; attractive, golden-yellow color. Very hot, being suitable for East Indian and Thai cuisines. Bushy, upright plant; much more productive than other hot peppers. A21, C69D{PL}, D92M, F73D, G53M, J4, K10, L42, MO

Grandpa's Home: 70 days. Small, brilliant-red, semi-hot peppers. Compact plant; grows to 12 inches in height; produces 50 or more fruit. Originated in Siberia where it is traditionally grown in pots set near a window. Will produce all winter long under low-light conditions. F44

Hot Apple: 70 days. Medium-sized, pale butter yellow, tomato-shaped fruit; 2 1/2 inches across, 1 1/2 inches deep; very thick, mild flesh; quite hot at the center core of seeds. Mostly used for pickling and canning; can also be used fresh from the garden. C69D{PL}, 177, M81T, N52

Hot Portugal: 64 days. Large, smooth fruit, tapered to a point; 6 to 7 inches long, about 1 inch in diameter; green, turning glos<sup>^</sup>, bright scarlet-red when ripe; thick-walled. Fiery hot but with good pepper flavor that survives the heat. Can be used when green, red or dried. Sturdy, high yielding plant. C69D{PL}, D68, D92M, F13, J4, L42, N52

Hungarian Yellow Wax: (Hungarian Long Wax) 70 days. Uniform, slightly tapered fruit; 6 to 7 inches long, 1 1/2 inches in diameter; waxy yellow, turning red at maturity; medium thick-walled, firm, very pungent. Popular for canning and pickling. Strong, upright plant; height 20 to 24 inches; sets fruit continuously. CUSUMANO [Cul, Re], SCHNEIDER 1986 [Cui, Re]; A16, B73M, B75M, C26{PL}, C44, E24, E75{PL}, F32D{PL}, F71M, G6, H61,184, J14{PL}, L7M, M1P, etc.

Italian White Wax: Tapered, pointed fruit; 2 to 3 inches long, 1/2 inch in diameter; pale yellow, turning pale red at maturity; moderately thin walls; snappy, mild flavor when picked young, quite pungent if left to mature. Upright plant; height 34 to 40 inches; productive over a long period. Very popular home garden cultivar for pickling. B63M{PD}, G93M, J4

Large Red Cherry: 75 days. Small, flattened globe-shaped fruit; 1 to 1 1/2 inches in diameter; medium-green, turning dark red when ripe; thick-walled, very hot. Widely used for pickling and canning. Strong, upright plant; height 24 inches; sets fruit continuously over a long harvest period. B75, C44, E91G, G71, H61,139,163T, J4, K10, K50, L42, M0, M1P

Long Red Cayenne: 70 days. Long, cylindrical fruit, tapered to a point; often curved and twisted; 4 to 5 inches long, 1/2 to 1 inch in diameter; deep green, changing to red when mature; very hot. Widely used fresh, dried, canned and pickled. Large, productive plant. DREMANN, S. 1986 [Re]; A25, B75, E91G, J20, J97M, L10, L42, R47

Long Slim Cayenne: 72 days. Long, slender fruit, tapered to a point, often wrinkled; 6 to 7 inches long, 1/2 inch wide; dark green, ripening to bright red; highly pungent. Excellent for drying. Vigorous, high-yielding plant; height 20 to 24 inches. Well known and popular cultivar. C69, C85M, C92, D76, E24, H61, H85M, /59M, /64, K5M, K10, K71, M0, M1P, N16, etc.

Malagueta: (*C. frutescens*) The most popular pepper in Brazil. Made into a sauce or *molho* which is the standard condiment on all Brazilian tables. Small, elongated, pointed fruits resembling Tabasco peppers; 3/4 to 1 inch long, about 1/4 inch wide; green, turning red when ripe; very hot and flavorful. Preserved in oil, vinegar or

*cachaga*, a sugar cane liquor. DEWITT 1996, IDONE [Re]; C26{PL}

Paprika: (Culinary Paprika, Paprika Mild) 85 days. Short, flattened, 4-lobed fruit; 2 inches long, 4 inches wide; thin-walled, very mild and flavorful. Excellent for drying and powdering. Especially popular in Hungarian cooking. Upright plant, 2 1/2 to 3 feet tall. A2, C92, E5T, L7M, M1P

Peter Pepper: Appropriately named, penis-shaped fruit; 3 to 4 inches long, 1 to 1 1/2 inches wide; green, turning red when ripe; thin-walled, very pungent. Excellent for pickling when green; also dries well. Large, prolific plant, 20 to 30 inches tall. A21, C26{PL}, C69D{PL}, D42M, J4, J4D, J25M, J25M{PL}, J76{PL}, K71, M1P, M81T

Piment d'Espelette: {DF} Conical fruit, 3 to 4 inches long, bright red when ripe; medium-hot; thin-walled and seedy. Traditionally roasted and ground into an aromatic reddish-orange powder known as *bipergorria*, and used in classic dishes such as *piperade* and *axoa*. Also popular for making ristra-like garlands called *cordes*. Grown near the village of Espelette in the Basque region of France. Celebrated there at an annual chile festival or *Fete du Piment*, on the last weekend of October. KARP [Re]; H25M{OR}

Pimenta de Cheiro: (*C. chinense*) Most popular Amazonian chile. Small, oval fruits; attractive, bright-yellow, turning red when ripe. Less intensely hot and more fruity than Malagueta. Collected from the wild, where it grows profusely, and sold in local markets. Often made into a sauce or *molho* that flavors soup dishes such as *pato no tucupi* and *tacaca*. IDONE [Re]; C26{PL}

Pimiento de Padron: Very small, slightly wrinkled fruit, 1 inch in diameter and about 1 1/2 inches long; may be sweet or hot depending on the season and individual plants. Only sold in the green stage, and cooked in one way—deep fried in olive oil and served piping hot with sea salt. Popular in tapas bars and restaurants throughout Spain, and at harvest celebrations. A specialty of Herbon, near Padron in Galicia, where it is thought to have been introduced by Franciscan monks. DOMINfi, DOMINGO, SEVILLA 1997a; L13P{DF}

Piquillo: (Little Beak) {PD} Medium-sized, triangular fruits; 2 to 2 1/2 inches in diameter at the top, about 3 inches long; deep, ruby-red when ripe; mildly hot. Unique, rich flavor that develops after having been grilled over beechwood fires. Famous Spanish roasted pimiento, highly valued for tapas. Grown mostly in the northern province of Navarre, those from Lodosa being the best. ANDREWS, C. 1988 [Re], DOMINE; G47J, L13P, N54

Piri-Piri: (Peri-Peri) (*C. chinense*) Small, extremely hot red pepper from Angola, widely used in Portuguese cooking. Often used for *molho de Piri-Piri* (hot red pepper sauce), or minced and preserved in olive oil. Originated in Brazil. Brought by the Portuguese to Angola, where it became an integral part of the local cuisine. ANDERSON, J. [Re], VON WELANETZ; A7{DF}, C26{PL}, K17J{PD}, L13P{PD}

Prik Kee Noo: (Pricky Nu) 75 days. Small, slender fruit, about 1 1/2 inches long; borne upright; intensely hot; distinctive, fragrant flavor. Very good for drying after turning red. May also be used when green, in the same manner as Jalapenos. Dwarf, ornamental plant, 12 to 18 inches tall; highly productive. The most popular pepper in Thailand. LOHA-UNCHIT [Re]; C26{PL}, L16M{DF}

Purple Venezuelan: Very unusual and ornamental pepper with leaves that are dark purple above and green below. Flowers, stems and unripe fruit are also purple. Small, round fruit; 3/8 to 1/2 inch wide; remains purple for some time before changing to green, then bright red when mature; sizzling hot. DREMANN, S. 1986 [Re]; D92M, E5T, J76{PL}, M81T

Red Cherry: (Small Red Cherry) 75 days. Small, nearly round fruit; 1 inch long, 1 1/2 inches deep; dark green, turning dark red when mature; medium thick-walled, quite hot. Excellent for pickling

and canning. Prolific, upright plant; height 18 to 20 inches. E13G{PR}, F71M, G57M, K5M, N52

Red Chili: (Finger Cayenne) (*C. frutescens*) Slender, conical fruit, borne upright; 2 to 2 1/2 inches long, 1/2 inch in diameter; green, ripening to a brilliant scarlet; exceedingly pungent. Good fresh or dried. Spreading plant, 16 to 20 inches high, 2 feet wide. Requires a long, warm season. Introduced prior to 1865. BURR, DREMANN, C, DREMANN, S. 1986 [Re], VILMORIN; C20M, C92, G71, J4, J73, K10, K71, MO, M1P, N52, N84

Rocotillo: (*C. chinense*) Small, squash-shaped fruit, 1 to 1 1/2 inches in diameter; deep carmine-red when ripe; crisp textured; pungent enough to be interesting, but never caustic. Excellent eaten raw; also makes an attractive garnish. Traditionally used as a condiment with beans or carne asada. Grows well in central Texas but does not attain the size it would in its homeland (Peru). ANDREWS, J.; A7{DF}, C26{PL}, C69D{PL}, J4, J25M, J25M{PL}

Romanian: 70 days. Semi-hot type. Blocky fruit, tapers to a blunt end; 4 to 5 inches long, 2 to 2 1/2 inches wide; yellow, turning brilliant red when mature; medium thick-walls, sweet flesh, pungent ribs. Used fresh or for canning. Bears continuously until frost. Traditional, medium-hot blocky type. F63, F71M, G82, J4, K10

Santaka: (Hontaka) 75 days. Very hot red pepper widely used in Japan for traditional dishes and in the spice trade. Slender, tapered fruit; 2 1/2 to 3 inches long, 1/2 to 1 inch wide; green, turning scarlet red when ripe; thin-walled. Small, compact plant; height 15 to 18 inches; sets fruit continuously. Popular in California, where it is called *Chili Japonese*. DREMANN, S. 1986 [Re]; A7{DF}, C26{PL}, D42M, E13G{DF}, HIM{DF}, H73{DF}, I63T, I63T{DF}, J73, K17J{DF}, L16{DF}, M81T, N40{DF}, S70

Scotch Bonnet: (*C. chinense*) 70 days. Small, roughly bell-shaped fruit, medium thin-walled; very attractive, turns red when ripe; extremely hot but with a distinctive spicy flavor and aroma. Short, compact plant. Popular in Jamaica and other parts of the Caribbean for hot pepper sauce. A7{DF}, B60M{PR}, D42M, E5T, F27{PD}, F37T{PL}, H73{PR}, J4, J4D, J73, K10, K17J{DF}, MO, M1P, N40{PR}, etc.

Spur: Small, narrow, slightly curved fruit; 1 to 1 1/2 inches long and 1/2 inch in diameter; green, turning red when ripe, very hot; ripens late. Much used in Oriental cooking. Excellent dried and ground for chili-powder. Grows to 2 feet tall, bears fruit in upright clusters. F80, L59, N84

Suryamukhi: (Surjamukhi, Clustered Suryamukhi) Slender, elongated-conical fruit, borne upright in clusters of 8 to 10; green, turning red when ripe; thick-walled, very hot and flavorful. Produces abundantly for 3 to 4 years; bears throughout the year. One of the best cultivars in India. J4, J73, N84, N91, Q45M, R50, S59M

Taka-No-Tsume: (*C. frutescens*) 68 days. Old-fashioned Japanese pepper, once widely cultivated in Honshu, Shikoku and Kyushu. Small, flame-shaped fruit; 1 1/2 to 2 inches long, 1/2 inch wide; upright growing in dense clusters at the ends of branches; deep dark-green, turning red at maturity; extremely hot. Dried fruits are powdered or added to pickled scallions. TANAKA; C26{PL}, C69D{PL}, F71M, G20M{DF}, J4, L79G

Thai Hot:<sup>3</sup> Thy, cone-shaped fruit, 3/4 to 1 inch long; green, turning red when mature; extremely hot. Dwarf, compact, mound-shaped plant; 8 inches tall, spreading to 18 inches; highly prolific. Ideal ornamental for patio containers or hanging baskets. C92, D42M, D55, D92M, E5T, E13G{PR}, I63T{DF}, J4, J20, J73, J76{PL}, K17J{DF}, K23{PL}, K71, M81T, Q34, etc.

Tiny Samoa: Extremely small fruit, only 1/8 inch thick and 1/2 inch long; green, turning red when ripe; very hot; Attractive plant with rich green foliage; produces hundreds of fruits. Makes an excellent house plant. J4, J76{PL}

Wiri Wiri: (*C. frutescens*) Small, globose fruits, about 1/2 inch across; glos<sup>^</sup>, bright red when ripe; seedy; quite hot but with a pleasing, fruity flavor. Often marinated in rum to form the condiment known as *Barbados pepper wine*. Erect shrub to 3 feet; bears fruit in upright clusters; perennial in the tropics. Very popular in Guyana and the Caribbean. Available fiesh at West Indian markets in the United States OMAWALE, ORTIZ 1973 [Re]; F73D, N84

Yatsubusa: (*C. frutescens*) 80 days. Small, tapered fruit, 3 to 3 1/2 inches long; turns red when mature; thin-walled, fiery hot. Productive plant; height 20 inches. Fruits are more easily harvested than those of Santaka. Once widely cultivated in Shizuoka Prefecture Japan and used in the spice trade, now on the verge of extinction. DREMANN, S. 1986 [Re], TANAKA; C26{PL}, C69D{PL}, C95, D29P, D92M, J4, J73, J76{PL}, N84

Yellow Squash: (*C. chinense*) 95 days. Flattened fruit, slightly scallop-edged, resembles a patty pan squash; 2 to 3 inches wide, 1 to 1 1/2 inches deep; medium green, ripening to a golden-yellow; very hot. Extremely productive plant; height 24 inches; requires a long growing season. A21, F73D, J4, J20, M1P, M81T

#### CODES FOR SPECIAL TYPES

1. Yellow-Ripening
2. White-Skinned
3. Dwarf
4. Orange-Ripening
5. Brown-Skinned
6. Purple-Skinned
7. Baby

## PERSIMMON {GR}

DIOSPYROS KAKI

DIOSPYROS VIRGINIANA

---

#### AMERICAN PERSIMMONS

Small-fruited cultivars of the species *D. virginiana*, which is native to the Eastern United States from the Everglades of Florida, north to southern Connecticut, west to Kansas and south to eastern Texas. Their culture has been extended to southernmost Canada and to the drier western states. All are astringent until fully ripe.

Craggs: Laige, somewhat acorn shaped fruit; skin yellowish, often red-blushed, attractive; flesh translucent, light yellow, texture and flavor excellent; seeds few; ripens in midseason, about Sept. 30 in Caseyville, Illinois. Tree sturdy; leaves glossy. Originated in Harrisburg, Illinois by a Mr. Craggs. Introduced in 1949. BROOKS 1972; 140

Early Golden: Laige fruit, up to 2 inches in diameter; skin orange; flesh orange, mild, dessert quality excellent; ripens mid to late October. Tree will bear fruit if planted alone, but better results are obtained if planted with a pollinator. Probably the most widely planted cultivar in the United States. Selected from the wild in Alton, Illinois about 1880. A91{PL}, B74, B99{PL}, 140, I49P, 160{PL}, I66T, 174

Evelyn: Very large, deep-orange fruit, 1 1/2 to 1 3/4 inches in diameter; sweet and usually seedless. Ripens in mid-September to late October. Sets very heavy crops of fruit. Originated in North Tonawanda, New York by John H. Gordon. B99{PL}, E62{SC}, 140

Florence: Medium-sized fruit of high quality, resembles Early Golden; flavor excellent; seeds small, giving it a very high flesh/seed ratio; ripens early. Tree occasionally bears a modicum of staminate flowers. Has potential as a parent in breeding. Originated as a seedling of Killen. I49P, I66T

Garretson: Fruit slightly smaller and more spherical than Early Golden; flesh a rich clear orange, very tender, highly flavored; ripens during September and early October, about 10 days ahead of Early Golden; moderately seeded, seeds small. Tree very hardy and

productive; nearly identical with Early Golden. Originated in Adams County, Pennsylvania. Introduced about 1921. BROOKS 1972; B74, C34,140,149M, I49P, I66T, 174

Gehron: Fruit medium-sized; skin bright orange-red; flesh sweet, nearly 100% seedless; ripens in late November and can hang on the tree until Christmas or early January. Tree with red-colored leaves; highly ornamental. Recommended for the deep south and Texas. Originated near De Ridder, Louisiana by Clyde Gehron. GRIF-FITH; H4

Golden Supreme: An older cultivar that is becoming more popular. Very large, bright golden-orange fruits with a full sweet flavor. Ripens in mid to late October, about a week after Garretson. May not ripen in far northern regions. Vigorous, spreading tree, bears heavy crops; requires a pollinator. C34,140,I49P, I66T

John Rick: Fruit one of the largest and firmest among September maturing American persimmons; flesh a beautiful red, quality excellent; resembles Florence but larger; the small deeply inset calyx minimizes skin punctures. Tree precocious; requires pollination by a 90 chromosome male cultivar, such as William. Originated in Urbana, Illinois by J.C. McDaniel. Introduced in 1963. BROOKS 1972; A91{PL}, E62{SC}, 140,I49P, I66T, 174, J61M, N24M

Killen: Fruit slightly larger, firmer and better flavored than Early Golden, which it resembles; ripens slightly later than Early Golden. Tree occasionally bears staminate-flowering branchlets; needs a 90 chromosome pollinator for reliable fruiting. A promising parent in breeding. Originated in Felton, Delaware by Joseph Killen. Introduced about 1930. BROOKS 1972; 140

Lena: (Mitchellena) Small to medium-sized, rather flat fruit; skin very tender, orange, attractive; flesh a beautiful red color, soft, of excellent flavor; ripens early and over a long period of time. Culinary qualities very good; frozen pulp maintains its flavor well for a period of one year. Winner of a first prize in the Mitchell, Indiana persimmon festival. 140

Meador: Medium-sized fruit; skin orange; flesh sweet, seedless if not pollinated; ripens in early October. Tree very hardy and productive; self-fertile, early bearing; good for cooler areas. Originated near Rochester, New Hampshire by E. M. Meador. Seedling of Garretson. C34, D37, E62{SC}, F43M, G16, H65, I25M{SC}, 140,146,149M, 174, J61M, N24M

Miller: (Marion) Large, roundish-oblate fruit; skin tough, skin reddish-yellow, translucent; flesh sweet, of good quality, seeds rather numerous. Originated in Jackson County, Missouri, where it ripens in September. BAILEY, L. 1947; 140

Morris Burton: Perhaps the best tasting American persimmon. Small to medium-sized fruit; skin very tender; flesh red, soft when tree-ripe, exceptionally high in sugar; not as early cropping as some. Tree somewhat slow to come into bearing, but then productive. Worth using as a breeding parent. Originated near Mitchell, Indiana by Morris Burton. GRIFFITH; B99{PL}, E62{SC}, F43M, 140

Penland: (Penland's Seedless) Fruit nearly seedless, varying with the abundance of compatible pollen from native male trees. Quality varies with location, but less sugary than many others. Trees have been killed by temperatures of  $-20^{\circ}$  F. Originated near Penland, North Carolina. Introduced about 1937. BROOKS 1972, GRIF-FITH; E62{SC}

Pipher: Medium to large, pale yellow fruit; has a bright apricot-like flavor; quality good; ripens in late October. Relatively few seeds. Originated in Illinois. Grows best from Ohio southward. E62{SC}, F43M, I60{PL}

Ruby: Small to medium-sized, roundish oblate fruit; skin yellowish-red, shading to deep-red, tender; flesh sweet, of very good quality, seeds few. Tree vigorous and heavy bearing; plant with a seedling for best results. Originated in Cartersburg, Indiana, where it ripens during September and for some time later. BAILEY, L. 1947; D37,140

Szukis: Medium-sized, orange fruit; has a bright apricot-like flavor; ripens in late September. Tree haidy, productive; produces male and female flowers, but best grown with a pollinator. E62, E91M, N24M

Tatum: Very heavy bearing Early Golden type with fruit of excellent flavor and texture. Attractive tree, about 40 feet tall. Apparently hardy in Zones 5 through 9. Originated in Kentucky. F43M

Wabash: High quality, fragrant, early persimmon with parthenocarpic tendencies. Fruit rather small; flavor distinctive and aromatic; flesh redder than any in the Early Golden family; seeds small when present. Leaves color red before falling. Originated in Pinkstaff, Illinois; hardy in Urbana, Illinois, where earliest fruits are ripe in mid-August. GRIFFITH; 140

Wayne: One of the few female varieties that bears pollen. Yields both pollen and fruit. No male tree required for pollination. Excellent appearance and flavor. Very good for eating out of hand or freezing. Originated in Wayne, New Jersey by Henry Hartmann. G3M

Yates: Very large, yellow fruit, up to 2 1/8 inches in diameter; fine apricot-like flavor; excellent quality; seedless if grown without a pollinator; ripens very early, in mid-August in southern Indiana. Tree a prolific bearer. Winner of the first prize at the Mitchell, Indiana persimmon festival in 1983. E62, F43M, I25M{SC}, 140

#### ORIENTAL PERSIMMONS

Large-fruited persimmons whose culture is generally limited to subtropical and warm-temperate regions. A few cultivars are dependably hardy as far north as Pennsylvania. There are two types: astringent and non-astringent, the latter being preferred for eating out of hand. One group of cultivars bears fruit with light-colored flesh when seedless, but after pollination and seed formation, the flesh is dark-colored. (D. kaki)

ASTRINGENT Fruit of astringent types must be fully ripe before eating or they will pucker the mouth. The existence of astringency is closely related to some cultural techniques, especially seed formation. Adapted to cooler areas than non-astringent types. In hot regions they show good coloring and high sweetness but poor texture, and deep black spots develop.

Eureka: Medium to large, oblate fruit, puckered at the calyx; skin bright orange-red; flesh astringent until fully ripe, of good quality; sometimes seedless; ripens late, or in November in Florida; hangs on tree until soft and ripe. Tree small, vigorous; drought and frost resistant; precocious and heavy bearing. One of the most satisfactory cultivars for Florida and Texas. MCEACHERN, MORTON 1987a; D77M, H4,14IP, I53M, 174, L90, M83, N33

Gailey: Fruit small, roundish to conical with a rounded apex; skin dull-red, pebbled; flesh dark, firm, juicy, of fair flavor. Tree small to medium; bears many male flowers regularly and is an excellent cultivar to plant for cross-pollination; has very attractive autumn foliage and ornamental value. MORION 1987a, POPENOE, W. 1920; G17, H4, J59, 097

Great Wall: (Atoma) Small to medium-sized fruit, 2 to 2 1/2 inches in diameter; flat, four-sided; skin orange, with fine black stripes extending around the calyx; flesh yellow, dry, very sweet, astringent; ripens in mid-autumn. Tree relatively slow growing, upright; heavy, but biennial bearing; very cold-hardy; recommended for colder regions; also does well in Florida. MORTON 1987a, SHANKS; C25, D37, G17,174

Guiombo: Very large, conical fruit, weighing up to 16 ounces; skin thin; flavor and quality excellent. Tree very productive and precocious; one of the best cultivars for Florida, but is a biennial bearer when young. Perhaps the same as Korean. MORTON 1987a; C25, G17, H4,174, J59

Hachiya: Large, oblong-conical fruit, up to 4 inches long; skin glossy, deep orange-red; flesh dark-yellow with occasional black

streaks; astringent until fully ripe and soft, then fairly sweet and rich. Seedless or with a few seeds. Ripens midseason to late. Much used in Japan for drying. Tree vigorous, upright-spreading; prolific in California, a scanty bearer in the southeastern United States. MORTON 1987a; A88M, C25, G17, *G49*, H4,149M, I83M, LI, L47, N20, N40{DF}, N40{PR}

Hiratanenashi: Fruit medium-large, oblate, somewhat four-sided; skin bright-orange, thick; flesh astringent, sweet, quality high when fully ripe; seedless; keeps only a short time after curing. Mostly used for drying. Tree medium-large, spreading; has a high annual bearing tendency. An old and popular cultivar in Japan. MORTON 1987a; C25, C30M, D37, G17, H4,174, Q93

Honan Red: Small, roundish oblate fruit, weight 2 to 4 ounces; thin skin; skin and flesh ripen to a distinct bright orange-red; very sweet and rich. Excellent for fresh eating or drying. Ripens mid-season to late, the fruit hanging well on the tree. Tall, upright, moderately vigorous tree; bears good crops. D57, G17,174

Kyungsun-Ban-Si: Fruit medium in size, oblate; 2 1/2 to 3 inches in diameter; flesh orange, sweet and juicy, of high quality; color ripe in early October; keeps well. Vigorous, upright tree with showy dark-green leaves. Has a very low tendency to parthenocarp, producing more fruit when planted with a pollinator, such as Yamagaki. SHANKS; D37

Okada: Local Hawaiian selection. Fruits reliably in low elevation areas like Waimanalo and Mililani. Regularly bears seedless or nearly seedless fruits. Must be fully ripe before being eaten or the fruit will be astringent. Developed for the large Oriental market in Hawaii. E8M

Saijo: Small, elongated fruit; skin dull-yellow when mature; flavor sweet, excellent, ranked among the best by gourmets; seedless; stores well. Mature fruits are attractive when dried, especially if they are treated with sulfur dioxide before dehydration to prevent browning. Tree medium in height; bears consistently; cold hardy to -10° F. Japanese name translates as "the very best one". C25, C54, D37, G17, H4, H65,149M, 174, J59, J61M, N53M

Sharon: An Israeli selection specially bred to be palatable in a conventional state of ripeness, not mushy soft like other varieties. When kept for several days it softens slightly and can be eaten like regular astringent persimmons. Small fruits with sweet flesh; seedless and coreless. Very good in salads, either fruit or savory. In season from November to January. Named after the Sharon Valley, between Haifa and Tel Aviv, where it is cultivated. BISSELL, DAVIDSON 1991, GRIGSON, S. [Re], VIARD; E13G{PR}

Sheng: Fruit medium to large, 3 to 4 inches in diameter; ribbed, puckered at the calyx; skin yellow-orange; flesh astringent, of high quality; ripens in October, loses astringency uniformly; dries well. Tree open, wide spreading, medium in vigor; irregularly branched; bears annually and more productively when planted with a pollinator, such as Yamagaki. SHANKS; C25, D37, G17,174, N53M

Smith's Best:<sup>1</sup> (Giboshi) Small to medium-sized fruit, 2 1/2 inches in diameter; flesh of seedless fruit yellow, astringent, seeded fruit will be dark-fleshed or "chocolate" colored when soft ripe, without astringency even when hard; color ripe in early October, or 2 weeks earlier than Tecumseh. Compact, densely branched, small tree; heavy bearing. Found at J. Russell Smith's farm in Round Hill, Virginia. SHANKS; D37

Tamopan: Large, somewhat four-sided fruit, broad-oblate; indented around the middle or closer to the base; 3 to 5 inches wide; skin thick, orange-red; flesh light orange, usually astringent until fully ripe, then sweet and rich; of medium quality; seedless or nearly so. Ripens late in Florida; midseason in California. In some parts of China and Japan said to be non-astringent. MORTON 1987a, POPENOE, W. 1920; A63, C54, H4,168,174, J59, L90, M83, N20

Tanenashi: Medium-sized, round-conical fruit, 3 1/3 inches long and 3 3/8 inches wide; skin light-yellow or orange, turning orange-

red, thick; flesh yellow, astringent until soft, then sweet; seedless; ripens early. Tree vigorous, rounded, prolific. Leading cultivar in the southeastern United States. In California, tends to bear in alternate years. MORTON 1987a, POPENOE, W. 1920; A85M, C25, C54, D77M, F93, G17, H4,153M, 168,174, L33, L90, M83

Yamato Hyakume:<sup>1</sup> Fruit large, elongated, conical; skin orange-red, attractive, streaked black at fruit top; flesh has little tannin when seed content is low, turns chocolate brown with pollination; tends to growth-ring cracking; ripens the end of October; suitable for drying. Tree upright; medium in vigor; bears heavily. MORTON 1987a; G17, J59

Yatsumizo: Small, orange-yellow fruit; very sweet and flavorful; usually seedless; astringent until cured; quality excellent. Produces large quantities of fruit. An important variety in Japan where it is grown commercially. Often used there for drying. MORTON 1987a; H4

NON-ASTRINGENT Fruit of most non-astringent types may be eaten when they are firm-ripe, much like apples. However, many develop a richer flavor if they are allowed to soften somewhat. Adapted to warmer regions than astringent cultivars. In cool areas, this type does not fully mature, they show low sweetness and are poorly colored.

Chocolate:<sup>1</sup> Small to medium-sized, oblong-conical fruit; skin reddish-orange; flesh brown-streaked when cross-pollinated, must be fully soft-ripe before eating; ripens late October to early November. Tree large; vigorous; produces many male blossoms. Recommended as a pollinator for pollination variant cultivars such as Hyakume and Zenji Maru, which require seed formation for the flesh to turn brown. A63, A88M, C54, D57, H4,168, LI, N20

Fuyu: (Fuyugaki) Medium-large, oblate fruit, faintly four-sided; 2 inches long, 2 3/4 inches wide; skin deep-orange; flesh light-orange, sweet, mild, non-astringent, even when unripe; seeds few or none. Keeps well; also an excellent packer and shipper. Tree vigorous, spreading, productive. Most popular non-astringent cultivar in Japan and the United States. MORTON 1987a; C25, D34M{PR}, F93, F97M{DF}, G17, *G49*, H4, I83M, L47, L90, L97G{DF}, N40{DF}, N40{PR}

Hana Fuyu: (Giant Fuyu) Large, roundish-oblate fruit; skin reddish-orange, attractive, when fully ripe has one of the deepest red colors of any persimmon; flesh quality good, sweeter than Fuyu, non-astringent even when not ripe; usually seedless; ripens in late October. Tree somewhat dwarf; bears regularly but sets a light crop in some seasons; prone to premature shedding of fruit. BROOKS 1972, MORTON 1987a; A63, A88M, C25, C54, D37, G17, *G49*, H4, H53M, 168,174,183M, J59, N20

Hanagoshō: Fruit large, flat, four-sided; skin orange; flesh of good texture; flavor and quality excellent; ripens mid to late November; slow in losing astringency in some areas. Tree vigorous, upright; not high yielding; deficient in male flowers. MORTON 1987a; G17, J59

Hyakume:<sup>1</sup> Fruit large, up to 3 inches long; roundish oblong to roundish oblate; skin buff-yellow to light-orange, marked with rings and veins near the apex; flesh dark cinnamon when seeded, juicy, of firm texture, non-melting; flavor spicy, very good. Non-astringent even while the fruit is still hard. Ripens in midseason; stores and ships well. MORTON 1987a; H4,168

Ichikikei Jiro: Medium-large, flat fruit; skin orange; flesh non-astringent even when not ripe, flavor very good; ripens in early midseason. Tree not vigorous, dwarf in habit, height 10 to 15 feet; recommended where space is limited; tolerant to anthracnose. To ensure good fruit production, plant with a suitable pollinator such as Gailey. MORTON 1987a; C25, D37, G17, H4,174, J59, J61M, L33, Q93

Izu: Medium-sized fruit, around 180 grams; skin burnt-orange, has virtually no brown lumps; flesh soft, with a good amount of syrup,

of fine texture; flavor very good; ripens early, from the end of September to mid-October, almost a month earlier than others; keeps well for an early cultivar. Tree somewhat dwarf; bears only female flowers; sets good crops. A63, A88M, B74, C25, C54, F93, G17, G49, I49M, I68, I74, I83M, J59, J61M, LI, N20, N33, Q93, etc.

Jiro: Fruit large, to 250 grams; resembles Fuyu, but more truncated and squarish in cross-section; skin orange-red; flavor and quality excellent; ripens late October and early November, ships well. Tree slightly upright; self-pollinating; tolerant to anthracnose. Second most popular non-astringent cultivar in Japan. A88M, B74, C25, C54, D37, E87, F93, H4, I49M, I66T, I68, I74, J59, J61M, LI, L47, etc.

Maekawajiro: Medium-sized, rounded fruit, smoother and less indented than Jiro; rich orange in color; sweet and of good quality; ripens in mid-season, or about with Ichikikei Jiro. Tree slightly upright; must be planted with a suitable pollinator to ensure good fruit yield. Bud mutation of Jiro. I74, 097

Maru:<sup>1</sup> Small to medium-sized fruit, rounded at the apex; skin brilliant orange-red, attractive; flesh dark cinnamon, juicy, sweet and rich; quality excellent. Stores and ships especially well. Pollination variant type, after pollination the flesh is dark colored and seeded. Tree vigorous and productive. Generally considered a group name. MORTON 1987a; A88M, D57, I68, N20

Matsumoto Wase Fuyu: Fruit of medium size, to 180 grams; skin glossy, orange; texture and quality very good; ripens mid to late October, 2 weeks earlier than Riyu. Tree vigorous, spreading; produces heavy crops if planted with a suitable pollinator. Bud mutation of Fuyu. C25, E56{DF}, H4, I74, J59, 097

Nishimura Wase: Medium to large, round to oblate, slightly squarish fruit; sweet, juicy, chocolate-colored flesh; ripens very early, about 1 month before Fuyu. Needs another variety for cross pollination. Requires about 100 hours of chilling. Discovered in 1960 by Yazo Nishimura. BROOKS 1997; A63, A88M, I68, N20

Shogatsu: Medium-sized, flattened fruit; flesh non-astringent, sweet, of fair quality; ripens mid to late November. Tree medium-sized, rounded, spreading; moderately productive; bears an abundance of male flowers, making it a good pollinator. G17

Suruga: Large fruit, weight about 250 grams; skin orange-red; flesh dense, very sweet, sugar content 17.5%, juice moderately thick, quality excellent; non-astringent; seeds few; ripens in November, keeps well. Tree almost free from biennial bearing; recommended for warmer climates. One of the most promising new cultivars, produced by a cross of Hanagoshō x Okugoshō. C25, G17, H4, J59, Q93

Triumph: Medium-sized, flattened, orange-red fruit; firm flesh, very sweet and flavorful; quality high; ripens late in the season. Pulp is brown and sweet in pollinated fruit, but yellow and astringent when fruit is produced parthenocarpically. Very productive tree. An important cultivar in Israel. E8M, H4, I74, N53M

#### CODES FOR SPECIAL TYPES

##### 1. Dark-Fleshed

## PLUM {GR}

#### PRUNUS SPP.

##### AMERICAN PLUMS

Included here are hardy, native American plums and their hybrids, which are generally crosses with the Japanese plum (*P. salicina*). The natives are the hardiest, some tolerating temperatures of -50° F.

#### GREEN/YELLOW-SKINNED

Dandy: (*P. nigra*) Medium-sized fruit, about 1 1/4 inches long; skin yellow, blushed with red; quality very good; ripens early. For eating fresh or for culinary use. Tree a prolific bearer. Originated in Valley River, Manitoba, Canada by W.J. Boughen, Boughen Nurseries. Introduced in 1923. BROOKS 1972; B47

Guthrie: (*P. angustifolia*) Large fruit, about 1 inch in diameter; skin yellow, blushed with red; delicious flavor; ripens early to mid May. Very productive tree; does not form colonies. Appears to be virtually disease and pest resistant. Originated in northern Florida. H14M

South Dakota: (*P. americana*) Medium-sized, oval fruit; skin yellow, blushed with bright medium red; flesh yellow, tender, meaty, very sweet; quality very good; freestone; ripens in September. Good for eating fresh or processing. Tree productive; very hardy; self-sterile; an excellent pollinizer for American-Japanese hybrid cultivars. Also an excellent parent for breeding hardy, freestone plums. ANDERSEN, BROOKS 1972; A91, A91{SC}, C27T{SC}, F91T{SC}, I49G{SC}, J89M

#### RED/PIURPLE SKINNED

Acme: (*P. nigra* x) Medium-sized, spherical fruit, up to 2 inches long under non-irrigated field conditions; skin dark red; flesh yellow, dessert quality excellent; ripens in early September. Tree hardy. Originated in Saskatoon, Saskatchewan, Canada by CF. Patterson. Introduced in 1960 for home gardens. BROOKS 1972; B47, C58

Assiniboine: (*P. nigra*) Medium-sized, round fruit; skin yellow with a bright red blush and light bloom, thin, astringent; flesh yellow, soft, very juicy, moderately sweet; quality good; ripens in mid-August. Tree upright, vigorous, productive. Widely used in breeding for winter hardiness. Named in 1908. ANDERSEN; A91, C58, F91T{SC}, I61M{SC}, J89M, N24M

Bounty: (*P. nigra*) Medium to large, dark red fruit; flesh orange-yellow, tender, juicy, sweet; quality fair for dessert, good for canning; ripens in late August. Tree upright, spreading; very hardy; productive; suitable for northern conditions. Originated in Morden, Manitoba, Canada. Introduced in 1939. BROOKS 1972; B47, C58

Elite: (*P. nigra* x) Large, spherical fruit; skin dark red; flesh yellow, juicy, of very good quality; ripens late, in early September; resembles Acme and Prairie. Tree vase-shaped, low spreading, hardy. Originated in Saskatoon, Saskatchewan, Canada. Introduced in 1960 for home gardens. BROOKS 1972; B47

Grenville: (*P. nigra* x) Large fruit, 2 inches long; skin red mottled with yellow; flesh golden yellow, dessert quality excellent; ripens in late August; resembles Burbank. Tree very hardy. Originated in Ottawa, Ontario, Canada. Introduced in 1941. BROOKS 1972; A65, B47, C58, H85, K64

Miner: (*P. hortulana*) Medium to small, round-oblong fruit; skin dull red with a bluish bloom and many yellow dots, thick; flesh yellow, quality fair to good; stone medium large, clinging. One of the oldest native plums known. Originated in Knox County, Tennessee by William Dodd, an officer under General Jackson. WAUGH; U7G{SC}

Monitor: (*P. americana* x) Medium to large, roundish ovate fruit; skin thick, dull bronze-red, with very conspicuous russet dots, bloom light; flesh yellow, tender, very juicy, firm, sweet, quality good; clingstone; cracks in rainy weather; ripens in late midseason. Tree vigorous, upright, spreading; very hardy; productive. BROOKS 1972; F91T{SC}, I49G, I49G{SC}

Patterson's Pride: (*P. nigra* x) Large fruit, up to 1 3/4 inches in diameter under non-irrigated conditions; skin deep red; flesh orange-yellow, quality excellent for dessert and processing; keeps well in ordinary storage; ripens in mid-September. Tree low-growing;

yields well; hardy. Originated in Saskatoon, Saskatchewan by CF. Patterson. BROOKS 1972; C58

**Pembina:** (*P. nigra* x) Large, round-ovate fruit, tapered to a point; skin red, thick, with a heavy bluish bloom; flesh light yellow, juicy, sweetish; quality good for dessert, only fair for canning; ripens in late August. Originated in Brookings, South Dakota by N.E. Hansen. Introduced in 1923. BROOKS 1972; A65, A74, B4, B47, C27T{SC}, C58, D65, D69, G54, H42, H85, I49G, I49G{SC}, K64, L79, L70, etc.

**Prairie:** (*P. nigra* x) Large fruit, up to 2 inches long and 1 3/4 inches in diameter under non-irrigated orchard conditions; skin dark red; flesh yellow, dessert quality good; somewhat freestone; ripens in early September; resembles Acme. Tree medium-sized, moderately spreading; hardy. Originated in Saskatoon, Saskatchewan, Canada by GF. Patterson. BROOKS 1972; A65, B47, C58, G54, K64, L79

**Salsberry:**<sup>3</sup> Small to medium-sized fruit, 1 1/4 to 1 1/2 inches in diameter; skin maroon to dull reddish; flesh dark maroon, sweet and juicy, excellent for dessert, also makes superior jam; ripens very early, mid-May to mid-June. Tree a genetic dwarf, mature height only 6 to 8 feet; apparently self-fertile, setting heavy crops annually. Very low chilling requirement. Originated in Vista, California on the property of Mrs. Pearl Salsberry. THOMSON 1983; T49M{SC}

**Supreme:** (*P. nigra* x) Large fruit, up to 2 inches long under non-irrigated field conditions; skin blushed; flesh yellow, dessert quality excellent; ripens in late August. Tree medium upright, slightly spreading; moderately vigorous; free of winter injury at Saskatoon. Originated in Saskatoon, Saskatchewan, Canada by CF. Patterson. Introduced in 1960 for home gardens. BROOKS 1972; M35M

**Surprise:** (*P. americana* x) Medium to large, roundish-oval fruit; skin bright red with medium bloom, moderately tough, slightly acid; flesh pale yellow, smooth, firm, melting, moderately juicy; flavor rich; quality good; stone oval, clinging. Tree vigorous, productive. Originated in Sleepy Eye, Minnesota by Martin Penning. Named in 1882. ANDERSEN, WAUGH; F91T{SC}, I49G{SC}

**Wayland:** (*P. hortulana*) Medium to large, spherical fruit; skin bright cherry red, with numerous white dots and a thin white bloom, thick and firm; flesh firm, meaty, yellow, quality good; stone semi-clinging. Tree vigorous and productive. Originated in a plum thicket in the garden of Professor H.B. Wayland, Cadiz, Kentucky. First propagated in 1876. WAUGH; U7G{SC}

**Weaver:** (*P. americana*) Large, oval fruit with unequal halves; skin thick, orange heavily overlaid with red, bloom bluish; flesh firm, yellow, moderately juicy, quality good; stone large, half-free; season medium late. Tree a strong, upright grower; moderately productive. Found wild near Palo, Iowa by a Mr. Weaver. Introduced in 1875. ANDERSEN, WAUGH; F91T{SC}

**Whitaker:** (*P. munsoniana*) Medium to large, roundish fruit; skin thin but firm, yellow-orange with a bluish bloom; flesh yellow, moderately firm, slightly stringy, juicy, flavor sweet and good; stone small, clinging; ripens early. Tree moderately vigorous, upright, hardy, moderately productive. Originated under cultivation with J.T. Whitaker of Texas, prior to 1900. ANDERSEN WAUGH; F91T{SC}

#### EUROPEAN PLUMS

Generally smaller than Japanese plums. They also have more solid flesh, are best when completely ripe, and have a greater range of flavors. They are suitable for dessert or cooking or for both. Most have a high chilling requirement, are late blooming and quite hardy. European plums pollinate only other European plums. Mostly *P. domestica*.

#### COMMON

##### *Green/Yellow-Skinned*

**Alabaster:** Very attractive, nearly round fruit; skin clear pale-yellow, entirely covered with a heavy white bloom; flesh firm, meaty but melting, juicy, very sweet and flavorful, quality excellent; ripens in mid-August, 1 to 2 weeks before Pearl. Tree a regular and heavy cropper. Originated by Southmeadow Fruit Gardens, Lakeside, Michigan. Received the highest rating in a four year taste-panel testing. L12

**Coe's Golden Drop:** Fruit medium to large; oval, with a prominent neck at the stem end; skin straw-yellow; flesh golden yellow, firm, very juicy, very sweet, flavor apricot-like; stone free; ripens very late. Has been described as the Cox's Orange Pippin or Doyenne du Comice of the plum world. First raised by Jervaise Coe, at Bury St. Edmund's, Suffolk, England about 1809. HEDRICK 1911, SIMMONS 1978; J61M, M22, 081, Q30{SC}, R77

**Golden Nectar:** Fruit very large; skin golden-amber, thin, tender; flesh amber, flavor excellent; stone very small; ripens evenly; matures in late July, has good keeping qualities. Good fresh or dried. Tree self-fertile. Promising, relatively new cultivar. A63, A88M, C54, H4, N20

**Pearl:** Medium-sized, roundish-oval fruit, with unequal halves; skin golden-yellow, speckled with red dots; flesh deep yellow, juicy, firm but tender, very sweet, aromatic, with a pleasant, mild flavor; quality very good to best; clingstone. Tree vigorous, hardy, unproductive. Originated in Santa Rosa, California by Luther Burbank in 1898. HEDRICK 1911; J93, J93{SC}, LI, L12

**Pershire Egg:**<sup>1</sup> (Pershoie Yellow Egg) English cooking plum, excellent for jam and canning. Medium-sized, golden-yellow fruit; firm, mealy yellow flesh; clingstone; ripens in late August. Generally picked when still firm and green. Compact, self-fertile tree, very prolific. Grown commercially in Vale of Evesham. Introduced about 1827. SIMMONS 1978; 081, Q30{SC}, R77

**Saint Catherine:** (Torlo d'Ovo) Small, teardrop-shaped fruit; golden-yellow with a thin bloom; flesh light golden-yellow, juicy, sweet, tender; flavor mild and pleasant; dessert quality good, excellent for drying. Large, vigorous tree, hardy and productive. Famous in France for producing the *pruneaux de Tours* or *pruneaux fleuris*, so named because of their whitish bloom caused by sugar crystallization. Of ancient and unknown origin. First mentioned in 1699. DAVIDSON 1991, HEDRICK 1911; T49M{SC}

**Warwickshire Drooper:** Medium to large, oval fruit; skin pale yellow, spotted and speckled with brownish-red, bloom light; flesh yellowish, firm, flavor fair to good. Good for preserving, the canned product having excellent appearance and a bright clear-golden color. Tree large, vigorous; very hardy; self-compatible. SIMMONS 1978; 081, Q30{SC}, R77

**Yellow Egg:** Medium to large, long-oval fruit; skin golden-yellow, covered with thick bloom; flesh golden-yellow, rather juicy, firm, moderately sweet, quality good; stone semi-free or free; ripens late, season short. Very good for canning. Tree large, vigorous; very productive; hardy. Introduced prior to 1676. HEDRICK 1911; E84, F91T{SC}, H65, H89M, H89M{Wf}, I61M{SC}

##### *Red/Purple-Skinned*

**Belle de Louvain:**<sup>1</sup> Cooking plum. Large to very large, long-oval fruit; skin dull purplish-red, covered with delicate bloom; flesh yellow, soft, not very juicy, becoming dark and richly flavored when stewed; stone partially free; ripens in midseason. Makes a fairly good jam. Tree vigorous; partially self-fertile; a biennial bearer. Originated at Louvain, Belgium about 1840. HEDRICK 1911, SIMMONS 1978; 081, P59M, Q30{SC}, R77, R83

**Czar:**<sup>1</sup> Popular English cooking plum. Medium-sized, roundish oval fruit; skin reddish purple, almost black when ripe; flesh yellowish-green, tender, rather mealy but cooks well and produces

a rich red juice, flavor pleasantly acid; ripens very early. First fruited in 1874 and named for the Czar of Russia who visited England during the same year. HEDRICK 1911, SIMMONS 1978; 081, Q30{SC}, R83

De Montfort: Small to medium, roundish-oval fruit; skin dark-purple, with russet dots; flesh green, juicy, sweet, rich; quality good; freestone; ripens during a 3 week period in July. Tree vigorous, spreading; productive; very haidy. Originated in Montfortin, France prior to 1846. HEDRICK 1911; F91T{SC}, J93{SC}

Early Laxton: Small to medium-sized fruit; skin pinkish-orange, washed and dotted with rose and violet; flesh golden, juicy, sweet, flavor good; freestone; ripens in mid-July; bruises easily. Good for dessert; excellent for cooking and canning. Tree small; partially self-fertile; highly productive; tends to shed its fruit before properly ripe. Originated in England in 1916. SIMMONS 1978; A91, A91{SC}, H90M{SC}, J61M, L12, 081, Q30{SC}

Early Orleans:<sup>1</sup> (Monsieur Hatif) Cooking plum. Medium-sized, roundish-oval fruit; skin dark reddish-purple, covered with thick bloom; flesh lemon-yellow, juicy, coarse, firm, sweet, mild but pleasant, with deep red juice when cooked; quality very good; stone free; ripens early, season short. Tree small, vigorous, upright-spreading; hardy; productive. An old French cultivar that has been known for about three centuries. HEDRICK 1911, SIMMONS 1978; Q30{SC}

Empress: Large to very large, oval fruit; skin purplish-blue; flesh yellow, firm but tender, fine-textured, sweet, quality good; ripens late, about 1 week before President; similar to President. Good for shipping. Tree strong, vigorous, upright; productive; blooms late. B83, C30M, F53, F91T{SC}, M11M{PR}, M22

Kirke's Blue: (Kirke's) Large, round fruit; dark purplish-red, with heavy blue bloom; flesh greenish-yellow, juicy, flavor very good; stone large, free; season mid-September. Tree dwarfish but spreading, making a bush-like tree with many fruiting spurs Very suitable for small gardens; self-incompatible, pollinated by Czar. Originated in Great Britain. Introduced about 1830. SIMMONS 1978; F88G, J61M, L1, M22, 081, Q30{SC}

Mount Royal: Medium-sized, roundish fruit; skin dark purple; flesh greenish-yellow, juicy, firm, sweet; quality good; clingstone; ripens in midseason. Tree moderately vigorous; very hardy; self-fruitful, a heavy annual producer. Originated in Outremont, Quebec, Canada by W.W. Dunlop. Introduced prior to 1903. HEDRICK 1911; A39, A74, A74{DW}, B15M{DW}, C27T{SC}, D65, E97, F53, F88G, G16{DW}, I49G, I49G{SC}, L27M, L70, M11M{PR}, etc.

Opal: Medium-sized, oval fruit; skin yellow, almost completely covered with purplish-black flush; flesh pale gold, partly transparent, fairly firm, flavor good; stone almost free; ripens in mid-August. Tree moderately vigorous; self-fertile; a regular bearer. Originated in Alnarp, Sweden. Introduced in 1948. SIMMONS 1978; A91, F88G, I49G, I49G{SC}, L12, 081, Q30{SC}

Peach: Medium-large, roundish fruit; skin dark purplish-red, covered with thin bloom; flesh golden-yellow, moderately juicy, firm, subacid, mild; quality good; stone free; ripens early. Excellent for canning. Tree large, very vigorous, spreading; hardy; moderately productive. HEDRICK 1911; A91{SC}, C34, F88G, H89M, H89M{DW}, I61M{SC}, M22

Pond's Seedling:<sup>1</sup> (Pond) Cooking plum. Medium to large, roundish-oval fruit; skin rose-crimson, with slight bluish bloom; flesh golden-yellow, rather dry, fibrous, firm, mild, flavor fair but good when stewed; freestone; ripens late, season short. Tree vigorous, upright-spreading; partially self-compatible. Originated in England prior to 1831. HEDRICK 1911, SIMMONS 1978; 081, Q30{SC}

President: Large, oval fruit; skin deep purple, almost black, covered with heavy bloom; flesh yellow, dry, with a rich, sweet

flavor, good when stewed; freestone; ripens late. Tree very upright, compact; productive; requires a pollinator. Raised by Thomas Rivers of Sawbridgeworth, England. First fruited in 1894. HEDRICK 1911, SIMMONS 1978; A5, A39, B53, B83, B93M, C27T{SC}, C41M, E4, F88G, I23M{PD}, M39M, 081

Purple Pershore:<sup>1</sup> Cooking plum. Medium-sized, oval fruit; skin purple, with a very heavy bloom; flesh yellow, firm, dry, flavor poor but cooks well; stone clinging; ripens in late August. Very suitable for jam and canning. Tree vigorous, upright; self-compatible; cropping heavy but irregular. SIMMONS 1978; 081, Q30{SC}, R83

Sannois: Medium to large, roundish-oblate fruit; skin reddish-purple; flesh dark coppery-yellow, juicy, rather coarse, very fibrous, tough, firm, very sweet and flavorful; quality very good; clingstone; ripens very late. Tree small, vigorous, upright-spreading. Originated in Sannois, France prior to 1901. HEDRICK 1911; J93{SC}, L12

Seneca: Large, attractive fruit; skin reddish-blue, resists cracking; flesh yellow, very firm, sweet; freestone; ripens in midseason. Good for eating fresh or canning. Tree upright, moderately vigorous; requires a pollinizer; bears regularly. Introduced in 1972 by the New York State Agricultural Experiment Station. A5, A88M{OR}, B74, C34, D28J, H90M{SC}, I49M, J61M, J93{SC}, K36, N20

Victoria: Large, oval fruit; skin pale red, mottled with bright red on the side exposed to the sun; flesh greenish-yellow, firm, fairly sweet, juicy, flavor fair; stone large, free; ripens in midseason. Usually considered the best of all canned plums for it is then tender and juicy, with an attractive pinkish-red color and an almond flavor. Makes a jam of good color and quality. Very popular in Great Britain. DAVIES [Re], HEDRICK 1911, SIMMONS 1978; F88G, H15T{PD}, J61M, J93, J93{SC}, M22, 081, Q30{SC}, R77, R83

Yakima: Very large, somewhat oblong fruit; skin bright mahogany red over yellow with heavy bloom, attractive; flesh clear golden-yellow, tender, sweet, moderately juicy, very firm; quality very good; freestone; ripens in late August. Tree vigorous, upright; a very shy bearer unless pollinated with other European plums. Originated in Bingen, Washington. Introduced about 1925. ANDERSEN, BROOKS 1972; B83, C27T{SC}, F88G, F91T{SC}, I49G, I49G{SC}, I61M{SC}

**BULLACES** Similar to damsons, but whereas the damsons are oval and purple in color the bullaces are generally round and may be white as well as black. They are useful as late cooking plums. The fruit is usually left on the tree until late fall, until frost has softened its acidity. 081. (R insititia)

Black:<sup>1</sup> Cooking plum. Small, oval fruit, necked at the stem end; skin purplish-black, covered with a thick bloom; flesh greenish-yellow, juicy, firm, sour or agreeably tart late in the season; stone small, clinging; ripens late. To be at its best for cooking it should be left on the tree until touched by the first frosts. Tree upright or slightly spreading; extremely productive. One of the oldest cultivated plums. HEDRICK 1911, SIMMONS 1978; Q30{SC}

Langley:<sup>1</sup> Cooking plum, resembles a damson more than the Bullace. Medium-sized, nearly oval fruit; skin blue-black, covered with a slight bloom; flesh greenish, firm, acid, sweet; ripens in October and November. Tree vigorous, upright; self-compatible; prolific. Farleigh damson x Early Orleans. First raised about 1902. SIMMONS 1978; Q30{SC}, R77

Shepherd's:<sup>1</sup> Fruit small, good-sized for a bullace; roundish-oval; skin greenish-yellow; flesh firm, juicy, tart; ripens in late October. Useful as a late cooking plum. Tree moderately vigorous, upright; prolific. Of unknown origin. SIMMONS 1978; Q30{SC}

White: (Gold) Small, roundish fruit; skin deep amber yellow, with thick white bloom; flesh deep golden yellow, firm, juicy, coarse, fibrous, sour to slightly sweet; stone clinging; ripens late. Tree upright-spreading, moderately vigorous; productiva Very old

cultivar of unknown origin. HEDRICK 1911, SIMMONS 1978; Q30{SC}

**DAMSONS** Similar to bullaces but generally more oval in shape, with less bloom, ripening at least six weeks sooner and with an entirely different richer and sweeter flavor. They are too astringent to be eaten raw, but are excellent for cooking and preserving. (P. insititia)

**Bradley's King:** Large, roundish fruit; skin dark purplish-red, with light bloom which gives it a bluish appearance; flesh greenish-yellow, rather dry, somewhat sweet, lacks the true damson tartness; stone free; ripens mid to late September. Tree vigorous, upright; very hardy; productive. One of the largest damsons. Originated in Nottinghamshire, England. SIMMONS 1978; Q30{SC}

**Briceland:** Fruit small; skin dark bluish-purple with a heavy bloom; flesh yellow, spicy, somewhat astringent; pleasant to eat when fully ripe, best used for canning. Makes an excellent rich purple jam when cooked with its skin. Tree semi-dwarfish, upright; well-adapted to conditions near Briceland, California where it was discovered. E84

**Damson:** (Blue Damson) Small, oval fruit; skin bluish-black, with a heavy bloom; flesh firm, greenish-yellow, juicy, tart; freestone; ripens in midseason. Excellent for jam and jelly. Tree upright-spreading; productive. Brought to Italy from Damascus at least a century before the Christian era, hence the name. HEDRICK 1911; A82, B73M{DW}, E68M{PD}, F61M, I9M, I41P, J83, LI, L33, L47, M69M

**Farleigh:**<sup>1</sup> (Crittenden) Small, roundish-oval fruit; skin purplish-black, covered with a very thick bloom; flesh greenish-yellow, firm but tender, sour, sprightly, very rich when cooked but not as rich as Shropshire; stone clinging; ripens early for a damson. Tree exceptionally prolific, with fruit borne in clusters. HEDRICK 1911, SIMMONS 1978; M22, 081, Q30{SC}

**Krikon:** Small, oval fruit; skin blue with a heavy bloom, moderately tough; flesh yellow, rather dry, very crisp, clingstone; quality fair for dessert, very good cooked; ripens in late August. Tree vigorous, upright-spreading; hardy; productive; susceptible to leaf spot. Originated in Sweden. ANDERSEN; F88G, F91T{SC}

**Merryweather:** Large, round-oval fruit; skin thick, blue-black, covered with light bloom; flesh greenish-yellow, firm, juicy, has a fair damson-like flavor; quality good; stone medium-sized, clinging. Excellent for preserving. Tree vigorous, spreading; self-compatible; prolific. Originated in Nottinghamshire, England about 1909. HEDRICK 1911, SIMMONS 1978; 081, Q30{SC}, R77

**Shropshire:**<sup>1</sup> (Prune Damson) Fruit fairly large for a damson, oval to oblong; skin blue-black, with a dense bloom; flesh golden-yellow, juicy, firm, sugary, astringent, dessert quality good when fully ripe or after a frost, flavor very rich when cooked; stone clinging; ripens late, season long. Excellent for cooking, preserving, bottling and canning. Tree large, vigorous, productive. Originated in England, sometime in the 17th century. HEDRICK 1911, SIMMONS 1978; F53, F88G, F91T{SC}, G79M{DW}, M22, 081, Q30{SC}, R77

**GAGES** There is less certainty of the origin of this type than of any other kind of plum and it may well be a distinct species. In Great Britain the gage is considered to possess the best flavor of all plums and has often been crossed with other cultivars. The hybrids usually have the color and flavor of the gage but most are larger, i.e. Cambridge Gage, Laxton Gage. *Elvas plums* are candied and semi-dried Green Gage plums produced near the medieval Portuguese towns of Elvas and Estremoz. GRIGSON, S., SIMMONS 1978.

**Cambridge Gage:** Small to medium-sized, round fruit; skin greenish-yellow; flesh greenish-yellow, firm, juicy, with a true gage flavor; ripens in late August. Excellent for dessert, cooking, preserving and canning. Tree vigorous; requires a pollinator; incompatible with Green Gage; not a heavy producer, but consistent. Seedling of

Green Gage. SIMMONS 1978; F91T{SC}, J93{SC}, L12, 081, Q30{SC}, R77, R83

**Count Althann's Gage:** Large, flattened globe-shaped fruit; skin dark purplish-red, with numerous golden-yellow dots, and a thick bluish bloom; flesh light golden-yellow, firm but tender, sweet, mild, pleasant; quality excellent; stone semi-clinging; ripens in midseason. Tree upright-spreading; productive; requires a pollinator. Originated in Hungary prior to 1869. HEDRICK 1911, SIMMONS 1978; J93{SC}, LI, L12, 081, P59M, Q30{SC}, R77, R83

**Denniston's Superb:** Medium-large, round-oval fruit; skin greenish-yellow, blushed with red; flesh yellowish-green, transparent, firm, fairly juicy, with a rich, vinous flavor; quality very good; stone practically free. Tree vigorous, upright-spreading; a reliable and heavy bearer. Originated in Alba, New York by Isaac Denniston, about 1835. HEDRICK 1911, SIMMONS 1978; 081, Q30{SC}, R77

**Early Transparent Gage:** Small to medium, roundish fruit; skin pale apricot yellow with white bloom and crimson dots, so thin that it shows the stone; flesh golden yellow, transparent, juicy, very sweet; flavor rich, distinctive when properly ripe; stone small, free. Subject to splitting. A connoisseur's fruit of the highest quality, usually considered the best early gage. SIMMONS 1978; 081, Q30{SC}, R77

**General Hand:** Fruit large, one of the largest of the gages; roundish-truncate; skin yellow, covered with thin bloom; flesh golden-yellow, juicy, somewhat fibrous, firm, sweet, with a pleasant, mild flavor; quality very good; stone semi-free or free; ripens in midseason. Tree large, vigorous, spreading; hardy; productive. First fruited in 1790 on the place of General Hand, near Lancaster, Pennsylvania. HEDRICK 1911; L12

**Golden Transparent Gage:** Large, oblong fruit; skin golden yellow, dotted with red, transparent, showing the stone; flesh transparent, firm, juicy, very sweet, rich, with true high gage flavor; quality excellent; ripens late. Tree small, self-compatible, productive. Originated in England by Thomas Rivers, about 1894. HEDRICK 1911, SIMMONS 1978; J61M, J93{SC}, LI, L12, R77, R83

**Green Gage:** (Reine Claude) Small to medium, roundish-oval fruit; skin yellowish green, covered with light bloom; flesh greenish-yellow, very juicy, firm but tender, sweet, mild, flavor rich and aromatic; stone partially clinging; ripens in midseason. Tree moderately vigorous; hardy; productive. The standard in quality for plums since 1699. HEDRICK 1911, SIMMONS 1978; A91{SC}, E9{PD}, E84, G79M{DW}, H15T{PD}, H65, I83M, L27M, L27M{PL}, L47, M11M{PR}, M39M

**Imperial Gage:** Small, round-oval fruit; skin dull greenish-yellow, covered with thick bloom; flesh golden-yellow, juicy, firm but tender, very sweet, mild; quality very good; stone nearly free; ripens in mid-September. Tree large, vigorous, upright-spreading; hardy; very productive. Originated in Flushing, Long Island, New York from seed planted in 1790. HEDRICK 1911; L12

**Jefferson:** Medium-sized, roundish-oval fruit; skin greenish-yellow, covered with a thin white bloom; flesh deep yellow, juicy, firm but tender, sweet, mild, pleasant, quality very good; stone semi-free; ripens in midseason. Tree medium to large, vigorous, spreading; productive; hardy. Originated in Alba, New York about 1825. HEDRICK 1911; C54, L12, 081, Q30{SC}, R77, R83

**Laxton's Gage:** Medium-sized, round fruit, larger than Green Gage; skin clear yellow; flesh greenish-yellow, fairly soft, juicy, has an excellent gage-like flavor; quality good for dessert, not suitable for canning; ripens the end of August. Tree vigorous, upright to spreading; self-compatible; productive. Originated in England. Introduced in 1919. SIMMONS 1978; 081

Reine Claude d'Oullins: (Oullins Golden Gage) Medium-sized, roundish-oval fruit, with unequal halves; skin light yellow, covered with a light bloom; flesh greenish-yellow, somewhat dry, firm, sweet, not high in flavor; quality good; stone semi-free; ripens early, season short. Tree large, vigorous, spreading; hardy; productive. Originated in France prior to 1866. HEDRICK 1911; C76M, L12, 081, P68M, Q30{SC}, R77, R83

Reine Claude de Bavay: Medium to large, round to oblong fruit; skin pale green yellow with numerous white dots; flesh deep yellow, juicy, with a rich gage-like flavor; ripens the end of September, will hang on the tree for several weeks. Tree moderately vigorous, compact, very suitable for small gardens. Introduced about 1843 by Major Esperen, one of Napoleon's cavalry officers. SIMMONS 1978; LI, Q30{SC}, R77, R83

Reine Claude Violette: (Purple Gage) Small to medium-sized, roundish fruit; skin light purple covered with golden dots, bloom slight; flesh greenish, transparent, firm for a gage, sweet and rich, juicy, excellent for dessert; stone small, free; ripens late August to early September. Tree upright, vigorous, fairly productive. SIMMONS 1978; LI, Q30{SC}

**MIRABELLES** Little known in this country but highly esteemed in France for the unique apricot-like preserve that can be made from them. They are also used commercially for the manufacture of a spirit. The flavor of most is greatly improved by cooking. SIMMONS 1978; E9{PD}, K32M{PD}

Mirabelle: Small, roundish-oval fruit, slightly necked; skin light golden-yellow, overspread with thick bloom; flesh light yellow, not very juicy, firm but tender, sweet, mild but pleasant; quality very good; stone free; ripens in midseason. Tree small, round and open-topped, handy. One of the favorite plums in France where it is in great demand for canning, preserves, compotes, tarts and prunes. HEDRICK 1911; G79M{DW}, H90M{SC}, J61M, M22, N24M

Mirabelle de Metz: Small, round fruit; skin pale golden-yellow with many red dots, covered with a slight bloom; flesh yellow, transparent, soft, sweet, flavor excellent; stone small, free; ripens in August. Suitable for dessert; also makes delicious conserves. Tree small, round-headed; productive Very old French cultivar. SIMMONS 1978; U7G{SC}, Y83{SC}

Mirabelle de Nancy: (Drap d'Or) Small, roundish-oval fruit; skin golden-yellow, covered with a thin bloom; flesh light golden-yellow, moderately juicy, coarse, firm but tender, sweet, mild; quality excellent; stone free; ripens in midseason. Tree small, upright-spreading; hardy; productive. A very old French cultivar of uncertain origin. A red-fruited type is available. HEDRICK 1911, SIMMONS 1978; F88G, 081, P59M, P68M, Q30{SC}

Mirabelle d'Octobre: (Late Mirabelle) Small, roundish-oval fruit; skin greenish-yellow, often with a light blush on the side exposed to the sun, covered with thin bloom; flesh yellow, very juicy, aromatic, sweet; quality good; stone semi-free; ripens late. Tree moderately large and vigorous, very handy, productive. HEDRICK 1911; Y83{SC}

Mirabelle Herrenhausen: (Mirabelle Double de Herrenhausen) Small to medium-sized fruit; skin yellow, mottled with red; flesh yellow, sweet, quality good; ripens late, following Mirabelle de Nancy. Tree vigorous, very productive. Originated in Germany prior to 1881. HEDRICK 1911; F91T{SC}

**PRUNES** Plums that have a high content of sugars and solids, which enables them to be dried without fermenting at the pit. The best cultivars have a small, smooth pit and a rich flavor that survives drying. As fresh fruit they are generally sweeter than other plums.

Bluebell: Fruit large, more so than Stanley; oval; skin blue; flesh firm, yellow, flavor good, sweet; freestone; ripens in mid-September, shortly after Stanley, which it resembles. Tree vigorous, upright, holds fruit through a long harvest period. Originated in Mountain Grove, Missouri. BROOKS 1972; M11M{PR}

Bluefre: Large, oval fruit; skin blue; flesh greenish-yellow, firm, thick, sweet, flavor good; freestone; ripens in late August, about 1 week after Stanley; resembles President. Retains its color well when processed. Tree vigorous; precocious, very productive; extremely hardy; holds fruit in good condition for about 30 days after normal harvest time. BROOKS 1972; A5, B83, F53, F88G, F91T{SC}, I61M{SC}, K36, M11M{PR}

Brooks: (Brooks Italian, Lafayette) Large, oval fruit, averages 50% larger than Italian; skin blue; flesh greenish-yellow, very firm, slightly tart, moderately juicy, sweeter than Italian; keeps and ships well; fair canning quality, good drying quality; ripens 1 week earlier than Italian. Tree bears annually. BROOKS 1972; D28J, E87, H89M, H89M{DW}, I49M, N20

Earliblue: Stanley x President. Medium to large, oval fruit; thin, purplish-blue fruit; sweet greenish-yellow flesh, firm, crisp, juicy, fine-textured; quality very good. Ripens early, in mid-July. Suitable for fresh use, canning, drying and juice. Upright, very hardy tree, self-fertile. Less productive than Stanley. BROOKS 1997; F91T{SC}, L33, M11M{PR}

Early Italian: (Richards Early Italian) Large fruit, slightly larger than Italian; skin purplish-black; flesh yellow, firm, sweeter than Italian; ripens 10 to 14 weeks before Italian, which it resembles; ships well. Tree less vigorous and weaker than Italian. An excellent commercial cultivar. BROOKS 1972; A91, A91{SC}, B74, B83, C41M, E87, F88G, I68, M39M, N20

French Improved: Medium-sized, oval fruit; skin red to dark-purple, tender; flesh fine-textured, tender, very sweet and rich; ripens August to September. Suitable for dessert, drying, or canning. Tree self-fertile. The leading prune in California. A88M, B71M, B93M{DW}, C54, E4, I68, I99M, L47, N20

Giant Prune: (Burbank's Giant Prune) Large, long oval fruit; skin purplish-red with numerous russet dots; flesh light golden-yellow, coarse, firm, rather sweet, mild, flavor fairly good when cooked; stone clinging; ripens in midseason. Tree moderately vigorous; precocious; bears heavily and annually. Originated in Santa Rosa, California by Luther Burbank. Introduced in 1893. HEDRICK 1911, SIMMONS 1978; 081, Q30{SC}, R83

Imperial Epineuse: (Imperial) Fruit large, slightly obovate; skin purplish red, darker on the side exposed to the sun; flesh greenish-yellow, tender, sweet, rich, of agreeable flavor; quality excellent; stone clinging; ripens late. Tree large, vigorous, spreading, fairly productive. Originated as a chance seedling in the great prune growing district of France, about 1870. HEDRICK 1911; G79M, H90M{SC}, J61M, K88T, LI, L12, Q30{SC}

Italian: (Fellenberg) Fruit medium to large, long-oval; skin purplish-black, covered with very thick bloom; flesh yellow, very firm, dry, sweet, aromatic when fully ripe; stone partially free; quality very good to best; ripens late, season short. Excellent for preserving and drying. Tree vigorous, spreading; precocious; a regular and heavy bearer. One of the most widely grown of all plums. HEDRICK 1911, SIMMONS 1978; B83, D81M{PO}, E84, F53, G79M{DW}, H65, H89M, H90, LI, M11M{PR}, M39M

Middelburg: Large, oval fruit; skin light to deep purplish-red, covered with thick bloom; flesh light yellow, rather juicy, sprightly when first mature, becoming sweetish, strongly aromatic, pleasant flavored; quality very good; stone semi-free; ripens very late. Tree vigorous, medium-sized; hardy; productive. Originated in Middleburg, New York, sometime prior to 1886. HEDRICK 1911; J93{SC}, L12

Moyer: (Moyer Perfecto) Fruit large, averaging 1 1/2 inches in diameter, ovate; skin thick, blue, bloom heavy and whitish; flesh yellow, firm, juicy, somewhat coarse, quality good, semi-clingstone; ripens about 7 to 10 days after Italian. Excellent for drying. Tree vigorous, self-fruitful. Originated in Roseburg, Oregon by

C.E. Moyer. Introduced about 1927. BROOKS 1972; *B71M*, *E4*, *E84*, *K73M*, *M63M*{DF}

Prune d'Agén: (French, French Petit) Medium small, long oval fruit; skin violet-purple, covered with thin bloom; flesh greenish-yellow, tender, sweet, aromatic; quality very good to best; stone semi-free; ripens late. Excellent for dessert and drying. Tree medium-sized, upright-spreading; hardy; very productive. Of ancient origin; brought to France from Turkey or Persia by Benedictine monks on their return from the Crusades. HEDRICK 1911; *B93M*, *C94M*{PD}, *E84*, *H89M/Xm*, *I19M*{DF}, *I50D*{DF}, *K73M*, *K88T*, *L12*, *L97G*{DF}, *M63M*{DF}

Quetsche:<sup>1</sup> Famous European cooking plum. Flavorless when eaten fresh, but develops a rich flavor after being stewed. Grown in Austria and eastern Europe for prunes, and in Germany for canning. Also used for *Quetsche* brandy. Occasionally available in cans or jars at gourmet specialty stores. Generally considered a class of plums rather than a cultivar. RAY, C.; *E9*{PD}

Silver Prune: Large, oval fruit; skin light yellow; flesh yellowish, firm, juicy, sweet and rich. Dries to a beautiful golden color. Seedling of Coe's Golden Drop, which it resembles, but is much more productive. Originated in Oregon by W.H. Prettyman. WICKSON; *D7*{DF}

Stanley: Medium to large, oval fruit; skin deep purplish-blue; flesh greenish-yellow, juicy, firm but tender, sweet; stone free; ripens late. Tree large, vigorous, spreading; self-fertile, precocious, bears heavily and annually. Most popular prune cultivar in the United States. Originated in Geneva, New York by Richard Wellington. Introduced in 1926. BROOKS 1972; *B73M*, *B73M*{DW}, *B83*, *D81M*{PO}, *G16*, *G23*, *G23*{DW}, *J61M*, *J83*, *K28*, *M11M*{PR}, *M39M*, *N33*

Sugar: Small, oval fruit; skin dark reddish-purple, covered with thick bloom, very tender; flesh golden-yellow, juicy, tender, sweet, mild; quality very good; stone free; ripens early. Excellent fresh; good for drying and canning. Tree moderately vigorous, spreading; hardy; self-fertile, productive. Originated in Santa Rosa, California by Luther Burbank. Introduced in 1899. HEDRICK 1911; *A88M*, *B93M*, *F91T*{SC}, *I68*, *K88T*, *N20*

Valor:<sup>3</sup> Medium-large fruit; skin dark purple, speckled, attractive; flesh greenish-gold, firm, semi-freestone; quality excellent; ripens with Italian or just ahead of it. Recommended as a fresh fruit cultivar. Tree vigorous and productive; foliage dark. Low chilling requirement. Originated in Vineland Station, Ontario, Canada. *C76M*, *F88G*, *J61M*, *M11M*{PR}, *P59M*

Weatherspoon: Large fruit; skin moderately thick, tough; flesh firm, sweet, aromatic; ripens a week ahead of Italian which it resembles; has good shipping qualities. Tree somewhat thorny; not hardy; blooms heavily but production is not high; requires pollination by other Italian type cultivars. BROOKS 1972; *F91T*{SC}

#### JAPANESE PLUMS

With few exceptions, the fruit is larger than that of European plums. It is also juicier, with a pleasant blend of acid and sugar. Most Japanese plums are used for fresh fruit only. They can be kept longer than European plums and are better shippers. They bloom early and are thus susceptible to spring frosts. Some do well in mild-winter climates. Japanese plums cross-pollinate readily and also pollinate American plums. Mostly *P. salicina*.

#### GREEN/YELLOW-SKINNEP

Byron Gold: Large, round fruit, 2 inches or more in diameter; skin bright yellow; flesh golden yellow, aromatic, crisp, sweet, quality excellent; ripens late June to early July, keeps very well. Tree vigorous, precocious, productive. Resistant to the bacterial and fungal diseases common to the southeastern United States. *C76M*, *E99M*, *F91T*{SC}, *G17*

Early Golden: Medium-sized, round fruit; skin golden, blushed with red; flesh golden, firm, smooth, quality good; stone small, free;

ripens 10 to 14 days before Shiro. Tree vigorous; productive; self-unfruitful, sets well with pollen from myrobalan; blooms very early; tends to bear biennially. Widely planted in Ontario, Canada. BROOKS 1972; *F53*, *F88G*, *I61M*{SC}, *J61M*, *M11M*{PR}

Ember: Medium to large, oblong fruit; skin yellow, blushed with red, bloom medium; flesh yellow, firm, fine-grained, tender, juicy, sweet; quality high for dessert or culinary purposes; stone clinging; ripens in early September; keeps well for 2 to 3 weeks after ripening. Tree low, spreading; vigorous; hardy. Originated in Excelsior, Minnesota. BROOKS 1972; *F91T*{SC}, *H44*

Great Yellow:<sup>3</sup> Large, roundish fruit; skin thin, clear yellow; flesh clear yellow, fine-textured, with a mild subacid flavor; ripens early. Tree moderately vigorous, hardy. Relatively low chilling requirement. Originated in Sebastopol, California by Luther Burbank. Introduced in 1931 by Stark Brothers Nuisery. BROOKS 1972, RUCK; *T49M*{SC}

Green Egg: A sour plum, craved by some people who appreciate acid fruits sprinkled with a little salt. Enthusiasts frequently prefer this plum to the older cultivar, Green Gage. The spicy flavor is refreshing to those who like to cleanse the palate after a heavy meal. Adapted to Southeastern growing conditions. *I53M*

Homesteader: (Profanoff) Medium-sized fruit, 1 1/4 inches in diameter; skin yellow-green, overlaid with orange, thin; flesh freestone, of excellent quality; ripens early; resembles Green Gage. Tree hardy, productive; pollinates with Pitsin #5. Originated in the former Soviet Union. *C58*

Howard Miracle: Medium to large fruit; skin yellow, heavily blushed with red at maturity, thin, tough; flesh yellow, firm, juicy; flavor distinctive, somewhat suggestive of pineapple; freestone; ripens midseason to late; ships well. Tree very vigorous; requires cross-pollination, Wickson and Santa Rosa recommended. Originated in Montebello, California. BROOKS 1972; *A63*, *C54*, *G49*, *H4*, *I68*, *LI*, *N20*

Inca: Oval, handsomely shaped fruit; skin golden-yellow tinged with crimson, bloom lavender; flesh pale orange, juicy, firm, sweet and flavorful; ripens in midseason. Originated in Santa Rosa, California by Luther Burbank. Introduced in 1919. Highly rated by members of the California Rare Fruit Growers. *D57*{OR}

Ivanovka: Roundish fruit, 1 1/2 inches in diameter; skin greenish-yellow, mostly covered with dull bluish-red, overlaid with medium bloom; flesh greenish-yellow to pink, somewhat starchy, very juicy, sweet, sprightly; quality very good for dessert and canning; clingstone; season late August. Tree vigorous, upright-spreading; hardy; productive. Originated in Manchuria. ANDERSEN, BROOKS 1972; *B47*

Kelsey: Large, heart-shaped fruit; skin yellow, tinged and splashed with red, with attractive bloom; flesh yellow, juicy, firm and meaty, rich, pleasant, aromatic; quality good to very good; stone clinging unless well ripened; ripens very late; keeps and ships unusually well. Tree vigorous, upright; productive; an early and regular bearer; tender to cold. Introduced into the United States from Japan in 1870. HEDRICK 1911; *A9*, *B71M*, *C54*, *E4*, *I83M*, *K88T*, *N20*

La Crescent: (Ciescent, Golden Minnesota) (*P. americana* x) Small, oval fruit; skin thin, tender, easily removed, yellow, sometimes faintly blushed; flesh yellow, juicy, very tender, melting, sweet, aromatic, suggestive of apricots, dessert quality good; stone small, free; ripens early. Tree large, extremely vigorous; moderately productive; hardy. BROOKS 1972; *A74*, *C27T*{SC}, *C58*, *D69*, *I49G*{SC}, *L27M*, *L70*

Pitsin #5: Medium to small, round fruit; skin yellow, covered with a moderately heavy bloom; flesh yellow, smooth, very juicy and aromatic, flavor excellent; freestone; ripens early; resembles Pitsin #9. Tree vigorous; hardy. Originated in Manchuria. Introduced into Canada in 1939. BROOKS 1972; *B47*, *C58*, *M35M*

Ptitsin #9: Medium-sized, nearly round fruit; skin green, becoming greenish-yellow when mature; flesh light greenish, firm, meaty, freestone; flavor very sweet, mild, pleasant, somewhat reminiscent of Green Gage; ripens in mid-August. Tree small, rounded, spreading; hardy; productive; adapted to prairie conditions. BROOKS 1972; M35M

Shiro: Medium-sized, roundish fruit; skin yellow, covered with thin bloom; flesh light yellow, semi-transparent, very juicy, somewhat melting, sweet, mild, lacks character in flavor; quality good; stone clinging; ripens very early. Tree large, vigorous, upright-spreading; tender to cold; productive. Originated by Luther Burbank, introduced about 1897. HEDRICK 1911; A5, B53, B83, F53, H65, I83M, J16, J93, L33, M11M{PR}, M39M

Wickson: Large to very large, heart-shaped fruit; skin yellow, blushed with dark red; flesh amber-yellow, juicy, coarse, somewhat fibrous, firm, sweet, pleasant but not high in flavor; quality good; stone clinging; ripens in midseason; keeps and ships well. Tree vigorous, upright; tender to cold; an uncertain bearer. Originated by Luther Burbank. First described in 1892. HEDRICK 1911; A9, A88M, B71M, B93M, C54, D81{PO}, D81M{PO}, E4, I68, I83M, LI, L90, N20, N33

#### RED/PURPLE-SKINNED

Abundance: Small to medium-sized, roundish-ovate fruit; skin dark red, covered with thin bloom; flesh yellow, very juicy, tender and melting, sweet, pleasantly aromatic; quality good; stone clinging; ripens early, season short. Tree large, vigorous, very productive. Imported from Japan by Luther Burbank. Introduced in 1888. HEDRICK 1911; F88G, F91T{SC}, G79M{DW}, I61M{SC}, M69M

Alderman: Large, conical fruit; skin orange-red with little or no bloom; sweet, juicy bright golden-yellow flesh; quality excellent; clingstone. Ripens in late August, about 1 week later than Superior or Toka. Vigorous, hardy tree; self-fruitful. Very precocious, often bearing the first year after planting. BROOKS 1997; <sup>^474</sup>, C27T{SC}, H44, I49G, I49G{SC}, J93, J93{SC}, L27M, L70

Beauty: Medium to large, heart-shaped fruit; skin bright red; flesh amber, tinged with red, flavor good fresh or cooked; ripens early; keeps well. Tree vigorous; productive; partially self-fruitful. Relatively low chilling requirement. Originated in Santa Rosa, California by Luther Burbank. Introduced in 1911. RUCK; A88M, B74, C54, I49M, I68, I83M, J61M, K88T, N20

Bruce: (Bruce's Early) (*P. angustifolia* x) Fruit medium to large, about 1 1/2 inches in diameter; skin wine-red; flesh deep red, soft, sweet, quality fair; matures very early, being its primary outstanding fruit characteristic. Used primarily for jelly. Tree bears heavily, often produces the first year; requires a pollinator, usually Methley. Originated in Donley County, Texas by A.L. Bruce. Introduced about 1921. BROOKS 1972, MCEACHERN; A82, A85M, C54, E45, E99M, F61M, G17, H63M, H63M{TM}, I41P, I53M, L90, M83, N33

Burbank: Medium to large, roundish-conic fruit; skin dark red, covered with thick bloom; flesh deep yellow, juicy, tender, firm, sweet, aromatic; quality good; stone clinging; ripens early, season long. Tree large, vigorous; very productive; unusually hardy for a Japanese cultivar. Raised from a seed sent to Luther Burbank by a Japanese agent in 1883. HEDRICK 1911; A82, E99M, F53, F88G, G72, G79M{DW}, H90, I9M, K28, M69M, M83

Burgundy: Small, round fruit, about 1 1/2 inches in diameter; skin and flesh an attractive dark maroon; flavor mild, sweet and pleasant. Ripens in July and August. Suitable for fresh eating, canning or preserves. Upright, very productive tree; self-fertile. Requires 400 hours of chilling. Recommended for home gardens. A63, A88M, C54, I83M, L47, N20

Catherine Bunnell: Large, deep-red to purple fruit; ripens around July 4th. Developed by Luther Burbank. Of little commercial value

because of defects such as cracked stones within the fruit, but of such exceptional dessert quality that trees were given to Burbank's close friends—including Catherine Bunnell of Berkeley—as enduring gifts. Recently resurrected by the California Rare Fruit Growers. MARIANI 1994; T49M{SC}

Duarte:<sup>2</sup> Medium to large, heart-shaped fruit; skin deep-red with silver markings; flesh blood red, firm, juicy, flavor good, tart when cooked; quality very good; ripens in midseason; keeps well. Good fresh or canned. Tree vigorous; cold hardy; self-fruitful; a good pollinator for other cultivars, especially Santa Rosa. Originated by Luther Burbank. Introduced in 1900. F91T{SC}, M39M

Eldorado: Large, oblong fruit; skin dark red; flesh amber, somewhat dry, clingstone; ripens early, stores well. Good for canning. Tree very upright; requires a pollinator; pollinated by Beauty, Laroda and Wickson. Originated in Sebastopol, California by Luther Burbank. Introduced in 1904. B93M, E4, F91T{SC}, K88T, N20

Elephant Heart:<sup>2</sup> High quality "blood" plum (blood red flesh and red juice). Medium to large, heart-shaped fruit; skin thick, dark brownish-purple; flesh blood red, sweet and rich, extremely juicy, juice red; flavor and quality excellent; freestone; ripens late. Tree vigorous; hardy; prolific; self-unfruitful. Originated in Sebastopol, California by Luther Burbank. Introduced in 1929 by Stark Brothers Nurseries. BROOKS 1972; A88M, C30M, C54, E87, E99M, F53, G49, I68, J93{SC}, LI, L12, L47, M39M, N20

Explorer: (*P. angustifolia* x) Medium to large fruit; skin bright purplish-black, covered by a heavy, waxy bloom; flesh deep amber, juicy, sweet, flavor very good, quality high; ripens during the first 10 days in Byron. Tree moderately vigorous, upright-spreading; requires a pollinator; disease resistant. Adapted to all areas of the Southeast. Originated in Byron, Georgia. Introduced in 1981. C30M, E99M, F61M, F91T{SC}

Formosa: (Wickson Challenge) Large, oval fruit; skin yellow with a pale bloom until nearly ripe, turning to a clear rich red; flesh pale yellow, unusually firm, sweet and rich, with a slight apricot-like flavor, nearly freestone; ripens in mid-August. Tree vigorous; very productive; susceptible to bacterial leaf spot. Originated by Luther Burbank. Introduced in 1907. SIMMONS 1978, WICKSON; A5, F88G, F91T{SC}

Friar: Large, oblate fruit; skin black when fully mature, resists cracking; flesh amber, firm, softens slowly after harvest, quality good; stone small, free; ripens in midseason, several days later than Nubiana. Tree upright; very vigorous and productive; requires a pollinator. BROOKS 1972; A9, A88M, B53, B71M, B83, B93M, D81{PO}, D81M{PO}, E4, F88G, H49, M39M, N20

Frontier: Large, round-ovate fruit; skin blue-black, more attractive than other red-fleshed cultivars; flesh red, not as dark as Mariposa, firm, freestone, flavor good, similar to Mariposa; ripens 10 to 14 days after Santa Rosa; softens slowly after picking. Tree vigorous; productive; requires a pollinizer, Santa Rosa and Redheart being effective. BROOKS 1972; C75M

Gaviota: Very large, oval fruit; skin dark red over yellow ground color; flesh yellow, aromatic, juicy, firm, sweet, with a sparkling rich flavor; quality very good; stone extremely small; ripens in midseason. Tree vigorous, productive, blooms late. Originated by Luther Burbank, about 1900. HEDRICK 1911; T49M{SC}, U7G{SC}

Hanska: Medium-sized, roundish-oblate fruit; skin bright red with a heavy blue bloom; flesh firm, yellow, aromatic, of good quality; stone very small, semi-free. Develops a strong apricot flavor when cooked. Tree very vigorous, three-year old trees attaining a height of 12 feet; hardy. Originated in Brookings, South Dakota by N.E. Hansen. Introduced in 1908. Hanska is the Sioux word for "tall". HANSEN, HEDRICK 1911; F91T{SC}, J93{SC}

Kaga: Small, crimson fruit; flesh amber, sweet and aromatic with an intense fruity flavor; clingstone; ripens in late August. Compact,

very hardy tree. Fbllinate with Waneta, Pipestone, Shiro, etc. Sibling of Hanska. Originated in Brookings, South Dakota by N.E. Hansen. Introduced in 1909. Kaga is Sioux Indian for "pitch a tent". TAYLOR; A91, A91{SC}, C27T{SC}, C58, D76, E97, F91T{SC}, I49G{SC}, I61M{SC}

Kahinta: Medium to large, roundish to slightly oval, very heavy fruit; skin dark red, thin, free of acerbitity; flesh yellow, firm, sweet, of excellent quality, freestone. Originated in Brookings, South Dakota by N.E. Hansen. Introduced in 1912. Kahinta is the Sioux Indian name for "sweep". HANSEN; C27T{SC}, F91T{SC}, I49G, I49G{SC}

Laroda: Large, nearly round fruit; skin deep reddish-purple; flesh light amber, light red near the skin, firm, sweet, mildly aromatic, quality good; ripens in midseason; ships very well. Tree vigorous, upright; produces numerous medium-sized spurs and buds; self-unfruitful, being pollinated by Santa Rosa. BROOKS 1972; A88M, B71M, K88T, N20

Late Santa Rosa:<sup>3</sup> Bud mutation of Santa Rosa. Medium to large, reddish-purple fruit; amber flesh, streaked with red near the pit; rich subacid flavor when fully ripe. Ripens about 1 month later than Santa Rosa. Productive, self-fruitful tree. Requires about 500 hours of chilling. Introduced in 1931. A63, A88M, C54, I68, I83M, K88T, L47, N20

Mariposa:<sup>2</sup> (Improved Satsuma) Large, round to heart-shaped fruit; skin maroon, thick, sweet; flesh blood red, firm, tender, juicy, sweet, freestone; sweeter than Satsuma which it resembles; ripens in midseason, holds on the tree 2 to 3 weeks after ripening. Tree medium to large, vigorous, upright. Originated in Pasadena, California. BROOKS 1972; A9, A63, A88M, C30M, C54, G17, G49, I68, I83M, K88T, LI, L47, N20

Methley:<sup>3</sup> Small to medium, round fruit; skin purple, blushed with red; flesh red, soft, very juicy, sweet, flavor distinct; quality good; ripens early. Tree vigorous, upright; hardy; self-fruitful; productive; a good pollinizer, especially for Shiro. Low chilling requirement, 200 to 250 hours or less. Originated in South Africa. A5, A82, A85M, B53, B74, C75M, F53, F88G, F93, G72, I9M, I83M, J61M, K28, M11M{PR}, M69M, N33, etc.

Morris: Medium to large fruit; skin reddish to purplish-black; flesh reddish-purple through to the seed, firm, crisp, flavor good; ripens early, about a week later than Methley. Tree may require a pollinator; slightly resistant to brown rot; very susceptible to black knot. Requires 800 hours of chilling. Originated at Texas A & M University by Dr. J. Benton Storey. MCEACHERN; A39, C75M, E45, E99M, F61M, F93, I53M, L90, M83, N33

Nubiana: Large, flattened fruit; skin deep reddish-blue; flesh light amber, very firm, meaty, moderately sweet, quality fair, turns red when cooked; ripens very slowly, in midseason, after Laroda and before President; ships well; resembles Eldorado. Tree very vigorous, medium upright; highly productive; self-fruitful. BROOKS 1972; A88M, B71M, B93M, C54, F91T{SC}, K88T, N20

Ozark Premier: Fruit extremely large, round to slightly heart-shaped; skin bright red, tough; flesh yellow, firm, fine-grained, juice tart, flavor good; stone small, clinging; ripens midseason to late, with Burbank, which it resembles. Good fresh or canned. Tree vigorous; hardy; productive; self-unfruitful; fairly resistant to bacterial spot. BROOKS 1972; A5, A39, A85M, B53, C75M, D37, F61M, F88G, F93, G65M, L33, L90, M69M, M83, N33, etc.

Pipestone: Large fruit; skin deep red with a golden blush, thin, tough but peeling easily; flesh golden-yellow, somewhat stringy, sweet, juicy, quality excellent; ripens early. For home gardens and commercial use. Tree vigorous; very cold hardy; reliably productive; requires cross pollination. BROOKS 1972; A74, A91, A91{SC}, B4, B15M, D69, F53, F88G, G4, G16, H44, I49G{SC}, L27M, L70, M35M, etc.

Queen Ann: Large, somewhat heart-shaped fruit; deep mahogany skin; flesh light amber, streaked with red, firm and sweet; texture and quality very good; semi-freestone. Ripens late, in mid-August. Tree only moderately vigorous; self-unfruitful. Pollinate with Santa Rosa, Wickson, etc. Requires 500 hours of chilling. B71M, F91T{SC}, N20

Red Ace: (Burbank Red Ace) Medium-sized, round-oval fruit; skin crimson to dull red, bloom pale blue; flesh light-crimson, sweet, delicious, quality excellent; semi-freestone to freestone; resembles Elephant Heart. Tree spreading, very productive, hardy; ripens in mid-August. Originated in Sebastopol, California by Luther Burbank. Introduced in 1929 by Stark Brothers Nurseries. BROOKS 1972; C27T{SC}, F91T{SC}, L33

Red June: Medium-sized, roundish fruit; skin garnet red, covered with thin bloom; flesh light yellow, fibrous, somewhat sweet, peculiarly aromatic; quality good; stone clinging; ripens early. Tree large, vigorous, upright-spreading; hardy; productive. Introduced in 1893 by Stark Brothers Nurseries. HEDRICK 1911; A82, E45, I41P, M25M

Redheart:<sup>2</sup> Fruit medium to large; slightly oval to heart-shaped; skin medium to darkish-red, covered with moderately heavy bloom; flesh blood red, sweet, mild, aroma pronounced, firm-melting, meaty, nearly crisp, fine-grained, not as juicy as Elephant Heart; quality excellent; stone nearly free; ripens early. Tree upright-spreading, very vigorous and productive; self-unfruitful. BROOKS 1972; B53, C27T{SC}, C30M, C45M, D37, F53, F88G, I61M{SC}, L33, L33{DW}, M11M{PR}, N20

Robusto: (P. angustifolia x) Medium to large fruit; skin solid bright-red; flesh red, juicy, sweet, quality good; stone clinging; ripens approximately 1 week later than Bruce. Tree extremely vigorous and productive; precocious; requires a pollinator; disease resistant. Adapted to most areas of the Southeast. Originated in Byron, Georgia. Introduced in 1982. E99M, F61M, F91T{SC}, G17

Roysum: Medium-large, oblong fruit; skin reddish-blue, adherent; flesh light yellow, firm, slightly acid, juicy, of high quality, freestone; ripens evenly, very late, 2 months after Late Santa Rosa, in early October; keeps very well; resembles Late Santa Rosa. Tree vigorous, spreading, self-fruitful. Originated in Tulare, California. BROOKS 1972; A9, E4, J93{SC}

San Jose Blood:<sup>2</sup> Very flavorful "blood" plum resembling Elephant Heart. Recommended by members of the California Rare Fruit Growers. Discovered at U.C. Deciduous Field Station, San Jose, California. T49M{SC}

Santa Rosa: Large, roundish fruit; skin dark purplish-crimson with russet dots, covered with thin bloom; flesh reddish near the skin, shading to amber near the center, firm, juicy, slightly tart; quality good; ripens early; keeps and ships well. Tree large, vigorous, upright; hardy; productive; widely adapted. Originated in Santa Rosa, California by Luther Burbank. Introduced in 1907. HEDRICK 1911; A88M, B83, D34M{PR}, D81M{PO}, E4, F74M{PD}, G23, G23{DW}, G49, H3{P}3, I68{ES}, I83M, J83, J83{DW}, K28, LI, M39M, etc.

Satsuma:<sup>2</sup> Small to medium, roundish fruit; skin dark red, covered with thin bloom; flesh blood red, juicy, tender, firm, sweet, flavor very good; stone semi-clinging; ripens in midseason. Tree vigorous, upright-spreading; hardy; productive. Originated by Luther Burbank. Introduced in 1889. HEDRICK 1911; A63, A88M, B74, C54, E4, G49, G87M{£D}, I53M, I68, I83M, LI, M39M, N33

Sierra: Medium-sized, roundish fruit; skin dark purplish-crimson, dotted with russet; flesh yellow, firm, juicy, sweet; semi-freestone; has good eating and keeping qualities; ripens late June to late July. Tree vigorous, fairly self-fruitful at place of origin. Originated in Ontario, California by Herbert C. Swim, Armstrong Nurseries. BROOKS 1972; D57{OR}

Simka: Large, oblong to cone-shaped fruit; skin dark purplish-red; flesh yellowish-white, very firm, sweet; freestone at fall maturity; ripens in midseason; keeps well on the tree; resembles Nubiana. Tree medium-sized, vigorous; bears heavily and annually; partially self-thinning. Originated in Fowler, California. BROOKS 1972; A9, B71M, B83, F53, M39M

Six Weeks: (Early Six Weeks) Fruit large, oblong; skin yellow, tinged with red, bright cherry-red when over-ripe; quality average; ripens early. Tree vigorous, upright, rapid in growth. Splits badly on both fruit and tree trunk. Named and introduced by J.S. Kerr of Texas, about 1901. HEDRICK 1911; E99M, F61M

Superior: Large, heart-shaped fruit; skin dark-red with russet dots, covered with heavy attractive bloom; flesh yellow, firm, juicy, flavor sprightly, slightly acid near skin, dessert quality superior; clingstone; ripens in late midseason. Tree vigorous, precocious, prolific. BROOKS 1972; A74, A91{SC}, C76M, D76, D76{DW}, E97, E97{DW}, H44, H65, H89M, H90{DW}, I49G, J93{SC}

Tecumseh: Medium-sized, round-ovate fruit; skin bright red, covered with bluish bloom; flesh yellow, firm, juicy, subacid; quality good; stone clinging; ripens in mid-August. Tree vigorous; very hardy; reliably productive. Originated in Brookings, South Dakota by N.E. Hansen. Introduced about 1923. BROOKS 1972; A65, B47, C27T{SC}, C58, F88G, H85, I49G, I49G{SC}

Toka: (*P. americana* x) Medium to large fruit, tapered to a point; skin orange-red, with a blue bloom; flesh greenish-yellow, very firm, aromatic, with a sweet, rich flavor. Tree moderately vigorous, spreading; very hardy; an excellent pollinator for Japanese and Japanese hybrid plums. Introduced in 1911 by the South Dakota Agricultural Experiment Station. A74, B4, B15M, D65, F88G, G4, G16, H44, I49G, J93, J93{SC}, L27M, L70, N24M

Underwood: Large, heart-shaped fruit; skin dull red, satin like, astringent; flesh golden-yellow, juicy, melting, tender, slightly stringy, sweet, quality good; stone small, semi-clinging; ripens early, extends over a long season. Tree vigorous; bears regularly and heavily; very hardy; requires a pollinator. BROOKS 1972; A74, A91, A91{SC}, B4, D65, D69, G4, L27M, L70

Wade: Large, oblate fruit, 1 3/4 inches in diameter; skin deep red; flesh yellow streaked with red, very juicy, tender, sweet; ripens late May to mid-June. Vigorous, upright tree; precocious; requires a pollinator. Relatively low chilling requirement. C75M, E99M, F91T{SC}, G8, G17, J93{SC}

Waneta: Fruit large to very large; skin reddish-purple; flesh deep yellow, firm but tender, juicy, sweet; quality good; clingstone; ripens in midseason. Good fresh or for processing. Tree extremely hardy; bears heavily and annually. Originated in Brookings, South Dakota by N.E. Hansen. Introduced in 1913. A74, A91, A91{SC}, C27T{SC}, D65, D69, E97, G4, I49G, I61M{SC}, J93, J93{SC}, L27M

Weeping Santa Rosa:<sup>3</sup> Large, slightly oblate fruit; skin purplish-red with numerous, small yellow dots, covered with blue-gray bloom; flesh pale golden-yellow, juicy, firm, flavor mild, quality good; semi-freestone; ripens in midseason. Tree ornamental, with long slender limbs which bow downward toward the ground; very vigorous and productive. Low chilling requirement, 150 hours or less. BROOKS 1972; A88M, C54, G17, H89M, I49M, I68, I83M, J61M, Li, mo

#### CODES FOR SPECIAL TYPES

1. Cooking
2. Blood
3. Low-Chill

## POMEGRANATE {GR}

### PUNICA GRANATUM

Ambrosia: Large to very large, roundish fruit, 32 to 40 ounces in weight; rind golden colored, heavily blushed with rose; juicy, bright carmine pulp with a very good tart-sweet flavor. Suitable for eating out of hand. Medium-sized bush, produces good crops of fruit. Produces sweet fruit even along cool, humid, coastal areas of California. Originated in Camarillo, California by S.J. Chater. C22M, LI, N20

Balegal: Large, roundish fruit, 3 inches in diameter; somewhat laiger than Fleshman; skin pale pink, lighter in color than Fleshman; flesh slightly darker than Fleshman, very sweet. Originated in San Diego, California. Selected by Paul H. Thomson. D57, G17

Daru: (Dalim, Daran) Small, globular fruit, 2 to 3 inches in diameter; rind yellowish-green, tinged with red; aril deep red to pinkish-white, high in acid. Traditionally sun dried to form the expensive spice *anardana*, used as a souring agent in chutney and a large number of other preparations. Bush spreading, very hardy, will grow even on very poor and shallow soils. Native to the western Himalayas. DEVI, PARMAR, C.; U7G{S}

Elf: Small to medium-sized fruit; yellow-green skin; sweet, rich, light-pink juice with very good flavor. Dwarf, heavy bearing plant. Ideal for container culture or where space is limited. From the University of California, Davis pomegranate collection. H4

Eversweet: (Armchat) Medium to large, round fruit, 3 1/2 inches long and 3 1/4 inches in diameter; thick pink skin, blushed with red; bright scarlet pulp, very sweet and flavorful, even when fruit is small, green and immature; hollow seeds. Excellent for eating out of hand; also good for syrup, wine and jelly. Average size bush, 8-10 feet tall; produces 2 to 3 moderate crops from mid-August through mid-November in southern California. Originated in Camarillo, California by S.J. Chater. C22M, H4, I74, N20

Fleshman: Large, roundish fruit, about 3 inches in diameter; pink outside and in; very sweet in flavor; seeds relatively soft; quality very good. Originated in Fallbrook, California. Selected by Paul H. Thomson, co-founder of the California Rare Fruit Growers. D57, G17, I74

Ganesh: Soft-seeded Indian cultivar. Prolific yielder of medium-sized fruits. Sweet, pinkish flesh with a very agreeable flavor. Has been recommended for commercial production in Maharashtra state. Evergreen in tropical and subtropical climates. R0

Granada: Bud mutation of Wonderful. Fruit resembles Wonderful, but displays a red crown while in the green stage, darker red in color and less tart, ripens one month earlier than Wonderful; flowers also deeper red. Tree identical to Wonderful. Originated in Lindsay, California. Introduced in 1966. BROOKS 1972; A88M, C54, H4, I74, K67, S97M

Green Globe: Medium to large, uniform, roundish fruit, about 3 inches in diameter; rind greenish, striped and blushed with pinkish-red; large, thick, bright reddish pulp, sweet-tart with a good pomegranate flavor; large, very hard seeds. Ripens early in the season. Medium to large bush, vigorous and productive. Originated in Camarillo, California by S.J. Chater. C22M

King: Medium to large fruit, somewhat smaller than Balegal and Fleshman; skin darker pink to red; flavor very sweet; has a tendency to split. Bush somewhat of a shy bearer. Originated in Fallbrook, California by Sam King. D57, G17, I74

Malcolm's Sweet: Very large fruit with sweet, flavorsome juice. Best quality for fresh eating is reached around Thanksgiving. Highly productive, ornamental tree. Adapted to Southeastern growing

conditions. The original tree was grown from a seed on a Georgia plantation over 100 years ago. F43M

**Muscat Red:** (Muskat) Small to medium-sized fruit; rind thin to fairly thick; pulp fleshy, juicy, medium-sweet; seeds soft to medium-hard. Tree a moderately prolific bearer. Originated in India. MORTON 1987a; R0

**Muscat White:** (Muskat) Large fruit; rind creamy-white tinged with pink, thin; pulp sweet; seeds medium-hard. Tree bears well. Originated in India, where it is desirable for commercial planting in Delhi. MORTON 1987a; R0

**Phil's Sweet:** Medium to large, roundish fruits; weight 8 to 12 ounces; skin yellowish-green to slightly pink; flesh red with a high sugar content balancing the slight acid overtones; seed carpel sections thin with much pulp, seeds soft. Tree very productive. Originated in Escondido, California by Phil Arena. D57,174, M16

**Plantation Sweet:** Original tree, believed to be over 100 years old, was found growing wild on a Georgia plantation by Dr. Silas Harmon of the Coastal Plains Experiment Station, Tifton, Georgia. Highly productive; documented to have survived 0° F. without freezing to the ground. Maximum flavor peak of fruit is reached for fresh eating around Thanksgiving. I53M

**Renan's Sweet:** Soft-seeded type. Round, light red fruit; flesh pinkish-red; sugar content high; thin membranes surrounding arils. Juices readily by cutting in half and pressing. Upright, very productive tree. Originated in Lemon Grove, California by Renan Prevost. D57,174

**Rosamia:** Medium to large, roundish fruit, 3 to 3 1/2 inches in diameter; skin shiny pink, blushed with red; bright reddish pulp with a very good, tart-sweet to sweet flavor; good pulp to rag ratio. Light colored juice; relatively soft seeds. Good for eating out of hand. Medium to large bush; produces good crops of fruit. Originated in Camarillo, California by S. J. Chater. C22M

**Sweet:** Fruit is lighter in color than Wonderful, remains slightly greenish with a red blush when ripe; pink juice; flavor much sweeter than other cultivars. Excellent in fruit punch. Tree highly ornamental, bears at an early age, productive. A63, A88M, C54, D37, H4, I68,174,183M, L47, M16, N24M

**Utah Sweet:** Medium-sized, good quality fruit; whitish skin, blushed with red; very sweet, juicy, light pinkish flesh; seeds notably softer than those of Wonderful and other standard cultivars. Vigorous and productive plant with attractive, pinkish-orange flowers. G49,183M

**White:** Large, pinkish fruit with transparent white flesh; very sweet and juicy when ripe; non-staining. Ripens in early September. Vigorous bush, grows to 12 feet tall; attractive, orange-red flowers. Requires 150 to 200 hours of chilling. A88M, C54,174

**Wonderful:** Large, deep purple-red fruit; rind medium thick, tough; flesh deep crimson in color, juicy, and of a delicious vinous flavor; seeds not very hard. Better for juicing than for eating out of hand. Plant is vigorous and productive. Leading commercial variety in California. Originated in Florida. First propagated in California in 1896. A63, B93M, F93, G49, G96, H4,149M, I68,174,183M, I91, K67, LI, L47, M16, N33, etc.

## POTATO {PL}

### SOLANUM TUBerosUM

#### BLUE/PURPLE-SKINNED

**All Blue:** 80 days. Medium-sized oval tuber; very deep bluish-purple skin; medium eyes; flesh an attractive lavender blue throughout, very moist; slightly smoky flavor; matures in midseason. Good

boiled or baked. An exceptionally good keeper. Heavy yielding. Popular specialty market potato. A95, D68, E97, H49,134M{PR}, I99M, J36M, J97M, J99G, K49M, K49T, K66, L89, M46, N7G{S}, N34, N34{PR}, etc.

**Arran Victory:** Large, round tubers with purple-tinged skin. Sought after by connoisseurs for its fine mealy flavor and floury texture. A *high* quality, late maincrop variety that stores well. Resistant to blight, and highly productive. Very popular in Ireland, where it has supplanted traditional favorites. Named for Arran Island, off the coast of Scotland. R32, S55

**Blue Victor:** 90 days. Large, blocky, roundish tuber with medium deep eyes; skin lavender with occasional white areas; flesh white, of good flavor and texture; keeps very well. Vigorous, hardy plant, high yielding. An heirloom that is still popular in parts of the potato belt. J99G, K20M

**Brigus:** 80 days. A new, high-yielding release from Newfoundland. Uniform, round tubers; bluish-purple skin; creamy yellow flesh; shallow eyes; matures in midseason. Excellent boiled or baked. Wart and late blight resistant. Shows promise as a very interesting home garden and market type. D68, J99G, N24M

**Caribe:** 65 days. Very large uniform tuber, with shallow eyes; form round to oblong; bright bluish-purple skin; tender, creamy white flesh; matures very early. Does not store well. Heavy yielding and reliable. Wide adaptability across the United States and Canada. Released by AgCanada in 1984. A95, C53, E75, D68, E24, G71, G87, H42, J99G, K66, K95M, M32, N34, N34{PR}

**Lavender:** Attractive, unusual looking potato. Very consistent deeply set eyes. Striking light lavender skin and flesh. Consistently creamy texture and excellent mild flavor. Matures midseason to late. Potential specialty market item. Developed and introduced by Seeds Bliim. K49M

**Purple Chief:** 80 days. Medium to large, oval-shaped tuber; deep purple skin; white flesh; excellent cooking qualities; matures in midseason, keeps well. Equally good cooked in any w/r. Good yields. An interesting home garden type. Has been grown in Atlantic Canada for many years. H63G, K95M

**Purple Peruvian:**<sup>3</sup> (Peruvian Blue) Purple fingerling potato introduced from South America in the 1970's. Long, narrow, dark violet tuber; weight 1/2 to 3/4 pound when mature; flesh purple throughout, of fine texture; matures medium late. One of the main cultivars used in the Altiplano of Peru and Bolivia for making *chuhu*. Excellent storage qualities, will keep until June. Attractive, purple-tinged foliage. High yields. F73D, H73{PR}, I99M, J99G, K49M

**Purple Viking:** 80 days. Unique, dark purple skin with pink-red splashes; very white flesh of smooth texture; matures in midseason; keeps very well. Excellent boiled or baked. Good yields of large tubers. Interesting item for fresh markets and gourmet sales. A95, C85M, D68, H63G, J99G, K49M, K49T, K95M

#### PINK/RED-SKINNED

**Alaska Sweetheart:** 70-80 days. Attractive, red-skinned, pink-fleshed potato. Medium-sized, round to oval tubers; slightly russet skin; moist, pinkish-red flesh; distinctive, earthy flavor. Excellent boiled or baked. Ripens midseason to late. Moderately productive. D68, E13G{PR}, H63G, K49M, K49T, K95M

**All Pink:** Smallish, round to slightly elongated tubers with shallow eyes. Very smooth, consistent exterior. Attractive pink skin and creamy light pink flesh. Has good potential as a specialty market product. Developed and introduced by Seeds Blum. K49M

**All Red:** (Cranberry Red) Medium-sized, round tubers; smooth, brilliant red skin; pinkish-ied flesh. Tends to be low in starch, lending itself well to all forms of cooking. Highly recommended for potato salads and potato pizzas. By far the best producer of the red-skinned, red-fleshed potatoes. Matures in midseason. A95, C85M, D68, H63G, I18M, J99G, K95M, N34, N34{PR}

**Bison:** 65 days. Uniform, round, medium-sized tuber; smooth, shallow eyes; bright-red skin; pale yellow flesh. Excellent for baking. Cooks up flaky and full of flavor with minimum shrinkage while retaining a smooth, firm texture. A reliable and heavy bearer. Developed in North Dakota. Bred for resistance to late blight and scab. H63G, J99G, I18M

**Blossom:** Oblong, somewhat flattened tubers with tapered ends; striking, smooth deep pink skin; delicate light-pink flesh. Good for baking. Heat resistant plant; produces large, very attractive pink flower blossoms. Ornamental as well as useful. Developed by Ewald Eliason. H63G, K49M, K95M

**Blushing:** Round tubers with deep eyes, often of very large size. Pink skin. Vibrant, bright pink flesh; white with bright pink rays when grown in certain soils. Makes delicate pink mashed potatoes. Matures in midseason. Developed and introduced by Seeds Bliim. K49M

**Chieftain:** 90 days. Tuber round to oblong, with shallow to medium eyes; attractive red skin; white flesh. Medium-sized, spreading plant; more productive than Norland; moderately resistant to scab and has field resistance to late blight. Canada's leading market red. Released by the Iowa Agricultural Experiment Station in 1968. A95, D11M, D68, F70, G50, J36M, J99G, K95M, N24M

**Cinderella:** Round tubers with shallow eyes. So named because the exterior can be somewhat rough. Pink skin. Delicate pink flesh. Flavor and quality excellent. Matures in midseason. Potential specialty market potato. Developed and introduced by Seeds Bliim. K49M

**Cinnabar:** Tuber pointed at the stem end; deep eyes. Unusual, waxy skin, an attractive deep maroon color. Deep pink flesh, somewhat darker in smaller potatoes and lighter in large-sized ones. Matures in midseason. Developed and introduced by Seeds Bliim. K49M

**Desiree:** 80 days. Very high-yielding English maincrop potato. Tuber oblong, with shallow eyes; skin pinkish-red; deep golden-yellow flesh, of very fine flavor. Excellent cooking qualities; rarely discolors. Produces well from seed, but matures somewhat later and up to 50% of the tubers may have white skin. Highly susceptible to scab. Drought resistant. A95, H42, H49, H63G, I18M, 191, J36M, J99G, K49T, K95M, P59M, R32, R83, S55

**Early Rose:** 80 days. An old standard, developed in Vermont and introduced in 1861. Tuber oblong, rather flattened, with medium deep eyes; skin pink, slightly tinged with salmon; white flesh, sometimes streaked with pink; matures early to midseason. Does not keep well. Vigorous and high yielding. Seedling of Garnet Chile. VILMORIN, WEAVER 1997; K49M

**French Fingerling:**<sup>3</sup> Medium to large, elongated tubers; very smooth pinkish-red skin; smooth, moist yellow flesh, often with an interior ring of pink when cut crosswise. Appealing, gourmet quality potato that has great potential as a specialty market item. Reportedly arrived in the United States in a horse's feedbag. D68, F73D, H63G, H73{PR}, J99G, K95M, M63M{PR}

**Garnet Chili:** 90 days. An American classic of the Nineteenth Century. Tuber large, roundish or oblong with medium deep, rounded eyes; skin thick, purplish-red or garnet-colored; flesh nearly white, dry and mealy when cooked, of very good flavor. Vigorous and productive plant. Originated in Utica, New York in 1853. BURR, WEAVER 1997; J36M, J99G

**Kerr's Pink:** Round, light pink tubers, delicate small red eyes; snow white flesh; very fine-grained, floury texture. Keeps well. Traditionally cooked unpeeled in boiling water, two thirds of which is poured off. The potatoes are then allowed to steam, after which they have the qualities of already mashed potatoes. Introduced in 1917 in Ireland, where it became the country's most popular potato. PHILLIPS; J99G, R83

**La Rouge:** 85 days. Tubers very uniform in size and shape, with deep apical eyes; attractive, smooth red skin; white to cream flesh; matures in midseason; has excellent keeping qualities. Medium-sized, spreading plant; has some resistance to common scab. Released by the Louisiana Agricultural Experiment Station in 1962. D68, J36M, K95M

**Pink Champaign:** Medium-sized, somewhat irregular tubers. Slightly rough, pinkish-red skin. Creamy, light pink flesh. More consistent and slightly deeper pink flesh coloring than Blossom. Exterior not as consistent or as attractive as Blossom. Developed and introduced by Seeds Blum. K49M

**Pink Pearl:** 90 days. Long oval tuber with attractive pink skin and shallow eyes; white flesh, of good flavor and cooking qualities. Matures very late, keeps well. Large, vigorous plant. Wart and blight resistant. Shows promise as an excellent home garden cultivar. K49M

**Red Dale:** 65 days. Large, round, very uniform tubers; attractive red skin; moist, white flesh with very good flavor; good storage qualities. Excellent for boiling, sauteing and baking. Will have good market characteristics when planted closely. Small plants, very prolific. Resistant to scab and verticillium wilt. J99G, N34, N34{PR}

**Red Erik:** 65 days. Red tubers, with shallow eyes. Excellent baked, steamed or boiled. Heavy yielder, 13% more than Norland; tends to produce "lunkeis", so should be planted closely. Tolerates wet soil; has immunity gene for late blight, low resistance to verticillium wilt, medium resistance to scab. Released in Minnesota in 1983; named after Viking explorer Erik the Red. A95

**Red Gold:** 80 days. Medium-sized tubers; light red, netted skin; delicate yellow flesh. Excellent boiled, steamed, baked, mashed, roasted, scalloped or fried; flavor very good. Matures in midseason. High yielding under most conditions. Appears to have resistance to diseases. Released in Canada in 1987. A95, E75, D68, E24, H63G, J99G, K95M

**Red LaSoda:** 80 days. Tuber round to oblong, with medium deep eyes; very smooth, bright red skin; white flesh; matures in midseason. Ideal for boiling, with no darkening after cooking. Medium-sized, upright plant; somewhat resistant to mosaic, susceptible to common scab; tends to produce misshapen tubers under adverse conditions. Released by the Louisiana Agricultural Experiment Station in 1948. E97, G71M, H42, J36M, J99G

**Red Norland:** (Norland) 65 days. Tuber oblong, regular in size and shape, with shallow eyes; skin red, very smooth; flesh white; matures very early. Ideal for boiling, with no darkening of skin. Medium-large, spreading plant; moderately resistant to scab. Introduced by the North Dakota Agricultural Station in 1957. A16, A95, C85M, D76, D82, E24, E97, G16, H42, H54,199M, J36M, J97M, J99G, M49, etc.

**Red Pontiac:** (Pontiac) 80 days. Tuber round to oblong, with medium-deep eyes; smooth to sometimes netted, intense red skin; matures midseason to late. Ideal for boiling, with only slight darkening after cooking. Also very good fresh from the garden. Large, high-yielding plant; very susceptible to scab; drought tolerant. Very popular with commercial growers and home gardeners. B75, D65, D68, D76, E97, G71, H42,199M, J36M, J97M, J99G, K71, L79, M32, M46, etc.

**Red Thumb:**<sup>3</sup> Small to medium-sized tubers, generally more oblong than other fingerling types; deep red, very smooth and clean skin; pinkish, somewhat sweet flesh; excellent texture and flavor. Matures midseason to late. Becoming popular as a specialty market item. H73{PR}, J99G

**Rojo:** Medium-sized, roundish tubers with shallow eyes. Reddish skin. Deep pinkish-red flesh. Very smooth texture. Excellent flavor. Matures in midseason. Potential gourmet and specialty market potato. Developed and introduced by Seeds Bliim. K49M

Rose Finn Apple:<sup>3</sup> Fingerling type. Medium-sized, slender tuber; skin rose-buff; flesh deep yellow blushed with red, firm, waxy, of excellent flavor; matures medium to late, stores well. Produces numerous, well-clustered "fingers". Medium-sized, scab-resistant plants with purple flowers. D68, F73D, G6, H63G, J99G, K95M, N34, N34{PR}

Rose Gold: 80 days. Round, medium-sized tubers; very attractive, bright rose skin; waxy, golden-yellow flesh of excellent flavor; matures in midseason. A good all-purpose cultivar, but low starch content makes it a quick boiler, frier and baker. Resistant to scab. Introduced by the University of Guelph. G6, H63G, N34, N34{PR}

Ruby Crescent:<sup>3</sup> Large fingerling type, 3 inches long, 1 1/2 inches in diameter; mature tubers weigh 3/4 pound each. Attractive, rose-colored skin; waxy, yellow flesh of very fine flavor, holds together well when cooked. Excellent for boiling, baking or frying. Vigorous vines that yield heavy crops. Good specialty market item. E13G{PR}, H73{PR}, I99M, J99G, K49M, M63M{PR}

Sangre: 65 days. Medium to large, very uniform, slightly elongated tuber; weight 4 to 10 ounces; shallow eyes; dark-red skin; white flesh; matures early. Becoming popular with the restaurant trade, being dug early for abundant "small reds" that are boiled and served whole, with the skin on. A95, D68, E24, H63G, I99M{OR}, J99G, K49T

Tobique: 80 days. Tuber oblong-flattened, with very shallow eyes; smooth, golden tan skin with pink splashes. White flesh with good texture. Good potato flavor. Excellent boiled, steamed or baked. Matures early. Medium-sized, productive plants; highly disease resistant. Makes an attractive specialty market product. D68

#### RUSSET-SKINNED

Acadia Russet: 80 days Very large, smooth, lightly netted tuber; rich white flesh of fine flavor; matures medium-late. Excellent for boiling or baking. Very vigorous, upright plant; high yielding. More consistent than Russet Burbank. Released in New Brunswick in 1981. A95, B75, H42

Butte: 90 days. An Idaho favorite Very large, flat oblong, heavily russet tuber; shallow eyes; white flesh; matures late. Excellent flavor; one of the best for baking. Very good keeper. Compared to Russet Burbank, Butte produces up to 7% more yield, 20% more No. 1 potatoes, 58% more vitamin C and 20% more protein. C53, E24, H63G, J99G, K95M, M49, N34, N34{PR}

Frontier Russet: One of the easiest to grow russet potatoes. Oblong to long-cylindrical, lightly russet tubers; dry, white flesh of good flavor; matures in midseason, stores well. Excellent for baking and frying. Compact, productive plant; resistant to scab, late blight, dry rot, verticillium wilt, knobiness and growth cracks. Does well in northern climates. A95, B75, D68, D76, E24, E97, G6, J97M

Nooksack: 90 days. Large to very large, uniform, oblong tubers; weight 16 to 18 ounces; fine heavy russet; dry white flesh, excellent when baked; matures late. Stores well and shipping quality is excellent. Vigorous, heavy yielding, broad-leaved plant; well adapted; has good disease resistance. J99G, K49M, L89C

Norgold Russet: 65 days. Tuber oblong to long, with very well distributed shallow eyes; uniform, heavily netted skin; white flesh. Good for baking, boiling or French fries, with no darkening after cooking. Consistent, high-yielding plant; resistant to scab. Popular with home gardeners. Released by the North Dakota Agricultural Experiment Station in 1964. D26D, D76, E97, G71M, H33M

Norkotah Russet: 65 days. Uniform, long-flattened tubers, with shallow eyes; matures early to midseason; stores well. Excellent eating qualities baked, steamed, boiled, French fried, chipped or scalloped. Best fresh from the garden. Heavy yields. Developed in North Dakota by Dr. Robert Johnson, breeder of Bison. D68, D82, G16, G50, G87, H63G, I18M, I99M, J36M, J99G, K71, K95M, M46

Russet Burbank: (Netted Gem) 80 days. Long, cylindrical or slightly flattened tuber; well-distributed, shallow eyes; russet and heavily netted skin. Good for every purpose, but ideal for baking and French fries, with only slight discoloration after cooking. Most widely grown potato in the United States. Original strain selected by Luther Burbank in 1873 from seedlings of Early Rose. A16, A95, D27, D68, D76, D82, E75, G87, H42, I34M{PR}, J36M, J99G, L79, M32, M49, etc.

Sierra: 65 days. Heavily netted russet type. Tuber long to oblong, medium to large, uniform; has excellent eating qualities; matures early; stores very well. Resistant to scab and hollow heart. Vines show good vigor. Released in 1987 by the University of California. J99G

#### WHITE/TAN-SKINNED

Arran Pilot: (Salt Water) 80 days. Large, kidney-shaped tuber; white skin; firm, white flesh of outstanding flavor. One of the earliest potatoes to mature. Heavy yielding; resistant to scab and frost, susceptible to blight. Introduced in Great Britain for the 1930-31 season. Named for Arran Island, off the coast of Scotland. J99G, R32, R83

Atlantic: 80 days. Hiber oval to round, with medium shallow eyes; skin white with light to heavy scaly netting; dry white flesh, very mealy for boiling and baking; matures in midseason. Medium large, upright plants; tolerant to scab and verticillium wilt. Yielding ability similar to Kennebec. Adaptable, especially in warm humid areas. Introduced in 1976. J36M, J99G, L89C

Candy Stripe:<sup>1</sup> 80 days. Medium-sized, oval tuber; skin white, striped or blotched with red; white flesh of good flavor and quality. Good baked, boiled or fried. High yielding and disease resistant. Potential gourmet and specialty market item. Originated in Tomales, California. J99G

Catalina:<sup>2</sup> Newest "true seed potato". Medium to large, flat-oval tubers with smooth, white skin and shallow eyes. Creamy white flesh, moderately high in dry matter. Very good for the fresh market as well as French fries. Ripens midseason to late, growing slowly the first 6 weeks. Moderately resistant to virus; somewhat susceptible to early and late blight. 139, K95M

Chippewa: 90 days. Tuber oval-flattened, with shallow eyes; skin smooth, white; stores exceptionally well. Ideal for boiling, with no darkening after cooking. Medium-sized plant with lilac blossoms; high yielding; tends to produce small tubers under dry conditions; very susceptible to scab. Introduced in 1933 by the USDA. G71, H54

Early Ohio: 65 days. An old traditional cultivar introduced in 1875. Grown in the Red River Valley by most of the early settlers until 1920 when the Irish Cobbler was introduced, yet still grown and favored by many Mid Westerners. Round to oblong tubers; smooth, pinkish-tan skin; deep eyes; matures early. Excellent baker, with a real down home potato flavor. J36M, J99G

Green Mountain: 90 days. An old favorite New England cultivar. Tuber brick-shaped, with moderately deep eyes; skin white, sometimes netted; matures late. Excellent culinary qualities, but flesh generally darkens after cooking. Large, heavy yielding plant; subject to misshapen tubers under poor growing conditions. Recommended for light soils where the growing season is cool. Originated by O.H. Alexander of Charlotte, Vermont, in 1878. GUNST [Re]; A95, D68, G71, I34M, I34M{PR}, J20, J99G, K49M, K95M

Indian Pit: 90 days. Small to medium-sized, round tuber; skin smooth, tan splashed with pinkish-red around the deep eyes; white, highly waxy flesh of very good flavor, remains firm when cooked. Well suited to slow simmering, campfire soups and stews. Vigorous, very productive plants. J99G

Irish Cobbler: (Cobbler) 65 days. Medium to large, round to oblong tuber; medium deep eyes; smooth, white skin; white flesh; matures early. May be baked, but is best boiled; darkens after

cooking. Consistent, heavy yields; grows well in heavy soils. An old standard that is widely adapted. Discovered in the late 1800's as a mutation of Early Rose. Reportedly named after its first grower, an Irish shoemaker living in New England. C85M, D26D, D68, E38, E97, G71, H33M, H54, J20, J36M, J97M, J99G, K95M

Jemseg: 65 days. Smooth, round tuber; tan skin; white flesh. Good baking and boiling quality. Considered by many as the earliest maturing cultivar, being harvested in July. Moderate resistance to scab. Grows well in hot, dry weather. Should be planted close together as it tends to "lunker". D11M, F70, G50, J99G, M49

Katahdin: Tuber flattened-spherical, with shallow eyes; skin white, smooth; maintains shape well even under poor growing conditions; matures in midseason. Ideal for boiling, with slight darkening after cooking. Medium-sized plant; not exceptionally high yielding, but very dependable; susceptible to scab. Shallow tuber set can lead to considerable sunburn. Introduced by the USDA in 1932. D26D, D68, G71, H54, I34M, I34M{PR}, J20, J97M, J99G

Kennebec: 80 days. Tuber elliptical to oblong, with shallow eyes; skin and flesh white; matures midseason to late. Good for boiling, baking and French fries; usually cooks white. Very large plant; high yielding; susceptible to scab; subject to sunburn under adverse conditions. Introduced in 1948 by the USDA. A95, B75, D65, D68, D76, E38, E97, G16, G71, H42, I34M{PR}, J36M, J97M, J99G, K71, etc.

Onaway: 65 days. Tuber elongated, with medium deep eyes; skin and flesh white; matures early. Tubers become rough when enlarged. Medium to large, upright plant; high yielding for an early cultivar; somewhat resistant to common scab. Released by the Michigan Agricultural Experiment Station in 1961. D68, K95M, N34, N34{PR}

Sebago: 80 days. Tuber deep oval to elongated, with shallow eyes; smooth, white skin; matures late. Good for boiling and baking, with no darkening after cooking. Large, upright plant; yields well; widely adapted to soil and climate; somewhat resistant to scab. Introduced in 1938 by the USDA. A95, C85M, E38

Shepody: 90 days Very long, uniform buff-colored tubers; medium shallow eyes; white flesh; matures mid-season to late. Heavy yielding. Resistant to verticillium wilt, fusarium wilt, rhizoctonia and net necrosis. Canada's leading French fry cultivar. Also good for baking and boiling. A95, G50, G87, I34M, I34M{PR}, J20, J36M, J99G, K95M

Superior: 65 days. Tubers uniform in size and shape; skin white to buff, slightly netted; matures medium early. Excellent market potato. Also a good winter keeper. Medium-sized, upright plant; has good resistance to scab. Tolerates varied spring planting soil and weather conditions. Released by the Wisconsin Agricultural Experiment Station in 1961. A95, D68, G16, G50, G71, H54, J36M, J97M, K95M, L89C, M49

Swedish Peanut:<sup>3</sup> (Mandell, Almond, Butterfinger) Small, teardrop-shaped tubers; smooth, thin, buff-colored skin, lightly russet; golden-yellow, nutty flavored flesh. Has a relatively high starch content for a fingerling. Very firm when cooked, holds its shape well in potato salads. Also excellent for roasting. Moderately resistant to blight and scab. E13G{PR}, G6, H63G, J99G, L89, N34, N34{PR}

White Rose: (Long White) Large, long, elliptical-flattened tuber; numerous, medium deep pink eyes; smooth, white skin; white flesh; matures early. Ideal for boiling and salads, with generally no darkening after cooking. Does not store well. Very good producer of uniform tubers. One of the most popular commercial market potatoes. G71M, H42, J36M, J99G

#### YELLOW-SKINNED

Anna Cheeka's Ozette:<sup>3</sup> Oblong tuber, 2 to 8 inches in length with an unusual number of eyes; thin, yellow skin; yellowish, very tasty flesh. Prolific. Historical heirloom, said to have been brought

from Peru in the late 1700's by Spanish explorers and traded with the Makah/Ozette Indian tribe of Washington's Olympic peninsula. D68, E13G{PR}, E24, H73{PR}, J99G, K49M

Augsburg Gold: 80 days. Large, flat, round to oblong tuber; golden-yellow skin; moist, deep-golden flesh; excellent buttery flavor; matures in midseason. Ideal for mashed potatoes. Superior yields. Very promising as a gourmet market potato. J99G, K49M

Austrian Crescent:<sup>3</sup> Small to medium, thin, crescent-shaped tubers; up to 10 inches long and weighing 4 to 8 ounces; smooth yellowish skin; light-yellow flesh, moist and dense; matures early. Excellent for potato salad, remaining firm and waxy after boiling. Does not keep well. Heavy bearing. E24, H63G, J99G, K95M, M63M{PR}

Belle de Fontenay: One of the classic potatoes of French cuisine. Very attractive, long, smooth tubers with yellow flesh. Highly esteemed for its fine flavor and waxy texture. Excellent in potato salad or simply eaten cold with the skin intact. Susceptible to blight and virus. Originated in Brittany. Introduced in 1885. R32

Bintje: (Yellow Finnish Bintje) 90 days. Small to medium-sized round tubers, with shallow eyes; yellow-brown skin; yellow, fine-textured, waxy flesh; matures late; keeps well. Excellent baked or boiled. High yields; up to 20 or 25 tubers per plant. The most widely grown yellow-fleshed cultivar in the world. Originated in Holland. Introduced about 1911. D27, E24, G87, H42, H63G, I18M, I34M, I34M{PR}, I99M, J99G, K49M, K95M

Carola: 110 days. Large, uniform, round to oblong tubers; shallow eyes; smooth, shiry, golden-yellow skin; firm, moist, light yellow flesh; very good buttery flavor; excellent storage qualities. Suitable for boiling, baking or frying. Vigorous, heavy yielding plants; resistant to scab. Originated in Germany. A95, D68, E75, H63G, I34M, I34M{PR}, J20, J99G, K49M, K95M, N34, N34{PR}

Catriona: (Blue-Eyed Russian) Very striking heirloom. Uniform, medium-sized, flat kidney shaped tubers; lightly netted pale cream skin, strongly marked with bluish-purple at each eye; firm, creamy yellow flesh, moderately starchy. Good flavor. High yielding, even on poor land. Susceptible to dry rot. Introduced into England by Archibald Finlay in the early 1900's. GENDERS 1975; F73D, J99G, R83

Fingerling:<sup>3</sup> (Yellow Fingerling) Light yellow-fleshed salad potato brought to the United States by early German settlers. Long, finger-shaped tuber; 2 to 4 inches in length, 1 inch in diameter; yellow skin; moist, waxy yellow flesh; unique, delicious flavor; matures early. Should be boiled with the jackets on and cut up for salads. Also good fried. G16, K49M

German Butterball: 90 days. Large, uniform, round to oblong tubers with shallow eyes; smooth, attractive golden-yellow skin; intense golden-yellow flesh of exceptional flavor and quality. Drier than other yellow-fleshed types. Excellent for boiling, baking, steaming and mashing. Dwarf plant with high yields. Heirloom. D68, H63G, J99G, K49T, K95M, M32

German Yellow:<sup>3</sup> (German Fingerling) Medium to large fingerling type. Smooth, golden-yellow skin; rich yellow flesh with a firm, sweet potato-like texture and a unique flavor; very good keeper. Excellent in salads. Extremely prolific. Good specialty market item. A95, C85M, E24, H73{PR}, J99G, L13M

Island Sunshine: Excellent all purpose potato that may rival Yukon Gold as the standard yellow-fleshed cultivar. Medium-sized, very round tubers; golden-buff skin; creamy, golden-yellow flesh with very good flavor; ripens late, and stores well. Has the strongest known resistance to late blight. Developed by Evert and Gerrit Loo, organic farmers from Prince Edward Island, Canada. A95, G6, H42, J99G, M49, N34, N34{PR}

Russian Banana:<sup>3</sup> Small to medium-sized tuber; yellow skin; slightly yellow flesh with a waxy texture, very firm when boiled; good potato taste. Matures very late. Heavy yields. Has shown

excellent field resistance to disease. Developed in the Baltic region of Russia. Very popular across Canada as a market potato. A95, B75, C53, D27, D68, G6, H73{PR}, J36M, J99G, K49M, K95M, L13M, L89C, M63M{PR}, N34, N34{PR}, etc.

Saginaw Gold: 80 days. Medium-sized, uniform, roundish tubers; skin very smooth, tan-yellow; pale yellow flesh of excellent texture and flavor; matures in midseason. Very good for boiling, baking and French fries. High resistance to virus and hollow heart. A joint release by the United States and Canada. A95, D68

Warba's Pink Eye: 65 days. Uniform, oval tuber; skin golden, splashed with pink in and around the pronounced eyes. Excellent steamed, baked, boiled or fried. Keeps well. Resistant to scab. Unique type that shows good promise as a specialty market potato. A95, J99G

Yellow Rnn: (Yellow Finnish) 90 days. Large, uniform, oval to round tubers; yellow-brown, lightly russet skin; smooth yellow flesh, more brilliant than others; matures late. Moist, smooth texture with an almost sweet flavor, especially when boiled. Very popular European cultivar, becoming well-known in North American specialty markets. E24, H63G, I99M, J99G, K49M, K66, K95M, L89, N40{PR}

Yukon Gold: 65 days. Large rounded tuber, with shallow pink eyes; attractive, light yellow-brown skin; rich yellow flesh, of very fine flavor and texture; matures medium-early. Unique for a yellow-fleshed cultivar in that it has good size and also keeps well. Excellent in storage. Medium-large, uniform yields. Released in Canada in 1980. A95, B75, D11M, D27, D68, E75, F70, G44M{PR}, H33M, H42, I99M, J99G, K49M, K95M, N34, N34{PR}, N40{PR}, N51M{PD}, etc.

#### CODES FOR SPECIAL TYPES

1. Striped
2. True-Seed
3. Fingerling

## PUMPKIN {S}

CUCURBITA MAXIMA

CUCURBITA PEPO

### HYBRID

Autumn Gold: 100 days. Medium-sized fruit, weight 10 to 15 pounds; round to rectangular in shape, nicely ribbed; has good handles; skin rich-orange when mature; flesh deep-orange, firm and meaty, suitable for pies. Contains the "precocious yellow" gene, so even the young fruits are deep yellow and there are no green pumpkins at harvest. Vigorous vine produces 3 or more fruit. All America Selections winner in 1987. C44, C85M, D6, G16, G71, G82, H33M, H49, H61, H95, K10, K50, K73, M29, M46, M49, etc.

Funny Face:<sup>1</sup> 100 days. An early, highly uniform and productive cultivar with short-vine plants, perfect for gardeners with limited space. Deep globe-shaped fruit with flattened ends, 12 inches in diameter; weight 10 to 15 pounds; skin smooth, bright-orange; flesh orange-yellow, thick, coarse, somewhat stringy. Excellent for canning and jack o'lanterns. A16, A87M, C20M, D6, E53M, F6J, G71, G79, G93M, H95, K10, M49, N16

Prizewinner: 120 days. Exceptionally large, uniform, roundish fruit; skin bright reddish-orange, smooth and glossy; ribs shallow; blossom scar small; orange flesh of good flavor. Vigorous vine, 30 to 40 feet in length. Largest "true" pumpkin, easily reaching 200 pounds in weight. Easily grown without special care. B6, B75, E97, F13, G16, G82, G93M, H57M, H61, H85M, 139, I50G, J97M, K10, K50, K73, L89, etc.

Spirit:<sup>1</sup> 95 days. Leading hybrid pumpkin for the Halloween trade. Uniform, round fruit; 12 inches in diameter, weight 10 to 15 pounds;

moderately ribbed; skin bright orange; flesh thick and meaty, suitable for pies and custards. Early maturing, but keeps well until Halloween. Short-vine plant with only a 5 foot spread, yet it produces a heavy crop of fruit. All America Selections winner for 1977. A16, B73M, D6, D11M, E38, F70, G16, G71, G79, H33M, H61, I64, K10, L89

Trick-Or-Treat:<sup>12</sup> 105 days. Hulless, "naked" seeded or "eat all" type. Round, very uniform fruit, 6 to 10 inches in diameter; weight 10 to 12 pounds; lightly ribbed; skin light orange; flesh thick, orange, suitable for pies and canning. High-protein seeds are good either raw or roasted. Also good for carving at Halloween. Short-vine plants, 5 to 6 feet long; suited for small gardens. A87M, B73M, C20M, D26D, F63, G13M, G16, G71, J20, K10, M29, M95M, N52

#### OPEN-POLLINATED

Baby Bear:<sup>2 3</sup> High quality mini-pumpkin with naked seeds. Deep orange fruits, weight 1 1/2 to 2 1/2 pounds. Sweet flesh which is excellent for pies; semi-hulless seeds are good for toasted snacks. Easy to grip handles. Produces 8 fruits per vine Very popular at farmers markets. All America Selections Winner in 1993. Developed by Johnny's Selected Seeds. A1, A25, B6, B75, C53, D74B, E9IG, G6, G16, G71, G82, 139, J20, J97M, K50, M29, M49, N40{PR}, etc.

Baby Pam:<sup>3</sup> 100 days. Very uniform fruit; 5 inches tall, 5 1/2 inches in diameter; long, tightly secured "handles"; smooth, deep-orange skin; deep-orange flesh, suitable for pies. Also used for painting and for decoration. Vigorous, 10 to 12 foot vines produce a dozen or more fruits each. D68, F13, F63, G13M, G93M, H61, I59M, K10, K50, K73, M95M, N52

Big Max: (C. maxima) 120 days. Very large, round to flattened globe-shaped fruits, often weighing 100 pounds or more; distinctive, pinkish-orange rind; bright yellow-orange flesh, 3 to 4 inches thick, of good cooking quality. Very large, spreading vine. Ideal for displaying at harvest fairs and farm shows. A1, B6, B8M, B73M, B75, D68, D74B, E5T, F13, G71, G71M, H49, J25M, J97M, K50, K71, M29, N16, etc.

Big Moon: (C. maxima) 120 days. Extremely large show pumpkin, may weigh 200 pounds or more; medium-orange, evenly ribbed rinds; thick, fine-textured, light orange flesh, of very good quality for pies. Very large, sprawling vine; requires plenty of space, water and nutrients to produce the largest fruits. C20M, D26D, E75{PL}, G27M, G57M, G82, G93M, H85M, H95, 191, K10, L89, M29, M46, M95M, etc.

Bushkin:<sup>1 3</sup> 95 days. Bush type triple-purpose pumpkin, fine for pies, carving and seed snacks. Bright golden-orange fruit; weight 8 to 10 pounds; thick, light-yellow flesh of good flavor; keeps well. Medium-large edible seeds have a slight husk. Short-vine plants spread only 5 to 6 feet, produce 1 to 3 fruits each; ideal for small gardens. B75

Connecticut Held: (Yellow Field) 110 days. Fruit moderately large; 10 to 14 inches in diameter, 10 to 18 inches tall; weight 18 to 25 pounds; form variable, globular to long oval, narrowly ribbed; skin bright yellow-orange; flesh thick, coarse, somewhat granular; slight flavor and sweetness; quality poor. Mostly used for canning and jack o'lanterns. Origin unknown, although it was probably grown by American Indians. TAPLEY 1937; A16, B75M, B78, C44, D6, E38, E59Z, F82, G16, H33M, H61, J20, K73, L7M, M49, etc.

Ghost Rider: 115 days. Uniform, deep round fruits, average weight 15 to 30 pounds; exterior dark-orange, hard, ridged; flesh yellow-orange to orange, depending on maturity. Unique, long dark-green to black handle. Ideal for processing and jack o'lanterns. A25, B75, B75M, D6, D26D, F63, G13M, G16, H33M, H54, H61, J84, K10, K50, L42, N52, etc.

Half Moon: Tall, uniform Connecticut Field type with a longer and better attached "handle". Fruit large, 12 to 14 inches in diameter; weight 15 to 20 pounds; deep-globe-shaped, with medium ribbing; skin medium-orange; flesh pale orange, thick, coarse and sweet. Excellent home garden cultivar. *AI*, A27M, C20M, C85M, *G13M*, G79, K10, M29

Howden: (Howden Field) Connecticut Field type which is considered a model for large pumpkins. Medium to large, roundish to slightly oval fruit; weight 20 to 25 pounds; rich dark orange, very hard rind, attractively ridged; extra-thick flesh. Keeps in prime condition for a very long time. Developed by John Howden of Massachusetts, in the early 1970's. B6, B8M, B73M, D6, D65, D68, F13, G6, G82, H61, H85M, J97M, K23{PL}, K50, K73, L89, M49, N16, etc.

Jack-Be-Little:<sup>3</sup> 95 days. Attractive "mini" pumpkin. Flattened, deeply ribbed, orange fruit; only 2 to 3 inches in diameter, approximately 2 inches tall, and weighing 2 to 6 ounces. Although very sweet-fleshed for cooking they are most appealing in fall table decorations and for crafts. A good specialty item for farmstands and the florist trade. Vigorous vine; produces 8 to 10 fruits that will keep up to 8 months. *AI*, A2, B73M, D6, D65, *F60*, F82, G6, G16, G71, *H33M*, H61, K73, L89, M46, N16, etc.

Jack-O'-Lantern: (Halloween) 95 days. Medium-sized fruit; 8 to 12 inches tall, 8 inches in diameter; about the size of a man's head; weight 10 pounds; irregular in shape, from round to quite oblong, slightly ribbed; skin bright yellow-orange; flesh medium-thick, deep yellow, fine-grained, suitable for pies. Very popular for Halloween decorations. A16, B6, B75M, C44, D6, D82, E38, *F60*, F82, G57M, G79, *H33M*, K5M, M46, N16, etc.

Lumina:<sup>4</sup> 110 days. Unique white pumpkin that is excellent for painting, decorating or carving. Medium-sized, flattened globe-shaped fruit, weight 10 to 15 pounds; smooth, white skin; bright orange flesh, very good for cooking. Should be harvested when slightly immature for the best white color. If plants are stressed, a blue tinge may occur on the fruit. B73M, B75, C53, D65, D68, E97, F13, G16, H49,191, J97M, K23{PL}, K50, K66, K71, L89, M29, N16, etc.

Manteca Large White:<sup>4</sup> Unique type, remarkable for its smooth, creamy white skin and large size. Excellent for pies or for carving unusual Halloween jack o'lanterns. Has the typical, roundish pumpkin shape. Will show some variation in size and coloring. J73

Munchkin:<sup>3</sup> 100 days. High-yielding, attractive "mini" pumpkin. Fruit 3 to 4 inches in diameter; flattened with a bright orange, scalloped skin; weight 1/4 pound; flesh orange-yellow, meaty, holds its firmness over a long period; has good sweet pumpkin flavor. Ideal for baking as individual servings; or for stuffing with soup, cranberry sauce, etc. Also used for decorations and carving. Heavy-yielding vines. C20A/, F13, *G13M*, G93M, K66, N16, N84, PIG

Pankow's Field: 110 days. Large, smooth fruit, deep round to tall in shape; weight 18 to 22 pounds; has good color; resembles Connecticut Field. Excellent for jack o'lanterns. Unusually thick and strong stem, much less apt to break in handling than standard pumpkins. Heavy yields. Introduced in 1981 by Joseph Harris Co. C20M, F13, *G13M*, G79, H95, M49, N16

Small Sugar: (New England Pie, Early Small Sugar, Sugar Pie) 100 days. Fruit very small; 8 to 9 inches in diameter, 5 to 6 inches deep; weight 5 to 6 pounds; more or less distinctly ribbed; skin reddish-orange, thick and hard; flesh moderately thick, yellow-orange, fine-grained, sweet and well-flavored. The standard pie pumpkin, introduced prior to 1865. BURR, TAPLEY 1937; A16, B6, B75M, C44, D3M{PR}, D6, E38, F60, G6, H61, J73, K73, L7M, M49, N34{PR}, etc.

Spookie: 100 days. An improved Small Sugar type with more uniformity, resulting in a higher percentage of marketable fruits. Fruit small to medium, 6 to 7 inches in diameter; weight 5 to 6 pounds; skin bright-orange, smooth and hard; flesh orange-yellow,

thick, fine-grained and sweet; excellent for pies. B8M, C20A/, F13, F60, F55, *G13M*, J84, K10, K20M, L79, N52

Sweetie Pie:<sup>3</sup> 110 days. Ornamental "mini" pumpkin. Flat, blocky, deeply ribbed fruits; 3 inches in diameter, 1 3/4 inches deep; weight 5 ounces; has old-fashioned pumpkin flavor. Grown from stock seed imported from China, where it is considered a delicacy. Ideal for Halloween and Thanksgiving table decorations. L42

Triple Treat:<sup>2</sup> 110 days. Triple-purpose, "no waste" pumpkin. Uniformly round fruit, 7 to 9 inches in diameter; weight 6 to 8 pounds, a good size for Halloween carving; bright orange skin; thick, deep orange, medium-fine-grained flesh is excellent for pies and puddings; keeps well for several months in a moderately cool place. Hulless seeds make a delicious high-protein snack, either raw or roasted. B75, C20A/, D11M, *E53M*, *F63*, F70, *G13M*, J25M, K10, K50, S55

Winter Luxury: (Luxury Pie, Winter Queen) 105 days. Moderately small fruit; 9 to 10 inches in diameter, 6 to 7 inches deep; weight 7 to 8 pounds; shape nearly globular, narrowly ribbed; skin yellow-orange, uniformly and finely laced with a light gray cork-like netting; flesh pale-orange, moderately thick, slightly juicy, tender and somewhat sweet; quality high. Keeps exceptionally well for winter use. Introduced in 1893 by Johnson & Stokes of Philadelphia. TAPLEY 1937; G16, K20M, K71

#### CODES FOR SPECIAL TYPES

1. Short-Vined
2. Hulless
3. Mini or Baby
4. White-Skinned

## QUINCE {GR}

### CYDONIA OBLONGA

Aromatnaya: Medium-sized, round yellow fruit; very aromatic. Has a distinct pineapple-like flavor and is sweet enough to eat out of hand. Also excellent for cooking. Ripens in October. Very disease resistant. Recently introduced into the United States from the Black Sea region of Russia and Turkey. One of the best varieties among thousands available in this area. J61M

Bereczki: (Vianja) Very large, pear-shaped fruit, golden yellow in color; quality very good; tender when cooked. Tree very vigorous; heavy yielding; comes into bearing early. A very old Serbian cultivar named after Bereczki, an eminent Hungarian pomologist. SIMMONS 1978; 081, Q30{SC}, R77, R83

Champion: Fruit very large, up to 24 ounces, intermediate in shape between an apple and a pear; skin greenish-yellow; flesh yellow, almost as tender as that of an apple, and only slightly astringent; ripens in midseason; keeps very well. Tree vigorous; very productive; bears at an early age. Will often not mature its fruit in regions with a short growing season. MEECH, WICKSON; LI, P59M, Q30{SC}

Cooke's Jumbo: (Jumbo) Large to very large, pear-shaped fruits, 6 to 8 inches in diameter; yellowish-green skin; white flesh; ripens in September and October. Good for cooking and jelly. Excellent for pies and preserves. Most likely a seedling of Van Deman. Introduced by L.E. Cooke Co. C54, G17, H4,153M, 174, N24M

Ekmek: Probably the most widely grown quince in Western Turkey. Small to medium-sized fruit; bright deep-yellow skin; pale creamy yellow flesh, dry, soft, coarse-grained. Ripens in midseason. Especially popular for making *composto*, a dessert of stewed quince. Ekmek means "bread" in Turkish. SYKES, J; U7D{SC}

Meech's Prolific: Large, pear-shaped fruit, up to 18 ounces; skin very fine-textured, bright yellow; exceedingly fragrant; of excellent

flavor; ripens 2 weeks earlier than Champion. Tree slow growing; heavy and regular bearing, often commencing to bear when only 3 years old. Originated in Connecticut prior to 1883. MEECH, SIMMONS 1978; 081, Q30{SC}, R77

Membrillo Manzano: (Apple Quince) Light greenish-yellow fruit with light pubescence; short neck at stem end; furrowed calyx end; white flesh that does not brown when cut. Much sweeter and juicier than other quinces. Also completely lacking in astringency, sourness and grittiness characteristic of most quinces. May be eaten raw like an apple. Originated in the Majes Valley, Arequipa Province, southern Peru. U7D{SC}

Orange: (Apple) Fruit large to very large, nearly round in shape; skin bright golden-yellow in color; flesh very tender, orange-yellow when raw, turning red when cooked. Quality very good in regions with cool summers, inferior where summer temperatures are high. Leading quince cultivar in the United States. A88M, C54, E84, G49, H4, H49{DW}, H65, I49M, I49P, I68, I66T, 174, J61M, V20, N24M, etc.

Perfume: Large to very large fruits, up to 1 1/2 pounds each; form oval to slightly rectangular; skin waxy, a glossy bright yellow; very fragrant; flesh tart but flavorful. Tree with attractive pink blossoms. D57, 174

Pineapple: Fruit similar to Orange, but smoother and more globular in shape. Skin golden-yellow; flesh white and extremely tender, low in astringency, with a slight pineapple-like flavor. Originated in Santa Rosa, California by Luther Burbank. Introduced in 1899. One of the leading commercial cultivars in California. WICKSON; A88M, C54, F43M, H4, I49M, I49P, I53M, I68, I74, I83M, LI, N20, N24M, N40{PR}

Pink Mist: Seedling quince recently imported into the United States from Russia. Has very attractive pink flowers, hence the name. Very fragrant fruits. Said to be somewhat good to eat out of hand, unusual for a quince. Also good baked or made into preserves. Apparently hardy in Zones 5 to 9. F43M

Portugal: Very large, oblong-oval fruit; skin almost orange when ripe, very woolly; flesh more juicy than other types, turns fine purple or deep crimson when cooked; flavor very good; ripens very early, 10 days before Orange. Tree vigorous; becoming large and spreading; not productive, and slow to come into bearing. Very old cultivar. SIMMONS 1978; F43M, N24M, 071M, R83

Smyrna: Large, round to oblong fruit; skin lemon yellow; flesh tender, mild, good to very good in quality; ripens with Orange, but keeps much better. Tree a rapid and vigorous grower, with unusually large leaves. Introduced from Smyrna (now Izmir), Turkey by George C. Roeding, Fresno, California in 1897. A88M, B93M, C34, C54, F43M, H4, I49M, I49P, I53M, I66T, I68, 174, J61M, LI, L12, N20

Van Deman: Large, oblong to pear-shaped fruit; skin pale orange; flesh pale yellow, moderately coarse, with a pleasant spicy flavor; retains good flavor after cooking; ripens in September. High yielding tree; considered among the hardiest cultivars. A seedling of Portugal pollinated by Orange. Selected by Luther Burbank. Introduced by Stark Brothers around 1891. I49M, I49P, I66T

## QUINOA {S}

### CHENOPODIUM QUINOA

407 Black: An ebony colored selection from 407. Has an unusual nutty flavor said to be like a medley of wild rice, buckwheat and adzuki bean. Best adapted to high altitude semi-arid regions. L3J

Apelawa: Very colorful quinoa with mixed green and red seedheads. Grows about 4 or 5 feet tall. Ripens in midseason. Tolerant of

drought, frost and alkaline soils. Should not be overwatered. Originated in southern Bolivia and northern Chile. C95, L3J

Black: {DF} Attractive brownish-black seeds with a pleasing nutty flavor, somewhat chewier than lighter colored forms. Requires lengthy rinsing and slightly more cooking time than other types. Can be eaten as a breakfast cereal with milk, cinnamon and sugar or ground into flour for pancakes and muffins. Especially good as an ingredient of stuffings and tabouli. Hybrid of quinoa and North American chenopods selected at White Mountain farm in Colorado. SASS; E13G, E56, F86T, M99

Cahuil: Seed small to medium-sized, light green with some variation. Good for grinding into flour. A good producer in Washington state. Yields well at lower elevations. C95, L3J

Cherry Vanilla: Very attractive strain with variably colored seedheads, from creamy-white to rose. Yields very mild flavored, especially white seeds. Whiteness of seeds is generally considered an indication of low saponin content on the seedcoat. Normally, saponin must be rinsed from the seeds before cooking to avoid its soapy bitterness. The development of low saponin strains should lead to greater acceptance of quinoa as an alternative to rice and other grains. F80, N7G

Dave: (Linares 407) 90-100 days. Medium-sized seed; yellow-brown in color. Ripens in mid-season, or mid to late summer from an April sowing. Height 5 to 6 feet. Very colorful orange and pink seed heads. Very short-season, high-yielding Chilean cultivar, adaptable to high or low elevations. Named for David Cussack, who was instrumental in bringing quinoa into North American agriculture. A2, C95, J39, K49T, L3J

Faro: 100-130 days. Small, yellowish-white seed. Height of plant 4 to 6 feet. Foliage light-green. Mid to long-season type, somewhat later than Linares. Originated at sea level. Performs well at lower elevations. Good-yielding, adaptable cultivar from southern Chile. Best yielding of 16 strains tested by Abundant Life Seed Foundation. A2, I99M, K49T

Gossi: 90 days. A mix of two Bolivian strains selected as the best of over 400 by the late David Kusak, who first introduced quinoa to the United States in the early 1970's. Will germinate in the ground in early May. Grows best in areas with cool nights. E24

Isluga Yellow: 90-110 days. Medium-sized yellow seed. Attractive golden-yellow or pink seed heads. Early-maturing, high-yielding, somewhat taller cultivar. Has grown consistently well in a variety of Western mountain and coastal sites. A2, J39, K49T

Kaslala: Very tasty quinoa that originated in the high altiplano region of Bolivia. Grows about 5 or 6 feet tall. Has a very rich flavor, and cooks drier than other sorts. Doesn't set seed well in areas with a very hot climate, especially when flowering. One of the main varieties of the Aymara and Quechua Indians. C95, L3J

Linares: Good yields of golden-yellow, medium-sized seed, high in saponin content. Flavor distinct from commercial quinoa. Ripens in mid-season. Height of plant 5 to 6 feet. Has grown consistently well at both maritime and Rocky Mountain planting sites. Originated in Chile at 36° south latitude, and at sea level. C95

Melang: Very attractive plant with large, well-filled seedheads; average weight 3 to 6 ounces; light-colored. A heavy producer. Grows 4 to 6 feet tall. Numerous arrow-shaped leaves which can be used like spinach. B49

Multi-Hued: Produces striking flower heads ranging from red through orange and yellow, to purple and mauve. Height of plant 5 to 6 feet. Very productive in northern latitudes, such as Canada. B49, K17M

Orange Head: Vivid bright orange seedheads. Golden yellow seeds. Tall, heavy yielding plants. Developed by Frank Morton of Shoulder to Shoulder Farm, from a single orange plant found in a planting of the 407 variety. F80, N7G

Pison: Produces medium to large, yellow to dark white seedheads. Grows about 4 1/2 to 5 feet tall. Will produce a crop in three or four months depending on climate, latitude and altitude. Originated in southern Bolivia. C95, L3J

Rainbow: A genetically diverse strain developed by Frank Morton of Shoulder to Shoulder Farm. Brilliant multicolored seedheads; dense and easily thieshed. Yellowish-white seeds. Tolerant of heat, drought and wind. F80, N7G, N84

Redhead: Brilliant reddish-pink seedheads Yellow-white seeds. Sturdy, high yielding plant. Should be spaced about 12 inches apart. Developed by Frank Morton of Shoulder to Shoulder Farm. Selected from the cultivar 407. N7G

Temuco: 100-110 days Very palatable, small white seeds. Ripens in midseason. Yellow-green seed heads (with some golden); large roundish leaves. Height of plant 5 to 6 feet; bears abundant crops. One of the best choices for maritime sites in the Pacific Northwest, but has grown well in the southern Rockies also. Originated in southern Chile at 38° latitude. A66, B49, C95, J9M, J39, K49T, L77D, N84

## RADISH {S}

### RAPHANUS SATIVUS

#### EUROPEAN RADISHES

#### SPRING/SUMMER HARVESTING

##### *Multi-Colored*

Bombay Red: An excellent, attractive Indian cultivar. Long, tapered roots, somewhat irregular in shape; the upper half red, the lower half white: Flesh tender and tasty. Medium-tall tops. Matures early. N91, R50, S93M

Buonissimo d'Ingegnoli: 25 days. A multi-colored radish that is rounder and plumper than the French Breakfast types. Uniform shape; bright crimson with just the edge of the tip bright white; excellent flavor; resistant to pithiness. Best harvested when 1 to 1 1/2 inches long. Very popular in Italy. Q11M

D'Avignon:<sup>1</sup> 23 days. One of the longest of the French Breakfast or "gourmet" type radishes, preferred by epicures for their delicate crunch and gentle fire. Smooth, slender root, about 3 inches long, tapered to a point; 66 to 75% red toward die top, white tipped. Medium green tops are excellent for steaming. E24, G6, Q34, S55, S95M

Early White-Tipped Scarlet: (Scarlet White-Tipped Turnip) 22 days. Root roundish, grows 1 to 1 1/2 inches in diameter; skin attractive, bright carmine pink on top, very white on the lower fourth part; flesh white, crisp and sweet. Matures rapidly, but quickly becomes hollow in the center; should be pulled as soon as fully grown. Introduced prior to 1859. VILMORIN; A25, E38, F80, G57M, G83M, G87,184, J39, L3J, L10

Easter Egg: (F.) 28 days. Multi-line hybrid that produces white, red, purple, pink and violet colored radishes. Roots have very good flavor and interior quality, remaining firm and crisp a long time without becoming pitty. Tops are medium height, medium green, and are strap-leaved. A16, B6, C44, C53, C85M, D27, E24, G79, 139,191, N40{PR}, R47

Eighteen Days:<sup>1</sup> (De Dix-Huit Jours) 18 days. A very quick maturing, half-long, French Breakfast type with a rose-carmine shaft and a white tip. Not recommended for mid-summer sowing. One of the most popular radishes in France. An older, traditional cultivar. E63D, G68, S55, S66M

Flamboyant:<sup>1</sup> 25 days. French Breakfast type. Semi-long, cylindrical, uniform roots; 2 to 3 inches long; skin Vermillion red on the upper two-thirds, snow white on the bottom third. Flesh crisp, tender and mild. Harvest when young for best quality. Short tops. Very popular in France. K66, P59M, RUM, S75M, S95M

Flamivil:<sup>1</sup> 25 days. French breakfast type. Medium-long, cylindrical root; about 90% intense red, with slightly pointed white tip and slender taproot. The French say that Flamivil, touched with a small splash of white on the tip, looks like it was just dipped in milk. D74B, F44, G68,177, S95M

Fluo:<sup>1</sup> (F.) 23 days. Hybrid French Breakfast type. Attractive bullet-shaped roots, 3 to 4 inches long; bright red with glistening blunt white tips; crisp and pleasantly pungent. Exceptional quality and uniformity. Very productive and widely adapted. Suitable for spring, summer or fall crops. Originated by Vilmorin. C53, DI 1M, F63, F70,177, J20, M46, N16, S95M

French Breakfast:<sup>1</sup> 25 days Very attractive market garden radish. Oblong, blunt-ended root; 1 1/2 inches long, 3/4 inch thick; rose-colored on the upper three-fourths, pure-white on the lower part. Flesh crisp, tender, mildly pungent, becomes hollow in the center if not pulled as soon as it is fully formed. Introduced prior to 1885. VILMORIN; A16, A25, A75, B49, C44, D3M{PR}, D82, G16, G68, G71, H33M, H42, L89, N40{PR}

Lanquette:<sup>1</sup> French Breakfast type. Medium-long, cylindrical, fleshy root with a slender tap root. Skin 75 to 80% bright red, 20 to 25% white at the slightly pointed tip. Should be harvested promptly at maturity since its fine flavor and texture does not hold in the garden. Suitable for spring and fall culture, and under glass in winter. E5T

Sparkler: (White Tip Sparkler) 25 days. Round to globe-shaped root; deep scarlet on the upper portion, pure-white on the lower end; crisp white flesh, never becomes hollow at the heart; holds its crispness long after maturing. Medium-tall tops. Popular for fresh market and home gardens. A16, A75, B6, B49, B75M, D11M, D82, E24, F70, G16, G79, H85M, 139,164, K49M, N16, etc.

##### *Pink/Red-Skinned*

Candela di Fuoco: 35-45 days. May grow to 12 inches long when planted in loose, sandy soil. Bright crimson skin; succulent, mildly pungent white flesh. Needs 35 to 45 days to reach maturity, but can be harvested and used when smaller. N84, Q11M, SI 7

Cerise: 21-25 days. A round, attractive bright red, highly uniform radish that has been selected in France for market growers. Holds well without becoming hollow or pitty. Short tops. Should be used when small, with the stems attached. Introduced by Vilmorin. G68, S66M

Champion: 24 days. Uniform, globe-shaped roots; bright scarlet skin; crisp white flesh, holds for a long period of time without becoming woody or pitty. Sturdy medium-length tops; good for bunching. For spring or fall crops. Thrives in cool weather. All America Selections winner in 1957. A16, B6, B73M, C44, D11M, D82, E24, F70, F82, G16, G71, H85M, K49M, L79, M46, N16, etc.

Cherry Belle: 25 days. Smooth, round root, 3/4 inch in diameter; bright cherry-red skin; crisp, firm, tender white flesh; holds its eating quality well as it is very resistant to pithiness. Short tops. Ideal for home use, market and forcing. All America Selections winner in 1949. A16, B6, B75M, C44, D11M, D82, E59Z, F70, F82, G16, H85M, 139, K49M, K73, L7M, M49, etc.

Comet: 25 days. Globe-shaped to round roots; skin bright scarlet red; flesh white, fine-textured, exceptionally firm and crisp. Short to medium tops, 3 1/2 to 4 inches tall. Excellent for bunching. Remains firm longer than most early globe types. All America Selections winner in 1936. A16, DIT, D12, D27, D76, F24M, G57M, G93M, H85M, K49M, L42, M49

**Crimson Giant:** 27 days. Large, turnip-shaped root; 1 to 1 1/2 inches in diameter, considerably larger than other early types; skin deep crimson; flesh firm but tender, crisp and sweet; remains in perfect condition several days after pulling. Equally desirable for forcing or outdoor planting. A25, A75, B6, B75, D65, G71, G93M, H85M, H95, I64, K49M, K71

**Early Scarlet Globe:** 20 days. Deep globe-shaped roots; bright red skin; pure-white, crisp flesh, of mild delicate flavor. Short bright green tops, excellent for bunching. For greenhouse or frame forcing, as well as muck or mineral soils. Has more heat tolerance than other cultivars. A25, A75, B6, B78, C85M, D65, G68, G71, H85M, J25M, K49M, K71, L89, M46, N16, etc.

**German Giant (Parat)** 29 days. A very large round radish that is a favorite of home gardeners in Germai. Scarlet red skin; crisp, slightly pungent white flesh. Can be harvested small or after reaching the size of a baseball. Will not split or become woody or spongy. Needs to be thinned to 1 inch apart to reach large size. B6, D76, E97, F73D, G16, G68, H85M, J20, K49T, K71, L13M, M46

**Long Scarlet (Cincinnati)** 25 days. Long root, a considerable portion growing above ground; 7 to 8 inches in length, about 3/4 inch in diameter; skin an attractive deep pinkish-red color, becoming paler towards the tapered lower portion; flesh white, transparent, crisp, mild. Very hardy; can be forced as early as February. Introduced prior to 1865. BURR; C20M, DIT, D12, D26D, F80, G57M, K27M, K71, PIG

**Pink Beauty:** 27 days. Smooth, round root, grows as large as Champion; unique rose-pink skin; crisp snow-white flesh, very mild flavor. Stays solid and crisp for a long period of time, never becoming woody or pithy. Short tops; easy to bunch. Adds variety to salads and relish trays. B6, B49, G6, H33M, RUM, R32

**Scarlet Globe:** 24 days. Smooth olive-shaped root, 1 inch in diameter at its widest point; thread-like tap root; bright scarlet skin; white, brittle flesh, very mild and tender; remains crisp over a long period of time. Small to medium tops. For forcing or outdoor culture. D12, FI, G57M, G83M, H49, R32

#### *Purple-Skinned*

**Plum Purple (Purple Plum)** 27 days. Smooth, globe-shaped roots; unique bright purple skin; crisp, juicy snow-white flesh, mild flavor; never becomes pithy or hot. Short tops; 4 to 5 inches long. Hardy and highly adaptable. Especially attractive in salads and relish trays. C28, C53, D26D, G53M, G87, G93M, I18M, I91, J97M, L10, L11, N40{PR}

#### *White-Skinned*

**Burpee White (Burpee's Round White, Snowball)** 25 days. Young roots nearly round; enlarge in diameter and become flattened as they grow. Pure-white skin and flesh. Best eaten when 3/4 to 1 inch in diameter, but stays tender, mild, and crisp for a long time. Medium-tall tops. A16, B75, D27, G87

**Hailstone (White Globe Hailstone)** 26 days. Globe-shaped root, somewhat larger than Scarlet Globe but not as large as Crimson Giant. Pure-white skin; crisp, tender, mild white flesh; earlier and larger than most round cultivars; holds its quality well. Medium-tall tops. B1, B75, D12, D26D, D65, D82, E24, G13M, G57M, H85M, H95, K10, M32

**Mimchner Bier:<sup>2</sup> (Miinchen Bier)** 67 days. A unique cultivar that produces masses of thick, tender, juicy, stringless pods at the top of 2 foot stems. Can be added whole or chopped to salads, boiled, steamed or stir-fried. In Germany, the long white roots are sliced thinly, salted lightly, and eaten on black bread or with pretzels and washed down with beer. C53, F24D, F24G, L91M, N81, N84, Q34, R32, R47, S55

**Philadelphia White Box (Earliest White Forcing)** Small, crisp round radish with very small leaves. Very quick growing, ideal for forcing in cold frames. Can also be grown in the open as a fall

radish. Very mild and delicate, especially when forced. Can be used like baby turnips. Developed by D. Landreth & Sons from the White Turnip radish. WEAVER 1997; D29P

**Snow Belle:** 26 days. Flattened globe-shaped root with a small tap root; skin pure-white, smooth, attractive; crisp, mild white flesh, tangy flavor; stays firm for a long period of time. Medium, dark green tops. Good for home gardens and bunching. C28, D11M, D76, F63, F70, H33M, H61, K10, K27M, L7M, L42, M29, M49, M95M

**White Globe (White Ball, White Pearl, Giant White Globe)** 25 days. One of the best early white radishes. Round to flattened-globe shaped roots; smooth, white skin; crisp, mild, glistening white flesh; holds its quality for a long time, never becoming pithy. Light green, medium tall tops. C92, E5T, E38, G57M, I59M

**White Icicle (Lady Finger)** 30 days. Long, slender, tapered root; 5 to 6 inches in length, 1/2 inch thick; thin, tender, snow-white skin; crisp, tender white flesh, mild in flavor; never becomes woody or pithy. Very tolerant of hot summer heat. Easy to force and fine for outdoor culture. A16, A25, B73M, C44, D11M, D65, E38, F70, F80, F82, G16, L7M, N16, N40{PR}, R47, etc.

**White Strasburg:** Stocky, parsnip-like roots with broad shoulders, 4 to 5 inches long and 2 inches in diameter; white skin; tender, white flesh, mildly pungent. Matures in about 6 weeks, and will increase in size for a month or more without loss of quality. Very productive and heat resistant. Heirloom from France. VILMORIN; K49M

#### *Yellow-Skinned*

**French Golden (Golden)** 32 days. Elongated, slightly tapered root; 4 to 5 inches long, about 1 inch in diameter; light-golden skin; very crisp pure-white flesh with a relatively mild, distinctive flavor. An attractive addition to salads. Very resistant to disease and insect problems. F73D

**Yellow Oval:** 50-60 days. Conical or elongated root, 3 to 4 inches in diameter and 6 to 8 inches long, half growing above ground; orange-yellow skin; juicy flesh with a hot, pungent flavor. E83T

**WINTER HARVESTING** Winter radishes are those that have such compact and firm-fleshed roots that they will keep through a great part of the winter without sprouting or becoming hollow at the center, as spring and summer radishes do when they are stored for any length of time. The black types are traditionally used by cooks of Russian and Jewish heritage. SCHNEIDER 1986 [Cu], [Re], VILMORIN [Cu].

#### *Black-Skinned*

**Long Black Spanish (Noir Gros Long d'Hiver)** 60 days. Uniform, cylindrical roots; 7 to 10 inches long, 2 to 3 inches in diameter; skin very black, somewhat wrinkled; flesh pure-white, firm, compact, pungent. Leaves stout, broad, long. Stores well. Can also be used for sprouting. Introduced prior to 1865. VILMORIN; D11M, D12, D82, E38, F70, F73D, G57M, G68, I39, J20, K49M, L7M, O53M

**Poids d'Horloge:** Long, cylindrical, club-shaped root; about 8 inches in length; slightly narrower at the neck than at the root end, somewhat reminiscent of Des Vertus Marteau turnip; skin pure black, smooth; flesh crisp and pungent. Sown in July and August for winter use. Keeps extremely well. P59M

**Round Black Spanish (Noir Gros Rond d'Hiver)** 55 days. Root roundish, often top-shaped; 3 to 4 inches in diameter, about 3 inches long; skin black, cracked in longitudinal lines; flesh white, very compact and firm, very pungent. Not very late for a winter radish; may be sown up to the end of July. Keeps exceptionally well. Introduced prior to 1865. VILMORIN; C44, C85M, D27, E13G{PR}, F80, G16, G71, I63Z, K71, K73, L7M, M46, N40{PR}, R47

**Wiener Runder Kohlschwarzer (Round Black Viennese)** 85 days. A round, black-skinned winter radish grown in Germany and

Austria especially for salads. A favorite Bavarian combination includes leaf lettuce, curly endive, cress, sorrel and chervil. Excellent, pungent flavor; pure white flesh. Planted in the fall for a late harvest. Stores well without wilting or losing its crisp texture. N81

#### *Purple-Skinned*

Violet de Gournay: 65 days. French heirloom. Long, cylindrical root, slightly tapered toward the end; 8 to 10 inches in length, 1 1/2 inches in diameter; dark-violet skin; pungent pure-white flesh. Stores well. Used for grating into salads, pickling and cooking. Sown in August for a fall and winter crop. Introduced prior to 1885. VILMORIN; E83T, G68

#### *Red-Skinned*

Bartender Red Mammoth: 35 days. Long, tapered root, 7 inches in length and 1 inch in diameter; skin deep red; flesh pink, firm, crisp, pungent. Tops grow 8 to 10 inches tall. Heavy yielder under semi-tropical conditions. For home gardens and fresh market. K49M

Fire Candle: Long, cylindrical roots with smooth red skin and crisp white flesh. Can grow up to 6 inches in length. Perfect for slicing. Especially appealing to those who prefer a strong-flavored radish. Usually sown from July onwards and harvested in the fall and winter. B49, R32

Salad Rose:<sup>3</sup> 35 days. Long, cylindrical roots, up to 8 inches in length; skin an attractive rosy pink; crisp, pungent white flesh. Good in salads or as a beer ndish. Young leaves can be used in salads or for stir-frying, similar to turnip or mustard greens. Excellent for fall crops. Originated in Russia. B75

### ORIENTAL RADISHES

**DAIKON** Also called *Japanese radishes*, these are exclusively white-skinned except for a few which become green where the shoulder grows above the soil. They are generally larger, coarser, later to mature, and more unpalatable in leaf texture than Lo Bok. (R. sativus Longipinnatus Group)

#### *Spring/Summer Harvesting*

April Cross: (F.) 60 days. High quality hybrid Minowase type. Slender, elongated roots, 12 to 18 inches long and 2 inches in diameter; pure bright white; crisp, mildly pungent flesh, very slow in becoming pithy. Excellent shape and uniformity. Most suited to late spring and early summer crops. Extra slow bolting. *A1, C20M, G16, G93M, 139,191, K10, K73, M29, M46, N81, S63M, S75M*

Early 40 Days: (Kaiware 40 days) 38-45 days. A cultivar developed especially for sprouting. Produces spicy sprouts in 2 to 4 days that can be added to salads, stir-fried, etc. Also grown for the white, mild-flavored roots which grow to 12 inches in length and 2 1/2 inches in diameter. Sow in early spring for an early summer harvest of roots. Tolerant to heat and cold. *D55, S63M, S70*

Minowase: (Minowase Early, Minowase Dark Green Leaved) 55 days. Very large, tapered root; 20 to 24 inches long, 2 to 2 1/2 inches in diameter; pure-white skin and flesh; juicy, crisp, mildly pungent flavor. Rapid growing and widely adapted. Heat and disease tolerant. Best sown in May for a summer crop. Optimum temperature for growth is 75° F. *A2, C97, D12, D26D, D55, E24, E97, G13M, G33, G93M, L3J, L59, L79G, Q18, S63M, etc.*

Minowase Summer Cross:(F.) Hybrid Minowase type with added disease resistance. Elongated, tapered roots, 12 to 18 long and 2 1/2 inches in diameter; pure-white skin and flesh; juicy and crisp, mildly pungent; slow to become pitty. Uniform, well-shaped and of high quality. Tolerant of heat and bolting. Resistant to virus and fusarium wilt. *A1, B75, C85M, D26D, G71,167M, J20, J97M, K10, K16M, K50, K73, M29, RUM, R32, S63M, etc.*

Pusa Himani: 55 days. Cylindrical roots, 12 to 14 inches long and 4 inches in girth; pure white skin, green at the stem end; crisp sweet

flesh, only mildly pungent. For fresh markets and home gardeners. Grown all year round in the hilly regions of northern India. Developed in Katrain, India from a temperate type and a popular Japanese daikon variety. BOSE 1993; N91, Q18, Q45M, R50

Tokinashi: (All Seasons) 85 days. Pure-white, square-shouldered root, tapering uniformly to a sharp tip; 12 to 15 inches long, 2 to 2 1/4 inches in diameter at the top; flesh fine-grained, crisp, very pungent. Slow bolting; tolerant of cold and severe heat; can be sown in any month where the temperature remains above freezing. *A2, G33, G93M, 139, J9M, J20, J73, L3J, L59, PIG, R47, S63M*

#### *Winter Harvesting*

Miyashige: (Green Neck Miyashige) 78 days. Long, cylindrical, stump-rooted radish; 16 to 17 inches long, 2 to 2 1/2 inches in diameter; skin white, green towards the shoulder; flesh white, solid, crisp, pungent. Excellent for pickling and winter storage. Sown from late August to early September in Japan. *C20M, C95, D55, F44, G6, G33, G93M, 139,199M, K49T, L3J, L13M, L77D, S63M, S70*

Miyashige Long White Neck: Pure-white, pointed root; 14 to 16 inches long, 2 1/2 to 3 inches in diameter. Flesh of very fine texture, mild pungency, and excellent quality. Usually sown at the end of summer (August or September) for harvesting from fall to winter (October to December). *G93M, S63M*

Nerima Longest: (Nerima, Nerima Long White) 90 days. Long, cylindrical root, narrow at the shoulder and tapered toward the tip; 28 to 30 inches long, 3 inches in diameter at the widest point in favorable soil conditions. The flesh is less juicy and easy to dry after harvest, yet is firm and tender. Requires deep soil. *C20M, C85M, G33, N52*

Okura: (Winter Queen) 78 days. Pure-white root; square at the shoulder, blunt-ended; 14 to 15 inches long, 3 1/2 inches in diameter; pure-white skin and flesh; mild flavor. Has excellent keeping qualities. Tolerant of virus diseases. Sown between August 20th and September 15th in Japan. *C95, E83T, G93M, L77D, N84*

Sakurajima: (Sakurajima Mammoth, Mammoth White Globe) 150 days. Very large, flattened globe-shaped root; 13 to 13 1/2 inches in diameter; average weight 40 pounds when mature, occasionally reaching 65 pounds at Sakurajima, Japan. The gigantic root development is attained only in areas where a fertile, light soil underlaid with pumice or lapilli is available, and the growing season is longer than 150 days. Rather sweet flesh; good for boiling or pickling. *A2, B73M, D65, F73D, G33,181, K49M, L77D, Q34, S63M*

Shogoin Large Round: (Shogoin Giant) 85 days. Large, globular root; vertical diameter 5 1/2 to 6 inches, horizontal diameter 5 to 5 1/2 inches, about 1/4 growing above ground. Flesh pure-white, firm, crisp, juicy, mildly pungent, excellent for boiling. Sown in mid August and harvested in early November in Japan. *C20M, D55, G33, G93M, 139, J9M, Q28, S63M*

#### *Others*

Bisai:<sup>3</sup> Widely used in Japan as a cut-and-come-again seedling crop. Cut with knife or scissors when 2 to 3 inches high. Seed should be broadcast in a small patch from spring to autumn. Also produces delicious radish sprouts. B49

**LO BOK** Also called *Chinese radishes*, these are more variable than daikon both in the color of their skin, and in their size and shape. The leaves are generally hairless and are more palatable. *E13G{PR}*. (R. sativus Longipinnatus Group)

#### *Multi-Colored*

Include here are mostly red and green fleshed Chinese and Korean radishes, usually having white and green skin. Red-fleshed Chinese radishes are indigenous to the Beijing area of northern China, where they are known as *Xin Li Mei*, *Shinrimei*, or *Beauty Heart radishes*. In the specialty food trade they are called *watermelon radishes*. The sweet roots are eaten like a fruit and are also used for carving

“radish flowers” and other decorative garnishes. Green-fleshed radishes are juicy and very sweet and are easier to grow than red-fleshed types. They can also be pickled or used for making soup. LARKCOM 1991.

Aomaru-Koshin: (Tsung Lo Bok, Beijing Red Core, Green Skin & Red Flesh) 55 days. Short, round root; 4 to 5 inches long, 4 inches in diameter; weight 1 pound; skin green above ground, white below; reddish-purple at the core, with rays spreading through the white flesh. Good raw, in salads, or pickled overnight in sweet vinegar. A good keeper, its sweetness increasing during storage. Popular in the Beijing area of China. D55, E83T, F80, L59, Q28, Q34

Green Meat: 50-60 days. An unusual radish from northern mainland China. Oblong in shape, 3 to 4 inches in length when mature; smooth white skin, green near the shoulder; flesh deep lime-green, crisp, pungent. Good sliced or grated with the Red Meat radish. Also suitable for pickling. C20M, N84, S63M, S70

Margilan: (Margelanskaya) 70 days. Very attractive, succulently sweet radish from Central Asia. Oblong roots, 3 to 5 inches in length and 1 1/2 to 2 inches wide; light jade in color. Often grated and made into a salad with grated carrots. This salad is traditionally served as an accompaniment to Uzbek lamb pilaf. VON BREMZEN [Re]; U15

Misato Green: 60-65 days. Long, cylindrical roots, about 8 inches in length; bright green on the upper two thirds, white at the base. Highly prized in Asia for its high quality, juiciness and sweetness. Light frost may enhance the flavor. Keeps well. Short tops; can be planted with close spacing. B49, C20M, G33, 139, J20, M46, N24M

Misato Rose-Fleshed: 65 days. Large, round-oblong root, about 4 inches in diameter; skin white, green over the upper one-third; flesh rose-red with lighter concentric rings; stores well. Should not be used for spring sowing. A colorful addition to salads; also good cooked. Imported from China. B49, G13M, G33, 139, 191, J20, L89, M46, N24M

Red Meat: 50 to 60 days. An unusual radish from mainland China. Large, turnip-shaped root; 1 to 1 1/4 inches in diameter when mature; smooth, creamy white skin, lightly tinged with purple; flesh red, pungent. Attractive as well as useful. C20M, G6, G13M, G68, R47, S55, S63M

Shangtung Green Skin: (Green Long, Tseng Lo Bok) 50 days. Long, slender root, about 10 inches long, 2 inches in diameter; green above ground, white below; weight about 1 pound; flesh green, crisp, juicy and sweet. Can be harvested in fall and stored until the following spring; the longer it is preserved the sweeter it becomes. Good raw, in salads, or pickled. ROSS; C95, D55, E83T, L3J, L59, L79G

Tae-Baek: (F) 70 days. Short, blunt white roots tinged with green on the upper third; weight about 2 pounds; very firm and uniform. Highly tolerant to virus, bacterial soft rot and downy mildew. Suitable for kimchi. Best suited to late summer planting. Can be stored for 4 to 5 months in winter. AI, C20M, D55, G33, H49, M29, N84, Q3

Valentine: 25 days. A novelty radish which was developed for the salad bar trade. Round in shape, with green and white skin, and red interiors at maturity. Introduced by Stokes Seeds. 177, K49M, L42

Wei Xian Qing: 90 days. Long, cylindrical root; 10 to 12 inches in length; skin dark green above ground, creamy white below; flesh green, crisp, juicy; stores well. May be eaten raw; called *fruit turnip* in China. Sown in mid-August in Shandong Province, China. 054

Xin Li Mei: (Shinrimei) 90 days. Cylindrical, turnip-shaped root, 3 to 4 inches across; skin white, green near the upper end; flesh bright pinkish-red; mild, sweet flavor. May be eaten raw as a fruit or used in salads. Sown in early August in Beijing, China. Harvested in the fall and winter. F73D, N84, 054, S70

### *Pink/Red-Skinned*

China Rose: (Chinese Red Winter) Root elongated, thicker at the lower extremity than at the neck, blunt at both ends, very closely resembling the Jersey turnip in shape; 4 to 5 inches long, 2 inches in diameter; skin bright rose-colored; flesh white, very firm, pungent. Leaves broad; leaf-stalks bright pink. Considered the best radish for sprouting. Introduced prior to 1865. BURR, MEYEROWITZ 1994a, VILMORIN; A16, C/4{SP}, E24{SP}, E38, E60P{SP}, F13{SP}, F80, G6{SP}, G16, G71, H99J{SP}, K71, K73, L7M, L59, R47, etc.

Chinese Short Red: 40 days. Slightly tapered, cylindrical root; 8 inches long, 2 inches in diameter; bright red skin; very juicy, pure-white flesh of very good flavor. Excellent for eating raw, mixed in salads. D55, L59, S70

Pink Ball: 70 days. Developed by careful selection from imported cultivars from China. Round roots with bright pink skin and pure white flesh; weight 10 to 12 ounces. High starch content and late pithiness makes it suitable for storage. Tolerant to summer heat, sudden low temperature, and virus disease. Dark green foliage with reddish petioles; somewhat spreading growth habit. Q3

Red Coat: (F) 45 days. Straight root, tapered towards the top; 7 1/2 to 8 inches long, 2 inches in diameter; purple-red skin; red flesh. Suitable for salads. Vigorous, erect plant; tolerant to mosaic virus; good for close planting. Not recommended for growing under cool weather conditions. Q39

Shunkyoh Semi-Long:<sup>3</sup> 35 days. Medium-long, smooth, slightly tapered root; about 4 to 5 inches in length; attractive reddish-pink skin; very crisp, nutty, pungent white flesh. Has a taste that is both hot and unusually sweet. Broad, smooth leaves with reddish-pink stems can be eaten in salads, pickled, or stir-fried with the roots. Slow bolting, can be sown in early spring or fall. Imported from mainland China. G6

### *White-Skinned*

Chinese Improved Earliest:<sup>3</sup> 38 days. Uniform, cylindrical root; about 5 inches long, 1 3/4 inches wide in cross section; skin and flesh white; flesh very tender and juicy, mildly pungent. Leaves dark-green, 12 to 13 inches long, unlobed, hairless, tender, well-suited for cooking with the root. Popular in Fukien, China and Taiwan where similar cultivars are called Kana. C20M, E83T, J73

Chinese White Celestial: (Chinese White Winter, California Mammoth White) 60 days. Long, cylindrical root, thickest at the lower extremity; 6 to 8 inches in length, about 2 1/4 inches in diameter; between 1 and 2 inches grows above ground; skin and flesh pure-white; flesh mild, lacking in pungency. Good for pickling and winter storage. Introduced prior to 1885. VILMORIN; A75, D12, G57M, G71, H49, H85M, J97M, K10, K49M, K71, L42, M95M, N16

Ta Mei Hwa: 55 days. Large, oblong, blunt-ended root; 6 to 8 inches long, 3 to 4 inches in diameter; can weigh 3 to 4 pounds when mature; white skin and flesh. Very tasty and mild-flavored; excellent when shredded or grated and added to soups. Quite popular in Chinatown markets. E83T, F73D, L79G

White Rat: (F) 45 days. Small, blunt, attractively shaped white roots weigh about 1 3/4 ounces each; highly uniform; very firm and resistant to pithiness; good pungent flavor. Fine, edible tops. Suitable for *chonggak kimchi*. Best for fall planting at close spacing. Retains its shape very well even when grown in high elevation areas. G33, Q3

### LEAF RADISHES

These have been bred specifically for use as a leafy vegetable, before the roots have developed. They are characterized by rapid growth of extra long leaves that are completely free of hairs.

**HYBRID**

4 Season: 25-30 days. Long, smooth, entire leaves, free of hairs; 12 to 14 inches in length at harvest stage. Vigorous and fast growing; harvestable in 30 to 35 days in spring, 25 to 30 days in summer and autumn. Moderately slow bolting. Tolerant of cold and heat; resistant to virus. Suitable for growing in all seasons. *C20M, D55, G33, L88J, N84, Q3*

Full House: Leaf radish with very slow bolting. The most useful cultivar for year round culture, being especially adapted to winter and spring growing. Can be harvested after 50 to 60 days in winter and 30 to 35 days in summer. *Q3*

No. 1: Attractive leaves and roots; suitable for harvesting when young. Young shoots are of high quality and can be harvested in 30 to 35 days in summer and fall. Grows well under mild climate conditions. *Q3*

Pearl: 30-35 days. Long, smooth, divided leaves, free of hairs; 12 to 14 inches in length at harvest stage. Harvestable in 35 to 40 days in spring, 30 to 35 days in summer and autumn. Extra slow bolting. Tolerant of heat and cold; resistant to virus. Can be grown during any season. *C20M, Q3*

Saisai: Popular variety developed especially for leaf harvest. Hairless leaves, 12 to 14 inches long; tasty and nutritious. Slow to bolt. Can be grown in all seasons. Harvested after 35 to 40 days in spring, and 30 to 35 days in summer and fall. *S70*

**CODES FOR SPECIAL TYPES**

1. French Breakfast Type
2. Edible-Podded
3. Edible-Leaved

---

## RASPBERRY {GR}

**RUBUS SPP.****BLACK RASPBERRIES (R. occidentalis)**

Allen: Large, attractive fruit; flesh firm, very sweet. Ripens slightly earlier than Bristol and a large portion of the crop may be picked at one time. Excellent for jam. Good all around cultivar but not outstanding in any one characteristic. Bush vigorous and productive; somewhat resistant to mildew. Originated in Geneva, New York by George L. Slate. *BROOKS 1972; F87, H65, K71*

Black Hawk: Fruit large, up to 3/4 inch in diameter, nearly round; skin glossy black; flesh firm, with little or no tendency to crumble, sweet to mildly acid; quality excellent fresh, frozen and processed; ripens in late midseason. Bush vigorous; hardy; yields extremely well; does not sucker; somewhat resistant to anthracnose. *BROOKS 1972; A82, B19, B73M, C45M, C61, D76, E3, F16, F93, 153M, 178, J83, L33, M83*

Bristol: Large, conical fruit; skin fairly glos<sup>^</sup>, attractive; flesh firm, sweet, highly flavored, nearly seedless, quality excellent; ripens in midseason over a period of a couple of weeks. Tall, vigorous bush; hardy; highly productive; generally disease resistant but very susceptible to anthracnose. Very widely planted. *BROOKS 1972; A74, B4, B19, B43M, B58, C45M, C47, C61, C84, F16, H65, 150, J97M, L79, M99G*

Cumberland: Large, conical fruit; skin glossy black; drupelets large, round, with strong coherence so that the berries do not crumble; flesh firm, juicy, sweet and rich; quality very good; ripens in early midseason. Tall, upright-spreading bush; vigorous; highly productive; susceptible to anthracnose. Introduced in 1896 and still one of the leading cultivars. *HEDRICK 1925; A82, B43M, B73M, B75, C61, E3, F93, G43, 141P, 178, J2M, J83, K75T, L70*

Dundee: Large fruit; skin glossy black, attractive; drupelets small; flesh moderately firm, mildly subacid, of very good flavor and quality; ripens in midseason, somewhat later than Bristol. Tall, vigorous bush; hardy; productive; moderately resistant to mosaic, susceptible to powdery mildew. Introduced in 1927. *BROOKS 1972; G16, H44, 178*

Haut: Medium-sized fruit; flesh firm and cohesive, very sweet, quality excellent; ripens over a longer period than other black raspberry cultivars. Vigorous, high-yielding plant; more productive than Bristol; disease resistant. Widely planted in New Jersey and other Mid-Atlantic states. *D37, F87, 150, M99G*

Jewel: Large fruit; skin glossy black, attractive, slightly woolly; flesh firm, flavorful, of high quality; ripens in early midseason. Bush vigorous and productive; winter hardy; not susceptible to any serious disease, and only slightly susceptible to mildew. Considered an improvement over Bristol. *B19, B43M, B58, C47, C61, F87, G8, G16, G23, H65, 149G, 150, J2M, J61M*

John Robertson: Large, plump fruit; flesh medium firm, juicy, quality very good. Bush productive; one of the hardiest black raspberry cultivars, reliable as far north as Canada. Originated in Hot Springs, South Dakota by John Robertson. Introduced about 1935. *B19, C61, D76, E97*

Lowden: Extremely large fruit; skin dull purplish-black when fully ripe; flesh juicy, sweet, of excellent flavor; canning quality especially good; ripens fairly late. Bush upright, quite vigorous; productive; very winter hardy; resistant to anthracnose. Hybrid of Bristol black and Sodus purple. *BROOKS 1972; G79M, J63M, M65M, N24M*

Mac Black: Medium to large fruit; flavor very good; ripens late. Freezes well. Bush hardy, vigorous and productive; often bears into August, and will occasionally produce fruit on the tips of new canes in September and October. Ideal for extending the harvest season. An older cultivar that is still popular, especially in some colder areas. *F16, F87*

Munger: Fruit variable in size, averaging medium, roundish to roundish conic; drupelets numerous; skin black with a light bloom; flesh firm, strongly coherent, juicy, mild, sweet, of good quality; ripens in late midseason. Vigorous, upright bush; hardy; only moderately productive; susceptible to mildew. Introduced in 1897. *HEDRICK 1925; A91, C15M, K17, M81M*

New Logan: (Logan) Fruit medium to large, glossy; flesh firm, sweet, of very good quality; ripens early, about a week before Cumberland and over a short period of time, making for easier picking. Holds its firmness all season. Bush very productive; hardy; highly resistant to mosaic, susceptible to anthracnose. *B19, C45M> C61, D65, G43, H58, J63M, M65M*

Wyoming: Purplish-black fruit of mild flavor. Makes excellent black jelly or black raspberry pies. Bush quite hardy, heavy yielding. Canes grow very tall and strong and do not sucker. Popular in the Canadian prairie provinces. *B47*

**PURPLE RASPBERRIES (R. x neglectus)**

Amethyst: Large, glossy fruit of good quality; always visible on the stem. Bush very hardy, productive, and resistant to disease. Good midseason cultivar for the Midwest. Developed in Iowa and tested over a twelve-year period. *HENDRICKSON; U7D{S}*

Brandywine: Large, round conic fruit; skin reddish-purple; flesh firm, coherent, tart but of good quality; ripens late. Excellent for jams and jellies. Bush large, erect, to 10 feet; very vigorous; hardy; outproduces red cultivars by 25%. Recommended for the home gardener and the commercial grower. *A82, C61, DI 1M, F70, F87, G43, J89M, N24M*

Estate: Large, round fruit with good sweetness and a naturally distinct raspberry flavor. Ripens late in the season. Very attractive fruit for fresh market and specialty sales. Vigorous, hardy plant with

strong, upright canes. Originated in Minnesota. Has performed well in most northern states. F16

Marion: Fruit large; skin purple; flesh moderately juicy, firm, tart, of good quality; ripens late, one week after Sodus. Bush vigorous, productive; resembles a red raspberry in habit. Popular in the Northeast. Originated in Geneva, New York by Richard Wellington. BROOKS 1972; U7D

Royalty: Large to very large fruit; flesh moderately firm, sweet, dessert quality very good; ripens late. Has a strong raspberry aroma that is preserved in processing. Vigorous bush, not as erect as Brandywine; winter-hardy; productive; resistant to raspberry aphid, the vector of mosaic virus. Excellent for home gardens or pick-your-own operations. B26, B58, C61, C84, F16, G16, G23, H42, H65, I49G, I49M, I50, J2M, J61M, L79, etc.

Sodus: Fruit large to very large; flesh fairly firm, coherent, sprightly, quality good though quite tart; ripens in midseason, shortly after Latham. Bush very vigorous and productive; winter-hardy; resistant to drought; free from mosaic, but susceptible to verticillium wilt. Introduced in 1935. BROOKS 1972; D65

Success: Medium to large fruit; flesh firm, sweet, highly flavored; quality good fresh, excellent for processing; ripens in midseason. Bush erect, grows to 8 feet tall; heavy yielding; winter hardy where temperatures do not go below -20 to -25° R; resistant to spur blight. Originated in Durham, New Hampshire. BROOKS 1972; U7D

#### RED RASPBERRIES

**EVERBEARING** Also called fall-bearing or primocane-bearing raspberries, since they bear on the current season's growth or "primocane". They can begin fruiting after less than a year in the garden, usually requiring no trellising or trimming. Since all canes are removed annually, diseases and pests that overwinter in them are virtually eliminated, and there is never a worry about winter injury.

Amity: Medium-large fruit; very firm flesh of excellent flavor; quality high; ripens 5 days earlier than Heritage; tends to adhere to receptacle. Good for fresh marketing, shipping and freezing. Vigorous, productive plant; canes nearly smooth, 4 1/2 to 5 feet tall. Resistant to root rot, somewhat resistant to mildew. A91, C15M, C54, H88, K17, LI, M81M

August Red: Medium to large fruit; skin crimson red; flavor excellent, sugar content high. Compact, erect bush, growing only to about 3 feet; highly productive; bears earlier than other everbearers; produces an early summer crop on old canes and again in mid-September until freezing weather. Good all purpose cultivar. Reliable in northern areas. Developed by Professor E.M. Meader at the University of New Hampshire. C61, D69, H88

Autumn Bliss: Large, oval-conical fruit; skin very dark red; flesh firm, with a pleasant mild flavor; ripens very early, 14 days earlier than Heritage; fairly easy to pick. Bush a superior yielder to Heritage; resistant to some aphid-transmitted viruses. Canes fairly erect; may be grown without support. Bridges the gap between the late summer cultivars and the fall-bearing cultivars. Originated in East Mailing, England. A74, B43M, B58, B74, C34, D37, D65, F16, F87, G16, I49G, I49M, J2M, K17, L27M, M81M, 081, etc.

Baba:<sup>1</sup> (Bababerry) Very large fruit, up to 1 inch long; flesh very firm; flavor sweet, rich, tapgy, reminiscent of wild raspberries; quality good; ripens in June and again in September and October. Bush extremely vigorous, up to 10 feet in height; spiny. Low chilling requirement; does well in hot, dry areas of southern California; also hardy to 0° F. Discovered in the wild near Idyllwild, California by Mrs. Gertrude Millikan. Introduced in 1979. A63, A88M, C54, D76, E97, F53M, G17, H4, I49M, I53M, 174, 183M, M83

Dinkum: Medium-sized, dark red fruits, slightly more glossy than Autumn Bliss; very firm flesh, flavor excellent; ripens about 3 days earlier than Autumn Bliss. Upright canes; very productive. Has a somewhat shorter ripening season than Autumn Bliss, but higher

yields at each harvest. Easy to harvest. Originated in Toolangi, Australia. BROOKS 1997; C34, K17, M81M

Double Delight: Very attractive, winter hardy everbearer which is relatively early ripening. Small to medium-sized, bright red fruits; firm, sweet-tart flesh. Ripens before Heritage or Redwing. Short, fairly erect plant. Tends to form twin fruits from the same flower, hence the name. Originated in Morden, Manitoba. BROOKS 1997; A65, F87, G54, H42, H85, K64

Durham: Medium-sized fruit; flesh firm, of good flavor; excellent for fresh use and processing; fall crop ripens 2 weeks before the fall crop of Indian Summer. Bush extremely hardy; very vigorous and productive; bears a heavy crop in early summer and again in a few weeks on the new canes. Originated in Durham, New Hampshire by A.F. Yeager. BROOKS 1972; B73M, H88

Fallred: Fruit large, larger than most everbearers; skin red, attractive; flavor very good, quality high; ripens early. Upright, vigorous bush; produces fruit continuously on highly productive primocanes until curtailed by frost; suckers freely; cold-hardy to -25° F. Developed by Professor E.M. Meader at the University of New Hampshire. BROOKS 1972; B19, C61, D65, E97, G79M, H65, H88, J83, K71

Heritage: Medium-sized, conical fruit; skin brilliant red, attractive; flesh very firm, quality excellent; first crop ripens in mid-July, second crop about September 1 at Geneva, New York. Bush tall, grows 5 to 7 feet; very vigorous; hardy; suckers prolifically; sturdy, requiring no support. Excellent for home gardens. BROOKS 1972; A38M{PD}, B43M, C61, C67{E2}, C84, F16, F87, G4, G16, G23, I78, J83, L33

Indian Summer: Fruit large, conic; skin bright red, glossy; flesh very aromatic, sweet; crumbles frequently. Quality good as an autumn fruiting cultivar; also useful for jam. Bush very productive; vigorous; hardy; escapes mosaic infection; produces a first crop in July and a second from September to the first hard frost. One of the oldest everbearers still in cultivation. BROOKS 1972; A88M, B19, C45M, C54, C61, F53M, G71

Nordic: Medium-sized fruit, firmer than Boyne, with tougher skin; ripens 14 days after Heritage. Bush very productive; extremely hardy; appears to have more resistance to fungal diseases and aphids than Boyne. Bears a fall crop too late for some northern areas. Good summer producer if primocane production is poor. Boyne x Fallred. Originated at the University of Minnesota. A74, F87, L27M

Oregon 10-30:<sup>1</sup> (California) Unique, continual-bearing raspberry, producing fruit from May through late November. Medium-sized fruit of very good quality. Bears fruit on new wood of current season's canes. Formal trellising system not required but some support is helpful. No chilling or heat units required for high quality fruit. D57, I83M

Red River: Medium-sized, glossy red fruits; good sweet-tart flavor; ripens earlier than either Heritage or Redwing. Recommended for fresh market. Short, stout canes that may require trellising if cropping is very heavy. Winter hardy in harsh prairie climates. Originated in Morden, Manitoba. Introduced in 1993. A65, B47, H42, H85, K64, L79

Redwing: Fruit slightly larger and somewhat softer than Heritage; dessert quality superior to Fallred; ripens 10 to 14 days earlier than Heritage. Outyields Fallred and Heritage. More heat resistant than Heritage, having performed well as far south as Georgia. Heritage x Fallred. Released by the University of Minnesota. A74, B4, D65, D76, F16, F87, I49G, J89M, K17, L27M, L70

Rossana: Highly regarded new raspberry with superb flavor. Medium-sized, conic, bright red fruit; not as firm as Heritage; ripens 3 to 4 weeks later than Heritage in Minnesota. Productive plant, about 5 feet tall; primocane fruiting. Hardy to USDA Zone 4. Somewhat resistant to rot. Originated in Torino, Italy. BROOKS 1997; F87, I49M, J61M

Ruby: Very large, conical fruit, up to 50% larger than Heritage; skin bright red; flesh firm, flavor slightly milder than Heritage; does not darken like Heritage; holds very well after picking. Not recommended for pick-your-own. Moderately vigorous plant; productive; highly susceptible to phytophthora root rot. Heritage x Titan. F87, 150, K17, L33

September: Medium to large fruit; skin bright red, attractive; flesh firm, coherent, juicy, sweet, of high dessert quality. Summer crop as early as that of Indian Summer, or about 5 days earlier than Newburgh; fall crop matures 2 to 4 weeks before that of Indian Summer. Bush vigorous; a reliable and heavy bearer; handy. BROOKS 1972; A88M, C45M, C47, C54, C61, E97, G43, G79M, H88, J63M, K75T

Southland: Medium-sized fruit, symmetrical and cone-shaped; skin light red, does not darken upon maturity; flesh firm, does not crumble; flavor slightly acid with good dessert quality; ripens early, 2 to 3 days after Sunrise, also produces a substantial crop in early or mid-August. Bush moderately vigorous; highly disease resistant. BROOKS 1972; C47, F93, K75T, L47, M83

Summit: Medium-sized, conical fruit; skin dark red, slightly darker than Heritage; flesh firm, of excellent flavor; ripens 10 days earlier than Heritage, ships well. Bush considerably less spiny than Heritage; does quite well in heavier soils; resists root rot. Introduced in 1988. C15M, F87, H88, 150, J61M, K17, L18, M81M

**SUMMER-BEARING** These bear fruit on "floricanes", or primocanes that have overwintered. They are susceptible to insects and diseases that overwinter in them, and also to winter cold damage. Most are limited to northern areas because the floricanes require a period of winter chilling to break dormancy.

Anelma: (*R. arcticus* x *R. idaeus*) Large, spherical fruit, about 3/4 inch long; skin highly colored; flesh very firm, very sweet, of good quality; ripens about a week after Boyne, fruits continuously throughout the summer. Bush spreading; very large and vigorous; very hardy. Canes nearly smooth. Originated in Piikkio, Finland. BROOKS 1972; U7D

Boyne: Medium-sized fruit; skin dark red, tending to become somewhat purplish-red when over-ripe, medium glossy; drupelets medium to small, cohering firmly; flesh tender, juicy, flavor aromatic, sprightly, moderately acid, superior to Latham in flavor but not as sweet as Chief. Especially adapted to home gardens and local markets. Bush moderately vigorous; very productive. BROOKS 1972; A16, A91, B26, B43M, B47, C61, D65, F67, F87, G16, G54, H42, 150, 178, K64, L79, etc.

Canby:<sup>2</sup> (Wonder Thornless) Fruit large, almost equalling Willamette; skin light bright red; flesh fairly firm, sweet, flavor mild; ripens in midseason, with Willamette. Bush very hardy; canes tall, straight, virtually thornless; highly productive; very hardy; immune to aphid, resistant to virus; susceptible to heavy soils. BROOKS 1972; B73M, C61, C76M, D65, E3, E97, F87, H49, H88, 150, 178, M81M

Chief: Small to medium fruit; skin cherry red; drupelets medium-sized; flesh very firm, juicy, very sweet, flavor and quality good; ripens early. Excellent for freezing. Bush very winter-hardy, vigorous. Originated in Excelsior, Minnesota. Introduced in 1930. BROOKS 1972; A16, B47, J89M

Chilcotin: Medium-sized, conic, glossy light red fruits; moderately firm. Flavor very good, recommended for fresh market. Ripens early and over a very long season. Moderately vigorous, productive plants. Moderately winter hardy in the Pacific Northwest. Originated in Vancouver, British Columbia. H88, J63M, K17, M81M

Chilliwack: Fruit large to very large; skin bright red, glossy; flesh firm, very sweet, of excellent flavor; quality exceptionally high; ripens over a short season in July; keeps well. Bush very productive; resistant to root rot, thriving on wetter sites where most others fail.

Originated in Vancouver, British Columbia, Canada. C15M, F16, J61M, K17, ZJS

Citadel: An older cultivar becoming popular once again. Very large, dark-red fruits; very firm flesh, good flavor; resembles Willamette. Ripens in late midseason. Extremely vigorous plant; highly resistant to leaf spot disease. Recommended for U-Pick operations because the fruits are easy to harvest. Originated in College Park, Maryland. B43M, D37, F16, F87

Cuthbert: (*R. strigosus*) Medium to large, conical fruit; skin dull dark red, with a heavy bloom; flesh juicy, moderately firm, aromatic, sweet and rich, of very good quality; ripens late, season long. Bush tall, vigorous, upright-spreading; not very productive; widely adapted to soils and climate; very susceptible to leaf curl and mosaic. Originated in New York City by Thomas Cuthbert, about 1865. Once the most widely grown red raspberry in North America. HEDRICK 1925; U7D

Dormanred:<sup>1</sup> (*R. parvifolius* x) Large, round fruit; skin light red, glossy; flesh very firm, flavor slightly reminiscent of mulberries; ripens very late. Has the habit of blackberries, and must be trellised; produces vines that grow 15 to 20 feet per season. Low chilling requirement; does well in Florida and other southern states; also survives the winter in St. Paul, Minnesota with snow cover. B19, B43M, B45M, C30M, F93, G8, 153M, K75T, L33, M83, N33

Hilton: Large to very large, long-conic fruit; skin medium red, darkens quickly, very attractive; flesh moderately firm, thick, quality fair to good; cavity small; clings to plant until fully ripe; ripens in midseason. Bush compact, vigorous; very productive; hardy. BROOKS 1972; C45M, C61, D76, H88, J63M, J89M

Killarney: Fruit somewhat larger than Latham; skin bright medium red, very attractive; flesh firm, sweet, flavor sprightly pleasant, excellent for dessert; good frozen or canned; ripens about a week after Boyne, and has a more prolonged harvesting season. Bush very hardy and productive. BROOKS 1972; B47, D69, F87, H65, H88, I49G, 150, J2M, L27M

Latham: Fruit large, frequently 1 inch in diameter, roundish; skin bright red, attractive; flesh firm, but often crumbly, moderately juicy, sprightly; season medium to late, ripening over a long period; quality superior for canning and freezing. Bush vigorous and productive; very handy. Standard cultivar in the East. Introduced in 1920. BROOKS 1972; B43M, B58, B73M, C61, G16, G23, G71, H42, 149G, 150, 178, J63M, J83, M65M

Madawaska: Medium-large fruit; skin medium dark-red; flesh moderately firm, with some tendency to crumble, quality fair; ripens early. Tends to be acid and dark when canned or frozen. Bush hardy; very winter-hardy; productive; canes moderately spiny. Originated in Ottawa, Ontario, Canada. BROOKS 1972; B73M, D11M, E3, F70, G50, H88, 178

Mammoth Red:<sup>2</sup> (Mammoth Red Thornless) Very large fruit, up to 1 inch long, conical; flesh soft, juicy, aromatic, sweet, highly flavorful. Very good fresh or in jams. Ripens in *My*. Bush very vigorous, up to 8 feet tall; winter-hardy; highly productive; canes thornless. B19, B75, C61, D76, E97, K89

Meeker: Very large fruit; skin bright red; flesh firm, flavor good; very good for freezing and jam. Bush very tall; vigorous; very productive; somewhat resistant to botrytis fruit rot; requires well-drained soil and mild winters. Excellent for home garden and local market use; also ships well. BROOKS 1972; C15M, C34, 149M, K17, L18, M81M, P68M

Newburgh: Large, attractive fruit; skin bright red; flesh fairly firm; dessert quality fair to good; keeping and shipping quality very good; does not process well; ripens 3 to 4 days before Latham. Bush productive; very resistant to root rot; widely adapted, being grown in the Northeastern states and the Pacific Northwest. BROOKS 1972; B19, C54, C61, H88

Nova: Medium to large-sized fruit; skin dark red; flesh firm, of very good flavor, will freeze well; ripens in midseason. Bush vigorous; winter-hardy; productive; exceptional in that it has shown complete immunity to late yellow rust. Bears a small fall crop. Originated in Kentville, Nova Scotia. B26, B43M, B75, C58, F1, F16, F87,149G

Reveille: Very large fruit; skin bright red; flesh of excellent quality; ripens early, with Sunrise. Bush upright, vigorous; productive; suckers freely; very winter-hardy; highly resistant to fluctuating winter temperature injury. Recommended for home gardens, roadside sales and pick-your-own operations. BROOKS 1972; B58, C85M, 150

San Diego: Dual-season raspberry, bearing spring and fall crops on 1 year-old canes and primocanes. Medium-sized fruit of very high quality. Vine needs traditional trellising and pruning. Requires less than 100 hours of chilling. Does very well along the coast or inland in California. U7D

Skeena: Fruit medium to large, conical; skin bright red; flesh firm, of good quality; ripens in late June in most areas. Bush high-yielding; one of the hardiest cultivars; requires excellent drainage; resistant to mosaic virus. Sturdy, upright canes are moderately spiny. Originated in Vancouver, British Columbia, Canada. H88, K17

Sunrise: Fruit large; skin bright red; flesh firm, flavor and quality excellent, does not crumble; matures very early, nearly 2 weeks before Latham and over a long period of time. Bush very hardy; resistant to leaf spot and anthracnose. Originated in Glen Dale, Maryland by George M. Darrew. Introduced in 1939. BROOKS 1972; A82

Taylor: Very large, long-conic fruit; skin bright red, attractive; flesh firm, flavor and quality very high, does not crumble; excellent for freezing; ripens midseason to late, with Latham. Bush vigorous and productive; more subject to mosaic than Newbuigh. Well adapted to all northeastern states. Introduced in 1925. BROOKS 1972; C76M, D69, H65, H88,150, K71, N24M

Titan: Large to very large, long-conic fruit; skin bright red; flesh moderately firm, dessert quality average to good; ripens early and over a prolonged season. Bush highly productive; winter-hardy to -15° F.; resistant to mosaic virus. Canes stout, nearly spineless, require trellising. Suckering is light to medium, resulting in a well-spaced row. B58, D76,150, L33

Tulameen: Very large, long-conic, glossy medium red fruits; firm, aromatic flesh with good flavor. Begins ripening with Meeker, but has a longer season, into July and August. Suitable for fresh market and processing. Vigorous, very productive plant; moderately winter hardy in the Pacific Northwest. Originated in Vancouver, British Columbia. C15M, F16, F87,150, J2M, J61M, K17, L18, M81M, M99G

Willamette: Very large, nearly round fruit; skin dark red; flesh very firm, slightly acid, but lacks an intense raspberry flavor; flavor good for canning, fair for freezing; excellent for shipping; ripens in midseason, with Canty. Bush vigorous; very productive. Grown extensively in Oregon and Washington. BROOKS 1972; A88M, C54, C61G{PD}, F53M, J61M, K17, L1, L18, M81M, P68M

#### YELLOW RASPBERRIES

##### EVERBEARING

Fallgold: Similar to Fallred, except for the color. Large, round fruit; skin golden yellow; flesh juicy, moderately firm, extremely sweet; ripens in late summer, with harvesting continuing into autumn. Bush moderately vigorous; high yielding; very winter-hardy. Good specialty market item. Developed by Professor E.M. Meader. A91, B43M, C61, D65, G8, G23, G43, H42, H58, H65, K89, L33, L79

Golden Harvest: Medium-large bright yellow fruits. Good flavor and quality. Vigorous, consistently productive plants. Resistant to virus diseases. Sturdy canes that sucker prolifically. Attractive in fall and winter, the canes having an appealing maroon color. Introduced by Makielski Berry Nursery. D37, F16

Golden Summit: Recently discovered golden mutation of the high quality Summit cultivar. Has the potential to become a new standard in golden raspberries. Attractive golden-colored fruit with qualities similar to Summit. Production and overall performance comparable to Summit. J61M

Goldie: (Graton Gold) Primocane fruiting sport of Heritage with superb quality. Medium-sized fruits. Unique golden color, deeper yellow than other yellow-fruited raspberries. Comparable to Heritage in firmness and flavor. Yields a heavier fall crop. Originated in Sonoma County, California. Introduced by Nourse Farms. B75, D11M, D69, F70, G16,150, J20

Kiwigold: Yellow-fruited sport of Heritage. Medium-sized, conic, firm yellow fruits; sweet and flavorful, quality excellent; ripens with Heritage. Vigorous, erect, sturdy primocanes; spicier than Heritage. Recommended for fresh markets and home gardens. Originated in Murrinsville, New Zealand. Introduced by Nourse Farms. BROOKS 1997; I49M, 150

##### SUMMER-BEARING

Amber: Large, long-conic fruit; skin amber; flesh tender, sweet, flavor good, quality very good; ripens in midseason. Bush very vigorous; hardy; productive once established. Originated in Geneva, New York by George L. Slate. Introduced in 1950; intended for home use, not considered of commercial value. BROOKS 1972, HENDRICKSON; B73M, H88

Golden Queen: Medium-sized fruit; skin light yellow, sometimes tinged with pink; flesh soft, sweet, delicately flavored, of very high quality. Excellent for home gardens and local markets. Bush hardy; very susceptible to mosaic; foliage tender, easily injured by strong winds. Originated in Berlin, New Jersey in 1882. Said to be a sport of Cuthbert. HEDRICK 1925; B19, C61

Honey Queen: Medium-sized fruit; skin amber; flesh very juicy, flavor mild, sweet, distinct, aromatic; seeds few; makes excellent jam. Bush vigorous; high yielding; very winter-hardy; produces well on natural rainfall amounts. Adapted to Canadian prairie states. Originated in Alberta, Canada by Robert Erskine. B47, B58, F67, F87, G54, H85, J89M, L27M, M35M

##### CODES FOR SPECIAL TYPES

1. Low-Chill
2. Thornless

## RHUBARB {PL}

##### RHEUM RHABARBARUM

Canada Red: (Canadian Red) Long, thick stalks; exterior dark-red from top to bottom; interior strawberry-red; does not lose its color in cooking. Juicy and sweet; needs less sugar. Very tender, never becomes tough or stringy; skin tender, needs no peeling. Highly productive; stalks can be pulled all summer. Developed in Winnipeg, Canada. A16, A91, B4, C61, D65, G16, G43, G71, H44, J63M, K64, L27M

Cherry Red: Large, well-colored stalks; rich cherry-red on outside of stalk, greenish inside; very tart, juicy and tender; has a good blend of tartness and sweetness; holds its quality well. Easy to process. Heavy yielding. Suited for mild-winter areas. A65, DI 1M, E13G{PR}, E97, F70,191, K64

Chipman's Canada Red: Large, thick stalks; rich cherry-red all the way through to the core; flesh tender, sweet and juicy; does not lose its color in cooking; good texture. Hardy, vigorous grower. Very heavy yielding. Seldom seeds so it must be propagated by root division. A74, D76, E97, G89M, H88, J83

Crimson Cherry: Bright crimson stalks, up to 2 feet long; red through to the core; keeps its color when cooked. Requires no peeling. Full, rich flavor with a good blend of sweetness and tartness. Reliable producer of heavy crops. H42, M81M

Crimson Red: Tall, thick, bright red stalks; red inside and out; free of fiber; very good flavor, sweet yet agreeably tart. Makes a rich red pie. Well-adapted to all areas. Disease resistant and cold hardy. A consistent producer of large stalks. Widely grown commercially. D76, E97, F35M, J99G

Early Red: Very sweet variety with lots of flavor. Easily grown from seed. Usually sown from April to June. Also suitable for gently forcing in a greenhouse or tunnel for an early crop. Should only be harvested sparingly the first year after transplanting. Introduced by Unwins of England. G53M{S}

German Wine: Large, deep-red stalks; thick yet tender; rich in natural sugars; full of the sweetness of a late-harvested wine grape. Winter hardy; vigorous and productive; will produce crops each spring for years. C85M, E33, F1

Glaskin's Perpetual:<sup>1</sup> {S} Greenish stalks of excellent flavor, never become bitter as they mature. Has the lowest oxalic acid content of any rhubarb. Can be pulled the first year from an early spring sowing. The only rhubarb that can be harvested late in the season as the oxalic acid content remains low. B49, L89, L91M, N84, O53M, R32, S55

Holstein Blood Red: (Holstein Red) Vigorous in growth, with erect, thick red to green stalks of excellent quality. Easy to grow. Sow when soil is warm (May-June); ready for harvesting the following summer. N81, P68M

Honeyred: An excellent rhubarb which produces rich, red stalks that are free of the usual stringiness of other cultivars. It requires less sugar than other sorts when used for fruit or desserts. Vigorous, extremely productive plants. Developed by Honeywood Lilies & Nursery. F67, H42, L79

MacDonald: (MacDonald's Canadian Red) Large, tender stalks; deep red inside and out; no peeling needed; lends a deep pink hue to sauces and pies. Extremely vigorous and upright-growing; resistant to wilt and root rot. Excellent production for commercial growers and home gardeners. Developed at MacDonald College, Quebec, Canada. A65, B47, B75, C58, D69, F13, G43, G54, L50, J20, K64, L27M, M99G

Ruby Red: Long, thick, deep red stalks; tender and juicy with a good sweet-tart flavor. Tall plant, very vigorous and erect growing. Popular in Texas where it is usually grown as an annual. Normally planted in February and March. Harvested throughout the month of June. M83

Starkrimson: Tall, moderately thick, bright crimson stalks; red through to the core. Very tender and sweet, contains less acid than most varieties. Ready for harvesting in May. Makes delicious rich red pies. Starkrimson is a registered trademark of Stark Brothers Nurseries & Orchards. L33

Strawberry: (Strawberry Red) Stalks of good size on mature plants; both the interior and exterior rose-red in color. Flavor mild and pleasing. Never becomes tough or stringy. Do not remove the tender skin; it cooks up well with the stalk. M81M

Tilden: (Tilden's Canada Red) A strain of Canada Red that has been selected for many years by the Tilden family for its fine red color. Not as upright in growth habit or as tall as the MacDonald strain, but the stalks are thick and attractive. B26, L50

Timperley Early: The earliest cultivar and the most rapid forcer. Can be forced to be ready for Christmas and pulled outdoors even in February in mild climates. Rather thin, bright-red stalks; green-fleshed. First raised prior to 1945 by H. Marshland. PHILLIPS; O81

Valentine: Attractive, thick, red stalks; 18 to 24 inches long, 1 to 1 1/2 inches in diameter; flesh deep-red, fine-grained, tender, juicy, very sweet; flavor pleasing; holds up well and does not lose its color during cooking; relatively little sugar required. Heavy yielding and precocious. Excellent for home gardeners. Thrives in areas where winters are cold enough to freeze the ground 3 to 4 inches deep. B6, B47, B75, E97, F16, G16, G43, H49, H65, L78, K89, L27M

Victoria: (Giant Victoria, Myatt's Victoria) Leaf-stalks very large, up to 3 inches at their broadest diameter, 2 1/2 to 3 feet long, up to 2 pounds per stalk; greenish, stained with red; skin rather thick; meat green, tender, not quite as sweet as other cultivars. Extremely heavy producer; excellent for commercial purposes. Reliably hardy. Introduced prior to 1852. BURR, VILMORIN; C85M{S}, D11M{S}, E38{S}, F70{S}, G57M, G71{S}, J63M, M65M, R47{S}

#### CODES FOR SPECIAL TYPES

##### 1. Low Oxalic Acid

## RICE {DF}

### ORYZA SATIVA

#### GLUTINOUS RICE

Also known as *sweet rice*, *sticky rice* or *waxy rice*. Very high in amylopectin, a waxy starch which causes the grains to form a sticky mass when cooked. Does not contain gluten. Soaked in cold water and then steamed, rather than boiled like other rice. Frequently made into desserts which are wrapped in banana leaves. Both long and short grain as well as white and brown (whole grain) types are available. A7, C34G, E56, E60P, F88, G47B, I8M, L16M

Calmochi-101: Short grain, waxy endosperm rice, often used for making sticky *mochi* rice cakes. Larger seed size and superior cooking qualities. Very early maturing. Semi-dwarf plants with excellent seedling vigor; photoperiod insensitive. Developed by the California Cooperative Rice Research Foundation, Biggs, California. Introduced in 1985. U8M{S}

Indonesian Black: (Black) Sweet, sticky rice with a somewhat fruity aroma reminiscent of blackberry jam. Long, black or brownish-black grains; distinctive, nutty flavor similar to wild rice. Excellent for making uniquely-colored mochi, pudding and other desserts. Often combined with coconut milk and palm sugar. Popular in Southeast Asia. GRIGSON, S. [Re], PASSMORE, YOONG [Re]; A7, E56, E60P

Thai Purple: (Purple) Long, purplish-black grain reminiscent of wild rice; rich, earthy, distinctive flavor. Turns an attractive, reddish-purple color when cooked, staining other ingredients. Ideal for classic Thai desserts or as a savory side dish. Often combined with coconut milk and pandanus leaf. Usually available in Oriental stores. A7, A90M, D93M, F86T, H73, L16M

#### NON-GLUTINOUS RICE

Includes the familiar long-grain, pilaf rices which cook up fluffy and separate, as well as short and medium grain types such as Japanese sushi rices, Italian risotto rices, and Spanish paella rices. More translucent and easier to digest than glutinous rice. Indica and Javanica rices, originating in India and Southeast Asia, are generally long-grained. Japonica rices, introduced into Japan from China, are mostly short-grained. ZEVEN.

Akitakomachi: Japanese short-grain sushi rice of premium quality. Short, roundish grain. Cooks up very glossy and sticky with a

smooth texture. Remains soft even after cooling. Also highly regarded for its aroma and flavor. Lodges badly and is much less productive than similar California varieties. However, California acreage continues to increase due to higher market prices. Developed by Akita Prefectural Agricultural Experiment Station. F86T

Ambar: (Ambar-Boo) Rare, very expensive Middle Eastern rice. Refined, slender, extra long grains, pointed at both ends; unbroken and pleasantly firm to the touch; attractive pale-golden translucence; very strong, appealing fragrance. Cooks up white, fluffy and quite separate, the grains becoming even longer. Highly esteemed in Iran and Iraq. MOJTAHEDI, SHAIDA; U8M{S}

Arborio: Classic Italian risotto rice of the *superfino* grade. Medium-sized, plump grains; high in amylopectin. Absorbs liquid well without breaking or becoming musty. Cooks up creamy and rich, the inner opaque core remaining slightly chewy or al dente. Traditionally not rinsed before cooking. Grows 3 1/2 feet tall. Raised commercially in the Po River aiea. Available in white or brown (whole grain) forms. A7, A90M, B71G, C34G, C94M, D93M, E56, E60P, H7G, H15T, H86, 194, L16M, L99, M56M, N54, etc.

Balam: Famous rice from the Barisal district of what is now Bangladesh. Very popular in Bengal where it is one of the most flavorful and longest-grained varieties of *siddha* or parboiled rice. Keeps better and is more nutritious than *atap* rice. Becoming somewhat rare. BANERJI; U8M{S}

Baldo: New, short-grain, *superfino* rice from Turkey. Has a quicker cooking time than other *superfino* varieties, which usually need 18 to 20 minutes. Favored by restaurant chefs due to its versatility. Suitable for risottos, soups, salads, stuffings, and even desserts such as rice pudding. A7,194, M56M

Basmati: Famous long-grain, aromatic rice of Pakistan and northern India. Prized for its very long grains, delicate bouquet, and buttery, nut-like flavor. Slender grains which elongate and often curl when cooked. Traditionally washed and soaked before use. Usually aged from 6 months to 2 years to enhance flavor, fragrance and cooking qualities. The aroma is said to resemble that of *Madhuca longifolia* flowers. DEVI, GRIST; A7, C34G, C94M, D26M{PD}, D93M, E47M, E60P, F74, H15T, H91,176T, L16M, L24G, L50M, L99, etc.

Bhutanese Red: Short-grain, semi-glutinous rice grown at 8,000 feet in the Paio Valley of the Himalayan kingdom of Bhutan. Irrigated with 1,000-year-old glacier water. Attractive, salmon-pink color; mild, earthy, nutty flavor; very soft texture. Lightly milled, cooks in only 20 minutes. Suitable for pilafs, soups, salads, risottos and puddings. Very popular with gourmet chefs. A7, E56, H3T

Black Japonica: Grows together in fields as a blend of short grain black rice and medium grain mahogany rice, forming a unique black and brown mixture. Nutty, mushroom-like flavor with a subtle, sweet spiciness; chewy texture. Well suited to stir fries, stuffings, side dishes and casseroles. Developed by Lundberg Family Farms from seeds originating in Japan. A7, A90M, C73P, E60P, F86T, H7G, J11M, L16M

Bomba: Rare, traditional, Spanish paella rice. Had fallen into disuse as it is difficult to grow and the yield is decidedly low. Being grown commercially again due to demand from restaurants in Spain because it makes a perfect paella. Small, round, flavorful grains which are extremely absorbent but remain firm and separate. Widely grown in Calasparra. DOMINE, FERGUSON [Re]; L13P

Cal Riso: The first large grain, Mediterranean-type Japonica rice originating in California. Resembles Italian and Spanish risotto and paella rices, but the kernel is whiter and has a higher starch content. Delicate, soft flavor; very creamy texture. Excellent for rice puddings and *torta di riso*. Selected from a complex breeding line developed at the Rice Experiment Station in Biggs, California. C60D, H3T, M63M

Calasparra: Famous Spanish paella rice of superb quality. Medium-sized, plump grains; excellent, robust flavor; firm texture. Cooks up slightly sticky yet dry. Makes a perfect paella. Grown near the town of Calasparra, on the upper reaches of the River Segura northwest of Murcia. The only controlled denomination of origin rice in Europe. DOMINE, FERGUSON [Re]; N54

California Basmati: (A-301) Long-grain, aromatic rice with the fragrance of Indian Basmati, but no elongation. Does not cook up as flaky as typical southern U.S.A. long-grain rices. Excellent in pilafs, salads, stir-fries and stuffings. Available in both white or brown (whole grain) forms. Developed by the California Cooperative Rice Research foundation. Introduced in 1987. H7G

California Jasmine: (A-201) Long-grain, aromatic rice with a nutty or popcorn-like fragrance when cooked. Cooks up softer, drier and less fluffy than typical non-aromatic long-grain rices. Does not elongate into a very long, slender grain when cooked, as Basmati does. Developed by the California Cooperative Rice Research Foundation. H7G

Calrose: Market class of conventional California medium-grain rices. Cooks up soft and sticky, but does not have the glossiness and smooth texture of Kokuho Rose, M-401, Akitakomachi, and Koshihikari. The original Calrose, developed in 1948, is no longer grown. Currently the cultivars M-201, M-202, and M-204 yield most of the Calrose rice, and account for 85% of rice acreage in California. C27G

Camargue Red: Premium whole-grain rice often grown by organic methods. Plump, oval, medium-sized grains; attractive, reddish-brown color. Cooks up slightly sticky, firm and chewy. Subtle, earthy flavor. Excellent with game, duck or goose. Spontaneous mutation originating in the Camargue region of southern France. FERGUSON [Cui, Re]; L24G

Carnaroli: Highest quality Italian rice. Has the best balance between absorption and starch loss during cooking of any rice. Also notable for having the largest kernel of the Italian grown Japonica or medium-grain rices. Makes the creamiest risotto. Classified as a *superfino* rice, a kernel size descriptor. Increases in volume and length during cooking. Fairly recent hybrid of Vialone and Lencino, two older cultivars. B71G, C60D, 194, L99, M56M, N54

Carolina Gold: Fabled long-grain rice of the South Carolina Low Country. Produces a snowy white, dry, velvety rice, with every grain separate. Excellent for pilaf and related dishes. Very attractive, delicate seed, ripening in the field to a spectacular sea of molten gold. Highly esteemed and famous throughout the world in the 19th Century. Reportedly the chosen rice of the emperors of China. Recently reintroduced to the trade by Richard and Patricia Schultz. HESS, SMITH, C; F68P

Chinese Black: (Forbidden) Distinctive, medium-grain black rice from China. Non-glutinous, unlike most other black rice from Asia. Plump, glossy black grains; delicious, slightly fruity flavor; soft texture; cooks up separate. Turns an attractive, deep, rich-purple color when cooked. An ancient grain that was offered as a tribute to the Chinese Emperors during the Tang Dynasty. E56, F86T, H3T

Colusari Red: Short-grain, Asian Japonica type rice. Plump, very attractive, translucent grains. Deep, rich, burgundy color, both before and after cooking. Delicious, nutty flavor; chewy texture reminiscent of wild rice. Pleasant, faint aroma while cooking. Excellent blended with long-grain rice and other grains. E56, F86T

Della: (Popcorn, Wild Pecan) Short-season, long-grain, Basmati-type hybrid developed for the specialty trade. Distinctive, subtle, nutty flavor and aroma reminiscent of roasted popcorn or wild pecans. Cooks up dry and flaky into separate grains with a smooth, even texture. Originated at the Rice Experiment Station in Crowley, Louisiana. Introduced in 1971. A7, B23P, C34G, E38M, G39M, H15T, I8M, I34J, I63T, J58

Dom Siah: (Black-Tailed) Excellent Basmati type rice. One of the most desirable of the traditional Iranian rices. Very long-grained, aromatic, hard, and with a creamy transparency. Most commonly used for festivals and entertainment. Not very productive. Occasionally available at Persian or Indian stores. SHAIDA [Re]; U8M{S}

Gerdeh: 140-150 days. Plump, short-grained, nearly round rice; easily milled; soft, very starchy. Mostly used for puddings, soups, stews, stuffings and *kofteh* (meatballs). Somewhat of a shy bearer. One of the three main types of rice traditionally grown in Iran. MOJTAHEDI, SHAIDA; U8M{S}

Gobindabhog: (Kala Jeera) Tiny, fragrant, Basmati-like rice from India and Bangladesh. Prized for its delicate aroma, flavor and texture. Cooks in only 10 minutes. Traditionally reserved for *pullao* and *payesh*, a rice pudding. Classified as an *atap* rice, i.e. one which has not been parboiled. Sometimes known as "baby Basmati". The Indian name translates as "rice for God". BANERJI [Re], KIRCHNER; A7, E56, H3T

Golden Rose: 120 days. Multipurpose, medium-sized grain; shorter and more cohesive than long grain types. Excellent in baked goods or whole grain casseroles and desserts. Highly esteemed in macrobiotic cuisine. Bred for whole grain brown rice flour. Developed by Lundberg Family Farms. G44M, H7G, H91, I19M, L3J{S}, L24G

Himalayan Red: Traditional red rice grown in the foothills of the Himalayan Mountains. Has been grown there for thousands of years. Medium to long, unmilled grains; firm, chewy texture. Retains its attractive, reddish hues when cooked. Still prized locally for its unique flavor and nutritional properties. Seldom available commercially due to low yields. BALLENTINE; D93M, F86T, H73

Jasmati: American jasmine-type rice developed by RiceTec. Has the same sweet aroma and subtle, nutty flavor. Cooks up snowy white, separate, very soft and tender. Suitable for a wide range of Oriental dishes. Short-straw, early-season rice adapted to the climate of the southern United States. A90M, G47F, H15T, J80M, L99

Jasmine: High-quality, long-grain, aromatic rice from Thailand. Slender, pointed grains with a unique, delicate fragrance. Said to be as fragrant as jasmine, hence the name. Cooks up fluffy and separate, although somewhat stickier than Basmati. For best flavor and texture, steaming is recommended. Sometimes sold as "Thai Fragrant Rice", especially in England. LOHA-UNCHIT [Pre, Re]; A7, A7M, A90M, C34G, C60D, D93M, E56, H3T, H15T, H73, I8M, I76T, L16M, M63M

Kasmati: New Basmati-type rice developed by RiceTec. When aged, the quality is very similar to Basmati. Long, slender grains with an exotic aroma and delicious flavor. Does not require rinsing. Cooks up fluffy and separate. Unlike Texmati, the grains elongate significantly after cooking. Excellent in curries and pilafs. Early-season, short-straw rice adapted to the U.S. climate. G47F, J80M

Kokuho Rose: Japanese medium-grain sushi rice of premium quality. Preferred by some connoisseurs over all others of this type, including varieties from Japan. Short, plump, oval grains. Cooks up firm yet tender, and moist enough to be picked up with chopsticks. Most desirable as "new rice" or *shinmai*, available in October and November. Developed in 1948 by the Koda brothers of South Dos Palos, California. COST 1988, TSUJI [Cui, Re]; G20M, L16M

Koshihikari: Japanese short-grain sushi rice of exceptional quality. Most often rated as the highest quality rice by the Japanese. Grain and cooking characteristics similar to Akitakomachi. Lodges badly and is much less productive than standard California varieties but commands premium prices. Somewhat later maturing than Akitakomachi. Introduced into California by the Rice Experiment Station. N49M

M-101: 120 days. Plants average 3 feet tall and produce good yields (5 lbs./100 sq. ft.). Easy to grow as upland rice; requires less water than com; has shown no insect or disease problems. California-type,

medium grain rice of the same quality as commercial brown rice. Grows from Albany, Nov York south to Florida. Requires dehussing prior to cooking. Dehussing equipment for small-scale growers is being investigated. L7M{S}

M-401: (Nishiki, Tamaki) Medium-grain sushi rice of premium quality. Grain and cooking characteristics similar to Kokuho Rose. Preferred by Japanese and Koreans as a table rice, and often used for sushi. Semi-dwarf rice with excellent yield potential, superior agronomically to Kokuho Rose. Matures late. Developed by the California Cooperative Rice Research Foundation, Biggs, California. G20M, I76T

Richvale Red: Short grain, red rice. Has some of the cohesiveness typical of short grain rice, but is characterized by its distinctive, musky flavor, almost mushroom-like. Well-suited for gourmet dishes such as casseroles, soups, side dishes and entrees, especially where a stickier texture is desired. Developed from Asian rices by Lundberg Family Farms. Used in their blend called Christmas rice. A90M, H7G, J11M

Rose Matta: Unique, medium-grained, rose-tinted rice. Peculiar, slightly smoky aroma and flavor; distinctive, mealy texture. The everyday rice of villagers in Kerala, Madras and other parts of south India. Becoming popular in the West with those seeking lightly milled, more nutritious rices. Occasionally available at ethnic and specialty stores. A7

Royal: Exotic, long grain, aromatic rice developed from Indian seed by Lundberg Family Farms. Resembles Basmati rice in fragrance and taste. Produces a fluffy rice, with each grain remaining separate after cooking. Excellent for making rice salads. Also good in soups and entrees. A90M, E60P, H7G, J11M

Texmati: Aromatic, Basmati-like rice grown in Texas. Long, slender grains; mild, nutty flavor and aroma. Cooks up light and fluffy. Does not elongate as much as Basmati when cooked. Washing or soaking before cooking is not required. Excellent in pilafs. Available in both white and brown (whole grain) forms. Originally marketed as "Ibpcorn Rice". A90M, G47F, H15T, J11M, J80M, L99

Vialone Nano: Medium-grain risotto rice from the Vento and Manatoba region of Italy. Roundish grain, shorter and plumper than Arborio; holds twice its weight in liquid, creating a very hearty, soupy risotto. Cooks in 16 minutes. Excellent paired with fish and other seafood. Classified as a *fino* rice. B71G, 194, L99, M56M

Wehani: Long grain, aromatic, mahogany-colored rice. Distinctive, hearty flavor and nutty aroma; chewy texture. Cooks up fluffy and separate, with split kernels reminiscent of wild rice. Suitable for stuffings, salads, side dishes, entrees, pilafs and some desserts. Developed by Harlan Lundberg of Lundberg Family Farms from Indian Basmati-type seed. COLE, C. 1991 [Re], SASS; A90M, E56, E60P, H7G, H91, J11M, L16M

---

## ROOTSTOCKS {GR}

### VARIOUS GENERA

---

#### ALMOND ROOTSTOCKS

Titan: Seedlings will produce sweet, intermediate flavored and bitter kernels. Mainly used as a parent to produce almond x peach hybrids. Selections from these hybrids are then used as rootstocks for superior almond cultivars. Trees grafted to these rootstocks are very vigorous, have a deep, well-anchored root system, and are well adapted to poorer soils and where calcareous conditions exist. JAYNES; A91,J61M

## APPLE ROOTSTOCKS

Alnarp 2: According to Polish information, the most hardy stock available. Produces trees that are standard sized. Vigorous and well anchored; susceptible to woolly aphid. Induces early bearing and productivity in the scion cultivar. Promising understock for use with interstem combinations. Originated in Alnarp, Sweden. Introduced in 1944. BROOKS 1972; F91T{SC}, I49G{SC}

Antanovka: Produces vigorous, standard size trees. Very resistant to winter injury. Often planted out and grown for several years before topworking; this insures maximum cold hardiness of the tree's framework. Trees on Antanovka are free from suckering. Widely used where winter hardiness is required. Also bears a large, yellow, white-fleshed apple that is highly prized in Russia for pies, strudels, salads, sauerkraut and pickles. Originated in Siberia. VON BREMZEN; A91, F88G, G66{PL}, G66{S}, H45M{PL}, I49G, J89M, K38{S}, K63G{S}, L27M, N71M{S}, N84{S}, P49{S}, R7S{S}

Borowinka: Most compatible and vigorous growing of the cold hardy rootstocks. Cold hardiness about equal to Antanovka. Does noticeably better in heavy moisture conditions. Recommended for Zone 3. G66{PL}, G66{S}, K63G{S}

Budagovski 9: Produces trees that are M.9 to EMLA 26 size and require support or staking. Induces early fruiting and is compatible with most cultivars. Resistant to collar rot, moderately resistant to powdery mildew and apple scab; very resistant to winter frost. Trees on Budagovski 9 have an open growth habit and bear in 2 to 3 years. Recommended as an interstem for colder apple growing regions. A91, I49G, /75, /75{IN}, J93, J93{IN}

Budagovski 118: Produces trees that are 75 % the size of those on seedling rootstocks. Resistant to collar rot and apple scab. Extremely winter hardy; has reportedly survived temperatures of -16° C. with no root damage. Can be employed as an interstem base on rich soils or as an understock for spur-type cultivars on poor soils. A91, I49G, /75, J61M

Budagovski 490: Scion cultivars on Budagovski 490 are comparable in vigor to those on EMLA 106. Induces early, very heavy production. Moderately resistant to collar rot. Very winter hardy. Trees on Budagovski 490 are well anchored and do not require staking. Developed by Dr. Budagovski in Michurinsk, Russia. 175

EMLA 7: Produces sturdy trees that are approximately twice the size of those on M.9 or 55 % the size of trees on seedling rootstocks. Trees on EMLA 7 have good anchorage and exceptional winter hardiness; are less precocious and have a lower crop efficiency than EMLA 9 or EMLA 26. Moderately resistant to collar rot. /474{PL}, A91, C76M, G66, H45M, H49, /75, J61M, J93, N19

EMLA 9: Has a dwarfing influence on all scions worked on it. Induces cropping early in the life of the tree. Considerably more vigorous and productive than M.9. Trees on EMLA 9 show a wide degree of tolerance to soil conditions; require staking throughout their life; resist collar rot. Fruit is larger and ripens earlier in the season, especially during the early years of the tree's life. G66, I75, I75 {IN}

EMLA 26: Scions on EMLA 26 produce a tree 40% the size of that on seedling rootstocks. Trees on EMLA 26 require permanent staking on exposed sites; should be planted with the union a few inches above ground level; produce few but very vigorous suckers; are susceptible to collar rot and fire blight. Not as hardy as EMLA 7. Useful for high density plantings. A91, C76M, G66, /75, J61M, J93

EMLA 27: Scion cultivars grown on EMLA 27 grow into small, compact, precocious trees, approximately half the size of trees on EMLA 9. Trees on EMLA 27 rarely sucker; yield heavy crops the second year after planting; show some resistance to apple mildew. Fruit is of good quality. Valuable for small gardens or pot culture. A91, H45M, /75, /75{IN}, J61M, J93

EMLA 106: (East Mailing 106) Produces trees that are 65% the size of those on seedling rootstocks. The most widely used rootstock in high latitude countries due to its heavy cropping potential, moderate vigor, freedom from suckering and resistance to woolly aphids. It is more sensitive to soil moisture than most rootstocks. Susceptible to mildew; not resistant to collar rot. G66, H45M, I75, N19

EMLA 111: Produces trees that are similar to, but more vigorous than, EMLA 106; approximately 75% of that on seedling rootstocks. Has a well anchored root system and is resistant to woolly aphids and collar rot. Susceptible to mildew. Recommended for dry sandy soils in low rainfall areas. An excellent rootstock for spur-type cultivars. A91, G66, H45M, /75, K88T, N19

Geneva 11: (G.11) Produces well anchored trees, precocious and productive; few burr knots and suckers. Dwarfing similar to M. 26. Moderately resistant to fire blight; somewhat susceptible to woolly apple aphids and powdery mildew. Originated in Geneva, New York by J.N. Cummins and H.S. Aldwinckle. Introduced in 1993. BROOKS 1997; C76M

Geneva 30: (G.30) New disease resistant rootstock developed at the Nov York Agricultural Experiment Station in Geneva, New York. Produces well-anchored trees, 50% of those on seedling rootstock. Resistant to fireblight, woolly apple aphid, and collar-rot. Reported to be precocious and productive. Appears to be adapted to a wide variety of soils. Recommended for trial.. C76M, /75, J93, M59M

Geneva 65: (G.65) Very dwarfing, disease resistant rootstock. More dwarfing than EMLA 9 but less dwarfing than M.27. Resistant to crown rot, fire blight, apple scab, and powdery mildew; somewhat susceptible to woolly apple aphids. Highly compatible. Originated in Geneva, New York by J.N. Cummins and H.S. Aldwinckle. Introduced in 1991. BROOKS 1997; C76M

M.7: (Mailing 7) Produces trees 55 to 65% of those on apple seedling. Has been the backbone of the U.S. fruit industry during the first 50-year introductory period of rootstocks in the United States. Still the most commonly used stock, the most disease tolerant, and the most adaptable to a range of soil types and climates. Has a tendency to sucker from the roots. ROM; F91T{SC}, G66, L12

M.7a: An improved clone of M.7 which was originally reselected free of the economically important viruses. Produces trees approximately 50% the size of those on apple seedling. Tends to sucker from the roots. About 20% of trees on M.7a require staking in their early years. Trees on M.7a bear heavily. A74{PL}, G66, I49M

M.9: (Mailing IX, Jaune de Metz) The most commonly used dwarfing rootstock throughout the world, both for single-union trees and also for interstem trees. Produces trees 25 to 35 % the size of those on apple seedling. Promotes earlier growth and fruit maturity, and precocious cropping. Tends to sucker from the roots; is susceptible to fire blight. Trees on M.9 require support. Widely used in high-density plantings. Originated in France in 1879. ROM; C76M, G66, /75, J93, J93{IN}, L12, N19

M.9/MM.106: A two piece interstem stock. Unites the anchorage and soil adaptability of the MM. 106 base stock with the dwarfing characteristics of the M.9 stem piece. Inherits the collar rot resistance of M.9. Trees on M.9/MM.106 are slightly larger than those on M.26, and do not require support. They should be planted with the top graft union intersecting the soil surface, the point where the collar rot organism normally attacks. L12

M.9/MM.111: An interstem combination, wherein the dwarfing stem piece M.9 is grafted onto MM.111, and grown 1 year in the nursery before the desired cultivar is propagated to it. Produces trees about 40% the size of those on apple seedling. Trees on M.9/MM.111 are well anchored and drought tolerant. Fruit quality is enhanced. The oldest interstem combination in use. A91, L12

M.26: (Mailing 26) Produces trees 40 to 50% of those on apple seedling. More vigorous and better anchored than M.9 with most

cultivars. Tolerant of extended wet soil conditions; susceptible to collar rot and fire blight. The most winter hardy of the Mailing rootstocks now used commercially. Trees on M.26 do not require support when planted in a deep, well-drained soil. ROM; A74{VL}, G66, H49, I49G, I49M, J89M, L12

M.27: Has a very dwarfing effect, producing trees only 4 to 6 feet in height. Very precocious and induces heavy fruiting. Trees on M.27 are well suited for growing in a container or a small yard. Requires staking. Not widely used commercially as a single-grafted tree. More commonly used as interstem material for grafting on vigorous clones. F91T{SC}, J93{IN}

Mark: (MAC 9) Produces trees that are approximately the size of EMLA 26. Trees on Mark are early flowering with good fruit set, highly productive, and open in habit resulting in excellent fruit color. One of the first dwarfing rootstocks which is strongly anchored and free standing without support. Resistant to fire blight; tolerant to cold temperatures. Developed by Dr. Robert F. Carlson at Michigan State University. H45M, /75, J61M, K88T

MM.106: (Malling-Merton 106) Produces trees that are 60 to 75% the size of those on apple seedling. Very precocious and more vigorous than M.7. Has shown a tendency for collar rot on poorly aerated soil. Trees on MM.106 are well anchored, do not sucker, and are very productive. Excellent for spur-type cultivars and as an interstem base stock. ROM; C76M, G66, H49, J93, LI

MM.III: A semi-standard stock that produces trees 90% the size of those on apple seedling. Not precocious, but more productive than apple seedling. Adapted to a wide range of soil and climatic types and has survived well compared to others. Widely used as an interstem stock base. Trees on MM. 111 are well anchored and tolerant of drought. C76M, F91T{SC}, G66, J93, L12

Ottawa 3: Produces dwarf to semi-dwarf trees, between M.9 and M.26 in size; not free standing. Consistently hardier than M.26; better anchored than M.9. Free of burr-knot and suckering. Resistant to crown rot; susceptible to woolly aphids and fire blight. Well suited to high density planting. Has a tendency to make its scion cultivar over-crop, resulting in small fruit if not properly managed. Developed at the Agriculture Canada Research Station, Ottawa, Ontario. A91, I49G, H45M, /75{IN}, J93

P.1: (Poland 1) Produces trees that are approximately the size of EMLA 26. Requires a rich well-drained soil and doesn't do well in wet soils; resistant to crown gall and mildew. Susceptibility to fire blight and woolly apple aphids is comparable to that of M.9. Trees on P.1 require staking and are suitable for high density plantings. Winter hardiness is comparable with EMLA 111. F91TISC}, /75, /75{IN}

P.2: (Poland 2) Produces trees that are M.9 to EMLA 26 size. Widely used in Poland as an interstem because of its exceptional winter-hardiness. Cropping efficiency is similar to M.9. Trees on P.2 display good open growth. Resistant to collar rot, susceptible to scab and mildew. Used for high density trellis plantings with vigorous cultivars. Precocious; crops in the third year. A91, F91T{SC}, /75, /75{IN}

P.16: (Poland 16) Produces non-suckering trees that are comparable in size to those on M.9. Induces early fruiting, with cropping occurring in the second year. Requires staking. Resistant to apple scab, powdery mildew, and crown gall; susceptible to fire blight. Suitable for rich, well-drained soils. Recommended for the central and southern states. F91T{SC}, /75

P.18: (Poland 18) Produces free-standing trees that are similar in size to those on EMLA 111. Resistant to collar rot, apple scab, powdery mildew, and crown gall. Adapted to poor, light, sandy soils. Cropping efficiency is slightly lower than EMLA 106. Very winter hardy. Trees on P.18 begin to bear in 3 to 4 years. Developed by Dr. S.W. Zagaya at Skierniewice, Poland. F91T{SC}, I49G, /75

P.22: (Poland 22) Traces on P.22 are smaller than those on M.9 and are comparable to those on EMLA 27. Resistant to collar rot, canker, apple scab, powdery mildew and crown gall. Has exceptional winter hardiness. Recommended as an interstem which will produce trees that are M.9 size. Induces early fruiting. Has a cropping efficiency like that of M.9, is better anchored and not as brittle. A91, I49G, I49M, /75, /75{IN}, J61M

Ranetka Purpurea: Cold hardiness greater than Antanovka but less than Malus baccata. More vigorous than Malus baccata; less problems with incompatibility. Withstands tough situations. Recommended for Zones 2 to 3. A91, G66{PL}, G66{S}, I49G

#### APRICOT ROOTSTOCKS

Haggith: Produces standard size trees that are cold hardy, consistently productive, self-fertile and disease tolerant. Haggith seedlings are quite uniform in the nursery new. Scion cultivars on Haggith stocks tend to have wider crotch angles and a more spreading growth than those on Alfred. Originated in Harrow, Ontario, Canada by R.E.C. Layne. Introduced in 1974. F91TISC}, I61MIS}, K88T, M89{S}

#### AVOCADO ROOTSTOCKS

Borchard: Chlorosis resistant clonal rootstock of the Mexican race. In grower trials, Borchard has shown superior growth under conditions which normally cause lime induced chlorosis. Also has good salt tolerance, but is susceptible to phytophthora root rot. B58M

Duke 7: Root rot resistant clonal rootstock of the Mexican race. Has moderate resistance to avocado root rot; also very good cold and salt tolerance. Preferred by most nurserymen because of superior horticultural qualities. The first commercially successful resistant rootstock. Selected from the Duke cultivar, which was discovered by George Zentmyer of the University of California, Riverside. B58M

TopaTopa: Seedling Mexican rootstock that shows a high rate of survival in clay soils as well as resistance to frost. A prolific seed-bearer. Produces vigorous, relatively uniform seedlings. Extremely susceptible to avocado root rot. A traditional rootstock that was used on many of the initial avocado groves in California. Originally selected in 1907 on the Topa Topa ranch in Ojai, California. B58A/{S}

Toro Canyon: Root rot resistant clonal rootstock. Has shown high resistance to phytophthora root rot in test plots, more so than Duke 7 or G6. Also shows good salt tolerance. Discovered as a surviving tree in an infested orchard in Carpinteria, California. B58M

Walter Hole: Seedling Mexican rootstock that produces a tree of manageable size, good shape, and healthy color throughout the year. More than 250,000 trees on Walter Hole rootstock have been planted in California since 1977. B58M, B58M{S}

#### CHERRY ROOTSTOCKS

EMLA Colt: (Prunus avium x Prunus pseudocerasus) Produces trees that are 70 to 80% the size of those on Mazzard seedling, 60 to 70% of those on F12/1. Compatible with most sweet and sour cherry cultivars. Resistant to bacterial canker, crown gall and cherry replant disease. Trees on EMLA Colt are well-branched with wide angles; yield significantly larger crops of good quality fruit earlier in the life of the tree. H45M, I75, K88T

F12/1: Compatible with all sweet and most sour cherry cultivars. Resistant to canker; susceptible to crown gall. Very prone to root suckering. Trees on F12/1 adapt to a wide range of loam to clay-loam soils, and are more vigorous than those on Mazzard seedling. Often used in Europe to transform bush form morello cherries into more easily manageable tree forms. F91T{SC}

G.M. 61/1: (Damil) (Prunus dawycensis) Scions on G.M. 61/1 are approximately 1/3 to 1/2 the size of scions on F12/1. Very precocious and induces early fruiting. Trees on G.M. 61/1 are less

bushy and more open, and much more productive than those on F12/1. Suitable for plantings of 150 to 230 trees per acre. Fruit has increased size and improved color. *H45M, J61M*

**Mahaleb:** (*Prunus mahaleb*) Produces well anchored, standard size trees. Cannot tolerate poor drainage; very drought resistant. Compatible with most sweet and sour cherry cultivars. Moderately resistant to crown gall; resistant to bacterial canker. Trees on Mahaleb may be slightly smaller, come into bearing sooner, and have a heavier set of fruit than those on Mazzard. Especially popular as a stock for sour cherries. *A74, A91, G66{PL}, G66{S}, K38{S}, K88T{PL}, L12{PL}, N19{PL}*

**Mazzard:** (*Prunus avium*) Produces well anchored, standard size trees. Many roots are shallow, resulting in injury by deep cultivation and drought. Compatible with most sweet and sour cherry cultivars. Moderately resistant to oak-root fungus; less susceptible than Mahaleb to peach tree boier. Recommended for soils that are too heavy for Mahaleb. *A74, A91, G66{PL}, G66{S}, K38{S}, K88T{PL}, L12{PL}, N19{PL}*

### CITRUS ROOTSTOCKS

#### CITRATES

**C-32:** Recommended for trial because of its resistance to the citrus nematode, *Phytophthora* species and tristeza virus. Produces vigorous seedling trees, equal in volume to Troyer, but less dense. More productive than C32. Ruby orange x trifoliolate orange. Released in 1985 by the Citrus Research Center, University of California, Riverside. *C29M{SC}, N18{S}*

**C-35:** Recommended along with C-32 because of its resistance to the citrus nematode, *Phytophthora* species and tristeza virus. Slightly smaller than C32, rather open and subject to some low-branch dieback in older trees. Ruby orange x trifoliolate orange. Released in 1985 by the Citrus Research Center, University of California, Riverside. *A71, B58M, C29M{SC}, N18{S}*

**Carrizo:** Trees on Carrizo are among the most vigorous, growing well on a wide range of soils. They are prone to zinc and manganese deficiency, and are less cold tolerant than those on trifoliolate orange, sour orange or Cleopatra mandarin. Carrizo is tolerant to the burrowing nematode. In Florida they grow and fruit unusually well in their early years. Fruit quality is often comparable with that produced on Cleopatra and sour orange. ROM; *A71, B58M, C29M{SC}, J73M{S}, N18{S}*

**Savage:** Has seeds that are highly polyembryonic, but usually produces seedless fruit. Trees on Savage have yielded well and withstood freezes in several trials on sandy and loam soils, and may be suitable as rootstocks for close plantings. The yellow, 2 1/2 to 3 inch fruits yield large amounts of fragrant, good quality juice. 174

**Troyer:** Along with Carrizo, the only commercially important citrange rootstocks. Trees on Troyer are among the most vigorous, growing well on a wide range of soils. Troyer has poor salt tolerance and sensitivity to exocortis and calcareous soils; not affected by xyloporosis. Susceptible to burrowing nematode. Sweet orange trees on Troyer in California are subject to tristeza decline in coastal areas. ROM; *C29M{SC}, G66{S}, J73M{S}, N18{S}, 093{S}*

#### CITRUMELoS

**CPB. 4475:** Trees on CPB are vigorous, productive and cold hardy. Resistant to nematodes and phytophthora root rot. Good for replants in commercial groves. Swingle is the name reserved for seed source trees propagated by budding from the original Swingle tree, while GP.B. 4475 trees are propagated from seed. ROM; *B58M, C29M{SC}, J73M{S}, N18{S}*

**Sacaton:** Trees on Sacaton are small and have potential for high-density plantings. May be susceptible to tristeza in some environments. Lemons on Sacaton have performed well in Arizona and California experiments. Sacaton seeds are polyembryonic but produce about 40% zygotic seedlings. Has been evaluated in the United

States with inconsistent results. ROM; *K67, N18{S}*

**Swingle:** One of the rootstocks that induces as much cold hardiness as sour orange. Swingle is very tolerant to the citrus nematode and root rot. In Texas, Red Blush grapefruit, Orlando tangelo, and Marrs orange yield and fruit quality surpass that of trees on most other stocks. In California, Swingle is compatible with Lisbon lemon and has performed well in grower trials. *A71, Q93*

#### ROUGH LEMONS

**Milam:** Possibly a rough lemon hybrid. Resistant to the burrowing nematode; susceptible to the citrus nematode. Has evolved essentially as a special-purpose rootstock in Florida, where commercial trees on this stock behave similarly to those on Rough Lemon. However, Milam has performed poorly in calcareous soil in Texas. ROM; *N18{S}*

**Rough Lemon:** An excellent rootstock for warm, humid areas with deep, sandy soils. In such an environment trees on Rough Lemon grow rapidly and are long-lived and highly productive, yielding large fruit with a low total soluble solids content. In arid or coastal environments and clay soils, trees on Rough lemon often decline prematurely. They are notably drought tolerant. Orange, grapefruit and lemon cultivars can be used with Rough Lemon. ROM; *A71, D13, J73M{S}, N84{S}, P5{S}, P17M{S}, Q93*

**Volkamer Lemon:** (*Volkameriana*) Has many of the same characteristics as Rough Lemon, although trees on this stock are more cold hardy and have often yielded more fruit with slightly higher juice quality than those on Rough Lemon. Apparently tolerant to mal secco, gummosis and foot rot; susceptible to root rot. Appears to be as susceptible to blight and woody gall as Rough Lemon. MORTON 1987a, ROM; *A71, B58M, D13, G66{S}, J73M{S}, N18{S}, N84*

#### TRIFOLIATE ORANGES

**Barnes:** Used as a clonal rootstock for sweet oranges. Highly resistant to phytophthora root rots. Seedling of trifoliolate orange. Originated in Gainesville, Florida. Developed by H.J. Webber at Riverside, California. Introduced in 1957. BROOKS 1997; *N18{S}*

**Flying Dragon:** Trees on Flying Dragon have been consistently small during field trials in California and Florida. Otherwise their performance is essentially the same as for other Trifoliolate Orange selections. Grown primarily as a potted plant in Japan where it is called *hiryo*. It has slender, crooked branches armed with large, downward-curved spines. REUTHER, ROM; *A71, C9, D37, D95, H4, 174, 183M, K67, M16, N18{S}, Q93*

**Rubidoux:** Trees on Rubidoux trifoliolate orange are 30 to 60% of standard size. Imparts a greater cold-hardiness to the tree. Susceptible to quick decline virus. Used extensively in the past for orange and grapefruit cultivars. Seedling of trifoliolate orange, originating in Riverside, California. Introduced about 1920. BROOKS 1972; *A71, 183M, N18{S}*

**Trifoliolate Orange:** Trees budded to Trifoliolate orange are cold hardy, standard sized on heavy soils and dwarfed on light soils, and intolerant of calcareous conditions. Tolerant to phytophthora and the citrus nematode. Yields small, high-quality fruit. Excellent for commercial replantings. The primary rootstock in Japan for large satsuma and unshiu plantings. ROM; *A79M{S}, B96, C9, D26G{S}, D95, F43M, G96, H4, J73M{S}, K38{S}, K63G{S}, N37M, 093{S}*

#### ot her s

**Alemow:** (*Macrophylla*) Trees on Alemow are vigorous, precocious, and fruit heavily when young. Resistant to phytophthora. Juice quality is lower than that for trees on virtually any other rootstock. Scion cultivars other than lemon produce fruit of only marginal quality. Trees on Alemow decline from xyloporosis and tristeza. Popular in California as a stock for lemons. ROM; *B58M, C29M{SC}, D13, N18{S}, 093{S}*

Citremón 1449: (CRC 1449) Used as a rootstock for limes, lemons, oranges and grapefruits. Trees grafted to Citremón 1449 have good size and vigor and are adapted to a wide range of soil conditions. Has shown good tolerance of crown rot but is susceptible to *tristeza*. C29M{SC}, N18{S}

Cleopatra Mandarin: Trees budded to Cleopatra are capable of achieving a large size, but are often slow to bear. Tolerant to *tristeza*, *exocortis*, *xyloporosis*, cold, and calcareous soils. Juice quality is excellent but fruit size is small, particularly with Valencia scions. Cleopatra is an excellent rootstock for mandarin and related cultivars, and Pineapple and Hamlin sweet oranges. ROM; C29M{SC}, J73M{S}, N18{S}

Rangpur Lime: Trees on Rangpur Lime are vigorous and highly productive, particularly as young trees. Sensitive to cold and *phytophthora*; very tolerant to drought. Fruit is medium to large with low to moderate juice quality. An excellent stock for deep, sandy soils in humid climates, where grapefruit and sweet oranges yield well. ROM; G49, I83M, J73M{S}, N18{S}

Ridge Pineapple: A sweet orange cultivar that is tolerant to the burrowing nematode. Has also shown good resistance to *tristeza*, *anthracnose*, *exocortis* and *cachexia*. Trees on Ridge pineapple are long-lived and have excellent fruit quality. Good compatibility with lemons and limes. Originated in Orlovista, Florida. BROOKS 1972, ROM; J73M{S}, N18{S}

Shikwasha: (Hirami Lemon) Various scions on Shikwasha are average or better in vigor and yield, with generally good fruit size and juice quality. Moderately cold and salt tolerant, but has a high level of tolerance to lime-induced chlorosis; also tolerant of *phytophthora* and the rootstock-related viruses. Shows promise as a rootstock for mandarins. ROM; N18{OR}, N37M

Sour Orange: Trees on sour orange are moderately vigorous and their size is generally considered as the standard for comparison. Valued as a rootstock for producing fresh market fruit. Fruit from trees on Sour Orange have high total soluble solids, and high vitamin C content. Navel orange juice quality and flavor are improved on Sour Orange stock. The premier citrus rootstock, common throughout the world where *tristeza* does not preclude its use. ROM; B58M, J17, J73M{S}

Sunki: (Suenkat) Tolerant to *tristeza* and *xyloporosis* like Cleopatra but is affected by *exocortis*, which is unusual for a mandarin-like fruit. Trees on Sunki are highly salt tolerant, moderately cold hardy, and adaptable to calcareous soils. In Florida, has induced greater yield and higher juice quality than Cleopatra. Commonly used as a stock in China and Taiwan. ROM; N18{OR}

Sweet Lime: Trees on Sweet Lime are medium to large. Juice quality is generally poor, but has been slightly better in some instances than that recorded for Rough Lemon. Nucellar scions perform best on Sweet Lime. Valued mainly as a rootstock, although it is grown in some countries for fresh consumption. ROM; I83M, J73M{S}

Sweet Orange: Most commercial scion cultivars on Sweet Orange are long-lived, and produce crops often equal to or better than those from trees on Sour Orange. Valencia oranges, mandarins, and lemons on Sweet Orange yield well, with good fruit size and juice quality. Trees on Sour Orange are often slow growing, and perform best on sandy loam soils. Susceptible to *phytophthora* and drought; tolerant to *tristeza* and *exocortis*. ROM; B58M, Q93

#### CUCURBIT ROOTSTOCKS {S}

Bond Shintosa: (*Cucurbita maxima* x *C. moschata*) Rootstock squash. Excellent for grafting watermelon, cucumber and melon. Scion varieties grafted onto Bond Shintosa are more vigorous under low temperature conditions. Resistant to fusarium wilt. Widely adapted to various soil types and growing conditions. Q3

Companion: (*Luffa cylindrica*) Rootstock sponge gourd. Special variety of Luffa, only used for grafting bitter melon (*Momordica*

*charantia*). Very compatible with scion varieties, retaining resistance to fusarium wilt and improving the yield and quality of crops. Q39

Knight: (*Citrullus lanatus*) Rootstock watermelon. Used only as a rootstock for grafting watermelon. Scions on Knight retain fusarium wilt resistance and improve the yield and quality of crops. Q39

Mutual Boom: (*Cucurbita* sp.) Rootstock squash. Only used as a rootstock for grafting watermelon, cucumber, melon or bitter melon (*Momordica charantia*). Scions on Mutual Boom have better growth, fruit-set, yield and tolerance to cool temperature, while maintaining their original quality. Resistant to fusarium wilt. Q39

Power Gourd: (*Cucurbita ficifolia*) Figleaf gourd rootstock. Special variety of figleaf gourd, only used as a rootstock for grafting watermelons. Thick hypocotyl, easy to graft. Good root system, plants remain vigorous through all stages of growth. Grows well under low temperature conditions. Resistant to fusarium wilt. Q3

Strong Man: (*Cucurbita* sp.) Rootstock squash. Used only as a rootstock for grafting melon, cucumber and \*atermelon. Very vigorous plant with small stems and leaves; early and prolific. Resistant to powdery mildew and viruses. Will produce a small, orange-yellow squash which is not suitable for eating. Q39

Tetsukabuto: (*Cucurbita maxima* x *C. moschata*) Rootstock squash. Used as a disease-resistant rootstock for watermelons, melons and cucumbers. Most suitable for grafting onto watermelon. Provides resistance to fusarium wilt. Also produces a delicious squash. C20M, L59, J20, L79G, Q3, Q28, S63M, S70

White Skin: (*Cucurbita ficifolia*) Figleaf gourd rootstock. Special variety of figleaf gourd, only used as a rootstock for grafting cucumbers. Scion varieties grafted onto White Skin come into production earlier, and have greater cold tolerance and disease resistance. Q39

#### GRAPE ROOTSTOCKS

A x R #1: (Ganzin #1) (*Vitis vinifera* x *Vitis rupestris*) Produces vigorous grafted vines that bear good yields of high quality fruit. Resistant to *phylloxera* biotype A; susceptible to *phylloxera* biotype B and nematodes. Roots its cuttings quite readily, and buds and grafts easily. Recommended for use with lighter bearing raisin and table cultivars in deep, heavier soils. E39, E39{SC}

Couderc 1613: (1613) (*Vitis solonis* x) Imparts moderate vigor to its scions. Resistant to the more prevalent strains of root-knot nematodes; moderately resistant to *phylloxera*. Cuttings of this stock readily root in the nursery and it buds and grafts easily. Does not sucker excessively, but disbudding is recommended before planting. Widely used with wine, raisin and table cultivars in California. El {SC}, E39, E39{SC}, J31M, J31M{SC}

Couderc 3309: (3309) (*Vitis riparia* x *Vitis rupestris*) Scion vines on Couderc 3309 are moderately vigorous and bear well. Has relatively poor compatibility with *vinifera* cultivars. Cuttings of this stock have medium rooting ability in the nursery; are relatively difficult to bench graft. Resistant to *phylloxera*; very susceptible to nematodes and drought. Widely used in Europe. B92M, D19, El {SC}, J31M, J31M{SC}, LIM, LIM{SC}

Dog Ridge: (*Vitis* x *champini*) Imparts great vigor to its scions. Resistant to nematodes; moderately resistant to *phylloxera*. Cuttings of this stock root with difficulty, however the rootings bud and graft readily. Suckering may be a problem, therefore disbudding the cuttings is recommended. Only recommended for light, less fertile, sandy soils. Gives best results with heavy-bearing wine and raisin cultivars. D79{OR}, El {SC}, E39, E39{SC}, LIM, L7M{SC}, N33

Freedom: (*Vitis* x *champini*) Produces grafted vines that are vigorous and heavy bearing. Has some resistance to *phylloxera* and is very resistant to root knot nematodes; not tolerant of drought. Cuttings of this stock root moderately well in the nursery, and it buds and grafts fairly easily. B92M, D19, El {SC}, E39, E39{SC}, J31M, J31M{SC}, LIM, LIM{SC}

Harmony: (*Vitis x champini*) Vines grafted on Harmony have moderate vigor and bear well. Has some resistance to phylloxera and root knot nematodes, but is not immune to either. Cuttings of this stock readily root in the nursery and vineyard, and it buds and grafts readily. Satisfactory for table grapes; especially suited for Thompson Seedless. *B92M, D/9{OR}, El {SC}, E39, E39{SC}, J31M, J31M{SC}, LIM, L7Af{SC}*

Salt Creek: (Ramsey) (*Vitis x champini*) Imparts great vigor to its scions. Very resistant to nematodes; moderately resistant to phylloxera. Roots its cuttings with difficulty, but buds and grafts readily. Performs well with wine and raisin cultivars in light sandy soils of low fertility. Has a greater range of use than Dog Ridge. Suckering is less of a problem than with Dog Ridge, however, dis-budding is recommended. *B92M, D/9{OR}, El {SC}, E39, E39{SC}, L/Af, LIM{SC}*

SO-4: (Oppenheim #4) (*Vitis berlandieri x Vitis riparia*) Scion vines on SO-4 are vigorous and productive. Has good resistance to phylloxera and nematodes; not tolerant of drought. Medium compatibility with vinifera cultivars. Cuttings of this stock root with some difficulty and it is not easy to bud or graft. Used commercially in German vineyards. *B92M, D79{OR}, El {SC}, E39, E39{SC}, L7M, LIM{SC}*

St. George: (St. George 15) (*Vitis rupestris*) Produces quite vigorous grafted vines. Drought tolerant, highly resistant to phylloxera; susceptible to nematodes and oak root fungus. Very compatible with vinifera cultivars. Cuttings of this stock root readily and it is readily budded or grafted. Suckers profusely, therefore careful disbudding is recommended. *B92M, D19{OR}, El {SC}, E39, E39{SC}, LIM, LIM{SC}*

Teleki 5BB: (5BB, Kober 5BB) (*Vitis riparia x Vitis berlandieri*) Produces grafted vines that are very vigorous. High resistance to phylloxera; moderately resistant to cold and nematodes; not tolerant of drought. Cuttings of this stock do not root well, and it is relatively difficult to graft. Very poor compatibility with *Vitis vinifera* cultivars. ROM; *B92M, D19, El {SC}, J31M, J31M{SC}, LIM, L/M{SC}*

#### PEACH ROOTSTOCKS

Bailey: Cold hardy seedling rootstock that produces a standard size tree. Develops an abundant root system. Adapts to sandy and sandy loam soils. Resistant to root lesion nematodes. Seedlings may vary in their resistance to cold. Originated in Scott County, Iowa by Jacob Friday. Introduced prior to 1909. *A74, F91T{S}, G66{S}, I61M{S}, M89{S}*

Chui-Lum-Tao: Relatively new cultivar from northern China, currently being developed in Canada. One of the hardiest rootstocks for peaches, along with Siberian C and Tzim-Pee-Tao. Moderately tolerant to nematodes. Has performed well as an understock for both nectarines and peaches. *g £S6{S}, M89{S}*

Halford: Seedling rootstock that produces a standard size tree. Similar to Lovell in performance. Has proved its consistency and adaptability to a wide range of growing conditions. Not resistant to nematodes. Compatible with all commercially grown cultivars. Also used as a rootstock for Japanese plums and Italian prunes in the Northwest. *G66{S}*

Lovell: Produces well-anchored trees of standard size. Prefers well-drained, sandy loam soils; is sensitive to wet soil conditions. Compatible with all peach cultivars. Highly susceptible to peach tree borer and root knot nematodes. One of the most valuable rootstocks in the United States and Canada. Widely planted where nematodes are not a problem. *A9{PL}, B71M{PL}, E4{PL}, G66, G66{S}, K73M, K88T{PL}*

Nemaguard: (*Amygdalus persica x Amygdalus davidiana*) Produces well-anchored trees of standard size. Sensitive to wet soil conditions. Very resistant to most economically important root knot nematodes; highly susceptible to peach tree borer. Has an adverse

effect on scions with regard to cold hardiness and bacterial canker. Widely used and preferred stock, especially in California and Florida. *A9{PL}, B71M{PL}, C9M{S}, E4{PL}, G66{PL}, G66{S}, K88T{PL}*

Nemared: Similar to Nemaguard, but red leaves of Nemared help identify "missed" buds in the nursery row. Has proven resistance to root knot nematodes. Lacks productivity in soils without nematodes when compared with other rootstocks. Susceptible to wet soils and bacterial canker. *F91T{S}, G66{S}, K38{S}*

Siberian C: Produces semi-dwarf trees that are 75% the size of those on standard seedlings. Transfers cold hardiness to scion cultivars. Induces earlier defoliation and hardening off of the scion cultivar. Susceptible to nematodes. Trees on Siberian C are precocious. Fruit matures earlier. Recommended for colder areas. Also used as a stock for apricot. Originated in Harrow, Ontario, Canada. *A91{PL}, F91T{S}, G66{S}, I61M{S}, MS9{S}*

Stark Red Leaf: Selected by Stark Brothers Nurseries for its resistance to heavy, wet soils and for its cold hardiness. West Coast trials have also proven it to be better adapted to western sandy loam soils than other red leaf peach rootstocks. Vigorous and precocious, worthy of trial in all areas where stone fruits are grown. *A9{PL}*

Tzim-Pee-Tao: Relatively new seedling rootstock from northern China, currently being developed in Canada. One of the hardiest rootstocks for peaches, along with Siberian C and Chui-Lum-Tao. Moderately tolerant to nematodes. Has performed well as an understock for both nectarines and peaches. *F91T{SC}, G66{S}, M89{S}*

#### PEAR ROOTSTOCKS

EMLA Quince A: Virus-free re-introduction of Quince A selected at the East Mailing and Long-Ashton experiment stations in Great Britain. Resistant to pear decline, root aphid and root knot nematodes; susceptible to fire blight. Produces trees that are relatively vigorous and hardy. Moderately tolerant of wet soils. */75, L12*

EMLA Quince C: More dwarfing and precocious than Quince A. Produces trees that are similar in size to those on M.9 apple stock. Resistant to pear decline, crown gall, mildew, nematodes and root aphids. Trees on EMLA Quince C are higher yielding and fruit size is greater than cultivars on Quince A; should not be planted in areas of severe cold. */75, J93*

Kirschensaller: Produces well anchored trees that are 90% the size of those on pear seedling. Slightly more vigorous and uniform. Nearly free of root sprouts. Excellent compatibility. Good resistance to pear decline and oak root fungus; tolerant of wet soil conditions; susceptible to fire blight. Trees on Kirschensaller are precocious and heavy yielding. *G66{PL}, V7/M{S}, P49{S}, R78/S*

OH x F 97: (Old Home x Farmingdale 97) Produces a vigorous, full-sized tree, 10% larger than that of seedling pear. Highly resistant to pear decline and fire blight. Somewhat susceptible to winter injury due to its growing vigor late in the season. Does not do well in heavy, clay soils. *J93*

OH x F 333: (Old Home x Farmingdale 333) Produces well anchored trees that are 70% the size of those on pear seedling. Nearly free of root sprouts. Has good compatibility, even with Asian pears. Resistant to pear decline, fire blight and bacterial canker. Trees on OH x F 333 are cold hardy, precocious and very productive. Fruit quality is very good. Selected by Lyle Brooks. *H45M, J61M, J93*

OH x F 513: (Old Home x Farmingdale 513) Produces trees that can be maintained at about 15 feet tall. Compatible with all pear cultivars, including Asian Pears. Induces heavy early production and is very hardy. Does well on a variety of soils. Resistant to pear decline, fire blight and bacterial canker. Trees on OH x F 513 are nearly free from suckering. *I49M*

Old Home: (*Pyrus communis*) One of the first clonal pear rootstocks used in the United States. Largely discontinued as a stock because of the very low yield efficiency it induces. It also tends to

sprout wry badly. Produces standard sized trees. Resistant to fire blight and pear decline; susceptible to root aphid and nematodes. Cuttings of this stock root readily. Still widely used as an interstem. I61M{SC}, M39M

Provence Quince: (*Cydonia oblonga*) Produces trees that are 50 to 65% of standard, larger than those on Quince A or Quince C. Characterized by vigor, resistance to drought, and tolerance to alkaline soils. Resistant to pear decline, root aphid, and nematodes; susceptible to fire blight. Trees on Provence Quince are heavy bearing, but not as hardy as pears on seedling rootstock. F91T{SC}, G66

Provence Quince (BA 29-C): Produces trees that are from 1/2 to 2/3 the size of standard pear trees. Compatible with Anjou, Comice and Flemish Beauty; other cultivars require an interstem to form a strong union. More winter hardy than Quince A. Resistant to pear decline, crown gall, nematodes and root aphids. Trees on BA 29-C are precocious and very high yielding. /75, J61M

Quince A: (Angers Quince A) Selected from Angers quince at the East Mailing research station in the 1930's. Produces trees that are about 50% the size of those on pear seedling. Trees on Quince A are generally precocious and productive. Tolerates wet soils better than Provence Quince; susceptible to fire blight. Widely planted in the more northern regions of Europe. G66, K88T

#### PLUM ROOTSTOCKS

Besseyi: (*Prunus besseyi*) Produces mostly dwarf trees that are poorly anchored. Prone to severe suckering. Compatible with most prunes; incompatible with Damson and Victoria plums. Resistant to crown gall. Trees on Besseyi are productive and very cold hardy. Cuttings of this stock are often easy to root. Seedlings vary widely. G66{PL}, G66,{S} H49, L12

Brompton: (*Prunus domestica*) Produces very large, well anchored trees, nearly free from suckering. Compatible with most European plums; incompatible with some prunes. Resistant to cold temperatures; susceptible to bacterial canker. Adapted to heavy, damp soils. Trees on Brompton are moderately productive. Widely used in Europe. F91T{SC}, G66{S}, N71M{S}

Marianna 2624: (*Prunus cerasifera* x *Prunus munsoniana*) Produces tree that are smaller than peach trees. Widely adapted to different soil types and moisture conditions, however will not tolerate extremely heavy soils. Not well anchored in early years. Resistant to oak root rot, root knot nematodes and prune brownline. Induces heavy production. Fruit is slightly earlier ripening. Best of the Marianna selections. ROM; A9{T\*L}, £4{PL}, F91T{SC}

Marianna 4001: (*Prunus cerasifera* x *Prunus munsoniana*) Produces very large, well anchored trees. Moderately prone to suckering. Compatible with most European and Japanese plums. Resistant to drought and bacterial canker. Induces heavy fruit production. Fruit is slightly later ripening. Widely planted in the United States. F91T{SC}

Marianna GF 8-1: Very vigorous. Relatively shallow rooting; well-adapted to calcareous soils. Compatible with all varieties of European plums, however unions with Count Althann's Gage may be weak. Very sensitive to nematodes. Not very winter hardy. More tolerant to root asphyxia than Myrobalan. Originated near Bordeaux, France. BROOKS 1997; H45M

Myrobalan: (Myro Plum) (*Prunus cerasifera*) Widely adapted to different soil types and moisture conditions, however will not tolerate extremely heavy soils. Compatible with most European and Japanese plums; poor compatibility with Green Gage and Stanley. Trees on Myrobalan are large, have good anchorage and are very productive. Fruit is slightly later ripening. Best worldwide stock, but highly variable from seed. ROM; A91, G66{PL}, G66{S}, K38{S}, K88T{PL}, L12, N19{PL}

Myrobalan 29C: (*Prunus cerasifera*) Adapted to a wide range of soil and moisture conditions. Anchorage is not very good in early

years. Compatible with most European and Japanese plums. Somewhat resistant to nematodes; susceptible to prune brownline. Trees on Myrobalan 29C are large and high yielding. Fruit is slightly later ripening. Widely used in the United States. ROM; A9{?L}, F91T{SC}, H45M

Myrobalan B: (*Prunus cerasifera*) Very vigorous stock with strong anchorage; does not sucker. Difficult to root in the nursery. Wide compatibility, especially with European plums; incompatible with Gages and Mirabelles. Recommended for lighter soils, especially in hot climates. Trees on Myrobalan B come into production late, but bear heavily when mature. F91T{SC}

St. Julien A: (St. Julien, EMLA St. Julien A) (*Prunus insititia*) Produces semi-dwarf trees, about 10 to 15 feet tall. Somewhat prone to suckering. Tolerates a variety of soils. Compatible with most European plum cultivars. Resistant to low winter temperatures. Trees on St. Julien A are precocious and moderately productive. Not recommended as a stock for Stanty. Also used as a rootstock for peaches and apricots. G66{PL}, G66{S}, I49M, J61M, J93, K63G{S}, L12, P49{S}, R78{S}

#### TOMATO ROOTSTOCKS {S}

Kage: Multiple disease resistant tomato rootstock. Provides resistance to bacterial wilt, verticillium wilt, fusarium wilt races 1 and 2, nematodes and tobacco mosaic virus. When using tomato varieties which are resistant to tobacco mosaic virus, only use rootstocks which have a similar tolerance. S63M

KNVF: A tomato rootstock which gives resistance to corky rot, root knot eelworm, and verticillium and fusarium wilts. Used as a rootstock for cultivars which are susceptible to these problems, especially under greenhouse conditions. R32, TIM

KNVFR Tm Signal: Resistant to tobacco mosaic virus, corky root, root knot nematodes, verticillium wilt, fusarium wilt (Race 1 & 2), J<sub>3</sub>, and similar to TMV (Tm2a/+) resistant tomatoes. S70

#### WALNUT ROOTSTOCKS

Paradox: (*Juglans regia* x *Juglans hindsii*) Trees grafted onto Paradox are more vigorous and have a greater circumference when grown on volcanic hillside soils. Resistant to some forms of root rot and root lesion nematodes; susceptible to the cherry leaf roll virus (black line disease) and crown gall. Seedling vigor and performance very variable. Widely used as a rootstock for Persian walnuts in California. Originated in Santa Rosa, California by Luther Burbank; first described in 1893. B71M{PL}, C54{PL}, D7S{PL}, K73M{PL}, K88T{PL}, L47{PL}

## RUNNER BEAN {S}

### PHASEOLUS COCCINEUS

#### BICOLOR-FLOWERING

Pointed Lady: (Bicoloi; York, Lancaster) 90 days. Not as long-podded as modern cultivars, but has a very good flavor; pods 9 to 12 inches long. Flowers half red and half white, the keel and wings being pinkish white, and the standard scarlet-red. Seeds dark brown to black, mottled with creamy white. Suitable for both the vegetable and ornamental garden. Originated before 1855. HEDRICK 1931, VILMORIN; B49, E33, J11M{DF}, K53, K66, L89, N84, O89, R32, R83, S55

#### PINK-FLOWERING

Sunset: Produces medium-length, richly-flavored pods. Has the added attraction of carrying pale pink flowers. Among the earliest maturing cultivars; can be pinched back and grown as bush beans for exceptionally early crops. S61

RED-FLOWERING

**Black Runner:** (Phipps Black Runner) Primarily used as a gourmet dry bean. Large, handsome, glossy pitch black seeds, about 7/8 inch long. Tender-skinned bean with firm texture and good flavor. Very good in black bean soup, chile or cooked and used in salads. Developed by Tom Phipps. MAYES; A90MJDF, 191, J11M{DF}

**Butler:** 65 days. Pods stringless all along their length; also fiberless in the thick flesh surrounding the seed itself; pod length averages 12 inches. Juicy pods remain in edible stage longer than other cultivars. Fast, productive grower; sets well in hot weather. Flower clusters ornamental with a very heavy bloom to stem ratio. B49, G53M, R32, R83, S61

**Dwarf Bees:**<sup>1</sup> 75 days. Unique dwarf Scarlet Runner type, growing only 18 to 24 inches tall. Does not produce runners, allowing for easy culture without the need for staking. Good quality pods. Seeds can be used as shell beans. Attractive, bright scarlet blossoms. Makes a colorful border. ^475, G16, G82, H49, J20, J39, L89, M32

**Enorma:** 92 days. Produces extremely long, slender pods, often up to 20 inches long. More highly flavored than Crusader which it replaces. Seeds purple with some black stripes. If picked young, pods can be used whole; as they mature they form tough strings along the edges which should be removed before cooking. Good freezing and exhibition qualities. Very productive. C95, N84, RUM, R83, S55, S75M

**Goliath:** (Prizetaker) 92 days. A very productive cultivar producing very long, bright green pods, often up to 20 inches. It has all the qualities of an outstanding bean—fine texture, heavy cropping, reliability and uniformity. Excellent for freezing. Seeds purple with over 50% black splashes. M46

**Gulliver:**<sup>1</sup> Smooth, bright green, fleshy pods, 9 to 10 inches long; completely stringless. Early high-yielding plant; does not produce runners, allowing for easy growing without the labor of tying and staking. Attractive, scarlet flowers. An Improved Hammond's Dwarf type. Developed by A.L. Tozer Ltd. J9M

**Hammonds Dwarf:**<sup>1</sup> (Hammonds Scarlet Runner Bush) 60 days. A true dwarf, non-climbing cultivar; height 16 to 18 inches. Needs no staking providing pods are picked regularly, however the top may need to be pinched out of an occasional plant to stop them running. Pods 7 to 8 inches long; when picked young they make good snap beans, later they can be used as a shell bean. Introduced in 1961. B49, E7M, G53M, M46, R32, R83, S55

**Kelvedon Marvel:** 84 days. Very early, producing long straight pods very freely. Pods 10 to 12 inches long, somewhat rough. Seeds purple with over 50% black splashes. Shorter than the average runner, growing only 4 to 5 feet tall; most productive if unsupported and left to spread horizontally. R32, R83, S55, S75M

**Lady Di:** 65 days. Large, slender, dark-green stringless pods; up to 12 inches long; very slow seed development; tender and delicious; quality excellent. Vigorous, very productive plant, adaptable to difficult growing conditions. Attractive red blossoms. Bears over a long period. G53M, L91M, R83

**Musica:** 55 days. Wide, flat, stringless pods; 9 to 10 inches long and 3 1/4 inches wide. Has an excellent, delicious true bean-like flavor. Very high yielding plant with red blossoms. Very early maturing, making it an ideal choice for growers in hot climates. L91M

**Pickwick:**<sup>1</sup> Compact, bushy plants without runners; height about 12 inches. Ideal for small or exposed gardens or for growing under protection. Quite early maturing, with stringless pods that should be picked regularly for continuity of supply. Can also be used for shelling and dry beans. J9M, S61, S75M

**Prizewinner:** 93 days. Produces a large crop of rich green pods, which are straight, smooth-skinned, 20 to 24 inches long, stringless when young, and have a rich bean-like flavor. Seeds purple with

some black stripes. Good for general garden use; also used along trellises for the flowers, which are brilliantly red. M46, N81, 053M, S61

**Red Knight:** 70 days. Long stringless pods, smoother than the rough-textured older stmins; ripen early. Can be picked young as snap beans, or left to mature for dry beans. Very heavy cropping, produces pods all summer long. Vines grow 10 to 12 feet and are covered with crimson blossoms. One of the best modern cultivars. C95, K66, N84, R32, R83, S55

**Red Rum:** 40 days. Narrow, medium-length pods, 6 to 8 inches long; fleshy, nearly stringless, well-flavored; matures very early. Produces very heavy crops. Somewhat resistant to Halo Blight. Highly recommended for organic gardeners. Developed by A.L. Tozer. L91M, S75M

**Scarlet Emperor:** 90 days. One of the longest-podded cultivars, with flat, slightly fuzzy pods of rich, dark-green color, frequently 15 inches long, but nevertheless of fine flavor and texture. Seeds purple with over 50% black splashes. Preferred by many gardeners for its rich, sweet, bean flavor. Vine a heavy producer, with large sprays of attractive red flowers. A75, B49, C53, C85M, E24, 139, J11M{DF}, K49T, L89, M49, N84, R32, S55

**Scarlet Runner:** 90 days. Dark green pods, moderately brittle, firm-fleshed, somewhat stringy and rather coarse in texture; quality fair. Seeds very large; shining black to violet-black, mottled with deep red; can be used as green shell beans. Flowers scarlet, very large, 20 to 40 on each long flower-stalk. One of the oldest known cultivars, originating before 1750. HEDRICK 1931; A16, A25, A90M{DF}, D11M, E7M, E38, FI, F70, F80, F92, G71, H42, L7M, L79, M46, R47, etc.

**Streamline:** 91 days. One of the longest cultivars, the pods being up to 18 inches long, straight and narrow; borne in large trusses and over a long period. Flavor very good. A good producer, ideal for those who want to exhibit, and who want to pick enough for a meal quickly. Seeds purple with over 50% black splashes. Good for heavy soils. GENDERS 1975; B49, 053M, R32, R83, S61, S75M

**Tarahumara Tecomari:** Produces very large beans in various colors such as all black, purple with black spots, all white, or gray with black spots. Attractive, red flowers. From the Tarahumara Indians of the Sierra Madre, Chihuahua, Mexico. F73D, 116, N84

WHITE-FLOWERING

**Czar:** (The Czar) A fine old white-flowered cultivar that produces long, tender, mild-flavored pods for eating green. If left to dry it will produce a crop of plump, fine-tasting white "butter" beans. One of the cultivars favored for quick freezing. An heirloom cultivar that was almost lost. B49, N84, R32, S55

**Desiree:** A white-seeded, white flowering cultivar that produces long, slender, fleshy pods 10 to 12 inches in length. Exceptional flavor and genuinely 100% stringless. As is it is a shy seeder, there is much more juicy, fleshy, edible area. Suitable for freezing. Bears very heavily, especially in dry conditions when 40 pods per plant can be expected; will attain large crops from a small area. B49, L91M, RUM, R32, R83

**Emergo:** 88 days. Long-podded type; white-flowered and seeded. Of good quality, but pods must be picked when young. Creamy white seeds are known as *sweet white runners*, and are considered excellent for use in soups and salads. Vigorous plants withstand adverse weather; are heavy-yielding. A75, E5T, F73D, G53M, J11M{DF}, K18M{DF}, N40{DF}, RUM, S75M

**Emergo Stringless:** 87 days. Produces an abundance of large (8 to 12 inch), tender, and flavorful beans. Well suited to Northern gardens as it may be planted earlier than other beans and thrives in relatively cool conditions. White-flowered and seeded. Vine length can exceed 10 feet. M46

Tkrahumara Bortal: 120 days. Large white runner bean, reputed to be one of the best tasting. Dry farmed on thin, rocky soils. From the remote mountain community of Otachique, Chihuahua, Mexico. 116, N84

White Aztec: (Dwarf White Aztec, Potato Bean) 55 days. Pods usually long, much curved, flat, dark green with a rough surface. Seeds very large, much thickened, very plump; color glossy white. Has a distinct running, spreading habit that forms a dense mass of runners over the ground around the central stem. Flowers numerous, large, white. Supposedly found in a sealed vase in an ancient Anasazi dwelling in New Mexico. HEDRICK 1931; 116, J25M, J97M, K49T

White Dutch: (Oregon Lima) Resembles Scarlet Runner very closely, differing from it in having stems and leaf veins solid green and flowers and seeds pure white. Seeds very large. Pick when 6 inches long for snap beans; for a meatier taste, pick when 12 inches long, or use later as a shell bean or a baking bean. A very old cultivar, listed by American seedsmen as early as 1825. HEDRICK 1931; E7M, F73D, K49M, M46

#### CODES FOR SPECIAL TYPES

##### 1. Dwarf

## RUTABAGA {S}

#### BRASSICA NAPUS NAPOBRASSICA GROUP

Acme: (Garden Purple Top Acme) 90 days. Small, early, purple top globe-type with sweet yellow flesh of very high quality. Uniform size and shape. High yielding. Recommended by the National Institute for Agricultural Botany of Great Britain. B49, 053M, R32

Altasweet: 90 days. Very large, globe-shaped root, 4 to 7 inches in diameter; skin, smooth, very thin, yellow with a purple top; flesh deep-yellow, tender, fine-grained, very sweet and mild; keeps well in the ground all winter. One of the best tasting rutabagas. A cross of Laurentian and Macomber, Altasweet is similar in form and color to Laurentian, but much milder in flavor. Developed by Robert Simonet of Alberta, Canada. I39M, J39

American Purple Top: (American Purple Top Yellow, Golden Neckless) 100 days. Large, smooth, globe-shaped root with small neck and tap root; 4 to 6 inches in diameter; skin bright yellow, purple on top; flesh creamy-yellow, fine-grained, sweet, firm, tender and crisp; stores well. Widely used for home gardens, local market and shipping. Traditional North American cultivar; introduced prior to 1888. A25, A75, B75M, D76, D82, G57M, G83M, K49M, K71, M46, N16

Best of All: 90 days. Medium-sized, globe-shaped root with a purple top; to 6 inches in diameter when well grown; flesh creamy-yellow, tender and mild; stores well. Very hardy; will stand in the ground all winter in milder climates. A home garden gourmet cultivar from England. Introduced in 1896. N84

Cambridge: (Waldoboro Green-Neck) Maine heirloom. Rescued from the steamship Cambridge, which sank in the Atlantic Ocean on February 10, 1886 after striking the Old Man's Ledge off of Friendship, Maine. Sweet and non-woody, can reach 20 pounds or more if planted early; matures midseason to late. Best harvested after several frosts. F73D, H15P

Canadian Gem: 120 days. Flesh light-yellow, firm, very fine-grained and sweet; flavor very good. Extremely hardy; a very good winter keeper in storage. Excellent for fall and winter use in the North. A16, K49M

Champion Purple Top: 90 days. Good quality roots that are improved by frost. Rose-colored skin; yellow flesh. Cooks to a

pleasing rich color and flavor. Long keeping. Reliable and widely grown. **PIG**

Eastham: (Eastham Tbrnip) A variety still grown commercially on Cape Cod in Massachusetts, but otherwise fairly rare. Large, rounded roots, 8 to 12 inches in diameter; delicious, sweet white flesh. Excellent green tops that can be used as a cooked vegetable. An early New England heirloom. D29P, J26M

Fortin: An heirloom from Quebec, Canada. Maintained there by the Fortin family. Roots are purple on the outside and yellow within and have an excellent flavor. Can grow to a large size. Appears to have some resistance to insects and disease. L88J

Fortune: (Fortune Certified) Similar to York in yields, with a wider tolerance to 6 strains of club root and a good tolerance to storage rot. Appearance, size and color similar to Laurentian or York. Good appearance and table quality. Bred at the Canada Research Station at Mount Pearl. L42

Gaze's Special Purple Top: Has proven to be a very high yielder. Superb table quality with a very mild flavor. Very good keeping qualities; stands up in storage better than Laurentian. Should not be planted too early as the roots can become overly large. E38

Improved Purple Top Yellow: (Burpee's Improved Purple Top Yellow) 90 days. Large, slightly oblong, short-necked, purple top yellow type; free of branching and coarseness of neck. Flesh yellow, solid, sweet and rich; keeps well when mature. Hardy and very productive. For table, stock, storage and shipping. Introduced by Burpee in 1883. C44, M95M

Joan: 95 days. An earlier cultivar suitable for drilling and covering with plastic. Uniform, attractive, round roots; purple-topped; yellow flesh. Good color. Sweeter, fresher and milder in flavor than other yellow varieties. An overall good quality horticultural type. G6, S75M

Laurentian: (Laurentian Purple Top, Laurentian Golden) 105 days. Uniform, nearly globe-shaped, almost neckless roots; 5 to 6 inches in diameter; free of branching; skin creamy-yellow, deep purple on top; flesh pale-yellow, texture fine, flavor mild; keeps well. Moderately short tops. Quality very good for table use; also used for storage, shipping and canning. Most popular rutabaga in North America. A16, C85M, D11M, E24, E38, F70, H42, H61, K49M, K73, L79, N34{PR}, N52

Marian: 76 days. Uniform, globe-shaped, purple-topped root; up to 8 inches in diameter; flesh yellow, of fine flavor, retains its color when cooked; keeps well. Highly resistant to clubroot, mildew, and root cracking. Vigorous, very productive plant; has shorter, wider leaves that allow for closer spacing. Introduced by the Welsh Plant Breeding Station. B49, E38, L89, R32, S55, S75M

Pike: 100 days. A purple top rutabaga similar to Laurentian. Flavorful yellow flesh. The larger tops give better protection to the roots from heavy frost. Can be left in the ground a little later in the fall. Storage quality equal to Laurentian. A local Maine favorite. G6

Purple Top Yellow: 90 days. An old, long-cultivated type, from which, most of the improved yellow-fleshed cultivars have originated. Form regularly egg-shaped, smooth, but with a few small roots at its base; neck short; size large, 4 or 5 inches at its largest diameter; skin purple above ground, yellow below; flesh yellow, firm, of good quality, turns orange when cooked. Very hardy; yields abundantly in rich, deep soils. BURR; B75, I39

Wilhelmsburger Gelbe: (Pandur) 85 days. Very early, very cold-hardy, fiberless cultivar with an attractive pink top and an excellent, mild flavor. Good size. Perfect for short season areas. Has the ability to store in a cool place for several months. N81

Wilhelmsburger Green Top: Green-topped root; flesh pale orange. Of fine table quality but also used for feeding stock. Keeps well. Has extremely high resistance to club root, a real boon to

farmers who are troubled with this disease. Popular in Atlantic Canada. E38

York: (York Certified) Similar to Laurentian but has resistance to some strains of club root. Produces smooth, uniform roots with fine quality yellow flesh and excellent storage capabilities. Selected from Laurentian by the Charlottetown Research Station, Prince Edward Island, Canada. E38, L42, M27, M49

## SALAD MIXES {S}

### VARIOUS GENERA

Popular in France, where they are called *mesclun* (mesclun and melange are both French words that mean mixture or miscelany), these seed mixes are carefully chosen so that the individual components have generally similar growth rates when planted together. The plants chosen for the mix also complement one another when harvested and form an attractive and tasty salad. ANDREWS, C. 1996; E97, F82, G82, K49T, M32

Bon Vivant: Gourmet lettuce blend designed to provide the best combination of flavor, shape, texture, and color including deep red and bronze leaves, and green colors ranging from dark emerald to light green. For added zest arugula, endive, raddichio and other greens can be added. A25, B73M, C85M, D74B, D76, FI, F63, G57M, G87, K71, M46, M49

Braising Mix: 28 days. Bright mixture of items like Red Russian kale, Gien Wave and Red Giant mustards, Hon Tsai Tai, Spring raab, and komatsuna. Provides a combination of various textures and tests for stir-frying and other light cooking. Grown secondarily as a salad mixture. G6, K57{PL}

Cutting Lettuce: A mixture which combines attractive leaves, looseleaf habit and vigorous regrowth after cutting to give the best possible base for salads. Suitable for cut-and-come again or once over harvesting. As a salad base, about 10 feet or so a week will be required. C53

Early Season Mix: Mix of gourmet greens chosen for springtime growing conditions. Contains lettuce, arugula, leaf radish, bok choy, mizuna, mustard, endive and spinach. Can be followed with Mid Season Mix. C44

Exotic Mesclun Mix: Unique blend of spicy salad greens including arugula, Tres Fine Maraichere endive, Giulio radicchio, mizuna, and Cocarde and Pirat lettuces. May be planted in a garden or a hanging basket in a shady patio area. K23{PL}

Fedco Mesclun: Contains a mixture of mizuna, chervil, corn salad, endives, sorrel, Giant Red mustard, arugula, tatsoi and the following lettuces: Rouge d'Hiver, Red Sails, red oak leaf, Salad Bowl, Green Ice and Black Seeded Simpson. D68

Flower Petal Salad: Specialty mix of 6 edible flowers for salads, baking and decorating. Selected for bright colors and uniquely different flavors and textures. Includes bee balm, borage, Calendula, Viola, nasturtium, and Tagetes. L91M

Garnish Mix: A mix for small gardens that makes it possible to add a touch of both beauty and taste to soups, dips, and entrees, without having to maintain a bed of garnishes. Contains Bronze fennel, green fennel, Dukat dill, cutting celery, Catalogno flatleaf parsley, and Bravour curly parsley. C53

Gastronome: Well balanced mixture of 8 green and red salad varieties: Salad Bowl, Red Salad Bowl, Marveille des Quatre Saisons, and Lollo Rossa lettuces, Bed Verona chicory, chervil, mache, and maraichere endive. Will add a gastronomic touch to your meals. P59M

Gourmet Salad Mix: An eclectic mix of Verte Maraichere, Sierra and Red Grenoble lettuces, arugula, Red Giant mustard, Ruby swiss chard and Verte d'Cambrai com salad. Colorful as well as delicious. Can be planted once a month beginning in spring and ending in early summer, the final sowing yielding a fall crop. E24

Harris' Mesclun: Carefully selected mix provides a combination of different colors, textures and flavors. Includes New Red Fire, Black Seeded Simpson and Oakleaf lettuces, Green Boy bok choy, Red Giant Mustard, Red Russian kale, Mizuna and Melody spinach. Should be planted in blocks and harvested when young. F13

Herbal: Distinctive mixture of various herbs and greens including sweet basil, borage, arugula, bronze fennel, sugar beet, and red leaf lettuce. Heat tolerant; suitable for mid-summer plantings. J82

Late Season Mix: Gourmet mixture of greens and herbs formulated to grow best in the fall, following Early Season Mix and Mid Season Mix. Contains lettuce, mizuna, mustard, garden cress, chicory, onion, endive and leaf radish. C44

Lettuce Alone: Special mixture of looseleaf lettuces offers a selection of color and textures that will continue to produce salads for months. Selected to grow well together and are easily harvested as a cut-and-come-again crop. Includes Deer Tongue, Oakleaf, Simpson Elite, Tango, Royal Red and Red Oakleaf. 139

Mesclun: A mixture of up to 11 different greens, usually including French lettuces, curled endive, arugula, com salad, spinach, chervil, cress and chicory. Best harvested when very young. Traditionally gathered by pulling up whole plants. Ideal for broadcast seeding in wide-row and raised bed plantings. C81M, D3M{PR}, D11M, D27, F92, G68, H21, H42, 167M, 089, PIG, P59M, Q34

Mesclun Ni^oise: A mixture that usually contains endive, chicory, dandelion, upland cress and arugula. It requires a little more attention, but is a must for those who like their salads tart. Best crops will be produced during cool weather. May also include wild onion or other greens. C53, L89

Mesclun Provençal: A traditional French mix popular in Provence, which usually combines dandelion, chervil, arugula, Feuille de Chene lettuce and Fine Curled Louviers endive in precise proportion for best effect. Good for the home garden or a balcony planter. May also include additional lettuces, mache, watercress, purslane, basil, parsley or raddichio. OLNEY; C53, E63D, L89, 089

Mid Season Mix: Attractive gourmet mixture of greens and herbs. Developed to follow Early Season Mix, as the weather warms up. Contains lettuce, corn salad, arugula, chervil, bunching onions and beet greens. C44

Mild Mesclun Mix: 21 days. Formula mix of lettuces and mild tasting leafy greens in green and red colors. Ingredients may include Red Sails, Salad Bowl, and Rosalita lettuces as well as Chinese bok choy, mache, Kyona, Red Russian kale, and Hon Tsai Tai. D76, G6, K490, K71, L42, L89, M46, Q34

Mild Mix: 21 days. A combination of mellow-flavored, heat tolerant greens that will provide a range of rare greens for salad making right through the hot weather. The early growth is dominated by Mizuna; as the Mizuna is cut, an understory of succulent, Golden purslane, Red orach, Brussels Winter chervil, and 3 cultivars of nutty mache begin to take their place. Keep the mixture cut and watered. C53, 191, K57{PL}

Miscuglio: An Italian chicory mixture including radicchio. Ideal for perennial cut and come again. The radicchio can be left to head up over winter, or may be blanched to produce attractive, tender pink leaves. Green varieties may also be left to grow on where required. S55

Misficanza: (Misticanze, Saladisi, Saladini) An Italian mixture of common and lesser known loose-leaved salad plants, usually including lettuces, chicories, endives, and water cress, blended in precise

proportions. As one variety finishes another appears. Ready for use when the leaves are approximately 5 inches long. For an extra spicy flavor, add arugula and upland cress to the mixture. And for even more variety, add purslane, rampion and mache. DE VITA [Re]; B8, C53, G53M, H49, J20, K66, L89, L91M, 053M, Q11M, Q34, R32, SI 7, S55

Napa Valley Lettuces: A custom formula blend containing Bibb, Little Gem romaine, green Oakleaf, Rouge d'Hiver, red Romaine, Red Oakleaf and rosy crisphead. Plus curly endive for extra texture. K66

Nouvelle Cuisine: A mixture of cut-and-come again greens for complementing standard lettuces. Plant and harvest a ready made salad. Good for gardeners with limited space. Long a tradition in fine French cooking, and becoming a popular trend at better restaurants. B49

Oriental Salad: (Oriental Saladini) Blend of Oriental leaf vegetables for growing in the "cut and come again" method that allows for harvesting each sowing 2 or 3 times. Usually includes komatsuna, bok choy, red mustard, mizuna, and red kale. May also include red Romaine lettuce, Santo cabbage and mibuna. All have been selected to grow evenly together. Can be cut at 2 to 3 inches for salads. Also suitable for stir-frying when 7 to 10 inches tall. 139, K66, L89, Q34, R32, S55

Piquant Salad Greens: A custom formula blend containing peppery sharp arugula, tart-sweet nutty Mizuna, tangy smooth Giant Red mustard and spicy Curly Cress. Contains enough seed to plant a 3-foot-square area 2 or 3 times. C20M, K66

Richters Special: Contains a mixture of red leaf lettuce, Kagraner Summer lettuce, arugula, radicchio, corn salad, borage, mizuna, mustard spinach, chervil and curled cress. Sow in early spring or late summer. J82

Spicy Mesclun Mix: 21 days. Formula mix of red and green leafy vegetables that usually includes spicy and strong-flavored ingredients such as Green Wave mustard, Arugula, Salad King endive and Catalogna chicory with a mild base of red lettuces, Hon Tsai Tai, and Kyona. G6, J82, K490, M46

Spring Mesclun: Includes 3 chicories, both red and green types, curly endive, 3 lettuces (late romaine, curly looseleaf, and Red Viper), plus minutina—Plantago coronopus. B75

Spring Mix: Contains a mixture of more than five cultivars, including looseleaf and butterhead types. Selected to provide a good range of leaf colors and forms without taking up too much space. Should be sown February through April for a late spring and early summer harvest. C53

Summer Mix: Contains a mixture of five or more cultivars of both looseleaf and butterhead types. Custom blended from a wide selection of the best heat-tolerant types. Should be sown April through July for a harvest in late summer and fall. C53

Super Gourmet Blend: A blend of five looseleaf types—Slobolt, Buttercrunch, Red Sails, Salad Bowl and Valmaine—in equal quantities. Even as seedlings, their appearance is quite different and they can be easily thinned to equal proportions in the row. L89

Tangy Mix: 21 days. Combines flavorful and colorful Japanese mustards with the piquancy of arugula, the clear peppery flavor of Broad Leaved cress, and the tangy beauty of a range of red and green chicories and endives. Good for livening up a salad of milder greens, or served on its own with a creamy dressing. Best adapted to cool weather, but can be kept going into the dog days of summer by frequent planting and prompt, once-over harvest. Shade and water also help. C53, D76, 191, K57{PL}, L89

## SHITAKE {SIM}

### LENTINUS EDODES

#### COLD WEATHER

These strains require cool or cold temperatures to fruit; with many, fruiting is arrested or aborted at high temperatures. Mushroom quality is very high due to cool fruiting temperatures. Fastest vegetative growth is near 77° F., but growth continues at colder temperatures. They have their highest yield after the second year and logs will produce heavily for four or more years. C27, I1M{CU}, M87{CU}

#855: Greenhouse or outdoor strain. Vigorous mycelium for good growth. Fruits during 3 seasons (October to June), not in summer, with large flushes at one time. Produces especially well during changes in weather - November, December, January and M<sup>^</sup>. Fruiting temperature 41° to 68° F. A good strain for drying. 13

CS-11:<sup>1</sup> Robust, thick-fleshed caps with a heavy white fringe and short, stout stems, often *Donko* grade. Has a spawn run of 16 to 20 months. A rapid colonizer, growing well at low temperatures. Logs can be fruited 3 times each cool season, will continue to fruit for 4 or more years. Optimum fruiting temperatures 45° to 60° F. 149

CS-16:<sup>1</sup> Robust, dense, thick-fleshed caps with heavy white fringe, often *Donko* grade. A rapid colonizer, with a spawn run of 16 to 20 months. Fruiting can be induced twice with only a 20 to 40 day resting period between times. Logs will produce for 4 or more years. Optimum fruiting temperatures 45° to 64° F. 149

CS-118: Medium, thick-fleshed cap with dense white fringe retains in-curved margin longer than other strains. An aggressive, rapid colonizer, has a spawn run of 6 to 12 months. Two or three fruitings can be induced in rapid succession. Logs will produce for at least 3 years. Optimum fruiting temperatures 45° to 68° F. 149

CW-12: A strain that produces the largest, thickest-fleshed mushrooms. Perhaps the most widely cultivated outdoor strain throughout the world. Notable for producing under the coolest conditions. Has a short fruiting period in the North, but produces heavily under late fall and winter conditions in the South. A long incubation period of 18 months can be expected before first fruiting. D75T

CW-25: Produces a smooth, medium thick-fleshed, flat-capped mushroom with a lacy ornamentation on its rim. Time to first fruiting 12 months. Natural outdoor fruiting season early to late spring, and mid to late fall. Indoor fruiting season fell through early summer. Optimum fruiting temperatures 47° to 68° F. Very popular among indoor growers. D75T

Flying Goose: A strain that fruits once as the snow melts, and once again when the snow threatens in the fall. Compared to Snowcap, fruitings are heavy and concentrated, taking place over several days instead of several weeks. Spawning is vigorous. Does not respond to soaking. Spawn run is generally 9 to 12 months. Fruiting range D75T

Neptune: Medium thick caps with dense white fringe; retains its inroll longer than most strains. Produces a very early spring crop and latter in the fall. Good indoors or out. Aggressive spawn run of 6 to 12 months. Fruits best at 45° to 68° F. Forcing requires a cold period followed by a 50° to 64° F. water soak. Short resting period of 20 to 40 days between flushes. K97

Pluto:<sup>1</sup> Grows slowly during cold spring and fall weather, resulting in attractive, thick-fleshed *Donko* caps with a heavy white fringe. The slow growth is also said to create the most healthful vitamin and mineral content. Spawn run of 15 to 18 months. Forcing requires a cold shock followed by a 45° to 54° F. soak. K97

Snowcap: Produces a large, thick, uniform mushroom brushed with abundant white tufted veil remnants. Very attractive. Good for

seasonal outdoor production. Time to first fruiting 12 months. This strain has a long natural fruiting season with most abundant production occurring in spring and fall in the north. Also fruits very well throughout the South in the winter months. Optimum fruiting temperatures 45° to 77° F. D75T

#### WARM WEATHER

These strains produce good quality mushrooms at high fruiting temperatures. They are well adapted to fruiting in warm, moist areas from the spring until the late fall when periodic rains or irrigation induce fruiting. Maximum growth during the spawn run is near 77° F., but growth is good at higher temperatures. C27, 11M{CU}

#512: Outdoor strain. Produces large mushrooms with medium-thick flesh. Begins fruiting 6 to 12 months after inoculation. A good producer. Optimum fruiting temperatures 50° to 77° F. 13

#852: Greenhouse only strain. Fruits faster than any other strain. Has a fast spawn run that prevents the growth of unwanted contaminants. Sensitive to overwatering, the fruiting area should be well ventilated and less humid. Fruits easiest in hot weather. Optimum fruiting temperatures 50° to 86° F. 13

#853: Greenhouse or outdoor strain. Produces the largest mushrooms with the thickest flesh. Highly productive, even old logs produce large mushrooms. Most strains stop growing at 89° to 93° F., but #853 can grow at temperatures up to 95° F., enduring high summer heat. Slowest to fruit but has the longest production life by 20 to 40%. 13

CS-24: Robust, thick-fleshed caps with a thick white fringe; stems thick and well proportioned. An aggressive, rapid colonizer, has a spawn run of 8 to 12 months. Fruitings can be forced 2 or 3 times with a 20 to 40 day resting period or fruitings can be evenly spaced throughout the year. Three to four years of production can be expected. Optimum fruiting temperatures 60° to 72° F., with a maximum of 81° F. 149

CS-125: Medium to thick-fleshed mushrooms with a moderate white fringe are produced at high temperatures. Thin to medium stems. An aggressive, rapid colonizer, with a spawn run of 6 to 12 months. Three fruitings in rapid succession can be achieved if logs are rested the remainder of the year. Optimum fruiting temperatures 50° to 68° F., with a maximum of 86° F. Optimum relative humidity low, 60% to 75%. 149

Felt Hat: Newer strain with a fine felt texture and impressive white ornamentation. Fleshier but less dense than other warm weather strains. Highly productive when force fruited, both indoors and out. For the best quality, pick as soon as the cap separates from the stem. Spawn run time 6 to 12 months. Fruiting range 50° to 80° F. D75T

Mercury: Produces mushrooms during the warm active summer months. Medium thick caps with moderate fringing. Spawn run time of 6 to 12 months after inoculation. Easily stimulation of fruiting by heavy irrigation or rainfall makes for easy home cultivation. Fruits best between 50° to 85° F. Excellent for summer farm stands and farmers markets. K97

V-3: A fast spawn run and early, heavy production characterize this strain. Produces an attractive mushroom with feathery scales brushed across the cap. Time to first fruiting 6 months. Optimum fruiting temperatures 50° to 80° F. Does best as an outdoor strain because of its prolonged pin formation period. From the 1986-1987 Ohio Shiitake Project. D75T

WW-44: Produces a thick-fleshed, dark-capped mushroom with abundant lacy ornamentation on cap rim that holds up well during storage. Has consistently high quality production during its fruiting season. Time to first fruiting 14 months. Natural outdoor fruiting season summer through mid fall. Indoor fruiting season late fall through early spring. Optimum fruiting temperatures 50° to 77° F. D75T

#### WIDE RANGE

These strains produce mushrooms under a wide range of temperatures and are easily induced to fruit by soaking following a dry period. They are particularly well suited to forced fruiting and can be produced year-round under controlled conditions. Under natural conditions they fruit during the late spring and early autumn. Growth during the spawn run is fastest at 77° F. but higher temperatures can be tolerated. C27, 11M{CU}, M87{CU}

406: Mid-range strain that is a fast, consistent producer of high quality mushrooms. Developed in France specifically for growing shiitake on sterilized sawdust. One 6 pound bag can inoculate up to 240 pounds of sawdust substrate. 13

410: Wide range strain that produces a large, full bloom of mushrooms from sawdust spawn when the logs first begin to flush, for a quick start into the season. The fruiting range of the strain is from 55 to 80° F. 13

510: Greenhouse or outdoor strain. Produces large mushrooms with thick flesh. An early strain that is tolerant to cool weather at higher elevations. Has one of the fastest spawn runs, fruiting 4 1/2 to 5 months after inoculation. First flush is initiated by soaking right after spawn run. After a flush rest the logs for 20 days before next soaking. Optimum fruiting temperatures 50° to 75° F. 13

CS-15: Thick caps with heavy white fringe; thick stems in good proportion to cap. An aggressive, rapid colonizer, has a spawn run of 8 to 12 months. Tolerant to low log moisture content. Often produces mushrooms in clumps. Highest yields are achieved if 3 or 4 fruitings are spaced evenly throughout the year. Three or four years of production can be expected. Optimum fruiting temperatures 50° to 64° F., but will tolerate higher temperatures. 149

CS-41: Medium-thick to thick caps with minimal white fringe. An aggressive, rapid colonizer, has a spawn run of 6 to 12 months. Four fruitings can be evenly spaced throughout the year. Three years of intensive fruiting can be expected. Optimum fruiting temperatures 50° to 64° F., with a maximum of 77° F. Optimum relative humidity low, 60% to 75%. 149

Jupiter: Attractive thick caps with a generous white fringe, on thick stems. Spawn run of 8 to 12 months. For forcing, soak in water of 55° to 65° F. Fruits best at 50° to 65° F. Produces during spring and fall outdoors. Also good for indoor production. The least demanding strain in the planet series. Highly recommended for home or commercial growers. K97

Mars: Widely adapted strain, growing well anywhere that shiitake is cultivated. Heavy producer of medium thick caps with a moderate white fringe. Fruits easily indoors or out, with an optimum temperature range of 50° to 70° F. Natural outdoor fruiting is in spring and fall. Spawn run of 6 to 12 months. Forcing soak water should be 60° F. K97

Saturn: Thick caps with a moderate white fringe, on medium stems. Because of an aggressive spawn run, has the shortest wait from inoculation to picking. Responds well to rainfall and irrigation soaking outdoors, fruits at 50° to 68° F., even with humidities as low as 62%. Only 20 to 35 days between forced flushes. K97

Southwind: Fast spawn run and ornate mushrooms characterize this strain. Super sensitive to fruiting stimuli, whether it be temperature change or log movement. The best strain for use in rain rooms to initiate fruiting. Holds up well to the heat in July and August under protected conditions. Fruiting range from 55° to 75° F. D75T

Venus: An easy to cultivate strain that produces good quantities of medium thick caps with a medium white fringe. Aggressive spawn run of 6 to 12 months. Force with soaking water of 52° to 68° F. Pinning range of 54° to 70° E, with 60° F. best. Fruits at 52° to 75° F. Grows indoors or out with natural fruiting in spring and fall. K97

West Wind: Very fast spawn run and consistency in yield and mushroom quality make this strain ideal for indoor or outdoor production. Abundant flushing occurs outdoors when forced or

spontaneously with rain and temperate change. A very easy strain to fruit. Time to first fruiting 6 months. Natural outdoor fruiting season mid spring through mid fall. Optimum fruiting temperatures 50° to 80° F. D75T

WR-46: Fast spawn run and relative ease of fruiting characterize this strain, making it an ideal choice for both indoor and outdoor cultivation. Produces thin-fleshed, honey colored mushrooms during the summer and a thick-capped, bright brown mushroom when temperatures are cooler. Time to first fruiting 6 months. Natural outdoor fruiting period mid spring to mid fall. Indoor fruiting year round. Optimum fruiting temperatures 50° to 75° F D75T

WR-85: An ideal strain for operations requiring high yields from minimal space, as it produces excellent yields early in the life of the bed. Produces superior quality mushrooms under cool fruiting conditions, thin fleshed mushrooms under warmest temperatures. Best suited as a commercial outdoor strain because of quality considerations. Fruiting range from 55° to 75° F D75T

#### CODES FOR SPECIAL TYPES

1. Donko

## SOYBEAN{S}

### GLYCINE MAX

#### FIELD SOYBEANS

Used as dried beans for cooking, flour, *soymilk*, *tofu*, *soy sauce*, *miso*, *tempeh*, etc. They require a longer growing season than vegetable soybeans, and need to ripen and dry before harvest.

**BLACK-SKINNED** {DF} For use as dried beans, black soybeans are sweeter, tastier and more versatile than the yellow type. Their rich distinctive flavor can be appreciated alone, or in mixed vegetable dishes. Also used for *fermented black beans* or *salted black beans*, popular in oriental cooking for adding a pungent, beefy flavor to meats and vegetables. The pods can be left on the plant to dry, for unlike many cultivars, they don't shatter as the plants begin to yellow. BELLEME 1993 [Re], CHANG, W. [Cul, Re], COST 1988, CUSUMANO [Cul, Re], HALPIN; E31, E56, E56{PD}, F73D{S}, F88, G44M, G47B, H91, H91{PD}, I19M, I19M{PD}, J11M

Black Jet: 104 days. Early maturing black soybean developed by Johnny's Selected Seeds for short season areas. The 2 foot tall plants are prolific yielders of medium-sized, jet black soybeans. The beans are thin-skinned, with good flavor and cook more quickly than other black types. A2, G6, J20, J39, K17M, L77D, N24M, N84

Kuromame: (Hokkaido Black) Large, black seeds. Good for tofu and soymilk; excellent for baked beans, refried beans and chili if pressure cooked. Popular in macrobiotic diets because it's more easily digested than yellow soybeans. Yields fresh green shell beans in 95 days, dry beans in 120 days. Organically grown in the rich volcanic soils of Hokkaido Island, Japan. Renowned for their nutritional and medicinal properties. C95, F88{DF}, G47B{DF}, H91{DF}, I19M{DF}, J97M, K17M, L77D

Lammer's Black: 104 days. The best black soybean for short season areas. Thin-skinned beans with good flavor. Very high in protein. Makes delicious black bean dishes. Can also be used for tofu. Large, bushy prolific plants, to 2 feet tall. Somewhat drought tolerant. Heirloom. K46T, K49T, L77D

Panther: 120 days. A highly regarded full-season black soybean introduced by Johnny's Selected Seeds. Large, dull-black beans with a very sweet, rich flavor, probably the finest of the dry soybean cultivars. Matures mid to late September from an early June planting. High yielding. C95, L31, R47

### YELLOW-SKINNED

Chico: 90-100 days. An excellent cultivar for making tofu and for sprouting. Nice, clear white hilum. High in protein. Recommended for planting in all regions except the extreme North. Developed by the University of Minnesota. K17M

Easycook: 125 days. Straw yellow seeds with a brown hilum; 2 to 3 seeds per pod. Oil content 19.3%. Has been found to cook fully as soft as navy beans in less time after a preliminary soaking of 12 hours. Stout, erect plant. Maturity group VI. Introduced from Shandong Province, China in 1894. PIPER; U38

Kura Kake Daizu: Two-toned, yellow and brown seeds of gourmet quality. Sweet, buttery and highly digestible. Delicious as a cooked dry bean. High yielding plant, about 3 1/2 feet tall. Ripens in mid-September from a late May planting. K17M

Maple Arrow: 113 days. Very popular early yellow soybean developed in Canada. Grows 30 inches tall. Produces large crops of medium-sized pods containing 2 to 3 beans each. Bright yellow, medium-sized beans have a brown hilum. Very high protein content; rich flavor. Good for processed soy products such as tofu and tempeh. Dependable in short season areas. M46

Natto: Very small, light-colored seeds. Traditionally used for making *natto miso*. Also one of the best varieties for sprouting. Very prolific plant, about 3 1/2 feet tall. Matures late, in September from a late May planting. C14, K17M, N24M

#### VEGETABLE SOYBEANS

Developed to be eaten in the fresh shell stage, green-seeded vegetable soybeans have a delicious, buttery flavor and a firm but tender texture, in Japan, they are cooked in the pod, popped into the mouth as needed, and served along with beer or sushi to form the summer snack called *edamame*. They are better adapted to northern growing conditions than limas, have more protein, and are higher yielding. HALPIN, TSUJI [Re]; B73M, C95, G33,197{DF}, L59

Agate: 90 days. An early maturing heirloom cultivar, originally introduced from Sapporo, Japan in 1929 by P.H. Doisset and W.J. Morse. Small, attractive beans are dark-brown blending into greenish-tan at the outer edge. Usually used as a vegetable soybean. Small, determinate plant; height 28 inches; daylength neutral. C95, F73D, I81M, K17M, K49T, N84

Buker's Favorite: 90 days. High quality vegetable soybean. Large, butter yellow seeds with excellent flavor. Very good eaten straight from the pod, in salads or stir-fried. Not sensitive to daylength, having tested well in North Dakota as well as Thailand. Selected by Dr. Robert J. Buker of Vancouver, Washington. 139

Butterbeans: 90 days. Sweet, buttery, bright-green beans are delicious cooked fresh and excellent for freezing. A good percentage of pods contain 3 large beans which are relatively easy to shell. Stocky 2 to 2 1/2 foot tall plants; well-branched and resistant to lodging; produce a prolific crop of pods. Widely adapted. Developed by Johnny's Selected Seeds. B6, F46, G6, K17M, N84

Envy: 75 days. A popular, well-established short season type. Reaches its prime picking stage considerably ahead of lima beans. Bright green beans have the delicious flavor characteristic of the green-seeded cultivars. For fresh shelling or drying. Upright, 2 foot tall plants are heavy yielding. Developed by Professor E.M. Meader at the University of New Hampshire. G6, L4, L77D, L91M

Hahto: 130 days. Large, olive-yellow, flattened seeds; hilum black; 2 to 3 seeds per pod. Oil content 17.9%. Excellent as a green shell bean. Dry seeds need no more preparation than the kidney bean as they cook up very readily. Stout, erect, bushy plant. Maturity group VI. Introduced from Wakamatsu, Japan in 1915. PIPER; U38

Hakucho Early: 75 days. A very early cultivar from Japan. Pods uniformly large, about 2 1/2 inches long, bright green; 3 to 4 small, yellow-green beans per pod. Can be cooked as green shelled beans

or dried like lima beans. Dwarf plant, only 12 to 14 inches tall; produces a densely concentrated pod set. Very reliable, even for short season areas. Not sensitive to short day-length. C85M, D55, 191, L88J, N84, S63M

Kegon: 83 days. Large podded type with excellent eating quality. Medium-green pods with white pubescence; bright green seeds, mild, sweet and tender. Suitable for eating fresh or freezing. Very productive plant; white-flowered. Standard midseason variety. C92, K16M

Prize: 85 days. Erect, bushy plants produce large clusters of pods, each pod containing 2 to 4 beans. Large, oval, plump bright-green beans are good for fresh use, canning, or freezing. Mature dried beans are yellow, nearly round; excellent for winter use, suitable for sprouts. Widely adapted; does well as far south as Florida. C92, G57M, G71, L77D

Tohya: 88 days. Light green pods, often with 3 beans per pods; delicious, light green beans. Vigorous, prolific plant; produces a concentrated crop of easy-to-pick beans. Very reliable, yields well in wet or dry conditions. A good substitute for lima beans in short-season northern regions. D68,199M, K49T, L77D, S70

White Lion: 70 days. Slightly curved, bright-green pods with white pubescence; contain mostly 3 plump beans of good quality. Vigorous plant, height about 30 inches; produces large clusters of pods. Very popular in Japan. Highly recommended both for fresh market and home gardens. C20M, D55, N84, S63M

## SPINACH {S}

### SPINACIA OLERACEA

#### SMOOTH-LEAVED

A distinct type, mostly of Oriental origin, that is considered the best for salad use. The leaves are thin and tender, with long upright petioles that protect them from rain and make for easier harvesting. They have a sweeter flavor, and being flat and smooth, are easier to clean.

#### HYBRID

Correnta: (Canadian Green) 45 days. Smooth, oval, very dark-green leaves; thick and heavy; mild, sweet flavor. Excellent in salads. Heat tolerant and very slow to bolt, can be grown from late spring until early fall. Erect growth habit. Resistant to downy mildew strains 1, 2 and 3. A16, B8M, C44, C92, D26D, D76, G57M, G87,139,164,177, J20, K49Z, K73, N52, etc.

Tamina: 38 days. High quality Asian spinach developed for slow bolting qualities. Smooth, dark-green, arrow shaped leaves; thick, crisp and sweet. Resistant or tolerant of downy mildew, virus and damping off. High yielding and heat tolerant. Recommended for spring sowing. K66, Q3

Teton:<sup>2</sup> 45-50 days. Smooth, uniform, very dark-green leaves; thick and succulent. Heat tolerant and slow to bolt. Erect growth habit makes for easy harvesting and bunching. Recommended for "baby" spinach. Suitable for late spring, summer and early fall production. Resistant to Races 1, 2, 3 and 4 of downy mildew. B75, D74B, D76, E33, F63, L89

Winter Green: Very distinctive type with deeply lobed leaves resembling dandelion or chicory. Thick, medium-sized leaves which retain a somewhat dark-red color when grown under low temperature conditions. Good resistance to downy mildew; tolerant of cold. Recommended for fall and over-winter crops. Potential specialty market item. Prickly-seeded. Q3

#### OPEN-POLLINATED

Summer Green: 25-30 days. Thick, dark green, serrated leaves with long erect-growing petioles. A very quick and sturdy grower from mid-summer to mid-winter, under short-day conditions. Sow seed at regular intervals beginning in early summer for a continuous supply. Q34

Ushiwakamaru: Fast-growing, erect, fall spinach with medium-green leaves and long petioles. The leaves are broad and smooth making it ideal for fine salads and mixtures with other greens. Resists bolting. Prickly-seeded. C20M

#### SAVOY-LEAVED

Better suited for cooking and processing than the smooth-leaved types. The leaves are broader and thicker and more bulk is retained after boiling or steaming. They are also much more difficult to clean due to the rough surface of the leaves.

#### hybrid

Indian Summer: 39 days. Large, thick, medium-savvy, dark-green leaves have an excellent flavor. Darker green, more crinkled, and longer standing than Melody. Upright growth habit makes for easier harvesting and cleaner leaves, Tolerant to mosaic virus, and races 1 and 2 of downy mildew (blue mold). For spring, summer and fall crops. AU B75M, C53, D26D, D68, G6, K49Z

Melody: 40 days. Semi-savoy type producing large, upright plants adapted for both spring and fall production. Leaves are thick, rounded, and deep-green in color. Popular for fresh market, freezing and canning. Bolt resistant. Vigorous plant growth results in higher than usual yields. Good resistance to cucumber mosaic virus, and downy mildew. All America Selections winner in 1977. C44, DI 1M, D82, F70, G16, G79, H33M, H61, H95,164, K73, M46

Olympia: 45 days. Large, heavy, deep dark-green leaves. Relatively smooth and easy to clean. Semi-erect plant; vigorous and productive; very slow bolting. Resistant to downy mildew races 1, 2, and 3. Suitable for fresh use or processing. Recommended for spring and summer crops. Good home garden variety. A16, C20M, C28, C97, E97, F13, F82, G16, G83M, G87, H33M, K10, L42, L89, N52, TIM, etc.

St. Helens: A smooth-leaved, hardy over-wintering cultivar. May be planted late summer for fall harvest or late fall (September-October) to over-winter for early spring harvest. Has an erect growth habit and is very resistant to mildew. Medium-long standing type suitable for bunching or processing. Resistant to downy mildew. Introduced in 1981. C20M, C28, N52

Tyee: 42 days. Dark-green, semi-savoy leaves, Very upright growth habit. Resists bolting under high temperatures and long day conditions. Compared to Indian Summer, Tyee is darker green, even more upright in growth, and stands over a week longer in hot weather. Good for spring, summer and fall crops, and for over-wintering. Tolerant to downy mildew races 1 and 3. AI, E24, F82, G6, H61,164, K71, K73, L7M, L79, M46, M49

Vienna: Most popular variety where full savoy types are preferred. Deep green, heavily savoyed leaves, thick and durable. Suitable for fresh market and processing. Semi-erect growth habit. Recommended for fall, overwinter and spring crops. Resistant to downy mildew races 1 and 2 and cucumber mosaic virus. AI, C28, F63, 191, G79, G82, H54, K50, K73, L42, M29, M49

#### OPEN-POLLINATED

America: 43 days, Very thick, well-crinkled, glossy dark green leaves. Taste trials show America to have a milder fresh taste than other cultivars, but superior taste when stir-fried. Grows 6 to 8 inches high, 10 to 12 inches in width. Intermediate in bolt resistance. Can be used in spring or fall, but is not suited for over-wintering. All America Selections winner in 1952. A16, F24M, G57M, L13M, Q11M, S17

**Bloomsdale Long Standing:** (Bloomsdale Savoy) 43 days. Thick-textured, heavy, dark-green, fully savoy leaves. Uniform, compact plants, dependable and heavy bearing; heat tolerant. Erect plants remain in the rosette stage for a long time without bolting. Recommended for home and market gardens. Also a popular commercial cultivar, being shipped extensively from the extreme South. Introduced in 1925. MAGRUDER 1938; A75, B75M, B78, D82, E24, E38, E59Z, FI, G16, H33M, H61, K23{PL}, L7M, M46, R47, etc.

**Broad Leaved Prickly:** (Standwell Broad Leaved Prickly) 40 days. A large-leaved, very hardy spinach which is extremely long standing. Short, thick stems with broad, deep-green, fleshy leaves that are produced over a long season. Does well in hot weather. Sow between mid-summer and the following early spring. B49, F24G, 053M, R32

**Cold Resistant Savoy:** 45 days. Dark-green, well-crinkled leaves. Good fresh flavor. May be used for late summer or fall harvests, as well as a wintered-over spinach for early spring cutting. Tolerant to heat, cold and blight. Slightly less resistance to bolting than Long Standing Bloomsdale. I39M, L42

**Fall Green:** (Improved Green Valley) 45 days. Developed by the University of Arkansas for superior disease tolerance. Highly tolerant of white rust, fusarium, anthracnose, blight, and cercospora. Produces deep green, semi-savoy leaves. For fall production. AI, A87M, C28, G57M, K73

**Giant Nobel:** (Giant Thick Leaf) 45 days. Large, medium-green leaves, notably thick in texture, moderately crinkled. Cooks very tender, and is of excellent flavor. Highly recommended for canning. Vigorous, spreading plant, often 25 inches across; has a quantity of thick, succulent leaves in the center resembling a half developed head of lettuce. Very heavy yielding. Introduced in 1926. MAGRUDER 1938; B75M, C92, DIT, D12, F24M, F80, G57M, G79, J20, K10, K49M, K71

**Giant Viroflay:** (Monstrueux de Viroflay) 43 days. Very broad, smooth, dark-green leaves; 10 inches long and 8 inches wide at the base. Large, vigorous-growing plants, often measuring 2 to nearly 2 1/2 feet in diameter. Early and quick-growing as a spring-sown crop, susceptible to bolting. When sown in autumn it yields a considerable crop in spring. An old French cultivar. Introduced prior to 1866. VILMORIN; C28, DIT, D12, E5T, E63D, F73D, G68, G71M, K49T, P59M, Q11M, S17

**Giant Winter:** (Geant d'Hiver) 45 days. Large, smooth, semi-savoy, medium-green leaves. A special strain for late summer or fall seeding for a crop in early spring, also for normal seeding. Cold hardy, remains marketable past Christmas in mild-winter areas. A2, B8, C85M, G53M, G68, K49M, P59M, Q11M, R47, 527, S75M

**King of Denmark:** 45-55 days. Very thick, dark-green, arrow-shaped leaves, semi-savoy; of very good quality either raw or cooked. Very hardy and early maturing. A heavy yielder. Resistant to bolting, remaining in good condition 2 to 3 weeks longer than other cultivars before running to seed. Introduced in 1919. MAGRUDER 1938; D27

**Low Acid:**<sup>1</sup> A round-leaved cultivar with very little oxalic acid content, and hence said to be the sweetest of all spinach leaves. Very high in vitamins A, C, and E. An excess of oxalic acid can cause a loss of calcium in the blood. C95, N84

**Medania:** (Mediana) 45 days. Smooth, broad, dark-green leaves; semi-savoy. Vigorous, erect plant. Heat and cold tolerant, stands up to chilly springs and hot dry summers. Winters over well. Can be planted in spring, late summer or fall. Especially bred to resist bolting, allowing for a much longer harvest. Resistant to blue mold races 1 and 3. B49, C20M, D76, E97, F63, L11, N52, N81, N84, R32, S55

**Monnopa:**<sup>1</sup> 45 days. Unique spinach, with low oxalic acid (an agent that causes loss of calcium from the blood). Ideal for baby food. The oxalic acid is also related to the bitterness of spinach and

so this cultivar is particularly mild-flavored. Light-green, crinkled leaves. Bolt resistant under reasonable conditions and winter hardy. B49, L91M, Q34, R32, R47

**Norfolk:** 45-55 days. Small compact plants with small, well-crinkled leaves. An old Canadian cultivar from the 1880's. Sow seed in late spring or early summer. One of the hardiest spinaches; has the ability to tolerate -30° F. temperatures and still not succumb. A2, E24

**Resistoflay:** 45 days. Fast growing spinach recommended for short season areas. Large, smooth, thick, medium-green leaves. Suitable for fresh market or processing. Spreading type growth habit; very heavy yielding. Resistant to downy mildew races 1 and 2. Can be grown for fall and winter crops or overwintered. C28, DIT, E38, K5M

**Sigmaleaf:** (Suttons Sigmaleaf) 45 days. Moderately crinkled, medium-green leaves with an excellent flavor. Vigorous, erect plants. Can be sown in spring or autumn, and stands fit for use over a long period without running to seed. S61

**Steadfast:** 50 days. Extremely bolt-resistant type. Attractive, smooth, dark-green leaves; flavor and eating quality very good. Not as productive as some other cultivars, but will remain in a usable condition in the garden for up to 2 months or longer. Sown from late April to early summer. A2, L89

**Victoria:** (Victoria Long Standing) An heirloom cultivar from England where it is one of the standard summer spinaches. Forms an abundance of thick, dark-green leaves, and rarely runs to seed. Good for succession plantings. GENDERS 1975; U14

**Viking:** (Northland) 40 days. Thick, very large, bright-green leaves; rounded at the edges; twice as long as they are broad; moderately crinkled. Borne on long, stout stalks, well above the ground, staying clean and free of dirt. Very early and very hardy. Productive. Blight and wilt resistant. Excellent for early spring plantings. B8, C69, P59M

**Virginia Savoy:** (Virginia Blight Resistant Savoy, Old Dominion) 40 days. Erect-growing plant with medium to long, rather thick petioles that hold the leaf-blades well above the soil. Leaf-blades dark green, oval-shaped, heavily crinkled. Very cold hardy and resistant to blight, recommended for planting in the fall or early winter where blight may be present. Introduced in 1921 by the Virginia Truck Experiment Station. MAGRUDER 1938; C95, L13M, N84

**Winter Bloomsdale:** 45 days. Thick, dark-green, deeply-crinkled leaves. Long standing and slow growing, offering good production well into the season. Good for early summer production and overwintering. Cold tolerant, takes temperature extremes better than many hybrids. Resistant to cucumber mosaic virus and blue mold. A2, C2S, D68, E24, F13, F44, G57M, K10, K50, K73, L7M

#### CODES FOR SPECIAL TYPES

1. Low Oxalic Acid
2. Baby

---

## SPROUTING SEEDS {SP}

### VARIOUS GENERA

---

#### SINGLE SPROUTS

**Aduki Bean:** 2-4 days. Use jar method and grow out of direct sunlight; 1/2 cup of seed per quart jar. Soaking time 5 to 10 hours; rinse 3 to 5 times per day. Optimum temperature range 65 to 85° F. Best harvested when 1/2 to 1 1/2 inches long. Yields between 3 and 4 cups of sprouts per cup of seeds. Often used in mixtures. B31, C14, F91, E47M, H99J, L24G, L24M, L89, L91M, M67

Alaska Pea: (for sources see Pea, page 450)

Alfalfa: 4-7 days. The most popular sprouting seed and one of the easiest to grow. Use jar or tray method and grow out of direct sunlight; 2 1/2 tablespoons of seed per quart jar. Soaking time 8 hours; rinse 2 to 3 times per day. Optimum temperature range 60 to 85°F. Best harvested when 1 1/2 to 2 inches long. Should be placed near a window to turn green and develop chlorophyll. Excellent for salads, sandwiches and juicing. B31, F37T, F91, F97M, G16, G91, J20, J73, L24, L24M, M63M, M67

Alfalfa (Hardy): Preferred for sprouts in some instances because it is easier to grow. Generally less vigorous and lower yielding than either non-hardy or semi-hardy alfalfas. Yields will generally be about 20% less than those of non-hardy types. Sometimes known as dormant alfalfa. C14

Alfalfa (Non-Hardy): Generally considered more difficult to grow when used for sprouts. Much more vigorous and higher yielding than either hardy or semi-hardy types. Will produce yields approximately 20% greater than those of hardy alfalfas. Also known as non-dormant alfalfa. C14

Amaranth: 1-2 days. Use jar method; 2 to 4 tablespoons of seeds per quart jar. Soaking time 12 hours; rinse twice daily. Best harvested when 1/4 inch long and 2 days old for use in salads. For use in baked goods seeds that have sprouted for just 24 hours are best. The sprouts have a flavor that is reminiscent of curry and fenugreek and are excellent in Indian-type dishes. COLE, J.; C25M, L24G

Arugula: 4-6 days. One of the newest sprouting seeds available. Use jar or tray method; 3 tablespoons per quart jar. Soaking time 4 to 6 hours; rinse 2 to 3 times per day. Optimum temperature range 60 to 80° F. Best harvested when 1 to 1 1/2 inches long. "Green" near window for chlorophyll development. Sprouts have an excellent, nutty, spicy flavor. Q11M

Barley: 1-3 days. Use jar or bag method; 1 1/2 cups of seeds per quart jar. Soaking time 6 to 10 hours; rinse 2 to 3 times per day with cool water. Optimum temperature range 68 to 80° F. Best harvested when 0 to 1/4 inch long as soon as the first seeds sprout. Viable seed not readily available, hulled seed may be used even if no shoot appears. Freshly harvested seeds are essential for good results. Used in *essene bread* and for barleygrass. BAKER [Re]; E47M, F97M, L24G, L24M, M67

Black Beluga, Crimson, Eston, Lain!, Vert du Puy Lentils: (for sources see Lens culinaris, page 106)

Black Garbanzo Bean: (for sources see Cicer arietinum, page 103)

Anasazi, Black Turtle Soup, Cannellini, Flageolet, Great Northern, Navy, Rattlesnake, Snowcap, Soldier Beans: (for sources see Kidney Bean, page 391)

Broccoli: 3-5 days. One of the newest sprouting seeds available. In great demand due to recent nutritional findings. Use jar or tray method; 3 tablespoons per quart jar. Soaking time 4 to 8 hours; rinse 2 to 3 times per day. Optimum temperature range 65 to 80° F. Best harvested when 1 to 1 1/2 inches long. "Green" near window before first harvest. Sprouts have a pleasant, fresh flavor similar to cabbage sprouts. F91, G6, L24G, L24, L24M

Buckwheat (Unhulled): 8-15 days. Use soil or tray method; about 2 1/2 cups for an 11 by 21 inch tray. Soaking time 8 to 14 hours\* do not cover seeds with soil. Optimum temperature range 65 to 80° F. Mist the sprouting seeds once a day. Best harvested when 4 1/2 to 6 inches tall. Cut the stems about an inch above the soil. Yields succulent seedlings, called *buckwheat lettuce*, that are an excellent substitute for lettuce, B31, C14, C95M, E47M, E60P, F97M, G91, H99J, J73, L24G, L24, L24M

Cabbage: 3-5 days. Use jar or tray method and sprout in indirect sunlight; 3 tablespoons per quart jar. Soaking time 4 to 8 hours; rinse 2 to 3 times per day. Optimum temperature range 60 to 85° F. Best

harvested when 1 to 1 1/2 inches long. "Green" near window during last day for best chlorophyll development. Sprouts have a pleasant taste, fresh and aromatic. Excellent with a steamed potato or in salads and sandwiches. F97, L24M, L34

Canola: 3-5 days. Use jar or tray method; 2 to 3 tablespoons per quart jar. Soaking time 4 to 8 hours; rinse 2 to 3 times per day. Optimum temperature range 65 to 85° F. Best harvested when 1 to 1 1/2 inches long. "Green" near window during last day for best chlorophyll development. Sprouts have a mild, cabbage-like flavor. Often used in mixes. G6, H99J, L24G

Cauliflower: 3-5 days. One of the newest sprouting seeds available. Use jar or tray method; 3 tablespoons per quart jar. Soaking time 4 to 8 hours; rinse 2 to 3 times per day. Best harvested when 1 to 1 1/2 inches long. "Green" near window before first harvest. Sprouts have a pleasant, fresh flavor similar to cabbage sprouts. G6, L24M

Chia: 12-14 days. Use clay method. Soak equal amounts of seeds and water in an unglazed clay flower pot saucer. Place in water up to 1/2 inch from the rim and cover with a plate. Do not rinse. Or use a decorative chia sprouter or *chia pet* and spread the mucilaginous seeds over the surface. Optimum temperature range 65 to 85° F. Best harvested when 1 to 1 1/2 inches long. "Green" near window during last day for best chlorophyll development. The spicy sprouts are good in salads or eaten as a snack. M15M

China Rose Radish: (for sources see Radish, page 500)

Chinese Cabbage: 4-6 days. Use jar or tray method; 3 tablespoons per quart jar. Soak for 3 to 6 hours; rinse 2 to 3 times per day. Optimum temperature range 65 to 85° F. Best harvested when 1 to 1 1/2 inches long. "Green" near window during last day for best chlorophyll development. Sprouts have a rich cabbage-like flavor and are excellent in salads C14, DIT, E60P, F13, G16, G57M, J20, L24G, L24, L34

Clover: 4-7 days. Use jar or tray method; 2 tablespoons per quart jar. Soaking time 3 to 6 hours; rinse 2 to 3 times per day. Optimum temperature range 60 to 85° F. Best harvested when 1 1/2 to 2 inches long. "Green" near window during last day for best chlorophyll development. Sprouts are sweet and juicy, similar to alfalfa sprouts but larger and more flavorful. (for sources see Trifolium spp., page 111)

Cowpea: (Black Eye Pea, Chinese Red Bean, Red Pea) 2-4 days. Use jar method; 3/4 cup of seeds per quart jar. Soaking time 8 to 12 hours; rinse 3 to 4 times per day. Optimum temperature range 68 to 85° F. Best harvested when 1/2 to 1 inch long. Can be used in sprout mixtures with lentils and garbanzo beans, forming up to 10% of the mixture. Also grown as 4 to 6 inch tall seedling "lettuce" or *red pea greens*. MEYEROWITZ 1994a; C14, E60P, F91, L24G, L24

Cress: 4-7 days. Use clay method. Soak equal amounts of seeds and water in an unglazed clay flower pot saucer. Put in water up to 1/2 inch from the rim and cover with a plate. Do not rinse. Optimum temperature range 50 to 72° F. Best harvested when 1 to 1 1/2 inches long. "Green" near window during last day for best chlorophyll development. Sprouts have a spicy flavor and are good in sprout mixtures. One tablespoon of seed yields 3/4 cup of sprouts. H99J, J73, K2, L24G, S55

Curled Cress: (for sources see Lepidium sativum, page 59)

Dill: 4-6 days. One of the few herb seeds which sprouts easily without a high percentage of seed spoilage. Fresh seed is essential for satisfactory results. Use jar or bag method and sprout in indirect sunlight; 2 1/2 tablespoons per quart jar. Soaking time 6 to 10 hours; rinse 3 times per day. Sprouts have a very strong taste and are best used in breads, soups or salad dressings. C14

Dun Pea: (Field Pea) 2-3 days. Use jar or soil method; 2 cups of seed per quart jar. Soaking time 7 to 10 hours; rinse 2 to 3 times per day. Optimum temperature range 50 to 72° F. Makes an excellent

sprout, crisp and tender. Should be harvested very small, when sprout first begins to form. Sometimes sold as *porridge pea*. C14

Esparsette: (Giant Clover) 4-6 days. Use jar or tray method; 2 tablespoons per quart jar. Soaking time 3 to 6 hours; rinse 2 to 3 times per day. Optimum temperature range 60 to 85° F. Best harvested when 1 1/2 to 2 inches long. "Green" near window during last day for best chlorophyll development. H99J

Fennel: 7-10 days. Use bag or tray method; 2 1/2 tablespoons per quart jar. Fresh seed is essential for good results. Soaking time 6 to 10 hours; rinse 3 times per *dzy*. Optimum temperature 75° F. Best harvested when 1 to 2 inches long. Relatively strong-flavored sprouts, but milder than dill sprouts. Excellent in salads and grain dishes or added to sprout bread. MEYEROWITZ 1994a; C14

Fenugreek: 3-6 days. Use jar or tray method; 1/4 cup per quart jar. Soaking time 4 to 8 hours; rinse 2 times per day. Optimum temperature range 65 to 85° F. Best harvested when 1 to 2 inches long. "Green" near window during last day for best chlorophyll development. Sprouts have a unique spicy flavor, but become bitter if left to grow too long. Excellent in sprouting mixtures with alfalfa and clover, or mung beans and lentils. C14, E47M, E60P, H99J, L24, L24G, L24M, L91M, R32, S55

Flax: 2-5 days. Use clay method. Soak equal amounts of seeds and water in an unglazed clay flower pot saucer. Put in water up to 1/2 inch from the rim and cover with a plate. Do not rinse. Optimum temperature range 65-80° F. Best harvested when 1 to 1 1/2 inches long. "Green" near window during last day for best chlorophyll development. Two day old sprouts are used in drinks; older sprouts have a somewhat bitter flavor. G91, L24G, M15M

Garbanzo Bean: 2-4 days. Use jar or colander method and sprout in indirect sunlight; 1 cup per quart jar. Soaking time 8 to 12 hours; rinse 3 to 4 times per *dzy*. Optimum temperature range 68 to 85° F. Best harvested when 1/2 inch long. Usually cooked for about 10 minutes and eaten as a side-dish, or added to soups, stews, casseroles, rice or vegetables. Ideal for sprouted *hummus*. C14, E47M{PD}, F91, H99J, L24G, L24M, L89, R32

Garlic: 12-14 days. Use tray method; 2 tablespoons per quart jar. Soaking time 8 hours; rinse 2 times per *dzy*. Optimum temperature range 70 to 75° F. Transplant to a second tray when 1/4 inch long. Best harvested when 2 inches long. "Green" near window during last day for best chlorophyll development. The sprouts lack the strong odor typical of garlic. MEYEROWITZ 1994a; C14, L24G, L24M

Garlic Chives: 12-14 days. Use tray method; 2 tablespoons per quart jar. Soaking time 8 hours; rinse twice per day. Optimum temperature range 70 to 75° F. Best harvested when about 2 inches long. Place near a window before harvest to develop chlorophyll. E60P, L24, L34

Hullless Barley: 1-3 days. An excellent barley for sprouting, there being no hulls to rinse. Sprouts readily because the germ is intact. Use jar or bag method; 1 1/2 cups of seeds per quart jar. Optimum temperature range 65 to 80° F. Harvest when 1/4 to 1/2 inch long and chop or grind to use in baking. Will also grow barley grass when planted in soil. H99J, L24G

Hullless Oats: 1-3 days. An excellent oat for sprouting, there being no hulls to rinse. Sprouts readily because the germ is intact. Use jar or bag method; 1 1/2 cups of seeds per quart jar. Optimum temperature range 65 to 80° F. For making sprout breads, the sprouts are generally harvested when 1/4 to 1/2 inch long. Can also be grown in soil to produce oat grass. H99J

Jaba Radish: A rapid-growing radish used for sprouting. Similar to regular radishes, but more crispy. Good in salads, sandwiches, etc. Young leaves also make a tasty addition to salads, being ready in 25 to 35 days when broadcast from spring to autumn. N84, R32, S55

Jumbo Sunflower: (for sources see Sunflower, page 548)

Kaiware Daikon: (Sprouting Daikon) A Japanese radish developed specially for sprouting. Grows very quickly. The white stem reaches 8 to 9 inches in length in 7 to 10 days. Crisp and tender with a spicy radish flavor. SCHNEIDER 1986 [Cui, Re]; C14, D1T, D12, E13G{PR}, F91, G6, G20M{PR}, G33, G57M, H73{PR}, H99J, L24G, L24M, N40{PR}, S63M, etc.

Kale: 3-6 days. Use jar or tray method and sprout in indirect sunlight; 3 tablespoons per quart jar. Soaking time 4 to 8 hours; rinse 2 to 3 times per *dzy*. Optimum temperature range 60 to 85° F. Best harvested when 1 to 1 1/2 inches long. "Green" near window during last day for best chlorophyll development. Sprouts have a mild, cabbage-like flavor and are excellent in salads. G6, L24G

Kamut Wheat: (for sources see *Triticum polonicum*, page 182)

Kidney Bean: 2-4 days. Use jar method; 3/4 cup per quart jar. Soaking time 8 to 12 hours\* rinse 3 to 4 times per *dzy*. Optimum temperature range 68 to 85° F. Best harvested when 1/2 to 1 inch long. Generally not eaten raw due to a digestive inhibitor which is reduced, but not completely eliminated by sprouting. Can be steamed, stir-fried, or ground and fermented overnight. L24G, L24M

Leek: 12-14 days. Use tray method; 2 tablespoons per quart jar; rinse twice per *dzy*. Optimum temperature range for growth 70 to 75° F. Best harvested when sprouts reach 2 inches in length. Place near a window to develop chlorophyll before first harvest. D3M{PR}, F91

Lentil: 2-5 days. One of the most popular sprouts and also one of the easiest to grow. Use jar or bag method; 3/4 cup of seed per quart jar. Soaking time 5 to 8 hours; rinse 2 to 3 times per *dzy*. Optimum temperature range 60 to 85° F. Best harvested when 1/4 to 1 inch long. Sprouts have a sweet flavor and are excellent either raw or added to soups, stews or vegetable dishes. C14, C95M, F13, F91, J20, L24, L24M, L89, M67, R32

Millet: 1-3 days. Use jar or bag method; 1 1/2 cups per quart jar. Soaking time 5 to 7 hours\* rinse 2 to 3 times per *dzy*. Optimum temperature range 70 to 80° F. Best harvested when 0 to 1/8 inch long. Viable seed not readily available, hulled seed may be used even if no shoot appears. Sprouts have a mild, nutty flavor which blends well with most kinds of foods. Also used for dehydrating and juicing. F97M, G91, L24G

Mung Bean: 3-5 days. Use jar or tray method; 1/3 cup per quart jar. Soaking time 5 to 10 hours; rinse 3 to 5 times per day. Optimum temperature range 68 to 85° F. Best harvested when 1 to 3 inches long. One of the few sprouts which should be grown in darkness for best results. Straighter sprouts are produced by the tray method, and when the sprouts are disturbed as little as possible in the container. Unsprouted or "hard" seeds can be an annoyance, and should be eliminated with a mesh frame. CHANG, W. [Re], DAHLEN [Pre, Re], HAWKES [Re]; C14, D65, F37T, F91, G57M, G82, G91, J20, J73, L24, L24G, L24M, L89, S63M

Mustard: 4-6 days. Use jar or tray method; 3 tablespoons per quart jar. Soaking time 4 to 6 hours; rinse 2 to 3 times per day. Optimum temperature range 65 to 85° F. Best harvested when 1 to 1 1/2 inches long. "Green" near window during last day for best chlorophyll development. Sprouts have a hot, spicy flavor and can be added to sprouting mixes with alfalfa and clover, forming 10 to 15% of the mixture. Dried sprouts are used as a condiment. C14, E24, G6, J73, S55. (see also *Brassica juncea*, page 53, *Brassica nigra*, page 53 and *Sinapis alba*, page 60)

Oats: 1-3 days. Use jar or towel method; 1 1/2 cups per quart jar. Soaking time 3 to 5 hours; rinse 1 to 2 times per day with cool water. Best harvested when 0 to 1/4 inch long. Viable seed not readily available, hulled seed may be used even if no shoot appears. Excellent for sprouted grain bread and juicing. Also good in salads, soups and dressings, or dried and made into *sun granola*. F97M, L24G

Oilseed Radish: 4-5 days. Very popular and easy to sprout. Use jar method and 3 tablespoons of seeds. Optimum temperature range 60 to 80° F. Best harvested when 1 to 6 inches long. "Green" near window during last day. Spicy flavor similar to common radish, but slightly milder than kaiware daikon. Excellent alone or in mixes. H99J, L24G

Onion: 12-14 days. Use tray method; 2 tablespoons per quart jar. Soaking time 8 hours; rinse 2 times per d<sup>^</sup>. Optimum temperature range 70 to 75° F. Best harvested when 2 inches long. Should be placed near a window to turn green and develop chlorophyll. C14, G6, H99J, J20, L24G, L24M

Oregon Sugar Pod Pea: (for sources see Pea, page 450)

Pea: 2-5 days. Use jar or soil method; 2 cups of seed per quart jar. Soaking time 7 to 10 hours; rinse 2 to 3 times per day. Optimum temperature range 50 to 72° F. Best harvested when 1/4 to 1/2 inch long. Yields between 3 and 4 cups of sprouts. Can be used in sprout mixtures with lentil, wheat, sunflower and buckwheat, forming 25% to 70% of the mixture. Sprouts are very sweet and are excellent raw, as a cooked vegetable or added to soups. Both green and yellow types are available. B6, C14, DIT, E47M, F91, F97M, H99J, L24, L24G, L24M, L34, L89, M67

Peanut: 2-6 days. Use jar or bag method; 1 cup per quart jar. Soaking time 8 to 12 hours; rinse 2 to 3 times per day. Optimum temperature range 68 to 85° F. Best harvested when 1/4 to 3/4 inch long. Can be used in sprout mixtures with garbanzo beans, lentils, soybeans and mung beans, forming 10 to 25% of the mixture. Valencia types sprout best. Dry roasted sprouts make a flavorful, easy to digest snack. In India, a delicacy is prepared by seasoning sprouted peanuts with various spices. MEYEROWITZ 1994b, ROSENGARTEN; L24M

Popcorn: 2-3 days. Use jar method; 1 1/2 cups per quart jar. Soaking time 10 to 14 hours; rinse 2 to 3 times per d<sup>^</sup>. Optimum temperature range 68 to 85° F. Harvest when 1/4 to 1/2 inch long. Sprouts are somewhat less sweet than those from sweet corn. Best in soups, casseroles and breads. Usually ground or blended with water before use. L24G

Psyllium: 12-14 days. Use clay method. Soak equal amounts of seeds and water in an unglazed clay flower pot saucer. Put in water up to 1/2 inch from the rim and cover with a plate. Do not rinse. Optimum temperature range 65 to 80° F. Best harvested when 3/4 to 1 1/2 inches long. "Green" near window during last day for best chlorophyll development. Sprouts have a mild flavor and are eaten in salads or as a snack. M15M

Pumpkin: 0-2 days. Use jar method; 1 1/2 cups per quart jar. Soaking time 4 to 6 hours; rinse 2 times per day. Optimum temperature range 65 to 85° F. Best harvested when 0 to 1/8 inch long. Viable seed not readily available; hulled or hullless seed may be used even if no shoot appears. Sprouts have a mild, delicate flavor. Excellent in soups, salads, dressings and blended fruit drinks. Soaked seeds make a very good fermented *seed cheese*. L24G

Quinoa: 1-4 days. Use jar or bag method; 1/3 cup per quart jar. Soaking time 2 to 4 hours; rinse 2 to 3 times per day. Optimum temperature range 55 to 80° F. Best harvested when 1/4 to 1 1/4 inches long. "Green" near window during last day for best chlorophyll development. After 1 day of sprouting, sprouts have a mild flavor and can be used like sesame or sunflower seeds. At later stages they have a red tint and are very good in salads and sandwiches. Sprouts develop a slightly bitter taste if grown too long. WOOD, R.; H99J, J56, L24G, L24M, S55

Radish: 4-6 days. Use jar or soil method; 3 tablespoons per quart jar. Soaking time 4 to 8 hours; rinse 2 to 3 times per d<sup>^</sup>. Optimum temperature range 60 to 85° F. Best harvested when 1 to 2 inches long. "Green" near window during last day for best chlorophyll development. Sprouts have a hot, spicy flavor and are very popular in sprout mixtures with alfalfa and clover, forming about 10% of the mixture. Dried sprouts can be used as a condiment. SCHNEIDER

1986 [Cui, Re]; E47M, F37T, F91, F97M, G16, G91, J73, L24, L89, M15M, M46

Red Lentil: Use jar or bag method; 3/4 cup of seed per quart. Soaking time 5 to 8 hours; rinse 2 to 3 times per day. Optimum temperature range 60 to 80° F. Best harvested when 1/4 to 1 inch long. Both hulled and unhulled types are available. Sprouts have a sweet flavor and are excellent either raw or cooked. B6, C14, E24, F91, H99J

Rye: 2-3 days. Use jar or soil method; 1 cup per quart jar. Soaking time 6 to 10 hours; rinse 2 times per d<sup>^</sup>. Optimum temperature range 50 to 72° F. Best harvested when 1/4 to 1/2 inch long, when the roots are no longer than the seed. Roots become long and fibrous if allowed to continue sprouting. Should be refrigerated if not used immediately. Excellent for juicing and sprouted grain *essene bread*. BAKER [Re]; B31, C14, E24, E47M{ED}, G91, H99J, K74M{PD}, L24G, L24M

Sesame: 2-3 days. Use jar method; 2 cups of seed per quart jar. Soaking time 6 to 8 hours\* rinse 3 to 4 times per d<sup>^</sup>. Optimum temperature range 60 to 85° F. Best harvested when 1/8 inch long. Sprouts have a mild flavor after 1 day of sprouting. Can be used in sprout mixtures with sunflower and almond, forming 10 to 20% of the mixture. L24G

Snowbean: 3-4 days. First introduced by Thompson and Morgan in 1983 as Sweet Lupin Sprouts, the name was later changed to the current Snowbean Sprouts. It is said to have a particularly desirable sweet, nutty flavor, and to be much more wholesome or substantial compared with other sprouts. BISSELL; L24G

Soybean: 3-4 days. Use jar or colander method; 3/4 cup per quart jar. Soaking time 4 to 8 hours; rinse 3 to 4 times per d<sup>^</sup>. Optimum temperature range 65 to 85° F. Harvest when 1 1/2 to 2 inches long. Best results are obtained with sprouters that have holes in the bottom, so the sprouts are never agitated during rinsing. Generally not eaten raw due to digestive inhibitors, which are not completely destroyed during sprouting. Usually boiled for 10 to 15 minutes with salt and oil and eaten with rice or millet. DAHLEN [Pre, Re], PIPER [Cu, Re]; C14, C95M, F97, G91, L24G, M67

Spelt Wheat: (for sources see Triticum spelta, page 182)

Sundak Sunflower: (for sources see Sunflower page 548)

Sunflower (Hulled): 1-3 days. Use jar or bag method; 1 cup per quart jar. Soaking time 2 to 4 hours; rinse 2 times per day. Optimum temperature range 60 to 80° F. Unsprouted seeds should be removed after the second day as they will rot and may spoil the whole batch. Best harvested when 0 to 1 inch long. Excellent in salads, blended fruit drinks, salad dressings, or as an addition to sprouted wheat breads. Also used for making sprouted *seed cheese*. MEYEROWITZ 1994b [Re]; B31, F91, L24G

Sunflower (Unhulled): 8-15 days. Use soil or tray method. Soak 10 to 14 hours. Optimum temperature range 60 to 80° F. Best harvested when 3 1/2 to 6 inches long. Can be grown in any sunny window. Harvest by cutting 1 inch from the soil, or by pulling the entire plant from the soil. Succulent seedlings, called *sunflower lettuce*, have a rich flavor and are an excellent substitute for lettuce. Also used for juicing, as a snack, for drying, or as a garnish. Contains chlorophyll and many vitamins, minerals and enzymes. C14, E47M, E60P, F91, H99J, L24, L24G, L24M, N7D

Triticale: 2-3 days. Use jar or soil method; 1 cup of seeds per quart jar. Soaking time 6 to 10 hours; rinse with cool water 2 to 3 times per day. Optimum temperature range 60 to 80° F. Best harvested when 1/4 to 1/2 inch long, when roots are no longer than the seed. Excellent for sprouted grain bread. Also good in salads and soups. L24M, M67

Turnip: 3-5 days. Use jar or soil method; 3 tablespoons of seed per quart jar. Soaking time 4 to 8 hours; rinse 2 to 3 times per d<sup>^</sup>. Optimum temperature range 65 to 85° F. Best harvested when 1 to 1 1/2 inches long. "Green" near window during last day for best

chlorophyll development. Yields between 3 and 4 cups of sprouts. Has an excellent cabbage-like flavor and is eaten in salads. L24G

Watercress: 4-5 days. Use jar or tray method; 3 to 4 tablespoons per quart jar. Soaking time 4 to 8 hours; rinse 2 to 3 times per day. Optimum temperature range 60 to 80° F. Best harvested when 1 to 3 inches long. "Green" near window during last day for best chlorophyll development. Excellent in soups, salads and sandwiches. L24G

Wheat: 2-3 days. Use jar or soil method; 1 cup hard red wheat per quart jar. Soaking time 6 to 10 hours; rinse 2 times per d<sup>^</sup>. Optimum temperature range 55 to 80° F. Best harvested when 1/4 to 1/2 inch long. Excellent for making sweet, rich, moist sprouted wheat or *essene bread*, which is not baked, merely dried in the sun or a low oven. Also used for *wheatgrass*, harvested after 7 to 10 days, at 5 to 6 inches tall—which is primarily used for juicing. Soft white wheat is preferred for snacking or making *rejuvelac*, sprouted pastries, and *sprout nuts*. BAKER [Re], MEYEROWITZ 1994a, MEYEROWITZ 1994b [Re]; A33M{PD}, B31, C95M, E22{PD}, E47M{PD}, F9I, F97M, G6, G91, J73, K74M{PD}, L24, L24{PD}, L24M, R32, etc.

#### SPROUT MIXES

Christmas Present: 3 to 4 days. Unique, gourmet blend of mung and aduki beans, and green peas. Requires a 2-step process. Use jar or tray method and soak 1/4 cup of mung beans and adukis for 8 to 12 hours. Rinse 2 to 3 times per d<sup>^</sup>. After 2 days, add the peas to a different container and repeat procedure. Will keep 7 to 21 days refrigerated. Excellent for snacking or sauteed in garlic butter. L24M

French Garden: 3-5 days. Gourmet sprouting mix. Combines clover, alfalfa, arugula, cress, radish, broccoli and fenugreek. Use jar or tray method; 2 tablespoons per jar. Soak 8 to 12 hours; rinse 2 to 3 times per d<sup>^</sup>. "Green" in indirect sunlight on the fourth d<sup>^</sup>. De-hull in a bowl of water. Excellent raw in salads and sandwiches. L24M

Halloween Treat: 2-3 days. Gourmet sprouting blend of black garbanzo beans, and red and black lentils. Will grow to approximately twice their original weight. Use jar or tray method; 1/2 cup of seeds and 2 cups of water. Soak 8 to 12 hours; rinse 2 to 3 times per d<sup>^</sup>. Refrigerate when no longer damp. Excellent in sprouted fried rice or with mustard sauce and spices. L24M

Hot and Sweet: 3-4 days. Distinctive, gourmet mixture of radish, wheat, 2 types of peas, and 2 types of lentils. Requires a 2-step process. Use jar or tray method and soak 3 tablespoons of radish seeds for 8 hours. Rinse 2 to 3 times per d<sup>^</sup>. After 2 days, soak 1/3 cup of the remaining seeds for 8 to 12 hours. Rinse once and again after 8 to 12 hours. De-hull and refrigerate when no longer damp. Excellent raw. L24M

Italian Blend: 3 to 5 days. Gourmet mix of garlic, alfalfa, clover, broccoli and cress. Use jar or tray method; 2 tablespoons per jar. Soak 8 to 12 hours; rinse 2 to 3 times per day. "Green" in indirect sunlight on the fourth day. De-hull in a bowl of water. Excellent in salads, sandwiches, tacos, pizzas, etc. L24M

Long Life Mix: 3-5 days. Gourmet mixture of broccoli, cabbage, cauliflower, arugula, cress, mustard and radish. Use jar or tray method; 2 tablespoons per jar. Soak 8 to 12 hours; rinse 2 to 3 times per day. "Green" in indirect sunlight on the fourth day. De-hull in a bowl of water. Excellent in salads, sandwiches, tacos, burritos, etc. L24M

Nick's Hot Sprout Salad: 3-5 days. Gourmet mix of clover, radish, mustard, dill, celery and cress. Use jar or tray method; 2 tablespoons per jar. Soak 8 to 12 hours; rinse 2 to 3 times per d<sup>^</sup>. "Green" in indirect sunlight on the fourth day. De-hull in a bowl of water. Excellent in salads, sandwiches, tacos, quesadillas, etc. L24M

Oriental Greens: 3 to 5 days. Unique, gourmet blend of alfalfa, mizuna, tatsoi and oriental mustard. Use jar or tray method; 2 tablespoons per jar. Soak 8 to 12 hours; rinse 2 to 3 times per day. "Green" in indirect sunlight on the fourth day. De-hull in a bowl of water. Excellent in salads and sandwiches, blended with juices, etc. L24M

Pea Carnival: 2 to 3 days. Gourmet mixture of green, yellow and speckled peas. Use jar or tray method; 1/2 cup of seeds and 2 cups of water. Soak 8 to 12 hours; rinse 2 to 3 times per d<sup>^</sup>. Refrigerate when no longer damp, 8 to 12 hours after final rinse. Excellent for snacking, spreads, or adding to a rice pot. L24M

Peasant Mix: 2 to 3 days. Gourmet mix of green, red, French, chocolate and black lentils. Use jar or tray method; 1/2 cup of seeds and 2 cups of water. Soak 8 to 12 hours; rinse 2 to 3 times per d<sup>^</sup>. Best harvested when "tails" first appear. Refrigerate when no longer damp. Excellent for snacking or in stir fries, curried salads, and soups. L24M

Rainbow Bean Mix: A mixture of 5 different colorful beans. Includes green lentils, Fiench Verte du Puy lentil, sweet green pea, yellow pea and adzuki bean. Use a bag or vertical sprouter and grow as for individual beans and peas. Harvest when small for best flavor. Good either raw or cooked. L24, L34

Russian Mix: 3 to 5 days. Unique, gourmet mix of clover, mustard, onion, dill, broccoli and fenugreek. Use jar or tray method; 2 tablespoons per jar. Soak 8 to 12 hours; rinse 2 to 3 times per day. "Green" in indirect sunlight on the fourth d<sup>^</sup>. De-hull in a bowl of water. Excellent in salads and sandwiches, as a topping for pizza, etc. L24M

San Francisco Mix: 3 to 4 days. Gourmet blend of mung beans, peanuts, 3 types of garbanzos, adukis, 4 types of lentils, and 3 types of peas. Requires a 2-step process. Use jar or tray method and soak 1/4 cup of mung beans and adukis for 8 to 12 hours. Rinse 2 to 3 times per day. After 2 days, add the remaining seeds to a different container and repeat procedure. Excellent for snacking, hummus, or making sprouted bean burgers. L24M

Smoothie Mix: 4-6 days. Selected mixture of lentils, canola, clover and alfalfa. Optimum temperature range 60 to 80°. Harvest when 1 to 4 inches tall. "Green" near window to develop chlorophyll. Excellent for blending into smoothies. L24G

Spicy Lentil Crunch: (Zesty Lentil Crunch) 4-6 days. Delicious blend of Eston lentils, alfalfa, red clover, radish, canola, and a trace of black mustard. Optimum temperature range 60 to 80°. Harvest green sprouts when 1 to 4 inches tall. Mildly spicy flavor. Very popular and easy to grow. H99J, L24G, L89C

Spicy Sprout Mix: A classic, zesty sprout mixture that usually consists of alfalfa, red clover and radish seeds, chosen because they compliment one another and mature at about the same time To mix your own, use 1 tablespoon of radish, 1 tablespoon of red clover and 4 tablespoons of alfalfa. D3M{PR}, E13G{PR}, L24M, L89, N40{PR}

## SQUASH {S}

CUCURBITA MAXIMA  
CUCURBITA MOSCHATA

CUCURBITA MIXTA  
CUCURBITA PEPO

### SUMMER SQUASH

These are usually harvested when about half-grown, before the seeds have become hard. They can be eaten raw or cooked, but are generally not canned or frozen. Some cultivars, such as Jersey Golden Acorn, can be harvested as summer squash when small or used as winter squash if left to mature. C. pepo unless otherwise noted.

**SCALLOP SQUASH***Hybrid*

Peter Pan: 50 days. Uniform, well-scalloped fruit, 2 1/2 to 3 inches in diameter at harvest size; small blossom end scar; tender, light green skin; pale green flesh, meaty, of excellent quality. Vigorous, bush-like vine; very productive, produces over a long period; widely adapted. All America Selections winner in 1982. A16, B75, C85M, F13, G82, G93M, H95, 139, 191, K50, K73, M46, N16

Scallopini: 52 days. Deep scalloped-shaped fruit, with medium fluting, 2 1/2 to 3 inches in diameter at harvest size; skin dark green; flesh pale green, meaty, sweet and nut-like, reminiscent of zucchini. Compact vines; extremely productive over a long season. Excellent for home gardens and local markets. All America Selections winner in 1977. B73M, C92, G27M, G82, G93M, 164,167M, K49Z, K50, L42, L89C, N40{PR}

Sunburst:<sup>1</sup> 52 days. First hybrid yellow scallop squash. Deep scallop-shaped fruit, with medium fluting; skin soft, bright deep-yellow, with a dark green "sunburst" pattern; tender, creamy white flesh, flavor delicate and buttery. Very attractive when picked as "baby" squash, with the blossom still attached. Compact vine; spreads to 2 1/2 feet. All America Selections winner in 1985. C44, C53, E13G{PR}, G6, H73{PR}, 139, K66, K73, L89, N40{PR}

*Open-Pollinated*

Benning's Green Tint: 55 days. Scallop-shaped fruit; 2 to 2 1/2 inches deep, 3 to 4 inches in diameter at harvest size; skin pale green; flesh pale green, thick, tender, fine-textured. Medium-sized bush; semi-open; very productive over a long period. Popular for home gardens, fresh market and shipping. *DIT*, E5T, E97, G6, G13M, G71M, G93M, L7M, L89, M32, M95M, N52, Q34

Golden Scallopini: 55 days. Saucer-shaped, golden fruits with scalloped edges, 3 to 5 inches wide Very good flavor, especially when picked small. Bush-type plant, early and productive, remains productive throughout the growing season if picked regularly. Italian heirloom from the 19th Century. 199M, K23{PL}, K49T, L13M

White Bush: (Early White Bush, White Patty Pan) 55 days. Deep scallop-shaped fruit; 2 1/2 to 3 inches deep, 5 to 7 inches in diameter; skin pale green, nearly white when ripe; flesh milky white, tender, succulent. Compact, bush-like vine; very productive Very popular home garden cultivar. Of ancient and unknown origin. BURR, TAPLEY 1937; A75, A87M, B75, F80, F92, G79, H33M, K49M, K71, L7M, N16, R47

Wood's Earliest Prolific: 50 days. Slightly scalloped fruit; 2 to 2 1/2 inches deep, 3 to 3 3/4 inches in diameter; skin heavily and uniformly tinted with pale green, pale greenish-white when mature. Bush-like vine; very productive, will produce fruits throughout the season when continuously harvested. Introduced in 1899 by T.W. Woods & Sons, Richmond, Virginia. TAPLEY 1937; F46, K49M, L13M, N84

Yellow Bush: (Golden Bush, Early Yellav Bush, Yellow Custard) 60 days. Deeply scalloped fruit; 3 inches deep, about 5 inches in diameter at harvest size; skin deep yellow, irregularly mottled with pale yellow; flesh yellowish-white, firm, fine-grained, flavorful. Bush-like plant, spreading to about 3 feet; very productive. Introduced prior to 1860. BURR, TAPLEY 1937; B8M, C95, G57M, K10, K49M, K71, L7M, L13M

**ZUCCHINI***Hybrid*

Arlesa:<sup>1</sup> 48 days. High quality French *courgette* type. Cylindrical fruit; skin glossy green, flecked with lighter green, thin; flesh firm, very flavorful; stays firm and fresh in storage. Best picked at "baby" size, but stays tender when larger. Vigorous, highly prolific plant.

Upright bearing habit and relatively spineless leaves and stems makes for easy harvesting. J97M, K66

Butterblossom:<sup>2</sup> 45 days. Developed to produce more prolific yields of extra large, firm golden-yellow male blossoms over a longer season. In Europe the male blossoms, which do not bear fruit, are sold as *squash bouquets* and used for stuffing. Female blossoms will produce fruit if not removed, and are most often sold attached to tiny zucchinis, the size of a little finger. BRENNAN [Cul, Re], SCHNEIDER 1986 [Cul, Re]; C44, D26D, D68, E63D, F63,177, M49

Cousa: (Lebanese Zucchini, Egyptian White Zucchini) 51 days. Short, cylindrical fruit, 3 to 5 inches long; skin pale greenish-white when young, turning buff colored when ripe; flesh fine-textured, of excellent quality, flavor unique. Easy to find and pick. Widely used in Lebanese and Middle Eastern cuisine. Vigorous, compact, bushy vine; very high yielding. MALLOS [Re]; D68, K49M, K49T, K73, L42, L77D, R11M

Ghada: 48 days. Cylindrical fruit, slightly tapered at the stem end, 5 to 6 inches in length at harvest size; skin light greenish-yellow, very smooth; flavor excellent. Fairly compact, very productive plant. Very early. A standard cultivar in the Middle East where it is popular for stuffing. C53, L42

Gold Rush: 52 days. Uniform, straight fruit, 7 to 8 inches long; skin deep golden-yellow, glossy with contrasting rich green stems; flesh creamy white, flavorful. Vigorous, open, single-stemmed plant; highly productive; easy to pick. Excellent for home gardens and specialty markets. All America Selections winner in 1980. A16, B75M, C44, C53, D11M, E63D, F70, F82, G6, G71, H61, 139, J97M, K73, L89, M46, N16, etc.

Gourmet Globe:<sup>1</sup> (Apple Squash) 50 days. Globe-shaped fruit, 3 to 4 inches in diameter; skin dark green, with light green stripes; flesh creamy white, firm but tender, very flavorful. Excellent eaten raw in salads; also good for stuffing and sauteing. Specialty market item when picked young as "baby" squash. Upright, open-bush type plant; very prolific. C20M, 191, N52

Roly Poly: 50 days. Unique, round, Middle-Eastern type zucchini. Very attractive, small, globe-shaped fruits; thin, light-green skin; very good, creamy, nutty flavor. Ideal for stuffing, each one making a single portion. Single-stemmed, prolific plants. Introduced by W. Atlee Burpee & Co. B75

Sardane:<sup>2</sup> 48 days. The large blossoms are excellent for sauteing, or for stuffing and baking still attached to the young fruit. Long, cylindrical fruit; skin deep dark-green, glossy; flesh firm, solid, flavorful. Bush-type, high yielding vine; relatively free of irritating spines. Can be succession sown for a fall crop in mild-winter climates. L91M

Spineless Beauty:<sup>3</sup> 50 days. Unique spineless type, free of leaf or stem spines. Uniform, cylindrical fruit, 7 1/2 to 8 1/2 inches long; skin medium green, very smooth, waxy; flesh crisp, white. Vigorous, medium open plant; sets continuously and produces high yields. Easy to harvest, with minimal fruit damage. AI, D26D, D76, F63, G13M, G16, G82, H61, /50G, J84, K10, K50, K73, L42, M29, etc.

*Open-Pollinated*

Black Zucchini: (Black Beauty) 50 days. Straight, cylindrical fruit, slightly ridged; grows to 9 inches long, but best quality is obtained when picked at 6 inches; skin dark blackish-green, glossy; flesh greenish-white, firm but tender, flavorful; small seed cavity. Semi-upright, prolific plant; has an open growth habit for easy picking. A25,y4Z5, B75M, C44, F60, G57M, H33M, H61,J97M, K50, K73, L7M, N16, R47

Burpee's Fordhook:<sup>2</sup> 57 days. Produced more male blossoms than most other summer squash in trials conducted by Burpee Seed Company. Long, cylindrical fruit; straight to slightly curved; skin smooth, deep blackish-green; flesh creamy white, tender, freezes

well; best when 8 to 12 inches long. Vigorous, bush-like plant. All America Selections winner in 1942. B8M, B75, G57M, N52, PIG

Caserta: 55 days. Cylindrical fruit, slightly tapered towards the stem end, 6 to 8 inches in length; skin grayish-green, streaked and mottled with darker green; flesh creamy white. Bush medium large, vigorous, open; very productive. For home gardens, local markets and shipping. All America Selections winner for 1949. C20M, C97, DIT, G57M, G79, G93M, J97M, K49T, N52

Cocozelle: (Italian Vegetable Marrow, Cocozella di Napoli) 55 days. Long, slender, nearly cylindrical fruit; slightly enlarged at the blossom end; ribbed; skin pale greenish-yellow, prominently striped with very dark green; flesh firm, greenish-white, very flavorful. Best harvested when 6 to 8 inches long. Moderately vigorous, bush-type plant. TAPLEY 1937; C44, D68, E24, E59Z, E63D, F44, G27M, I39, I59M, J25M, K23{PL}, K27M, L13M

Costata Romanesca: (Roman Ribbed) Very distinct strain of zucchini with long, fluted or ribbed fruit. Medium green-striped skin, with white flecks. Rich flavor. Will grow to 2 feet long and still remain tender. Develops a very long ovary at the blossom stage. Usually picked when less than 8 inches long and fried whole, with the flower. When cut, the slices are scalloped on the edges. Very large, vining plant. D29P, D68, G6, J73, L11, L94, M27, Q34

Dark Green Zucchini: 55 days. Cylindrical fruit, slightly tapered towards the stem end; 6 to 8 inches long at harvest size; very dark green skin; flesh greenish-white, fine-textured, of strong flavor. Popular for home gardens and fresh markets. Medium-large, bush-type plant. A2, A16, A75, C85M, E24, F80, G27M, G71M, G79, G93M, H42, K10, K71, L7M

French White: (French White Bush Zucchini) 50 days. Vigorous white bush zucchini from France. Firm flesh, mild but flavorful; seed cavity small. At its peak of flavor when 3 to 5 inches long. Very popular and versatile. Semi-bush type plant. F73D, I39, K20M

Golden Zucchini: (Burpee's Golden Zucchini) 55 days. Medium-long, slender, cylindrical fruit; attractive, glossy, bright golden-yellow skin; distinctive flavor. Excellent raw or cooked. Compact, bush-type vine. Developed by W. Atlee Burpee Company, from genetic material supplied by Dr. Oved Shifriss, Rutgers University. B75, C20M, G57M, J73, K10, K49M, PIG

Grey Zucchini: 50 days. Small to medium-sized fruit; straight when young, becoming slightly tapered toward the blossom end; skin smooth, medium-green, mottled with attractive grey specks, very attractive; high quality flesh, small seed cavity; ships and stores well. Bush-type vine; highly productive over a long period. A75, A87M, B75M, DIT, D12, F44, F60, G13M, G27M, G57M, G79, K5M, K71, L7M, N16, etc.

Lebanese Light Green: 40-50 days. Slightly bulbous fruit, tapered at the stem end; lime green exterior, cream interior; excellent, sweet flavor. Weight 1 to 2 pounds but better picked when small. Capable of withstanding variable climatic conditions. Very popular in the Middle East. B49

Long Cocozelle: (Long Dark Cocozelle) 50 days. Long, narrow, straight fruit; skin smooth, dark green, with light green stripes; flesh greenish-white, firm, very flavorful, of excellent quality. Best harvested when 6 to 10 inches long. Vigorous, bush-type plant. Popular home garden and local market cultivar. B8M, C20M, C69, D74B, G57M, G71, G79, I84, K49M

Long Green Trailing: (Long Green Striped Vegetable Marrow, Green Striped) 58 days. Nearly cylindrical fruit, slightly tapered towards the base; skin irregularly striped with dark and light green; flesh pale greenish-white. Moderately vigorous, trailing vine, 12 to 15 feet long; best grown on a fence or trellis. An old-fashioned English cultivar. TAPLEY 1937; B49{OR}, K20M, N84, R32, S55, S61

Long White Bush: (White Bush Vegetable Marrow) 55 days. Nearly cylindrical fruit; 10 to 12 inches long, 3 to 3 1/2 inches in

diameter; skin creamy white; flesh greenish-white, fine-textured, delicately flavored. Very prolific, bush-type plant. An old English cultivar, introduced into the United States prior to 1824. TAPLEY 1937; A16, C85M, D11M, D27, E38, FI, F70, G71, I67M, L42, M49, PIG

Rondede Nice: (Tonda di Nizza) 45 days. Unique, globe-shaped zucchini. Skin very fine and delicate, bruises easily, pale green. Very flavorful, greenish-white flesh. Can be harvested up to 5 inches in diameter without loss of quality or flavor. Saute whole when 1 inch in diameter. Ideal for stuffing when tennis ball size. Very vigorous, quick-growing plant. For home gardens and specialty growers. B49, B75, C53, C92, E63D, G68, G93M, K23{PL}, K49T, K66, L91M, M46, PIG, Q11M, R32, R47, S55, etc.

Round Zucchini: 45 days. Small, globe-shaped fruit, 2 1/2 inches in diameter; with slight ridges; skin grey-green; flesh creamy white, firm but tender, flavorful. Ideal for stuffing. Very productive, bush-type plant, produces fruit throughout the summer. B75M, C20M, DIT, D12, F60, F82, G57M, PIG

Striata d'Italia: 50 days. Medium-long, cylindrical fruit, 8 to 9 inches in length; somewhat bulbous at the blossom end, faintly ribbed; thin skin, striped and mottled with light and dark green; excellent texture and flavor. Bushy but open plants, easy to harvest. Highly regarded in Italy for its earliness and flavor. B8, J20, Q11M, S17

Table Dainty: 60 days. English marrow type. Medium-sized, cylindrical fruit; skin striped with dark and pale green; flesh very firm, retains firmness when cooked. Good for stuffing; excellent when fried; also makes good wine and marrow jam; keeps well. Vigorous, trailing vine, 18 to 20 feet long; very productive. Introduced by Suttons & Sons of Reading, England, in 1909. TAPLEY 1937; K20M, S61

Tatume: 50 days. Oval to slightly elongated fruit; 7 inches long, 5 inches in diameter at maturity; skin medium to dark green, faintly striped with lighter green; flesh firm, flavorful; keeps well. Very vigorous, trailing vine. Popular in Texas and parts of Mexico. Used to prepare a famous Mexican chicken soup. A1, A87M, D68, F71M, H61, K20M, L77D, L88J

Tender and True: English marrow type. Nearly round fruit, distinctly flattened at top and bottom; 5 to 6 inches in diameter; skin mottled with light and dark green; flesh firm but tender, flavorful. Best harvested when young. Semi-trailing, moderately vigorous vine. Introduced as a novelty in 1907 by Sutton & Sons, Reading, England. TAPLEY 1937; K20M, S59M, S61

Winter Zucchini: 65 days. Long, dark-green fruit; usually picked at 6 to 8 inches long when the skin is glossy. Firmer and sweeter than other zucchinis, but less productive. Large, bush-like plant with large leaves that provide cover for cold protection. Adapted to frost-free, coastal areas of southern California. Should be planted between September 15th and October 15th. Hand pollination may be required in weather too cold for bee activity. Developed by Charles B. Ledgerwood of Carlsbad, California. G71M

## OTHERS

### *Hybrid*

Goldbar: 60 days. Hybrid straightneck type for commercial and home garden use. Uniform, cylindrical fruits; 5 to 6 inches long at harvest size; smooth, golden-yellow skin; creamy yellow, smooth textured flesh. Compact, bush-type vine; has an upright, open growth habit for easier harvesting; highly productive over a long season. G27M, G79, H54, H61, J20, K10, K50, K73, M46, N16

Multipik: 50 days. Straightneck type fruit, 7 to 8 inches long; skin creamy yellow, glossy; flesh light and sweet with a true squash flavor. Strong, bush-type plant; very productive. Resistant to fruit-greening caused by cucumber mosaic virus. Contains a "precocious yellow gene" which causes increased production of female flowers,

resulting in early and continuous bearing. *A87M, C20M, F13, G1M, G13M, N16*

**Pic-N-Pic:** 50 days. Crookneck type, more attractive than standard Yellow Crookneck strains. Bright golden-yellow fruit with small blossom scars; smooth, unwarded skin and tender flesh. Best when picked small. Heavy yielding plant with an open growth habit; bears over a long period. Fruits are easy to see and harvest from a single stem. *B75, F63, K50*

**Seneca Prolific:** 51 days. Productive straightneck type. Long, cylindrical fruit, tapered towards the stem end; smooth, attractive bright yellow skin; light green stems; firm flesh. Erect, bush-type plant allows closer spacing for maximum yields; has an open growth habit for easier harvesting; highly productive throughout the growing season. *B75M, D68, G1M, G6, G71, G79, H61, K10, K73, M95M, N16*

**Sun Drops:**<sup>1</sup> 50-55 days. Unique, oval-shaped light yellow fruit with a mild, nutty flavor. Perfect for stuffing. Harvest when immature as "baby" squash with the blossom attached, or when fruit is 3 to 4 inches in diameter. Compact, bush-type plant; suitable for the small garden. All America Selections winner for 1990. GORMAN [Re]; *C20M, E91G, F63, G27M, G71, G93M, H57M, I50G, 191, K10, K73, L91M, M95M, N52*

**Sundance:** 52 days. Early hybrid crookneck type. Curved, club-shaped fruit; medium thick neck with a full crook, making for less breakage; very smooth, bright yellow skin; firm, creamy white flesh; small blossom scar. Very compact, bush-like plant; widely adapted. Good for home gardens and commercial production. *B6, B73M, E53M, G27M, G79, G82, G93M, 139, J20, L42, M29, N16*

#### *Open-Pollinated*

**Early Prolific Straightneck:** 50 days. Cylindrical, club-shaped fruit; 5 to 7 inches long at harvest size; skin light yellow, sparsely warted; flesh creamy yellow, firm but tender, succulent. Large, semi-open bush; very productive. Standard straightneck type for home gardens, local markets and shipping. All America Selections winner in 1938. *A25, A75, B75M, B78, C44, D82, G71, H61, H95, I64, K73, L7M, M46, N16*

**Maltese Marrow:** Elongated, pear-shaped fruit with aromatic, orange-yellow flesh that is fine-textured and delicious. Used immature as a pale yellow zucchini. Mature fruit is traditionally cut in two lengthwise, stuffed, and baked whole. The fruit stores well. Short, vining plant. *PIG, R47*

**Royal Knight:** 50 days. Unique summer squash in the crookneck class. Bottle-shaped fruit with a slightly crooked neck, resembles Yellow Crookneck in size and shape; skin light green with a slight tint of yellow; excellent flavor. Should be harvested before the fruit turns very dark ebony green. Can be eaten fresh or cooked. Introduced in 1982 by Hollar and Co. *U14*

**Tromboncino:** (*Zuccheta Rampicante d'Albenga*) (*C. moschata*) Very long, slender fruit; curved at the stem end, bulbous at the blossom end; skin light yellow-green; flesh very firm, flavor mild, sweet, delicious. Best harvested when 8 to 18 inches long. Very vigorous, vining plant, grows 30 to 40 feet in a season; requires a strong trellis. *C53, 177, J20, K66, L79, N84, 089, Q11M, Q34, R32, S55*

**Yellow Crookneck:** (Early Golden Summer Crookneck, Dwarf Summer Crookneck) 55 days. Distinct, curved, club-shaped fruit, bulbous at the blossom end; 8 to 9 inches long; skin golden-yellow, warted; flesh pale yellowish-white. Freezes well. Moderately vigorous, bush-like plant; very productive. Popular home garden cultivar. Introduced prior to 1828. *BURR, TAPLEY 1937; A25, A75, B78, C44, E24, E38, F82, G6, H33M, H61, J97M, K23{PL}, L7M, N16, R47, etc.*

**Zapallo del Tronco:** (Redondo di Tronco) 85 days. Round, medium-green fruit, 2 1/2 to 3 1/2 inches in diameter. Can also be

left to mature to a winter squash which keeps and ships extremely well. Excellent, characteristic flavor picked young or old. Busty, upright plant. Very popular in South America as a fresh market and home garden cultivar. *B49, K10*

#### WINTER SQUASH

Slower growing than summer squash, most require a long season and grow on long, trailing vines. They have shells that are hard enough to permit them to be stored during the winter. Many are canned for use in pumpkin pies.

#### ACORN SQUASH (*C. pepo*)

##### *Hybrid*

**Carnival:** 85 days. Very unusual and attractive variegated squash. Uniform, acorn-shaped fruit, 5 inches high and 4 inches wide; striped, splashed and mottled with various shades of green, yellow and orange. Delicious, golden-yellow flesh, improves in flavor with storage. Vigorous, semi-bush plant, very high yielding. Popular specialty market item. *C20M, D11M, E13G{PR}, E75{PL}, F13, F70, G13M, K57{PL}, N40{PR}*

**Cream of the Crop:** 82 days. Unique creamy-white skinned acorn squash. Uniform fruits weigh 2 to 3 pounds. Golden-cream colored flesh with a mild, nutty flavor. Very good for baking and stuffing; can also be used as a delicious summer squash when immature. Stores well. Compact, bush-type plant spreads 3 to 4 feet. Yields are comparable to the best acorn types. All America Selections winner for 1990. GORMAN [Re]; *A1, B73M, D65, F13, G16, G27M, G82, G93M, /50G, 191, J97M, K10, K50, K73, L91M, M29, M49, etc.*

**Heart erf Gold:** 90 days. Distinctive type, intermediate in shape between an acorn squash and Sweet Dumpling. Blunt, heart-shaped fruit, 4 1/2 inches by 5 1/2 inches; creamy white, striped and mottled with dark green; flesh yellowish-orange, dry, very sweet, fine-grained. Excellent as table fare or decoration. Vigorous, semi-bush plant. *B73M, B75, C85M, D26D, D65, F63, G13M, G71M, G82, H61, 191, J84, K10, K50, K73*

##### *Open-Pollinated*

**Bush Table Queen:**<sup>4</sup> 85 days. Very similar in color, size, shape and keeping qualities to the regular Table Queen. High quality, orange flesh; cooks dry and sweet. Bush-type vine, spreads to only 3 feet in diameter; sets the same number of fruit per plant as trailing types; widely adapted. *A25, A75, B75, B75M, C20M, C92, F60, G13M, G79, K10, L7M, N52*

**Ebony Acorn:** (Table Queen Ebony) 100 days. Improved Table Queen type. Uniform, acorn-shaped fruit, prominently ribbed; skin deep green, attractive; flesh thick, deep-orange, fine-textured, dry, sweet. Has good keeping qualities. Vigorous, highly prolific vine. Developed by Dr. Henry Munger, Cornell Univeisity. *A2, B49, B78, F44, G6, G71, K73, N84, R47*

**Gill's Golden Pippin:** 100 days. Very small, deeply ribbed fruit, 1/2 to 3/4 inch in diameter; weight 1 to 2 pounds; golden-yellow skin, slightly streaked with pale yellow; flesh more orange and drier than most acorns. Vigorous, semi-running vines; highly prolific. Old Native American cultivar. *A2, C95*

**Jersey Golden Acorn:** 50-85 days. Dual-purpose squash. Can be harvested as summer squash when small, or left to mature for winter squash. Skin light yellow, becoming bright golden-orange when ripe; flesh pale golden-yellow, thick, fine-grained, sweet and tender; has a nutty flavor when mature. Contains 3 times more vitamin A than green acorn types. All America Selections winner in 1982. *C20M, C95, G57M, N40{PR}*

**Royal Acorn:** (Royal Table Queen, Mammoth Table Queen) 85 days. Similar to Table Queen, but larger and more prolific. Small fruit; 5 1/2 inches in diameter; weight 2 to 4 pounds; medium dark-green skin, sometimes turning yellow to orange at full maturity; flesh pale orange, medium thick, very tender, dry, sweet, flavorful.

B6, C69, F60, F63, G13M, G57M, H21,164, I67M, K10, K49T, M29, N16

Snow White:<sup>4</sup> Well-shaped fruit with smooth, pure-white skin. Bush-type plant; produces and abundance of early maturing fruits. Superior to other white acorn types in spite of the fact that it will occasionally produce plants with green fruits and white flesh. Primary breeding work done by Glenn Drowns of the Seed Savers Exchange. J9M

Swan White: (White Acorn) 90 days. Similar in shape to other acorn squash, but with more pronounced ribbing; weight 2 1/2 pounds. Skin snow-white, turning creamy yellow; flesh pale yellow, smooth; flavor delicate and sweet. High in calcium. Can also be harvested when 3 inches long and used like zucchini. High yielding. Good specialty market item. Developed by Mrs. G. Swan, a customer of Stokes Seeds. C20M, L42

Table Gold:<sup>4</sup> 80-90 days. Improved Jersey Golden Acorn type. Deeply ribbed, heart-shaped fruit, about 4 inches tall and 4 1/2 inches across; weight 1 1/2 pounds; flavorful, orange-yellow, medium-grained flesh. Can be harvested after 65 days when fruits are bright yellow, or after maturing to dark orange. Compact, bush type plant. A1, B8M, C85M, D26D, F13, F63, G13M, G16, G82, G93M, H61, J9M, K10, K73, L42, M49, etc.

Table King:<sup>4</sup> (Table King Bush) 80 days. Small, ribbed fruit, pointed at the blossom end; 5 inches in diameter; weight 1 to 1 1/2 pounds; skin smooth, dark grayish-green; flesh yellow-orange, thick, tender; flavor excellent, improving in storage. Short-vined plant; widely adapted. Ideal for small gardens. All America Selections Winner in 1974. D11M, D65, E24, F70, G71, G83M, G93M, H33M, H61, K71, K73, L79, L89, M46, M49, etc.

Table Queen: (Acorn, Des Moines) 85 days. Small turbinate fruit; 5 to 6 inches long; deeply furrowed; skin deep dark green, changing to dull orange in storage; flesh pale orange, firm, tender, moderately dry, moderately sweet, of good flavor; quality good. Moderately vigorous vine, 12 to 15 feet long. The original acorn squash, introduced in 1913. TAPLEY 1937; A16, A25, A75, B75M, C85M, C92, D11M, D65, D68, FI, F60, F70, G79, H33M, L7M, N16, etc.

#### BUTTERCUP SQUASH (*C. maxima*)

##### *Hybrid*

All Season:<sup>4</sup> 90 days. Attractive, oval, bright-orange fruit; weight approximately 3 1/4 pounds; has a delicious nutty flavor typical of Buttercup squash. Excellent for baking and winter storage. Bright yellow immature fruits may be eaten as a summer squash in as little as 65 days. Compact plant, spreads only 3 feet, produces 5 to 8 squash. G13M, G82,191, K10, M95M

Sweet Mama:<sup>4</sup> 100 days. High quality "cupless" Buttercup type. Flattened globe-shaped fruit; weight 2 1/2 pounds; skin deep green, with light green stripes and blotches; flesh very thick, deep yellow, very sweet, has a nutty flavor; stores well. Compact, semi-bush type vine, to 4 feet long; somewhat tolerant to wilt and vine borer. Good for home gardens and specialty markets. All America Selections winner in 1979. SCHNEIDER 1986 [Cui, Re]; D11M, D65, FI, F70, G13M, H95,139,191, K10, K73, L42, M46, M49, S63M

##### *Open-Pollinated*

Burgess Strain: 100 days. Relatively uniform, blocky, turban-shaped fruits with a small blossom end "button"; 8 inches in diameter; weight 3 to 3 1/2 pounds; skin deep green, furrowed with light green stripes; flesh medium-orange, fine-grained, fiberless, rich and sweet. Released by the North Dakota Agricultural Experiment Station. A2, D82, FI, F60, G6, H61, H95,139, K71, K50, K73, L7M, L42, M46, M49, etc.

Buttercup: 105 days. Unique turban-shaped fruit, with a distinctive protruding "button" at the blossom end; weight 3 to 4 pounds; skin deep green, flecked and striped with grey; flesh deep orange, texture

very fine, sweet, of excellent quality and flavor. Moderately vigorous vine, 10 to 12 feet long. Introduced in 1931 by Oscar H. Will & Company, Bismark, North Dakota. SCHNEIDER 1986 [Cul, Re], TAPLEY 1937; A16, A25, B75M, C85M, E59Z, E75{PL}, F82, F92, H33M, N24M

Emerald:<sup>4</sup> (Emerald Bush Buttercup) 80 days. An improved strain of bush buttercup. Uniform, turban-shaped fruit; 4 1/2 inches deep, 6 1/2 inches in diameter; medium dark-green skin; thick, orange-yellow, sweet flesh. Short-vine plant, grows 3 to 4 feet across. Ideal for limited space gardens. C20M, C44, D68, D74B, FI, F60, G13M, G16, G82, K73, M49, N24M, N52

#### BUTTERNUT SQUASH (*C. moschata*)

##### *Hybrid*

Early Butternut: 80 days. Uniform, blocky fruit, bulbous at the blossom end; 10 to 12 inches long; skin smooth, thin and hard, evenly tan; flesh deep orange, medium dry, fine-textured, of very good flavor and quality. Compact, semi-bush vine. Excellent for home gardens and commercial production. All America Selections winner in 1979. A87M, C85M, D11M, D65, E91G, F13, F70, G79, G93M, H61,164, K49Z, K73, N16

Zenith: 88 days. Exceptionally uniform fruit, averages 2 1/2 pounds in weight; thick, cylindrical neck; smooth, tan skin; flesh deep orange, fine-textured, sweet, of very high quality. High yielding. For home gardens, local markets and commercial growers. A1, D65, F60, F63, G1M, G13M, G82, H61,164, J84, K10, K50, K73, L42, L89, M29, N16, etc.

##### *Open-Pollinated*

Butterbush:<sup>4</sup> (Burpee's Butterbush) 75 days. The first bush-type butternut, introduced in 1978. Short, compact vine; only 3 to 4 feet long; bears 4 or 5 fruit. Small, blocky fruit; weight 1 1/2 to 1 3/4 pounds; smooth, tan skin; deep reddish-orange flesh. Excellent storage qualities. Ideal for gardeners with limited space. B6, B75, C85M, D76, F63, J9M, J20, L79, L88J

Butternut: 95 days. Bottle-shaped fruit; 8 inches long, 3 to 4 inches in diameter at the blossom end; weight 3 to 5 pounds; skin smooth, buff-colored, thin and hard; flesh bright-orange, firm, fine-grained, dry, sweet, of very good quality; keeps very well. Excellent for baking. A16, A25, B78, E59Z, F82, F92, H49, M95M, N24M

Hercules: 95 days. Large, straight, blocky fruit; 12 to 15 inches long, 4 1/2 inches in diameter; weight 4 1/2 to 5 pounds; skin buff-colored, thin and hard; flesh rich orange, firm, dry, fine-textured, sweet, of very good flavor and quality; has a very small seed cavity; keeps very well. Vigorous, highly productive vine. All America Selections winner in 1963. C20M, G79

Ponca: 90 days. Similar to Waltham butternut, but more uniform in size and shape and slightly smaller. Blocky, cylindrical fruit; 6 to 8 inches long; weight 1 1/2 to 2 1/2 pounds; skin smooth, hard, evenly tan; flesh light orange, fine-textured, sweet, of very good quality; has a small seed cavity; keeps well. Highly productive, compact vine. Developed at the University of Nebraska. C95, F63, G13M, K10, K49M, K73, M32, M46, N52, S75M

Puritan: 100 days. Smaller strain of Waltham butternut. Uniform, blocky fruit; 7 inches long, 4 inches in diameter; smooth, cylindrical neck free of crooknecks; weight 2 to 3 pounds; smooth, tan skin; rich orange flesh, dry, of very good flavor. Released by the Massachusetts Agricultural Experiment Station. J84, K50

Waltham: 95 days. Uniform, blocky fruit; 8 to 10 inches long, 4 1/2 to 5 1/2 inches in diameter at the blossom end; weight 3 to 4 pounds; skin light tan to buff, thin and hard; flesh dark-orange, fine-textured, medium dry, sweet, of excellent quality and flavor; has a very small seed cavity; stores well. Very popular. All America Selections winner in 1970. A75, B49, B75M, C44, G6, G16, H33M, H61, K73, L7M, M46, N16, R47

HUBBARD SQUASH (*C. maxima*)

Baby Blue: 90 days. Small, flattened to round fruit, 5 to 6 inches in diameter; weight 5 to 7 pounds; skin grayish-blue, warted; flesh yellow-orange, thick, sweet, dry, flavor very good; stores well. Excellent for baking. Ideal size for the average family. Also popular with market gardeners. Semi-bush type. Blue Hubbard x Buttercup. Developed by Professor E.M. Meader. A2, C20M, D26D, D68, E13G{PR}, F63, K10, K71, L13M, N40{PR}

Blue Hubbard: 110 days. Large, nearly globular fruit, with a neck at both ends; 15 to 18 inches long, 9 to 12 inches in diameter; weight 12 to 15 pounds; skin blue-grey, hard and thick, coarsely warted; flesh bright yellow-orange, thick, dry, fine-textured, very sweet; stores extremely well. Highly productive. Standard winter storage type. Introduced in 1909. TAPLEY 1937; A25, C44, D65, E13G{PR}, F60, F80, G6, G71, G79, K73, L13M, L89, M46, N40{PR}, R47, etc.

Chicago Warted: (Green Chicago Warted Hubbard, Warted Green Hubbard) 110 days. Largest of the Green Hubbard types. Nearly globular fruit; pointed at the blossom end, rounded at the stem end; 13 to 15 inches long; weight 12 to 14 pounds; skin deep dark-green, heavily warted, thick, very hard; flesh rich golden-yellow, thick, fine-textured, dry, sweet. Good for shipping and storage. Introduced in 1894. TAPLEY 1937; B75M, C20M, F73D, G13M, G16, G79, G82, G93M, H61, J84, K10, K71, K73, L42, M49, etc.

Gold Mountain:<sup>4</sup> 95 days. Space-saving orange Hubbard type. Large orange fruits weighing 10 to 20 pounds each; thick, sweet flesh. Relatively easy to cut. Runnerless plants can be spaced 2 feet by 4 or 5 feet apart for high yields. Produces 1 to 3 fruits per vine. Developed by Tim Peters of Peters Seed & Research. J9M

Golden Hubbard: (Red Hubbard) 100 days. Relatively small fruit; 10 to 12 inches long, 8 to 9 inches in diameter; skin slightly warted, orange to orange-red, striped with tan toward the blossom end, attractive; flesh deep orange-yellow, moderately dry and sweet, firm, of good flavor and quality. Keeps very well. Introduced in 1898. TAPLEY 1937; A16, A25, G57M, G79, G93M, J20, K10, K49M, K50, K71, K73, L42

Green Hubbard: (True Hubbard, True Green Hubbard) 110 days. Medium-large fruit; nearly globular, tapered at both ends; 12 to 15 inches long; weight 9 to 12 pounds; skin dull bronze green when mature, thick, very hard, slightly warted; flesh orange-yellow, thick, fine-grained, firm, dry, moderately sweet; keeps very well. Introduced about 1798. BURR, TAPLEY 1937, VILMORIN; A16, A25, D27, E38, FI, F60, F92, G79, H54, I64, K10, K50, K71, L13M, N40{PR}, etc.

Kitchenette: (Baby Green Hubbard) 105 days. Small, slightly curved fruit, tapered abruptly to a short constricted neck; 8 to 9 inches long; weight 5 to 7 pounds; skin deep green, moderately warted; flesh deep yellow, very fine; dry, sweet, well flavored. Excellent for baking. Ideal for family use. Developed by Richard Wellington. Introduced in 1919. TAPLEY 1937; C20M, D26D, D82, K10, N34{PR}, N52

Little Gem: 80 days. Miniature Golden Hubbard type. Small, bright-orange fruit; weight 3 to 5 pounds; flesh deep orange, thick, dry, fine-grained, sweet and flavorful. Excellent for pies or baking whole. Good storage capabilities. Vigorous, highly productive vine. A2, C95, E5T, F73D, G68, L77D, L88J, M49, S55

New England Blue: 110 days. Largest strain of Hubbard squash, typically about 1/3 larger than regular Hubbard squash but may reach 30 to 45 pounds. Also higher yielding. Very large, necked fruit; roughly warted, bluish-gray rind; orange flesh of fine flavor and texture. Keeps very well. Vigorous and quick-maturing for its size. D11M, E24, F60, F70, G13M, G57M, G93M, H21, K10, L42, N52

KABOCHA SQUASH Japanese squash notable for their superior flavor, rich sweetness and nearly fiberless flesh. When baked or steamed they have a balanced flavor of sweet potato and pumpkin. They are also braised, added to salads or pumpkin *risotto*, deep-fried in tempura batter, or simmered in *oden* stew or *dashi* stock. COST 1988 [Cul], CUSUMANO [Cul, Re], SCHNEIDER 1986 [Cul, Re]. (*C. maxima*, *C. moschata*). N40{PR}

*Hybrid*

Delica: (Ebisu) 75-85 days. High quality kabocha squash, one of the top sellers in Japanese markets. Flattened, globe-shaped fruits weighing about 21/2 pounds; striped and mottled with light and dark green; thick, yellow-orange flesh, dry, very sweet and nutty. Good storage capabilities. Very uniform and vigorous; highly productive. A16, C20M, D55, E24, G13M, G33, G93M, K10, K73, M49, N52, S63M, TIM

Golden Debut: 105 days. Unique orange-skinned type with skin that is edible after cooking. Medium-sized, oblate fruit; skin attractive, green, turning bright scarlet orange at maturity, with slightly mottled vertical stripes; flesh yellow, very sweet, moist, less starchy than Home Delite. Excellent boiled or baked; ideal for squash pies. C20M, M46, N52

Honey Delite: 95 days. Medium-small, flattened globe-shaped fruit; weight 2 to 4 pounds; skin dark forest-green, striped with moss-green; flesh bright rich-orange, very sweet and flavorful, cooks up dry and flaky; quality excellent; stores well. Good specialty market item. C20M, C92, G6, G13M, G33, J20, K10, K16M, L42, L79G, N52

Shintosa: (*C. maxima* x *C. moschata*) 100 days. Slightly flattened, globe-shaped fruit with shallow ribbing; rind dark green, waxy, somewhat bumpy; weight 4 to 5 pounds. Used by Japanese and Chinese in rice cakes, or steamed or baked like a sweet potato. Very vigorous, productive plant; resistant to disease and insects; does well under dry or wet conditions. E83T, Q3, Q28, S70

Tetsukabuto: (*C. maxima* x *C. moschata*) Nearly round fruit, 8 inches in diameter; glossy dark green rind, lightly mottled and ribbed; thick, deep orange flesh with a very sweet yam-like flavor; stores very well. High yielding. Good specialty market item. Very popular in Japan. Also used as a disease-resistant rootstock for watermelons, melons and cucumbers. C20M, L59, J20, L79G, Q3, Q28, S63M, S70

SPAGHETTI SQUASH (*C. pepo*)*Hybrid*

Hasta-La-Pasta: 75-80 days. Colorful new orange spaghetti squash. Small, elongated fruits, 6 to 8 inches long and 4 or 5 inches across. The perfect size for a family meal. Deep orange inside and out; high in beta carotene; mild, pleasant flavor. Compact plants, suitable for dense plantings, very heavy yielding. B75, K50

Qrangetti: 85 days. An attractive orange spaghetti squash. Small, oblong fruit; 8 inches long, 6 inches in diameter; weight 2 to 2 1/2 pounds; skin golden-orange, smooth; flesh bright orange. Higher in vitamins A and C than other types of spaghetti squash. Semi-bush type plant; bears numerous fruit close to the crown. C20M, P75M, M95M

Pasta: 85-90 days. Improved type with better flavor and texture. Long, cylindrical fruit, 10 to 12 inches in length and weighing about 4 pounds; creamy yellow skin; butter yellow strands of delicate flavor and texture. Excellent served with pasta sauce or chili. Medium-sized vine, very productive, yields concentrated sets of uniform fruits. B75, D26D, D68, F63, G13M, G16, G57M, G71, G82, G87, H57M, H61, 139, 191, K10, K50, K73, etc.

Stripetti: 95 days. Unique hybrid of Spaghetti Squash and Delicata. Attractive, elongated fruit, 8 inches long and 4 inches in diameter; weight about 4 pounds; cream-colored skin, striped and mottled with green, turning orange when well ripened; creamy-yellow flesh,

sweeter and better flavored than other types. Very uniform. Suitable for long term storage or shipping. *F60, F63, G13M, K10, K50, L42*

Tivoli:<sup>4</sup> 98 days. Unique bush spaghetti squash. Medium-large, oval fruit, 9 1/2 inches long and 6 inches in diameter; rind smooth, pale creamy yellow; flesh separates into noodle-like strands when cooked. Vigorous, space-saving bush, may have a few short vines. All America Selections winner for 1991. *AI, C92, E24, E97, G13M, G27M, G71, G82, H61, J20, J84, K10, K16M, K57{PL}, L91M, M29, etc.*

White Fall: Oblong, creamy-white fruit; 9 inches long, 6 inches in diameter; weight 5 1/2 pounds; flesh crisp, tender, creamy-white when fresh, turning yellow after cooking (steaming). Fruits reach maturity 40 days after flowering. May be stored for months. Well adapted to mild, cool climates. *Q39*

#### *Open-Pollinated*

Spaghetti Squash: (Vegetable Spaghetti) 100 days. Unique squash with spaghetti-like strands of flesh. Small, oval fruit; 8 to 10 inches long, 6 to 8 inches in diameter; weight 1 1/2 pounds; skin yellow, changing to buff-colored when ripe, smooth; flesh golden-yellow; stores well. Usually boiled or baked whole. Can also be used in breads, muffins, pancakes, puddings, etc. Introduced in 1934 by Sakata Seed Company, Yokohama, Japan. *FELL 1982a [Pre, Re], SCHNEIDER 1986 [Cui, Re]; A16, E63D, F60, G6, J73, K10, K16M, L13M, L59, M46, M49, N16, 053M, R47*

#### OTHERS

##### *Cucurbita maxima*

Arikara: 72 days. Small, oval-tapered fruit; 9 to 10 inches long; widely ribbed; weight 6 to 8 pounds; skin pale salmon pink; flesh deep yellow, tender, moderately moist and soft, flavor lacking, faintly sweet; quality poor. Extremely dependable producer under drought conditions. Originated with the Arikara Indians of the Fort Berthold reservation, North Dakota. Named and introduced by Oscar H. Will & Company, Bismark, in 1920. *TAPLEY 1937; L13M*

Ambercup: (F<sub>1</sub>) 100 days. Attractive, slightly flattened, globe-shaped fruits; 5 to 6 inches in diameter and weighing 2 or 3 pounds; smooth, bright orange rind, faintly ribbed; firm, deep orange flesh, dry, nutty, very sweet and rich; quality excellent. Good storage qualities. Vigorous, high yielding vine. *B75, E24, F13, G13M, G16, G82, G83M, H61, 139, K10, K50, K73, L42, L89, L91M, M29, M49, etc.*

Atlantic Giant: (Dill's Atlantic Giant) 125 days. Developed by Howard Dill of Nova Scotia for producing extremely large fruits, consistently weighing 400 to 500 pounds or more. A yearly world record holder since 1979. An all-time world record of 1,061 pounds was obtained from this cultivar in 1996. Yearly international competition was established in 1983 under the rules of the World Pumpkin Federation. *B73M, C92, D6, D65, E5T, F1, G16, G71, H42, H95, 181, J97M, K50, L79, M46, M49, N16, etc.*

Blue Kuri: 100 days. Japanese squash derived from Hubbard. Small, globular fruit, weight 4 to 5 pounds; skin blue-green, fairly smooth; flesh yellow-orange, thick, dry, fine-grained, very sweet, of good quality. Heavy yielding vine. Does well in short season areas. For roadside stands and specialty markets. *A2, B49, C20M, D55, G13M, G33, G93M, 177, K10, N52, R32, S63M*

Boston Marrow: 100 days. Nearly globular fruit, abruptly tapered at the stem end; 12 to 14 inches long, 10 to 11 inches in diameter; widely ribbed; weight 12 to 16 pounds; skin apricot-orange; flesh orange-yellow, moderately fine-grained, tender, fairly sweet and rich, moderately moist; quality *ikir*. Introduced in 1831. *BURR, TAPLEY 1937; A75, C95, E5T, G57M, G71, 163Z, K49M, K73*

Chestnut: 105 days. Medium-small, flattened globe-shaped fruit; weight 2 to 4 pounds; skin dark slate-green; flesh deep orange, thick, very sweet and dry. Good for storage, with sweetness increasing during the first few weeks after harvest. Moderate yields. The result

of "target breeding" for high sugar and dry matter. Very popular in natural foods and macrobiotic markets. *C95, D3M{PR}, G6, N84, R47*

Flat White: (Flat White Boer) 100 days Very flattened, ridged, white-skinned fruit; sweet, orange-colored flesh; leaves no fiber when passed through a sieve. Makes a pie that is lighter in color. Keeps well. Imported from South Africa. *A2, G68, K49M*

Gold Nugget:<sup>4</sup> (Golden Nugget) 85 days. Small, round to slightly flattened fruit; 5 inches in diameter; weight 1 1/2 to 2 pounds; skin bright orange, hard; flesh yellow-orange, thick, fine-grained, of good quality and flavor; keeps well. Short-vined plant; produces 5 to 8 fruit. All America Selections winner in 1966. *SCHNEIDER 1986 [Cui, Re]; B1M, D3M{PR}, E13G{PR}, F44, K49M, L89, M49, N40{PR}, R32, R47, TIM*

Golden Delicious: 105 days. Small, heart-shaped fruit; 10 to 12 inches long, 8 to 10 inches in diameter; weight 8 to 10 pounds; skin reddish-orange, striped with pinkish-buff; flesh orange-yellow, thick, dry, medium-textured, of good quality. Widely used for commercial canning and freezing. Boston Marrow x Delicious. Introduced in 1926. *TAPLEY 1937; C20M, D26D, E75{PL}, F13, F60, F63, G13M, G57M, G82, K10, K71, L42, M46, N52*

Jarrahdale: 95-100 days. Highly decorative and useful. Medium to large, flattened fruit with heavy, rounded ribs; average weight 6 to 10 pounds; striking, slate gray skin; thick, orange flesh, moderately sweet, quality good to very good. Stores well. Very popular in Australia. Once carried by Yates Co., now maintained by amateur seed savers. *B49, G6, G68, 118M, K10, K20M, PIG, Q34*

Lakota: 85 days. Very unique and decorative. Similar to a type once prized by the Lakota Sioux, hence the name. Teardrop-shaped fruits, 8 inches by 9 inches and weighing 5 to 7 pounds; rind bright orange, mottled with dark green; yellow-orange flesh, fine-grained, sweet and nutty. Excellent for baking and pies. Will occasionally produce solid green or orange fruits. *B75, K50, Q34*

Marina di Chioggia: (Chioggia, Sea Squash) Small, flattened fruit; weight 5 to 7 pounds; skin dark grayish-green, coarsely wrinkled with large protuberances; flesh bright orange, very firm, very mealy. In Italy, the fruit is boiled, baked or pureed, and also used in minestrone soup, and an unusual *risotto*. Unripe fruit can be used in relishes and preserves. Widely grown around Venice. *BIANCHINI; C53, N84, Q11M, S17, S55*

Mayo Blusher: 120 days. Large, round to elongated fruit; skin light green to white, blushed with pink when fully ripe; flesh apricot-colored, sweet, excellent for "pumpkin" pie; stores well. Adapted to the low hot desert, where it is planted in early spring. *A2, 116, K46T, N84*

Mooregold: 90-95 days. Blocky, flattened, globe-shaped fruit; 6 inches tall by 4 inches deep; weight 3 to 4 pounds; skin bright orange, faintly striped with salmon; thick, smooth-textured, bright orange flesh, flavor very good. Stores and freezes well. Developed at the University of Wisconsin by Professor J.G. Moore, in the 1940's. Still popular in the Midwest. *E24, G16, J9M*

Pink Banana Jumbo: 105 days Very large, cylindrical fruit, slightly curved towards the stem end; 48 inches long; weight up to 75 pounds; skin grayish-green, turning bright pink at maturity, thin, very hard; flesh light orange, thick, fine-textured, sweet, of high quality. Good for pies or baking. Very popular in California. Usually cut in sections for fresh market or used for processing. *B75M, C92, D76, G82, G93M, H61, H85M, H95, 164, K71, N16*

Queensland Blue: 150 days. Small, drum-shaped fruit; 8 to 9 inches in diameter; weight 6 to 9 pounds; skin blue-grey, hard and thin; flesh deep orange, very fine-textured, firm and solid, dry, moderately sweet, of good flavor; quality very good. An old popular Australian cultivar. Introduced into the United States in 1932. *TAPLEY 1937; E13G{PR}, G68, 177, J39, K20M, K49M, N40{PR}, N84, PIG, R47, TIM*

Red Kuri: (Orange Hokkaido, Uchiki Kuri, Baby Red Hubbard) 92 days. Nearly globular fruit, tapered at both ends; weight 5 to 8 pounds; skin smooth, bright reddish-orange; flesh yellow-orange, thick, fine-grained, dry, sweet and rich; keeps very well. Good for pies. High yielding. Of Japanese origin. BELLEME 1993; B49, D68, G6, G93M, 177, K49M, L13M, N40{PR}, N52, N84, S55, S63M

Rouge Vif d'Etampes: (Bright Red Etampes) (Cinderella) 125 days. Medium-large, flattened fruit; 9 to 10 inches deep, 16 to 18 inches in diameter; weight 30 to 35 pounds; prominently ribbed; skin bright orange-red, glossy, attractive; flesh coarse, fibrous, moderately moist and tender, quality fair to poor. Originated in France in the middle of the 19th century. Reportedly the model for Cinderella's fairy-tale coach. TAPLEY 1937, VILMORIN; A2, B49, C53, C92, C95, D3M{PR}, D26G, D65, E63D, F80, G6, G16, G68,177, K23{PL}, K49M, K49T, K66, K73, P59M, etc.

Sibley: (Pike's Peak) 120 days. Relatively small fruit; oblong-pyriform; 10 to 12 inches long; weight 8 to 10 pounds; skin bluish gray; flesh pale orange, very fine-textured, tender, slightly moist, somewhat sweet, of fair flavor and quality. Probably of American Indian origin. Introduced in 1887. TAPLEY 1937; K49M, N84

Spanish Valencia: Large, flattened fruit, hollowed on both ends; weight 15 to 20 pounds; skin grey-green blotched with pink when ripe, often with a light bloom, very hard; flesh yellowish-orange, thick, extremely sweet. Keeps for an exceptionally long time, up to 2 years. Long, trailing vine; tends to be a shy bearer; requires a long, warm growing season. One of the sweetest of all squashes, reminiscent of a high quality, moist-fleshed sweet potato. LI 1

Sweet Meat: (Oregon Sweet Meat) 110 days. Large, flattened globe-shaped fruit; weight 10 to 15 pounds; skin thick, very hard, slate gray; flesh golden-yellow, thick, fine-grained, very sweet and rich. Has excellent keeping qualities. Local favorite in the Pacific Northwest. Originated in Portland, Oregon by Gill Brothers Seed Co. A2, D82, E24, F13, F82, G57M, G83M, H95,139,177, K10, L89, N52

Triamble: (Triangle) 135 days. Small, trilobular fruit, arranged in a triangle; 4 to 5 inches deep, 10 to 12 inches in diameter; weight 10 to 15 pounds; deeply furrowed; skin bluish-grey, smooth; flesh pale orange, thick, slightly fibrous and granular, somewhat sweet, of fair flavor and quality. Introduced into the United States from Australia, in 1932. TAPLEY 1937; N84, R47

Turk's Turban: (Turk's Cap) 115 days. Distinct turban-shaped fruit; 10 to 12 inches in diameter; weight 8 to 10 pounds; skin variously striped with red to green to white and orange; flesh light orange, fine-grained, rather juicy, tender; quality poor. Mostly used for ornament. Introduced at the beginning of the 19th century or earlier. BURR, TAPLEY 1937, VILMORIN; B75M, C92, D11M, E24, F60, F70, G71, G79, G93M, H61, K73, N16, N40{PR}

Umatilla Marblehead: 115 days. Large, uniform, oval fruits, often weighing up to 40 pounds; rind grayish-green, slightly ribbed, free of warts; flesh pale orange, very thick (1 1/2 to 2 1/2 inches), fine-grained, quite sweet; flavor and quality very good; keeps well. Vine vigorous, trailing, highly productive; resistant to curly top virus. An old local favorite in Oregon. L3J, L77D

Whangaparoa Crown: (Crown) 140 days. Small, drum-shaped fruit; blossom scar with a button, giving a crown-like appearance; weight 10 to 12 pounds; skin grey, hard; flesh deep yellow, very firm and hard, slightly stringy, moderately dry and sweet, quality fair to good. Popular in New Zealand and Australia, where it is used for pies and as a cooked vegetable. Introduced into the United States in 1932. TAPLEY 1937; C95, N84, TIM

#### *Cucurbita mixta*

Chompa:<sup>5</sup> Medium-sized winter squash, usually eaten when young or grown for its edible seed. Grows well in poor soil. From the

Zapotec Indians of Oaxaca, Mexico. THEODOROPOULOS; F80, N84

Golden Striped Cushaw: 110 days. Strain of Green Striped Cushaw. Large, pear-shaped fruit; long neck, may be straight or crooked; weight 25 to 30 pounds; attractive golden-yellow skin, striped with white; flesh gold-colored, thick, smooth, sweet; keeps well. F73D, K10, K71

Green Striped Cushaw: Medium-large fruit; pear-shaped, with long, slightly curved neck; 16 to 20 inches long; weight 12 to 16 pounds; skin cream-white, mottled with green; flesh pale yellow, coarse and fibrous, moist, slightly sweet, quality poor. Used for pies and baking or for livestock feed. Very popular home garden cultivar. Introduced prior to 1893. KAVENA [Pre, Re], TAPLEY 1937; A87M, E97, F60, G71, H61,163Z, J20, J97M, K49M, K71, L7M, N16

Santo Domingo: 90 days. Medium-large, pear-shaped fruit; weight 15 to 20 pounds; skin striped with light and dark green; sweet, pale yellow flesh; stores well when not bruised. Can be used as a summer squash when picked young. The tasty seeds are also edible. Drought tolerant. F73D, K46T, N84

Silver Edged:<sup>5</sup> Grown for the large, tasty spectacular seeds, white with silver edging. Seeds are roasted for *pepitas* or used in *pipian sauce*. A Mesoamerican land race. Adapted to the high semi-desert where it is planted in early spring or with the summer rains. 116, N84

Tamala de Game:<sup>5</sup> (Meat Tamala) Large, buff-colored fruit, variable in shape. Has skin that remains soft even when fruit is ripe and that can be cooked and eaten along with the bright orange, juicy flesh. Seeds are edible. Grows best in hot weather. THEODOROPOULOS; F80, N84

Tennessee Sweet Potato: 105 days. Medium-large, pear-shaped fruit; 12 to 15 inches long; weight 12 to 15 pounds; skin pale yellow, striped with greenish-yellow; flesh light yellow, thick, coarse and granular, dry, fine-grained, moderately sweet, quality poor to good. Popular in the South. Originated prior to 1883. TAPLEY 1937; K20M, K46T

White Cushaw: 120 days. Medium-large, crookneck fruit, 18 to 20 inches long and 8 to 9 inches in diameter; weight 12 to 16 pounds; skin pure white, sometimes with faint green stripes; flesh coarse, rather stringy, moist, moderately tender, quality poor. Resembles Green Striped Cushaw. Introduced in 1891. TAPLEY 1937; D26D, F73D, K10, K71

#### *Cucurbita moschata*
