Eighteen Years In Publication

COINCIDENCE, OR COSMIC

When something happens twice, or more times, we often attribute it to coincidence. When it occurs three times over a period of time, and occurs in nature, one would believe the pattern relates to natural laws and is cosmic.

One incident happened in 1919. Another was revealed in 1952 and again in 1971, and all of these three patterns are alike so we rule out coincidence. The first, in 1919, was revealed in Seattle, Washington. U.S.A. The second, in 1952, was published in German in Innsbruck, Austria, in Europe. The third in 1971 was published in Portland, Oregon. U.S.A.

If we go back still further in ancient records, the Chinese had the same pattern of circles thousands of years ago. They called this circle pattern "The Cosmic Flower" and attributed to it the source of all energy.

We are reprinting, on page 9 , the diagram drawn by Joseph Cator and published in the "Portland Flying Saucer Club" bulletin of March, 1971. The Director of this club is Edward M. Palmer, and their address is: 1646 S.E. Elliott Street, Portland, Oregon. 97214. Write to this address for any further information on Joseph Cator's work.

Here is what Joe Cator says: -

The kinetic energy of a moving charge is completely manifested in the magnetic field that is formed around it. (This is true of all moving bodies whether charged or uncharged!) The reasons for this will not be given here. As anyone who has worked with coils wrapped around an iron core has noticed, the instant it is connected to a source of electricity there is a momentary surge of current that greatly exceeds the original current. As soon as electricity is applied to such a coil, magnetism is induced in the iron core. This of course, produces a change of magnetic flux, which in turn induces an EMF in the coil which tends to increase the flow of current which induces a greater magnetism in the iron, etc.

This condition quickly reaches a maximum. When there is no more change in the magnetic flux, the current instantly drops back to normal. As soon as the current is cut off the magnetic field collapses and we have an instant surge of current in the opposite direction for the same reasons. During these extremely short intervals of time we had a current output that greatly exceeded the input! THIS ALONE SHOWS THAT OUR COIL IS A PERFECTLY FEASIBLE PROJECT.

It has always been assumed that amperage alone in a coil surrounding an iron core determines the extent to which the iron is magnetized. THIS IS FALSE. It is wattage (volts times amps) that is the deciding factor. This is in keeping with the important principle stated earlier. Since wattage is a measure of energy, the energy or intensity of the magnetic field around a wire carrying a current is directly proportional to the wattage of the current. We already know that it takes a magnetic field to magnetize iron so we will make good use of this principle. -

-FIRST: From where does the inexhaustible source of electricity pouring out of a typical generator or the secondary coil of a transformer come?

Here we have insulated wires, the ends from which emanate electrons indefinitely, yet there are not enough free electrons in the wire to maintain an appreciable current for more than a very short time. How do we get the other electrons? They are not supposed to get through the insulation on the wire.

SECOND: The second of these puzzles is the fact that a coil carrying a very modest current with an almost imperceptible magnetic field will induce considerable magnetism in an iron core, yet the same core placed inside a powerful cylindrical permanent magnet with the same magnetic configuration as the coil, but hundreds and even thousands of times the intensity, fails to magnetize it to the extent the coil does! WHY?

Taking an overall look at our problem of generating a current of high voltage from a small initial current, it stands to reason that coils of wire must be exposed to rapidly changing magnetic fields, and

also that these coils must be wound on iron cores (This is making use of the principle described above involving momentary surges of current). If we can get a magnetic field of high enough intensity and one that is changing at a desired frequency from our initial DC current our problem is solved. Obviously then, our DC current must first be transformed into an AC current. Since we want as rapidly a changing magnetic field as possible, the normal 60 cycle current is insufficient. (Remember - for a given magnetic intensity, the induced EMF is directly proportional to the rate of change or frequency).

Something on the order of 10,000 cycles per second or more is desirable. High frequency currents and high voltages from DC currents are accomplished in battery operated TV sets, so we have no great problem here. At this stage one might ask, "Why can't we use a transformer directly to get our increase in current? It must be kept in mind that the wattage of the secondary can never exceed the input wattage. By Newton's law of action and reaction, the primary coil induces a current in the opposite direction in the secondary coil. This tends to produce a cancelation of magnetic effects in the iron core such that in an ideal transformer there is no magnetism produced in the iron. We thus have only a transfer of energy from one coil to the other. However, transformers do play a vital role in reaching our objective.

From our initial DC current, which now has been transformed into a very high frequency AC, we wish to produce as high a magnetism as possible into a substantial iron core which has been laminated, or else consists of small iron bars or pins impregnated with iron dust (to prevent eddy currents). This means we must put a high number of turns on the core in a relatively small space, since the coil should not extend very far beyond the core for obvious reasons. For a given wattage, the higher the voltage the smaller the wire we can use.

Therefore, our initial AC current should be stepped up by a transformer to several thousand volts for the best results before passing through the coil. We are now faced with another problem. Such a coil will have a very high inductance or in other words will offer a very high impedance to an AC current; especially on

such a high frequency. This will prevent much current from passing through the coil unless we do something about it. It is a well known fact that the impedance of a circuit containing an inductance and a resistance can be reduced by connecting it in series or parallel with a capacitor. If a capacitor of the right size is placed in the circuit, the inductive resistance will be cancelled out completely and we have what is known as a resonant circuit. This happens when the following relation is satisfied -

$$F = \frac{1}{2\pi\sqrt{LC}}$$

where, F, is the frequency of our AC current, L, is the inductance of

our coil in henries and C is the capacity in farads. The inductance of the coil can be quickly determined by checking with an AC ohmmeter and then using the standard formula for inductive resistance which is: $R = 2\pi FL$, where, R, is in AC ohms. From this formula, it is apparent that for a coil of high inductance we must use a very small capacitor at such high frequencies. We have now jumped our major hurdle by creating a high intensity and high frequency magnetic field. All we need to do now is surround this core or electro-magnet with a series of coils wound on iron cores. They should be brought as close to the pulsating magnetic field as possible. If our coils are connected in series we will again have a very high inductance, and it may be desirable to connect them to a capacitor for another resonant circuit. If the above instructions are carried out properly, we will end up with much higher voltages than we need so a step down transformer is in order, and from there our current can be changed back into a DC current since such a high frequency AC could not be used for most appliances.

Depending on the needs there can be many variations in the number of coils, their size, number of turns, gauge of wire, etc., surrounding the central core. No doubt one question which may come to the minds of some is, why isn't such a device in violation of the law of conservation of energy. What we are actually doing is harnessing the energy of the magnetic field produced by orienting iron atoms, which fortunately requires only a small expenditure of energy. There are tremendous quantities of energy in a magnetic field of even moderate intensity. From the previously stated law, it is equal to the energy of a current necessary to produce a magnetic field of this intensity. -

"THE NEW SCIENCE" clearly shows that inertia is dependant on an objects ability to generate a magnetic field of a certain intensity for a given velocity. An ordinary atom has inertia only because it has a net positive charge effect, (small as it may be). Positive charges follow the right hand rule while negative charges follow the left hand rule. Hence, during an increase in velocity the magnetic field of positive charges in an atom tend to cancel out the field due to the negative charges. Lack of space prohibits an elucidation of the reasons for the net positive charge of an atom in the normal state.

It is sufficient to relate that a former Nobel Prize winner, Gabriel Lippmann, about 90 years ago, unwittingly demonstrated the validity of the principle stated above, when he found that bodies in the charged state offered a greater resistance to acceleration than when they were uncharged. This experiment was quickly forgotten since it undermined the established "laws" involving mass and inertia. We are now ready to understand the behavior of a coil. When a wire is wound into a coil the magnetic effects of a current are reinforced. This means that each segment of the wire experiences a more intense magnetic field than is the case when the wire is straight. This also means that for a given change in current there is a greater change in magnetic intensity at each section of the wire. We also know a flow of electrons has inertia. The reason for inductance is now obvious from what has just been given. A current simply has a greater inertia when passing through a coil than through a straight wire. Since with the AC, a current is constantly changing in magnitude, we should, by now expect a coil to offer an impedance to AC. It is also interesting to note that an iron core does not change the impedance of a coil to any appreciable extent. This is because the iron atoms are readily aligned and their magnetic field is separate from that of the current. THIS FACT ALONG MAKES POSSIBLE THE SUCCESSFUL BUILDING OF OUR ELECTRICAL DEVICE. You now have the necessary basic insight to build this device, may your efforts meet with success.

Joseph H. Cator

In 1952, in a paper entitled, "The World of The Secret Forces", a group of Austrian scientists disclosed the segmented energy pattern of the surface of the Earth. Their research was carried on at the 48th° North Latitude.

The segmented checkerboard pattern of positive and negative squares on the surface of the Earth, at the magnetic equator, was ca. 32 meters on each side and becomes zero at both magnetic poles. At the 48th° North Latitude the squares were 15.9 meters. They also discovered that the Cheops pyramid, in Egypt, is about 30° North Latitude and the diagonal of the pyramid magnetic field was ca. 30 meters.

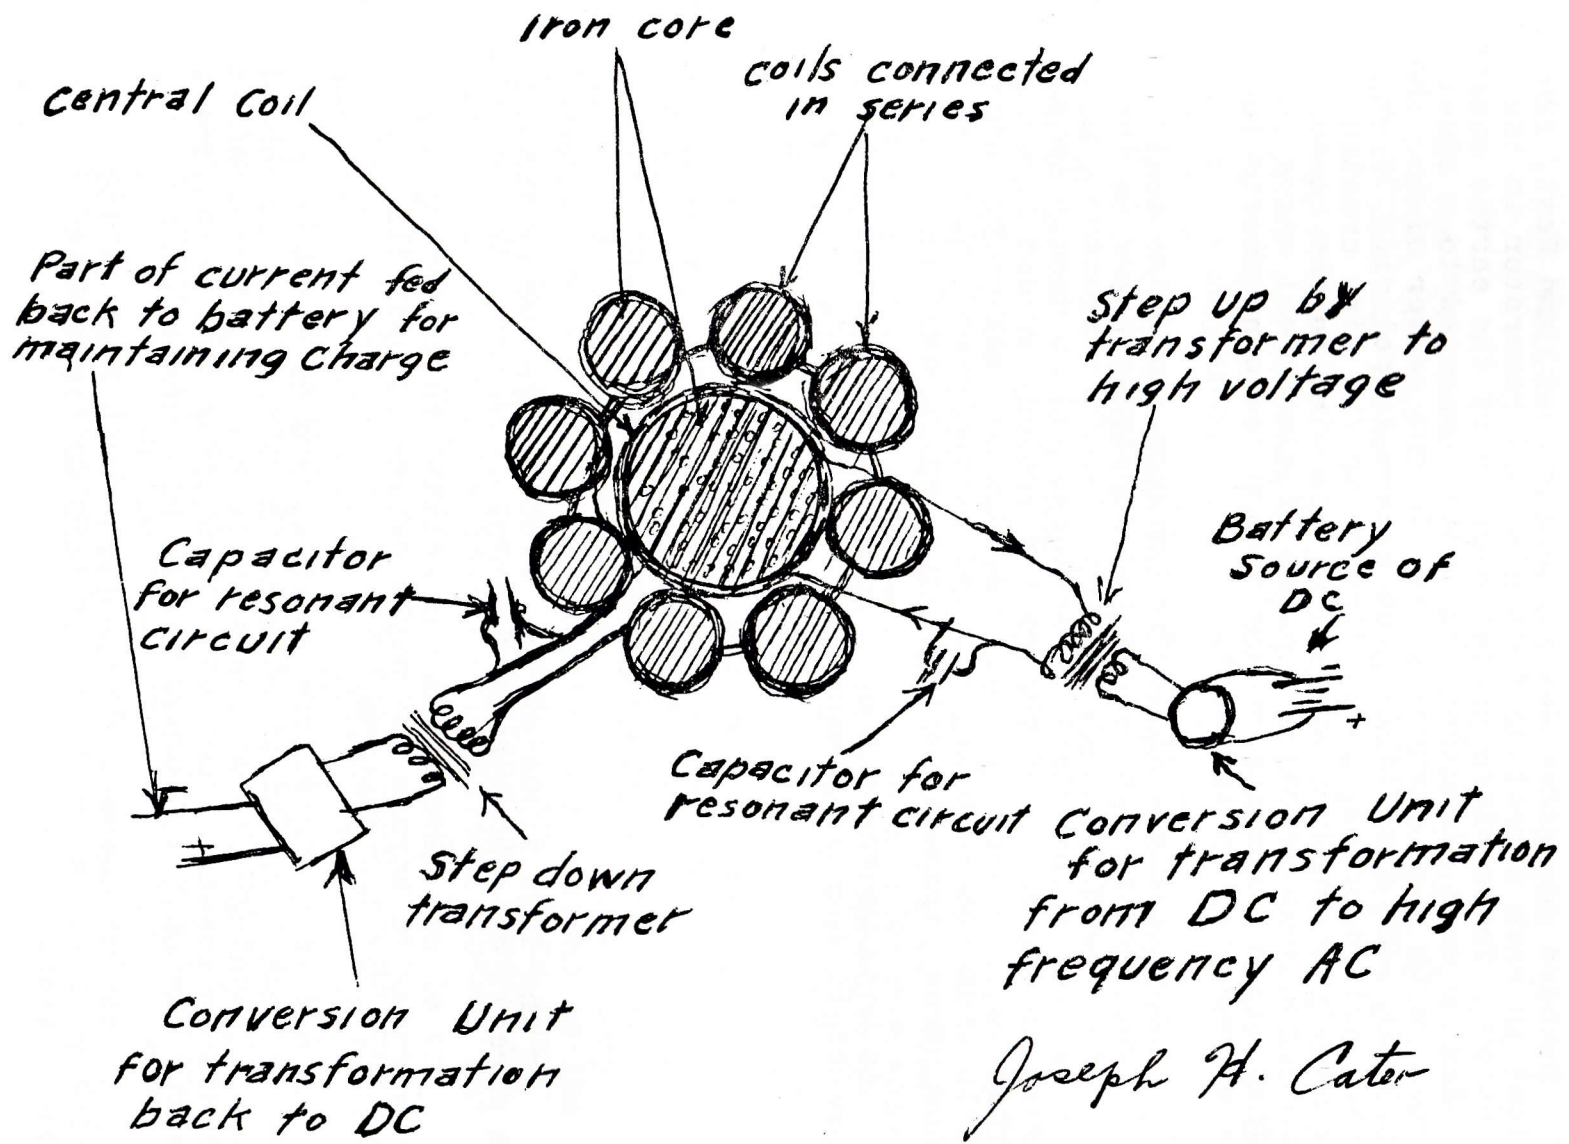

It is amazing that they discovered each of the squares had positive and negative poles in their centers, and that these poles conform to "Hubbards Energy Generator" in 1919, Cators Energy Generator in 1971, and the Chinese "Cosmic Flower" the source of all energy.

The poles in these checkerboard squares are 2.45 meters diameter in the center pole and the eight surrounding poles are 60 cm. diameter at 48th° North Latitude. We are convinced that Hubbard tapped the energy from these earth surface poles in Seattle, Washington in 1919.

Alfred M. Hubbard, was front page news on December 17, 1919, in the Seattle "Post Intelligencer" newspaper. Hubbard was only 19 years old when he powered an 18 foot boat around Portage Bay with a 35 horsepower electric motor hooked to his energy generator which was only 11 inches in diameter and 14 inches long. There were no batteries in the boat and the boat ran for hours beyond the life of batteries.

Hubbard's generator was a central coil wound on a tube, with eight coils around it, wound on iron cores. Here is real power without smog, or fumes and at no cost to operate. This explains why the "authorities" stepped in and stopped the experiments as in other cases through the years.

A Finnish citizen, who worked with Hubbard, gave some additional data to Art Aho and we have the original tubes that were part of Hubbard's equipment.

6

Joseph H. Cater

Hubbard ran wires North, South, East, and West, 1200 feet in each direction from his coil generator in the center. These wires passed over 18 of the earths square poles in each direction and ended connected to a steel tube, with some mercury in it, in the center of the 19th pole in each direction. The alternate polarity, from each pole crossed, perpendicular to the wire created a wave pattern from one end of the wire to the center coil-assembly creating a pulse of electrical energy. This fixed generator transmitted a resonant energy to the generator in the boat.

Can you picture these "no maintenance", "no cost" devices, set up around cities, supplying power to the present circuits, with no radiation from reactors, no smoke from steam-plant generators, and no danger from dams that break, and change the ecology around rivers. This is the power principle hidden by "authority" since 1919 that has made the cost of electricity what it is now, from expensive maintenance-hungry sources.

We hope we can set up a separate research on this principle when we finish the "Integratron".

MULTIPLE WAVE OSCILLATOR

In the last issue of the "Proceedings" we reprinted a circuit of a home-made "Multiple Wave Oscillator".

One of our associates has written to us to express a warning to anyone who might decide to make this M.W.O. from the diagram.

Avoid touching either antenna, and do not come within 18 inches of either antenna while the unit is turned on. Touching both antennas while the unit is turned on could be fatal. A method of grounding out the antennas after the unit is turned off is also advisable.

We advise anyone, not familiar with high voltage electricity, to avoid making this Multiple Wave Oscillator.

PRICES, PRODUCERS AND PLUTOCRATS

In the "Proceedings" issue of July, August, September, 1969, on page 14, we said "Price and wage controls are on the way as sure as we are presenting this."

Now, President Nixon's "bombshell" announcement may have been a startling statement to the mass of people in the world, but to those few who know what's going on it was no surprise.

Since 1964 the plan for such an action has been pigeonholed in order to wait for the proper time to institute such an order. Mr. Nixon also declared a state of "National Emergency".

Most citizens of the United States never heard of "The Office of Emergency Preparedness" until the President announced his wage and price freeze. "The Office of Emergency Planning" was one of eleven executive orders placed in a pigeonhole for future use by John F. Kennedy. Observe how many years ahead of the action the plans are laid.

Under President Kennedy, Executive Order No. 110051 designates the responsibilities of "The Office of Emergency Planning". "In time of increased international tension, or economic, or financial crisis", this Executive Order instructs the Director of Emergency Planning to "perform such additional functions as the President may from time to time direct". Note that this Executive Order does not confine the Presidents action to a national crisis in the United States, but to any crisis world-wide.

The price freeze is worded real slick, to allow the plutocrats of this country to give it to the consumers (you and I) from both ends to the middle. The order by President Nixon puts the ceiling on prices "at the highest level a product sold for before the order of August 15, 1971. Of course the nations largest distributors knew before the order was issued that this was to be the case. For instance, one choice cut of meat was raised 30 cents a pound, from \$1.19 to \$1.49, in the week preceeding the order. This established the

previous highest price. This tip-off to the food distributors alone is going to cost the people plenty in the months ahead.

Now what else did President Kennedy provide us with in the way of Executive Orders in a National Emergency?

Executive Order No. 10995 gives the President the power to take over all communications media.

Executive Order No. 11005 provides for the government to take control of all railroads, inland waterways and all public storage facilities.

Executive Order No. 10997 provides for the take-over of all petroleum and gas, fuels and minerals.

Executive Order No. 11004 provides for Federal Housing and Finance Authority, to build new housing with federal money; designates unsafe areas and establishes new locations for citizens forced off their land, and out of their homes, with complete integration in all of the new areas.

Executive Order No. 10998 provides for the federal take-over of food resources and farms, including all farming equipment.

Executive Order No. 11003 provides for federal take-over of all aircraft and airports.

Executive Order No. 10999 provides for federal control of all modes of transportation, control of highways and seaports.

Executive Order No. 11002 says the Postmaster General shall require the registration of all citizens in the fifty states at their local post office.

Executive Order No. 11000 provides for mobilization of all civilians into work forces under Federal supervision.

Executive Order No. 11001 provides for all health, education and welfare functions.

It should be evident that these Executive Orders could have only two purposes; either recovery after a massive war emergency, during a war, or to create a socialistic society from within before a war.

On page 12, of the "Proceedings" of October-November-December 1968, we printed "The devaluation of the dollar is eminent with financial chaos a possibility in 1969". By priming the pump with additional billions of dollars in the National Debt, the wizards of federal finance managed to drag this out until 1971. On the same page in a paragraph on President Nixon we printed, "History will blame him for the results of those who used him."

Under the National Emergency, declared by President Nixon, he could institute all of the Kennedy-Johnson Executive Orders and be a virtual dictator.

The plutocrats, advisors, and appointees, are all so short-sighted that they cannot see that the present economic crisis is going to backfire.

Producers, who are the working people who make all of our products, are going to foot the bill for this economic blunder. The surtax of 10% on foreign imports will be added to the price of foreign products and the American consumer will be paying the tax, not the foreign exporter.

Big-money stockholders apparently were also tipped off before the price-wage freeze, as evidenced by the stock market increase. Now when the stock goes high enough these same big stockholders will sell, to get the capitol gain, and the market will drop lower than it was. If the small stockholders panic and sell at the same time, the drop will make the 1929 stock market failure look like a picnic. I expect to see this happen before March of 1972.

Don't blame President Nixon for this fiasco; he inherited it from prior administrations. His trip to China is rigged to create an international incident and it may cost him his life.

The Governor of Texas announced on August 19, 1971, that Texas will not conform to the wage-price order.

Don't forget that Texas was the only state that reserved the right to secede from the United States when they joined the union of states.

Why was this Executive Order by the President proclaimed at a time when Congress was out of session, and the Pacific Coast was tied up with a shipping strike?

I don't believe President Nixon is going to run for the Presidency again, and if he does he will lose the election. He is either being poorly advised, or he is being used to the hilt because he will not be President much longer.

It is a sad thing for the American people to see the United States being torn apart from within and threatened from without.

What we see happening today is the accumulative reaction of one administration after another perpetuating itself in power, hiding the wrongs each inherited, and draining the taxpayers to promote an expanding policy of one-worldism.

The tax paying goose that lays the golden eggs of taxes has collapsed because of the expanding appetite of a plutocracy that thinks everyone has as much as they do.

The price-wage order will not solve the problem of inflation.

LECTURE TOUR

After six years of work that required me to be at home, we are considering going on a lecture tour.

This tour would be scheduled to start around the middle of October and last about a month.

We are considering going only to cities WEST of the Mississippi River.

Any club, or individual, in this area who knows how to arrange a lecture should let us know now, so we can plan it.

SPACE CONVENTION

Many of our readers have written to ask about the date of the 1971 Convention at Giant Rock Airport. Since this has been a personal activity, and not connected with the Ministry of Universal Wisdom, Inc., in any way, we wish to inform you that there will not be a Convention this year.

Since the law cannot maintain order at these events, and the people that do the work are tired after 17 years of them, it was decided to call the Convention off for 1971.

Friends who attended these affairs, are welcome to vist us at any time.

WHAT'S GOING ON

Despite the fact that the Atomic Energy Commission has stated, that fallout will increase up until 1975 from past atmospheric bomb tests, the French continue atmospheric bomb tests. Since June 5, 1971, the French Defense Ministry has exploded four fission bombs and one fusion Hydrogen bomb on August 14, 1971 on Mururoa Atoll in the South Pacific Ocean. Watch for extreme weather reactions throughout the Winter, including massive snow falls.

Several high energy physicists at Stanford University have discovered a light called "Hadron" in the nucleus of an atom. The "Hadron" light is so heavy it has a mass of 765 million electron volts as compared with the mass of 500 thousand electron volts in an electron.

We believe that at least one destructive earthquake will strike a major city, with massive damage, before February 1972. This will be caused by a stress triangulation in the ring of the Pacific Ocean fault. The city, or cities, affected will be North of the 30° North Latitude line.
