God was calling in the guise of Mrs. Godsey, Uncle Emmitt's neighbor down in Finley County, but Divine Right had no doubt who it really was. Her high, nasal voice was certainly a strange one for such a weighty summons, but the Call was clear and unmistakable: Emmitt was dying at the homeplace and he must go to be with him.

Mrs. Godsey told D.R. she hated to worry him, that it might be a false alarm, but she didn't think so. She said the Lord worked in mysterious ways, that it wasn't given people to understand everything He does, that Emmitt might perk up tomorrow and outlive them all, but according to her son Leonard who had been to see Emmitt twice the day before, he was twice as bad off as he had been and that she just had to call Marcella and try to do something about getting somebody to go up and stay with him, or else get an ambulance to haul him out of that holler to the hospital. D.R. told Mrs. Godsey he couldn't get there before late that night, but that he would come on if she thought that was what ought to be done. Mrs. Godsey said what honey? Some fool's eavesdropping and cut out what you said. D.R. repeated what he'd said and Mrs. Godsey said she thought it would be wonderful if he would come, that it would certainly be a Christian act and a wonderful blessing for Emmitt. Then she told D.R. that the last time she had seen him he was the least little old thing that ever was. She said you must be a great old big boy by now. D.R. said he was twenty-one. Mrs. Godsey said my, my, time flies don't it? She said she knew his parents, God rest 'em, would of been proud he had turned out to be such a fine young man, and that she was looking forward to seeing him again. Then she said well honey, this is costing money. D.R. told her to tell Leonard to go tell Emmitt he was on his way, that he would be there late that night or tomorrow at the very latest, and Mrs. Godsey said bless your heart child, and hung up.

Handbook of Prescription Drugs

A drug ordered by brand name can cost several times as much as the same drug ordered by generic name. This book spells out the difference, its reasons, and how to get generic name prices. One way is, ask your doctor when he's prescribing a drug to prescribe the generic name.

or WHOLE EARTH CATALOG

CELESTONE® Betamethasone, N.F.
0.6 mg tablets \$133.56/1000
0.2% cream 1.08/5 g tube
2.22/15 g tube

Betamethasone is a steroid chemically and pharmacologically similar to dexamethasone (Decadron®). Like dexamethasone, it is immensely expensive, and in nearly every case it can be replaced by less costly prednisone, for oral administration, or hydrocortisone, for topical administration. See Prednisone, U.S.P., and Hydrocortisone Ointment, U.S.P., in the Price Lists.

Nonetheless, in 1967 Celestone® was among the top 200 drugs prescribed to people of all ages. In 1966 it ranked 143rd among prescriptions written for the elderly; 312,000 prescriptions cost these consumers \$1,526,000.

CODEINE SULFATE, N.F.

The manufacture and sale of this narcotic substance and also its price are rigidly dictated by the United States government: 450 grams cost approximately \$350. Therefore, a single 15 milligram tablet has wholesale value of approximately one cent. A representative price to druggists is \$11.80 per thousand 15 milligram tablets (Vitarine). See price list for Codeine Sulfate, N.F.

The *Handbook* lists Codeine Sulfate, N.F., rather than Codeine Phosphate, U.S.P., because the latter, being more soluble, is more bitter to the taste.

CO-HYDELTRA® Prednisolone, U.S.P.
5 mg tablets \$3.25/100 Magnesium Trisilicate, U.S.P.
Dried Aluminum Hydroxide Gel, U.S.P.

Prednisone is preferable, and can be less expensive. See Prednisone, U.S.P., in the Price Lists.

From a Medical Student

I did, however, register a note of dismay at the listing of *The Handbook of Prescription Drugs*. Pharmacology, in case you have not yet looked it up, may be defined as the study of the preparation, actions, and uses of drugs. Thus, although I am only a grad student, I feel obliged to comment on this book. Strictly speaking, there is no such thing as a "generic equivalent." The term should be "chemical equivalent." Most drugs currently used are so potent that doses are less than half a gram. This means that the drug manufacturer is obliged to dilute drugs so that a dosage form may be of a convenient size. In addition, if the dosage form is a tablet (commonly, but incorrectly called "pills"), then, no matter what the dosage, various agents must be added which will allow the formation of a compressed tablet. The consequence of these added or adjuvant materials is that they often affect the efficacy of the dose of the drug.

An excellent case in point is aspirin. Most aspirin tablets contain 5 gr (300 mg) of aspirin. However, the actual tablet weight is several times this. This is due to the addition of diluents, binders, stabilizers, and disintegrators. Aspirin (acetylsalicylic acid) is a very unstable compound, and in itself, even in its purest form, is a severe irritant of mucosal tissue, such as is found in the stomach and intestines. It has been estimated that about a teaspoonful (5 ml. or 1/6 oz.) of blood is lost for each aspirin tablet ingested. However, this value is only for pure aspirin, and aspirin easily breaks down in the presence of moisture to acetic acid (vinegar) and salicylic acid (used for removing corns). By this time, it should be obvious that the care and skill with which a tablet or any medication is made and the extent of testing of the final product has a direct effect on the action of the product. Thus, when you open that bottle of cheap aspirin and smell the odor of vinegar, it is advisable only to dose your sewer system, unless, that is, you feel that you have a corn in your stomach that you would like to remove.

Another interesting case is one cited in the catalog, prednisone versus Meticorten. There are several cases reported in the medical literature where a patient received, not necessarily Meticorten, but a "brand name" prednisone while hospitalized, and then was discharged with a prescription written generically. It was found that several prednisone tablets made by "generic" manufacturers were considerably less effective than the ones previously dispensed.

There are efforts being made by the AMA, American Pharmaceutical Assoc., and the Federal Government, as well as the manufacturers, to develop standards for drugs. However, these standards, when available, are basic minimums. There is no way at present of insuring anything but basic physical similarity between two "generically equivalent" medications. Thus, two aspirin tablets may both meet the legal standard of disintegration in less than thirty minutes in a special apparatus, but one tablet may take 29 minutes, while the other takes ten seconds. I have seen this

Celo Direct Drug

Another thing you might like to list in a future edition is the Celo Direct Drug catalog. The Arthur Morgan School is closely associated with the co-op movement and has championed various consumer causes. For some years we operated *Celo Laboratory Products*, a project for supplying Co-op pharmaceuticals by mail at low cost. Then the Co-ops started their own mail order drug service. At this point we turned our business over to them, but edited and published their catalog. I'll enclose a copy of it. It can be had free by addressing Celo Direct Drug Service, Burnsville, N.C. 28714.

Vitamin E

about burns (July \$1 catalog, pg 47), last november the gas stove in the place we were renting blue up and messed up my arm. In some places it was pretty bad (black and flacking away by the time i got to the hospital) and it hurt. i was given a shot (5 mg morphine) and the started splaching the arm with phisohex and cool water. The dr also told me to plan on skin grafting because the elbow was bad also. my old lady told me about vitamin e and i squised some under the bandage, took 3-4 grams a day with the same of vitamin c. IT WORKS. The only signs of the burns left show up on those occasional times when a dr gives me a through phiscal.

I forgot to say that the 3-4 grams was saved under the bandage. I think that the oral dosage also may be important getting the stuff into the system, there by getting to the burn several ways and making it available over a long time, but I don't know.

I know a couple of women who squeezed Vitamin E from the capsule onto their stomachs during & after pregnancy to prevent stretch marks. They also exercised a lot & didn't get any stretch marks. They also exercised a lot & didn't get any stretch marks. We'd like to know more including natural sources for Vitamin E.

john mccarthy
denver, colorado

happen, and I ask you which tablet you think would release its ingredient faster for more rapid absorption and consequently more rapid action? The ten second tablet was Bayer, the other was a readily available, but very cheap product whose manufacturer I shall not name.

I would like to conclude this tirade by stating that there are instances where a generic drug will be similar in action to a branded drug and that merely the fact that a drug is given a brand name does not insure efficacy. Thus, the choice of the medication by a doctor should be tempered by his experience and his faith in the dispensing pharmacist to carry a reliable line of generic drugs, in addition to the ability or desire of the patient to receive the best possible medical care. Therefore, the blanket statement that a generic prescription will save you money, while generally true on a per dose basis, may not be true if it takes more of the cheaper medication to cure you.

As I see it, the solution to the problem at present from the patient's viewpoint is twofold. First, you must choose a doctor who is not an automaton and is thus capable of discussing with you the validity of a generic prescription in your specific instance. Secondly, you must choose a pharmacy which carries products from reliable lines, and not necessarily the cheapest stuff that is available. This entails, in most cases, finding a pharmacy where the practice of pharmacy is treated as a service, rather than a business. Unfortunately, neither is very easy, thus, the problem boils down to *caveat emptor*.

I would like to add, as a footnote, that most of us closely associated with drugs avoid taking them as much as possible.

Sincerely,
Craig K. Lewis
Nashville, Tenn.

Vitamin C and the Common Cold

Several people around here are in a vitamin C research program at Stanford; they're pretty healthy, maybe more so than last winter. Linus Pauling has made vitamin C very popular. Linus Pauling, what do you think of, um, marijuana? -SB

Vitamin C and the Common Cold

Linus Pauling

First, for good health I recommend the regular ingestion of an adequate amount of ascorbic acid. I estimate that for many people 1 g to 2 g per day (1000 mg to 2000 mg per day) is approximately the optimum rate of ingestion. There is evidence that some people remain in very good health, including freedom from the common cold, year after year through the ingestion of only 25- mg of ascorbic acid per day. The requirements of a few people for ascorbic acid may be expected to be even smaller. For some people optimum health may require larger amounts, up to 5 g per day or more.

NRTA—AARP Pharmacy

Biggest and best source for mail order drugs. Offers both prescription and non-prescription items at a great discount. Especially good for vitamins if you buy the NRTA-AARP Formula that's equivalent to nationally advertised brands. Also has a good selection of elastic stocking and hearing aid batteries.

They say their service is only for members of the National Retired Teacher's Association-American Association of Retired People. The scrupulous among us will join (they don't check) for an annual fee of \$2.00. Well worth it for a confirmed pill popper. You don't have to be old, after all, to be retired.

Interestingly enough, I've been lead to believe by an official of NRTA-AARP that, despite the really good discount given, the co-op pharmacy is a real money-maker for the organization; so don't feel like you're robbing a bunch of old people by taking advantage of this. Other good things: they will give you credit with no delay for credit clearance and there are no postal charges.

American Indian Medicine

The definitive book—all the tribes, all the medicines. The author is looking through the window of Western medicine and Western anthropology, but he is looking with detailed appreciation. Weedmunchers could find no better guide. The people who could use it best probably can't afford a doctor and drugstore and probably can't afford this book—another good reason for libraries.

American Foundation for the Blind, Inc.
15 West 16th St.
New York, N.Y. 10011

Raised Line Drawing Kit. A method whereby blind people may draw or write and feel the lines on the top surface as the lines are made. The kit comprises a rubber covered drawing board with hold-down clips for 8½" x 11" material, a ball-point pen filled with a colorless lubricant, and a package of polyester film sheets which serve as the "paper."

Heretofore, it has been necessary to turn the page over to feel the lines made with tracing wheels and the like, but with this new development, the lines can be felt on the top side of the page. The lines so made are quite easily followed by sight. (See Mathematical Aids section for description of Graph Marking Slate and Draftsman's Compass for use with kit.)

WS194—\$7.10

Polyester Film Sheets. Package of approx. 70 sheets.
WC195—\$2.85

Braille Music. Braille music must be purchased from:

American Printing House for the Blind
1839 Frankfort Ave., Louisville, Kentucky, 40206 or Howe Press, Perkins School for the Blind, Watertown, Mass. 02172.

Electronic Level — AFB Model. Standard Stanley level equipped additionally with mercury bubbles to provide an audible signal. Accuracy equivalent to sight bubble. When no signal is heard, accurate horizontal or vertical measurement has been obtained. Seasoned cherry wood, 24" length. Supplied complete with 9-volt battery. (Easily obtainable replacement batteries must be bought from local supplier.)

Two types:

Horizontal measurements only. TM325—\$39.50

Horizontal and Vertical Measurements. TM326—\$50.30

Himes concluded that "American tribes had no effective methods of preventing conception," and that they relied mainly on abortion, infanticide, and abstinence to control family size.

Events have since proved how wrong Himes was, for not only have oral contraceptives come into general use in advanced countries, but Indian herbs were finally subjected to laboratory tests in the search for an effective oral means of controlling fertility, and some of them were found to be effective. Just as America was considered to be undiscovered before the white men found it, so the Indian drugs were unreal or of no account until the white men discovered them. This is one example among many of the ethnocentric attitude which has hurt the white men more than the Indian by delaying scientific inquiry into aboriginal herbal knowledge. The Cherokee drug may have been of no use, but what is striking here is the way it was rejected *a priori*, simply because white men knew of no oral contraceptive, and therefore, presumably, none existed. It is noteworthy that until recently it could not only be said that Indian recipes for controlling fertility had not been investigated, but that the very names of the drugs used were largely unknown.

Dig Warts

I cured my WARTS with a SWISS ARMY KNIFE. A true testimonial by Malaclypse the Younger of San Francisco—Plagued with Planter's Warts for over a year, and advised by the medical profession that regular medication is GENERALLY HOPELESS, I cured my WARTS with a SWISS ARMY KNIFE and voodoo. Twice a week for twelve months I cursed the warts and made them feel unwelcome. During that time, I took my stainless steel SWISS ARMY KNIFE and dug at them relentlessly. They have now more or less DISAPPEARED leaving only gaping holes and volcano-like craters on my calouses. I recommend this cure for any person with a cool hand, a knowledge of voodoo and a SWISS ARMY KNIFE. A SWISS ARMY KNIFE may be purchased at your nearest SWISS ARMY KNIFE dealer.

Wheelchairs

What do you do— and you might answer this question in your next edition— with the poor people who cannot walk and who have just enough to buy a vehicle for 100 or 200\$? And who risk to be fitted into their wheelchairs like the victims of Procrustes, the figure of Greek mythology, who put his short people in long beds and long ones in short beds, stretching the legs or cutting them off accordingly.

Well, there is a good book out for those 400000 people or so, to speak only of USA. See the enclosed clipping.

Herman L. Kamenetz, M.D.
State Veterans Hospital
Rocky Hill, Connecticut

THE WHEELCHAIR BOOK: Mobility for the Disabled by Herman L. Kamenetz, State of Connecticut Veterans Hosp., Rocky Hill. All types of rolling chairs, stands, beds, and walkers along with the services of each are reviewed in this reference manual. Numerous illustrations with explicit legends develop an understanding of the hundreds of features of modern wheelchair design—size, type, construction and accessories. Contains valuable information for professionals as well as laymen. *69, 288 pp. (6¾ x 9¾), 81 ill., 8 tables, \$14.75

Charles C. Thomas, Publisher
Springfield, Illinois 62703

Mesquite (*Prosopis juliflora* [Swartz] DC, and *Prosopis glandulosa* Torr.). *P. juliflora* was the *mezquite* of the Aztecs (hence, *mesquite*), who mixed the leaves with other substances for an eye lotion when the eyes were hot and painful from sickness. Seventy years ago Bourke reported that this shrubby tree was used for the same purpose by Mexican Americans in Texas, and Hrdicka found Indians of the American Southwest using it in a similar manner. The Mescalero Apaches ground the leaves to a powder, placed the substance in a thin cloth, added water, and squeezed the liquid on the eyes. The Pimas applied the sap to sore eyes. The Maricopas used the dried juice, ground fine, as a sore-eye remedy by applying the substance to the lids and later washing it off with warm water.

The skeletal remains of unquestionably precolumbian date [he concludes] are, barring few exceptions, remarkably free from disease. Whole important scourges were wholly unknown. There was no pathologic microcephaly, no hydrocephaly. There was no plague, cholera, typhus, smallpox or measles. Cancer was rare, and even fractures were infrequent. There was no lepra [leprosy] . . . there is as yet not a single instance of precolumbian syphilis. There were, apparently, no nevi [skin tumors]. There were no troubles with the feet, such as fallen arches. And, judging from later acquired knowledge, there was a much greater scarcity than in the white population of many diseases of the skin, of most mental disorders, and of other serious conditions.

The chief diseases to which the ancient Indians were subject, he added, were digestive disorders, particularly in children and older persons, pneumonia, arthritis, and localized maladies such as nutritional disorders.

Wild mint. This is the only indigenous species of *Mentha*. Dr. Clapp reported in 1852 that it was little used in medicine but would be a tolerable substitute for the European species when they could not be obtained.

The Cheyennes ground the leaves and stems of this species and boiled them for a medicine to prevent vomiting. Wild mint was used by all the Missouri valley tribes as a carminative, being steeped in water and sweetened with sugar for a drink. Because of its aromatic flavor, it was also used as a beverage. Among the Menominees it was combined with catnip and peppermint for a pneumonia remedy, being drunk as a tea and also used as a chest poultice. The Flambeau Ojibwas brewed a tea from the entire plant for use as a blood remedy. It was also used in the sweat bath, and the Pillagers made a tea of it to break fevers. The Potawatomis used the leaves or tops for fevers and as a stimulating tea for pleurisy. Whites have used the whole plant for its bitter, pungent, antispasmodic, antirheumatic, stimulant, and anodyne properties.

Wild mint (*Mentha arvensis*, var. *canadensis* L.) has not been official, but it contains a volatile oil from which pulegone and thymol (USP 1882-1950, NF 1950—) or carvacrol have been isolated.

The shock experienced by plunging into cold water after the sweat bath is parallel to hydrotherapy treatments commonly used today for patients suffering from nervous tension. Therefore it was probably effective for ailments of a psychosomatic nature.

Barre, Vermont, being the largest granite-cutting center in the world, I decided to try adding granite dust which, as it comes from the dust-removing device, is fine, like flour. Granite dust contains 5 per cent of potassium, and has associated with it sixteen minerals. When I applied it to the soil around my garden plants, a number of things happened.

Among my flowers, I have 125 plants of delphinium. Each year I had been having to combat a tiny mite which caused the leaves to curl up and turn black. These harmful mites were so small that I had to use a magnifying glass in order to see them crawling on the leaves. I used a spray but it did not do away with them. When I added the granite dust to the soil around the plants, these harmful mites deserted my garden and have not returned.

Following the general examination, and the special examination of his nose, I gave the boy a chew of honeycomb, to learn what might happen. I wrote out directions for treatment to be followed at home and prepared drops he was to take. Before I had finished this—after about five minutes—the boy suddenly said, "My nose is open! I can breathe through it!" I gave the medicine for home use to the mother and discussed the written directions. Then I examined the boy's nose again to see what the honeycomb had accomplished.

The nose tissues had subsided, as they would have if I had used a shrinking agent in the nose. Instead of being pale, the mucous membrane was now light pink in color. One week later, at the next office visit, the boy's nose was still open and he was breathing with his mouth closed.

THE THIRD DEPARTURE

After God hung up D.R. sat a few minutes listening to the dial tone. But then he put the receiver down and went about getting ready to go. There wasn't much to do, actually, except put his clothes on, and leave a note on the desk for Marcella. Someone had left four dollars and some change in an ashtray on the desk. D.R. took it, and added a P.S. to his note explaining that he had. He made himself a smoked-ham sandwich, put some apples and oranges in a sack and took them out to the bus. Urge was in the worst mess he had ever been in, but mechanically he was all set to go. Half an hour after the call from God, Divine Right backed out of his sister's drive way and set out down Clark Creek for Kentucky.

Blessed Event at Cabin

THE FARM JOURNAL AND BABBS JUICE

Friday June 13, 1969 Weather: Cloudy with chance of clearing

BLESSED EVENT AT CABIN !!!!
NADINE AND PAGE PRODUCE !!!!
INTREPID REPORTER ON HAND

Daughter born to joyous couple sits up for pic.

HOSANNA AND HURRAH FROM THE HIGHEST TO THE LOW ON A SUCCESSFUL BIRTH

At eleven minutes before eight this morning, Nadine gave birth to a fine healthy pink skinned daughter.

Page had stepped out of the cabin for a moment.

Contractions were steady and fierce, but with Nadine directing the energy, the baby moved swiftly down the birth canal, through the cervix, and appeared at the "door."

Babbs, on hand for the occasion, broke the membrane with his finger, allowing the juices to flow freely and the head to push through.

By this time Page had reappeared.

In fact he was there for the whole thing, Nadine having the presence of mind to send Bukovich looking.

"Piped right up, didn't he," said the proud father.

"Yep," squalled like a baby.

Cassie assisted with back rubs, wet cotton balls to the lips, and solid reassurance.

Gretch provided swabs, blankets, tie ties for the cord, scissors, and kotex from Nadine's well prepared stash.

At a finely timed moment, Buko came back with hot tea for all participants.

At press time the Farmsters are gathering around the breakfast table, the afterbirth blazing merrily in the fire-place on the patio.

"That don't give up easily," says Page.

"Emergency, Says Craig. This cups broken."

Scary Event Almost at Home

I love every one of you, but I must reluctantly beg to join those who plead for less do-it-yourself midwifery unless— and this is a HUGE unless— you have a hip doctor on instant, around-the-clock ambulance call, and a girl in attendance who has been through a practical-nursing course and can (AND WILL!) put her foot down if she sees any signs of trouble.

Take me, for instance. No one could have imagined I'd get into any trouble. I'd had two babies as easy as spitting. I thought I was a perfect risk for home delivery, but my nasty old spoilsport doctor talked me out of it. "Yeah," I thought, "She wants those high hospital fees."

Nevertheless, I went into the hospital. Grousing to the last minute about all that nasty red tape and inhibition of a woman's simplest function. Who, me, have trouble? Why, I dropped babies as easy as a Chinese peasant woman. And so on, and so forth, far into the night. And farther into the night. And farther yet into the— hey, damn it, that baby should have been here a long time ago and I was beginning to feel rottener than I (a prime natural-childbirth candidate with two births behind me) should EVER have felt.

Medication— I still felt worse. X-rays; no, not twins, just one block-buster. Anesthesia— not enough to put me out but enough to stop the screaming (and baby, I'm NOT a coward, I didn't utter yell one when I had a dislocated knee reduced without anesthesia since I can't take demerol.) To late for a Caesarean. More anesthesia. And far into the night, with my husband's face whiter than I ever saw it, the doctor dripping with sweat, and finally a "blue baby", eleven pounds, bruised and scratched and one shoulder fractured in spite of the best O.B. in Berkeley. Ten minutes of straight oxygen to bring her round, forty stitches or so and (I think) a pint or two of blood in me. (I lay there and counted the damn stitches while they put them in. You can feel them even if they don't really hurt.)

Just imagine doing that in your commune?

Yeah. One woman screaming her head off for eight or nine hours. (As I say: I didn't even moan for No. 1 and No. 2). One dead— very dead— baby, probably, at the end of it, since only incredible skill revived this one. Probably one very dead, bled-out woman, too. Six or eight nervous amateur midwives. ...all of whom would have two inconvenient corpses on their hands, and be charged with being accessories before, during and after the fact of

- gross negligence
- practicing medicine without a license
- maybe even manslaughter.

Oh, brother, would you ever have your troubles. Not to speak of me and my baby— although our troubles might be strictly between us and the Keepers of the Gate to the next world!

I wonder how often it's happened that a bungled childbirth has destroyed a workable commune? Once would be too often.

So have your babies at home if you must, but for the love of God, send the girl to the local clinic for (1) prenatal care— the doctor will warn her if she's likely to have trouble. And even then it may come unexpectedly, as in my case, since I had NOT been so warned.

Send her STRAIGHT TO A HOSPITAL if she (1) bleeds, (2) has a history of swollen ankles or any signs of toxemia impending as in the Merck Manual, or (3) if her first baby has been over seven pounds or if there is more than six or eight ounces increase between her first and second babies; that means the third may be enormous. This happens in pre-diabetic women who have no other symptoms. And finally (4) keep a telephone line open all the time she is in labor, so that if she manifests any trouble you can get hold of a doctor within minutes, preferably an ambulance.

One birth in ten shows complications; one baby IN FOUR shows a birth defect— which can be aggravated if birth is hard or prolonged. Unattended births show the most serious oxygen starvation/ anoxia-brain-injury which leads to mental retardation. And three births in a hundred are so complicated that without EXPERT medical help you may have a death on your hands, without warning. Don't say "It can't happen to you." I said it couldn't happen to me— but if I'd stuck to it and fled to the hills to escape that de-humanizing hospital I'd be dead, or at best seriously damaged with a dead child, or brain-injured baby to raise. Have you ever seen a badly brain-injured child? Visit your local hospital for the feeble-minded some day. Most so-called "idiots" and "imbeciles" are victims of brain injury.

I dislike many, many of the fruits of civilization. But modern obstetrics is one I'd sooner not dispense with.

Sure, having a baby is natural. So is dying in childbirth. Look in any medieval graveyard. Most men went through a few wives that way.

Love to you all,

Marion Zimmer Bradley (Breen)
Staten Island, New York

Birth at Home: The Precise Considerations

Many situations in medicine involve attempts to balance the costs and benefits of one possible course of action or inaction against the costs and benefits of another possibility, and to choose the alternative with the lowest cost/benefit ratio. Unfortunately medicine has often ignored psychosocial benefits to the patient and over-emphasized personal benefits and convenience to the doctor. Child-bearing is one such situation: the psychic benefits to the whole family of being present at the birth of a new child has largely been ignored, while the convenience to nurses, anesthetists and doctors has been over-emphasized. One result of this has been the "backlash" of interest in home deliveries, usually without the doctors approval, much less with his help. Without attempting to assess the psychic value or reduced economic cost of home deliveries, I would like to clarify some of the risk variables involved.

In the best of situations, it can be expected that about 3 to 4% of deliveries will result in either a stillbirth or a child who dies during the first week of life. This figure can result in optimism—over 95% of women will have few problems—or pessimism—nearly one in twenty women will have prenatal death *no matter how good their care.*

Because of this situation, such generalized statistics are worthless to the woman thinking of having her baby at home. Adding to the confusion is the knowledge that British and Dutch women routinely have their babies at home with apparent success judging by their lower overall infant mortality than ours. Their success however is dependent on the statistical knowledge of which situations are likely to be complicated—necessitating hospitalization and specialist care—and which are very likely to be uncomplicated—necessitating only routine measures available to a midwife in the home.

Steward Clifford, a leading expert on high-risk pregnancy, states: "it should be emphasized that in every case the identification of the high risk patient should be possible at the initial examination and at various times in the prenatal course and before labor and delivery." What are these risk factors and how can they be recognized?

First there are demographic factors. Women over forty or first pregnancies over 35 are more risky than average. Low education levels and low income are also high risk factors, even when good medical care is obtained.

Next is prior obstetric history: first births are higher risks as are fourth or greater. Infant mortality is high for patients with a previous abortion or ectopic (out of the womb) pregnancy; it is even higher if there is a history of previous premature births (weighing less than 5½ lbs.) and higher still for those women with a previous history of stillbirths or neonatal deaths. A history of a large baby (greater than nine pounds) or a baby requiring transfusion is also a danger signal. Prior high blood pressure, marked swelling of hands and ankles, or protein in the urine during a previous pregnancy are further cautions.

Any woman with heart disease, diabetes (or a strong family history of diabetes) or any kidney disease should be followed closely by a doctor throughout pregnancy and delivery.

During the pregnancy there are also warning signs which preclude home delivery. Without attempting to explain the disease entities involved, suffice it to say that any vaginal bleeding after the first month of pregnancy (except very slight spotting or "show" at the beginning of labor) or any report of high blood pressure is sufficient to necessitate specialist care.

As delivery approaches there are more clues, including rupture of the bag of waters before the onset of vigorous labor; labor beginning before the thirty-eighth or after the forty-second week of pregnancy (counting from the first day of the last menstrual period). If nothing has gone wrong up to the onset of labor, but labor has progressed for eight hours without births being imminent, this is another indication to rush to the hospital.

In summary, if you are between twenty and thirty years of age, a high school graduate with a fair income and good nutrition, with one or two but not more than three previous uncomplicated births, and no medical problems, you might begin to consider home delivery as an acceptable risk. Your first step toward success is to have adequate prenatal care (mortality is much higher for women without prenatal care, mainly because of avoidable complications) beginning no later than the third month of pregnancy. You will still not be completely safe from unexpected complications, but you will have reduced the risk to proportions where the benefits to you and your family from home delivery may—for some families—be great enough to make these risks acceptable. But to fail to reduce the risks through prenatal care or to ignore any danger signal is not only invite disaster, but also to bear the responsibility of knowing you didn't do all you could to avoid the disaster.

Bruce Ferguson, M.D.

Commonsense Childbirth

Mrs. Hazell writes from the personal experience of having had one child under anaesthesia, another using La Maze method, and a third at home. The book covers pregnancy, birth, and care of the newborn. It is gently positive about husband-coaching and breastfeeding. There's a good chapter on home deliveries. It's written by an intelligent woman, and it doesn't needlessly complicate what is really a very simple method of controlled breathing and relaxation.

or WHOLE EARTH CATALOG

My own point of view on home delivery is influenced by the fact that all my experience with it has been positive. Babies born at home seem better to me in every respect, and my students who have had both home and hospital deliveries prefer home. These babies are born crying and healthy, and with their mothers they continue in the pattern of life they have been living the last nine months.

What a mother eats has a profound effect on the outcome of her pregnancy and on her baby's start in life. A number of very convincing studies tie complications of pregnancy to a poor-quality diet. Not only do many minor annoyances of pregnancy vanish when ample amounts of necessary elements are added to the diet, but the baby is basically affected as well. One study found that 94 percent of babies born to mothers whose diet was excellent were perfect specimens, whereas 92 percent of babies whose mothers' diets were inadequate in as little as one element were defective in some way. It has been my observation that the women who feel on top of the world are usually the ones who take good food seriously and concentrate on eating types of food that contain the raw material with which to maintain health and manufacture a healthy baby. . . .

You certainly don't have to become a nutrition expert, however, to provide yourself with high-quality food. The trick is to keep your eye on how much protein you eat and at the same time to see that you get something every day from each of the four major food groups: 1) meat-egg; 2) milk-cheese; 3) vegetable-fruit; 4) bread-cereal. If we want to use a mnemonic device, we can call this the P-4 plan: Eat lots of protein in each of the basic four every day.

As soon as the bearing-down reflex is established, second stage is begun. For the next few contractions you push your baby down two steps, and he slides back one. This can be discouraging if you don't realize that this is the normal pattern of labor. However, when you stop to think about it, this makes good sense. In this way your passages are dilated gently and slowly by the plunger action of the baby, the baby has fluid squeezed from his lungs, his skin is stimulated preparatory to his existence in a world that will be constantly touching him, and then during the interval between contractions everyone rests.

What does the bearing-down reflex feel like? Everyone has experienced this to some degree. It is very like the pushing of a bowel movement, only more sustained and more demanding. It is far easier not to push when one is having a bowel movement than when one is having a baby. However, the second-stage contractions are not, as a rule, painful. In fact, they are very satisfying. You may be surprised at the noises you make. So may your family.

The first milk that flows is the high-protein, nonfat type. This fairly gushes into the baby's mouth. Later when the flow is slower comes the cream. The cream sticks to the baby's ribs because it digests more slowly than the nonfat milk. It is also more filling. So it is providential that while the baby is nursing vigorously in the first flush of hunger, he does not get his high-calorie dessert. Entrée before ice cream is a habit formed early!

Thus a baby knows best how to regulate how long he should nurse. He does this according to the needs of his stomach as well as for the joy of cuddling with his mother.

The let-down of the milk is a conditioned reflex. In the early days of nursing the milk flows frequently at only the thought of the baby or even the cry of someone else's baby. Later this becomes conditioned to the particular baby's sucking. Hence the working mother can go all day long and not feed her baby, and her breasts will remain flat and comfortable. As soon as her baby takes a few sucks, the milk flows in any quantity he needs.

We know that gross brain damage rises in direct proportion to the amount of analgesic medication given to the mother during her labor. The baby of an anesthetized and dopey mother will have been subjected to the same or greater degree (relative to body size) of anesthesia and dopiness at a time when he needs to breathe well and when his circulation should be operating at peak efficiency.

Yet the educated laboring woman finds that at every turn she must defend her position that she doesn't need analgesic medication as one attendant after another presses her to accept such nostrums. She may even have to apologize for not wanting to take medicine which she knows could jeopardize her baby.

Maternity Contour Cushion

Pregnant ladies can't lie on their bellies because there's no place to put the bulges. With this cushion there is. It's well designed, and the ladies say it makes a big difference.

Preparation for Childbirth

This is a thoroughly practical handbook. The suggestions if followed for carrying, climbing, lifting, breathing, and conscious relaxation are sound suggestions for the pregnant woman or anyone, for that matter. One chart on the Relief of Common Discomforts that May Occur During Pregnancy matches a discomfort with an exercise or position to alleviate it. The book does not advocate "Natural Childbirth" but rather suggests that each person is individual in his need for anesthetics; its aim (by use of many illustrations) is to make pregnancy, childbearing, and post partum as comfortable as possible.

EARLY FIRST STAGE Cervix effacing, dilation beginning Contractions become strong enough that you feel need to do something Dilation continuing, contractions becoming somewhat closer and stronger	When contractions start breathe out and relax. Continue slow deep breathing through contraction. Try sitting positions (9) If between contractions rest, read, watch TV, etc. Go to hospital as doctor directs Relax as much as possible in sitting or lying positions during travel and admitting procedures Lie on side, breathe deeply and slowly while rocking pelvis very gently throughout contraction (11)
If contractions are causing backache	

Childbirth Education

ICEA is engaged in furthering the cause of family-centered maternity and infant-care and believes in closer roles for the father during childbirth and periods before and after, breast-feeding, the La Maze natural childbirth method, and generally, further education about childbirth for all concerned. They answer specific questions about childbirth, help organize classes, and "make available through the ICEA Supplies Center significant information on all aspects of childbirth education and family-centered maternity and infant care."

PART FIVE

ACROSS THE BRIDGE

There goes D.R. Davenport, David Ray some folks call him, across the bridge into Kentucky, flipping the dial through Bill Monroe and his Bluegrass Boys to the Reverend Archie Turner saying Jesus on the main-line, tell him what you need, everybody here loves Jesus say amen. D.R. said amen and roared on across the bluegrass toward the range of hills that stretched across the windshield like the jagged spine of some old dinosaur.

Tits for Tots

I'd like to see La Leche League added to the Catalog, right in there with Dr. Spock. The League is a non-profit organization of nursing mothers, whose purpose is to encourage and counsel other women who want to breast-feed their babies. They feel that nursing a baby is an art, best learned from someone who has done it. Most women these days find their doctors, hospitals, relatives, and friends and terrifically bottle-oriented and the League can really be a help in standing up against them.

They publish a "manual", THE WOMANLY ART OF BREASTFEEDING (\$3.00 paperback, \$4.00 hardcover) and a bi-monthly newsletter (\$2.00 a year plus 25 cents postage) both available from their central office:
La Leche League International
9616 Minneapolis Avenue
Franklin Park, Ill. 60132

Local League groups in most parts of the USA and in some other countries meet to talk over the advantages and the problems of breastfeeding and to trade experiences. The central office can tell you where the nearest group is or can tell you how to start your own; they'll give you telephone numbers of League mothers to call for help.

I'd add from my own experience that nursing a baby is a great trip and that the League, though its composition varies from place to place, usually attracts interesting women whose concern is for PEOPLE more than things or images.

Christine Mulford

The Womanly Art of Breastfeeding

Want to nurse your baby? The Womanly Art of Breastfeeding prepared by the La Leche League offers a complete guide of "how to", as well as a philosophical treatise on "why to".

Chapters include suggestions on how to prepare the breasts, how to get reluctant hospitals to cooperate with breastfeeding, how father can help, and weaning processes. In our opinion the book represents the most complete and useful information available concerning breastfeeding.

[Reviewed by Jane Stallings.

We who nurse our babies have often been agreeably surprised to note that when the rest of the family comes down with a cold or flu, the baby remains free of it, or has only a mild case. Studies have shown that breastfeeding definitely prolongs the period of natural immunity to virus diseases. These include mumps, measles, polio, some kinds of pneumonia and other respiratory infections, and some diarrhea.

Many studies indicate that nursing your baby will improve your chances of avoiding breast cancer.

Won't Nursing Spoil the Shape of My Breasts?

On the contrary; if breastfeeding has any effect, it will be to improve your figure. The bugbear here is the fear of developing pendulous breasts. Proper support during pregnancy and the avoidance of obesity (both needed whether you plan to nurse or not) are all that is necessary to keep you in good shape.

Nursing Your Baby

Nursing Your Baby by Karen Pryor (Harper & Row 1963— \$5?) which you really ought to list by the way, has a picture of a baby carrier fashioned from 2 yards of fabric— we took 1/2 an old sheet and tied it appropriately, and discovered that it is much more comfortable than even the Peterson carrier. This at a maximum cost of \$1 if you buy a 2 yard remnant. My sister with her super big little boy couldn't use a back carrier once he got over 15 lbs (quite young), until she started to use a bedspread folded African style. So— why don't you ask the SNUGLI reviewers to try the cloth folding (which more people could afford) and see if they don't like it as well. If they do, we have a cheaper and easier to obtain tool.

Nursing Your Baby by Karen Pryor— In my opinion is a more complete & useful compendium of information on breastfeeding than even The Womanly Art of Breastfeeding. The Womanly Art... has a sexist bias that woman's place is in the home and who would ever want time off from her baby? Karen Pryor is more realistic. 84 hour weeks get to be a drag, particularly when they are a drastic change from an autonomous, intellectual state. She has all the same facts as The Womanly... an more. The book is not written in such a soap opera mystical style— Aw! just read it, and you'll know what I mean!

This is not to put down La Leche League— they are one of the greatest single forces enabling women to succeed in breastfeeding today. If you want to breastfeed, and don't have at least 2 close friends who did for at least 6 months, you stand a better chance if you'll find your local La Leche & join. Not that breastfeeding is intrinsically difficult. It's the know-nothing doctors & neighbors that make it so.

Arlington, VA.

Swedish Milk Cups

For nursing mothers, these are a real boon, especially during the first few months after birth when your breasts have not completely regulated themselves to your baby's needs.

Swedish Milk Cups are made out of strong boilable plastic and are composed of two pieces. The front part looks like a hubcap with a small air hole at the top. The back part looks like a very thin warped donut. They fit together securely and fit over the nipple inside a nursing bra. What they do is collect excess milk. That means you can sleep through the night without waking up in a pool of milk, which often happens at first when your baby gives up the middle-of-the-night feeding.

I used the extra milk for mixing with our baby's cereal, or I froze it to have on hand to leave with babysitters. I wish I had had milk cups when my milk first came in, two days after birth. I was engorged (a common occurrence) with too much milk and was quite uncomfortable for three days. The milk cups press lightly on the areola (the milk duct area around the nipple), and if your breasts are too full, they alleviate the situation by squeezing extra milk out.

They are also excellent to use in the treatment of sore or infected nipples because they keep pressure off the nipples and allow air circulation. And they are good for people with flat or inverted nipples. Wear them during your last month of pregnancy.

I am now in my ninth month of nursing our baby and I still wear mine occasionally. I attribute the never ending milk supply to healthy eating and nutritional yeast. Swedish Milk Cups can be ordered from Marianne Alstrom, 34 Sunrise Ave., Mill Valley, CA 94941, 388-3660. They cost \$5.78 which includes tax & postage, and are worth every penny.

Teething Biscuits

Teething biscuits: I use Milkbone Dog Biscuits, they are not crumbly, gooey, sugary. They are the right size and shape, and are made of mere healthful ingredients. Any other dog biscuits would probably serve as well.

Barbara Bauer Schenker

Nūk Orthodontic Exerciser

Pacifiers are something babies love and parents worry about. Most pacifiers are made in such a way which may cause the baby's mouth to maladapt as it grows, which may result in dental problems later. The Nūk pacifier was designed by an orthodontist, originally, as a therapeutic tool for correcting oral abnormalities. It is constructed so that every aspect of it has a precise function, and thus aids the proper development of a baby's mouth and teeth. In addition, it is also boil-able; it contains no goo to ooze out and concern mother; and 3rdly, the shield is shaped like a happy baby smile—no more of that "plugged" look! The Nūk Orthodontic Exerciser can be found in discount department and drug stores from 44-49 cents. It is available from the manufacturer at its standard price of 59 cents (Reliance Products Corporation, Woonsocket, Rhode Island) Item No. 530.

[Reviewed by Barbara Bauer Schenker.
Suggested by Lisa Law]

- Soft, hollow oral baglet collapses and expands readily during sucking and oral actions.
 - Broad, curved top (palate) side conforms to palate and arch of mouth.
 - Tongue rests in proper position on bottom or concave side.
 - Forward inclined planes contact upper and lower arch elements and collapse and expand during sucking.
- Flat passage encourages baby to close lips and helps nasal breathing.
- Curved shield gives indirect contact with upper dental arch through firm contact with upper lip. Angled position of baglet leaves free space between lower part of shield and lower lip, thereby allowing jaw to work forward and backward.

Population Services

Here's a non-profit organization which supplies contraceptives, at low cost, by mail. Condoms and contraceptive foam are their main items, but they also have several books and publications with useful information and low prices. They have a policy of charging lower prices to young and unmarried people.

—Hal Hershey

Items: 1. We no longer have the Twentisc Pregnancy Test kit as it wasn't reliable enough. 2. We are starting up on a mail-in pregnancy test service— 2 to 4 day results depending on the mailman. 3. We had to split our non-profit and sales operation thanks to good old IRS. Sales are now through Population Planning Associates, P.O. Box 2556, WE1, Chapel Hill, North Carolina 27514. 4. We'd like to offer a ten percent reduction on all prices to all Whole Earth Catalog readers. 5. We have gotten exclusive distribution rights to two fine English condoms and now carry Naturalambis too (see enclosed blurbs). We'll be supplying a couple of more top brands soon. 6. Note our sample package—it's going good.

Peace,

Women and Their Bodies

If anyone has any doubts left that women can really get it together, they should have a look at this book. It's written by and for women and is a masterpiece. The subject is our bodies— our relationship to them, to ourselves, to men, to each other, and to our society. It makes me feel very special but in no way unique— a warm and wonderful feeling. It's a political book in the best sense of bringing it all back home and making it clear how we got here and where we need to go. It's full of good solid information which is presented in a tone totally different from either the usual medical presentations, or the "just relax sweetie, and I'll tell you where it's at" tone of some women authors. If you don't think you have any questions about your body, you'll probably be surprised. And if you're looking for a stronger, clearer sense of yourself as a woman, you'll be satisfied. What it reminds me of most is a woman's body— intelligent, warm, soft, inviting.

Masturbation is not something to do just when you don't have a man. It's different from, not inferior to, sex for two. It's also the first, easiest, and most convenient way to experiment with your body. It's a way to find out what feels good, with how much pressure, at what tempo, and how often. You also don't have to worry about someone else's needs or opinions of you. The more you know about your body, the easier it is to show someone else what gives you pleasure.

To masturbate you have to know something about your body, and in particular about your clitoris (klit' - o - ris). This is a small round ball of flesh located above the opening of the vagina, and it is the center of most sexual stimulation. It functions like the penis in the man. When it's rubbed up and down rhythmically, you get excited. The clitoris is where all female orgasms happen, whether by masturbation, intercourse, or fantasy.

Some women masturbate by moistening their finger (with either saliva or juice from the vagina) and rubbing it around and over the clitoris. The amount of pressure and timing seems to vary among women. Some women masturbate by crossing their legs and exerting steady and rhythmic pressure on the whole genital area. A smaller number learn by developing muscular tension through their bodies resembling the tensions developed in the motion of intercourse. Some ways of doing this is by climbing up a pole or a rope or even chinning parallel bars. Other techniques for masturbating include using a pillow instead of a hand, a stream of water, and electric vibrators. Some women find their breasts erotically sensitive, and rub them while rubbing the clitoris. It's nice sometimes to make up sexual fantasies while masturbating. Some women like to insert something in the vagina while masturbating, (like a finger or vibrator) but few women get more satisfaction out of vaginal penetration than they do from clitoral stimulation.

If you have never masturbated, don't feel you are confined to these techniques. Finding what you like to do is what it's all about.

To any men who happen to read this: this pamphlet was not written for you. Please do not use it as a marriage manual; please do not "try out" the "techniques" you think have been suggested here; please do not suggest to your girl that she read it. If you do want to change your behaviour and you are living together, you might start doing half the housework. If you insist on being pre-occupied with her as a sex object and want to know specifically what you can do in bed, you might try to become more open to

her wants and needs. Listen to what she says, and if you can, do what she asks. In the long run you should try to change your own life, and the society, so that you can be pleased with and proud of yourself without having to exploit her. For either of the sexes to be free, both you and she must be leading worthwhile lives.

Norinyl, Ortho-Novum:

These pills are the same, just made by different companies. Norinyl contains 2 mg. norethindrone and 0.1 mg. mestranol, as does Ortho-Novum (2 mg.). The Ortho-Novum (10 mg.) contains, as the name states, 10 mg. norethindrone rather than 2 mg., and also contains 0.06 mg. mestranol rather than 0.1 mg. The pregnancy rate for both types of pills is about 0.5%. They are considered the best pills after the minipill for pregnancy prevention. Norinyl is made by Syntex Labs, Inc., Palo Alto, California, and Ortho-Novum by Ortho Pharmaceutical Corp., Raritan, New Jersey.

As these pills are androgenic, they should not be given to women with much body hair, unless those women like more hair. They produce lighter periods because they favor a thin endometrium, not very suitable for an egg to implant upon. Derived from 19-nor testosterone.

At this time our demands should include: 1) availability of life supporting mobile units to all homes; 2) doctors deliver babies at home until 3) there are enough trained midwives to take the place of doctors. We women want to have our babies in safety and in comfort. And we will not be satisfied until this is a right of all women.

A Better Pill

On the cover of our March 1969 Supplement we printed a rumor:

SYNTEX, DEVELOPERS OF THE PILL, HAVE DEVELOPED AN EFFECTIVE APHRODISIAC AND DON'T KNOW WHAT TO DO WITH IT.

We also printed our correspondence with Carl Djerassi of Syntex. We are even more convinced the rumor is true.

Dear Dr. Djerassi:

If inconvenience is caused by our report, I apologize. However the rumor preceded our notice of it, and identifying it as a public rumor rather than a public fact may be helpful. Any reply you care to make we are glad to publish along with the rumor and this letter.

Whether the rumor be true or false, it is maintained by desire for its truth and will probably continue until it gets what it wants: an effective aphrodisiac on the public market. The human advantages and legal disadvantages of such a drug are doubtless well-considered by you. What I would like to particularly stress, and it is the main purpose of this letter, is the public need for a double-function Pill—a combination aphrodisiac and birth control pill.

World famine versus heavy governmental controls over sex behaviour is no pleasant choice. If technology such as yours can design around the problem and encourage personal incentives to population control, there might yet be a pleasant choice. The public consequences of a cheap, legal, effective aphrodisiac would no doubt be wild and woolly, putting the psychedelic furor in the shade. But surely a revolution of pleasure-fiends is preferable to world conflict between starving populations. It's not that simple, I know, but before the Combination Pill can be realizable, some laws and attitudes are going to have to get out of its way.

Perhaps the Combination Pill could be called Make Love Not War. Stewart Brand

Dear Mr. Brand:

I think that you have given our Syntex technology too much credit. If we have developed an effective aphrodisiac, our laboratory people have selfishly kept the whole business very quiet.

New drugs are approved for use on the basis of demonstrated relative safety and efficacy. The more serious the disease condition, the greater degree of risk is acceptable. There is nothing in the present regulatory system to accommodate the idea of the validity of drug induced pleasure, erotic or otherwise.

Your proposed oral contraceptive and aphrodisiac combination will indeed be a large pill for the FDA and the medical profession to swallow even if it has the favorable social effects you attribute to it.

Yours sincerely,
Carl Djerassi, President
Syntex Research

How to Adopt a Child

If infertility or population concerns are frustrating your desire for children around the place, adoption can be an adventurous solution. This book details what you can expect in adoption procedure, compares the adoption regulations in the various states, and lists all the U. S. adoption agencies. Roy Rogers and Dale Evans adopted a whole rainbow of kids from overseas. —SB

In recent years, once a home is approved by the agency, placement of a child almost always follows. Further, the time necessary to determine home eligibility has been steadily decreasing. The average time necessary for a private agency to approve or disapprove a home for adoption has dropped from nine months to six months in the period 1958 to 1962. In the same period, public agency time required dropped from six months to four months.

Agencies have also grown more flexible about their age requirement in recent years. Similarly, the number of years a couple has been married is not as important as it used to be. Religion is another area where agency policy has become increasingly more flexible. Even the fact that applicants have natural or other adopted children is of declining importance. Agencies are becoming more concerned, as well they should be, with finding the proper home, one where the child can grow up in a stable and understanding environment. Of course, the adoptive parents still have to satisfy certain statutory requirements (as well as other requirements that the agency might impose), and these requirements are less susceptible to change.

To sum up, there are an increasing number of children available for adoption, and agencies are reacting to this trend by being more flexible in many critical areas.

In recent years, the number of white children adopted has been approximately ten times greater than the number of nonwhites adopted. However, nonwhite adoptions are increasing at a faster rate than white adoptions.

The proper procedure for adopting a foreign orphan is by means of an authorized placement agency. Two such agencies have handled the major part of United States placements of foreign children. These are the International Social Service and the National Catholic Welfare Conference. These agencies have been able to supply foreign children to American couples in most cases for a fee of less than three hundred dollars.

BIG HILL

In the section of Kentucky where the bluegrass and the eastern mountains meet, near Berea, one of the major landmarks is Big Hill. There are several distinctive hills and knobs and rises in the vicinity, but Big Hill is the dominant land mass for several miles around. For travelers on U.S. 421, the bottom of Big Hill represents the precise dividing line between the flat lands and the branch of the Appalachian Mountains known as the Cumberland Plateau. At the bottom, the traveler headed west is entering the Kentucky bluegrass country. From the top, he faces a range of hills flowing south and east for more than a hundred miles, until they are finally broken by the broad agricultural valleys of Southwest Virginia and East Tennessee.

Women in Communes

"In education, in marriage, in everything, disappointment is the lot of women. It shall be the business in my life to deepen this disappointment in every woman's heart until she bows down to it no longer." — Lucy Stone, 1855

The first time I picked up an ax, I felt a sense of failure. Twenty-two years of inactivity, a few isolated attempts—pretending to paint the house with water while my brother, who was only a year older than I, did the real job; or being told to do the dishes instead of mowing the lawn.

What I have learned about the ax is true of most kinds of physical work; use your head, and the ax does the work for you. I learned to hit the log first at one angle, then at another, forging a "V" into the trunk. I learned that the thicker the log, the wider the angle had to be; that the ax should come down of its own weight, guided by the hands, and that the arms and body should follow through, just as in swinging a baseball bat. The first day it was hard work—I kept missing the log, and I got tired very easily. The second day was not so bad. Now I'm no longer afraid of the ax. There are different kinds of weakness—the kind that grows in the mind, the kind that the body feels if it never has been used—and the weakness of bullshitting yourself by assuming you can't do something.

The world we live in moves so incredibly fast that it is very easy to avoid asking what we can do, and more important, what we like to do. Conditioned we are—for instance, any woman who lives in the city can pretty well write off needing to use an ax. And most white middle class women (and men) assume that such activity is beyond the scope of women's potential, calmly ignoring the trusty old pioneer women, the women in rural areas who still chop wood every day—and even the ones who live in the less affluent part of the city, who more often than not work a hard day to earn a wage that barely supports a family, then work as their own house-keepers for no pay and no recognition. The assumption that women are "weak things" is a middle class luxury. For lower class women, the opposite myth is more convenient—women are good at tedious (and physically difficult) shit work.

Certain tasks have to be done every day in nearly every living situation (although we often exaggerate addenda into the essential; furniture wax is both a luxury and a cruel oppression), but this world never offers a us chance to "start again," with a lump of labor and a group of undifferentiated human beings, so that everyone can decide what he or she really prefers to do, and in the process become not just man or woman, but human.

Something approximating such a chance occurred this summer for a small group of people living on a farm commune. There were twelve of us, give or take a few, for most of the summer, doing work which consisted of planting, weeding, pulling trees, and harvesting, as well as chopping wood, cooking over an open fire, washing clothes, and keeping the tents and the camp clean. There

was no running water, which made housekeeping chores a little more difficult, and no electricity, which meant that some of the work, like washing the dinner dishes, was usually done in the dark.

Even though there was no society-dictated division of labor, even though we had complete freedom to determine the division of labor for ourselves, a well-known pattern emerged immediately. Women did most of the cooking, all of the cleaning up, and of course, the washing. They also worked in the fields all day—so that after the farm work was finished, the men could be found sitting around talking and taking naps while the women prepared supper. In addition to that, one of the women remained in camp every day in order to cook lunch—it was always a woman who did this, never a man. Of course, the women were excused from some of the tasks; for example, none of us ever drove the tractor. That was considered too complicated for a woman. We never would have had to haul wood or chop it if we hadn't wanted to.

Does this story sound exaggerated? I think it is true that even men who verbally condone the liberation of women would tend to react the same way in a similar situation, as the result of conditioning. It is true that to some extent our group was free of the dictates of society last summer—but of course we weren't free of our cultural conditioning, which exists outside the society's institutions, and is, in fact, embodied in the individual. The men in our group were exhibiting a collective system of belief based on early training.

The women, too, had much to overcome, and we had to consciously organize ourselves to face the oppressive conditions which we were partially responsible for creating. We were a minority, and most of us were unattached; we were all between the ages of fifteen and twenty-four; all of us had thought and read, in varying degrees, about the problems which women face. We began holding private caucuses in the woods, far enough from camp so that we could feel free from any stray masculine ears. These meetings were not held in secret, though we said little about them, but they were considered a declaration of war by the men in camp, and in a sense we considered them a sign of secession from the normal order of life as pre-determined by the men, and by our own maimed outlooks.

In the meetings we discussed day to day experiences in the camp, related them to what we had gleaned from the past and the condition of women in general, and began to educate ourselves by reading and sharing general knowledge. Our strategy was a total re-orientation of our images of what we could and could not do.

One of our tactics was complete non-response to hostility on the part of the men. We had to learn to differentiate between legitimate attempts to discuss women's liberation, and sheer harassment. To the former we would willingly respond; the latter met with neutral silence. In order to forcibly shift the division of labor, we began doing other chores around dinner time. Collecting and chopping wood was an activity which was often neglected in the course of the day, so after our regular farm work, we would turn to the wood instead of the pots. We tried to discover and do things that

needed to be done for the maintenance of the camp—building rather than cleaning.

If a tense situation arose, where a sister was uncertain how to react, there was usually another sister nearby, and a smile, a hand on the arm, or just the knowledge of concern, helped everyone keep calm. We felt that consistency and complete discipline in regard to our willingness to work were of utmost significance in showing the males that our intent was not to humiliate them, but to work toward a more healthy environment for everyone concerned.

Our experiment was a colossal failure. In analyzing what went wrong, it is probably unfair to place the blame on the men's inability to understand. Yet, as a woman, that is the only conclusion I can come to. A lot of dusty old myths were dragged out and shoved in our faces. . . you don't work fast enough; a man can't even get a decent meal around this place unless he cooks it for himself; before you learn to drive a tractor, learn to get the dishes clean (I don't want you fucking with my tractor, baby!); is there something wrong with your sex life? you want to be just like a man . . .

For several weeks we lived in two separate camps. If we went gathering wood at dinner time, the men cooked—for themselves only. They washed their own dishes, but never the pots and pans that the food had come from. In the field we were a separate women's brigade—all day we worked together and talked liberation, separate from the men.

Those were happy days! Left alone, we taught ourselves, feeling free to be clumsy at first, knowing that we wouldn't laugh at each other. I think we all began to develop confidence in our ability to do things, and my own physical endurance increased tremendously—I had no reason to let a man take over, ever. I think my sisters and I learned to love and value each other as women seldom can when they are divided from each other and forced to compete for recognition by the men in their lives—forced to compete much in the same way that capitalism forces men to compete against each other. In each case, it is the best position in the pecking order that determines how people act toward each other.

The fact that half of the women involved with the farm commune project are no longer there, and that the other half are consciously compromising in order to insure the success of the farm, is a testimony of the long fight which we all face. The inability of men to respond to our attempts to liberate ourselves seems to be an indication that now is the time to isolate, to learn, to build, and if necessary, when we have the strength, to force a change that must come if we are to be free. Cultural change, through the breaking of boundary conditions on behavior, will have to occur, and can only occur, through a conscious re-orientation of our own self-images.

Diana's Rap

I successfully avoided dealing with the whole women's lib question for months. Faced with the necessity of working on these pages, I sat myself down and read Time's spread, and Life's and a bunch of other stuff. And I came to realize why I'd been avoiding it. I've been relating to all kinds of far-out movements for years, but this time, I couldn't identify. Sympathize, empathize, yes, but the evening's reading left me feeling terribly sad and alienated from a scene that somehow should be my scene too. Nearly all the literature refers to the rare exception—the woman who has somehow "overcome" all these cultural patterns and makes her own decisions, leads her own life, does her own thing. Well, I don't at all enjoy feeling like an "exception", and I was never aware of overcoming great obstacles—male or otherwise. I've simply been leading my life and making my choices and sort of assuming everyone else was too. I have been: —a secretary, —a lab technician, —a clinical social worker, —an encounter group leader, —a wife (for one year), —a student (for six years), —a lover (ess?), —a political activist, —a probation officer, —an editor (tress?), —paid less, always, than my male counterparts. I haven't ever been: —pregnant, —married for ten years, —a mother, —a full-time housewife, or lots of other things which I realize form some of the experience from which women's lib springs. I'll be 30 next year.

I have also never felt completely satisfied and fulfilled as a woman and as a human being. Neither has anyone else I know, and that includes men. I do remember once a woman I was working with confronting our male co-workers with a very passionate plea, "You see me as a woman, as a mother, as a little girl, as a this, as a that—I wish you'd remember I'm a HUMAN BEING!". It blew my mind, and I jumped in with my, "I feel just the opposite—you see me as a competent, talented, strong, and you forget I'M A WOMAN!". Whereupon I burst into tears, having meant, of course, "I'm JUST a woman; I shouldn't HAVE to be as strong as you are; I need also to feel helpless, dependent, and weak sometimes".

Well.

SEVEN MONTHS LATER:

Wince, shudder. I wrote that six months ago, & now I want to say, "I take it all back! I didn't know what I was talking about!" I don't know very well how to describe how my head's changed around since then, but it's been a lot & in such a direction as to make me wince & shudder at what I wrote then. A lot of the women's issues are far more subtle & pervasive than I had realized, & getting into them has been an exciting & devastating experience, and still is. Becoming more aware of how we all are, indeed, oppressed, goes

I dig women's lib very much and appreciate a lot of what it's all about, and I find myself being affected by some of the thinking that's going on. I don't dig large parts of it—having spent a lot more of my life in the conventional "men's world" than in the conventional "women's world" (i.e. at home), I suspect a lot of women of over-romanticizing "the world out there". Thousands of men's jobs are at least as boring, tedious, repetitive, non-creative, and unsatisfying as housework and diapers. Nearly always there's less opportunity for physical movement during the day, for doing different things on different days, for listening to music while you work, for taking a nap, or doing a dance—in the "men's world". I have longed—get this—for the freedom of being able to regulate and choose my own schedule to some extent. For possibly having sometimes four hours to prepare a feast, when the mood strikes, instead of the hungry, post-working day quick supper. I have certainly over-romanticized the life I've never led —husband that will take care of me and deal with all that "business", babies, etc. The current sweep of women's lib inclines me a lot less toward these indulgences, and that's probably what I most appreciate. That and the theme that "this is bigger than the bot'n us"—that men suffer from their cultural roles at least as much as women do, and that the real problem lies deeper—lies, in both cases in a society and family structure which makes it very difficult for anyone to realize his full potential, or even any very close approximation.

On one level, I simply lucked out. With three sisters and no brothers and a father who is no sort of male chauvinist, I always felt there was plenty of room for me to define my own role, without a whole hell of a lot of respect for convention. I live in a commune now, with 5 men and 5 women, and we all take turns cooking. The women tend to clean up more, but the men always take out the garbage & take care of the yard. Various of us work at various times, and perhaps our strongest implicit goal is for everyone to be able to live the way they most want to, within our "family structure", and within the recognition that everyone has to do their share of the chores. The sisterhood between the 5 women is the strongest

hand in hand with becoming more frustrated because we have so far to go. The most tolerant of environments doesn't go very far in undoing the years (centuries!) of conditioning/suffering we all carry around inside ourselves. The process of sharing & exploring with other women helps a lot. For the first time in a long time, for me, there's a kind of integration going on in my head that involves getting my own experiences together with what's happening in the world in some kind of sensible way.

A couple of books that really turned me on: *Sisterhood is Powerful* edited by Robin Morgan (Vintage, \$2.45), whose introduction is worth a whole book in itself. And, in a totally different line, Doris Lessing's *The Golden Notebook*, a story of two very unliberated "liberated" women.

—Diana Shugart

Photo from *Women & Their Bodies*

and most profound I've ever experienced—I think the same is probably true of the brotherhood of the men. I can't deny that we've all been affected by our cultural conditioning. Perhaps all I really want to say is that changes are being made, right here in river city; sympathetic male ears are available—my god, the last thing our men want is a bunch of submissive drudges around the house. Which isn't to say they aren't capable of feeling threatened by us. I experienced very peculiar feelings myself when I walked into the kitchen and saw one of my "brothers" cleaning out the refrigerator, and whistling like a lark, grinning to himself, muttering and wondering what had got into him, and really enjoying himself thoroughly. What I love most about the commune is that I feel like I can be whoever I want to be—I can wait on the men (and the women, too, for that matter) and take great pleasure in it, and I can also argue with them, be hostile, be loving, be submissive, be rebellious, do someone else's thing, do my own thing, participate in our communal vision, etc. Just like a family should be. See, the thing is, I suspect that lots of women could do all these things with their families too, if only they would. Your freedom is often, or largely, as much as you have the courage to grab for yourself. Which is to say, mine has been. And which isn't to say I can always do any, much less all, of the above. I figure I have a pretty tolerant environment, though, and it's my responsibility to get it on for myself. With a lot of help from my friends. Ok.

—Diana Shugart

Victimized

Women's Liberation convinced me with the complaint voiced by Laura: "I resent having to sleep on the wet spot in the bed, and I particularly resent being made to feel guilty about it."

—SB

On Death and Dying

On Death and Dying establishes a psychological fact that most people close to a dying person already know, even if they can't admit it: One tends to turn away. Even from husbands, even from wives, even from one's own children. Dying people are casualties of life. Their dying, especially if it is a long, drawn-out affair, is a reminder of how vulnerable we all are, and that's something most people want to forget.

It's in our process of trying to forget that the dying person himself is often forgotten. There he is, lying there, waiting to be recognized. Doctors, nurses, friends and relatives come to "see" him every day. But what he is desperate for is recognition, and recognition is what we seem so utterly unable to give.

On Death and Dying is a powerful book, because it forces the reader into the point of view of someone dying. Suddenly you're on the other side of that glass between the living and the dying, and it's not comfortable. But, as Elisabeth Kubler-Ross points out, the point is not always to "comfort" the healthy. That tendency is a major cause of the intense psychic suffering dying people must endure, in addition to the physical failures that are killing them. This book speaks for the dying in a way they are unable to speak for themselves. It's disturbing, but then so is all education. I'd say this book is indispensable for all people who are living in the presence of someone else's gradual death.

I remember as a child the death of a farmer. He fell from a tree and was not expected to live. He asked simply to die at home, a wish that was granted without questioning. He called his daughters into the bedroom and spoke with each one of them alone for a few minutes. He arranged his affairs quietly, though he was in great pain, and distributed his belongings and his land, none of which was to be split until his wife should follow him in death. He also asked each of his children to share in the work, duties, and tasks that he had carried on until the time of the accident. He asked his friends to visit him once more, to bid good-bye to them. Although I was a small child at the time, he did not exclude me or my siblings. We were allowed to share in the preparations of the family just as we were permitted to grieve with them until he died. When he did die, he was left at home, in his own beloved home which he had built, and among his friends and neighbors who went to take a last look at him where he lay in the midst of flowers in the place he had lived in and loved so much.

He was quite aware that his days were numbered, and his greatest wish was to be moved into different positions (he was paralyzed to his neck). He begged the nurse never to put the siderails up as it reminded him of being in a casket. The nurse, who was very hostile to this patient, agreed that she would leave them down at all times. This private duty nurse was very angry when she was disturbed in her reading, and she knew that he would keep quiet as long as she fulfilled this wish.

But I, it isn't dying alone, it's the torture that pain can give you, like you just want to tear your hair out. You don't care if you don't bathe for days because it's just so much effort, like you're becoming less a human being.

Everybody expected her to die soon, but day after day she remained in an unchanged condition. Her daughter was torn between sending her to a nursing home or keeping her in the hospital, where she apparently wanted to stay. Her son-in-law was angry at her for having used up their life savings and had innumerable arguments with his wife, who felt too guilty to take her out of the hospital. When I visited the old woman she looked frightened and weary. I asked her simply what she was so afraid of. She looked at me and finally expressed what she had been unable to communicate before, because she herself realized how unrealistic her fears were. She was afraid of "being eaten up alive by the worms." While I was catching my breath and tried to understand the real meaning of this statement, her daughter blurted out, "If that's what's keeping you from dying, we can burn you," by which she naturally meant that a cremation would prevent her from having any contact with earthworms. All her suppressed anger was in this statement.

Funeral and Memorial Societies

The best alternative to expensive, hastily-improvised funerals is membership in a memorial society. The Continental Association of Funeral and Memorial Societies, Inc. publishes a list of member groups in the United States and Canada. —SB

A Manual of Simple Burial

Not everybody has an opportunity to depart this world gracefully, and those that do usually blow it. The people left behind fumble just as badly, for largely the same reasons: ignorance, fear, a lack of foresight and preparation. None but the dead can know for sure the full consequences of the failure. But even if there are no consequences for the dead, there are enough of them for the survivors in the forms of trauma and ruptured bank accounts, to make this Manual of Simple Burial seem something like a life-saver.

For this little manual of death is firmly on the side of life. As part of the literature of funerals, it's like a living rosebud in a bouquet of plastic flowers. In 64 pages it quietly tells you how to avoid the ghastly system of converting human left-overs into products packaged as "funerals." In simple language backed by intelligent sympathy, it suggests ways to surround the act of passage with appropriate rites of passage that offer real meaning to people in need of meaning.

According to the manual, the main alternative to expensive, hastily-improvised funerals is membership in a memorial society. A memorial society is "a voluntary group of people who have joined together to obtain dignity, simplicity and economy in funeral arrangements through advance planning." The manual provides a list of several societies by name and address. It also has information on cremation, autopsies, eye-banks, bequethal of bodies, and the business and legal matters that usually attend a death, as well as chapters with titles like "Interpreting Death To A Child," and "What to Do When Death Occurs."

Men choose their horrors. We choose war. We choose pollution. And, by default, we choose to make the rituals surrounding death grotesque. But what is chosen can be unchosen, once an alternative is clear. The Manual of Simple Burial describes a clear alternative to one of our chosen horrors.

Euthanasia and the Right to Death

In the midst of his terminal ordeal sustained by the hospital, my father wished to take matters into his own hands. He was not permitted. I can't see any way that that's right. He was robbed. The most law-abiding man I've known died in prison. The doctors there were friends of ours who did the best they could for him. I don't believe they are wrong, but something surely is. Some deep fault zone in our morality or our control of our technology. Whatever, I don't want that kind of exit for anybody I love. If you want to work out an elaborate scheme with lethal pills or midnight escapes, count me in. The law is wrong.

Death is both a friend and an enemy. The aim of this volume is to suggest that we have a basic human right, in certain circumstances, to decide for ourselves when it is one more than the other. When we are confronted with this fateful choice our society and our doctors must in the end allow us, suffering in life or triumphant in dying, to 'hold fast to our own discriminations'.

Not long ago a man came to me deeply depressed about his role, or lack of one, in his mother's death. She had been an invalid for years, requiring his constant care and attention. At last her illness reached a 'terminal' stage and she had to be taken to hospital. One Saturday after work when he arrived in her semi-private room the other patient greeted him by crying out, 'I think your mother has just passed away. See. Quick!' His immediate reaction was relief that her suffering, and his, were now ended; so he hesitated to act on the other patient's plea to breathe into his mother's mouth in an effort to resuscitate her. Ever since, he had been troubled by a profound sense of guilt. His 'conscience' accused him. This conflict is a 'lay' version of what many doctors, if not most, feel when they forego some device that might sustain a patient's life a little longer. Some are comforted when their action, or inaction, is interpreted to them as a refusal to prolong the patient's death.

A Suggested Non-Statutory Declaration

I DECLARE AS FOLLOWS:

If I should at any time suffer from a serious physical illness or impairment thought in my case to be incurable and expected to cause me severe distress or render me incapable of rational existence, then, unless I revoke this declaration or express a wish contrary to its terms,

I REQUEST the administration of whatever quantity of drugs may be required to prevent my feeling pain or distress and, if my suffering cannot be otherwise relieved, to be kept continuously unconscious at a level where dreaming does not take place, AND I DECLINE to receive any treatment or sustenance designed to prolong my life.

I ASK sympathetically disposed doctors to acknowledge the right of a patient to request certain kinds of treatment and to decline others, and I assure them that if in any situation they think it better for me to die than to survive, I am content to endorse their judgment in advance and in full confidence that they will be acting in my interests to spare me from suffering and ignominy, and also to save my family and friends from anguish I would not want them to endure on my behalf.

It is likely to be a long time before there is adequate probate reform in America. Don't be discouraged, though. You need not be the system's victim. There exists a magic key to probate exemption, a legal wonder drug which will give you permanent immunity from the racket.

The magic key is the inter vivos or "living" trust, a financial bridge from one generation to another. . . . Few laymen know about a living trust. Indeed, only a small proportion of attorneys know about it or understand its use. At least half of the attorneys who do know of it will either deny that knowledge or strongly advise against its use. The inter vivos trust, you see, is exempt from probate. Most attorneys derive a substantial proportion of their income from seeing the estates of deceased clients through probate. Seriously, now, do you expect them to tell you how to avoid probate? I would put the proportion of attorneys who know about and recommend the inter vivos trust at less than 1%.

When you set up a living trust you create it now, while you are here, not through the instrumentality of your will after you've gone. In effect, you say: "I hereby declare that I hold this property in trust for the benefit of so-and-so, I appoint John Smith as successor trustee and I direct that at my death the successor trustee shall dispose of the property as follows, etc."

Big Hill is a special place upon the ground, and it was an important feature in the landscape of D.R.'s mind as well, because it reminded him so much of his father, and Daniel Boone. The Boone legend in Kentucky, or one version of it anyway, has it that it was from Big Hill that Boone got his first look at the lush central Kentucky plain, the fabled garden spot that had been the object of his fantasy and quest. When D.R. would ride over Big Hill with his father, his father never failed to make some reference to Boone and the Wilderness Road. D.R. had no idea how many times that might have been, but surely it was in the thousands. When his father left the coal country of Kentucky in the fifties and moved the family to Cincinnati, they came home every weekend for the next year, and almost every weekend for two years after that. And they always passed over Big Hill on their way to the homeplace up in Finley County.

(continued)

◆ The Monastic Way of Death ◆

When a monk dies here, unless it is in the middle of the night, the big bell is rung slowly for a longer period, a signal for the monks near the monastery to drop what they are doing and come pray for the Brother that he might have a good trip into eternity. Generally a large number are on hand to gather around the bed and join in the prayers. (We do the sacramental Anointing of the Sick in church for any monk getting on in years or sickly, but long before he is approaching death).

Some moments after his death, all take their leave and the Brother Infirmarian takes over. He first washes the body with care and then clothes it in a fresh habit. There is no embalming, and the only special items are that the anus is stopped up to prevent any draining, and a cloth band is wrapped around the head and under the chin to keep the mouth closed. We call the local hospital for a doctor to come out and remove the eyes for the Eye Bank, to which all the monks are subscribed, or else drive the body to the hospital if the doctor is tied up. We do not paint the face or anything like that, but simply pull his hood up over his head and fold his hands in his sleeves. If he is also a priest, he wears a stole. Then, when all is ready, the body is brought in solemn procession with the community to the monastery church. Since one of the monks is a doctor, the official declaration of his death and all the legal matters are taken care of by him and the local monk notary: the laws are quite detailed.

The body is laid out on a pallet or stretcher reserved for the purpose and is placed in the nave between the two rows of choir stalls. Then monks in turns keep watch by the body, two at a time, continuously until the burial. They watch in half-hour turns, reading the Psalms aloud to one another. The Psalms are good poetry and good prayer, and they sit well with the heart in the presence of death when you are alone with it in the deep of night. The Easter Candle is kept burning by the body as witness to our faith in the Resurrection: this is a big candle some four feet tall and as thick as your wrist. This with the large processional cross is used at all death rites. The regular Choir Services continue in the presence of the deceased monk, seven times a day, beginning at three in the morning. At such times the two by the body join the choir. The Choir Services are adapted to the event and are concerned with appropriate themes: time, eternity, death, life, resurrection.

The funeral Mass generally takes place the next morning, the Memorial Supper of the Lord. Such a Eucharist is quite filled with hope and with joy, and all eat the bread and drink the cup to faith in the life to come and in prayer for the dead Brother. After the Mass the body is sprinkled with blessed water and a thurible of smoking incense carried around it. Then the procession forms and we carry him out to the graveyard back of the monastery church.

There the Brothers have already dug a grave deep into the earth, sometimes with the help of compressed-air shovels, since there is hard clay and shale not far below. We gather around the grave and there are more prayers and readings, the grave is blessed and incensed by the Abbot. Then the Brother Infirmarian goes down into the grave by a ladder to receive the body. Meanwhile the pall-bearers have lifted the body from the pallet on the quilt mat which has three long cloth bands on each side by means of which they lower the monk into the grave. The Brother down below arranges the body, slips the quilt out so they can pull it up, pulls the monk's hood down over his face, covers him with a white sheet, and then comes up the ladder. The ladder is removed and the Abbot steps up and scatters a first handful of earth over him in the form of a cross. The pall-bearers start to fill in the grave quietly and gently, beginning at the feet. When the whole body is well covered they stop and the community leaves, after first kneeling on the earth to ask pardon for themselves and all men. A few remain to finish. Then a cross is erected over the grave and later on the name put on it.

For some weeks after his death, a cross stands at the monk's place at table in the refectory to remind all of their Brother that they may pray for him. During the days after, the monks will be praying their Psalters for him that all may be well with him in the next life.

Such a monastic funeral is very simple and beautiful. There is nothing gruesome or morbid about it, nor anything phoney or artificial. Death is recognized for what it is: the end of life on earth, and no attempt is made to hide this. The body is treated with reverence and love, but is not embalmed or falsified in any way. Nor do we use a casket or box, since the Brother is being returned to the mother which bore him and who will keep him in her depths until the last day.

Possibly the only one in the cemetery (besides an abbot who died while on a trait trip) to be buried in a casket is Father Louis (Thomas Merton). He died in Bangkok and was given a military coffin and flown back to this country by the Armed Forces with other dead. Since there had been a long delay, the Abbot decided not to remove the body from the casket, no embalming having been done. The monks found the large casket in their midst somewhat incongruous, yet noted that it was perhaps fitting that the author of *The Sign of Jonas* should have been buried inside so large a fish. Father Louis was always fond of the genuine character of the monastic funeral, and we wondered that he did not in some way make it known to us that the real Jonas did not stay permanently in the belly of the whale. Other than that he had the regular monk's funeral.

Father Matthew Kelly
monk of Gethsemani
Trappist, Kentucky

All things are in process, rising and returning. Plants come to blossom but only to return to the root. Returning to the root is like seeking tranquility. Seeking tranquility is like moving toward destiny. To move toward destiny is like eternity. To know eternity is enlightenment, and not to recognize eternity brings disorder and evil. Knowing eternity makes one comprehensive; comprehension brings nobility; nobility is like heaven. The heavenly is like Tao. Tao is the Eternal. The decay of the body is not to be feared.

Laot-se

(Peruvian Dance Song (Ayacucho))

Wake up, woman,
Rise up, woman,
In the middle of the street
A dog howls.
May the death arrive,
May the dance arrive,
Comes the dance
You must dance,
Comes the death
You can't help it!
Ah! what a chill,
Ah! what a wind . . .

Technicians of the Sacred

-SB

The whole system of human life has been appreciated only in its ascendant aspects lately. We have entire industries—medicine, warfare—devoted to death-prevention, and a kind of pathological secrecy has surrounded the event of dying.

Dick Alpert, several years ago, proposed a Center for Birth and Dying. A place where, if you were going to die or

wanted to die, you go and do it in style, perhaps even grace. There would be whatever religious, pharmaceutical, medical aid you wanted. (If LSD has been proven to ease the departure of terminal cancer patients, why is it not in general use? What else enhances the experience of death?) The Center is also a place for natural childbirth, family supported, so that arrival and departure in this world are not estranged.

-SB

The death of Osceola, the Seminole January 30, 1838

About half an hour before he died, he seemed to be sensible that he was dying; and although he could not speak, he signified by signs that he wished me to send for the chiefs and for the officers of the post, whom I called in. He made signs to his wives (of whom he had two, and also two fine little children by his side), to go and bring his full dress, which he wore in time of war; which having been brought in, he rose up in his bed, which was on the floor, and put on his shirt, his leggings and moccasins—girded on his war-belt, his bullet-pouch, and powder-horn, and laid his knife by the side of him on the floor. He then called for his red paint, and his looking-glass, which was held before him, when he deliberately painted on half of his face, his neck and his throat—his wrists—the backs of hands, and the handle of his knife, red with vermilion; a custom practised when the irrevocable oath of war and destruction is taken. His knife he then placed in its sheath, under his belt; and he carefully arranged his turban on his head, and his three ostrich plumes that he was in the habit of wearing in it. Being thus prepared in full dress, he lay down a few minutes to recover strength sufficient, when he rose up as before, and with most benignant and pleasing smiles, extended his hand to me and to all of the officers and chiefs that were around him; and shook hands with us all in dead silence; and also with his wives and his little children; he made a signal for them to lower him down upon his bed, which was done, and he then slowly drew from his war-belt, his scalping-knife, which he firmly grasped in his right hand, laying it across the other, on his breast, and in a moment smiled away his last breath, without a struggle or a groan.

Catlin, *The North American Indians*,
Vo. II, p. 251n.

The Indian in America's Past,
Jack D. Forbes, \$1.95 from Prentice-Hall, Englewood Cliffs, N.J. 07632

From Newsweek April 6, 1970

"The city person usually asks me to spare no expense in order to keep a dying relative alive," observes Dr. Robert Leachman, director of cardiology at St. Luke's Hospital in Houston. "But the rural person who has lived his life in close contact with the cycle of nature accepts death more readily as a fact of life." . . . at one Boston hospital, . . . Kastenbaum found that the terminally ill had dubbed their wing "Death Valley." the dying were kept alive with drugs till their machine ran out. In time, however, the psychologist was able to cut the use of drugs by introducing a simple humor touch: once a day, the residents of Death Valley were allowed to throw an old-fashioned beer party.

His father would say, "Right here now David's where old Boone got his first look at his new country. Stopped right over there by that mailbox, could see as far as he could see." He would grin then, and wait for David to respond. He made the joke two times every weekend, coming and going, but somehow it was always funny. David would begin to anticipate it miles before his father would say it, like a story he knew but never got tired of hearing. His father would say, "Yes sir, old Boone loaned his gun against that very mailbox yonder, and looked all around."

(continued)

Do-It-Yourself Burial for \$50

Human bodies are an organic part of The WHOLE EARTH and at death must return to nourish the ongoing stream of life. Most of the billion dollars annually which Americans pay to the undertaking industry to dispose of corpses is sheer waste, both of money and of ever decreasing living space for posterity.

Isn't there some way, "I was asked by a widow," that two or three of us could dispose legally of the corpse for a few dollars? My husband's death left us badly in debt but I had to go further in debt to pay a funeral director because I didn't know what else I could do."

Contingency Planning is the essence of a Do-It-Yourself Funeral. What we need is not so much to escape the clutches of a profit-motivated business but to remove our own vulnerability by preparing to do ourselves what needs to be done. Actually in usual cases it is quite easy. Nothing very "professional" is required that any poor man or woman cannot do themselves.

If you are going to act "in place of" a funeral director you have to get prepared well ahead and take charge immediately. There is not time to learn the ropes after death occurs. One cannot just copy the writer's experience, but I can give you a close idea of what to expect. Then decide if you want to take the trouble or just pay a professional to do the work for you.

The when and where and who of death is not always very predictable. It is best to have a group plan for one's family, church, union or commune. A burial committee of 3 persons, any one of whom can take charge, can be specified in one's last instructions, just so no one is paid.

Take this example (in California):

The grandfather entered keenly into the project to set his whole family an example. When he died here is how we carried out his wishes:

- 1) We got out his instructions which were left handy to get at. The other grown members of the family had each completed their own set of instructions—or specified that the same ones be followed. Three of us, a son, grandson and uncle were named, any one of whom were authorized to act as his "funeral director."
- 2) We went immediately to our County Health Department office of Vital Statistics and obtained a Certificate of Death form, showing our authorization to do so. We had already in advance obtained a copy of the form to familiarize ourselves with the information required. We filled in the details and
- 3) Took it to the medical doctor who verified the facts of death to complete the technical questions. In cases requiring a coroner's action the latter would do that.
- 4) Then the "person acting in place of" a funeral director completed the Death Certificate and returned it to the Registrar of Vital Statistics to become a part of the state's permanent public records.

We applied for a certified copy of that Death Certificate and paid the \$2 fee. For another \$1 we obtained a "Permit for Disposition of Human Remains." These are needed to satisfy a hospital, possible police inquiry and to assure the receiver that he is authorized to cremate.

6) We went home and got out the six foot box which we had made long before from odd bits of plywood for \$5. The cheapest wooden casket sold for \$85 but why waste it? Some places do not even require a box for cremation.

7) After checking the crematory about delivery we took our box of remains there by pickup truck and handed over a check for \$40, the local fee which elsewhere varies. We presented the two certificates from the County Health office and signed the authorization to cremate.

The crux of disposal is the requirement on all these forms that one must specify a legal (i.e. cemetery or columbarium) place of final interment by name and address. In practice this means another \$150 or more for a plot or niche. Even strewing ashes at sea is made ridiculously complicated and costly—to discourage it. The lobby of the industry in this state has so far defeated all attempts at funeral reform which would permit relatives to keep the ashes at home or to strew them in the family garden or at a public (outside city limits) park or seashore. You may find that where you live it is perfectly legal to do this.

8) However, in this case Grandpa ordered his "funeral directors" verbally to finish his wishes as follows:

- a) fill in the name of a cemetery back in his home town to satisfy the statistical requirement.
- b) take personal custody of the ashes for delivery in a little box we made.
- c) then later scatter the ashes on the Sierra as he had privately ordered.

Most people would rather "pay the piper," even though they feel that final regulation is ridiculous and exploitative—rather than be forced to subterfuge. However, these last wishes were complied with discreetly and privately and no questions have arisen in this or other similar cases.

To complete this example I must report that two Sundays later friends and relatives gathered for a jolly memorial feast, to which all contributed, in honor of our departed. The full amount payable in "death benefits," \$1000, the deceased left in a scholarship savings account for a couple of his grandchildren.

For your further study get through WHOLE EARTH CATALOG Ernest Morgan's "Manual of Simple Burial," an excellent guide to lots of other business that needs attending to at the time of a death. Also join with others who are already organized to handle death simply and with dignity. The Continental Association of Funeral and Memorial Societies at 59 East Van Buren Street, Chicago, Illinois 60605 can direct you to one of their non-profit member societies near you, to which millions of families and individuals belong. Their voluntary elected officers can help you, as they did us, to make your own family death contingency plans.

The most popular procedure up to now seems to be an arrangement with local funeral directors who co-operate with a Memorial Society in providing minimal disposal service \$150 and up plus another \$150 or so for a cemetery plot or columbarium niche. However, in the example given total burial costs were \$48.

Anton Nelson

How to Live on Nothing

(Our best selling book.)

This book has a lot in common with *Champagne Living On A Beer Budget* (below), but there's enough difference between the two to make them more companion pieces than competitors. The emphasis in *Champagne Living* is on the cheap accumulation of necessary things. *How to Live on Nothing* covers some of that ground too, but its main concern is the development of personal skills to help you get free of the need to pay people like carpenters, plumbers, doctors and real estate agents to live your practical (that is to say, your "real" or "concrete") life for you.

Of course there's no such thing as "living on nothing." The book would be more properly titled, *Living for Something*. For in a curious, unintended, Zen sort of way, that's what this book is about: living simply to establish familiarity with the details of your world, with ordinary local mysteries and miracles such as the wiring system in your house, the fabric of the garments you wear, the truth of the food you eat, and the fuel you burn. Behind the information, the advice, the hints, and the facts, this book is about coming to see things as they are, through your own eyes, instead of the hired eyes of some expert or other. It's about training yourself to trust yourself, and trusting yourself to train yourself, until you're able to claim your right as a human to be competent with your hands.

Finally no one is ever competent with his hands until he uses them, and flipping through how-to-do-it books can hardly be described as manual labor. So perhaps the best way to recommend a book like this is to call it literature and emphasize its inspirational value. I kind of like that idea. I've thought the same thing about the *Whole Earth Catalog* in general, which brings up an interesting question: if the ultimate test of a good manual is its success as art, does that mean that the ultimate test of a good novel is its uses as a manual? We'll see. Meanwhile, here's a good 95 cent how-to-do-it book that could be a help to you on your next trip, real or imagined, into the New Wilderness.

Champagne Living on a Beer Budget

If your vision of an alternate life style includes a dome in the mountains, raising your own food and making your own clothes from homespun wool, you probably ought to pass this book up and wait til somebody writes *Beer Living On A Bay-Rum Budget*.

But if you are pioneering in or near a city, and if money passes through your hands with some regularity; if, that is, you consider yourself what I have come to think of as a 'suburban guerrilla,' then *Champagne Living On A Beer Budget* would be a handy tool to have around your camp.

(Someday, after I've lived in the suburbs longer, I'd like to write an essay about my vision of the suburban guerrilla. He's a definite phenomenon. There's a sizeable population of them here in the San Francisco Bay area, men and women out to enjoy the advantages of town life without paying the customary penalties. Every suburban guerrilla probably has his own definition of himself, but my own sense of him is this: he has a job, but not a career. He likes the comforts, but doesn't want to go into debt for them. He makes distinctions between things that are good and things that are merely expensive. He may go in for elegance, or he may dig the funky scene. Hippies, after all, are urban guerrillas. But hippies are kids mainly grooving on each other in special enclaves, and that isn't quite what I'm talking about. I'm talking about people who see the possibility of a rich and abundant adult life within the context of those same suburban communities generally condemned as such hopeless wastelands that 'real' life cannot be supported there. The suburban guerrilla I have in mind is one of the suburbs, as well as in them.

He challenges the assumption that the suburban context is hard, absolute, impenetrable, like plastic. To him, more like a piece of cheesecloth, full of holes to breathe through, and to wind in and out of, like a morning glory, or a pale bean. He borrows much of his point of view from the orientals. He realizes that life goes on in the suburbs just like every other place, even if most of the people there are too blind and deaf to see and hear it. The guerrilla lives by his wits, one day at a time. This makes him alert and alive. He has a talent for cultivating the holes in his cheesecloth. One hole might simply be the way the world is at six a.m. Another might be first-hand knowledge of all the footpaths in the neighborhood. He creates his freedom here and there and now and then, and by diligence winds up with as much as any conscious man

anywhere. His landscape is small and patterned, but there are discoveries to be made on it, discoveries that can feed his own life at the same time they are important to the culture. I know of one elderly couple that subsists almost entirely on the food they raise in their organic garden in the backyard of their home in suburban Menlo Park. As far as I'm concerned, the trip those two people are on, the life they are proving possible, is the most inspiring radical activity in all of San Francisco's radical environs).

One needn't romanticize his life as much as all that, however, to find the book we're talking about a worthwhile manual. Anybody interested in bargains ought to have it. It's loaded with facts, tips and information on good deals in all the important categories. Food, clothing, shelter, real estate, automobiles, household appliances, medical things, taxation, funerals, recreation, retirement, consumer co-ops, travel, babies, insurance, charities, and more. It's entertainingly written; yet the rhetoric never gets in the way of the information. The people who wrote it obviously want to beat the money rap as much as any of us. They also want to live well. Their book will be of considerable help to other people trying to do both, simultaneously.

or WHOLE EARTH CATALOG

For a dollar a year, you can subscribe to *Our Public Lands*, a quarterly magazine telling how to buy public lands, where to hunt, fish, or camp; also details of 'Alaskan opportunities.' Order from the Superintendent of Documents, Washington, D. C. 20402

Finally we called eight establishments under Typewriters, Rental. For comparable models of a Smith-Corona electric portable, two companies wanted \$25 per month; two wanted \$22.50; three were asking \$20; one, \$15; one, \$12.50. We finally rented a nearly new machine from a firm that charged \$9 monthly on a two-month basis.

A food and nutrition chapter would not be complete without mention of a food bargain that is unknown to most of us. It is MPF, the Multi-Purpose Food, developed at the California Institute of Technology and merchandised through the Meals for Millions Foundation Incorporated, [correction: 1800 Olympic, Santa Monica, CA]. This is a non-profit organization dedicated to relieving and preventing starvation and malnutrition throughout the world. Meals for Millions supplies MPF for 3 cents a meal to famine areas.

BLACKBOARD CHALK. Leftover ends of chalk will give metals a shine when rubbed on. Also, store these ends with costume jewelry to keep it from tarnishing.

City dwellers can get many vegetables for the asking at less trouble than we who have to wander among the weeds. The grocer nowadays has a perfect passion for washing greens and wrapping them in ploom. If you reach his place early in the morning when he's engaged in this vitamin-robbing task, you may receive a gift of the discarded vitamin-rich outer leaves plus a stray carrot and some celery stalks. I've obtained boxfuls from a grocer in a nearby town and I use the wooden boxes for fuel while I'm preparing the greens.

CORKS. A used cork should be kept near the kitchen sink in a jigger glass or eggcup so that it is handy for scouring cutlery, etc. Used with scouring powder, it is effective and saves wear and tear on your dishcloth.

BREAKFAST WHEAT MEAL. Wash 2½ cups (1 pound) wheat kernels. Spread on cookie sheet to dry and toast in moderate (350 degrees) oven for ½ hour. Put kernels through coffee grinder, adjusting to fine if you want meal, coarser if you want grits or groats. Makes 3 cups. Store in cool place. To make 4 small or 2 large servings and add concentrated milk values, mix ½ cup wheat meal with ½ cup dry milk solids. Mix to paste in ½ cup cold water. Add to 1½ cups boiling water with ¼ teaspoon salt. Stir over low heat 3 minutes. When smooth and thick, add a teaspoon of honey or raisins or other dried fruit or omit sweetening and serve with butter or cream as your taste dictates.

DOORKNOB. If you have no pestle for pulverizing pills and bruising seeds, mashing herbs, etc., use a doorknob in a wooden salad bowl.

If you live in the city you can usually get plenty of discarded crates for tinder, but unfortunately logs are expensive. Newspaper, however, is cheap. If you haven't enough of your own, collect your neighbors' or raid the nearest trash can. To make a log out of paper, roll the newspaper from the bottom up so that the length of the log will be no more than the width of the paper. Make a thick roll (a single Sunday edition should do it) at least 6 inches in diameter. Then fasten the roll by rolling it on the diagonal of two sheets of fully spread-out newspaper and tucking each end of this covering piece into each end of the log roll. You'll not believe this until you try it—I didn't—but this paper log burns slowly and will stretch out a scant wood supply admirably. We use these in our fireplace when it is too damp to go out for wood.

ENVELOPES, either the ones addressed to you or the ones enclosed as postage reply envelopes with ads or the ones enclosed with wedding invitations, etc., should be re-used. Open addressed envelopes carefully. Turn them inside out and reglue the seams.

Motor-driven equipment is an increasingly heavy expense as our homes become more mechanized. Most of us, however, pay for unnecessary appliance repairs through ignorance of how to avoid them. It's not necessary to try to rival the skill of a professional repairman. Simply keep him away by knowing a few rules of care and repair. Car engines aren't the only ones to suffer strain in cold weather. A hard start strains any motor. Your washing machine standing on the back porch in a temperature below 40 degrees F. must stand half a day inside in the warmth before you do the wash. If you keep your sewing machine in the cold spare room, apply the same rule. Even the motor-driven grinder out in the unheated garage needs warming before running. Vacuum-cleaner, freezer, and refrigerator motors all need warmth before starting.

'Overexposed steaks' are a find for those who will literally look beyond the surface of things. The fluorescent lighting used in grocery store meat shelves darkens the steaks quite rapidly. Once a steak turns maroon, it's usually marked down by 25 percent or so—and it's fine.

Some expensive canned fruits, like Elberta peaches and fine Bartlett pears, can be bought in cans of 'chunks and pieces' for a fourth or less than you'd pay for canned halves.

Or, if you'd rather, the National Association of Housing Cooperatives, Inc., invites your query. Address: 465 Grand Street, New York City, N. Y. 10002. Latest information on new cooperative would be available from the United Housing Foundation, same address; or from the Association for Middle Income Housing, 217 Park Row, New York; or the FHC Company, 322 Main, Stamford, Conn. (FHC International, 1001 15th Street NW, Washington, D.C., is an affiliate of the FHC Company and helps develop housing cooperatives overseas.)

Homes in the paths of proposed freeways have usually been bought by the city or county and are rented on an annual lease basis until time for demolition. Friends of ours are renting a \$30,000 home for \$85 a month—until the bulldozers claim it. They simply called the city switchboard and asked to speak to someone about renting city-county-owned homes.

Homes being rented are often not due for demolition for eight or ten years. They're bought up far in advance of need so there won't be last-minute snags or holdouts.

Avoid the cheap \$10-\$17 brake jobs advertised by some service stations and shops. At the price, the linings are most likely of inferior quality, and wheel cylinders won't be rebuilt.

When it comes to air travel you can avail yourself of bargains if you'll fly major airlines on weekdays, regional airlines on weekends...fly by night...forgo the two glasses of champagne in first-class quarters...buy a 'run-of-the-airline' ticket on a regional western carrier if you live in the eastern half of the country...travel to Europe in off-seasons...fly a triangle, with a stop at an intermediate glamour city thrown in for a few dollars extra...travel a heavy-volume, frequently scheduled commuter flight...forgo reservations and fly for half fare, on a standby basis, on at least one airline...or register as a first-time airline rider on another and make any round trip in the system for \$25...buy a package which wraps up hotel, entertainment, and air fare.

To locate a Memorial society in your area, or for bequeathal information, write to:

Continental Association
39 East Van Buren Street
Chicago, Ill. 60605

For \$1, this nonprofit organization will send you *A Manual of Simple Burial* (64 pages).

For 25 cents, the Continental Association will send you *Memorial Associations: What They Are and How They are Organized*. The association will also be happy to inform you if any societies are newly active in your area.

Buying Wholesale

Buying wholesale is a thing lots of people can do IF it is gone about correctly. Wholesalers are interested in making a profit, as are retailers. Keep this in mind when approaching a wholesaler. Show him how he can make money by selling to you at wholesale (like, you'll go elsewhere if he doesn't). Often, a courtesy discount is given to legitimate non-profit (that means recognized by the state and Federal tax men) organizations. Courtesy discounts are usually offered only by retail establishments. They sell to you at the wholesale price and often make no money on the transaction.

Wholesalers are able to sell at lower markups and still make money by keeping down bookwork and unnecessary stock handling. That means they want to sell in quantity. So get your friends together and make up as big a list as possible. And be prepared to pay cash.

Don't expect dealer service from wholesalers. You haven't paid for it and if you ask for it, you probably won't ever be able to buy wholesale there again. Don't ask to examine everything. They can't afford to let you.

Some wholesalers will sell only to persons or firms having a resale tax license (State Board of Equalization in California). This usually requires posting a good sized bond (\$50 minimum) to assure that you will pay sales tax on everything you buy. These wholesalers don't want the bookwork involved in sales tax, so they sell nothing that they will have to charge tax on.

Often, after meeting all of the above basic requirements, you still can't buy wholesale from some sources. At this point a "front" letterhead helps. Better get a city business license or DBA (Doing Business As) and stay out of trouble. These are usually free or cheap.

Buying food wholesale is more difficult, because the markup is very low. Sometimes a store will give you a special price if you buy by the case. Or buy direct from the farmer at the same price you would pay in the store. Get fresher produce and let the grower have the profit. He needs it.

Most of all, remember to show the wholesaler that he will make a profit by selling to you. That's usually all you need.

-Fred Richardson

Consumer Reports

Consumer Reports is a comfort. When the time is come to buy some goodie— color television, or a hi-fi, or a sewing machine— CU (Consumers Union) is there with the information on what's the best, or the best buy, or the healthiest of the brands available. i.e. how not to get burned (one anticipates the CU research on brand-name psychedelics). Consumer Reports is a monthly magazine with articles on various classes of products and various cases of marketing misbehavior; the December issue is the Buying Guide— a dense compendium of all the quality/price information, available separately for \$2.65. I only wish the magazine would print ads, give the manufacturers a place to beef back, liven up the Liberal Hour.

CU'S KEY FINDINGS

CU tested Super 8 cameras equipped with zoom lenses, automatic exposure control and, by and large, through-the-lens viewing and metering. Four earned a check-rating—the Nizo S36, the Argus Cosina 708, the Honeywell Elmo Dual Filmatic 909 and the Eumig Viennette 3. Each of the check-rated models enjoyed some distinction in addition to high overall quality. The Nizo, light and compact, was particularly comfortable to work with; the Argus provided an outstandingly wide range of zoom settings; the Honeywell could, with an optional back, take Single 8 as well as Super 8 film; and the Eumig fixed-focus camera (a Best Buy) provided optical performance comparable to the best focusing models at all but the shortest distances. The Bolex Macrozoom models also proved interesting because they can focus at extremely short distances.

CU'S KEY FINDINGS

You needn't spend a small fortune for a cartridge, or pickup, suitable for use with a high-quality stereo system. The best one we tested, the check-rated Shure V15 Type II (Improved) lists at \$68 (but probably sells at closer to \$50). Yet none but a perfectionist could quarrel with such a pickup as the Shure M91E, which we were able to buy at half its \$50 list. And those planning a stereo system on a tight budget can buy the ADC 220XE, which should sell for under \$20, or the Shure M7N21D, which lists at \$18 but sells for a good deal less.

Cross-country, most food sales occur from Thursday to Saturday. If this is true in your area, plan to shop at the end of the week.

If you shop on Saturday, watch for reductions on foods the store doesn't want to keep over a weekend.

Shop when the selection of perishables is the freshest, usually in mid-morning.

Study the fine print on labels of processed food. Ingredients must be listed in descending order of quantity. This legal listing tells the true story, which product titles or handsome pictures may not. A main dish may be called "chicken with rice," but if the label lists rice before chicken, you know it's more accurately "rice with chicken."

Bananas may be refrigerated once they reach the brown-flecked stage of perfect ripeness. They will hold for several days, but do lose a bit of their lush flavor from refrigeration.

Discount Suppliers

I am just now getting around to reading back issues of the W.E.C., and have come across the letters in the July 1970 issue about "dis-unity" (page 9). Having been ripped off by Unity Buying Service a couple of years ago I would like to submit the following in hope that others might be saved the pain and financial loss.

It should be obvious that this service is a rip off. I would discourage people from using it. There are any number of more reputable and cheaper outfits. One that I have dealt with in Rochester, New York is Naum Bros., 2373 Ridge Rd. West. They operate several stores with the same type of catalogue/discount plan, without the membership or service charge. I'm not up on their mail order procedure.

I most strongly recommend another which I have come in contact with since moving to Tennessee. The name is Anderson's, 404 Bernard Ave., Greeneville, Tennessee, 37743. They have a catalogue very similar to U.B.S., and operate on the same discount procedure. There are, however, several big differences.

1. They charge no fee for membership
2. They have no handling charges. Only price + COD or postage.
3. Their prices appear to be lower. E.G., the Kodak 850 projector illustrated (pg.95 Sp 70 WEC) UBS—\$144.00+ 5%; Andersons—\$137.55 + nothing! CAN YOU DIG IT?!

Anderson's belongs to a group of 35 such stores through the South-Mid West. I'm trying to get the names of the other members. One drawback is that they are very much into the Middle America/jewelry & silverplate stuff—but they have several items worth considering, especially if you are many miles from a big discount store. Also, the manager says that he will consider any requests for unlisted items (no guarantee that he can get them). They handle several limited items that they do not list, and they can get some stuff on special order.

I will personally be willing to follow up any complaints about poor service.

Harvey Williams
Greeneville, Tennessee

While I'm at it I'd like to introduce you to another friend— Jung Seed Co., Randolph, Wisconsin, 53956. They have an extremely wide variety of vegetable and flower seeds at very reasonable prices— usually 20 or 25 cents per packet. They also have prices for larger quantities (1/2oz. oz or pound etc), and they handle fruit and ornamental trees. Only 35 cents handling charge on orders under \$10, and they pay postage on all orders (with very few exceptions— parcel post or freight charges not paid to Far West). They are very fast and cooperative. They even sent me seeds when I was in Panama and paid the Air Mail postage themselves. Not organic as far as I know.

Note their prices for fruit trees, grapes and berries are as much as 1/2 as much as Stark Bros.

Consumer Bulletin

Over the years we've found that a less well-known magazine than Consumer Reports called Consumer Bulletin has a more ecological approach. It is published by Consumers' Research, Inc., Washington, N.J. 07882, boasts of being the original consumer magazine, and costs \$8.00, including an Annual issue.

Audrey Newcomb
Rochester, N.Y.

One time when Boone leaned his gun against the mailbox he found a letter in it from John L. Lewis that said DON'T COME TO KENTUCKY, BOYS, THE WORK'S TOO HARD AND THERE'S TOO DAMN LITTLE PAY" Another time there was a letter to Daniel from his brother Squire that said, "If you see a boy named David Ray Collier out in them woods, you send him home, he's too young to roam."

David said, "There was not."
"Oh yes there was too," said his father.
His father's name was Royce. Royce Collier. And in those days, before his mother's second marriage to Wallace Davenport, Collier was David Ray's last name too.
"Oh yes," said Royce. "Squire sent that very letter to Daniel Boone. You ask Doyle here if he didn't."

Doyle, the assistant driver and chief mechanic for the old Pontiac, only twenty-four then, tall and lean, fresh out of the army, sitting in the front seat beside Marcella, would nod and say that it was so, and that if David didn't believe it he could just ask Royce there. And round and round it would go, two men supporting each other's teasing lie, and sometimes it was funny and David would laugh, and sometimes they would tease too far and hurt David's feelings, and then he would sit back into the crowd of cousins in the back seat and pout the rest of the way to the homeplace.

Moneysworth

I don't like their hard sell, nor their thinness, but they do in fact have original information on money-saving.

Use WOK for rice preparation, baking, frying, steaming in large quantities. Recipes incl. 11 A 9271—Shpg. wt. 8 lbs. 8 oz.—\$24.99

Sears/Wards mail order

If you live away from cities, where telephone calls and quick car trips aren't possible, the Sears and Wards catalogs are indispensable. Clothes, tools, building materials all via mail and service is rapid. Both catalogs are intelligently organized. Although we take such for granted, the Sears catalog was on display in the U. S. pavilion at the Brussels World's Fair and continually mobbed by people of other countries.

Both have farm catalogs, with contractor's and light industrial equipment and all types of farm equipment, including live poultry. Sears has a separate catalog of Craftsman tools, which are considered the best low-cost hand tools. Most electric tools have a year's guarantee and other tools are unconditionally guaranteed. If you break a hammer handle after three years' use, they'll give you a new hammer.

Order from nearest Sears or Wards store. Two catalogs a year: spring-summer and fall-winter. Free. To stay on the mailing list you must make two orders every six months.

-Lloyd Kahn

Sears now has special catalogs on Hand Tools, Building Materials, Hunting, Toys, Old Time Movies, Business Equipment, Water Systems, Car Parts, etc. Free from Sears Catalog Sales Offices.

-SB

Riverside "110" Generator

INSTANT 110-volt AC power from your car, truck, boat or tractor engine. Dependable power—at the site, on the job, on or off the road—exactly where and when you need it. Isolated ground permits use under otherwise hazardous conditions. Universal mounting bracket included.

Applications: Home—operates 110-v. AC or AC/DC tools and appliances—ideal for emergency lighting in power failures. Police and fire departments—operates radios, smoke ejectors, floodlighting. Heavy equipment—use to run water pumps, blower, various electrical tools for on-the-spot repairs. Farm tractors, trucks—runs pruning saws in groves, orchards; lighting for night farming. Forged steel housing, 110-v., 27 amps., 3500 watts peak output, 60-cycle rated frequency at 3600 RPM shaft speed. Outlet box. Ship. wt. 42 lbs.

61 C 11497 R. \$10 mo., Terms page 1218, or cash 198.00

Voltage regulator—permits operation of above unit with vehicle in motion. Mailed, pay from factory in New York. Allow 7 days plus transit time. Ship. wt. 5 lbs.

Will not rot or mildew. Tied-in leather honda. 7/8-in. diam., 30 ft. long. 89 FR 22475—Ship. wt. 2 lbs. 9.00

RECOLLECTION

That car of Daddy's was an old Pontiac he bought with the first wages he ever earned in Cincinnati. It had over a hundred thousand miles on it when he got it, but he never hesitated to take off in it for Kentucky. The first year we lived up there we never missed a weekend going home. Fifty-two round trips in a year, over two hundred miles each way, six, seven, sometimes eight and nine people in it every run. Every Friday as soon as Daddy'd get home from work we'd load up and head out, and drive six straight hours south on old U.S. 25, through Lexington and Richmond, east into the hills on 421, then down state route 666 to the homeplace in Finley County. In the winter time it would be dark before we even set out, but in the summers the light would hold till almost Richmond, and I remember the programs that came on the radio about that time of day. My daddy played the guitar some, and he loved hillbilly music, and so at six o'clock he'd tune in the Hillbilly Hit Parade out of WCKY in Cincinnati. I remember it started and ended with somebody's fierce picking of the Steel Guitar Rag, and then when it was over Wayne Rainey and Lonnie Gloschen would come on, trying to sell harmonica instruction courses. Wayne and Lonnie were good musicians too, and when they'd get wound up Daddy would get excited and start to sing along with them, and bounce around in his seat and beat on the steering wheel with his hand. He'd cut up like that for miles and miles. He'd tickle us all so much we'd forget how uncomfortable we were, piled on top of one another in the back seat of that old car. On Fridays you wouldn't mind being uncomfortable because you knew you were on your way to some place you really wanted to be a lot, but on Sundays you'd feel so blue about having to leave the homeplace to go back to Cincinnati there wasn't any way in the world to get comfortable and Daddy would have to stop every hour or so and let people out to stretch. We hated it, coming back, but then it was only five more days till we'd go down home again, and we cheered ourselves up with that thought. The five days would drag by but finally Friday would get there, Daddy would come in from work, clean up a little and then there we'd be, on the road again. About six hours later we'd turn off at Mrs. Godsey's store and drive up Trace Fork to the homeplace.

It would be midnight by the time we'd get there and Grandma and Granddad would be in bed asleep. Granddad never let anything keep him from getting his sleep, but if Grandma was feeling well she'd get up and come in the kitchen and hug us all and start taking cornbread and beans and cold mashed potatoes out of the oven and setting them on the table. Daddy would say here now Mommy, you quit that, we've all done and eat. But Grandma would keep hauling out the food and before long we'd all be seated at the table, me and Daddy and Marcella and Doyle and usually some of Doyle's kin folks would be with us and they'd sit down too and there we'd all be, in the middle of the night at Grandma's house, eating cold beans and potatoes and blackberry jam on that good cold cornbread.

Then it wouldn't seem like half an hour till there we'd be again, sitting at the table, Granddad with us this time, the beans and potatoes hot now, the pork hot, the beans hot, the cornbread hot, the collard hot, and the milk cold as ice from sitting all night in the spring house. That would be Saturday dinner. Sunday dinner was always chicken and gravy and cole slaw with beans and potatoes, a big pone of biscuit instead of cornbread, and ice tea for those that didn't want milk.

Sunday dinner was considered the best meal of the week at the homeplace but I never did like it after we moved away because it was after Sunday dinner that we always had to load up in the Pontiac again and go back to Cincinnati. I was always too sad to eat much on Sundays, and what little I would eat I'd usually throw up as soon as we got back on the road. At dinner time on Saturday I'd eat like a starved horse thinking: twenty-four hours. Twenty-four whole hours to romp around the pasture and the woods, then in the evenings to hang around with my grandfather while he went about his chores. On Saturday that twenty-four hours stretched away forever, but when it was over and it was time to leave it would all seem like some strange little fifteen-second dream.

When it was time to go, Grandma and Granddad would follow us out to the car and stand around while we got in. Then Daddy would start the motor, back up to the coal pile, fight the steering wheel till the wheels turned, then ease forward down the lane, pausing in front of Grandma and Granddad for a final goodbye. I always wanted to cry at that point but I never did, except once as we were leaving, at the last second, as a surprise, Grandma tossed a Payday candy bar to me through the window and hit me in the eye. I let out a terrific squawl, and cried till it was time to get out of the car and puke. I held my eye and screamed like I was mortally wounded, but the thing nobody knew was that I wasn't really crying about being hit in the eye at all. All that was just an excuse for this other kind of crying I wanted to do, which I did plenty of on that occasion. I suffered pretty bad that trip till we got back down around Big Hill and Daddy started carrying on about Daniel Boone again. Daddy always made me laugh on Big Hill, and passing over it tonight I could feel that old familiar laugh sensation start to rumble in my guts again.

160-200 lb. Rigid PVC* plastic cold water pressure pipe

*Poly-vinyl chloride pipe—easy-to-install—can be cut with a saw. For cold water lines only; inside, outside; above or below ground. NSF-approved safe for use with drinking water. In 10-ft. lengths with plain ends. Meets Commercial Standards CS 256-63. Won't rust or rot. Working pressures at 73° F.—200 lbs. for 1/2, 3/4 and 1-in. size; 160 lbs. for 1 1/4-in. size. Clean with PVC Cleaner no. 43466R. Make connections with PVC Cement 43462R or 43463R at right. To connect to steel pipe use (14) or (15). Insulate in freezing temperatures.

The Armchair Shopper's Guide

This cheerful book is an uncommonly practical compendium of access. Listed here are all of the major and many of the minor mail order shippers in the world. To a large extent the shippers carry items not available locally. Each source is very well described and compared with its competitors. The Armchair Shopper's Guide is more general than us, and geared to wealthier readers, but if you use the **WHOLE EARTH CATALOG** very much, you can almost certainly use the Shopper's Guide.

or **WHOLE EARTH CATALOG**

You'll have to pay the sales tax if the mail order house is located in your own state or municipality, but you aren't required to pay it to firms in other states, nor may they charge you their local sales taxes. Although this has always held true for most mail-order houses, in the past such big firms as Sears, Roebuck and Co. made a practice of collecting the various local sales taxes from their customers and passing them on to the state or city involved. However, a recent court ruling has declared this illegal. So, if you live in a place such as New York City you can save a pretty penny (5 per cent) by buying by mail from out-of-state firms.

Katherine Smith, P. O. Box 121, Fort Worth, Texas 76101 (catalog 25 cents) offers new recordings made by old-time country and western singers, in partnership with the Bluebonnet Recording Co. In addition, she issues lists of old 78's for collectors.

Sunray Yarn House, 349 Grand Street, New York, New York 10002 (catalog free; yarn samples 50 cents) offers an enormous selection of discount yarns and knitting supplies, as well as some art needlework.

Australian Gem Trading Company, 294 Little Collins Street, Melbourne C 1, AUSTRALIA (catalog free): rough-cutting opal is available here at \$1 per ounce for the lowest quality, going up to \$60 and over for the more valuable types. Cut and polished stones and opal doublets are also available. In addition, there's Australian sapphire (both blue and black star), rough and polished.

The Putney Nursery, Putney, Vermont 05346 (catalog free) sells wild flowers by mail—not the wild flowers that have become accepted as regular garden plants, but such blossoms as harebells, trillium, wild ginger, and the like.

Katagiri & Company, Inc., 224 East 59th Street, New York, New York 10022 (catalog free): This well-known Japanese grocery has everything for the Japanese cuisine—dried bean curd, dried seaweed, pickled ginger, candied baby abalones and baby octopus (an 8-oz. can is 75 cents) and so on. Confections include bean jelly (16-oz. for 70 cents) and seaweed candy (6-oz. for 39 cents).

Gohn Brothers

Gohn Brothers supplies chiefly the stricter Mennonite orders and the various orders of the Amish Mennonite people all over the country. Since the Amish have managed communal living successfully for about 350 years, I figure at least some of their practices must be valid. Their clothing in particular is comfortable, durable and of low price. I can recommend from experience their broadfall work pants (no fly: broad button flap like lederhosen in front), overshirts (plain jacket with two roomy pockets on the inside) and overcoats (Heavy Dark wool, with cape). Many hard to find practical items listed, as well as a broad selection of rather plain yard goods. Service is fast and courteous. Once on their mailing list you get about four to six catalogs a year.

PROFESSIONAL RAZOR. Why does the barber always trim and shave with an old-fashioned straight razor? Because it's the quickest, gives the closest shave, is easiest to use and costs the least! Any man can learn, in ten minutes, to shave with this imported top quality German razor, full concave, double hollow ground blade, with non-slip, serrated thumb rest, ivory-like handle, molded carrying case. No. 41238. \$12.75. Ship. Weight 1 lb.

PROFESSIONAL RAZOR STROP. You'll learn in seconds to run your beautiful razor a few times over this fine strop of selected genuine horsehide, dark mahogany Russian hone finish with Scotch Canvas hose, all broken-in and ready to use. Individual double leather handles, gilt clincher swivel, gold stamping. No. 11644 \$6.00 each. Ship. Weight 1 lb.

SHAVING SOAP. In Europe and in the best men's clubs, you'll find gentlemen still lathering up with Pears Soap, the oldest in the world. No. 669. Box of three cakes. \$2.00. Ship. Weight 1 lb.

Factory Stores

The factory store is one of the first places to go if you want to get certain merchandise cheaply. This guide lists direct-from-the-manufacturer outlets for clothing and other personal and household items, but there are many other manufactured goods to be sought out in the same way.

This guide is only regional, but it's listed here to stimulate bargain hunters in other parts of the country as well as readers who live in the New England area. Why couldn't someone go out and compile the same sort of valuable information for whatever area they lived in, and make it available through the community media serving the people there? You probably have enough friends, each with his own favorite source of inexpensive goods, that you'd be able to start your research with lots of good leads.

Fabrics

THE MILL STORE

Dorr Woolen Company

Routes 11 and 103

(Store also in Old Sturbridge Village, Sturbridge, Mass.)

Monday-Saturday, 9-5.

This is one of the most extensive and attractive fabric mill stores to be visited. Only fabrics loomed by the Dorr Woolen Company are sold here; these are available at savings of 40%. The wide selection includes solids, checks, tweeds, and Scottish plaids in both bonded and unbonded fabrics. Dress, suit, coat, and skirt weight wools are offered, either from the bolt or by the piece.

Braid and hooking wools are also available, as well as rug patterns and supplies. An infinite variety of shades is available for that "just-right" hooking design. Pieces suitable for braiding start at 50¢ per pound.

Trimcomb

The barbershop has been obsolete for several years. Now trimmers and hair cutters follow. This absurdly simple item uses a double-edged razor blade (one edge trims, the other dry-shaves) to sculpt your hair with simple amateur dabs at your head. It works better if your hair is wet.

Trimcomb costs about \$3 at most dime stores. -SB

Kalsø Earth Shoe

Have you heard about the Earth Shoe? The enclosed will tell most of it. Ray Jacobs is doing the Earth Shoe thing here, working hard to improve it and make it cost less (note the price on the domestically made women's shoe). Jacobs found out about the shoe when touring in Europe and looking for relief for his wife's backache (yes). She had flat feet (no arch) and was pretty uncomfortable, I guess, but these funny shoes relieved the backache after a few weeks and now she has an arch where before. . . . Anyway, it's one of those things that seems to draw testimonials like flies. The shoes are strange to look at and stranger to wear; they hurt for the first few days but then they're dynamite. [Suggested and reviewed by Ron Williams]

Definitely worth a mention. The straps of the wooden sandals are not so well made as the beautiful, polished bottoms, but the Kalsø people say they're working on a new version. The oxfords are the best pair of shoes I've ever worn, expensive & dearly loved hiking boots included. If you send a drawing of your foot w/your order they try to match it up with a shoe. Expensive but you don't need more than one really good pair of shoes anyway.

Cheap Glasses

Some people have eye defects or disease that require prescription glasses; they should see a doctor. Most of us just get far-sighted as our muscles age, and all we need is simple magnification with a shorter focus. Certain states seem to discourage stores from stocking standard lenses in inexpensive frames on open counters. Perhaps there's an optometrist's conspiracy. But normal eye needs are no more various or peculiar than foot needs. There are standard shoe, shirt, and shorts sizes—why not standard lenses? With TV tube distortion, wrap-around windshields, and tinted sunglasses, nobody sees the real world much any more anyway. My nearsighted kid's eye examination, lenses, and frames cost \$35. My own Nu-Life specs (I am farsighted and getting along) cost \$3.95. Been wearing 'em 3 years, changed them once, satisfied & I Can't see any difference. Avoid plastic hinges. Outasight, intosight. Great gift for oldies who haven't seen the light.

[Suggested and reviewed by
Tom Wertenbaker]

Catalog from:
free Nulife Products
Cos Cob, Connecticut

These glasses are just perfect for reading fine print and doing close work, for people over 40 who do not have astigmatism or eye disease and need the help of simple magnifying glasses. Doctors term these glasses completely safe and a highly effective aid for the natural aging of the eyes which affects the vision of most men and women after the age of 40.

Be sure to give age when ordering one of the Full Frame Magnifying Reading Glasses below as we send stronger lenses to older people.

LEATHER WALKING SHOE— Hand-made of top quality suede. Thick rubber sole. Available in tan and moss green.
Women's sizes— 5-10 Price: Women— \$32.00
Men's sizes— 6-13 Men \$35.00

Government Product-News

This is a goofy array of new products ranging from police equipment to seam sealant that can be applied to a wet or oily surface without cleaning it first (and whoop dee doo if that one works!) A subscription would be useful to a buyer for a school system or the like, but would be of limited value to a commune. It's one of those things that new products freaks and designers like to read once a month but isn't really worth the price of the subscription to typical private citizen. Read it at your local business library.

I dig it.

Retread Your Feet

Tried and true hiking boots are a pleasure to have, and a sadness to lose. Shoe repairmen are not only expensive but their repairs often don't last very long. Here are two ways in which I've prolonged the life of my boots; they may be useful to some of you.

1) Soles from auto or truck tires

The soles on my boots were smooth and still firmly attached—just thin. If you have lug soles (vibrams, etc.) you'll have to modify this technique. If the old soles are coming off, you'll either have to take them off entirely or glue them down securely.

First, get a discarded tire. There are lots of them along back roads. I used a near-new tire (blown out) with a heavy duty tread. Cut out a section slightly longer than your boot and then cut off the side walls. Long-handled pruning shears work fine for cutting tires. Next, pry the heel off your boot and thoroughly work over the bottom of the boot and the inside of the tire with a stiff wire brush (the first key to success). Coat the two surfaces with a thermosetting resin (like epoxy) and clamp together securely (the second key to success).

Here's how I clamped mine—

tie ends of
boards together
with cord.

Let it dry for about 24 hours, and then trim the tire to the shape of the boot. I wasn't too fussy about looks; if you don't like the sole sticking out here and there, you'll need to finish the job with a wire grinding wheel. I left the heel off and have found that it didn't make a bit of difference in how they "walk".

2) Repairing uppers with fibreglass tape and polyester resin

One of my boots was worn through at the toe. I filled the hole with fibreglass tape shredded and saturated with resin, then put a patch cut from the tape over the top and smeared this liberally with resin. Push the whole thing down until there are no trapped air bubbles. It dried hard and durable. If you don't yet have a hole, all you need do is apply a patch and soak it in resin.

I'd put on about 1,000 miles on these boots before I repaired them, and have since added another 500. If the tire manufacturer's claims are true, the soles ought to be good for another 19,500 or so. And I leave the most unique foot-prints around.

Ruby Valley, Nevada

CROSSROADS

Traffic seemed fairly normal the first hour or so past Berea. But once he turned off 421 onto 666 D.R. went almost twenty miles without seeing another car and began to wonder if he had got on the wrong road somehow. He wasn't lost exactly but he was afraid he might be, and at night in the mountains on the Wilderness Road it amounts to the same thing. He drove on a while longer, looking for signs, but he couldn't find any and the road got narrower and narrower. To be on the safe side D.R. turned around and retraced his path to a crossroads where there was a sign that said 666. It was a confusing intersection and he sat there a minute studying the sign, making sure it referred to the road he was on. Two other county roads came into 666 from each side near a sharp curve, and in the dark you couldn't see very far down any of them. The only marker was the 666 sign, which as D.R. read it seemed to refer to the middle road. He looked at the sign and the middle road, and finally set out down it into the night again.

Hong Kong

If you have the time (5 weeks or so), Hong Kong offers fantastic deals in cameras, tape recorders, motorcycles, binoculars, calculators, suits, etc. Prices generally include seamount costs. You pay import duty (like \$15 on a \$118 Canon FT-QL—that costs \$280 in the States), and Customs obliterates the trademark. Catalogs are free.

We've had exactly no complaints about any of these firms.

Hong Kong Suppliers

Friends:

Below you will find a new suggestion for Hong Kong mail order, and, if you want it, a general review for all five firms.

1. Wood's Photo Supplies

Wood's has the following price lists, all of which are sent by airmail:

- A. 8 mm movie cameras & projectors
- B. Popular 35 mm SLR cameras & lenses
- C. Tuners & amplifiers
- D. Speaker systems, turntables & record changers
- E. Stereo tape recorders and decks
- F. Portable tape recorders.

Wood's price lists arrived faster than any of the others. And as a company, Wood's seems to be the most personal and conscientious. Their information on U.S. import duties was most specific. All items with restricted trademarks (which must be obliterated) were noted. Wood's even suggested that I contact customs before purchasing any item.

2. Far East Company

As far as I know, Far East company has only one catalog. It includes cameras, projectors, other camera accessories, binoculars, radios, tape recorders, and Hi-Fi equipment. The catalog was sent by air mail, and it arrived second fastest (a couple of days after Wood's).

They mentioned import duties and restricted trademarks. If you order enough Hi-Fi equipment from them, you get a discount.

3. Albert White & Co., Ltd.

White offers information on the following items. I sent for the camera catalog, and it arrived by airmail, third fastest (a few days after Far East Company)

- a. Photo Department catalog
- B. Motorcycles
- C. Office equipment
- D. Woolen carpets
- E. Men's custom tailoring
- F. Electronic desk calculator
- G. Office equipment
- H. Chinese coromandel Furniture
- I. Noritake China
- J. Hi-Fi equipment.

I sent for information on motorcycles six months ago, and I haven't received anything yet. The catalog of camera equipment made a somewhat inaccurate mention of import duties ("15% on camera equipment" is too general— duty on still cameras with original lens is 10%, extra lenses 17%). There was no mention of restricted trademarks.

4. T. M. Chan & Co.

Chan has three catalogs available.

- A. Photographic equipment (with a few portable tape recorders)
- B. Catalog from the "Gents Customs Tailor Department"
- C. Catalog from the "Custom shirts department"

I received the photo equipment catalog by surface mail. It arrived about three weeks after the one from White and Co.

There is absolutely no mention in Chan's catalog about import duties or trade restrictions. He says his prices are the lowest possible and invites comparison with other firms' prices, but as I have shown below, his prices are not the lowest.

5. Universal Suppliers

Universal has a whole slew of brochures. When I asked them for their "catalog", they sent me an aerogramme telling me that a "supply of catalogues" was being sent by surface postage. A little more than a month later, this small package arrived, weighing about 2 lbs., with all of the brochures listed below. All catalogs are sent by surface mail unless you send them money for air postage.

- A. Cameras & accessories, binoculars, telescopes, rifle-scopes, spotting scopes.
- B. Art carved furniture
- C. Ivory carvings
- D. Swiss watches— Titoni & Tugaris Breitling chronographs
- E. Original Oil paintings
- F. Legacy collection: Brassware, antique bronze lamp bases
- G. Noritake China
- H. Rolex watches
- I. Cassette— recorders, transistor radios, cartridge players, portable tape recorders & TV sets
- J. Sony Hi-Fi components & tape recorders
- K. Hand embroidered tablecloths in linen, cotton or lace

The catalog of photo equipment lists import duties on all the photographic equipment, but they make no mention of trade restrictions.

Guarantees:

1. Wood's— makes no mention of a guarantee. They may have one and they may not.
2. Far East— guarantees that what you ordered is brand new
3. White— one year guarantee, free repair, free return by sea mail
4. Chan— no mention of guarantee. Maybe so, maybe no.
5. Universal— same as White.

Prices:

For camera equipment. Prices on Hi-Fi equipment seem to be agreeable with those of cameras, i.e., if prices are lowest for cameras, they are generally lowest for Hi-Fi equipment. Comments below are generalizations— they can be prefaced "on the whole".

Lowest prices— Wood's and Far East

Close third— Universal

Somewhat distant fourth— Chan

Definite Fifth— White

So, on the whole, Wood's & Far East have the lowest prices. But Universal has the lowest prices on some items. (When I say "price", I mean price of the item plus packing, handling, insurance, & sea mail shipping)

The only conclusion I'm going to make is this: If you are going to order any camera equipment from Hong Kong, write to the three top firms— Wood's Photo Supplies, Far East Company, & Universal Suppliers.

Remark: Personally, I wouldn't order any Hi-Fi equipment from Hong Kong. The prices, after sea freight charges, are not exceptionally low. They can be equalled or beaten by some of the discount houses in the U.S.

Remark No. 2— I have never ordered anything from any of the five firms above, so I don't know anything about service.

Jim Kessler
Oxford, Ohio

DIAGRAM A

Lee Kee Boots & Shoes

Lee Kee Boot & Shoemaker, Ltd., Universal Commercial Bldg., No. 65 Peking Road, Kowloon, Hong Kong— will make any boot, shoe you want— send them a drawing or magazine picture & they'll do it to your size specifications. They charge for materials & not labor, so they're quite reasonable. If you'll write, they reply very speedily with price list & instructions to measuring your feet & sample sheet with range from dupont corfam to ant-eater & ostrich skin to some reasonably nice suedes & plain leathers. All leather lined. Haven't received our boots yet but have heard they do great work. See old price list enclosed. (I'm getting some knee-high brown suede lace-up-the-front high-wood heel boots for \$25.00— made to fit my poor screwy feet.

Crow & Ceres Hyatt
Cedar City, Utah

BOOTS

HALF-WELLINGTON BOOTS:

West German Calfskin, Scotch Grain or Rough Suede	US\$13.00
West German Calfskin Top with Genuine Shell Cordovan Vamp	US\$19.00
Genuine Shell Cordovan	US\$24.00
Kangaroo Skin or Fine Suede	US\$15.00
Du Pont Corfam	US\$16.00
Italian Soft Calfskin	US\$16.00

International Shopping

I would strongly suggest that anyone who wants to make any large purchases should arrange a letter of credit with a local bank. This will protect your money and will guarantee the foreign merchant his also.

Don't forget that sea mail can take an awful long time— and that air mail runs about \$5.00 per pound.

You can order lists of foreign businesses from the State Dept. They will send you a catalog of countries with classifications such as machinery, textiles, etc.

For \$1.00 they will send you names and addresses of specific companies (lots of them) for each classification.

From there you can write the company directly or go back to State for detailed reports on each company (assets, reputation, number of employees, language spoken, etc.).

This can be most helpful provided you have a pretty good idea of what you're after.

A.G. Willis
Washington, D.C.

All Purpose Far East

Suppose someone wants a good camera, recorder, or watch at about half the regular U.S. price. Here's a legal way with no risk. Decide the brand and model number and get a local price. Then send a 13 cent aerogramme to Mr. Tan Tieng Liat, 2 Jalan Isterewa, Singapore, 10 specifying the product desired. (Asian and European and American manufactured goods are all cheaper). Liat will refer your request to a local merchant who will reply by air mail within two weeks from the day you mail your request. They will quote a given price which will include the item, manufacturers guarantee, fabulous packing, shipping, and insurance by Lloyds of London. You then send a certified check or money order in the specified amount to the merchant. If air shipping is used, it's seven days for delivery to the U.S. Seamount takes ninety days but who'd want to ship a recorder airmail? A lens is something else.

Your postman will deliver the parcel and collect customs but you'll find a 10% rate on a \$40 lens is less than the same rate on the U.S. price of \$110. Singapore merchants make a profit, don't worry. But they think 10% markup is fair and Kodak has a standard 33%, Sears marks up over 40% and so on.

It's a good way to do business, and help Asia help herself by transferring capital from surplus to shortage areas.

Incidentally,— if the transaction doesn't work out, the Chinese Chamber of Commerce and Prime Minister Lee Kuan Yew of Singapore will investigate immediately on hearing from you. My US \$279.00 Minolta SRT 101 cost \$124.00 in Singapore. My \$175 extra lens cost \$80.00. I paid all the duties! I just dealt with the good old Singapore merchants! In half a decade not one has ever let me down even a little.

Lloyds will send your insurance policy before the parcel arrives.

Biggest surprise to me was that I lived near Ampex in California and went to Singapore and found that Ampex stereo recorders sell for half the San Francisco price.

Wake up America. Regain the free trade heritage which initially made this country great. Save dollars for America's best products: color film for example!

James M. Oswald
DeWitt, New York

Apocalypse juggernaut, hello

As if the spirits of our ancestors weren't trouble enough, now we're haunted by the ghosts of our descendants.

Ken Kesey claims that ecology is the current handy smoke-screen for everybody's Dire Report—the voice of white-eyed paranoia. Gary Snyder (strong proponent of population control) when told of an Earth of solid people impending soon, commented dreamily "think of all that consciousness."

I tend to view the whole disaster as an opportunity to try stuff. If you take all the surprise-free projections for mankind's near future and connect them up, they lead neat as you please right into the dead end meat grinder. The only Earth we had, used up.

Unless there are surprises. Which is what we're here for. The Standard Operating Out, when a species is in a bind, is to diversify. Multiply alternatives. If you don't know what's coming, the way to evolve ahead of the changes is to try everything.

Reasonable laws made by reasonable men in reasonable times proscribe trying everything. For a good reason: people get hurt trying stuff. If you're bound to try stuff anyway, then either you're working directly for City Hall or you're an outlaw, or both.

Buckminster Fuller:

"It surprises people when you tell them that since the last ice age three-quarters of the earth has been water, and of the one-quarter that is land very little has been lived on. Ninety-nine percent of humanity has lived on only about five per cent of the earth, and anyone who went outside of it—the tiny minority that went to sea, for example—immediately found himself outside the law. And the whole development of technology has been in the outlaw area, where you're dealing with the toughness of nature. I find this fascinating and utterly true. All improvement has to be made in the outlaw area. You can't reform man, and you can't improve his situation where he is. But when you've made things so good out there in the outlaw area that they can't help being recognized, then gradually they get assimilated."

[From Calvin Tomkin's profile of Fuller, "In the Outlaw Area", *The New Yorker*, Jan. 8, 1966]

Present outlaw areas include space, the oceans, mountains, desert, northwoods and tundra, jungle, and then places like molecular biology, your mind, and other state-of-the-art frontiers whose languages are still foreign to lawmakers.

One thing we need is better outlaws. The antidote to external routine is internal routine, not sloppiness. The finding and following of your own drum. Help save the world: do something wrong today. Do it today because time is short, and capable outlaws aren't made overnight.

Is it a contradiction to design an outlaw area? In the past there was always undesignable frontier to serve, some space left over or not reached yet. If we run out of that resource, can we synthesize it, or intentionally preserve it? Or will it spontaneously bubble back up in the middle of our cities? (Oh yes.) I suggest that we must give the devil his due or he will surely extract it.

Any design fantasy is just loose talk until it happens. Here's one.

The definition of revolution, "the overthrow or renunciation of one government or ruler and the substitution of another" does not accord with the present continuum of events. The upheaval in America today provides a chaotic surf upon which would-be revolutionaries steal wild rides, but to define the upheaval as revolution is to fail to understand its essence. It is not organized. It has no plan. It has no doctrine. There is no pattern, no structure— no leaders and no followers. It happens. It is.

Guidance System

To the degree that a corporation serves the purposes of its original founder, it tends to be "humanoid." Mr. Post cared very much about Postum and personally mixed, sipped and tasted the product as his personal substitute for coffee. Henry Ford I spent much of his early life under the hood of the Model T and would tolerate no compromise in its design. Walt Disney held exact standards for his cartoon characters, and Land of Land Cameras,

Loose Talk 1: The Outlaw Area

The specific fantasy called OUTLAW AREA is a geographical place where anything goes. Let's say it's an island.

For society it functions as a human dumping station. When a guy gets a jail sentence he has the choice of serving the sentence or being deported to the Island. He can't come back for some specific period of time, or he must meet some bureaucratic criteria to return, or the expulsion is permanent. Yessir, put all the bad apples in one bad apple barrel.

For the individual it serves as an always possible alternative to the situation he's in. He can simply split for the Island and take his chances there. No one's going to try to get him back.

For evolution it's an open end, a place for other stuff

to happen. High energy, minimum prior form, violent range of constant inputs; it should be wild. "In wildness is the preservation of the world."

It's difficult to imagine how it would be in the Outlaw Area. You can project some from the history of Australia, once a penal colony, or from the present underworld. Robert Heinlein has a book about the Moon as a penal colony called *The Moon is a Harsh Mistress*. It's kind of nice: they have a revolution and throw the jailers out.

Depending on the size of the island, my expectation would be either a dictatorship or warfare of rival gangs, like in old China, warlords. Maybe not though. This is a different age. The Island might become an Aquarian haven for the most useful pioneers—the cream and the dregs of society, (Kesey's notion) bending reality off into unimaginable directions with no restrictions save the harsh ones of nature.

Aquarian Haven

Photo from "Open Land: a manifesto" published recently for defense of the commune at Wheeler Ranch, Box 81, Bodega Bay, CA 94923.

But ten or fifteen miles later D.R. grew so doubtful that it was right he stopped and backtracked again. It just couldn't be the right road. The farther he went the narrower it got, and there wasn't a house or a road sign on it. D.R. went back to the crossroads, pulled off into the gravels and looked around inside the bus for a roadmap of Kentucky.

There wasn't one, of course. There must have been a dozen roadmaps scattered around, including one of the Eastern United States that showed the freeways in Kentucky. But for driving on the local roads away from the traffic mainstream there wasn't a map in the bus that showed the way and that pissed D.R. off and scared him at the same time.

His first impulse was to blame Estelle. At about the moment he realized he wasn't going to find a Kentucky roadmap he came across Estelle's knitting bag in a pile of stuff behind the driver's seat. In his mind the knitting bag, and its owner, seemed to be responsible for there being no Kentucky roadmaps. In a fury he grabbed the bag and flung it out Urge's side door. Some of the yarn fell out and tangled up around D.R.'s feet. In trying to get it off he tied his hands up in it for a second and that almost drove him crazy. He screamed through his teeth and started flinging things left and right. When he came to something that felt like Estelle's he tried to throw it out the door, but most of it caught on the door facing and piled up at the foot of the bed. D.R. picked up his cassette recorder and almost threw it too, but he caught himself and turned it on instead. The voice of the Greek filled the bus and flowed out into the night, uttering for the first time in the history of the Kentucky mountains the names of Ouspensky and Gurdjieff. D.R. shouted "Fuck Ouspensky and Gurdjieff," and threw the recorder hard against the back of the bus. The Greek groaned and spoke like Donald Duck for a second, then died.

(continued)

Ed McClanahan found these notes by Ken Kesey in a box of stuff, two and a half years after Ken made them the night he got out of jail. The notes were made as Ken was waiting to be released. They are published here unrevised, and unedited.

-Gurney Norman

FRIDAY OCT 10, A'TANK,

MAYBE THE LAST TIME

And as I come in dressed in my usual street business, leather, striped pants and shoes, whistle hanging out, Derner takes one look and his already stone face freezes even harder.

"All right, Kesey, give me everything."

"What?" Usually they let the honor camp men take in anything except knives or watches.

"Everything. I don't want you in there blowing your whistle."

"Okay, then, make me out a property slip."

He gives me a steady unwavering stare through the bars. Tears a scrap of paper from a notebook and slips it in the typewriter.

"One Whistle," I say. He doesn't type. "One yellow pen." He continues to glower, stoney cold unmoveable. "Come on, I want a property slip." I'm worried about my two camp notebooks is what we both know.

"Just put it all in the trough, he says. "In fact, strip out of that jacket!" He comes out of the cage. I take off my leather jacket. "Hands on the wall. Spread 'em." He gives my feet a kick. "Now. Don't move!"

He frisks me, the whole show. Taking pens, sunglasses, handkerchief, everything. And my two notebooks, wrapped in the farewell card Stevenson made and the camp guys signed.

"Listen. I get a property slip for this stuff."

"While you're here, you do it my way," Derner lets me know. No malice in his voice. No anger. Just stone information and not to be argued with.

"Okay then," I hold up my two notebooks. Show them to Deputy Johnson. "Witness these?" And the rest of the men waiting in the receiving hallway. "You guys check this?" Then hand the notebook to Derner.

"You think the rest of your book will come out in Ramparts?" Deputy Johnson asks.

"No, it'll be a book of it's own."

"You'll have to change the title then."

Friday Oct 10
A tank
Maybe the last time.
And so I come in dressed in my usual street business, leather, striped pants and shoes, whistle hanging out, Derner takes one look and his already stoney face freezes even harder.
Allright Kesey, give me every-
thing.
"What?" Usually they let the honor camp men take in any-
thing except knives or watches.
"Everything. I don't want you in
there blowing your whistle."
"Okay then, make me out a
property slip."
He gives me a steady unwavering
stare through the bars. Tears
a scrap of paper from a

"I'll bet you a carton I don't," I say, watching my pens and notebooks disappear through the cage window.

"Okay, Kesey, you can move on. Next."

I come to A Tank. Boro is still here. In blues now. But still trying to keep up that old front. One by one the other guys show up. Derner has given them each the same treatment taking cigarettes, everything.

"Sorry about that," I tell them. "I should have been way at the back so you could have gone through first. But he saw my outfit and it blew his head so he had to follow through with the rest of you."

"Yeah," Boro says. "Stir clear of Kesey, he brings you nothing but trouble."

"Kesey!" Keys jingle. "Man's here to see you." Door slides open. I follow the turnkey to where Faber waits in front. He tells me I'm getting out at midnight. Who'll be here to pick you up? Who knows.

And he wants to see my notebooks. I'm leery but I figure better him than Derner. "Go ahead."

"And you're to be in my office Monday morning at 10:30 to sign your release to Oregon."

I say okay. We talk a little more about the camp. I tell him that all the camp needs is support from Redwood City. He hems and hums. Asks me when I think The Book will be coming out. Who know? When it quits happening. "This talk will be in it. Our talk Monday morning will be in it. Your reaction to what you read will be in it. It will be finished when its all over."

And Boro shouts Kesey. "Put this down. Put this down in your fucking book. A guy—me—a guy plays pinochle 4 1/2 months with the motherfucking brass up there—4 and one half months—and one of the deputies misses a pack of Winstons when I leave and he calls down and asks what brand of cigarettes did Boro come in with. I mean, ain't that cold, man? Ain't that a bitch?"

Weekenders—bringing the Street in to tantalize you.

You can be made to serve double time—now time and street-to-come time—even triple time which adds street-ago time and is called guilt. But the man who pulls straight time—now tripping is neither short or long but serves in Eternity and very close to paradise.

More Weekenders. A Tank gradually burgeoning. "Hey Deputy, we already got motherfuckers, wall to wall." Boro has a way of sniveling so it sounds like a banty crowing.

Drunk tank full to overflowing
Motherfuckers wall to wall
Coming twice as fast as going
Heads get big and the tank gets small.

Dominoes slapping on the table
Bloods playing bones in tank next door.
Bust a bone if you be able
Red Death stick it good some more.

Three days past my kickout time
Ask to phone but don't got the juice.
And crime times crime just equals more crime
Cut the motherfuckers loose.

Will I make the Christmas kickout?
Will commissary come today?
Will they take my blood or take my good time?
Or just rip my guts away?

Some snitch has found my fucking outfit.
They've staked a bull up at the still.
They've found the pot sprouts I was sprouting
At the bottom of the hill.

They've punched my button, pulled my covers,
Blown my cool and ruind my ruse
They rehabilitated this boy
So cut this motherfucker loose.

And the fish that angles for the bull
Let him off his heavy rod
And you that suckers the gavel banger
Cut him loose from playing God.

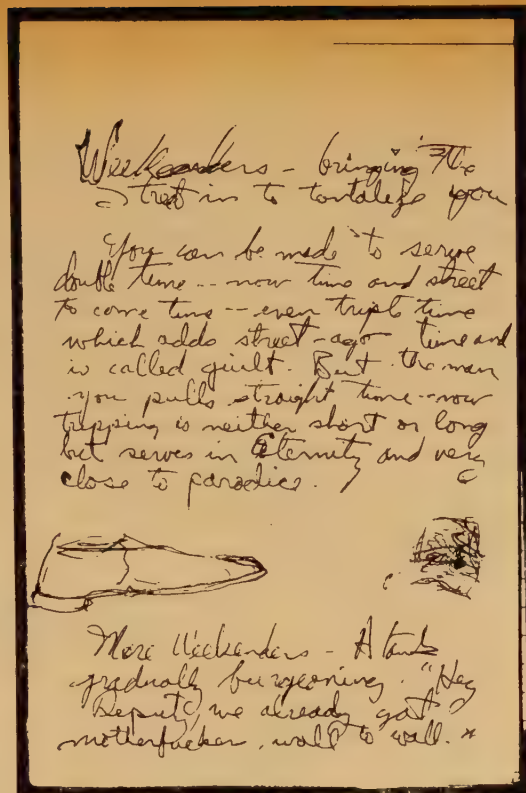

Back off from Johnson all you peace freaks
So he'll back off from Vietnam
Cut loose the squares, cut loose the hippies
Cut loose the dove cut loose the bomb.

You the finger on the trigger
You, the hand that weaves the noose
You, you hold the knife of freedom
Cut all the motherfuckers loose.

11:30

After a long talk with Braun, soft-peddling in circles and coming in Contact occasionally—back to A Tank.

Simpson: "I just don't trust Braun. I don't think he's got any balls. I think he's basically weak and I think he's trying to build his image by associating with you, Ken Kesey."

I know all that. But I'm also onto what he wants to be—the strong thing he wants to be. And I'm willing to try to support that image.

an voice at the bars: "11:30. Kesey? Yeah. You ready? eady as I'll ever be. Come on then."

And into receiving where an old colored dude is excitedly getting into his clothes. Typing of forms next door. Ritual of red tape typing, gently typing at my chamber door—

The colored dude—an old shoe-shiner packs his work gear into a black cardboard box and ties it with a rag. His shirt is white and looks nice. His shoes are a sensational gloss.

"What you in for?"

"Oh I pulled a knife. Woman called the cops. Wasn't no actual fight. Well, I on my motherfuckin' way..." Picking up his bag and putting on his hat.

"Yessir on my way."

"Good luck to you."

"Lost some weight here. Needed to. Met some good people too. All right now..."

A young blood stops him, gives him his address.

"You all better print it. That the only way I can read it."

"Take it easy now, Pop."

"All right. . . ."

The kid leaves. "Damn fool tramp. Got some motherfuckers in this jail. Oh, I'm ready. City be just right. I get the right bus, that is."

Still no call to leave. He fingers a corncob full of tobacco, lights it, goes to lean at the door. "What the time?"

"12 straight up," the deputy says.

"Oh, I'm ready."

"If my people are there I'll give you a ride to the bus station."

"Appreciate it. Didn't sleep all night. I got nothin but time no way. What you in for."

"Dope. Weed."

"That a shame. That good green stuff. Make you feel good. If God hadn't wanted it on airth he wouldn't a put it here would he. That a stone shame. How much they give you."

6 months. \$1500. 3 year tab.

"That a motherfucking shame."

"Well. It's done."

"I reckon."

"Rucker!" a bull's voice calls.

"I comin'."

And I'm alone on the bench with his half-drunk cup of coffee, spoon still sticking out of it. His blues on the floor. The polyethelene bag his suit had hung in the corner.

"Ken."

Justice Without Trial

The social edge that the policeman patrols is highly visible these days, and all too relevant, and so ambiguous that few can bear to look at it close. But until it's looked at close, and in broader terms than one's own bust, we'll be stuck with it the way it is. This book is inherently interesting, dealing with goals and tactics and anecdotes of our closest war. It also should be interesting to those who would redesign the edge.

Whenever rules of constraint are ambiguous, they strengthen the very conduct they are intended to restrain. Thus the policeman already committed to a conception of law as an instrument of order rather than as an end in itself is likely to utilize the ambiguity of the rules of restraint as a justification for testing or even violating them. By such a process, the practical ambiguity of the rule of law may serve to undermine its salience as a value.

The policeman is directly antagonistic toward euphemisms. Unlike the peacetime soldier, the policeman is *always* in "combat", out on the streets, doing his job. Like the dogface, he is irritated by most manifestations of what he terms "chicken shit"—an inclusive abstraction encompassing minor organizational rules, legal technicalities, and embellished descriptions. The policeman's culture is that of the masculine workingman. It is of the docks, the barracks, the ballfield—Joe DiMaggio was a helluva good "wop" center-fielder, not an athlete of "Italian extraction," and similarly, the black man is a "nigger," not a member of an "underprivileged minority."

"Straight date" refers to genital intercourse. "Half-and-half" means half "French," half "straight," that is, fellatio followed by genital intercourse. "Greek" refers to anal intercourse. Other sexual acts may be purchased as well, but these are the standard products.

Indeed, from his familiarity with the law about possession, the nonaddict-dealer is likely to have a "stash" or a "stash pad" somewhere removed from his own residence, perhaps at the home of a girl friend, or even in any of the numerous places in the public domain that can serve as "stashes," such as trees, directional signs, the undersides of benches and so forth.

Community Profile

Interested in moving to some part of the country but never been there before? To help you examine an area, you can order a "Community Profile" on any of the 3135 counties in the U.S. Delivery takes about 3 weeks.

The Drug Bust

John Dominick
1970; 95 pp.

\$1.95 postpaid

from:
The Light Company
259 W. 15th St.
New York, N. Y. 10011

or WHOLE EARTH CATALOG

Defendants in drug cases are often confronted with a form that purports to ascertain if the defendant is a drug addict. The form contains questions concerning the drugs the defendant has and is presently using. The answers to these questions constitute admissions and can be used *against* the defendant. A defendant does not have to answer these questions and should not do so, nor should he sign any form until he has consulted his lawyer.

The defendant has the right to remain silent and should exercise this right. Many a case has been lost before the lawyer ever met his client. The police may hint at making a deal in exchange for information. However, any deal made under these circumstances is worthless. If a deal is to be made, your lawyer is the one to make it. Let him do the talking; what he says cannot incriminate you.

Whenever possible a woman should step forward and speak to the officer. Whenever dealing with a policeman, respect and politeness are in order. The police are accustomed to encountering aggressive personalities they enjoy the opportunity to assert their authority. Policemen should be addressed as "Sir" or "Officer."

While maintaining this attitude one should make it as difficult as possible for the police to make an illegal search. In practice the police will do anything you let them do. And if they find drugs they'll lie in court saying they were in open sight or the defendant dropped them on the street when he saw the policeman approaching.

If a policeman approaches your car or house, you should step out, locking the door behind you. If one is going to be the victim of an illegal search, look around for a witness. Stop a passerby or summon a neighbor. Many policemen are reluctant to make illegal searches and will attempt to acquire your cooperation with a leading question, i.e., "What's inside the car?"

At this point the defendant should try politely to assert his rights. If the police ask you to open the trunk or "What's inside the car?" you should ask if you are under arrest. If the police say no, you should state, "With all due respect, I would like to continue my private lawful business. Good afternoon." If the police hint that you are under arrest, request the charge and demand to be informed of your rights, to be taken immediately to be formally charged, and allowed to contact your lawyer. Police are reluctant to make false arrests. It leaves them open to embarrassment and a lawsuit. Polite confrontation is the only way to remind them that they too are subject to the law.

Never carry drugs in a demonstration!

If you smoke, bring a pack of cigarettes. If you get busted you'll be glad to have them for yourself, and to hand out in jail.

Never take your address book to a demonstration! If you're arrested the cops will get everyone's name.

If you're worried about having something planted on you (this is not common in New York except for Movement leadership or for addicts) have a set of demonstration clothes with the pockets sewn up or cut out.

Never carry a pen-knife or a nail file to a demonstration. You can be charged with possession of a dangerous weapon if you get busted.

You are not required to say anything to an investigator. If local cops are belligerent, and you are afraid to refuse outright to talk, tell them you want to speak to your lawyer first. The FBI will hardly ever threaten you, but they will be persistent, trying to draw you out with a "friendly" manner. They may get you into political discussions and pretend that you are winning them over as a way of getting you to talk even more. One of them may play friendly and the other tough as a way of getting you to sympathize with the friendly one and talk. You aren't required to talk to the FBI any more than the local cops— and you should clearly refuse to say anything to either one.

PRY-AXE

Forcible Entry Tool

Law enforcement officers and fire-fighters find this 6 lbs. of forged steel excellent for forced entry and rescue. A multi-purpose forcible entry cutting tool designed for the serious business of operating at fires, wrecks and other emergencies. Complete with operating manual and leather sheath. Shpg. wt. 6 1/2 lbs.

Heavy Duty ea. \$39.00

The search for the map was so frustrating it automatically turned into a search for dope. D.R. didn't remember for sure if he even had any, and the stupidity of not having any compounded the stupidity of not knowing where it was if he did have any. That too seemed like Estelle's fault and he screamed at her as loud as he could and called her a stupid bitch. D.R. was so furious he leaped into the driver's seat and roared off down one of the three roads without bothering to close Urge's side door. Shit was falling out and crashing on the road but D.R. didn't give a goddamn. He didn't know which road he was on but he didn't give a goddamn about that either. When he'd gone ten miles and hadn't found a 666 sign he turned around and roared back to the crossroads, right on through it and down the other road across the way. He didn't find any signs on that road either. He was on his way back to the crossroads to set fire to Urge and commit suicide when a rear tire hit a chughole so hard it knocked something loose and caused the motor and headlight to quit, right there in the middle of dark nowhere. D.R. didn't even get out to see what was wrong. He just sat there behind the wheel staring through the windshield at the black shapes of mountains all around.

All power to the persons. —SB

I believe that man is about to learn that the most practical life is the moral life and that the moral life is the only road to survival. He is beginning to learn that he will either share part of his material wealth or lose all of it; that he will respect and learn to live with other political ideologies if he wants civilization to go on. This is the kind of argument that man's actual experience equips him to understand and accept. This is the low road to morality. There is no other.

Power is the right word just as self-interest, compromise, and the other simple political words are, for they were conceived in and have become part of politics from the beginning of time. To pandor to those who have no stomach for straight language, and insist upon bland, non-controversial sauces, is a waste of time.

Tactics means doing what you can with what you have. Tactics are those consciously deliberate acts by which human beings live with each other and deal with the world around them. In the world of give and take, tactics is the art of how to take and how to give. Here our concern is with the tactic of taking; how the Have-Nots can take power away from the Haves.

For an elementary illustration of tactics, take parts of your face as the point of reference; your eyes, your ears, and your nose. First the eyes; if you have organized a vast, mass-based people's organization, you can parade it visibly before the enemy and openly show your power. Second the ears; if your organization is small in numbers, then do what Gideon did: conceal the members in the dark but raise a din and clamor that will make the listener believe that your organization numbers many more than it does. Third, the nose; if your organization is too tiny even for noise, stink up the place.

Always remember the first rule of power tactics: Power is not only what you have but what the enemy thinks you have.

The second rule is: Never go outside the experience of your people. When an action or tactic is outside the experience of the people, the result is confusion, fear, and retreat. It also means a collapse of communication, as we have noted.

The third rule is: Wherever possible go outside of the experience of the enemy. Here you want to cause confusion, fear, and retreat....

The fourth rule is: Make the enemy live up to their own book of rules. You can kill them with this, for they can no more obey their own rules than the Christian church can live up to Christianity.

The fourth rule carries within it the fifth rule: Ridicule is man's most potent weapon. It is almost impossible to counterattack ridicule. Also it infuriates the opposition, who then react to your advantage.

The sixth rule is: A good tactic is one that your people enjoy. If your people are not having a ball doing it, there is something very wrong with the tactic.

The seventh rule: A tactic that drags on too long becomes a drag....

The eighth rule: Keep the pressure on, with different tactics and actions, and utilize all events of the period for your purpose.

The ninth rule: The threat is usually more terrifying than the thing itself.

The tenth rule: The major premise for tactics is the development of operations that will maintain a constant pressure upon the opposition.

The eleventh rule is: If you push a negative hard and deep enough it will break through into its counterside; this is based on the principle that every positive has its negative. We have already seen the conversion of the negative into the positive, in Mahatma Gandhi's development of the tactic of passive resistance....

The twelfth rule: The price of a successful attack is a constructive alternative. You cannot risk being trapped by the enemy in his sudden agreement with your demand and saying "You're right—we don't know what to do about this issue. Now you tell us."

The thirteenth rule: Pick the target, freeze it, personalize it, and polarize it.

What do I want? I want a spring...well, I want it to run the dial, the outside dial, and of course the real problem is how to get a band out of this motion. Let me look at the motion again. How do you get inside that spring? If I...if there were an enormous spring...a spring as big as a house, and I hold onto it and it goes in and out, in and out.

What happens to me? Well, let's see, I can put a little drop of ink on the thing. Now I wind it in and out. Look. If I get a spring big enough, as the spring tightens... the blob of ink will move in... and out as the spring relaxes....

"Funny... now I have the feeling that this thing is on its own, completely outside me... that the whole idea is no longer... no longer anything to do with being mine, my idea... it's just like flying now because if I put a spot on the spring and tighten it up, it performs an arc which is exactly the band I'm looking for [cf. Fig 4 (a), (b), (c)]. It's amazing, and this is no longer I... it's as though it was taken away from me... This must be what people mean when they say you start writing a play and the people you've put in the play just go on by themselves."

Vocations for Social Change

All about alternatives, by people who are living them. Mainly employment, but that's a whole lifestyle, becoming your vocation, the most integrated part of the search. How to work at changing the world.

—Hal Hershey

Economic Alternatives

Co-op League, Carol Hall, 1012 14th St. NW, Washington, D.C. 20005, publishes several pamphlets of how-to-do-it information for starting or managing a cooperative. They are: *A Manual of Basic Co-Op Management* (\$1.00); *To Tell the Truth*, an outline of consumer information and protection activities (\$2.75); and *Co-Op Depots*, an extensive how-to-do-it (\$3.50). They also distribute a film, *Changing It*, about the establishment of a co-operative food store in the inner city. (Phone: 202 628-9000)

Cooperative Services, Inc., 7404 Woodward, Detroit, MI 48202, is a big co-op service organization. They can help get co-ops off the ground.

DEVcorp, Don Newey, 26 Exeter St., Boston, MA 02116, provides a continuous buying club service to help consumers find better quality food and encourage the producers to provide better quality food. Anyone interested in either joining a buying club in your city or helping to organize one should contact them.

Foundation for Cooperative Housing, 1012 14th St., NW, Washington, D.C. 20005.

North American Student Cooperative Organization, 1500 Gilbert Ct., Ann Arbor, Michigan 48105, is a clearinghouse on cooperatives in the U.S. They have information on all forms of cooperatives: credit unions, groceries, laundries, eating clubs, etc., "as long as they are cooperative". In addition to their newsletter they publish a directory of cooperatives entitled *Crashing in North America*.

Synecotics

An outline of a method for training creative groups and maintaining their creativity in the business environment. This book provides both the theoretical and experimental background and the practical details of how to put the method to work. Although written for use by business executives, the applications to other situations are obvious and important. Anyone attempting to create a commune or other group of people who will work together creatively will find many useful ideas here. The problem of interface between the creative group and the workaday world is also treated in some detail. Extensive examples of the method in operation, and a lengthy bibliography on creativity.

Ecology action organizations should provide the following services to the community: a regularly distributed newsletter on what has to be done and what has been done; grievances and discussion meetings and community projects. Scout troops, women's clubs, school groups, etc., are good places to plant suggestions for projects.

Within the organization itself, utilize a storefront office as a place from which to (1) publish research; (2) keep a file on local polluters; (3) document the legislative records of local congressmen and representatives to see if they match recent eco-rhetoric; (4) publicize an environmental hot line which gives the phone numbers of government agencies in your area to contact about instances of pollution; (5) lobby for legislation banning the internal-combustion engine and funding good efficient mass transportation; (6) start an ecology food store which specializes in organic food, returnable containers, and minimal packaging; (7) in conjunction with the food store, establish an ecology counseling service which develops with people ways to run an ecologically sound household; (8) send out speakers, movies, and literature; (9) distribute birth-control information and devices (check the legality so you know the situation). Demand that abortions and birth-control devices be provided free; (10) organize boycotts against local or national firms which insist on operating without regard to the environment; (11) send out guerrilla theater groups to hold mock funerals for rivers and other dying resources or hold parades for clean air complete with balloons, gas masks, drums, and coughing participants; (12) initiate campaigns to return all bottles, cans, and excess packaging to stores. Ask that it all be sent back to the manufacturer; (13) watch over, and fight when appropriate, "urban renewal" zoning, highway and airport projects, university and corporate expansion into surrounding neighborhoods; (14) set up "people's parks" in abandoned lots; conduct neighborhood cleanups (with community consent and participation).

Baldwin: This is very funny. Go on.

Mead: But I had reversed it, and my picture of rape was of a black woman raped by a white man. He was a butcher, too, and that's one of the things I thought of: he was a brutal character. So whenever I dreamt of rape, I dreamt of this black woman being raped by a white man. And our mother insisted on our calling her Mrs. — this is 1912. And whenever she turned up in a dream, I knew exactly what I was dreaming about. This is a straight reversal of ordinary American experience.

Baldwin: That's right. The ordinary American mythology is entirely different. I suppose that explains a lot about you.

Mead: Probably, although I'm not completely free. You see, I don't think any American — any white American — is free of a special attitude toward American Negroes. Just as you're saying there aren't any Negroes outside of America. We are often nice to other dark-skinned peoples. We treat African princes or Indians with turbans very well. When I went on... My first field trip was to Samoa. Well, of course, the Polynesians are people everybody thinks are beautiful. If you look at them very closely, they are not really the most beautiful people in the world by any absolute standard. Yet everybody thinks they're beautiful. Chinese people think so, black people think so, everybody thinks so. I've now figured out why: that for maybe two or three thousand years they never saw anybody but themselves, and they think they're beautiful and they are so impressed with themselves that everybody else thinks they're beautiful. If you think you're beautiful, you move like a beautiful person.

Baldwin: In the name of your ancestors; let us put it that way. I have heard myself walking around the house singing a song I had forgotten, or didn't even know I knew, because I had to get through something and I had to find the only weapons I had. You reach out behind you and pick up whatever there is to confront this moment and to get past it. There is something very mysterious about it. Mystery is the only way I can define it. It is not mystical, but it seems to me that your ancestors give you, if you trust them, something to get through the world.

Handbook for Conscientious Objectors

The most comprehensive and authoritative single guide to the legal requirements and procedures for C.O.s under the present draft law. This book does not advise you to become a conscientious objector, but it does help in thinking through your beliefs and realistically making a decision about the draft. If you are considering asking your draft board for conscientious objector status, considering resistance, or just exploring your alternatives with the draft, this book is valuable. It also has information for C.O.s in the military, and describes the possible eventualities of court and prison.

CCCO also provides counseling, legal advice, help with bail, and publishes information useful to counseling agencies, lawyers and objectors. CCCO is non-church related, and lives on voluntary contributions.

In the ancient Runic writing, common to the Scandinavian and Celtic lands, the symbol Signifies "Man Dying". Contained within a circle, the symbol signifies "Man Dying in harmony with the established forces of Nature, to be reborn." Likewise, the symbol signifies "Man Worshiping." Contained within a circle, the symbol signifies "Man affirming Life in harmony with the Cosmos, the established forces of Nature." In both cases, the symbol is extremely positive, an affirmation of the place of the person in a creative Cosmos, and from this ancient use as well as from its later derivation from the Semaphore letter, it is most appropriate to signify the fact that surrounded by forces of hatred, death, and destruction we must choose love, life and creativity. In the words of the Old Testament prophet: "I have set before you this day life and death, a blessing and a curse. Therefore, choose life!"

It remained for Henry Martin Robert, an engineer and general in the United States Army, to modify these rules to meet the needs of "ordinary societies." His first *Robert's Rules of Order*, published in 1876, soon became a handbook for organizations, clubs and schools all over the land. In a constructive way, it exposed the uselessness of attending meetings which began late and dragged on. It gave enlightenment and comfort to frustrated members who, without knowledge, were easily victimized by overbearing chairmen and ruthless small cliques. And it armed the general membership with the know-how to combat those seeking to push through controversial resolutions without proper consideration.

Our commitment to revolution must contain a recognition that we ourselves are damaged; a revolution is not a gift bestowed on others, but a process beginning with our own selves and moving outward to a fuller and more human sense of self. Blacks and women should have taught us that revolutionary politics is the effort to overcome your own victimization— this is the only lasting source. Quit over what has been done to the Others is simply not sustaining, whatever its other noble virtues. It is urgent that we confront first the facts, then the sources of our own poisoning; and it will be as risky and terrifying a confrontation as any on the streets. We all want to believe that we can remake ourselves simply by wishing, or by some mechanical act; but could it be that the society we know to be so pernicious toward blacks and Vietnamese lets us off with a wish or a single decision?

There are a lot of specific revolutions that the movement should make in itself. Everybody has stored up his own list, but if there is a name for the attitude I would like to see, it might be *revolutionary humility*, a way of living we will have to take and make the time to struggle for. And I do not pretend that, in some sweet bootstrap operation, we can liberate ourselves if we only dissect ourselves enough. The process of liberation must remake the society as in the process we remake ourselves. It is said that Moses' liberation army had to undertake its 40-year-long march through the wilderness because no ex-slave would be fit to live in a new society. Do we dare now to decide that the revolution is not simply for those who come after us but for ourselves?

Imperialism is far older than capitalism. It goes back to Alexander the Great wanting to conquer the world to give it the blessings of Greek culture— and even earlier. It includes the wars unleashed by Muslims to give the world the blessings of Islam and those unleashed by the Church to convert the Infidel. Economics has sometimes been important if only because countries imagined that colonies would bring greater riches than they did. More often than not colonies have brought their mother country closer to bankruptcy than anything else. Partly because the eighteenth century English ruling class believed colonies were profitable they struggled relentlessly against American independence. To practically everyone's surprise the profits of English business on its trade with America increased fantastically after the revolution. In fact, the growth of America unleashed by the revolution was one of the most glorious things that ever happened to English Business. Liberal English economists like Huskisson argued on the basis that England should let all its colonies go. However, the glory of empire evidently moved stronger than strictly economic motives and so England held on to their colonies.

SALE OF TIMBER

If you own farm or country property with a woodlot on it, or a tract of land or large parcel on the mountain in timber country, use caution if someone comes along and wants to make a deal to cut the logs or pulpwood. Talk to your area Forest Ranger or County Agent. You can be guided by what they tell you. Also have a deposit and a contract from the lumberman. Keep in mind that it takes a lifetime to grow a logging tree, and you don't want to be cheated. We used to figure that it took 70 years for decent growth of spruce to mature. Of course, pulpwood is cut in smaller growth, large pulpwood bolts have to be split. I know of one woodlot owner that was offered \$900 for the timber rights of the entire stand on his woodlot. He checked with the Forest Ranger who told him that did not seem like enough money. He gave him the name of a Timber Cruiser, the cost was not great, but the final agreement on the cutting operation was \$2,800.00 I know of several other cases, but this is enough to give you an idea not to be hasty in making a deal to sell your timber. You might be given an offer that seems like a lot of money, but check into it.

Wood Heat Quarterly

The best aspect of the current resettling of the countryside is that so many of the settlers are intensely spiritual and recognize the depth of the archetypal relationship of man to earth. (That's many, I said, not all.) Such religious feeling for the agrarian life hasn't been manifested since the last century. By now, every state of the union (and many other countries) has its proportion of the new homesteaders. The Number is growing.

Wood Heat Quarterly is Vermont living, simple living, spiritual living. Practical, plain and poetic, all at once. Its articles on fuel supply, mules, soil care, herbal medicines and water witching are mixed in with the philosophy of Kirpal Singh, Wei Po-yang and the Essene Gospel. They talk about the Shakers and the Population Explosion. It's early New England transcendentalism, reborn, redefined and revitalized.

Arrangement of Smoke Stars in Shell

VOLCANO

This very pretty little device, easily made and perfectly safe for use by small children is produced by rolling a stout cone, 3 to 4 inches long and 2 inches in diameter at its base, on a former similar to that shown for sky rocket cones. The tip is cut off so as to allow an opening about 1/8 inch, into which a stout piece of quickmatch is inserted. A ramming mold is now made from a 4 inch block of wood, into which a tapering hole, of the same taper as the volcano cone, is worked. A case is inserted and rammed with the following composition:

Saltpeter	24
Sulfur	4
Mixed charcoal	4
Steel filings	10

A cardboard disk, somewhat smaller than the bottom of the cone, is now forced into the bottom of the volcano and secured with glue.

AMERICAN PYROTECHNIST FIREWORKS NEWS

A MONTHLY MAGAZINE ON FIREWORKS, & PYROTECHNICS

This completes the listing of commercial fireworks Herr Staedtler has submitted as used by the public today in Germany, but a few of his comments on several of them will be of interest: Regarding "Frogs" or "Grasshoppers", he says: "One of the most unpredictable and dangerous fireworks and one of the most unpopular: for adults, for it is well known, what damages these things can-cause. A paper and office supply shop sold fireworks between Christmas and Silvester and wanted to try out one of the big Frogs. They lit it and threw it out the open shop door and smiled when it blew off, but with the second bang the frog jumped back into the store and on the third bang ignited a box containing several dozen cannon crackers. With the next bang consisting of over 10 kilograms of fireworks going off and destroying the whole shop.

Kinnikinick

Available from: AMERICAN INDIAN TOBACCO & ENTERPRISES
Lamentation Mountain
U.S. Route #5
Meriden Connecticut

Write to: Tall Red Oak

Real and authentic indian tobacco, several types for different tastes. I haven't tried rolling any in paper yet, but the wet type might do it if cigarettes are your bag. But, the stuff is really for pipers. The Ceremonial tobacco is by far the richest they carry, heavy and black leaf. Western Plains tobacco is in my opinion the smoothest all round stuff, mostly pure tobacco. None of the tobaccos are aromatic in the white man's sense of the word. Don't smell like mixture 79 or the like. BUT, the kinnikinick, the NON-TOBACCO leaves sold as "Chippewa Straight" is truly the find. No nicotine for you guys who've quit but long to puff on something that won't send you UP. Also, used as a mix with other blends makes the very best smoking.

Mountain Men of the 1840's—traded very heavily for the mixture called Kinnikinick, (Algonquian for smoking stuff) that was made best by the Chippewas of Bear Berry Leaves and Red Willow bark and other herbs. It smells like the forest. Sitting in New York, the aroma fills the apartment and for an instant, you're away. It helps. Try some.

Mohawk Blend is already a mixture of tobacco and Kinni. Northwest Coast tobacco is heavy and minty:

They'll send a sampler package of three types for \$2.55 inc. post. If you want the straight non-tobacco stuff ask for sampler number two.

Otherwise just write for their free pamphlet on tobaccos and other goodies.

Earth Flag

A gentleman named John McConnell came into the Truck Store a few weeks ago and said that since all the nations have flags, and the UN has a flag, and states and businesses have flags, maybe there ought to be a flag that's just for people. So he got together with artist Norman LaLiberte and one of the Apollo Earth Photographs and came up with the Earth Flag. I don't know if I'd die for it, but it's the first flag I've seen that I don't feel it somehow excludes me. The Earth Flag feels nice to wave.

Paper

The other day, while cruising around Bizarre Acres, I came across a recipe (?) for making paper. Now at first, the thought of slogging over some soggy pulp to make a few sheets of paper a dull experience but just think how nice it would be to paint or write on paper that has been produced and prepared by your own hands.

EQUIPMENT: A Stanley knife or something equivalent with which to chop up pieces of wood, one large saucepan (a pressure cooker would be better but don't worry if you haven't got one) and a rolling pin.

INGREDIENTS: Quantities of birch, pine or spruce (there's no need to hack down a tree because branches and twigs picked up from the ground will do just as well)

METHOD: Cut the wood into pieces for easy handling, remove the bark and chop into small chips. Place these chips into the saucepan, add sufficient water and boil until they have been broken down into fibres of desired length. Be careful not to let the saucepan run dry. (For the owners of a pressure cooker, cook at 15 lbs pressure). After a few hours you will have a fibrous cellulose. At this stage, if you fancy a coloured paper, add a dash of a non-toxic dye (a vegetable dye is preferable as its non-chemical) and stir gently.

Drain the mixture carefully, roll out into the thickness you want and dry over an even heat to remove the excess moisture. When you're satisfied that the sheets are dry enough, roll into reels and leave to stand. You now have a fine matt paper ideal for all your purposes.

Should you want to work on hand-made paper but find it awkward to get things together, you can always buy some from Paperchase (half way up Tottenham Ct. Road) for about 4/6d imperial size or from Kettles (127 High Holborn, WC1, near the Art College) at roughly the same price.

The Green Revolution

Seems to be the grandmother of the alternative culture newspapers and magazines. She's spunky (been publishing since the '30's) and always has lively articles (written by Mildred Loomis and a young and young at heart staff). Wears simple, functional layout, newspaper format. Nothing called "news," though, just in-depth stories that are relevant. Latest issues have dealt with massage, pig slaughtering, rescuing trees, planting trees, defoliation, dandelions and water wheels. They're always promoting the green revolution, the return to the land.

OFFING THE PIG

by Larry Lack

Last Saturday we lovingly liberated Ron's soul from his well-developed body. The previous day we'd transported his little sister, Laura, to a neighbor's farm so she wouldn't have to witness her brother's demise. She will remain at her new home for some time, making babies.

Ron and Laura, named for the couple who point the way in Mildred Loomis' "Go Ahead and Live," were Heathcote's pampered porkers, held in highest esteem by the entire community.

I won't attempt to describe the technics of the butchering process there: they are best observed on the spot. A few notes on the killing may be useful: several people told us that the most humane killing technique was a hammer blow to the skull prior to opening the throat and bleeding. I could not do it, and chose instead the more common method - a .22 rifle pointed just above a line between the eyes and fired point blank, I fired the shot myself, and I think it entered the brain, causing a very quick if not entirely painless death.

I chose to kill Ron myself because I strongly felt that all meat eaters should come to terms with the killing their diet requires, and should assume moral responsibility for that killing by doing it themselves whenever practical.

THE GUIDE

"I thought you was a cow," said the man with the light on his cap. It was a coal miner's hat, with a burning carbide lamp on the front. "I heard you way back yonder and told myself I said that's somebody's old cow got out."

"I thought you was a ghost," said D.R.
The miner laughed. "Well now, I could have thought the same thing about you. But I've walked this road many a time at night and I learned a long time ago it's always better to tell yourself it's a cow instead of a booger."

The miner laughed some more and then set out walking again, and D.R. fell in beside him. If the miner thought it was odd that D.R. changed directions to go with him he didn't say anything about it. The miner acted as if it was a common thing to run into people on that road at night. He was perfectly at ease and confident in his direction, and when his fright had passed away D.R. was glad to be beside him.

"What are you doing out here tonight anyway?" asked the miner.

"I'm trying to get to my uncle's place in Finley County," D.R. said. "But my bus quit on me up the road here a ways."

"You a bus driver?" asked the miner.
"It's a van," said D.R. "One of those Volkswagen vans."
"Oh yeah," said the miner. "They've got a lot of them up in Dayton."

(continued)

Paul Krassner approaches every moment in his life as a potential source of humor and moral dilemma. He is seldom disappointed. Neither are his readers.

-SB

Far away I could hear the roar of the falls. Catatonic and gibbering I rose to the rear. Also Butch lifted me up. We climb a final knoll and ooweee. Natural fuckin wonder Jim! The majesty of all that water flashing and crashing like a moving post card. Without camera or guard rail or tour guide or beer can . . . not even the plastic music that pervades most national scenery marts.

This place was special because you had to earn it. Here come Bonnie Jean and White rabbit and David LeBruean all wasted from the walk. But the falls fixes all. Quivering with dying sun shouts rose and orange. rusty like the lord's own snot she set us down to worship while the sun sunk into sleep.

Let's take a quick look at the blackboard. All us earth people are holding hands in a circle. Whether we know it or not. We are all dancing and chanting and making our own individual sound which makes up the whole racket of life. Now somewhere along the line the circle turned in on itself so the folks in the middle are squished and screaming like hell. Maybe that's where Hell is . . . in the middle of that circle . . . Hiroshima . . . Dachau . . . Vietnam . . . Bellevue. Just close your ears and you can hear 'em. Now what we can do is help relieve the pressure by absorbing a taste of the tug. Pass it on. Trust your neighbor. Trust your trust. Practice makes perfect and everybody wants to be practice. Open the whole thing up so everybody's comfortable. Take a deep breath and start all over.

It gets real cozy in the center when everybody's watching out for everybody else like at Yale University. In the middle of all rock and roll my brother-in-law let loose 5 live frogs . . . on cue . . . I grab a mike. "Don't anybody move! Some nut has just let loose 5 live frogs!" And the hunt was on . . . like looking for jumping contact lenses but we brought 'em back alive. It was a calculated risk and it worked.

Later we all laid on the floor with his head on her tummy and her head on somebody else. Not freaky at all but warm and snug. After a while I asked to be passed around. Over the top of the pile. Everybody lend a hand . . . and I'm skimming along at a pretty good clip and it really felt nifty. Then we sent Tooker aloft. The baby of Barry and Moe. He's maybe two and bald like the buddha. Talk about total attention. Hand over hand . . . it was really quite grand with Tooker on top of us all. We can fly with the help of our friends.

All Watched over by
Machines of Loving Grace

I like to think (and the sooner the better!) of a cybernetic meadow where mammals and computers live together in mutually programming harmony like pure water touching clear sky.

I like to think (right now, please!) of a cybernetic forest filled with pines and electronics where deer stroll peacefully past computers as if they were flowers with spinning blossoms.

I like to think (it has to be!) of a cybernetic ecology where we are free of our labors and joined back to nature, returned to our mammal brothers and sisters, and all watched over by machines of loving grace.

The Long Song

It saddens me that we all have never been able to make our times of functioning together really sing a long song, though maybe we are singing a long song that is more subtle than I can grasp— sometimes I suspect this, but most often I think that the subtle song thought is a bunch of shit and we're really all raving and lost in different parts of the woods. Who knows. I continue to have an enduring desire for a lot of money to enable the realization of my dreams. In any event the denouement of our movie or movies will occur and etc. I hope eventually to live in the nice-smelling pine trees in a house I've built and have a nice garden and animals and have clean streams and rivers and lakes and the hills and forests and congenial friends nearby and etc. But maybe we'll all live in plastic 21st century or maybe we'll all die.

The Realist

The Case of the Cock-Sure Groupies

The Trial of Abbie Hoffman's Shirt

by the United States Government

check one:

BANG!

WHIMPER

Seeping through our decadence-in-the-guise-of-insight come the totally related scents of responsibility to pass on this book choice: *Efficiency in Death* (Harper & Row, \$1.50), a documented analysis of 105 ordinary business firms that have been manufacturing and assembling anti-personnel weapons for the Department of Defense. Naturally, this suggestion is offered purely as an amoral tool. Does a blunt instrument know whether it's hitting a head or a nail any more than the *Ching* intends its coincidences to be taken personally? "Freedom's just another word"—Janis has taken her chants on that great Mercedes-Benz in the sky—"for nothin' left to lose."

-Bobbie McGee

Now a courtroom will only hold so much. The primary job of the bailiff and the law of evidence is to keep too much from happening. "We don't want any of that in here." But if you fill it up softly, stealthily, using the rules of evidence like the zen rules they are, you can fill it too full, just a little. Then there's the thing which can be done: the right cough or a certain question. . . Overload! Makes it harder for judge and jury to think along their old rut. (Moral: even if you blow up the courthouse, sooner or later, someday, goddamit, you're still going to have to blow the judge's and jury's minds, else it ain't revolution, only more bullshit, I'm sorry to say.)

There is another thing which can be said in a couple of ways. Bob Dylan's is the neatest: "To live outside the law you must be honest." Inside the courtroom it reads, if you lie you had better be telling another, truer, truth. Shucking and giving won't do, for justice may have nothing to do with what goes on inside a courtroom, but it has everything to do with the people who walk in and out.

This one can't help but be a little corny when it's said; that's why you can't ever come out and say it. Understand the thing is a ritual; we don the garb of judge, juror, prosecutor and defense lawyer and become possessed, dancing out justice. The dance now is become demonic and monstrous and just a bit incredible. Maybe and only just maybe you can reach out and touch—that being no part of this particular dance—another dancer; or even a look of regret, as when two persons who wanted so much to meet, part.

The Last Supplement

The March 71 Supplement to the Whole Earth Catalog was edited by Ken Kesey and Paul Krassner. I've refrained from copying much of their material for this LAST CATALOG because The Last Supplement is really its own publication, valuable by itself. Kesey has more writing in it than has appeared anywhere since Sometimes a Great Notion. There are sundry good articles, particularly Jim Wolpman on law, Chloe Scott on feet, Paul Robertson on flute, Paul Krassner on gas. The Bible and 1 Ching reviewed by Kesey. R. Crumb cover. Not your usual comic book.

WINTER SOLDIER READING TOOLS

Here are some books highly recommended for your private consciousness-raising sessions:

"*Revolutionary Non-Violence* by Dave Dellinger—morality reports that should be required reading in all high schools, colleges, communes and barracks.

"*No More Lies* by Dick Gregory—the truth about American history (and be sure to hear his album, Frankenstein).

"*Sisterhood is Powerful* edited by Robin Morgan—a collection which provides the kind of inspiration that transcends gender.

"*How to Talk Dirty and Influence People* by Lenny Bruce—an autobiography of the funny prophet which makes you wonder what he'd be saying if he were alive now.

"*Johnny Got His Gun* by Dalton Trumbo—my personal Bible.

-p.k.

Say, for example, there is the Light, and also the Way, the Prayer and the Action (and that, perhaps, the Way does not necessarily move at all times toward the Way) then we need tools in two areas. The Bible is, for me, a tool of Light and the Ching is most practical day-by-dawdling-day tool of the Way. The oracle works on the cybernetic gestalt principle that when you stand at the free-throw line that the information concerning the future and distant relationship and outcome of ball-and-basket is contained in your physical state at the moment of the shot. We always know down in our cells which fork in the road to take but the knowledge is usually not permitted audience in the tight-assed regime of the courthouse of ego and attachment that we recognize, in a kind of diplomatic dither, as our consciousness. . . ("The cells say they got a lotta useful information, Captain, but great scott! you start listening to advice from that mob and the next thing you know they'll be demanding voting rights and vacations in Atlantic City and plasma pensions and god only knows what all. . .!") so we are sometimes forced to rudely bypass the red-tape media garble of our city hall for some grassroots opinion. So we give the Ching a ring. Of course we can't stop the boys in the smoke-filled rotunda from tapping our line but then neither have they figured out a way to stop the call so we toss the coins and figure, What the hell; go ahead and listen, Captain. You get good advice from the Ching even when you're eavesdropping.

Rolling Stone

Primarily an emergent-music trade magazine, it has expanded to be the dominant newspaper to its Generation. The music information is still there, and so is dope notes, lengthy thorough reports on Generational heroes and events, and no-heavy-ax-to-grid-yet accounts of political occasions. The Stone's editorial standards, both on writing and graphics, are refreshingly high, and Wenner and crew have good ideas—which may save them from the cramp that Graham and the Fillmores got into with similar success in the same high-energy field.

Funny Smell Hits Halls of Finance

BY MAITLAND ZANE

SAN FRANCISCO—Forty-five years ago in the Financial District it was hip to carry a silver hipflask and know a good bootlegger. Today, booze is for the over-40s and the younger guys brag about the supergrass their connections laid on them last week.

"What do you do? I don't know but I do it every day. Why do you do it? I don't know; but I know I do it anyway. I do what I do indeed I do. I do what I do every day. (Indeed I do.)

I do what I do. I am what I am. We are what we are. We do what we can."

—Bonzo Dog's *What Do You Do?*

Friends

This is the British equivalent of Rolling Stone (derivative; for a while they were together, then severed). It has some kinds of items we've seen nowhere else, and that's welcome.

—SB

Listen, Hippies, Look, Wake Up. You are being too hip. So you've taken your tabs of 500 microgram Orange Golden Sunshine Purple Special and you reckon you know it all, no-one can teach you anything, you got the power of Lerv, an' yer fat smiles an' yer Biba dresses an' yer seven-skin joints an' yer long lervly hair just gotta turn the natives on. Will you wear that smile right through your five year jail sentence in Malaga, Erzurum, Bombay, Tetouan? Will you grin as they stamp something strange in your passport (pity you never learnt the language and can't understand it), will you hand them a flower when they try to rape your dopey girl friend who used to sunbathe naked on the roof and say 'fuck what the neighbours think, a bit of tit won't kill them.'?

Wake up. Stop carrying your plastic hip culture round the world. Formentera used to be a beautiful island of sleepy farms and white-washed houses. This summer it was like the carbon-copy of the main drag in any big Western City, flashy boutiques full of ugly clothes, bars full of freaks bashing bongoes long after the owner has asked them to stop, everyone playing the same dreary games they played in Finch's bar or the Fillmore East. Ask the local people what they think: they'd rather have fat middle-aged German tourists who spend money than a load of penniless bums who steal from them and stir up the police while trying to turn their paradise into a psychedelic circus.

"Oh, come on, mother," he muttered. "Not now. I haven't got the energy."

"Yes. Now," she said. "You've always made me feel a little ashamed whenever I criticized you, but you're not perfect, you know, and I've decided to speak up rather than let resentment grow inside me any more. You can take this any way you want to. The only time we see each other is when I invite you to my apartment. It never occurs to you that I might like to be asked out to dinner sometime. Let alone to one of your parties. I like being around young people. But you cut me off. It's not fair. I feel exploited, for example, bringing the borscht with me this afternoon, as much as I enjoy cooking for you. Can you remember the last time you took me out anywhere?"

What else could Leo say: "You're right, mother, absolutely right and I apologize. I never thought of it that way before. How about dinner next Thursday?"

"I'm busy Thursday night." She drew herself up straighter, and continued with increasing confidence. "There's more honesty in the air than ever before, in my lifetime anyway. It's simply great the way people are speaking out against injustice and prejudice... black power, women's liberation, gay liberation... people are no longer staying silent and neither will I. As wonderful as youth is today, they think they have a monopoly on the truth.

"Young people tend to discount both the interests and the opinions of elderly people. I will no longer stay silent against this form of racism. I'm thinking of starting a movement for elderly people's liberation."

Leo went over to her, kissed her on the cheek, raised a right fist, and said: "Right on, mother."

She laughed: "Up against the wall, son."

Michael Zwerin

The O.F.S. Directory is continually growing and is produced once every one to two months. The idea is that you flick through the list, find your nearest grower and then go and call on him and collect what you want — thereby cutting out the middleman. A good idea. No charge (other than stamps to cover postage) is made to eaters or growers. If you grow (or know someone who grows) organic food make sure you're on this list.

United Kingdom Whole Earth Catalogue

"j" life: a game to be played for all it's worth."

L. RON HUBBARD CRUISES THE MEDITERRANEAN IN HIS YACHT APOLLO AT THIS VERY MOMENT. HE IS THE CLEARST OF THE CLEAR. HIS CHURCH, GROSSING MORE THAN \$75 MILLION A YEAR, IS COMPLETELY IN THE CLEAR. RON IS HAPPY. HE KNOWS THAT IF YOU LIKED HIS SCIENCE FICTION, YOU'LL LOVE HIS RELIGION.

At the core of Synanon is the Synanon game. The rules of the game are simple, straight forward and inviolable; no physical violence or threats of physical violence, no drugs and, most recently, no smoking. These plus the rule that no one leaves the game until it is over are the only ones by which the players have to abide. Anything and everything else goes. Literally nothing is sacred. From these rules and the game itself comes the Synanon life style.

The students of Objectivism are filled with the wild-eyed idealism and romanticism that one normally outgrows along with pimples. A retail exec recalled, "When I think back to those in my class at N.B.I. I see them all as tall, confident, clear-eyed..." A young career woman who'd been through the mill explained, "The Fountainhead seemed so moral to me, so upright and clean and clear and logical. I read it when I was at Bryn Mawr. I was brought up a Roman Catholic and I had begun to think religion was hypocritical, full of myths. I suppose I was looking for another code, and she gave it to me. It was simple and direct. I became so involved with individualism that I was a bitch for three years, and everybody blamed it on Bryn Mawr."

D.R. asked the miner if he lived in Dayton. "Off and on," he said. "I use to work at Frigidaire but they laid me off last year and I ain't been back. I told my wife I said if I'm going to be unemployed I'm going to be unemployed some place I care about living. So we come on home. We're staying with her people on Lower Elk right now. That's off the Poor Valley road, near the Crab Orchard."

"I see," said D.R.
As they walked on in silence D.R. tried to get a better look at his companion. He was about D.R.'s height, but much stockier. The light on his forehead went out in a jet. From the side it was hard to see his face in any detail. When the miner's face first materialized out of the dark and scared D.R. so, he had seen it from the front, and although he hadn't seen it in any detail then either, it had appeared to D.R. a very old face, weathered and deeply lined about the eyes. He had looked vaguely like an old Chinaman, but now from the side he did not look like an old Chinaman at all. He looked very young, in fact, and he certainly walked young. They'd only walked a quarter of a mile together but already D.R. was having to work at it to keep up. After they walked on in silence for perhaps another quarter mile, he asked the man where he was going.

"To join the Happy Pappys if they'll have me," said the miner. "They might not have me. It's hard to get much out of them people in town except appointments."

Rags

Never fear, Rags is nowhere near a newsprint version of Glamour, so don't be put off by the fact that they talk about fashion sometimes. All they're really doing is talking about wearing your insides on your outsides. All of us feel that fashion can be superficial, trivial and irrelevant and it is . . . if you take it too seriously. Rags has zeroed in on fashion as just plain ole daily living and they look to the street for people who dig fashion as self-expression and not what-to-wear-when-and-why-not. They know that nobody should have to think twice about clothes or how they look except as a whimsical, trippy kind of safe-valve. Put on what you feel and you can't help but look beautiful. They print some good how-to articles, so you can pick up on all sorts of old and new recipes, beauty and otherwise, to make you feel better by doing it yourself and enjoying it all too. If your insides are being energized and revolutionized and beautified then those ole familiar outsides just have to be getting better too.

Make It

Make It

Issued quarterly, first issue, Fall 1971.

How to obtain, build, repair, recycle and renovate what you need. Dedicated to survival, economy and conservation.

Price—\$3.00

Box 526, Old Chelsea Station
New York, N.Y. 10011

As soon as possible, we would like to have requests for information and projects you want.

We will also pay for suggestions and for articles describing projects you have completed.

The idea behind the periodical we're planning is pretty important, we think. Here's how it got started. I've been repairing, restoring/renovating and building things from scratch for about 25 years now, and was interested in it for a few years before that. I'll try to keep it short, but things repaired include small and large appliances like washers, refrigeration, small engines, cars of course, recording and film studio gear, radio, TV, radio and TV station gear (I have the FCC license), farm implements, steam engines and many more. I've built houses including all plumbing, wiring, finishing and cabinet making, made portland cement and bricks from clay and limestone, chemicals, jewelry, gemstones, tape recorders, recording studio consoles, radio studios, potters wheels, tools of all kinds, freezers and refrigerators, underwater photographic gear and lots more. I have considerable experience as a machinist, carpenter, mason, electrical and electronic engineer/technician, teacher, blacksmith and technical writer. My buddies have similar backgrounds.

I tell you this, not because it's some kind of a big deal— I've found that anyone with enough determination can do practically anything they want to if they take enough time— but rather to let you know where I stand and to support my belief that anyone who plans to publish or teach should know about the subjects they're talking about. And it isn't enough to have learned in an academic sense only— that may be enough for purely academic subjects, but practical subjects need to be supported by practical experience. A good way of learning a new subject is to tie it in with the related knowledge one already has learned/experienced— a craftsman can therefore learn in a very special kinetic way— by visualizing the subject as a job that will be executed to yield a finished product. If you project yourself into a job, you can predict what the order of the steps should be and what problems might come up. I'm not putting down books or even abstract or academic thinking, but when I pick up a book that claims to tell me how to do something, it should really work. It's happened to me and to everyone I know—and it must have happened to you, too— that after finding that a project from a book won't work and checking the work very carefully, you discover that the thing couldn't possibly work no matter what, because the basic concept is wrong. Then it becomes clear that the dude that wrote the book didn't try out the project, didn't have enough practical work behind him to evaluate the project, and, worse yet, didn't bother to tell the reader that the project was purely theory and therefore speculative. No good. You plan to end up with a working thing and instead you find yourself in a research project.

Our plan is to describe projects that have been done so that the idea is tested and the usual problems involved in execution can be described in a step-by-step procedure. We'll work up some of the projects ourselves, and we'll print articles from readers (paid for, of course) provided they are tested. We'll also run some abstract things or propose projects, but these will be clearly identified. The project articles will be as concise as possible, but complete enough that a newcomer to the subject can be sure that it will work if done carefully. We want to avoid the kind of abstract writing you find in survey type books where you plunk down 10 or 15 bucks for a book and get a text for an Animal Husbandry 101 class that tells you what a sheep looks like. Some books are really empty, and sadly, they may be the only thing available on a given topic. Others are written to the wrong audience. We think that home-steaders need information that applies to their needs.

An example: Instead of listing a catalog for cooper's tools, we will run an article on how to make barrels. It's important to tell where the tools can be had, as you have done so well, and it's also important to now how. We will tell how an experienced cooper makes a barrel in the classical way, where to get the tools and how to use them. We will describe how to make the tools— pretty essential when you look at the prices. Finally, we'll tell how to make barrels, using techniques that journeyman coopers don't use, but that are effective for people who want to make a barrel right the first time rather than making a lot of scrap ones as the cooper does in his apprenticeship. This will apply to all of our articles.

Max Pepke

CAUT/ON: RAILROAD RIDES MAY PULPIFY YOUR HEALTH.

'Twas on the stretch of track between Starkey, Nevada and Utah that I began to learn the dangers of the rails.

I had been riding in an empty coal car with a floor that consisted of six large trap doors. Several dozen miles out of Starkey I picked up my pack and moved to another side of the car. A few seconds later there was an enormous clatter. The door I'd just been standing on had fallen open.

Sitting or lying down in my cozy coal car was impossible. The freights have no shock absorbers, a fact I'd never noticed on slower jaunts. When a train hits sixty miles an hour, the fool who attempts to sit is rewarded with a smashed ass.

Canadian Whole Earth Almanac

son of whole earth meets the mapleleaf mysteries and superpress, breeds with them, and gives birth to a beautiful babybeaver catalog, that's the script.

A brush dam

India Trading Co. Ltd.

111 Dundas St.
Toronto 180, Ont.

Carries a complete line of all ingredients necessary in Indian cookery. Spices, flours, rice, Dabhi, chutneys, nuts, and vermicelli. Free list upon request.

Garlic—inhibits peas and beans. Garlic is very useful elsewhere in the garden as a pest repellent. A tea made with fresh garlic helps against potato blight. Beans grown near garlic have a stronger perfume. Onions—are good planted with beets and carrots. A few cannoneer plants (1 every 1 yds. of onions) are beneficial to the onions. Do not plant onions near peas or beans, as onions inhibit their growth.

Atlas and Gazetteer of Canada

\$5.00

From:
Queen's Printer

This has to be the definitive book of Canadian maps. It comes somewhere between the gas station variety and (unbeatable) local topographical maps. The scale is 1:2,000,000 and shows township lines along with all cities, towns, villages, and even most unincorporated communities. Up to date.

Whole Australian Catalogue

The first issue of The Whole Australian Catalogue should be out early in 1972. At present we are negotiating with a publisher; if they print it, they will distribute it in the U.S.; if we distribute it, you can get it from us at:

Source Books
121 Collins St.
Melbourne
Victoria
Australia

The price will be about \$3.00.

Purpose: We think of Australia as one of the last frontiers. In a country so vast, the possibilities for learning, experimenting with new ways of living, and discovering untouched land and resources are still great.

This catalogue is for people who live in Australia, and for those who are interested in or who want to immigrate to this part of the world.

It is a guidebook to what is available here in the way of tools, materials, information, books, land and whatever else can help us to create a new and better environment.

Contents: Dwellings: adobe; ferro cement; bark huts. Land: zoning; prices; availability. Craft: weaving; ceramics; bush crafts. Aborigines: myths; culture; survival. Learning: experimental schools; useful tools. Ecology: conservation activity; use and misuse of land. Communications: music; film; T.V. Flora and Fauna: Australian native plants; animals; edible plants. Food: growing your own; beer and wine making. Immigration: jobs; acceptance of foreign credentials. Industry: access to materials for building, crafts. Communes: why, who, how're they're doing. Survival: in the bush, on land, at sea, in the air; outdoor activities.

Meanwhile, we might be able to offer some help and ideas for those who are thinking of coming to Australia.

Immigration: If you want to get a visa for travel only, there's no problem. Getting one for permanent residence is another thing. It can take 2 or 3 months, so you have to be patient. Also, they check lots of sources: your background, past activities, etc. Sometimes they refuse without telling you why.

Maine Times

John Cole is not reporting on the whole earth. The state of Maine is his beat, and the results of his focus are obvious. Earth Times folded the same year Maine Times soared. Cole's weekly circulates all over the U.S., but his paper is primarily about Maine's ecological problems. Maine Times is revolutionary in that it's a straight business, dependent upon circulation and advertising revenue like most publications; and yet, it takes no shit. If the Times' editorial policy offends a potential advertiser, that's the advertiser's problem. Aside from its good work as a conservation news medium, the Times does a favor for us all by proving that power does not always rest in the hands of sons of bitches. The Times has been a central force in uniting Maine's lonely, isolated little voices for conservation into a tough political fist. It ain't hippies they're uniting, and Maine Times ain't a hippie newspaper, although the Freak spirit obviously dwells in the hearts of these newspaper pros. The Times lives at that difficult but special meeting place of overground and under-ground, with no apologies in either direction. So do a lot of other people, apparently. Maine Times circulation is climbing. Let's hope it's true, that as Maine goes, so goes the nation.

Natural Life Styles

The Whole Earth Catalog never became what it started out to be. Natural Life Styles comes closer. They take the time and (believe me) trouble to do a full job on subjects, like a long illustrated rambling talk with Euell Gibbons, a thorough letter on New Zealand, a comparative list of outdoor suppliers, and so forth. A hell of a lot of information for a dollar. Layout is funky but not obscure. Hang in there folks. Stay loose.

—SB

pond

I suppose the ideal location for a pond would be a half-acre (or larger) gulley or valley with clay soil, located on a gentle, grassy slope directly below a spring or artesian well. All a builder would have to do, in such a situation, is build an earth dam (with a spillway or drain pipe to control the water's depth) across the lower end of the depression and let it fill.

If you've got the gulley and slope but not the spring or well, you may still be in luck. As long as you have five acres drainage for each square foot of water that is six feet deep in your mini-lake, you can build the dam and let the rainwater runoff from the hillside fill your pond. As a matter of fact, you can get by without the gulley and slope. Even if your homestead is flat as a pancake you can still have that "private fishin' and swimmin' hole" . . . by excavating.

An excavated pond is more work but it's also the most versatile (therefore, most popular) mini-lake. Such a pond can be located anywhere a source of water is available or can be made available. An excavation— instead of a dam— can even be placed in one of the gullies mentioned earlier and, so located, would probably be easier to keep full of water than a dug-out pond on level land. Most valley ponds are at least semi-excavated, as a matter of fact: the dam at the gulley's lower end being constructed, generally, of clay bulldozed out and pushed down from above.

The only minus factor (vastly overstressed in my opinion) of an excavated pond is the difficulty involved in draining such a reservoir dug into level ground. I believe, once your pond is stocked, you'll find yourself much more concerned with how to keep the water in than with how to let it out. A pond can always be speedily drained with a large pump that can be borrowed or rented if you don't have one of your own.

There are still other ways to get a pond constructed for very little out-of-pocket cash. If yours is to be located at least one-half mile from human habitation, blasting is a very reasonable way to remove the dirt. It's not necessary to pay for dynamite to move all that earth, either, although dynamite will be used to trigger the blast.

The main explosive element is Ammonium Nitrate saturated with fuel oil. This is the same Ammonium Nitrate farmers use for fertilizer and the fuel oil is the number two grade available at any service station. A good-sized pond can be blasted for less than ten dollars with this method. Before you try it, however, you should obtain a copy of the booklet, "Blasting Potholes For Wildlife" from the Wisconsin Department of Natural Resources, Box 450, Madison, Wisconsin 53701.

Journalistic Opportunity

The big question is: How do you implement a good intention or a good vision or even a good plan? If the counter culture is going to live up to its name it's going to have to shift from the role of critic to that of producer. It's going to have to produce viable examples of what it's asking for— or else invalidate its discontent. It seems to me that this need suggests a journalistic opportunity that has barely been touched: the great labor of discovering who has made a better what, and how did he do it.

Wendell Berry
Port Royal, Kentucky

D.R. asked the man what the Happy Pappys were. The miner snorted, and spat on the roadside. For the first time D.R. realized he was chewing tobacco. "Standing around for a dollar and a half an hour, mostly," he said. "Make work for them has got children at home." He spat again; then asked D.R. if he lived in Finley County.

"I use to," said D.R.
"Who's your people?"
D.R. said, "The Colliers. From over on Trace Fork."
"I know Trace Fork," said the miner. "Toward Blue Diamond, over yonder past Hardly. Collier, you say."
D.R. said, "My father was a Collier. My mother married a Devenport after he died."
"Well I'm glad to know you, Collier," said the miner. "My name's Virgil Amburgey."
Virgil had got D.R.'s last name wrong, but D.R. didn't feel like correcting him. They stopped long enough to shake hands with one another. Then they set out walking again, and a while later they came to Urge, sitting like a shadow by the road.

Vision, With Rap

I like your collective prose and the selections, under-the-skin communication. So therefore I feel called upon to criticize, no matter what your reasons for stopping publication, even of the most personal sort! I'm a new convert, and we are the crankiest!

Anyway, here are my suggestions. The catalogue and the truck store, truly beautiful in their concepts of space-mind preparations, stop short. There are other tools beside books. We do need to arm ourselves with knowledge and a clear mind to perceive, among other things the applications of knowledge. But reading is a limited way to understanding. When I came to the truck store, impatient to get there, I'd expected to find tools, models, materials, a community making a new design for Stores, that is—Information Centers, a place where you launch a new beginnings from. I would've like to see displays such as macrame and weaving, wind generators, plus having the wind generator working and producing, what? maybe lights and color machines, or tape music, or better yet, if we are speaking of new communities, running a motorized pump, that someone there has devised, with only available materials and his imagination. And so on. I suppose you'd need more room, but that might be exciting too! Could you go a bit farther out, close enough to urban centers, but still on the land itself, could the shape of the store change often—could people design, out of cheap materials, or plentiful materials, a changing line of Stores. I'd like to make a huge canvas shape, for instance, having it bulge and corner and dome where needed, held up by plastic rods, or aluminum poles—or another of scraps, driftwood and scrap metal. How about a small, shifting community, as people moved outward on their spiral, others come in who were interested in the Whole Earth concept, and also in spending some time in devising needed tools for where the truck store was at, putting together solar water heaters, hand made cowboy horse gear, (if of course you had horses!) organic gardens to feed this Whole Earth Truck Store Family. I think you have a lot of very committed people out here, who'd like to come together to really do things, solve common problems and learn. I think that this should happen in a real situation—there are many free university type courses, dealing well with theory and practices. I think a new book store could perhaps offer information in a more real way. That a small staff—or group— could work out many solutions to new communities, to ecology and survival. The customers to your store could really be involved in these solutions, checking them out, offering their own, would in fact, be as neighbors concerned with the success of problems solved, not just in theory. The catalogue could, if publishing were continued become more as the supplements, be indexes of real experience (as the story of Libre, and Gary's Four Changes).

I mentioned earlier my own feeling of diet imbalance, and I know that this is not your responsibility; there are groups out in the "wilderness" learning just how one digs a well. There are many more people getting ready to go out, and not quite knowing how. I suppose we will all find out when the need hits us, soon enough! I also feel you've done a lot. So much, in fact, that I would like to see you continue. If I haven't totally turned you off by my Virgo-Vision, perhaps we can get together some time and rap about dream theories.

Thank you for creating the Whole Earth,

Sincerely,
Ann Hatch
San Anselmo, CA

I'm impressed with these ideas and moved by the vision. I expect it's not all that individual a vision, either; many of our readers and customers may have felt vague rumblings along these same lines, not to mention our own staff. We did rap with Ann—no indication yet whether she'll go any further with it. We can't do anything to actuate or realize this particular vision, beautiful as it is, and still continue the trip we're into at the Truck Store, which has its own dictates (time, energy, direction, money, space), its own pace, meaning, goals, joys, frustrations, tiresomeness, challenge and beauty. By the same token, there's nothing that would turn us on more than to see it happen. A lot of times, when people say, why don't you do such & such, we say hey that's a groovy idea, why don't you do it? We're doing our ideas and even that seems a bit much to tackle at times. I dunno, it's always seemed to me that one of the main things the CATALOG says is do it yourself, man. We dig most of the criticisms we get very much, whether or not we make changes around them. What I don't dig is the underlying feeling I sometimes get that we're being asked to do stuff that belongs by its very nature to the head that thought it up, to do it. It would be so much better ecology if some of the mental energy that gets directed toward us were directed instead towards the real and physical realization of the ideas. A lot of visions don't ever get out of the head, and that can be a waste. Some get as far as being down on paper, and that's a beginning. Only! Or get stopped after they've been rapped about, because there's a false sense that something has happened. And again, we really don't mind having visions laid on us. But I, for one, keep wishing folks would realize that we may dig it, encourage it, feed it however we can, but in approximately ten cases out of ten we aren't going to DO it. So, all you visionaries, consider, instead, laying it on your own self, and you might find out whether it's just a trip, or an idea worth realizing in your own life. I understand more and more why our collective failures so outnumber our successes. It's just very much damned harder to succeed and take the responsibility of that position. Who'll do this one?

—Diana Shugart

A New Mexico Road

Dear Friends,

As the time to till the soil comes near, I think back over our time in New Mexico. Not yet a year but enough time to learn much about this beautiful land that we dreamed of so long. There is much we have learned— not in a mind blow out but rather in the joy and perfection of creative living. There is a great magnificence to New Mexico, the special fields the surrounding mountains and mesas, and the cultural individuality of the people. To live in this grand setting utilizing the raw materials, being close with local people and make a life time home.

Your past doesn't matter when you come but your skills do. How long you went to school is unimportant when drinking wine with the Indians and Mexicans or when carrying water from a couple of miles away because the stream froze and the water went underground. The tools you brought are probably the second most important thing. That and your ability to utilize whatever is around.

When my husband and I left the east, we had each made many scenes been many places but the peace that we were seeking always came in a natural setting. New Mexico told me that there was great wisdom to be found here. I felt this when I was last here six years ago. So we saved, without selling our souls, to get a vehicle to get us across country. We wanted to make my five year old daughter feel comfortable. So my husband built a house on the back of an old flatbed. This tin roof chicken house was able to house four people, two dogs and a cat. Seems impossible but he took out the back window and made a hole to the house so the animals and small people could move around comfortably without stopping. A fifteen year old boy from the school we taught at came with us.

Like most of our people we didn't have much money, so we wanted to take the essentials— warm clothes, tools, plenty of blankets, cooking utensils and some craft materials. We had lived in a tipi for a year and I forgot how small it closed up to. Three ft wide by 2 ft high lining and floor covering included. Our tipi was an eighteen footer. We didn't take the poles because wood would be accessible. A supply of food was necessary so we never would have to lean on friends. There are so many foods that will keep and a larder of grains, dried fruits and such could keep us going for a while.

Our route depended on where our friends lived. Stops along the way were necessary because of the physical defects of the truck. The truck became known as Blood Sweat and Tears and that is what it needed to keep it going and of course lots of oil. Actually the truck was a joke but with perseverance and cursing we somehow made it to New Mexico.

From my time on the peyote road I had friends in Santa Fe. We also knew people who ran a Summerhill school, the Santa Fe Community School. Most of the good people had headed for the hills. It was summer and the height of the hippy season. The people we talked to were so uptight about anyone new. Later I understood their situation but then information was all I was seeking. Not a place to crash or a meal just where certain communes and people were. The only information I got was where to stay. Hyde Park was a perfect place. \$1.00 a day wasn't much then. The only difficulty was going down the mountain with little or no brakes. We were looking for a commune some where near Colorado named Libra that's only requirements were that you would support yourself, not build in the sight of anyone else, and you were together enough not to bring your problem to others. The scanty information we got was that it was near Chama. Of course all we need to do was ask around. That didn't seem like much to go on but I didn't want to stay in Santa Fe any longer. It seemed like the place to come in the dead of winter with some hand made goods to sell. The only warmth we felt was from the shopkeeper at the Old Santa Fe Trail.

So up the trail we continued. Of course we never found Libra. But we saw another part of New Mexico. I was ready to settle among the Mexicans and sell leather goods and pottery to wealthy Texans that came hunting in northern New Mexico.

We decided to try the Taos area and see some friends at the Hog Farm before we settled. I was amazed at the help we got. Taos too was flooded with wandering people searching. Lorien Enterprises had set up an information center where you could find out about communes, can food and a lot of other helpful things. Somehow we landed at a commune called Five Star. I liked the feeling of the people camping around. We didn't want to get too involved so we stayed on the side lines helping in the garden. The garden these people planted was plentiful. They did a great job and could have easily lived on what they produced. Even get off food stamps but there were so many people tripping by. I cooked at the big house a couple of times and there were between sixty and eighty people.

It was a favorite spot for Mexicans, Indians, Hippies and straights because of the Ponce de Leon Hot Springs. It was easy to just sit in the hot springs drinking with the people gawking at the naked chicks. But that wasn't what we were looking for. There were a few kids around that my daughter could play with. Most of the trippers were young and free and not too interested in working the garden but interested in eating. At Five Star about eight or nine people did most of the work.

As summer drew to an end we decided to put the tipi up the canyon. A friend had checked with a realtor to see if there was land available to live on free. My husband was into building a rabbit hutch for some 4-H rabbits that were laid on us. I was preparing for winter by helping canning, picking, pickling and drying foods with the Five Star Commune. A pressure cooker was essential for at this altitude vegetables had to cook for eight hours. Getting water and cutting wood was an everyday job but it was doubled when canning. That's when the Information Center came in handy again.

We had picked peaches off the ground at an orchard. Many commercial orchards will let you pick fruit off the ground. That and the wild plums, cherries and with the food Five Star had grown, canning was a full time project. The Information Center had several stoves and info about canning. They had a large kitchen. When I was there I found out about the other activities of Lorien Enterprises.

They put out a paper called *The Fountain of Light*. Helped run a garage called M and M where you could work on your car free using their tools. Ran the General Store where you could buy and sell at reasonable prices. Most important they backed the Free Clinic that later saved many lives.

Next year they were planning to open a school. That is when I decided to apply for a New Mexican teaching certificate. No matter where we were I would probably be teaching my daughter and other kids. I talked to a hippy social worker that dealt with the communes. He said a school of any kind was desperately needed. The schools had enough trouble assimilating the Mexicans and Indians and they didn't want the problem of long hairs. They were keeping the long haired boy we brought with us out of school. So we talked about setting up a small school at Five Star. I got together with interested people and set up a schedule of what people wanted and could teach.

Then we met with the kids and found out what they wanted. The kids came from the Taos area. There were only ten to begin with.

Before we got started we were hit with a plague of amoebic dysentery. It was the fly season and the mosquito season had just ended. A couple thousand people had tripped through the hot springs and the pool had never been cleaned. So my husband and a friend that lived with us started hauling water from town. Water was even more precious. The hot springs had amoebic dysentery in the algae in the pool. Many people were coming down with the dysentery. The Free Clinic was filled. I was pregnant and they insisted I go into the hospital because I too got the bug. The kids and the teachers of this new found school all came down with dysentery.

Going to the hospital was foolish— they did nothing more than I did at our tipi. My husband had just built a cook shack out of totally scrap lumber. Now sanitation had to be thought of more. So an out house was begun. It was Sept. and we were getting ready for the first snows. There was always some question about whose land we were on. Land in New Mexico has been divided up from Spanish land grants and passed down to each son in long narrow strips. Of course to listen to our Indian friend, they say that the land around Taos belongs to the Pueblo Indians. But if you talk to a Jicarilla Apache they say that land is theirs for they hunted and camped in the area.

The largest family who owned land near our tipi sight was the _____ family. One day an Uncle of the clan from California, a cousin from up north and one of our neighbor friends happened by our tipi checking cattle. They wanted to know what our plans were. How we made our money and what we were going to contribute to the economy. When we spoke of being craftsmen they said they had their own craftsmen who needed to make a living off the tourists. The conversation left a stale air in the tipi. Somehow I knew we weren't settled yet. Even though we rarely went into Taos, I felt we were too close for comfort. So we started asking about land further away.

I won't go into the sad story of the break up of a community. Somehow we were visited every night by several people of the commune. The final push was when a group of well dressed Chicanos came and told us this was their land. We'd better get off or they would bring the sheriff. Our friend checked with the realtor and they said they could stay. But we did not want to.

We had heard about some land about a hundred miles away. It had been bought by a New York doctor and turned over to God. Our truck had broken down a long time ago and been traded for another broken down small car. So our next project was to get a truck to move us.

It was the full moon that speeded us up but still it took us four days to find an ex-Hells Angel with a classic 1937 flatbed. While some of us looked for our Angel others went to visit God's land. They came back with beautiful stories of running fresh streams, oak groves, ponderosa pine forest and mica speckled rocks. What a picture we made when we started off with all our possessions. Our family had changed and grown to five— a lot of rabbits and dogs. This time we took the tipi poles.

It was great leaving the sage and sand behind. Going over large mountains which opened up to lush valleys with cattle and cowboys along the road. Our destination was in a valley surrounded by mountains. There were five people already here. They had been living off the apple and plum orchard and ate heartily when we arrived.

We still didn't want to be part of a community but being organized makes you a nucleus for people to come around. We set up our tipi by the stream and further away dug an out house. We agreed not to ruin the land in any way. Not to cut any living trees. Not to build in the sight of one another and try to keep cars off the land. There of course could be no rules for people who didn't believe in rules. Since new people would always be coming everything was subject to change.

First the local people were very interested in this new population. For a town of about 100 that are all related, we were an entertainment. Cars came up at all hours, sober, drunk, before church and after church. Actually the people, whatever condition, were very nice and concerned about how we were going to make it. When they found out that we were not different from them, the traffic slowed down and we made friends with many families. We learned much from our neighbors.

The first snow was a shocking reality to many. It weeded out many crashers so we could move around a little easier. People that didn't even have a warm coat or a good pair of shoes hit the road for Taos. We realized that our supply of wood was scanty and we had best get to work. We were cooking out doors, as I usually did when we lived in the tipi. It was neater and there were now seven people sleeping in the tipi. One of the local families came with their twelve kids the first snow bringing beans and biscuits. They told us this was an early snow and were worried if we were warm enough. Thanks to all the blankets we were comfortable.

The men started to increase our wood pile and I got squaw wood. We had two axes but a well meaning tripper who didn't know what he was doing broke our ax handle. It would have been good if we had another hickory handle for there were no cars on the land. A friend of my husband's had learned the skill of making ax handles. He found a piece of oak and finished the job with a draw knife, a wood rasp and a D-saw.

The two shovels we brought were essential because the guys started to dig a house below ground. They had dug six feet in some places. Then they were told that the water level rises ten feet and we would be flooded come spring. So that project was abandoned.

A well meaning person in the town told them they could cut timber or use tree tops that couldn't be used for logging. So a week was spent in dragging down logging tools, cutting the small branches off and cutting them to the correct size for our log cabin. We then found out that even though many son, daughters, aunts, uncles, cousins and nephews own one piece of land— it is the oldest member of the family that has to give permission before anything can be taken off said land. So logs had to be found some where else.

In between all the projects of trying to build, we still needed to eat. Up until then we had not used food stamps. Somehow one of the chicks went down and gave everyone names for food stamps. Our winter supply had been depleted by the amount of people we were feeding. All time was needed for trying to build so food stamps were welcome. But we hoped we would be off them come planting season.

Every time new people came to the land it showed. So luckily only the prepared could stay. The tipi was comfortable if we had enough smokeless wood— dry cedar in combination with split dry oak and plenty of kindling. The next cozy temporary shelter were army wall tents.

The guys heard of a national forest where one could get logs that were down but couldn't cut green trees. The fiasco of getting 42 logs was unbelievable. The first part only took three days. After the second part of the trip, the local bar owner told us that we could take log tops that he had paid for and did not need. The cabin materials were coming together. The guys had gotten eleven vigas from helping tear down an old garage. Also most important were three sets of eight paned windows.

When pulling all the materials together they totaled to 16 logs— 18 feet long and 20 logs— 11 feet long. We bought three truck loads of half rounds at \$4.00 a truck load. The first project in putting this large Lincoln log set together was to debark the logs with an ax. The dimensions of the cabin were 21 ft. long by 10 ft. wide. The vigas were to be used for the back wall with a stone fireplace as the center. The 18 footers were cut in half for the front leaving 3 ft. for the door. The notches were made with an ax for the lower logs and a chisel for the upper logs. After all the logs were laid, the four main roof vigas were placed. The roof was put on with tar paper and half rounds for latias. Half rounds were used for the final layers of roofing. The sloping sides were also finished with half rounds.

Adobe was a new material to work with. It was used for chinking and the fireplace. Its mixture was earth, straw and water. Everyone including my daughter could help with the adobe. The guys hauled rocks from near and far. Four hundred rocks in a jig saw puzzle had to fit tight without the adobe. The adobe for the fireplace did not have straw and was stuffed into the cracks. Snow was threatening for the seventh time and I was expecting in a month. A full stone chimney would have taken too long. They rocked in a chimney to the edge of the roof. They then got four pieces of stove pipe and took them apart and put two pieces together to make the funnel twice as large. They were held together to make the funnel twice as large. They were held together by rivets. They found a metal earth drag and cut a hole in the top and put it on the rock chimney. Then the stove pipes were riveted to the piece of metal. An empty fifty pound lard can served as a revolving draft control.

The final projects were done inside. A wood stove had been given to us by a local family. Two sleeping lofts were built and a bunk for my daughter. Our great Christmas present was moving in before a lasting snow from middle Dec. to late Jan.

The total cost of the cabin was \$14. Even cheaper than Thoreau's cabin that cost \$28. It took two and a half weeks to build our new home. We felt very wealthy in many ways so we traded our tipi so others could also feel comfortable. There were three cabins on the land now all totally individual.

Now it was time to sit back, relax, create and wait. We had decided to deliver the baby ourselves. Midwifery is a dying profession and in these parts mid-wives only speak Spanish and are very old. You have to pick them up and since we had no transportation, that would be impossible. I went in for an examination to the local clinic. They couldn't find my veins, my blood pressure and most suspiciously the fetal heart beat. This seemed strange because when I was in the hospital in Taos they also had difficulty finding the fetal heart beat. Also when ever my daughter and I would make a wish, I would wish for a healthy baby. We never listen enough to our intuition.

My water broke on a night we were invaded by ten people interested in the land. Luckily they had a car and children. So my daughter tripped off with them. We had all the necessary items ready— hot water, lots of towels, sterile gloves, gauze, cotton, bacitracin ointment in liquid form for the baby's eyes, cradle clothes and some tetracyclin to prevent infection. It was a simple birth much easier than in the hospital. With each contraction I tightly held my husband's hand and drifted off into the conversation of the couple who had come to help. With a few blood curdling screams, the baby was out. I delivered the baby on my daughters bunk and practically crawled up the wall for bearing down. Breathing was essential. I had practiced both the LaMaz method of breathing and exercised during pregnancy. My husband and friend had been prepared by the doctor who owned the land on what to do. Not to cut the umbilical cord right away. Clean the baby's eyes out and not worry about the vernix caseosa. For it was most important to keep the baby warm. We had a roaring fire in the stove and fireplace. A Coleman lantern gave off so much light it almost blinded us. All seemed well; I felt great and was waiting to pass the afterbirth. My husband noticed the baby wasn't breathing steadily. After dressing the baby I held him and realized that even with my warmth and many blankets our son was cold. As much as I hated to we called the local clinic from a neighbor's store, three miles away. We wanted to give our son every opportunity for life.

A doctor and a nurse came at dawn. What a farce. He had the wrong emergency bag, didn't know how to work the oxygen tent, insisted it would require an operation to pass the afterbirth. So my husband, our baby and I went into the clinic twenty miles away. The doctor was annoyed and left a nurse in charge. I easily passed the after birth and my husband took care of the baby. He took a stethoscope and realized that breathing had stopped. As well as delivering his son he also made out his death certificate. We wanted to bury our son on the land nearby, so some red tape had to be dealt with. Luckily the visitors picked us up and we returned home.

An Indian Friend stopped by that day. He told us not to worry and forget. We didn't want to forget; we were sad then but that was natural and soon we would be able to talk about the short life of our son. There are many beautiful things in a world of nature that can cure all sorts of wounds. We had much to be thankful for.

The snow melted— we tripped— and began to build and create. An outhouse was again dug and built. That was a great luxury. In between building the guys began to hike up some of the mountains. They could see for hundreds of miles. They made all sorts of discoveries about the area. The mountain would be a source of inspiration always. My daughter and I climbed to a small ridge and sat a long time listening to the winds.

When they came down they brought a new material for working, antler. They spent many hours making antler pipes, buttons and knife handles. My husband works with leather so after having made enough serviceable clothes for himself, he started to make things to sell. I got into making candles and ordered some pottery supplies. With hand made goods and our coming garden, we should be able to be self sufficient.

The summer I'm sure will bring an onslaught of people that can't be turned away. The land can only hold so many people and we do not want to bring a city condition to such a perfect setting. So we look to the hills for the future. Land with no roads to it where we can build a stone house and live again on a new frontier.

L.

At the starting line Hugh Romney mounts his bus.

Feverish last minute preparations aboard Further.

THE GREAT BUS RACE

Winning Time 2:32. Who Won Is Debated.

Aspen Meadows, New Mexico. Summer Solstice, 1969

Hugh Romney, who mustered this 1000 in this mountain pasture, is announcing the start of the Bus Race and that a couple named John and Mary are somewhere around and must be found because they have the bubonic plague and require inoculation immediately. Everybody's pretty inoculated already; it's the spiciest part of the afternoon. The race was going to be one bus at a time against the clock, but Ken Kesey and others are maintaining that's a chickenshit race. It's got to be all at once.

The buses are Kesey's renowned Further, with a skeleton crew of Farmsters aboard, and the Hog Farm's fleet: Road Hog, Hospital Bus, Kitchen Bus, etc. The Motherfuckers' tight little bus is around but not in the race.

Everyone will go one trial run around the course: ¼ mile up the meadow, around the flag, and back downhill to the starting line. Majestically the line of buses staggers up the course. "I don't know about this," says Mike Hagen, "Further ain't got much brakes." The Hospital Bus is stalled half-way up the hill right where it's almost impossible to get around. Reportedly it also ran over a pup tent (unoccupied).

The survivors of the trial run line up. They're immense, these faded colorful wrecks filled with folly. People are climbing off, others are climbing on. It's a test of passengers as much as drivers. The mood is pure: fatalistic optimism.

And it's begun. Road Hog gets off first. Further is dragging. The air is filled with buses and exhaust and din. They wallow up the pasture like berserk pigs. As Further sways past the grounded Hospital Bus Kesey disappears over the windshield shouting orders to driver Bucavich. Over there in the bushes the Foot Swami from India is watching it all go by.

Further approaches the flag from the left. The Kitchen Bus with Romney on top is coming around the other way. They intersect, pass narrowly, and ram into opposite hillsides, then rev and back blindly toward each other. Frantic shouting gets them forward again. For a moment the entire solstice is tied in a sweet mad knot at the top of the pasture.

Bucavich gets Further around. The Kitchen Bus is still hung with a rear bumper gouged in the creek bed. Rocket, who's driving, surges again and gets it free. The buses swarm downhill. Hugh Romney's mouth is wide open, his toothless warning wailing down the pasture, "BEEE CARREFUULLLL." At the finish line a thousand longhairs cheer and dodge.

Afterward, at the award-giving argument, Romney is saying, "A miracle. It's a pure miracle nobody was killed." Kesey is saying, "Two minutes thirty-two seconds. It's something to think about for next year."

Further ain't got much brakes.

Barrelling toward the first turn Kesey has an excellent view of the rear of the Hog Farm fleet.

Tied up at the flag, Romney and Further pass in opposite directions. Fierce bus action is visible on the track below.

The Great Bus Race May Never End

In the pursuit of truth via participatory journalism our reporter at the Great Bus Race drank fluid from a Donald Duck glass. Consequently he was too stoned to function and misrepresented some facts, such as:

- * The Kitchen Bus is really the Just Bus
- * The Hospital Bus is really the Us Bus (Just Us Buses)
- * The other bus besides Road Hog is The Queen's Midtown Tunnel of Love Bus, and was the one which broke down.
- * Rocket wasn't driving the Just Bus, Bob Redhat (narcoleptic from Ann Arbor) was.
- * Bucavich isn't spelled Bucovich, it's spelled some other way.

Romney had lost his notes and was starting to make up facts and the reporter sensed that once again truth was drifting. Here are some other accounts. Perhaps they converge.

The Great Bus Race

c. 500 yards up the mountain, the same distance down, around a red flag marker and down past the swami's gathering place where they all sit and chant OM.

They're off we get a terrible start, next to last, 5 buses up the hill—Bucko at the wheel picks up steam, passes them all except the Road Hog—bouncing, bumping—we're scared as hell on top—the kids all love it—we lose our bell to the Road Hog—Get the Weather Vain from Just Bus. 2:29 the official record time.

Paul Sawyer

A few months later Hugh Romney became his own sequel, Wavy Gravy, who was last seen bussing out of East Pakistan just ahead of a civil war.

And in Aspen Meadow above Santa Fe the Great Bus Further lost her silver bell to the Great Bus Road Hog in the First Annual Summer Solstice Great Bus Race.

Ken Kesey
9 Aug 69 ROLLING STONE

Obviously truth is not to be found in the past, nor likely in the future, next summer, when the buses race from Stonehenge to the Pyramids, maybe. Truth was good while it lasted. —SB

Leisure Camping

For group travel exactly nothing beats a worked-over school bus. Cheap, dependable, adaptable, and impressive. This book is the only we've seen on bus conversion, by a family man in Minnesota. It's too thin for \$4, but some of the tips might pay its way for you.

—SB

Leisure Camping
1969; 53 pp.
\$3.95 postpaid

from:
Camping Enterprises
923 Dodd Rd.
St. Paul, Minnesota

The school bus is a very well insulated vehicle— made of double wall construction, which also makes them very easy to remodel into a motor home. They have large radiators which give excellent cooling capacity in traveling hilly or mountainous country. They are all equipped with excellent heating plants. Most of the 1955 or newer buses have 6 foot ceilings so that you do not have to stoop while walking inside and are very comfortable to ride in.

You will probably get your best buy from a school that owns and operates their own bus lines and they usually keep them in better shape than the busses that are owned by individuals and leased to the schools. From a bus company that takes them in trade from schools as they purchase their new buses. . . .The best time to scout for a bus is in May, June or July. The schools are in the process of taking delivery of new buses for the school year and they are anxious to dispose of the surplus buses so they don't have to carry them over to the new school year.

You should also buy a "Motor Minder" for \$8.95— which is a small vacuum gauge that will tell you if the motor is in good condition or not. It tells you if the rings, valves, etc., are good and can be used as a real lever in the purchase of the used bus. It is a very simple matter to hook up by removing the wiper hose line and hooking it to the vacuum gauge.

The Motor Minder is a valuable asset to your unit and as you can tell when you are driving, the most economical speed and if you are overworking your motor.

If you can buy a 12 to 14 year old bus for \$250.00— his price should be okay, because you will probably put another \$250.00 in it for repairs: A 10 to 12 year old bus should run between \$200.00 and \$500.00 depending on its condition. In any case, \$500.00 to \$600.00 should be your top dollar because if it is perfect the seller would be using it for the purpose for which it was intended.

A good place to find nomad equipment is at the larger marine supply houses. The stuff made for boats will often adapt to land use and is likely to be of better quality. Prices are likely to be higher. Marine catalogs also list an impressive variety of pulleys, cable and rope, eyebolts, caulking compounds, and other nautical stuff that can be useful.

If you are building your own truck body, round off the front corners of all surfaces to a radius of at least 8 inches. This radius will give the least possible air drag (and consequently the best gas mileage) to a basically rectangular shape. You can make the edges of the body curved easily from sheet metal or masonite and fashion the corners from fiberglass over carved styrofoam. Funky log cabins on wheels are users.

AAA

If you own a car or if you're likely to be driving one much, an AAA card is worth its weight in battery charges. For \$15—20 a year you get 1. Free Towing, battery jumps, emergency gas delivery. 2. The best up to date maps available for the U.S., plus booklets of camping sites, plus help in choosing travel routes. 3. Insurance discounts. 4. Bail for misdemeanor traffic charges. Our AAA has paid for itself in the first 3 months of every year we've had it.

(AAA offices in every major city.)

Roadside Camping

Honda has a new 300 watt generator big enough for lighting and small appliances. It's really quiet, you can talk in normal voice with it running on your table. \$185.00 They make a very nice larger one too that is exceptionally easy to operate and though it isn't as quiet as the small one, it still is remarkably quiet. 1500 watts will run Skilaws and pumps. They are reputed to last an exceptionally long time too.

For heating a camper bus or tent there is a small but good silent heater that makes no fumes called the Therm'x. They are safe and do their job well, but use special fuel that's too expensive for heating for weeks or months. For that job the same company makes excellent propane catalytic heaters for about \$75. The small Therm'x is about \$20 at most camping stores.

CLEAN
BURNING

hunting, fishing, camping, small trailers, boats, cabins, camper units, station wagons, planes, engine heating and hundreds of other uses. Operates up to 24 hours on a filling of white gas, campstove fuel or Thermasol fuel. Minimum 3,000 BTU output; 9 1/2" high; 8" dia.; wt. 3 lbs. Color, Hunters Red and Ivory. Suggested retail only \$27.95.

A really good toilet for minibuses and vans or even cabins is the PORTA POTTI. It does its job as advertised for \$109.00 and there is no installation chore. The same manufacturer makes nice plastic sinks for \$7.50.

Honda Generators

used to be that gasoline driven generators were big clumsy oafs, but wily honda has begun to do the same thing to the generator that he did to the motorcycle. the company makes a wide variety of power models, most of them being ac-dc at the flip of a switch.

look good for auxiliary power sources, easily carried into about anywhere, fourstroke, aircooled, ten hours per gallon.

E600 (AC only)

Gardena, California 90247

There's been some model changes in the Honda generators. The E300 was \$150 as it changed to E400.

—SB

Camper trucks and busses can be made a lot more comfortable to ride in by replacing the seats with good quality bucket seats out of cars. Most junk yards charge outrageous prices for buckets, but one of the very best seats is from a Renault R8 or 10. These cost as little as \$25 a pair and make a big difference. Get them tracks and all.

Good sunglasses can greatly reduce fatigue and headaches and also save your eyes for night driving. RayBan with g-15 gray lenses take out most of the ultraviolet and infrared rays, but pass most of the light for less eyestrain. They also don't distort colors which is nice for color freaks. These cost about \$12, but are sturdy shock resistant ground glass with no distortion. They also come prescription.

Pacific High School
Saratoga, CA

Thermal Springs of the Western United States

Another over-priced pamphlet. This is a copy of part of a U.S. Geological Survey book titled Thermal Springs of the United States and Other Countries of the World, now out of print. It was 383 pages and cost \$2.75. It is public domain. This photo copy of 37 pages costs \$3.

Nevertheless it's the important 37 pages for local travel. Here are map locations of most of the known U.S. hot springs complete with information on temperature, rate of flow, mineral content, and whether commercial or wild. Some former wild springs are now power generating plants. The publishers claim they will update the book. I hope they don't.

The book fails to mention the plastic ice-water afterlife that awaits those who mess up wild hot springs.

Airstream Travel Trailer

I've lived in a 22' Airstream with wife and two cats for most of three years now. It's the only high-tech home I've found at all lovable, indeed comparable to the way some ocean-going boat owners feel about living on board. The Airstream is an elegant honest design-job. It makes us parsimonious (and conscious) about using water, gas, power. It frees us from owning land, and encourages us to live in wilder places. It is proof from fire, earthquake, floods (drive away) and mice (except what the cats bring in and lose). It's one of the few domes I know that doesn't leak. When we travel with it, wherever we go we're coming home. One more month of production and we're hauling ass and house out of here to the desert.

Therm'x Heaters

Therm'X catalytic propane heaters are neat, safe, silent, odorless, ventless, hot, and very efficient. The 6000 BTU model, enough for a typical camping bus, will run wide open for more than 100 hours on a 5 gallon propane bottle. (The usual heater of the same rating runs about 15 hours on the same bottle). They light instantly without trickery and regulate nicely to the desired output. Full heat appears about a minute after it starts, is mostly radiant, and feels good. There's an eerie red glow in the dark, but it won't ignite gasoline fumes, for instance. Emissions are very small amounts of CO2 and water vapor. We haven't had any trouble with the vapor condensing on things. The heaters cost a lot more than the local Bernz and Turner competition, but the Therm'X has the advantage of a positive automatic safety shut-off in case of trouble, and it is a handier shape to install. She also comes in a 12,000 model.

Katadyn Pocket Filter

Perhaps these devices would be of interest to some of the people, especially those travelling in tropical countries.

We can vouch for the pocket filter walking through Switzerland, Italy and Yugoslavia we drank from puddles, cemeteries and fetid marshes. Sometimes the water tasted like diluted cough syrup but we thrived never once having an instance of sickness.

This added up to a tremendous saving in not having to look for safe water supplies or carry so much at a time or worry.

Note that the filters only remove biological contaminants from the water— insecticides, fertilizers salt and other chemicals whose size is many orders of magnitude smaller are not filtered out.

Katadyn told us they used to have an agency in L.A. but that at the present time the simplest way to order is directly from the factory.

Write to find exact cost including postage and insurance and then send a check. They are a great firm to deal with.

John and Jane
Rochester, New York

Costs about \$30 (plus shipping), pumps about a gallon in 5 minutes.

-SB

Katadyn Products Ltd.
P.O. Box 154
CH-8304 Wallisellen
Switzerland

Our test was run as follows: The hand operated pumping unit was taken to Missouri River where the packing house waste and sewage enters the main stream. A sample was taken from the Missouri without Katadyn treatment for control. The pump was operated on the Katadyn unit sucking Missouri River water through the unit and discharging it into a sterile bottle. We found this sample to contain no intestinal organisms of any kind after being pumped through this unit; and thus this water, after treatment, meets the standards of the Health Department for potability.

The sample that was collected from the Missouri River without treatment showed pollution of intestinal organisms of all types present in extremely high numbers.

In our opinion, from the result of this test, this process would be very satisfactory for the bacterial purification of water for drinking purposes on hunting and camping trips.

Monomatic Toilet

Every time you take a dump or a leak in a standard john, you flush five gallons of water out with your piddle. Five gallons in the Monomatic accommodates one hundred uses before it needs replacing. The cycling system, involving a chemical and filtration, was developed for the airlines and has spun off into general use for recreational vehicles such as campers, trailers, boats, etc. It might also be useful for water-short areas such as deserts, mountain tops, and New York.

-SB

Monomatic Toilet

\$195.00 approx.

from:
trailer supply dealers or write
Monogram Industries, Inc.
10131 National Blvd.
Los Angeles, CA 90034

The chemical costs \$4.75/box. The Monomatic runs on 12 volt current. I see where they have a box that disguises your toilet as a suitcase.

If you prefer fire to water, try Destroylet, which cooks the living shit out of you. No water. Requires gas and electricity. \$350. from Combustion Toilets, Walworth, Wisconsin 53184.

Monomatic Note

The monomatic-type toilets have been available here for several years. The chemicals (which keep the smell down) have caused problems since they utterly destroy all bacteria. Thus, when you dump the bucket in your friendly neighborhood sewer system, their bacteria (which eat the garbage) are destroyed which makes them unhappy.

MONKEYING AROUND

In D.R.'s mind the bus was a total wreck and he was ready to leave it and go on to town with Virgil and find a mechanic who could fix it for him. But Virgil said let's take a look at it since we're here. About two minutes after he lifted the hood and shined his light on the problem he had Urge's motor and the headlights working as well as they ever had.

"How did you do that?" asked D.R.

"Oh," said Virgil. "I just said a little prayer and monkeyed with it." He laughed then and settled back in his seat as D.R. put Urge in gear and pulled back onto the blacktop.

How to Keep Your Volkswagen Alive

John Muir has written what may well be your V.W.'s best friend. In this book you are invited to "Just take the book out to the car with your coversalls on for a guided tour."

So I did. My guided tour of the car and the book's easily versed descriptions convinced me that it is the best I've encountered yet. It's written for the layman (us), and as such makes about 80% of the common V.W. ailments both clear and repairable.

If you take it literally, you will learn to "feel the car" and perform the necessary tasks with love. There are also many pages devoted to what you can do when hung up on the mud flats for one reason or another. While "Volkswagen Technical Manual" contains more pictures of the beast, "Volkswagen Alive" is what I would prefer to have when it's time to unroll the metric wrenches.

[Reviewed by Don Burns]

OK so here's a good book on how to fix your VW written in a chummy style that will not be too amusing the second time you read it. There's a real collection of tricks and pitfalls that to my mind is well worth the money. But some of them are reshapes of old wives tales that are not true (there's a bit about the VW Understeer. What makes the VW dangerous is Oversteer: it steers more than you tell it too. Also, some of the really damnable aspects of repairing old VWs such as headlights that are about as bright as birthday cake candles, are simply and groovily dismissed without telling you how to do anything about it. HOWEVER... an idiot can actually do major repairs on his VW with the aid of this book, and that, friends, is saying a lot. I would recommend that you have this and the Elfrink book at your side. John Muir also gives lists of tools you need, which hand to hold them in, and when to stop for a morale-building smoke. He also tells you when to quit and what not to attempt. Any VW owner should be able to save the price of the book within a week of getting it. Reading it will aid you in keeping your bug out of the shop in the first place. Come to a "how to buy a used VW" chapter too! And he starts out "There's a kindly terms with your Ass for it bears you." Indeed. I'd call it indispensable.

Volkswagen Technical Manual

Besides Muir's book Elfrink is considered the best VW repair book. This one covers only up to 1965. For later models they have other manuals. Good prevention against getting burned by the Volkswagen agencies in Reno and Oklahoma City (name your favorite villain; those are mine) when a dismaying noise starts following you down the road and your trip shifts from 400 miles a day to nothing a week.

The methods employed to boost the power output of the VW engine follow the usual speed-tuning pattern: dual carburetors, supercharging, high compression cylinderheads, high-compression pistons, long-stroke crankshafts, special camshafts, extra large cylinders and the various possible combinations of these methods.

Get away from the car and the owner or salesman to let your mind and feelings go over the car and the idea of the car. What has its Karma been? Can you live with the car? Walk around or find a quiet place, assume the good old Lotus and let the car be the thing. At this point some revelation will come to you and you will either be gently guided away from that scene and can start looking again, or you will still be attracted toward the car and can continue with your inspection. It is important that you neither run the motor or ride in the car until this preliminary scene has run its course. It also puts the owner-salesman up the wall because he has no idea of what you are doing and will be more pliable when the hard dealing time comes.

When the Volkies front end needs your tender attention, it'll let you know by feeling insecure, a not-unknown trip in any relationship. This insecurity can be evidenced in many ways: wandering mindlessly across the road, impulsively darting here and there, wearing tires out in funny patterns or making nerve-wracking noises on dirt roads. These are the symptoms and you are the doctor, at least almost a doctor. I've told you so many things to do, it's a real pleasure to tell you something not to do. Don't rotate your tires! It takes about 500 miles for a tire to get used to its position on a car, and changing it around just messes up its head. It will last as long or longer right where it is. The reason I tell you this now is that changing the tires around will sometimes make your front end feel insecure when there's nothing wrong with it.

Take the hub cap off the wheel and check the brake lining in each wheel. You can see it through the adjustment hole with the flashlight. You may have to roll the car back and forth a little to get the lining in view, and if the outside light is strong, a jacket or cloth over the fender and your shoulders will cut the daylight so the lining can be seen. If the lining is about one-eighth of an inch thick, you have plenty, but if it is less than a sixteenth, you will soon have to reline the brakes and you should know that.

Again, this doesn't apply to those who already know they're going to buy new pistons and cylinders, but you others, mark the pistons.

With a nail or file, scratch the number on the top of the piston, through that carbon, and draw an arrow pointing toward the flywheel, like I, II, etc. Start with #1, get it out as far as it'll go, and remember the WARNING.

Western Distributors

Bug parts—*at sensible prices. This small mailorder house offers the VW owner a chance to buy imported parts for his car at really fair prices. Not all parts are offered, but the ones most often replaced (cables, points, brakes, etc.) are there. Genuine Bosch sparkplugs are a bargain at 55¢ each postpaid. No minimum order, either. A few accessories, plus a VW Technical Manual complete the offering. Parts are listed for the Beetle as well as the Ghia, Bus, Fastback, Squareback, and Variant. Free catalog is offered. Service —good. Postage—all items are shipped postpaid.*

Another VW Book

You have in your catalogue two very good books on VWs. *How to Keep Your VW Alive* is good for technique while Elfrink's *Technical Manual* supplies sometimes very helpful extra information. However if you happen to own a 1965 Sedan (like I do) or a later model you will find that the *Technical Manual* is confusing and not complete. The latest edition of this book was published in 1965.

I have a better one. It is called *The Volkswagen Owners Handbook of Maintenance and Repair*, published by Floyd Clymer. This is a very thorough book with up-to-date and easy to understand (and to locate) exploded diagrams, and pictures. I recommend it highly to anyone that owns a '65 Sedan or later as it has sections for '65's, 1300's, '67's, '68's, and '69's.

Clymer publishes other books on VWs including one on 1600s, Transporters, Souping Up a VW, How to Drive and Road Test a VW, and even an old reprint of one of the first VW instruction books. Clymer also publishes books on many other foreign makes (Porsche, Datsun, Volvo).

Best Regards,
Steve Keleher

Baja Bug Kit

VW Owner!

Is your commune's road impassable during the winter rains; have you always wanted to drive the rough dirt roads of Baja? If you already have a VW beetle, the Baja Bug is the simplest least expensive and most versatile conversion kit on the market. You can keep your sedan and have your dune buggy too! Unlike other dune buggy kits, this one does not require chopping, shortening, and welding the belly pan or buying an expensive fiberglass body without heater, windows or top. You can do this conversion easily at home in one- or two weekends. More ground clearance, room for big wheels and tires and easy access to the engine are major advantages. Important accessories available for serious off road drivers: skid plates, air filters, high clearance exhausts, etc. VW bus owners will be interested in flared fiberglass fenders for wide tread tires.

Basic Auto Repair Manual

This manual is intended to be an introduction to automobile mechanics and the more fear-some professional shop manuals. It contains about all the amateur mechanic needs to know in order to diagnose, repair, and maintain domestic cars and VW 1954-1965. It is assumed that the mechanic has no experience at all. All major assemblies are well illustrated and explained both in principle and specifically, with note made of quirks found in certain models. There are chapters or remarks on tools needed and how to use them, working safely, junk yard technique, on-the-road repairs, and general money saving. There is a very good chapter on logical trouble shooting. "If this is wrong, try this first, this second, etc." Included is most likely diagnosis and prescription. Common repairs like 'putting in new points' are covered neatly. Major jobs are presented so that the amateur mechanic can get most of the work done before calling in expensive expert help. It is clearly stated when to give up, and what not to attempt without expertise. They even tell you how much you will save, and how long it will take. This is a great book for that person trying to keep the oldie going and/or who wants to understand cars in general. It fits girls too. Well worth the money.

SA oils are non-detergent, with no performance requirements. This classification includes not only high-quality, non-detergent oils put out by major companies, but also the dregs from the local tar pit. If you want a good non-detergent oil, you will have to rely on the reputation of the maker.

SB oils have a few additives that protect against scuffing, bearing corrosion, and oil oxidation. These oils give only minimum protection.

SC oils are better. They have additives that protect against high-and low-temperature deposits, rust, wear, and corrosion.

SD oils are the best. They protect against all the conditions that the other oils do, only more so. If a car maker recommends SC oil, you will be giving your engine greater protection by using SD oil.

Mail order, as we've said, takes a little time but is an entirely satisfactory way of buying parts. The Sears, Ward, Spiegel, J.C. Whitney and Honest Charley catalogs, free for the asking, are amazingly complete and J.C. Whitney, at least, offers to help you find a part that is not listed. All of them stock parts for a wide variety of imported cars. A further advantage is that they "guarantee satisfaction or your money back," a protection that may or may not exist when dealing with a car dealer or jobber.

Joblot Automotive

Very groovy place is Joblot Automotive in Queens, N.Y.—Address: Joblot Automotive, Inc. 98-11 211th St. Queens, N.Y.— they have an almost complete stock of spare parts for all Fords Mercury & Lincolns (including truck parts) going back at least to Model A days, and the parts are mostly original factory parts that they bought up over the years as the dealers and factory decided not to bother stocking them anymore. They have a catalogue and will mail order stuff anywhere. The last time I was there the owner told me that he started out supplying hard to get Model A parts to South America and other places where they were still widely used. When stocks of original Model A parts became scarce people in those countries began manufacturing them domestically to supply the local demand. He now imports a tremendous range of newly manufactured Model A parts and asserted that it would be possible to assemble an entirely new MINT Model A from parts. He is very helpful and should give very satisfactory service.

A comment about the J.C. Whitney catalog:

I have been ordering from them for several years, and find their catalog an intriguing mix of good stuff and junk. Read the description of an item carefully. If an item says "No cutting, drilling or tapping" you may have to weld! The key phrases are: "Fits perfectly" or Duplicate of Original Equipment". These mean you'll have little trouble. Beware of the miracle spark plugs, "Minisuperchargers", fire injectors, and the like— they're near-useless gimmicks. They are always recognizable by a full page exhortation on what wonders they'll work. (The pitches are fun to read, though).

Sincerely yours,
George F. Suetnam, Jr.
Reston, Va.

VIRGIL'S RAP

"Yeah," said Virgil. "It's mighty hard times around here these days. If it wasn't for food stamps and the Happy Pappys some folks would starve plum to death, that ain't no lie. A lot of 'em are hungry like it is. Of course I've seen it when it was worse, and a man's got to count his blessings I reckon. My daddy mined coal in this county in the 1920's, no union or nothing in here then, and you talk about mean times, them times was mean. Of course they's not enough union left worth speaking about, but what I mean is, now, you take this Happy Pappy program. Take all this welfare stuff. It ain't nothing but a sop to keep the people from acting up. That's all in the world it is, and yet everybody wants to make so much out of it. Everybody give the President so much credit for coming in here and setting it up. All that President was doing was laying out a sop to try to keep the lid on things. And I mean to tell you, buddy, the lid was about to pop around here a year or two ago. It was like a time of war nearly. People hungry, out of work, losing their hospital cards, getting their pensions cut, little old younguns going around with worms in their bellies, some of 'em half naked in the winter time, I mean they wasn't nothing else to do but go to war. Big gangs of men roving up and down the highways, stopping cars, shooting, getting shot at. They was a tippie burnt ever day for two straight weeks up in your country, two or three railroad bridges went up, people's cars and houses dynamited.

(continued)

Carolyn Cassidy: "Neal in heaven—an old car and a girl."

"Now you just dig them in front. They have worries, they're counting the miles, they're thinking about where to sleep tonight, how much money for gas, the weather, how they'll get there — and all the time they'll get there anyway, you see. But they need to worry and betray time with urgencies false and otherwise, purely anxious and whiny, their souls really won't be at peace unless they can latch on to an established and proven worry and having once found it they assume facial expressions to fit and go with it, which is, you see, unhappiness, and all the time it all flies by them and they know it and that too worries them no end."

Propane Conversion

How to Propel Your Car with Propane
An Immediate Personal Action for Cleaner Air
reprinted from *Freedom News*, February 1970)

In addition to long range cultural change, Ecology Action is interested in immediate personal actions aimed at waging war on environmental problems. In this endeavor we attempt to practice what we preach, and to that end have begun converting the vehicles upon which we must occasionally rely to propane gas (also butane).

We have culled the following information from Imperial Rock Gas of Richmond.

If you're interested in doing something about air and water pollution now, and drive a gasoline fueled, internal combustion engine vehicle, convert to propane. Conversion is a simple, financially beneficial operation which reduces your vehicle's harmful emissions by 50%. Some estimates go as high as 75% to 80% reduction in harmful emissions.

There are other ways to reduce your personal impact on the environment, of course, and several alternatives to pouring gasoline wastes into the eco-system. Walking is the best alternative of all, and public transportation use reduces your impact.

Gas turbines, steam driven and electric engines all produce less harmful exhausts than the present gasoline engine, but these alternatives are not possible ones for most people, for a variety of reasons. Electric, steam and gas turbines cannot be made available to any significant number of persons soon enough.

Propane is different. You can go to a local propane dealer who does conversions and have your car running on propane in one day. That's how long it normally takes.

The cost is approximately \$300 from which you can shave substantial amounts in a variety of ways. Labor costs about \$40, but the job is simple enough so that anyone with rudimentary mechanical knowledge can do it.

How it Works: Basically: A special carburetor replaces the air filter; a heat exchanger is mounted under the hood and connected to the water hose that runs to the heater; a fuel line must be run to the tank which is usually mounted in the trunk.

This last item, the tank, is the single most expensive aspect, costing \$120-\$180 for a new tank capable of holding 24-36 gallons of fuel. A used tank often costs less than half as much, so shopping around for one is worthwhile.

Even with these cuts in cost, however, the average American car owner may not feel he can afford conversion. But, as economists point out, cost is a relative concept against which we must pose benefits, and the benefits of propane are substantial.

First, as previously mentioned, the use of propane cuts harmful emissions by 50%, thus reducing air pollution directly and water pollution indirectly (hydrocarbons and other exhaust products are inevitably washed off the road by rain or precipitated out of the air).

Another benefit is that the use of propane can increase the life of a new engine from 2-10 years. According to Mr. Carl Warner of Imperial Rock Gas in Richmond, forklift truckers, who have used propane for many years because of its lower emissions and the enclosed, indoor nature of much of their work, claim at least a 5-2 ratio of improved engine life. This is because, in part, the propane enters the engine as a gas, not as a liquid, and sludge and carbon are essentially eliminated.

Fuel Cost is Lower: Still another benefit of propane cost is fuel cost. Only one grade of propane is distributed: a high octane grade comparable to high test gasoline. The cost, in the Bay Area, is about twenty-four cents per gallon. Though the per gallon mileage of propane is about 3% less than gasoline, the consumer still saves a considerable amount, which, even excluding longer engine life, makes propane conversion profitable over the long run.

Cal Gas of Sacramento claims other propane benefits: cuts maintenance costs; cleaner oil; longer spark plug life—no carbon to foul spark plugs; instant cold weather starting—no flooding or choking of carburetor; fuel pump problems eliminated because there is no fuel pump.

Another consideration the potential propane converter makes is the availability of the fuel. Most cities of 50,000 or more have propane supply outlets. National and state listings are available from gas companies usually on request.

But even without careful planning the propane motorist need not fear being stranded without fuel, for the standard conversion oper-

ation leaves the vehicle with a gasoline potential which may be realized by flipping a dashboard switch. Just keep a small amount of gasoline in your car.

A few other considerations: If your car is air cooled (for example, Volkswagens) about \$20 extra must be spent for adaptive equipment. The higher the compression ratio of your engine the more efficiently it will run on propane (compression usually corresponds to engine size and number of cylinders but not always, so check your owner's manual).

Pressure Conversion: In addition to converting your own car, you can take a step toward lessening pollution by encouraging other individuals, industry and government to convert. Some steps have been proposed already in this area, e.g., Reagan's claim that state vehicles were to be converted and recently publicized intentions of Contra Costa vehicle conversions. Concerned individuals should keep track of these intentions.

If you want better quality air and water enough to do something, but don't think you can afford the initial cash outlay for conversion, you might consider trading in your present car for one worth about \$300 less and use the difference. You'll make it back in gas savings.

Further, remember that propane is only a partial and interim solution to pollution. Even with a converted car, you still are responsible for concrete highways, noise, congestion, Santa Barbara oil leaks and Torrey Canyon shipwrecks. The answers to these problems lie with a deeper commitment to a quality life; with walking and relearning the joys of bicycle riding.

I have heard of a new car dealer who is using a free propane conversion as a way to boost sales of his left over 1969 models. (Hillsdale Dodge in San Mateo, spec.) He also tries to sell a propane conversion with all new car sales (\$500 per) by giving the customer a stiff lecture about civic duty and air pollution.—Fred

Auto Engines and Electrical Systems

There are a number of books available on how to repair automobile engines, but not many which explain so well as this one does why each part is designed as it is, why a certain repair procedure is used, or what causes the wear on a worn part. I wanted a book which would help me to understand the details of engine design and construction instead of just how to fix them; and I was extremely pleased to find that this book does both. Its explanations are clear, concise, complete, and profusely and excellently illustrated. Its authors obviously know what they are talking about, and write well. There is no bullshit and no excessive technical jargon, just good solid information. It is practically oriented, written as a textbook for mechanics, to provide the groundwork of basic knowledge a mechanic should have.

Hemmings Motor News

A 100 page magazine full of ads for Ford and Non-Ford cars and parts and literature and misc...that's "Hemmings Motor News!" Lots of pictures make the whole thing worth while for the person with a casual interest in old cars. (Almost all the cars advertised are vintage or antique...but not all of them.) It's monthly and cheap.

The publishers are coming out with a magazine called "Special Interest Autos" that looks good. It will be available for about five bucks per year. Looks like it will be interesting, but you can decide for yourself. Get the "Hemmings Motor News" first and it will tell you where to send off for "Special Interest Autos." The former is the real tool, the latter looks like it might be fun.

When driving in sand or snow, traction can be increased by partially deflating tires. Drive slowly on low tires. Do not remove so much air that the tire may slip on the rim. Start, stop, and turn gradually, as sudden motions cause wheels to dig in. If you plan on driving in the desert, practice "difficult traction" in a dry wash with another car standing by to tow you out if you become stuck. Experiment with the various footings. There are certain tool and equipment requirements if you intend to drive off the main roads: one or more shovels, a pick-mattock, a tow chain or cable, at least 50 feet of strong tow rope, tire pump, axe, water cans, gas cans (both FILLED), and of course, your regular spare parts and auto tools. For rope, consider nylon rather than manila. It costs more, but has twice the strength, will last much longer, and its elasticity is highly beneficial in extracting stuck vehicles. 3/4" nylon has a working strength of 2,000 pounds and a breaking strength of about 10,000 pounds. Be sure that your car is in sound condition with a full gas tank, a filled radiator, a filled battery and new (and extra) fan belts.

Determining Direction from Shadow: Select an object at least 3 ft. high which casts a shadow with a well defined projection. Mark the shadow tip—wait 10 to 15 minutes and again mark the shadow tip. A line drawn from the first mark through the second mark will point EAST. Effective from about 9 a.m. to 3 p.m.

QUICKSAND

Quicksand is a deposit of fine sand in combination with water. It may have the appearance of smooth dry sand, but the water underneath lubricates the grains and allows them to flow easily. There is nothing mysterious about quicksand—it acts as any thick liquid would, and if we react sensibly we can escape it. Man is lighter and will float in water, and therefore, quicksand. It has no power to suck down bodies, but frantic struggling to free the feet creates forceful downward movement which causes the sand first to move away, then quickly return to pack around the legs. The result is a firmer and deeper hold on the body. Further struggling repeats the process until the body is engulfed completely. If caught throw yourself flat on your back. You will float. Get rid of extra weight. Throw your gun and pack off quickly. Don't hold up your arms—let them rest spread out on the surface. Roll slowly to firm ground, or turn onto your stomach and do a slow breaststroke. Move slowly and carefully, and you will "swim" to safety. Avoid getting caught—look for quicksand in river beds, washes and run-off areas of recent flash floods.

Toyota Land Cruiser

The most work per dollar in 4-wheel drive you can get this side of a truck. New soft tops run about \$3,000, hard tops \$3,350.

—SB

Toyota dealers are pretty well spread around. You can check with:

Toyota Motor Sales
2055 West 190th St.
Torrance, CA 90501

Virtuoso Handy Jack

In going over your July issue, was interested to note your mention of the Handy Jack. I have used one for year—very effective. Here are three uses for it well worth featuring:

- In case of auto wreck and car is collapsed, insert jack and use to "unpry" the car and remove victim. Last time I used it, man was badly crushed and was able to get some of the weight of car off him. He had skidded off road, turned upside down and roof collapsed and squeezed him. The Handyman Jack took a lot of weight off him, but I still couldn't get him out, although he was alive when I first reached him. If I had had two of these, I might have gotten him out—but dead when our ambulance arrived and took a tow truck to lift car off his body!
- When you skid off road in snow (or mud)...place Handyman Jack (or any bumper jack that will lift 3 or 4 ft.) under rear bumper. Raise to maximum height...then stand to one side and topple car off jack toward roadway. This will move rear end at least 3 ft.!! Repeat once or twice and you will have car wheels on road where they will get traction.
- Getting car out of a deep mud hole...I have used this many times! Attach a lumber chain (or 3 or 4 strands of heavy rope...chain is best as it doesn't stretch) to a tree or possibly another car or truck. Attach chain to one end of Handyman Jack. Attach other end of jack to car spring or bumper if VERY securely fastened and work jack to pull car out. i.e. Jack is horizontal. This really works as jack will pull car at least 3 or 4 feet with each setting. Shorten chain and repeat as necessary. Carrying one of these jacks and a 100 ft. length of chain may save a \$20 towing bill!! And in some parts of this country there just aren't tow trucks or phones available.

Maj. Lyman F. Barry
Nunda, New York

In conclusion then, here are more of our somewhat subjective opinions about the various 4wds:

Most durable vehicle: Land Rover
Most for the money: Toyota Land Cruiser
Best on/off road combination: Ford Bronco
Best for long-range off-road touring: International Travelall
Best all around vehicle: Jeep Wagoneer
Most fun to drive off-road: CJ-5 Jeep

There are some other driving pointers that apply almost exclusively to the snow country, such as rubbing a plug of tobacco or a piece of raw onion on your windshield to keep it clear of snow and ice (but don't use your wipers too).

Also as a general rule, your best tires should be on the front. Three-quarters of all tire troubles happen to the front tires in 4-wheel driving since they're the ones that reach the trouble first. It's a matter of putting your best foot forward.

At this point, we've got to say something about jacks. Here we heartily agree with the experts—always carry two jacks. There are times when two jacks may come in very handy—like the time when you want to switch a better tire to the front and use your not-so-good spare on the rear. But the primary reason, honestly, is to assure that you always have at least one jack that works.

"And so the President comes in with all this give away. Of course now he did have to do something, let's give the devil his due. And the people did get a little something to eat out of it which they had to have, and here I am on my way to get on the Happy Pappys if they'll have me. But what I mean is, everybody talked about how good it was of the President to do that, how kind it was of him to send in the food stamps and start the Happy Pappys. Oh he was smart, you need to doubt it. One day they was about to revolute, the next they're glad to draw a dollar and a half an hour. And top it all, here comes the President's wife down in a jet plane to show how concerned her and her husband was for all the hungry people. They lined up by the thousands just to get a look at her ride by in a big car. Parked up yonder in front of the courthouse, got up on a truck bed and made a little speech about how beautiful these old hills are. And how fine the people are, how rugged and independent and so forth all the hillbillies are. And her supposed to be so beautiful. I didn't think she was so beautiful. Why that woman was so bow-legged she couldn't hem a hog up in a pen. I felt about half sorry for her, I declare I did. Me on welfare, her richer'n Jay Goo, and I felt sorry for her because her legs was bowed. A man's got to be about half crazy to go around thinking like that, I'll swear it."

Off Road 251
Nomadics

BMW Motorcycle

BMW motorcycles— as far as quality there is not another vehicle on the road that can touch them. Mine is 10 years old and has 143,000 miles on it. Last year I loaded it up with 430 pounds of people, camping gear and luggage and drove to Maine and then went 50 miles into the wilderness. I figure she's good for another 10/143,000. They are a bit expensive but worth every penny. If you're going to go nomadic, on or off the road, you might as well go all the way. It's the only way to travel. Western distributor is Flander Co., 200 West Walnut St., Pasadena CA 91103. Eastern distributor and sole importer is Butler & Smith, 160 West 83rd St., N.Y., N.Y. 10024.

[Suggested and reviewed by
Larry Kafka]

Note. About 2 miles from here and eight months ago the reviewer Larry Kafka was killed and his wife Janet nearly killed— she's still in the hospital. It wasn't the BMW's fault, except that when the bike and a truck tried to occupy the same lane the truck driver had lots of protection and Larry and Janet none. No bike gives you protection. I ride mine slow.

\$2.00 postpaid

from:
Paradise Publishers
Box 5372
Santa Barbara, CA 93103

With anyone who has ever had a flat at speed on a cycle, preventive maintenance of tires and tubes rate high priority. A rider can ride a raggedy old machine with chipped paint and a smoking exhaust, but as long as the wheels are well shod, he will avoid the first and foremost hazard of motorcycling.

There are probably only two suitable methods of coping with rainy days as far as cycles are concerned. The first is to stay home or take your car. The second is to ride with the mental attitude that you are traveling on a sheet of oil-coated glass enhanced here and there by large patches of greased BB's. This attitude should help

give you the sensitivity of response and precise control necessary to stay up on rain-slick pavement.

In the realm of spare parts, a new spark plug and a wrench to install it ranks high. . . perhaps tops. Other essentials are a spare master link, a few nuts and bolts, a roll of tape and length or two of baling wire. These items plus a screw driver and pliers taped to the frame will most often be sufficient to get a rider home from the boondocks should something fall off or poop out.

Minimum equipment for the off-the-road rider starts with an approved helmet since about 75 percent of all vehicle accidents result in head injuries. Also required for the boondock bouncer are gloves, boots, and, if possible, leather clothing or heavy denims. Remember, even when the weather is warm and heavy clothing is uncomfortable, protection for your elbows and knees will keep the skin in those areas intact.

Jawa Motorcycle

I was glad to see the BMW mentioned in the Supplement, as bikes are good tools with lots of mythic freedom meanings for most Americans; and for those who are still into the internal combustion reciprocating life style, they have the extra advantage of being: smelly, noisy, sexy, and fast.

I'd like to mention the Jawa, which is at the other end of the scale from the BMW and might be of more interest to rural/community people.

The Jawa is a 2-stroke 125-300 cc lightweight made in Czechoslovakia. Parts are easy to get in the East (a problem in the West) and the bike is dirt cheap to buy and run. Prices run about \$150-\$200 below Italian and Japanese machinery.

But the best thing about the Jawa is that you don't need many parts. The bike was designed to be, and is the staple transportation device of the Communist world. It's simple, slow, reliable and strong.

Like the BMW, the Jawa is an old-fashioned "backwards" machine— unchanged since 1954. The engine is a long stroke, piston port, plain bearing low RPM single (except for the 350 twin), all of which means high torque at low speeds. It's a thumper, a tractor.

The BMW is a great road bike but as soon as you take it in the dirt you're in trouble. With the Jawa, it's the other way around. It'll shake the shit out of you on a long trip, but kick it into low and stand up on the pegs and you can chomp through anything. I like to ride mine in the sand and mud, and I'm sure I could plow with it.

I bought my new 1969 for \$420! Old ones are even cheaper, as they start to rust before you even get them home. Like an East European drip dry suit, it wets right away but wears forever. This seems like a good cheap draft horse for a community, as you can carry a lot of stuff on a bike after you get used to it, and also hook up a small trailer. I cruise Manhattan looking for firewood on mine.

Check any bike shop in the east or AMERICAN JAWA LTD.
38-15 Greenpoint Avenue, Long Island City, N. Y. 11101.

Modern Motorcycle Mechanics

ride your motorcycle;
fix your motorcycle.

—jd

[Suggested by Bob McIntyre]

TRIUMPH TAPPET ADJUSTMENT

Adjusting screw is at valve end of rocker on all Triumph models, most B.S.A. and some other makes.

On Triumph models that require .010" tappet clearance, this can be obtained by slackening adjusting screw one-quarter turn beyond point at which it becomes free.

On models that specify .002" inlet and .004" exhaust clearance inlet rocker screws should be adjusted so that rocker is free with barely perceptible shake. Exhaust rocker should have slightly more "shake".

Schwinn

Since the ecology drive is on, I guess there'll be more and more people riding bicycles. I used to work in a bicycle shop which carried various brands. Having worked on bicycles and having heard compliments and criticisms about different brands, I have come to the conclusion that there is only one bike worth buying; a Schwinn. Selections in frame sizes, models and colors, along with their well-built construction, are some of the reasons why I favor them. Also the availability of Schwinn parts is something many people overlook. Schwinn's guarantee cannot be excelled, (most don't even have a guarantee). I've seen Schwinn's 50 years old that are in much better mechanical shape than new off-brands. Also, in your Spring Catalogue's Bicycle Page, it advises oiling the hubs and bearings. Don't! The grease that is in these hubs will be washed out when the oil quickly seeps out, leaving dry bearings.

10 Speeds from Canada

I've got a good idea for traveling, and since I haven't seen anything about it in your catalog, I'll let you in on it.

Last summer, I decided to travel, going down to Boston, Cape Cod and then back thru Vermont, and then back here, Montreal.

One Problem.

I am not a rich person. So, to make a long story short, I rented a 10 speed bicycle. After cycling just 10 miles the first day, and 15 miles the second day, (had some tired muscles, but nothing really bad) the third day went 30 miles, so that at the end of the 6th day, I could do 70 miles.

Yeah.

Well, you might say: "That guy's an athlete" But no, I'm a girl, and for exercise I walk around the block once a week, so, you really don't have to be strong in any way, just a bit a patience, and around \$120.00 to buy one of these things. With a 10 speed Gitane (what I recommend) you practically glide up a hill, People don't get heavy when you go thru a small town like when your hitchhiking, cause they know your leaving. . . by your own means. And you can carry loads of stuff with you on a saddle bag on the carrier on the back of the byke. I can't recommend any magazines or booklets off-hand, but if you know of any, I think it would be a good idea to print it.

Also great to fight pollution, and move around faster, in the city!

SORRY ABOUT MY ENGLISH BUT I'S A FRENCH CANADIEN, AN' YOU ENGLISH AR OWT TO GETT US.

André Laparé
Ville LaSalle, Quebec

P.S. If you want to write back, feel free & we could rap about our nice fascist prime-minister, our little revolutionary ideas, the kidnappings, I knew the kidnappers' sister.

The Complete Book of Cycling

This book, which contains almost everything you want or need to know about bicycling, was written by a man who rides his own 10-speed lightweight 30 miles a day in Chicago commuting between home and job. He deals knowledgeably with cycling and health, bicycling safety, choosing a bicycle, cycle touring and camping, racing, history of bicycling, accessories, and maintenance.

His advice on choosing a bicycle is quite similar to that given in the Bicycle Page of the Whole Earth Catalog, although much more extensive. Basically it amounts to this: the most satisfactory bicycle for the serious cyclist is the precision lightweight with derailleur-shifted gears. Such bikes cost about \$200 or more, and the only smart place to buy one is at a reputable shop that can set it up properly when it is new and provide good service and maintenance for it as it ages.

The book has a wealth of technical detail and many good illustrations. Of special interest are the sections on choosing a bicycle and maintaining it. The former includes a thorough discussion on selecting suitable gear ratios. This important matter, unhappily, is often neglected by the inexperienced cyclist. Thus he may find—unless he is athletic and in top physical condition—that his expensive new lightweight has gear ratios better suited to road racing than to more casual touring. The book explains how to avoid this problem by ordering wider range gears.

In the section on maintenance are included detailed instructions and enough illustrations to enable the reader to do most of his own upkeep and repairs if he wants to. With this book and a few tools one could keep a bike running indefinitely at very small cost.

or WHOLE EARTH CATALOG

Before you buy your good machine, count the number of teeth on each of the gears on the rear derailleur. For example, the freewheel gears on the usual fine machine will start with 23 teeth on the large gear and work down in two-tooth jumps to 15 teeth on the small gear, so that you will have gears of 23, 21, 19, 17, and 15 teeth. This is a close ratio freewheel that I do not recommend for the average cyclist for cross-country tours, or for riding about in hilly country, because there is not enough variation in gear selections. You can have your bicycle dealer install a set of gears with a wider range. I recommend a rear freewheel gear cluster with these teeth: 28, 24, 20, 17, and 14, with double chainwheel of 40 and 50 teeth.

About horns. A mechanical horn, such as a squeeze-bulb type, takes up too much room for the noise it makes. Tinkle bells are about all you need if you do a lot of sidewalk riding. If you really want noise, try a Freon-powered boat horn, which can be heard for ten blocks. When they were new on the market, I bought one and put it in a bottle carrier on my handlebar, where I could get at it quickly. It sounded rather like a diesel freight train coming down the highway. The first time I used it, I was between a squad car and the curb, and it caused the squad car to leap forward with dome light flashing. The second time, I tried it on a woman driver coming at me from an intersection. She came to a satisfying, screaming stop. The third time, I blew it at a driver who opened a car door in front of me, and it frightened him into closing the door rather quickly. By the time he did I was long past him. But since I find my lung power about as good as a horn as I need, I discarded the Freon horn and its pound of gas. In general, it's far better to be alert at all times to what's happening around you and be prepared to take evasive action than it is to count on a horn to get you out of trouble. In my opinion, any horn is just dead weight.

Never pedal on your arch. For maximum efficiency, use ball of foot. Then ankle correctly to get maximum pedaling action, as shown here. Correct ankle technique involves ankle positions with toe pointing slightly upward at top of stroke to push pedal forward and down; downward at bottom of stroke to force pedal back and up.

Tire Pumps

A pump that can be seat-tube mounted is a "must" if you tour or take trips very far from home. After having used a number of pumps, I find the Silca or the Campagnola plastic pump the best and easiest to use. These pumps can be obtained with either a Presta head for tubular tire valves, or Schrader for American tube valves. They cost about \$4.00 and are well worth it. Other pumps I have tried soon fell apart or became dented and were therefore useless.

Fig. 36: Never pedal on your arch. For maximum efficiency, use ball of foot. Then ankle correctly to get maximum pedaling action, as shown here. Correct ankle technique involves ankle positions with toe pointing slightly upward at top of stroke to push pedal forward and down; downward at bottom of stroke to force pedal back and up.

PRICE/BIKE GRAPH

(January 1970, compiled by Turin Bicycle Co-op staff with Sage) (high quality—well worth price)

Before you buy a bicycle, think about what you are going to use it for.

If you are going to ride over plowed fields, or on sand flats at low tide, or if you plan to take only short rides to the corner store, get a sturdy coaster-brake model, a balloon-tire bomber. \$10-\$50.00.

If you plan leisurely shopping jaunts, weekend excursions up to 30 miles, or commuting for short distances, all on reasonably even terrain, get a 3 speed. If you like a comfortable ride and maneuverability, you might try one of the newly introduced small-wheeled bikes. \$50-\$80.

If you plan to cover long distances over varied terrain, and if you are willing to accommodate yourself to a specialized riding position for the sake of vast improvement in cycling speed and responsiveness, get a 10 speed. \$80-\$300.

10. Find a bike shop that *cares*. They will get you hard-to-find parts, give you advice, and help you when this book can't. There are bike shops that care. They aren't necessarily the big and flashy ones—remember, it's the people that count. When you find a good shop, do all your business there. Tell people who want new bikes to shop there. It's the least you can do in exchange for the small-parts hunting that a good shop will do for you.

11. Cultivate a fine ear so you can hear any little complaint your bike makes, like grinding bearings, or kerchunking chain, or a slight clunking of a loose crank. You don't have to talk to your bike when you ride it—just learn to listen to it affectionately and sensitively.

12. Keep all bearings adjusted properly. Your bicycle has between 150 and 200 ball bearings. To keep them all rolling smoothly, you have to learn to adjust the *cups* and *cones* in which they run. Adjustment involves screwing the cone and cup together until they are snug on the ball bearings, then unscrewing the cup and cone slightly. The bearing should revolve smoothly, without any "play" or looseness between the cup and cone.

If your brake stickies are in the lever itself, you have either an unlubricated unit, a bent lever, a bent lever axle, or a misshapen post. Try a little dab of light oil on the lever axle; that's the easiest thing. No luck? The most common problem is a bent lever. Is the lever out of line? If it is, try straightening it with your bare hands, holding the post in one hand and bending the lever with the other. If that doesn't help, you can try using various metal-eating tools, such as the vise-grip.

Virgil leaned his head out the window to spit again. This time he let go of his whole plug. He hawked and spat and dredged a mouthful of phlegm out of his throat and when he'd let that go too he cleared his throat and continued.

"And so what comes next but the strip mining. I mean we had some of it right along, but after that woman come in here and made her speech, seemed like it just broke out all over.

Whole mountain ranges chewed up and spit right out in the river. They've done destroyed your county, Collier. Finley County's bad hit, you won't recognize that place. They say they's a strip mine bench through the Rockhouse drainage over eighty miles long, and getting longer ever day. What's worse it's a coming right my way. Man have a house and a barn, some pasture in the valley, they come right over it, the law says that's just fine. Law says a operator got a deed to the mineral, it don't matter what he does or who he does it to, it's legal to take that mineral out any way he wants to. They gouged a woman's baby right out of the grave over in Knott County, and her a looking. Said her husband had already been took to jail for brandishing a rifle at a bulldozer operator. Then they gouged up their baby right out of the grave, flung it end over end into the sky, the mother a looking. My wife's people got sixty acres on Lower Elk. Lived there thirty years. Got cows, good garden and a spring, man can live good there if he's willing to work. But they's this outfit owns the coal rights underneath, and they're on their way to get it.

Eighty miles long, that bench is. Reminds me of a big serpent sneaking through the hills, big old eight miles long snake killing everything in its path. It's that way everywhere around here. Some folks call it the end of time but me, I just call it a bunch of goddamn criminals out tearing up the world.

The Way of the White Clouds

*pilgrims are religious nomads,
people who go with a purpose,
think as they go,
move for a reason.
they have constancy in flux,
patterns in variety,
knowledge of the void.
this is the story of a nomad in the mountains,
a buddhist pilgrim in tibet.*

To see the greatness of a mountain, one must keep one's distance; to understand its form, one must move around it; to experience its moods, one must see it at sunrise and sunset, at noon and at midnight, in sun and in rain, in snow and in storm, in summer and in winter and in all the other seasons. He who can see the mountain like this comes near to the life of the mountain, a life that is as intense and varied as that of a human being. Mountains grow and decay, they breathe and pulsate with life. They attract and collect invisible energies from their surrounding; the forces of the air, of the water, of electricity and magnetism, they create winds, clouds, thunderstorms, rains, waterfalls, and rivers. They fill their surroundings with active life and give shelter and food to innumerable beings; such is the greatness of mighty mountains.

We had crossed the feared 18,000-foot pass in perfect ease and under a cloudless sky. The sun was so hot during the ascent that I had discarded my warm things, but hardly had we entered the shadows on the other side of the pass when we were plunged into icy cold, that made me regret not having kept my warm clothing at hand. Tibet is a country where one is ever up against the unexpected and where all accepted rules of nature seem to be changed. The contrast between sunshine and shade is such that if for any length of time one part of one's body would be exposed to the sun, while the other remained in the shade, one could develop simultaneously blisters, due to severe sunburn, and chilblains due to the icy air in the shade. The air is too rarified to absorb the sun's heat and thus to create a medium shadow temperature, nor is it able to protect one from the fierceness of the sun and its ultra-violet rays.

The Odyssey: A Modern Sequel

This epic poem may well turn out to be the spiritual handbook of the future. In fact, our future may lie within its pages. Imminently suitable to the Whole Earth philosophy and this revolutionary generation, it traces the struggle of one hero through the successive stages of ego, race, mankind and all matter to a communion with the best post-Christian, non-Eastern concept of God I've run across yet; a struggling, ascending, evolutionary Spirit, neither Almighty, All-holy, nor pitiless, haphazard Nature itself. Odysseus finds it is his duty as the Spirit's highest, most sublime evolutionary creation to assist in the struggle; that his freedom, his salvation is concomitant with that of his God, that he must save his God to save himself, even from the illusion of salvation itself. It's a harsh, rugged philosophy, necessitating a joyously tragic, dionysian nihilism; but its essence is pure spiritual freedom and it places the burden of action directly on men.

On the other hand, like all great epics, it can be read first on the superficial level of great adventure, replete with battles, orgies, desert treks and primitive jungle kingdoms as Odysseus' spiritual journey takes him almost due south from Achaean Ithaca to decadence in Crete, political oppression in Egypt, down the Nile to its source near the mountain peak of his enlightenment, and on through Africa to freezing death in Antarctic wastes. Buddha and Christ, Faust and Don Quixote put in appearances and rap with Odysseus, the famed ascetic philosopher, in various adventures after his enlightenment. The splendid verse translation is lush, organic with lots of good Nature symbolism. In short, this book's got everything and covers everything. Get it and be a believer.

[Reviewed by Thomas Edwards]

O gypsy Life, with sun-braids, with coquetting eyes,
for years I've stumbled in your light, your holy haunts,
for years been put to shame, hunting your empty shade,
thrashing my arms with rage, tearing the wild wind's hair!
Sometimes you seemed like Beauty, passion-quelling Helen,
a shadow's coolness, smell of musk, or the sea's air,
seductive dancer paid in the ecstasy of drink
to please our eyes with your adroit erotic tricks;
at times, when earth embittered me in my full youth,
you seemed, O Life, like the grass-widow Virtue, sad,
unlaughing, and I seized my spear to guard you well,
as though you ever cared, O luring siren-song,
for justice or injustice of the joys of men!
One dawn as I gleaned the mind's loneliness in vain,
I heard the seas, the heart, the earth call me for help;
God called in greatest peril, and I rushed to build
a head for him to hide in, a town in which to sleep.
Forgive me, Life, if I've so stupidly pursued
such gaudy plumes as whence we come and where we go;
I've squandered years in hunting what I thought firm flesh,
your three great shadows: Beauty, guileless Virtue, Truth;
but may these wanderings, too, be blessed that in good time
brought me to your nude body cool as warbling water.

Let Death come down to slavish souls and craven heads
with his sharp scythes and barren bones, but let him come
to this lone man like a great lord to knock with shame
on his five famous castle doors, and with great awe
plunder whatever dregs that in the ceaseless strife
of his staunch body have not found time as yet to turn
from flesh and bone into pure spirit, lightning, deeds, and joy.
The Archer has fooled you, Death, he's squandered all your goods,
melted down all the rusts and rats of his foul flesh
till they escaped you in pure spirit, and when you come,
you'll find but trampled fires, embers, ash, and fleshly dross.

There was nothing I could do. I couldn't change a flight of stairs into a creek. The boy walked back to where he came from. The same thing once happened to me. I remember mistaking an old woman for a trout stream in Vermont, and I had to beg her pardon.

"Excuse me," I said. "I thought you were a trout stream."
"I'm not," she said.

A little way from the shack was an outhouse with its door flung violently open. The inside of the outhouse was exposed like a human face and the outhouse seemed to say, "The old guy who built me crapped in here 9,745 times and he's dead now and I don't want anyone else to touch me. He was a good guy. He built me with loving care. Leave me alone. I'm a monument now to a good ass gone under. There's no mystery here. That's why the door's open. If you have to crap, go in the bushes like the deer."

"Fuck you," I said to the outhouse. "All I want is a ride down the river."
"Good luck," he said.

I went upstairs and there were thousands of doors there. I'd never seen so many doors before in my life. You could have built an entire city out of those doors. Doorstown. And there were enough windows up there to build a little suburb entirely out of windows. Windowville.

I turned left and went back and saw the faint glow of pearl-colored light. The light got stronger and stronger as I went farther back, and then I was in the used plumbing department, surrounded by hundreds of toilets.

The toilets were stacked on shelves. They were stacked five toilets high. There was a skylight above the toilets that made glow like the Great Taboo Pearl of the South Sea movies.

Stacked over against the wall were the waterfalls. There were about a dozen of them, ranging from a drop of a few feet to a drop of ten or fifteen feet.

There was one waterfall that was over sixty feet long. There were tags on the pieces of the big falls describing the correct order for putting the falls back together again.

The waterfalls all had price tags on them. They were more expensive than the stream. The waterfalls were selling for \$19.00 a foot.

Some of them old boys are into making houses out of chicken wire and condoms. Some of them can gather you a salad right off the forest floor. Some can make you a computer out of old Stromberg-Carlson radio parts and have enough wire and tubes left over for two laser death rays and a UFO. But Colin is into walking. His two previous books are mainly about walks: In *The Thousand Mile Summer* he tells about one he took up the entire Sierra range, and in *The Man Who Walked Through Time*, he walks the whole Grand Canyon. This one is about walking, not walks. It's not full of lore and woodsiness. It doesn't tell you how to get back to nature, or cast civilization from your back and wander out with a bowie knife and a jock-strap. It gives a little walk philosophy, and then proceeds to discuss, in just the right detail, how to put a nice little well-equipped house and its fittings on your back, how to be able to go out and walk for a long time without having to come back for more stuff.

Besides just the stuff, what to take and what to leave behind, it also takes you on a trip through Colin Fletcher, which is quite an outing all by itself. It's hard to imagine a book on backpacking technique that will make you laugh out loud all the way through, but he does it. He really loves poking fun at himself. He gets completely hung up describing some gadget or technique which he then admits he's never tried. He'll spend a whole page defending what seemed at first an impossibly fussy personal idiosyncrasy, and at the end you'll be dying to go out and try it for yourself. He actually has a sizable section on how to urinate and defecate in the outdoors, and it's a fine description. He includes a very complete appendix on suppliers, a list of walking organizations, and even a series of inspiring quotations to read while walking or thinking about walking.

Most important, though, it's the only backpacking book I've ever seen which, if read carefully, will actually tell you how to do it in great enough detail to enable you to just go out and do it. It's also the only one that will really make you want to go out and walk for absolutely no ulterior motive.

Be sure to dig pages 45-52, 123-132, 182-186, 213-218, the whole Furniture and Appliances section, and all the illustrations.

The only adverse comment I would make is that his food preferences seem pretty sanpaku. But he also quotes the old proverb about hell being a place where the politicians are French, the police German, and the cooks English.

[Reviewed by Roland Jacopetti]

First remove any obvious and rectifiable local irritant, such as a fragment of stone or a rucked sock. Then cover the tender place. Cover it even if you can see nothing more than a faint redness. Cover it, in fact, if you can see nothing at all. Being a 'hero' is being a bloody fool. The covering may only be needed for a few hours; if you take it off at night and let the air get at the skin you may not even need to replace it next morning. But if you do nothing at the first warning you may find yourself inside the hour with a blister that will last a week.

One of the surest ways to tell an experienced walker from a beginner is the speed at which he starts walking. The beginner tends to tear away in the morning as if he meant to break every record in sight. By contrast, your experienced man seems to amble. But before long, and certainly by evening, their positions have reversed. The beginner is dragging. The expert, still swinging along at the same easy pace, is now the one who looks as though he has records in mind. One friend of mine, a real expert, says, 'If you can't carry on a conversation, you're going too fast.'

When crowds assemble in Trafalgar Square to cheer to the echo the announcement that the government has decided to have them killed, they would not do so if they had all walked 25 miles that day.

At this point, steam issues from the stew pot. You reduce the heat to dead-low or thereabouts (taking care not to turn the stove off in the process), stir the compound a couple of times, inhale appreciatively and replace the cover. While dinner simmers toward fruition you empty two ounces of dehydrated peaches and a little water into the small cooking pot and put it ready for breakfast, up alongside the pack. Then you jot down a few thoughts in your notebook, stir the stew and sample it, find the beans are not quite soft yet. So you study the map and worry a bit about the morning's route, put map and pen and pencil and eyeglasses and thermometer into the bedside boots, take off your shorts and slide halfway down into the mummy bag out of the wind, and stir the stew again and find all ready. You pour-and-spoon out a cupful, leaving the balance on the stove because the wind is blowing distinctly cool now. And then, leaning comfortably back against the pack and watching the sky and the black peaks melt, you eat, cupful by cupful, your dinner. You finish it—just. Then you spoon-scrape out every last possible fragment and polish-clean the pot and cup and spoon with a piece of toilet paper. You put the paper under the stove so that you can burn it in the morning. Then you put cup and spoon into the break-fast-readied small pot, pour the morning tea water into the big pot, set the big pot alongside the small one and the sugar and milk containers alongside them both, put the current day's ration bag into the pack (where it is moderately safe from mice and their night allies) and...

Office-on-the-yoke

Because I so often walk without a shirt and therefore without a front pocket, I have had a five-by-six-inch pocket sewn onto the front of my yoke strap, roughly where the shirt pocket comes. Into it go notebook and map, and sunglasses when not in use. Pen, pencil, camel-hair lens brush (page 233), and metal-cased thermometer (page 259) clip onto the front of it. I cannot imagine how I ever got along without such a pocket. Mine is made of ordinary blue-jean material, but anything stout will do.

For which side to put your office, see page 64.

There is a cardinal rule of travel, all too often overlooked, that I call the Law of Inverse Appreciation.

It states: "The less there is between you and the environment, the more you appreciate that environment."

U. S. G. S. Topographic Maps

If you're interested in buying land or visiting remote areas you'll be using any maps you can get your hands on. The United States Geological Survey publishes the most accurate and detailed maps generally available for the U. S. (and possessions). Although some are a little dated, they consistently pack a lot of information into a fairly understandable format. Besides contour intervals, these maps indicate type of earth surface, roads, train tracks and trails, buildings, mines and various land marks; plus a whole lot of other stuff.

Two series of maps are available—15 minute quadrants (approximately 1 inch equals 1 mile, with 80 feet contour intervals, covering an area 14 x 18 miles); and 7.5 minute quadrants (approx. 2" = 1 mi., 40' contour, covers 7 x 9 miles.). The 7.5 minute maps are more up-to-date but have not been prepared for the whole country.

LETTING VIRGIL DRIVE

D.R. was fascinated by all the things that Virgil was saying, but after about half an hour on 421 again he started getting so sleepy he barely could keep his eyes open. He drove through the narrow curving part of the road that had caused him to turn back before, but once into the long valley beyond the narrows, Urge's front wheels started dropping off the blacktop every mile or two, and finally D.R. had to tell Virgil they would have to stop so he could nap a while, unless Virgil would like to drive. Virgil said he'd be glad to try, but he was a little nervous about operating a car with such funny gears. He offered to just sit and wait while D.R. got some sleep, but when he thought about it that seemed pretty silly, so he pulled off the road and spent a few minutes teaching Virgil about Urge's gears. When Virgil said he thought he had it, D.R. told him it was all his, and he crawled through the junk scattered on the floor of the bus, stretched out on the mattress and fell asleep immediately.

The Last of the Mountain Men

*sylvan hart lives on the river of no return,
the north fork of the salmon in idaho,
he's been there a few decades.
he builds his own tools,
grows and hunts his own food,
wears buckskin,
has a college degree,
and built a bomb shelter.
harold peterson went to visit sylvan hart,
and wrote this book about him.
a couple of friends of mine went to visit sylvan hart,
to make a film of him. turns out they didn't like him.
that shouldn't say anything about the book.
i'm hoping sylvan hart isn't the last of the mountain men.*

The guns with which Buckskin bags his trophies, trinkets, and trousers have aroused considerably more avarice than that. One handmade flintlock rifle, a particularly enviable product of loving craftsmanship, so excited a wealthy Los Angeles businessman that he offered \$500 for it. "It's not for sale," Bill told him. The rich Angeleno thought a moment, offered \$750. "It's not for sale," Bill repeated firmly. By this time, the man, used to having his money count, was sorely vexed. "\$1,000," he snapped. "It's not worth it, but I want that rifle." "It's not for sale," Bill said, as calmly as before. The Angeleno left in a terrible temper. A week later he was back with a blank check. "Fill it out for whatever you want," he barked. "It's not for sale," said Bill. "Damn it," said the man. "You need the money. You do use money, don't you?" "No," said Bill. "Not where I live."

The rifle in question has a beautifully hand-bored, hand-rifled barrel, a mechanism with double cock and double-set trigger, and an ornately carved mountain mahogany stock. Bored to .45 caliber, the barrel is Swedish jackhammer carbon steel, which he had sent in to him.

Sylvan's pole bridge, pinned precariously to the sheer face of a cliff high above the roaring River of No Return, constitutes the only path to the outside world.

Although accurately described by Buckskin as "a rotating helix drive by fingers on a headblock nailed to a table top," the machine used to make that rifle scarcely seems sophisticated enough to uncork a pop gun. As for the handmade "rifling saw" which cuts the actual groove, that looks like nothing so much as a half-inch-long bit of scrap metal. Yet if Sylvan, looking down the barrel, can find a flaw, no one else can, and the rifle shoots with deadly accuracy. "It's nothing but muscle power," Sylvan says, "but I really lay into it. That cutter comes out of there smoking."

With its light, steady touch, the firing mechanism is no less astonishing. "The interesting part is a pitiful little thing called a detent," Sylvan explains, taking a listener's comprehension for granted. "It causes the sear to ride over the half-cock notch in the tumbler."

Each of these samples of his innumerable hammers, scrapers, punches, awls, adzes, gouges, and other implements was hand-made by Hart.

Smoother than rosewood, the stock was simply blackened with sulfuric acid and rubbed to its lustrous deep brown finish by rubbing with the palm of the hand. It's carvings variously depict an old mountain sheep resting its heavy horns on the ground while drinking, two rams fighting, and the exact defensive deployment of a band of bighorns being attacked by eagles.

"I just make one as I need it, but I don't like to spend less'n a year making a rifle," Hart said, opening the patch button in the stock to show the orange flicker feathers inside. They are used to flick dust and lint out of the mechanism.

Mountaineering: The Freedom of the Hills

By far the most complete and sensitive treatment of mountaineering available. Oriented around Pacific Northwest mountaineering, where trails often end miles before the peaks begin, it is particularly relevant to wilderness camping and travel. It is much more than a book on how to climb. Reflects several generations of respectful relationship with mountains. If you move (or sit) where there are trees, rocks, snow and brush, it speaks to your terrain. One limitation: little about dry, arid areas—glaciers are the local functional equivalent of deserts.

Mattresses often give a chill sleep on snow due to interior convection currents, and with age they develop leaks that let the sleeper down in the middle of the night. Convection can be reduced by inserting a few ounces of down; in this case a filter is needed on the inlet and the mattress must not be blown up by mouth because of the moisture thus introduced. Sheets of foam plastic are superior in every respect except their incompressibility and consequent bulkiness.

In recent years many a mountaineer has developed the habit or hobby of not only making his own passage invisible but of spending extra effort to obliterate evidence of his predecessors—most of whom were just ignorant and thoughtless.

If a skirmish with brush must be accepted there is no technique at all. Brushfighting is not a diversion for civilized, gentle folk. One cannot afford charity toward slide alder or devil's club; one must hate and punish and kill when possible.

The irregularity of a mountain range tends to break up a front, especially the narrow turbulence zone of a cold one. Instead of advancing in a solid line it may surge forward up a deep valley while held stationary by a high massif, this bulge perhaps being attacked by flanking air—little squalls breaking off and wandering about apparently at random. A party on one peak may experience lightning, hail, driving snow, pouring rain, and calm sunshine all within the space of an hour. On a nearby peak another party may spend the entire day undisturbed by so much as a drop of rain, using up all their camera film shooting the superb cloud structures.

The quest of the mountaineer, in simplest terms, is for the freedom of the hills, to be fully at home in the high wilderness with no barriers he cannot pass, no dangers he cannot avoid.

COOKING AND EATING UTENSILS

The least-expensive cooking utensils are tin cans in various sizes, junked (at home, not in the mountains) when rusty. Aluminum utensils cost a little more but are more durable. Bails are desirable for suspending pots over the fire, and lids to keep ashes out and steam in. Aluminum foil is versatile beyond description, under adept manipulation becoming a frying pan, oven for baking foods in a bed of coals, reflector oven for biscuits, and if need be even a cup or a pot.

BREAKFAST

If the climb begins in the middle of the night, breakfast is merely the first installment of lunch. A tiny can of fruit cocktail, or a doughnut and a swallow of milk, are typical menus. Some climbers are convinced their legs won't work without hot food; their neurosis can be quickly pampered with instant cereal or cocoa cooked by chemical fire.

LUNCH

As soon as breakfast is completed the climber commences lunch, which he continues to eat as long as he is awake, stopping briefly for supper. He has food in his rucksack and knick-knacks in his pockets, main courses for the summit lunch, nibbles for rest-stops, and sweets to suck while walking.

Summit

The only monthly magazine published in the U. S. devoted to mountaineering fortunately covers all phases. Articles range from accounts of "treks" in Nepal and even more remote areas to logs and descriptions of spectacular climbing achievements. Of special interest has been their publication of good medical articles pertinent to conditions such as altitude, cold, and fatigue

The deadly effects of hypothermia are primarily circulatory and cardiac, with rather characteristic electro-cardiographic changes, and the secondary pulmonary vascular congestion and pulmonary edema tends to simulate the entity of high altitude pulmonary edema, with foaming at the mouth. Hypothermia is generally considered to exist when the body temperature, rectally, falls below 95° F., with degrees between 90-95° F. requiring only vigorous supportive care, while temperatures below 90° F. require immediate and sometimes heroic medical treatment. In the infamous Dachau experiments on seven unanesthetized healthy human subjects intentionally chilled in ice water, death occurred between 75.2-84.2° F. with an average value of 80.6° F.

Mountain Safety Research Newsletter

When you are in the outlaw area of the mountains—on rock and snow—you want tools that will break after you do. Mountain Safety Research, Inc. is an organization that tests climbing gear and where it finds a need, designs and manufactures new equipment. It was founded by inventor-manufacturer-climber Larry Penberthy when he realized that much too of the gear on the market was shoddy. It is the closest thing to a testing service for mountain equipment that exists.

Working through existing channels in Seattle mountain climbing circles produced little support and a good deal of resistance so Penberthy started his own organization.

At any rate, Mountain Safety Research has turned up some disturbing things: carabiners and ropes that broke before their rated strengths, pitons made of metal with the grain running the wrong way, and ice axes of insufficient strength. For lack of another outlet, Mountain Safety Research retails its own design of pack and frame, process-your-own nylon ropes at below retail costs, ice axe shaft reinforcements kits, and other items.

MSR BODY HARNESSES

East Coast Mountains

The Appalachian Mtn. Club offers a number of Trail guides, books, and maps of interest to New England hikers, climbers, and canoeists. The guides and maps are accurate and easy to read. The size of these books (approx. 3" x 6") make them handy to carry on trail. Some maps are available in a weather resistant material.

Available from:
Appalachian Mtn. Club
5 Joy St.
Boston, Mass.

The Appalachian Trail Conference also publish a few booklets and guides. The guides cover the entire length of the Appalachian Trail. Personally I prefer the A.M.C. guides for the A.T. in New England. The booklet Hiking, Camping, and Mountaineering Equipment lists over 400 items, including foods with descriptions, weights, suppliers (domestic and foreign), and prices.

Available from:
Appalachian Trail Conference
1718 N. St., N.W.
Washington, D.C. 20036

Anyone interested in hiking or backpacking in New York State can get information from the Finger Lakes Trail Conference. Believe it or not there is still some "wilderness" left in N.Y.! This organization is made up of various trail clubs, all are active environmental conservationists.

For info: Mr. Ervin H. Markert, Trail Chairman, Pittsford, N.Y. 14534.

or WHOLE EARTH CATALOG

Two-step—One of the most useful maneuvers for attainment of speed on the level or on slight downhill gradients is the two-step, which uses the gliding ability of skis. If the two-step is to be used for long, it must be deliberate and rhythmic, slow enough to let the skier relax during the glide between thrusts.

Take a short step for propulsion, lean well forward from the waist, placing the poles well ahead, and lunge into a glide on the opposite ski by shifting the propelling thrust smoothly from the driving ski to a strong followthrough with the poles. Slowly bring the driving ski alongside the gliding ski in preparation for the next short step. Occasionally two consecutive short steps are taken to change the glide from one ski to another (this constitutes the three-step), and to tire out a new set of muscles.

Lightning and the mountain.—The urge to know more concerning the effects of lightning becomes stronger when one is on a peak with the static charge beginning to make its power felt. When every projection in the vicinity, and finally the climber himself, begins to spark and the air is filled with ominous hissing, the desire to be in camp becomes overwhelming. Since this desire cannot always be satisfied, it is well to know what to do at this time.

The reasons behind the classical warning to be off the summit and ridges in a lightning storm can be seen when the mechanics of the lightning discharge are studied.

Mountaineering Medicine

It is small enough to carry any time you go into an isolated or hazardous area; well organized, and fairly up-to-date. There are sections on various injuries, snow blindness, bites and stings, sunburn, water purification, etc.. The booklet concludes with a section on making and using a first aid kit. (You'll need a physician to write 'scripts for certain drugs listed.)

Chouinard Equipment for Alpinists

Almost everyone who goes into the mountains eventually develops an urge to try rock scrambling or climbing of some kind. It is therefore important to be aware of the best safety procedures and climbing aids available.

Alpinists Yvon Chouinard and Tom Frost design and fabricate a high quality selection of modern climbing equipment. Along with descriptions and illustrations of gear, their definitive catalog includes sections on history, use, care and precautions. There is even a beautifully illustrated article on ice climbing.

THE BEAST OF THE SEA

Or thought he did anyhow. It sure was wild not to know for sure. Half of D.R. was very deep asleep. It was his other half he wasn't sure about. He didn't know if what he felt around him as he lay there on the mattress, and saw, quite clearly, through the windows by the road outside, was in the actual, waking world or just a dream his sleeping half was having. D.R. felt his body rolling back and forth from side to side as Urge leaned into the curves, then straightened up again. He heard Urge's motor whirring underneath, and smelled the odor of Estelle in the mattress he was lying on. That was what he felt and heard and smelled. What he saw through the windows was the dark, lit by eerie light from slag heaps burning in a dozen different places. He saw sulphuric smoke rise from scattered fires and spread across the landscape of the night. He saw hulks of abandoned automobiles strewn about like monster corpses on some prehistoric battlefield, and he saw coal tipples by the highway like preying creatures frozen by the sudden glare of light. Animals darted off the highway as the bus approached, then gathered on the pavement when they'd gone by to stare with shining, yellow eyes. In one place the road was lined with monsters grinning wickedly. Some were merely bloody heads impaled on fence posts, or hanging by the hair from limbs of trees. Some stuck out their tongues that turned to snakes that hissed and snapped and bit as they drove by. He saw a beast from the depths of the sea, covered with weeds and ancient slime except for its head, which was adorned with jewels that glistened in the light from its own winking eyes. On the beast's head were seven horns, and crowning each horn in rays of light was Estelle's face, distorted by a grin so evil and so knowing D.R. shuddered and pressed his face into the mattress thinking surely I'll wake up now, surely this is just another dream.

Breaking and Training the Stock Horse

Most books on, and methods of, training the western type riding horse are a collection of anecdotal tricks and clever gimmicks with which you may force or frighten the horse into doing what you have in mind. Mr. Williamson's is not.

It is a concise, orderly, and complete explanation of how, with minimum paraphernalia, to condition the horse to interpret the most subtle movements and pressures of the legs, hands, and entire body and to turn these commands into movement with the freedom and ease of an unmounted horse. A horse well trained by this method can easily be ridden without a bridle. Williamson's method develops discipline and sensitivity in the trainer as well as in the horse.

Although intended primarily for the stock horse, its basic training principles can be applied to the training of any type of riding horse, including hunter, jumper, gaited, and high school dressage. There are also chapters on horsemanship, riding, and riding a bucking horse.

Mr. Williamson has been occupied with horses all of his life—the Cavalry in the First World War, running pack outfits, catching wild horses, and training and exhibiting. He now conducts a school in horse training and horsemanship in Hamilton, Montana.

A correct sliding stop on hind feet. Horse and rider relaxed, nose down, reins slack.

The running W

Work on the longe line. Teaching the green horse to listen to and obey the trainer and not to fear articles tied to the saddle.

Halterbreaking the green horse. Never pull a steady pull on a horse whether mounted or working from the ground. Pull and slack. Stay slack when the horse is doing what you want.

Contrary to the usual idea *little* equipment is necessary in the proper training of saddle horses.

A horse responds to training to relieve pressure on some part of his body. He follows you when you are leading him to relieve pressure on his poll. He goes forward when the legs are used to relieve pressure on his sides. He stops or slows when the reins are pulled backward to relieve pressure on his mouth. When he does what you want, if you do not slack and relieve pressure, he has no incentive to do the same thing again for you and finally gives up in disgust and carries you about in a listless or even defiant manner because he must.

Horses

When handling horses there is no substitute for experience, but this book is as close as you can get. In the first 115 pages the author presents encyclopedic information on all phases of horse management. The last fifty pages are devoted to a brief discussion of eastern riding and showing.

V. FIRST AID

Accidents and injuries—Treatment of lameness due to injury—Lameness due to wounds or infections—Lameness due to chronic condition or disease—Wounds—Treatment of common illnesses—For the medicine chest

VI. HANDLING THE HORSE

General characteristics and temperament—Fundamental rules for handling and controlling in the stable—How to lead—How to back out of a stall—Working around a kicker—Catching a horse in pasture—Bridling and saddling

VII. CAUSE AND CONTROL OF VICES

Stable Vices: Cribbing—Tearing the blanket—Weaving—Crowding—Kicking in the stall—Backing out of the stall suddenly
Other vices: Kicking while under the saddle—Kicking while being mounted—Biting another horse—Shying—Charging in the pasture—Rearing under the saddle—Bolting—Shying—Refusing to leave his companions, or to leave the stable alone—Eating grass while under the saddle—Shying out at jumps—Getting overexcited at jumps

LEADING A HORSE

With neither bridle nor halter. Grasp the horse's forelock in the right hand and put your left hand on his muzzle over the nostrils. It is the latter which will give control if he tries to pull back or jerk away. Slightly pinching the nose just above the nostrils will distract his attention. With a mean, stubborn animal you may have to pinch hard enough to close the air passage. A horse cannot breathe through his mouth and will soon give up if his wind is cut off.

Practical Western Training

In an area where most of the horseshit does not come from the horses, *Practical Western Training* is a refreshingly useful and sensible book. Dave Jones is a working western horseman and he gives the reader the benefit of years of successful, practical experience. Most important he treads the fine line between senseless counter-productive brutality and letting the horse run the whole show.

OUT OF PRINT

Colt backing in draw reins. This is very good, for the pull is low. It's easy for a colt to back if his head is low, almost impossible if he's "star-gazing." Notice that Ken has his weight off the seat, which allows the horse to back fast and straight.

Some guys "knock and spur" a handle on their horses; that's one way. You won't find that kind of stuff in this book. Sure, sometimes you have to get a little rough with a rough horse, and I'll tell you how to do this. But I won't tell you how to beat up a horse.

Horses, Hitches and Rocky Trails

Right. You got your land fifteen miles into nowhere from the nearest roadhead. You deplore noisy trail bikes and ATVs, and you can't afford a helicopter. Then you're into packing. Joe Back is a packer, and talker, and illustrator, and he can help you.

or WHOLE EARTH CATALOG

If you can, pick a good short-backed horse, thick in the body, with strong sturdy legs. A long-pasterned horse cripples up faster than one with short pasterns. You'll find a lot of thin, spindly-legged ponies that'll pack OK but they don't stand up well. Too heavy and too big horses slow you down and are not agile. About a 1200 lb. horse is just right for weight, although lots of smaller horses are used and stay right in the ring. The Morgan type is the boy if you can pick and choose, but don't get too choosy or we'll never get to camp.

If you don't balance each load, it's your hard luck. The handiest and cheapest tool you can buy is a fairly accurate spring or other scale that will take weights up to 100 or 150 pounds. It will last for years and you'll always use it. Some people like the style with a hook at the bottom and a ring or handle at the top. Seven or eight bucks for one will save you and your outfit a million dollars worth of grief.

Balance the two sides of each pack, being sure they weigh the same, whether they're panniers, side packs of any kind, mantled cargo, bedrolls, tents, or any daggoned ordinary pack you load.

Manila is the stuff. Most people, including me, like good manila rope for both pack and sling ropes (sling ropes 3/8 inch diameter, lash ropes 5/8 or sometimes 3/4 inch diameter: a good many times you will use a lash rope also for a picket rope, and will want it big for safety). Of course, you can use sisal, which is cheaper, and I think much weaker and less durable than manila. Cotton is good, but boy! when she gets wet and frozen you need a hacksaw blade for your knots. Nylon is a billionaire's dream, and say, Bud, try to splice one! Besides, you've seen the ads praising the stretch in milady's nylons; it's so, it never stops, you can't keep it tight.

The Spanish Mustang Horse

For anyone who needs a good, tough, dependable, intelligent, quick, sure-footed, little horse, the Spanish Mustang is the answer.

The horse of the Spanish conquerors, Indian pony, and original wild horse has suffered as bad a fate as his native American masters. Castrated, crossbred and shot for dog food, he is almost extinct. There is now a registry, founded by Bob and Ferdinand Brislawn, for the preservation of the mustang horse. Most of the foundation stock was caught wild in remote areas or found on Indian reservations.

They are small horses (12 to 14.2 hands). Their speed, endurance, and ability to withstand hard winters on little food is legendary. One Mustang, Yellow Fox, won the 100 mile Bitterroot, Montana, endurance ride at age eighteen. They come in conventional colors— bay, sorrel, black, chestnut— and in many others— blue and red roan, medicine hat, grulla, bluecorn, buckskin, claybank, overo paint, steeldust. . .

Kamawi, No. 115, black stallion

"His qualities are complete. Now he looks anxious; now to be losing the way; now to be forgetting himself. Such a horse prances along, or rushes on, spurning the dust and not knowing where he is."

Chuang-Tzu, Book XXIV, Part III, Section II, I Trans. James Legge

They make good pack, cart, children, saddle, or even light plow horses. Mustangs are priced from cheap (\$100 to \$150 for a registered colt) to expensive, depending on the breeder. Most breeders are old-timers and reasonable. We bought three last year in Wyoming and are very well satisfied. They are remarkably fast learners.

IN THE FLESH

But it was not a dream. Those were really beasts outside the windows, and that was really David, sleeping there beside him on the bed. D.R. felt as if his blood was full of methedrine. Something racing through his mind increased its speed so much it disappeared completely out of sight. The half of D.R. that was sleeping was a separate, living person! It was really David, sound asleep beside him, like a child. Surely it's a dream, he thought. Surely that's me sleeping, and all of this I'm seeing is a dream. D.R. leaned up on his elbow and looked around. He breathed deeply, and smelled and listened. Urge's motor whirred beneath him, Estelle's odor rose into his nostrils from the bed. Virgil was up front at the steering wheel, guiding Urge around the curves, shifting gears from time to time, driving slowly. The world inside the bus was still in place. And David was a living person in it with him, lying there before him in the flesh.

Is he really in the flesh? D.R. wondered. Is that really David there beside me, or are we somehow mixed up in each other dreams?

Touch him, D.R. thought. Touch his face and feel if he is breathing.

Don't touch him! D.R. told himself. Let him lie there, don't!

With the tips of his fingers D.R. touched David just below the lobe of his left ear. David stirred and smiled with pleasure, he yawned and stretched and opened wide his eyes. When D.R. started whimpering David touched his finger to his lips and whispered shhhhhh. He was sitting up now, looking deeply into D.R.'s face. Moving very slowly, David leaned and placed his head on D.R.'s shoulder. Don't be afraid, he whispered. I love you, and you mustn't be afraid. David kissed him then, he kissed him on the neck and lightly on the corner of his mouth. Then he took D.R. by the shoulders and pressing tried to stretch him out full length upon the mattress.

"No."

"Shhhhhh," David whispered.

"I don't care. I don't feel like lying down."

"What's that you say?" Virgil called out through the car.

"I said I don't much feel like lying down."

"Well," said Virgil, "It's just as well. I'll be getting out in another mile or two."

Sioux Indian Saddle

I noticed you had a section on Horse books in the Spring catalog and thought you might be interested in the saddle we make. This type saddle was used by plains Indians warriors and is very practical. It is much lighter, cheaper, and more comfortable than a western saddle which was designed for roping cows more than for riding. It is made by hand of high quality materials and is very durable.

Your readers might also be interested in buying a product made by members of a rural crafts co-operative rather than more exploitative type factories.

These saddles retail for \$40 postpaid or \$30 for three or more. They are available in rust, dark brown, cedar, or beige colors.

Huw Williams
Tolstoy Farm Handcrafts
Davenport, Washington 99122

Sioux Indian Saddle— Suede cowhide, padded with thick foam-rubber. Adjustable cinch and stirrup straps of heavy harness leather comes complete with cinch and stirrups. More comfortable for horse and rider than any other kind of saddle.

Regarding horses and ecology. When cars first came in, everybody said, "At last our streets will be clean and safe." As horse turds dropped off, the English sparrow population was drastically reduced.

—SB

Horse Freaks of the World. . .

As you may well realize, our planet is becoming foul. An answer, perhaps? Horses, manure is better than pollution.

I have noticed that many a freak has realized that the horse sometimes proves himself better than the car, and that since horses can be kept cheaper than a car, on the whole, they are really more economical.

As a horsewoman and a freak I am aware that many a freak doesn't have information at hand, and the books dealing with horses don't really go into the aspects of horses vs. the people that really appreciate the horse, more than the red neck thinks he does. Anyway, all the books you can find on the subject have a minimum requirement for owning horses; at least an annual income of \$9000 or more. But this isn't necessary. There are secrets one cannot find over night in owning horses, but, if anyone would like to try they are more than welcome to write me, and I am sure, if I can get it all together, I can help them take care of their horses on a minimum of \$5 a month, and have them take care of them well (a sick horse is no horse at all, remember.). To repeat, if anyone would like some enlightening answers to some puzzling questions concerning the freak and the horse, living compatibly together, do write.

Love,
Gail Lusk

White's Boots

White's Shoe Shop has been making hand made shoes for as long as I can remember and I say this because my Father wore them for 40 years, in every condition the Pacific Northwest has to offer, he always had three pairs at once rotating them to dry when wet also one of the pairs were elk tanned for summer. We Condras have always taken care of our feet and White's shoes are the best bar none. I've had at least one pair on hand since my feet stopped growing. The pair I have now No. 375 "Smoke Jumpers Shoe" are going on three years old, and will go more as long as you sole them etc. They aren't cheap, but if you ever spent \$30.00 for a pair of shoes and only had them last a year, you'll find them a bargain in the long run. I've fought a lot of forest fires and good shoes on your feet are as much a necessity as a shovel or pulaski in your hands— if you have hard or very hard to fit feet they make shoes for you too. A nice little catalog and all the help you need with OLD fashioned quality and service.

Jungle Boots

An excellent product, especially for those engaged in any kind of heavy outdoor labor, is the jungle boots originally made for the U.S. armed forces. These canvas and leather combat boots can be found in surplus stores for about \$12 to \$15 new, and about a third of that price used. Many used ones are in excellent condition, but even the ones in poor condition will last a very long time. I worked for the highway dept. last summer, along with a couple of other college students. They bought normal leather work boots for about \$15 and \$20 while I bought a pair of jungle boots in good condition. Both my friends wore out their boots. I can detect no wear on mine and am saving my pair for next summer, or whatever. I highly recommend this product to hikers also.

Jungle Boots Price: \$15 New, \$3-6 used.

Good Boots

Loggers, construction workers, and foresters in the Pacific Northwest need rugged boots with good grip to endure a lot of rough going. One of the boots often used by these men is the 210V built by the West Coast Shoe Company, Scappoose, Oregon 97056. This company's boots are carried by stores in the Pacific Northwest and can be ordered by mail from elsewhere. The company will send measuring instructions on request.

The 210V boot fits the foot with firm support. The boots are carefully constructed of high quality leather which is tough but soft. The leather keeps its shape and dries soft after being wet. The quality of the leather is one reason these boots keep their fit and stay comfortable while giving long service.

The 210V Boots have Vibram lug soles. It costs \$32. Those who have worn boots with Vibram lug soles know the great traction which these soles develop. The rubber compound has a high coefficient of friction and clings to both wet and dry surfaces. The lugs give good bite on loose surfaces. Vibram lug soles get work done with less effort. They make hiking and climbing easier, safer, and more enjoyable.

The woodsman's heel is well undercut so that when a step is taken and the heel is put down the force is through the center of the ankle joint. A large flat heel produces a force behind the center of the ankle joint which must be resisted on each step by muscles in the front of the leg which is tiring.

A little care will provide a lot of wear. Mud should not be left on the boots as it will draw the oil from the oil tanned leather. An occasional rubbing with mink oil, also available from the West Coast Shoe Company, keeps the leather in good condition.

R.C. Engle
Sioux City, Iowa

Gokey

Gokey Company is in St. Paul, Minnesota. They sell junk like Abercrombie's and those mail order places and they sell custom made (hand made) (machine made with hands) shoes (and the other kind too). They sell Wallabee's (which is another story). But lately they sell fewer of their own make shoes, which is a shame; there are fewer men around who can do hand sewing and that's essential to Gokey's shoes, which are the most comfortable things I've ever owned. I walk a lot. On city streets. I've gone through every type of shoe from \$150.00 Lobb to \$25.00 Wallabee (and yes, that's another story) to Herman's work shoes to climbing boots & cowboy boots and finally, heaven, comfortable shoes. And besides there being fewer men around who can sew, the demand is outstripping what the available men can supply.

Gokey seems to have found the economic mean between a massed produced shoe and the hand lasted shoe. It works. They also make snake proof boots to measure. Testimonial. The important thing, however, is as Gokey says, to get more people who can work leather. This should be a fantastic opportunity... why isn't it? Or is it? It is!

Craft Manual of North American Indian Footwear

moccasinmaking. the fellow who put this book together has saved a truckload of good information from being buried in family shoestores around the world. thirty or forty designs and patterns set out, using length and circumference of whatever pretty foot to be shoed. step by step instructions for stitching and assembly can be followed by anyone who can read and use a knife and needle. not recommended for people wanting heavy-soled fringed streetshoes or patent-leather leggings. meant for people who want to build north american indian footwear like the north american indians feet wore.

Yellow Knives - "Center Seam"

1. See general instructions.
2. Special instructions as follows:
3. Line L M = (length of foot + 3/4" at heel + 1/2" at toe) See general instructions.
4. A B measures circumference.
5. A'B measures leather which added to tongue insert is equal to A B or (A A' = 1/2" width of tongue.)
O K = 1/2 H K.
6. Draw all measurements on foot tracing.
7. Fold pattern on line L M and cut both sides symmetrical.
8. See general instruction for tracing pattern on leather. Make two alike as there is no left or right.
9. Fold leather inside out.
10. Sewing: join H H' and sew to K K'. Use 1/8" stitching.
11. Sew toe with 1/8" stitch, and turn outside out.
12. Center (tongue insert. See figure 12.) on H H'. Use 1/8" stitch on insert and 1/4" on side piece as sides must be gathered.
13. Sew heel either inside out, or right side out. (See heel detail)
14. Sew on extensions. (see figure 4-a)
15. Tie strings. See figure 4-b.
16. See Figure 5 for cutting the strings.

Kaibab boots

Kaibab boots are the real thing: traditional Indian desert moccasins. Made of deerskin and horsehide, they are light, attractive, and durable - just the right amount of improvement over bare feet. Unfortunately there are innumerable imitations of Kaibabs, all terrible. The giveaway is the seam between sole and top: if the sewing is visible on the outside the moccasins are frauds and will fall off your feet in a few weeks. Real Kaibabs will last six months of steady use, and when you finally come through the soles, you can send the tops to Tucson for new soles (\$12.00) and get another six months. (One warning. Kaibabs on wet slick sidewalk are sudden death.)

European Shoes

Walter Dyer Moccasins

Buying Guide: Sturdy clothes, good walking shoes, sleeping bags, rucksacks, etc., can often be bought for less than half cost by ordering from a regular sporting equipment house in Europe, even including postage and duty. Procedures: write for catalog, for example to Sporthaus, Schuster, Rosenstrasse, Munich, West Germany (or find others by asking English, German, French and Swiss consulates, trade offices, embassies). Since catalogs come with many illustrations it isn't difficult to decipher languages once you know what you're looking for. Check with U.S. Treasury Department for information on amount of customs duty on that particular item desired. Sometimes the item will come in without any duty being charged, this is generally so on small items. You can send an ordinary American check made out in dollars; you need to know your size in the European system or send foot outline and American size and hope for best. Generally, European shoes are narrower in toes and wider in heels than American shoes.

MAYBE VIRGIL LEAVES

At a junction where the road to Blaine came into 666, Virgil stopped the bus and got out, and D.R. crawled forward to sit behind the wheel. He offered to drive Virgil the three miles on into Blaine, but Virgil said he believed he'd rather walk. Light was in the sky now, but it was still a long time till Virgil's appointment at the welfare office, and he was just as glad to have three miles to walk to pass the time away. He thanked D.R. for the ride, and D.R. thanked him for getting the bus to run again, and driving as far as he had. They shook hands, and Virgil set out walking down the road toward Blaine.

Light Weight Camping Equipment and How to Make It

It's all here: design, patterns, assembly techniques, light-weight materials, and sources of the materials. Because of good information on what's needed for various environments, it's a useful book even if you aren't making your own stuff. An indispensable book if you are.

Sleeping Bag Materials

Since you're finishing up I guess I'd better add something now.

About making sleeping bags—

Light Weight Camping Eq. and How to Make It is instructive but careful not to give you a design for anything that would compete with their own gerry's line. You have to make your own adaptations. The basic book is still helpful.

Goose down costs a fortune from the sources listed. Most feather suppliers don't want to see you unless you can buy about 100 lbs. of down. Sometimes quilt makers will sell however. I got mine at \$8 per lb. from:

J. Schackter Co.
Allen St.
N.Y.C.

(Gerrys charges \$19.50 per lb.)

Nylon material is very hard to find. I was astonished to find that almost all of the fabric centers in Syracuse had no idea of what type of fiber went into their fabrics, which were strong set. All they cared about was color! After scouring the Carmet distict of N.Y.C. I happened upon a dark little store which sold "Mill Ends" or remnants. I found just what I wanted at half price—with a smile!

Fabric Export Co.
45 Walker St.
N.Y. 13, NY

Long zippers are hard to find—long zippers which are nylon and which open at both ends such as the *Waldes* zipper are extremely hard if not impossible to find. *Waldes* does not sell retail. I still haven't found a zipper but the sleeping bag (?) is so warm that I haven't needed one yet.

David Briars
Syracuse, N.Y.

Antarctic Products

The Antarctic Products mailorder brochure contains an assortment of very high quality but low cost cold weather items made in New Zealand such as sleeping bags, parkas, sweaters, sheep skin rugs, raw wool yarn, etc. The down filled products are by the makers of the bag *Hillary* and *Tensing* used on Everest and have been chosen for dozens of world expeditions.

The prices of the items are exceptionally low for the reasons mainly that they are either high in labor or raw materials both of which are very low in cost here by U.S. standards. Mailorder also cuts out the retail markup, the import agents fees and costs, also the New Zealand government subsidizes exports (The identical sleeping bag costs \$14.50 more to buy in N.Z. than the U.S. mailorder price.

Frostline Outdoor Equipment

Frostline Outdoor Equipment is the manufacturer of do-it-yourself kits of lightweight camping equipment: tents, down sleeping bags and clothing. They also sell the raw materials for making such equipment (pre-packaged down; zippers; nylon fabrics; velcro self-sticking nylon tape fastener; Dacron thread; etc. The company's service by mail has proven prompt and dependable, all of this reviewer's orders having been filled correctly.

This reviewer has made Frostline's "Big Horn" ("Winter") sleeping bag (2 1/2 lb. down filled overlapping tube design with no stitched through seams), stuff sack and poncho. She found each kit to be all that the manufacturer had claimed, the catalog description scrupulously accurate.

Frostline kits are complete; all they require is assembly with a sewing machine. This reviewer used a Singer Featherweight for the purpose.

Before deciding on the Frostline kits, this reviewer compared Frostline prices and specifications with those of other companies. (The Ski Hut, Recreational Equipment Inc., Thomas Black and Sons Inc., etc.) She concluded that the Frostline kits were the most economical product without any compromise in quality.

Warmlite Tent

The Stephenson Warmlite tent is the 2-3 man tent for backpacking and mountaineering. The basic Model 6—Single Wall Tent weighs 36 ounces complete with poles. It has been designed by Jack Stephenson, an aerodynamicist and mechanical engineer, who fabricates them as a part-time operation at home. The tapered hoop shape is very stable and doesn't flap in the wind. It also provides extra interior head room compared to conventional A-frame designs. Interior thermodynamics are designed to provide good ventilation and minimize heat loss. Length is over 10 feet, width of 5 feet. Fits in small size sleeping bag stuff sack. \$100-\$215.

Bishop Ultimate Tents

I have used the Ultimate 2-man tent & fly in a two week rain & snow spell in the Wind River Mts. It made the difference between two weeks of unpleasantness and two weeks of pleasure. When sealed, this tent will not leak and condensation does not form on the inner tent if the window is left open and the temp is above 30°. I have never before used a tent which was a joy as opposed to a hassle. As far as I am concerned, this is the tent for winter backpack camping or camping in unpleasant weather.

I have also used the 4-man Ultimate for camping out while on a ski trip. This is the tent for 2 people & ski equipment. (I haven't tried the 6-man however, so this should be qualified.) It has the space (when used by two) to live in under extreme conditions for extended periods of time. The little "extra" makes the difference. (Barry Bishop & family (wife and children ages 4 and 2-1/2) spent 15 months living in this tent in Nepal last year (yes, 15 months). They are alive and sane.) Next time you go skiing for three weeks consider spending the \$300.00 you would spend on a room on a 4-man Ultimate; at the end of the trip you have "earned" the tent.

Poptent

The best roadside tent by far is the Thermos POPTENT® a dome shaped affair that erects in about one minute without ropes, poles, or stakes and will withstand bad weather remarkably well. Comes in two sizes with sewn in floor, screen door and window. Hexagonal floor about 6½ feet across the flats sleeping two and a child, and a larger one about 8½ feet and 6 feet high that will sleep four but with less wind stability. The smaller one is best, folding up into a bag 5 inches diameter and two feet long weighs 13 lbs. Prices vary from store to store, but expect to pay about \$65 for the small one, \$90 for the big one. Don't pay more. Cut urethane foam 2" thick to fit the floor and you have a good camp for a small car or motorcycle.

Tent from Virginia Ripoff

Several issues ago you carried a letter from me asking about advertising my quonset tent design. Since it was only an inquiry I didn't include any prices for the plans. When the letter appeared I began begging requests for the plans. I was unprepared by was finally able to get copies off to all who asked. With each copy went an apology for the delay (8 weeks) and a bill for the plans (\$3.00) also my best wishes.

To date (3 months later) I have received a total of \$3.00, I am now only \$33.00 in the hole. Since your publication concerns itself to some extent with the quality of contemporary products, I thought you might like an indication of the quality of some of your contemporaries.

TEARS

As soon as Virgil was out of sight D.R. started crying. He couldn't help himself, the tears came pouring out, and when David came up front and put his arm around him D.R. yielded. David was very cool. He didn't say a word. He just sat there with his arms around D.R. and let him weep into his shoulder as long as he had tears.

Jacket about \$7
pants about \$6

Barbour +

I have some information about Barbour Suits. I have owned their heavyweight International Suit Jacket for 3 years now. (It is mostly motorcycle stuff, from my knowledge.) It is as waterproof as rubber, but on a hot day only a bit less sweaty than rubber. Mine is heavy woven cotton treated with some goo. I got an extra can of the goo for renewing the waterproofing when I bought the jacket but haven't needed it yet. This goo isn't sticky or anything, but it will rub off lightly on, e.g., another coat which rubs it a lot. And the jacket will start to have an interesting smell on hot days around the 2nd summer you have it. I prefer the jacket to leather for bike riding. The pockets (designed to be worked with gloves on), the waterproofing & windproofing and the protection are much better. I have dumped while wearing mine and it had no permanent scuffs, which leather won't do. It is not warm of itself as a lined leather jacket is, but I wear a sheepskin vest I made inside of it in winter when necessary (they sell one too). A sport coat fits comfortably under the jacket, when you have bought it properly— I wear mine to work (I teach just now). It is the standard for touring & general use for serious bike riders in Europe; worn for most competition except the road races. I have found you can wear it into a strange cycle shop (even if you don't ride a bike up) and be treated respectfully, even if you look a bit freaky otherwise, and I've had shop owners (like Moto-Guzzi M7 in 1967) apologize for not having bikes available for test driving at the moment, but if I'd care to make an appointment. . . They are very well made, and the fittings (brass) are beautiful. They are well designed for keeping out the weather, allowing for individual adjustment at the openings. I wear mine all the time, not just for riding, and it is the most comfortable 100% waterproof thing I've worn. After I've said all this, I must tell you I haven't worn the pants, however. (I guess my enthusiasm is obvious.)

Thomas Reynolds

Ocaté Sleeping Bag

The ideal poor man sleeping bag, now even cheaper than it was (replacing nylon exterior with taffeta, you can still get nylon if you want it). Since it's made of polyurethane foam you've little need for a pad or air mattress, and if you get rained on you stay warm— it's like a wet suit. The material breathes okay and by adjusting the hood and strings you can adjust to temperature. I've used a space blanket in combination with the bag for temperatures down toward zero. The heavy models of the bag are 1/3 thicker and a lot warmer. Ocaté is now coming out with a double bag. Rolling the Ocaté is difficult until you get the hang: squish the bag with your knees as you roll it.

Can Opener

The P-38 (or GI can opener, as surplus store owners tend to refer to it) may well be the highest point to which technology has ascended and is certainly an indication of the direction in which it should be headed— away from complex, flashy gimmickry and onward into simplicity and reliability.

It weighs no more than a nickel, takes up less room than a key (I always carry mine on my keychain; you never know where your next can's going to turn up), has a breakdown factor of 0, gets better with time (as all good things should), and, should you be unlucky enough to lose it, can be replaced for just 9¢ (\$.09) at the going rate.

Within my admittedly limited experience, it has also served as an effective, if frustrating, fishhook, a reasonable facsimile of a knife-point, a tack remover, and a superb toothpick (though my dentist would probably flip his fillings if he heard me say that).

Invest a dime, slip it on your keyring (or lovebeads, depending where you're at) by means of the thoughtfully-provided hole (it was originally meant to go on a dog-tag chain), try to forget its militaristic ancestry, and never, never be without it.

Note on can-opening with the P-38: Do not open the entire lid; leave a piece attached, fold the lid back, bend it in half, and you have a backwoods coffee cup, soup bowl, water glass, etc.

JanSport Packs

this is the review we received of JanSport packs from Dennis Hollenberg.

A remarkable system because its oval design and weldless construction allow the Jan Sport pack frame to flex when strained by shocks and heavy loads, avoiding the sad broken-parallelgram demise of some ladder types.

Each frame section of tubular aluminum is swaged and fitted in an admirably craftsman-like manner and compressed to its mate by a tensional system of webbed nylon belts. The frame system is in dynamic equilibrium, continuously accommodating the load for more dependable balance; a special model is made for the high angle freaks.

Hefty machined blocks connect the cross pieces, enabling both easy height adjustment and disassembly to fit in a suitcase for that Himalayan assault. In fact, it has more provisions for adjustment than any other unit. Packing with a Jan Sport is like getting an extra pair of arms.

-DH

We sent for a pack, tried it a little, and decided it was a quality pack, so we got in touch with Murray Pletz, Mr. JanSport, and asked him to work up a series of good packs for us. here's what he came up with. it looks to be the best deal in packs we've seen. everything in forest green.

Adventure 16 Pack Kit

Something you might want to look at for the Nomadics; Adventure 16 backpack and trail supplies 10056 Bert Acosta Drive, Santee, Calif 92071. Their strong point is their Kit-pak, which is what it says— bent aluminum tubing, fittings and rivets and all the nylon material, cords, zippers, grommets, etc. to make a pack. The pack is large, and there's enough material left over to make two extra pockets. In my opinion the belt arrangement is superior to Sierra Designs. There's a lot of work involved getting it together—especially if you don't know sewing-ese. But what you have upon completion is a pack that is far better than those selling for \$50 and equal to those selling for \$65-75. Cost of kit: \$16.95 (with pattern), \$14.95 (without pattern).

Investigate!

MAYBE VIRGIL LEAVES

After a while D.R. realized he was on the bed again, and that the bus was moving. He didn't remember leaving the front seat, but what was more confusing, it seemed dark outside again. D.R. rolled to the edge of the mattress and looked up through the window at the sky. The clouds were there, but the sky was dark as midnight, there wasn't even a speck of moon to light them up. When D.R. looked toward the front of the bus to remark about the light, he saw Virgil sitting behind the wheel, and David in the other seat beside him. D.R. almost yelled then, but before he could the bus slowed down and stopped at the junction where the road to Blaine came into 666. D.R. listened as David offered to drive Virgil on in to Blaine. Virgil thanked him, but said he believed he'd rather walk. He only had three miles to go, but it was a long time till his appointment at the welfare office, and he was just as glad to have that far to walk to pass the time away. Virgil and David shook hands. When Virgil set out walking down the road toward Blaine, David shifted gears and headed down the final fifteen miles to Godsey's Grocery Store.

Coleman Lanterns & Stoves

"Coleman lamps are terrible—they hiss clank and blind you, just like civilization."

Fact is: when the man says they blind you, what he's really saying is that they put out a lot of light. In most circles this is considered a plus. The big drag is that the bright light attracts everything that flies, every moth and his cousin for a radius of a mile comes to circle around your lantern. Simple remedy: buy yourself an amber glass (just \$1.99 at big 5 sport stores). Softens the light, doesn't attract bugs—at least not too many.

Come to think of it, I guess Coleman lanterns, stoves, etc. deserve a praiseworthy word from you folks. I've owned the same gasoline lantern for at least 15 years, and going strong. I'm about to replace the stove—with another Coleman, but that's because I'm messy, and too lazy to clean it. It is interesting to note that other companies have marketed similar products in recent years, but have not at all improved upon the original design that Coleman has been selling. Also, Coleman sells replacement parts. You can buy a new generator pipe or valve, and get another 15 years of use out of a lantern or stove. This is unusual for an American co.

Outdoor Suppliers

An excellent list of practically all mail order outdoor suppliers (many more than we list) may be got from:

The Potomac Appalachian Trail Club
1718 N. St. N.W.
Washington, D.C. 20036

Recreational Equipment, Inc.

"The Co-op" as it's called, probably offers the widest selection of camping and climbing gear available in the U. S. They carry many outstanding lines of gear; sometimes confusingly too many (their catalog shows 21 different ice axes!) I fully recommend the French Millet rucksacks (especially the ones with tough canvas sacks and leather bottoms) and their own line of Cruiser packs... both good values. Some of their "special imports" (from Japan) are cheap in quality besides price. For instance rubber water-proof coating peeled off scree gaters after 2-3 uses but they took them back for full credit two years later.

Membership is \$1 and you get approximately a 10% dividend each year.

1-4952 BLANKET PINS - Large 4" safety pins for keeping covers on during cold nights, etc. Wt. 1 oz. \$.20

PONCHO/SHELTERS are made from completely waterproof ultra lightweight coated nylon material with a snap-up hood. Snaps are provided along each side spaced approximately 2"-3" apart so that each side can be snapped closed without side leakage as is common with ordinary ponchos. Also these snaps allow pairs of these ponchos to be snapped together with any other size, and these can be set up either as an inverted V-shaped tent or a lean-to shelter. Grommets are provided at the four corners and at the mid-points of the sides. Wear your shelter during the day as a poncho and use your poncho as a shelter at night.

- 6-5428 PONCHO/SHELTER, Large. Size 106" x 63", for persons over 5' 8" tall. Wt. 1 1/4 lbs. \$17.50
- 6-5429 PONCHO/SHELTER, Long-Tailed Medium for over-the-pack. Size 106" x 52". Wt. 1 lb. \$16.50

HARDLY

By the time they got to the little community of Hardly, three miles down the road from Godsey's store, it was light enough outside to see the barns and houses they drove by. As far as David could tell, Hardly hadn't changed a bit since he used to come there on Saturdays to the stock sale as a child. Mooney's store and filling station were on the left exactly as they had always been, and beside them Harold Campbell's Feed and Grain. On the right were the rows of stock pens, and the old run-down house at the end where missionary ladies used to sell second-hand clothes. Across the road from the second-hand store was Mable's Place, and beside it, set back from the road a ways, was the old flat-roofed, red brick-sided Pentecostal Church of God. The place was so still that hour of day it looked more like a movie set of Hardly than actually Hardly itself. David wanted to stop the bus and get out and walk around.

He asked D.R. if that would be all right. D.R. was sitting in the front again, but he was sullen now and didn't have much to say. "Come on," said David. "Just for the hell of it. There's nobody out there."

But D.R. didn't want to, and David didn't want to push. He drove on, and a few minutes later pulled up in front of Mrs. Godsey's store at the mouth of Trace Fork.

Herter's

If we gave a prize for most-suggested item, we would have to award it to Herter's, the people's choice (maybe 30 suggestions, 15 or so reviews). Everybody says their prices really are low and their quality good on a truly unusual range of products. And Herter's indeed puts out the most entertaining catalog in the business (\$1.00 until you're a regular customer; 656 pp.). At mail order distance it's a giggle, all those inflated boasts and fierce gun and trap write-ups and between-the-lines patriotism. We visited their showroom in Minnesota a summer ago, and in the presence of their guards and threatening signs and shoddy goods on display—well, up close we stopped laughing. [By the way, I could see people doing very similar takes on the WHOLE EARTH CATALOG—we pretend to be a consumer service, but it's just a front for fuzzy-headed apologism for dope and sex and subversive activity. No wonder I'm freaky about Herter's. We're sisters under the skin.]

HERTER'S COTTONTAIL RABBIT FLUSHER

FLUSH COTTONTAILS FROM ANY TYPE OF COVER

tails in brush and grass without getting them up.

Our call is loud and piercing and will get them up in about a 20 yard circle. Just right for good shooting. Takes only minutes to learn how to blow it.

The main problem in cottontail hunting is to get them out where you can get a shot at them. Unless you have a good rabbit dog or there is fresh snow on the ground, you walk right past cottontails.

HERTER'S GENUINE HUDSON BAY WILDERNESS ICE CHEST

THE ONLY ICE CHEST ENDORSED BY THE INTERNATIONAL GUIDE ASSOCIATION

You will see it in Africa as well as in Asia and in Canada, and it went up Mount Everest. This is the only ice chest endorsed by the International Guide Association. This ice chest is made for the serious outdoorsman who must have a chest that will stand up under the hardest use and one that honestly will keep food fresh for weeks, not just days.

The outside of this chest is made of durable duraluminum. The insulation is genuine epofam a full inch thick. It gives over four times the insulation of fiberglass. The cover is also insulated with a full inch of epofam. This cover has over six times the insulation of any ice chest. Handles are not cheap metal stampings but solid cast duraluminum handles that lock the cover tightly in place with a ball bearing roller. These handles are the only genuine heavy duty handles on any ice chest. They are made so they cannot cut your hands as you lift the chest. You can

Hurter's

I realize there are many good things about Herter's. Yet I feel there are much more important things about them that should be brought to your attention. In 1970, Herter's was fined \$15,000 for hiring, or paying poachers for killing an almost extinct Indian bird, illegally importing them, so they could use their feathers for fishing lures. . . .

I would also like to bring to your attention that Herter's sees wildlife as a product to be consumed, not honored. This is repeatedly brought up in their own catalog, those guns and traps you talked about.

Thirdly, Herter's exploits the people who work for him by the fact that he underpays the workers, and has little if any interest in them. He doesn't even insure his help while they work for him. It seems ironic that he should produce a book on how to get out of the rat race, when he himself is making a very good living off it.

Again, I would like to tell you that I really think you have a good thing, but please make it a little better. . . . please?

A local Wasecan

P.S. I may be a farmer & can't spell well, but I also love the animals and plants that share my farm.

Thank you.

4 **DEERSKIN FACE MASK** - Soft to the touch, windproof and washable. One size fits anyone; wide elastic headband; essential for frostbite protection. More compact than any other mask; will fit in your shirt pocket. Tan.
Cat. No. 651 Wt.: .11 lbs. \$4.00

6 **COLLAPSIBLE WATER JUG** - tight seal with spigot for carrying water over long distances; polyethylene; 2 1/2 gallon capacity; can be folded flat repeatedly without damage.
Cat. No. 505 Wt.: .50 lbs \$ 2.00

A SENSE OF DANGER

D.R. stayed in the car while David went up on the store porch to talk to Mrs. Godsey. The store wasn't open at that hour, but Mrs. Godsey lived in the rooms behind it and David knocked on the door till she came through and answered. D.R. was so terrified Mrs. Godsey would see him he hunkered down low in his seat while she and David stood facing each other, talking about death and heaven and God.

(continued)

The New Cross-Country Ski Book

I'm really irked. your January, 1971, issue mentioned cross-country skis as being "awkward" (article on snowshoes). Falsa. Ski touring is the best, quickest, most healthy, and most beautiful way to travel across the snow. And right now, before the big industries exploit the market, good equipment is still very cheap. A pair of cut-down army-surplus touring skis run from 50¢ to \$5.00 in your local Army-Navy.

I don't know if it snows in California, but in New England half the year involves snow. Why not mention cross-country skiing, not just as a fun sport, but as the smartest way to get about during the winter months? It's a way of life in Scandinavia. Speaking of ephiphanies, give touring a try. It's better than acid. And it's ecological.

The best, and still cheapest, handbook is Johnny Caldwell's Lots of pictures, and the words of an expert—the US Men's Cross-country Ski Coach, and a devout Vermont farmer in his spare time (during the Sugaring Season, anyway). All you need to know to get going and to love what you are doing. I don't care what you say, but MENTION CROSS-COUNTRY SKIING. Not all your readers are summer people!!!!!!!

If you're already skiing x-c and are perfectly happy with your technique, OK; don't be dumped by this chapter. I've seen a lot of happy golfers or tennis players go sour after trying to "improve their game." Enjoyment by the participant is the most important aspect of sport, to my way of thinking. So for you at this stage, why not approach method as a means of increasing your pleasure, and not as an end in itself?

Akers Ski Equipment

Unfortunately there are still not many stores that sell cross-country equipment and those that do overprice equipment and don't have a very good selection.

Akers has a good variety of boots, skis, poles, wares, etc., at reasonable prices. They are also amazingly prompt in filling mail orders. A pair of skis we ordered arrived within the week.

Snowmobiles

Snowmobiles have waked the frozen north out of its hibernation. Some eskimoes have traded in their dog-sleds on snowmobiles and fashioned fuel filters out of driftwood when necessary to keep them going. Among off-road vehicles snowmobiles cause the least ecological damage provided you don't go bashing the bush tops. The worst damage they do is bringing clutter and haste to still winter woods. Manufacturers are precisely irresponsible for not quieting their engines. As soon as a quiet one is built, buy it and boycott the others.

Ski-doo is the most economical-dependable-popular of the 50 or so snowmobile makes. They have a dual track that looks good for winter hauling.

We're listing Sno-Scat here because it's the only snowmobile kit we've seen. Don't know about its performance. The manufacturer also has kits for little tractors (including caterpillar) and all-terrain vehicles.

No. 19. The x-c way to climb a hill: ski up the thing.

Snowshoes

Winter in the woods. Snowmobiles too noisy, ugly and maybe fuck up the ecology. Cross country skis dandy but too awkward for working (Cutting trees, working in brush, etc.) Best snowshoes I've ever seen are Walter York shoes. Better made than Canadian shoes which are the most often sold. York starts by cutting and drying his own ash. Steams and bends the ash. Makes his own rawhide and his own harnesses. The shoes are fucking beautiful. Light and very strong. Good tools. He'll even sell you shoes with turned-up toes (Alaska type) but you'll have to persuade him because turned-up toes slide you backwards down hills. He also reluctantly admits that neoprene is maybe better than rawhide for webbing because wet snow don't stick to neoprene. He sells both. Prices about comparable to usual prices. Abt. \$30 plus \$4 for the binding. He custom makes shoes to order and specific need. (Heavy people need bigger shoes. Some people want a quick-release harness etc.) He says he fixes shoes too but he hates to work on Canadian ones. After using his shoes, I can't blame him.

Good luck to the Catalog & Godspeed,

Complete information on ski touring, trails, clinics, and clubs can be obtained by sending \$2.00 to Rudolph F. Mattesich, President, Ski Touring Council, Inc., West Hill Road, Troy, Vermont, 05868. We recommend this for all ski tourists.

The air should be emptied from the lungs with a great, big, powerful whooooooshh, thus emptying the lungs of the carbon dioxide which has accumulated from the strenuous physical exercise. The skier should not even be thinking about breathing in. If the air is forced out of the lungs, the lungs will draw the breath in quite naturally on their own and in a very comfortable and invigorating manner.

If the skier can acquire the habit of emptying his lungs in this manner thus getting rid of the excess carbon dioxide, the way his stamina in skiing will increase will be almost miraculous.

Beck Neoprene Bindings

Leather bindings for snowshoes and crampons stretch and freeze up. Beck's neoprene bindings don't.

—SB

Bruce Beck
Box 3061
S. Berkeley, Calif. 94703

REGULAR MODEL makes use of the design used widely over this continent by trappers, lumberjacks, and real outdoorsmen—men who sometimes must be on snowshoes 25 hours a day. We have replaced their leather straps with neoprene-nylon, which lasts longer and doesn't stretch. We have added riveted tabs for adjustability in the arch area, and special length-adjusters where heel straps attach to snowshoe crossbar. Three buckles per shoe (heel strap buckle shown in photo No.2). All ends pointed, all notes punched clean. Standard size shown, the first item on page 1 list. 7.00 ppd.

When the dog is traveling well, he may still stop when the drag strikes an obstacle or catches on something. This is where he learns to pull. If you think he can break it loose with no assistance, use your "impatient" voice, "Rover, Okay, Okay" (or whatever forward command you use). Step forward so that there is slack in the long lead, and if the dog does not try to break loose the lead, flip it in a quick throwing motion— but not letting go of the end— so that the loose line slaps against his rear. If he makes any sort of attempt to pull, the drag will usually come loose and move again, and you have accomplished your first major feat; getting the dog to pull something he thought he couldn't pull, on your command. Tell him he is a good dog; keep traveling.

Novice Sled Dog Training

Alaska Wilderness

bob marshall's wanderings in the brooks range, with a good introduction that lays down the dangers of ramming a pipeline through the wilderness without knowing much about pipelines or wildernesses. ecology at the practical level.

-jd

Our routine in camp was the result of many a night out in the deep snow. We would start with nothing but two bundled sleds, a wilderness in which a shelter had never yet been erected, and more (Ernie) or less (I) personal competence to combine the two into something safe and comfortable. Our procedure generally began by Ernie tramping down with his snowshoes a space big enough to pitch the 9 by 9 tent, with a little extra room to prevent our sinking clear to our waists the moment we stepped outside our tent. Then we usually hitched the tent to trees by ropes at either end of the ridge, and stretched out the wall ropes to trees, shrubs, or specially cut poles, whichever happened to be most handy. Meanwhile I would hack down a green spruce for blocks on which to set the stove, saving the boughs to spread on top of the snow inside the tent. Ernie would cut more boughs, and soon we would forget we were roosting on snow, unless we happened to look under the stove.

Before we started out in the morning, Ernie always filled the stove with shavings, kindling, and dry sticks of wood, so that once it was set up and the stovepipe attached at night, we would have a roaring fire in a few moments. Getting a fire started quickly was most important in really cold weather. Even in relatively mild weather the sooner the fire got going the better, because all cooking had to wait until we had melted enough snow to get the water we required. For melting the snow we used five-gallon gasoline cans, with one side cut out. Each night we used three of them, half full of water, two for cooking dog feed and one for ourselves.

But with melting the snow our nightly task was far from finished. Wood had to be cut. The dogs had to be unhitched and tied to trees. Spruce-bough bedding had to be prepared for them. Then we had to take in our own bedding and spread it out on our boughs. We had to scrape the snow from our socks, overalls, and moccasins, and hang them up to dry. When a little of the snow was melted we started the tea water, and after that the rest of the supper. While we were eating and afterward, the dog feed would be cooking. After supper there would be dishwashing, sewing, repairing snowshoes, and—most tedious of all—crawling, head first, into a sleeping bag to change films in total darkness. When the dog feed was done we would take it outside, pour it into separate pans for each dog, and let it cool. Just before going to bed we would serve it.

This may sound like a lot of work, and actually we were kept busy until ten or eleven o'clock. Nevertheless these evenings were very pleasant. Ernie was a simple but excellent cook, and the meals he prepared added real joy to our life after a day of mushing. The *piece de resistance* of our suppers was always a pot of boiled meat. Ernie believed it essential for healthy camp life to avoid too much frying, and above all to avoid burned grease. The meat was tender sheep, which Ernie had shot late in the fall. With the natural cold-storage facilities of the Arctic there was no trouble in keeping meat all winter. We varied our suppers by boiling lima beans, peas, dried vegetables, rice or macaroni with the meat. One potful lasted us for two nights. On the second night it was only necessary to thaw out and heat what was left from the first. The same was true of fruit. We always had a pot of dried apples and cranberries cooked and ready for immediate use. The only fresh cooking necessary for supper on the second night was tea, biscuits, and sometimes rice or macaroni.

Hunters of the Northern Ice

For anyone wanting to stay alive around ocean ice this book is necessary: otherwise it is merely fascinating. Nelson was an eskimo for the U.S. Air Force. He spent four years engaged in the seal hunters' life accumulating polar survival lore and respect for Eskimo endurance and ingenuity. His report is as dense and pungent and nourishing as good pemmican. Every sentence tells you something about ice formation, ice movement, finding open water, weather forecasting, cold injury, ice camps, bird behavior, game habits, hunting techniques . . . survival in terrain without margin.

-SB

Hunters of the Northern Ice
Richard K. Nelson

University of Chicago Press
5801 Ellis Avenue
Chicago, Ill. 60637

Unlike the westerners with whom he has contact in modern times, the Eskimo seldom doubts what he has been told by others, especially if they are his elders. Thus, without previous actual experience in a given situation he will unquestioningly respond to it in the way that he has been told. The outsider, on the other hand, continually frustrates the Eskimos by doubting these instructions and attempting to formulate original solutions which he believes to be better. Those who live with Eskimos over a long enough period find themselves questioning less and less, and following whatever they are told to do by their more experienced native companions.

Returning to the ice apron after retrieving a seal with an *umiahaluqak*. The man at the left spreads his legs wide to prevent his breaking through the thin ice. He will use the hook of his *unaak* to draw the boat up onto the ice.

There is one other attitude of the Eskimo which seems to be adapted to his economic life. This is his ability to find genuine humor in misfortunes that befall him, or in his own errors. It is sometimes explicitly stated that a hunter should laugh when things go wrong, because anger never helps him, while laughter makes him better able to overcome setbacks. In an environment where so much can go wrong, and it is so easy to lose something that has nearly been gained, such an attitude is almost a necessity. If a hunter has shot a bearded seal, and when the harpoon is tossed it glances off just as the animal sinks, this is an occasion for laughter, not for disgust. The old hunter, Kavik, never tired of telling stories of his exploits, and he would sometimes laugh until tears glistened in his eyes when he told of his greatest and most frustrating mistakes.

HACKSAW BREAD KNIFE

Up on higher ground where the soil is mixed with sand and well drained, I plant my potatoes early in June, for I depend on the late crop to put away for the winter. We grow very fine potatoes here in the woods and they have a flavor all their own, especially when baked in the ashes of a campfire. There is quite a trick to cut seed potatoes, for you get a better yield if you cut them so that you get the eyes on the flower end and in the middle instead of the stem end where the potato was attached to the plant. When the time comes to harvest the crop we have to watch for sudden cold rains which make the potatoes soggy. Another thing is that if potatoes lie in the sunlight for any length of time after digging they turn green and are not much good. For keeping through the winter, potatoes should be stored in a dark dry place where the air circulates freely, but they must always be protected against freezing.

WILDERNESS EDITION

Life in the North Woods

JOHN J. ROWLANDS
Illustrated by **HENRY B. KANE**

Another sign that may mean stormy weather is that earthy, rainy smell you sometimes notice before a storm, especially near a muddy pond or marshy place. Some of this odor, which at times is very unpleasant, is caused by marsh gas escaping from the mud at the bottom of the pond, where it is formed by rotting vegetation. This gas is most likely to bubble up from the bottom when the atmospheric pressure is low as it usually is before a storm. When the pressure is high and the weather clear most of the gas is held at the bottom. When I was a boy I would row out on a pond and drive a pole into the bottom and touch a match to the gas when it came to the top in the form of bubbles. Makes quite a flare for a second or so. In addition to gas, low atmospheric pressure has a tendency to keep odors close to the ground, which accounts for all kinds of strong woods scents, including the musky smell of animals just before a spell of bad weather.

Arrangement of Coltsons, Pumps, Sluice, and other Equipment.

D.R. was too far away to understand all they said, but those three words ran through their conversation like a refrain. "Death," said Mrs. Godsey, and David smiled and said, "Yes mam, and God and heaven too." Mrs. Godsey's face was lined with age, but her voice and gestures were as vigorous as David's. She had long, white hair, gathered behind her in a bun. Dressed in a long, white robe, she looked like some Old Testament prophet just stepped out of the Bible she carried in her hand. "God and heaven," she said. David said, "Yes mam, and death too." David seemed to be enjoying himself immensely. He leaned against the wall, his hand spread out on a sign advertising Bruton's Snuff. "Death and heaven," he said, and Mrs. Godsey nodded and said, "That's right, honey. And God too. We mustn't never leave out God." Once when Mrs. Godsey glanced toward Urge, D.R. got so scared he lay down across the front seats and hid till David came back to the bus ten or fifteen minutes later. "Come on," said David. "We have to walk the rest of the way." D.R. asked how come. "You can't get a car up Trace Fork any more. We have to walk." D.R. said he wasn't going. "Sure you are," said David. "Come on, it's only a mile to the homeplace." D.R. said he refused to leave the bus till he had some kind of protection. David looked at him and asked him what he was talking about. "You and Mrs. Godsey were up there talking about me," D.R. said. David laughed. He'd been standing outside the bus, but now he got in and established himself in the driver's seat. "That's a very weird thing to say, D.R." "I don't care if it is," said D.R. "It's true." "You don't know that," said David. "And even if it is, what difference does it make?"

(continued)

Camping and Woodcraft

How could anything written in 1916 still be so useful? One, it is a masterwork. Two, in Kephart's day when you went camping you really disappeared, so there's a valid nostalgia factor. But the main thing is, the book survives on its wealth of specific practical lore. Game: find the information that is outdated, sort it from the information that is correct and available nowhere else.

Fig. 185.—Splicing thongs

Men working hard in the open, and exposed to the vicissitudes of wilderness life, need a diet rich in protein, fats (especially in cold weather), and sweets. This may not agree with theories of dieticians, but it is the experience of millions of campaigners who know what their work demands. A low-protein diet may be good for men leading soft lives, and for an occasional freak outdoorsman, but try it on an army in the field, or on a crew of lumberjacks, and you will face stark mutiny.

Rabbits are unfit to eat in late summer, as their backs are then infested with warbles, which are the larvae of the rabbit bot-fly.

Green Corn.— If you happen to camp near a farm in the "Roasting-ear" season, you are in great luck. The quickest way to roast an ear of corn is to cut off the butt of the ear closely, so that the pith of the cob is exposed, roast it out a little, impale the cob lengthwise on the end of a long hardwood stick, and turn over the coals.

Skilligalee.— The best thing in a fixed camp is the stock-pot. A large covered pot or enameled pail is reserved for this and nothing else. Into it go all the rag-ends of game — heads, tails, wings, feet, giblets, large bones — also the left-overs of fish, flesh and fowl, of any and all sorts of vegetables, rice, or other cereals, macaroni, stale bread, everything edible except fat. This pot is always kept hot. Its flavors are forever changing, but ever welcome. It is always ready, day or night, for the hungry varlet who missed connections or who wants a bite between meals. No cook who values his peace of mind will fail to have a skilley simmering at all hours.

A woodsman, on the contrary, walks with a rolling motion, his hips swaying an inch or more to the stepping side, and his pace is correspondingly long. This hip action may be noticed to an exaggerated degree in the stride of a professional pedestrian; but the latter walks with a heel-and-toe step, whereas an Indian's or sailor's step is more nearly flat-footed. In the latter case the center of gravity is covered by the whole foot. The poise is as secure as that of a rope-walker.

It is not nearly so much the "make" of rifle as the load it takes that determines the gun's shooting qualities. So, choose first a cartridge, then a gun to handle it.

BENDING WOOD.— Small pieces of green wood can be bent to a required form by merely soaking the

Fig. 54.—Spanish Windlass (for bending wood)

pieces for two or three days in water, but if it is desired that they should retain their new shape, they should be steamed.

Oleomargarine, largely because it keeps so well, is recommended for general wilderness use. To cut hard margarine or butter cleanly, use a knife that has been heated in hot water.

To protect yourself from popping hot fat, stop the spattering by sprinkling a bit of flour into the frypan. If the grease catches fire, throw a handful of flour on it or extinguish the flames by covering the burning fat and shutting out the air.

In Alaska, all animals leave for the snow-line as soon as the mosquito pest appears, but the enemy follows them even to the mountain tops above timber-line. Deer and Moose are killed by mosquitoes, which settle upon them in such amazing swarms that the unfortunate beasts succumb from literally having the blood sucked out of their bodies. Bears are driven frantic, are totally blinded, mire in the mud, and starve to death. Animals that survive have their flesh discolored all through, and even their marrow is reduced to the consistency of blood and water. The men who penetrate such regions are not the kind that would allow toil or privation to break their spirit, but they become so unstrung from days and nights of continuous torment inflicted by enemies insignificant in size but infinite in number, that they become savage, desperate, and sometimes even weep in sheer helpless anger.

Fig. 68.—A Masked Camp

Trees and Lightning.— I have never seen, nor heard of, a beech tree that had been struck by lightning, although beeches are plentiful on many battle-scarred mountains where stricken trees of other species can be noted by the score.

One glance at a camper's fire tells what kind of a woodsman he is. It is quite impossible to prepare a good meal over a heap of smoking chunks, a fierce blaze, or a great bed of coals that will warp iron and melt everything else.

Skills for Taming the Wilds

Bradford Angier's outdoor books are generally thin, sketchy, and repetitive from book to book. This appears to be the least diluted one. Applicable mainly to north-woods, where indeed Angier has lived for many years.

Water Cress (Nasturtium)

Stopper Knot

When campfire or cabin smoke, after lifting a short distance with the heated air, beats downward, it is a sign of approaching storm. On the other hand, steadily rising smoke prognosticates fair weather.

Pockets are so handy in the outdoors that special attention should be paid to their deepness and ruggedness when buying clothing for the woods. Because of the danger of losing your already limited essentials, it is well to get most or all of these with fasteners.

It usually requires a disproportionate amount of energy to travel straight up and down hills, as the trails of animals reveal they well know. You generally will do better in the long run either to zigzag or to slant off at a gradual pitch. Energy will be conserved if you can proceed without cutting across major drainage systems. As for resting, this is more beneficial when enjoyed frequently for brief periods. Hurrying ahead for long stretches and then taking prolonged breathing spells tends to cause the muscles to stiffen.

Telling Direction by Watch and Sun. When the hour hand points directly toward the sun, south lies midway along the smaller arc between the hour hand and twelve o'clock.

Wildwood Wisdom

this is the only book of wilderlore i've ever read from front to back, mainly because one third of the book is pictures, and i got sucked from one picture to the next, all the way through, jaeger assumes that you are in the wildwood because you want to be, and that the woods dictate as much a style of living as do the sidewalks of omaha, if you are going to live anywhere, do it with style, like an indian, with decorum, simply, carefully, quietly, but with style.

-jd

Colorful blankets, striped or in plain colors, may be cut up into the patterns shown in the drawing. The front is made in two parts, the back in one. The wide circular collar is made double thickness. Large patch pockets are sewed on the front sections before the coat is stitched together. The equaletlike pieces of blanketing at the shoulders are placed there to act as drains, so that the rain will not soak in at the shoulder seams. Coarse blanket fringe may be stitched on at the front and back, as well as the belt loops, if desired. Double-stitch the front and back together at the shoulders. Sew the sleeves and the epaulets double at the armholes, and double-stitch the circular collar to the coat proper. If a belt is wanted, sew double thicknesses of the blanket together about four inches wide. The belt may be fastened with buttons or it may be made long enough for a sash. A colored yarn tassel ball may

be attached to the belt ends. Buttons and buttonholes must be provided on the front and on the patch pockets.

Now stitch the sides of the coat and the sleeves, starting at the bottom and continuing upward and along the sleeves. Turn up the cuffs of the sleeves to the desired width and fasten them with a few stitches. A french-Canadian capote, or hood, may be added, and the illustration shows how it is made. This fits over the upturned collar and may be fastened to the collar with a few small buttons, or it may be worn by itself and held with tie-strings under the chin. This briefly completes the job; and a colorful, picturesque, and very warm addition has been made to your outdoor wardrobe, one which can be worn for many years.

The Golden Book of Camping

As usual, wonderfully clear information from Golden Press. I'd have put this book in the Learning section of the CATALOG only it has better camping information than the authoritative tomes here. Some tips I've never heard anywhere before. Profusely illustrated. I can hardly wait for the Golden Book of Dope.

Being Your Own Wilderness Doctor

My husband suggests you include *Being Your Own Wilderness Doctor* by good old B. Angier and Dr. E.R. Kodet. The medical guide is very up-to-date, better than in *How To Survive In The Woods*, we feel. It is written with the problems (probably) encountered while hiking back in, etc. It is one we want to add to our personal library as soon as \$ allows. In the front is a quick-reference index of stuff. While the supra-organic finks won't be too keen on it because of its emphasis on new drugs, the rest of the info provided (sprains, dislocations, fractures, stitches, etc.) certainly would be useful. I worked two years in a hospital emergency ward and to me, this is about the best emergency guide I've come across that is written for non-medical people.

or WHOLE EARTH CATALOG

The following medicine chest should be adequate for a longer stay, or when several people will be in the party. Double or triple the quantities of drugs suggested for the light kit. Otherwise, make up as follows:

- Aspirin— 100 tablets will be a good idea.
- Aspirin with codeine— twenty-four.
- Darvon Compound— Eighteen tablets in addition to the above codeine will be adequate.
- Compazine— twelve.
- Lomotil— Thirty-six.
- Sulfasuxidine— Fifty tablets for one individual, one hundred for several.
- Bismuth and paregoric— eight ounces, mixed in equal parts.
- Probanthine— Thirty-six.

Pyridium— Eighteen. Take one every four to six hours. If this causes stomach irritation, take with food, otherwise as needed. Pyridium will stop all urinary burning and distress. It will color the urine red.

Gantrisin— Fifty. These are for treatment of a urinary tract infection, as well as for the continued treatment of strep infections, pneumonia, and the like. They can be used if only a few antibiotic tablets are carried, and the condition requires additional treatment. Some individuals are sensitive to sulfa. Gantrisin should be discontinued if there is rash, fever that comes and goes when the sulfa is used, or nausea or vomiting.

Erythromycin— Twenty-four or thirty-six tablets, depending on the remoteness and the number of people.

Pyribenzamine— Thirty-six.

Dexedrine— Twelve

Cortisone (prednisone)— Thirty.

Sterile vaseline— One tube.

Baciguent— One one-ounce tube of this antibiotic ointment should do.

Zinc oxide— One tube, for chapped lips or for mixing in equal parts with Eugenol to make a temporary filling for a tooth.

Eugenol— One-quarter ounce bottle will be adequate.

Oil of cloves— small bottle, as only a few drops are needed for toothache.

For surgical supplies, it is suggested that you take both a two-inch and a four-inch Ace or similar elastic bandage. Although optional for a short trip, these are very handy for holding splints, etc.

The amount of gauze and tape to pack along is optional, particularly as it is always possible to improvise. For a long stay, two packs of each type of suture material are recommended.

You'll want a thermometer. Check this before taking a temperature and first shake its mercury down, if necessary.

There is no absolute normal temperature. Ignore the red marks on the thermometer. They do not mean fever unless the temperature is over 99.6°. Keep the thermometer in a case and out of the sun. In most cases, a temperature taken under the tongue or armpit will suffice.

Costs

Eighteen dollars should do it for the light kits, plus several dollars more for the snakebite kit with suction cups. Add eight to ten dollars for antivenom.

Fire Without Matches and Books

A browseful hour spent with the WE catalog indicates that some readers are on the fire-without-matches kick. For what they're worth, a few suggestions.

Ordinary household steel wool, of the kind available in any grocery store, is the best tinder ever invented (if you really want to go first cabin, get the extra-fine kind that cabinetmakers use). Scratch a spark into a small glob of steel wool and watch it glow! Wrap the steel wool in a fist-sized glob of dried grass (say), blow on it for ten seconds, and presto! Instant fire.

And where do you get the sparks for the above process? From a cigarette lighter, man! A cheap cigarette lighter, used without fuel, provides an excellent source of sparks. Some spare flints can be carried inside the lighter, down where the cotton filler is located, and you have a lifetime source of sparks— so much handier than a hunk of quartz and a broken file. Of course, you can fill your lighter with fluid if you want, but that takes all the fun out of it...

And now a real survival item: the reflector in a flashlight (head-light, etc.) can start a fire for you on a sunny day. Simply take your flashlight apart, aim the reflector toward the sun, and poke a bit of tinder up through the hole where the bulb fits (a cigarette works fine), extending it no more than half-an-inch (less may work better) and presto! again. (You don't actually get fire this way; what you get is a lighted cigarette which, with patience and tinder like steel wool or dry grass should make fire for you...) This, of course, is an adaptation of the "Solar cigarette lighter" that was common in novelty shops a few years ago.

Wilderness Camping

A magazine by this title is starting up. \$3/yr (bimonthly).

Wilderness Camping
Box 1186
Scotia, N.Y. 12302

"Mrs. Godsey wants to see me dead," said D.R. "I've known that much all along."

David shook his head, as if from profound sadness. "Well," he said. "Personally, I think we ought to quit thinking about ourselves and put our minds on Emmit. He's the one we've come down here to help."

"He's probably in on it too," said D.R. "And you are too, and I know Virgil was."

David looked at D.R. grinning. "You want to know what I think?" he said.

D.R. waited for him to say.

"I think you're stoned on your ass." He laughed, but D.R. was not amused. "All I know," said D.R., "is I don't trust you for a minute, and I'm not getting out of this bus till I feel protected from all this bullshit going on."

There was a little silence between them then, and in it David's tone and manner changed. When he spoke again his voice had a new edge, a touch of cold impatience. "Let me ask you a question," he said.

D.R. waited for him to ask it.

"How'd you like it if I went in and got Mrs. Godsey, and told her to come out and talk to you about the bullshit. How would that be? I'll go in and tell her you're feeling a little bad out here and ask..."

D.R. didn't wait for him to finish. He had seen the evil in David's eyes, he knew for sure now that David was in on it, and that he must run to get away or he would die. Without looking at David again he flung the door open, leaped out and took off running, with David chasing after, close behind.

Good pack horses and mules can carry a pay load of 200 pounds when expertly packed. One hundred and seventy-five pounds should be considered a maximum load on one's first trip. The pack train can be counted on for 15 miles a day on good trails if it keeps pushing. These animals walk at a good clip and, unless their handlers are fast hikers, all personnel should be mounted. This becomes more important as the size of the party increases. Mules are led singly by pedestrians or are tied in groups of not more than five animals and are then led by a man on horseback. This is the "string" of the professional packer.

In addition to standard equipment, it will be wise with preschool-age children to take along some portion of the home environment whose value is purely emotional, even at the expense of inconvenience and irreparable damage to the articles; these might be, for example, teddy bears, toys, books, familiar clothes, or eating utensils.

At Home in the Wilderness

As a preference of weapons, I like a .22 bolt action rifle for providing the weekly meat larder with small game. I prefer this to automatic as you are not as inclined to waste shells. When deer or big game hunting, I like a 30-30 for open country and use a shotgun in brush country with slugs or buck shot. Sometimes in the brush country, when deer hunting, I still carry a slingshot for small game. Instead of old auto inner tubes, I use a surgical rubber for the slingshot. The new type of inner tube does not have the stretch that the old post-war tubes had. Many a ruffed grouse, gray squirrel or rabbit has found his way to my table, thanks to the slingshot. Back during the depression—W.P.A. days, there was hardly an Indian working on the road crew that did not carry a slingshot to get a little camp meat.

The Book of Survival and The Survival Book

One barometer of people's social confidence level is the sales of books on survival. I can report that sales on The Survival Book are booming; it's one of our fastest moving books. What's weird is that it's almost pure romance to buy The Survival Book, which is an excellent handbook for Air Force pilots downed in remote regions. The other book we list, The Book of Survival, is far more practical and far better organized. The threats it deals with are closer and realer: burning buildings, freaked humans, speeding cars, dogs, floods, electricity, poison—genuine homely hazards. From what we can see, people are less interested in survival and more interested in the return of the frontier or maybe a sudden desert island. Fat chance.

DO'S AND DON'T'S FOR THE TRAVELER IN ARABIAN DESERTS

Here are a few of the most important don't's. In general they apply to the deserts everywhere.

- Don't reprimand an offender in front of other people.
- Don't draw sand pictures or maps with your foot—stoop down and draw with your right hand.
- Don't swear at a native.
- Don't expose the soles of your feet to others. Sit tailor fashion or on your heels.
- Don't ask about a man's wife.
- Don't throw a coin at a man's feet. That is insulting.
- Don't try to gamble. It is forbidden.

And here are a couple of Do's worth remembering. Do have patience when dealing with desert people. Do act friendly.

sand dunes in the Gobi Desert

A "Panic Panel", 20" square, weighing 13.5 lbs., containing a fire extinguisher, a first aid kit, poison antidote, a resuscitator, an aerosol spray, an emergency bar, a torch and batteries and candles and matches, is now on sale in the USA. At least once in life, every man, woman and child should know (1) the feeling of complete dependence on the bounties of nature, (2) hunger and hardship, (3) the meaning of total self-dependence, and (4) the personal inventiveness required to wrest a living from nature. Each should have the opportunity to learn the use of his own two hands in making necessary items for comfort and survival in nature.

Few of us ever depend upon our own skills and resources for our needs. We depend, instead, upon the manufactured items of our

OUTDOOR SURVIVAL SKILLS

civilization to the extent that it would be nearly impossible to conceive of a life without them. We marvel at the ability of Stone Age people to survive under such adverse conditions as they were usually found. We envy somewhat their ability, and deep down inside of us we hold a secret fear that somehow, someday we may find ourselves in the same situation as these primitive folks. Even worse, we may find ourselves lost in a wilderness without food, water, shelter or even the know-how to provide them. We fear the thought of getting along without our "gadgets."

Survival Arts of the Primitive Paiutes

This book is about people living in equilibrium with their environment. They probably had no words for garbage or waste because they used everything— cattail, tule, willow, rabbit pelts, buckskin, sagebrush bark, bones, rocks. Somehow the story of how they did it, which is told with simple words and ungimmicky photographs, reflects the expanse and serenity of the Great Basin environment and is beautiful.

Shoveling hot coals from the breakfast fire onto the small, brown pinenuts in the winnowing tray, she began immediately to bounce and turn them, keeping them in constant motion to protect the basket from becoming scorched.

When the nuts hissed and popped somewhat like popcorn, she knew they were cooked. This first roasting leaves the meat soft and translucent.

When the boat was completed, Jimmy stepped in the center to form a deeper hollow. The finished boat was eight-and-a-half feet long but so light that it could easily be lifted with one hand.

To play the game, two people on one side each concealed a pair of sticks or "bones" within their closed fists. One bone of each pair was plain, the other ornamented. The guesser on the opposing team had to choose in which hands the unornamented sticks were hidden. If the guess were correct, his side was awarded a tally stick. If not, his side lost a stick. The side winning all ten tally sticks claimed all the bets. The singers opposing the guesser shouted, waved, and beat the logs to confuse him, but he sat quietly, apparently oblivious to the distractions, concentrating on his choice. It is remarkable how often a good guesser won. Winners were never congratulated, nor were losers ever consoled. The game is still played in the Great Basin with stakes often running into hundreds of dollars.

The 10 Bushcraft Books

... it's sort of a how-to-do-it-in-Australia, which turned me off at first until I read it a little more thoroughly. The problem with most books on this subject which are available in this country is that they are basically dilettante's manuals; they tell you how to live in the open for a week or two, but always presuppose that sooner or later you're going to go back to your Telegraph Hill apartment and take a nice hot shower. Australia, however, is a different scene, more like the U.S. a hundred years ago, when quite large numbers of people were accustomed, for various reasons, to living out of doors for most of the year. And that, I take it, is what more and more of our brothers and sisters are doing or thinking about doing (or have to do.)

A TOOTHLESS MOUTH

Half a mile up Trace Fork from the store D.R. stopped to hide and rest a while behind a rusted hulk that used to be a '47 Ford. There was a four-room house with the roof caved in half-hidden in the weeds behind he might have gone to, but D.R. was scared to go to places he couldn't make out clearly with his eyes. He hadn't seen David behind, or heard him, in several minutes now, but he knew that he was somewhere close around. David had been right behind him the first several hundred yards, but then D.R. had left the road and plunged over the bank into Trace Fork creek and David hadn't followed. D.R. didn't stay in the creek. The banks were thick with weeds for David to hide in, and the water was slimy-yellow from the strip mining operations at the headwaters. D.R. slogged up the creek for perhaps a hundred yards, then scrambled up the bank again and hid behind the corpse of the old car.

D.R. knew he was close to the homeplace now, but the hollow the creek flowed through had been so disfigured by the strip mining he didn't see a feature on the landscape that he recognized. The ridges where the Trace Fork waters gathered were so uniformly scarred they looked like rims of craters on the moon. The guts of entire mountains had been ripped out and strewn about like so much worthless slop. Every roll and fold, every feature of the drainage that might have framed a context and established where the homeplace was had been torn away by bulldozers or smothered by fathoms of overburden. A slope that might have been the lower pasture on the homeplace was littered by shattered rocks and jagged ends of broken trees sticking up like legs of mules slaughtered in some awful no-man's land.

D.R. heard a snapping noise behind, then David yelling, "Hey! D.R.! Where are you?"

His voice came from the old abandoned house not fifty yards away. It was as if the house itself had yelled. Its vacant windows were like eyes of some old dead man, its door a toothless mouth that never closed. "Wait up for me, okay?" yelled the mouth as David stepped through it and headed through the weeds toward D.R.'s hiding place.

Trail Food

Thought you might like a great recipe for survival food for anyone going off into the woods for a long jaunt— cross country ski trips, hikers, mountain climbers, cycle trips, snow mobiles, etc. It doesn't spoil, tastes not too bad, and it keeps forever— well, darned near it.

- 2 tablespoons wild honey (tame will do, but not the flavor)
- 2 cups oatmeal (or bran or wheat germ)
- 2-1/2 cups powdered milk
- 1 cup sugar
- 3 tablespoons of water
- 1 package jello in your favorite flavour (I'm partial to raspberry)

Boil the water and honey together, then add jello. mix dry stuff together, stir in water mixture. Mix well— probably with your hands. You might need a drop more water but don't add too much—it has to be dehydrated. You might like to add a little grated orange or lemon peel. Now spread the stuff into a 9 x 13 cake pan and put it in an oven at about 200 degrees. Leave the door ajar and let it "cook" for about six hours. Be sure to cook it that long or it won't keep. When done, let it cool and then cut it into 2" bars. Wrap them in foil and they will keep for years— Each is packed with energy— really one makes a meal. On a camping or back-packing trip you can crumble one and add boiling water and have a hot meal.

Good Tools That Shoot

The recent suggestions in the *Supplement* re: black powder shooting led me to attempt laying a double of heavy thoughts on you, one on cheap shooting, and one on a couple of good buys for communes who need game (and other interested parties.)

Reloading: All right, black powder is cheap. Also messy, and damn dangerous to keep around your pad. Also, from now on, you have to register it. If you want cheap shooting with some other advantages, try handloading, using the Lee Reloader (\$9.95 usually discounted to \$7-\$8, includes all the tools you need except some kind of hammer).

Advantages: 1.)— it's cheap; I shoot .30/06 ammunition that is just about as powerful as factory ammo only it costs me \$1.57 for 20 as opposed to \$5.30+ for 20 factory rounds. Using cast bullets for practice, it costs me 97¢ for 20. 2.) Hand-loads are more accurate. Want proof? All current records for accuracy were set using hand-loaded ammunition, in some cases using the 'cheap' little Lee Reloader. For me, 5 shot groups on my iron-sighted Springfield shrink from 2 1/2" (factory) to about 1 1/2" with hand-loads. 3.) You can load weights and styles of bullets not available in commercial factory ammo. Example, the Speer 165-gr. .30/06 bullet is the best all-round bullet for the '06, combining high down range velocity like the 150-gr. and high energy like the 180- and 220-gr.

What you need to reload: Principally, some time, a little patience and capacity for taking a very pains, some freedom from distraction while actually working and a tool with maybe a few accessories;

THE TOOL is the Lee Reloader, which comes with complete instructions, in any rifle, pistol, or shotgun size you need. It includes everything you need to reload ammunition for all guns with the possible exception of relatively weak lever actions, namely the Winchester 94's which are notorious for stretching brass badly. As a guide, if you can re-chamber the fired case and re-extract and eject it, you don't have to full-length resize your brass and can use the Lee Reloader. Should you have a gun that does stretch your brass too badly, either get rid of it or get the hand-operated full-length re-sizing dies that L.E. Wilson, Cashmere, Washington sells for \$9.95. Although I have some pretty complicated, sophisticated equipment, including bench press and scales, I use my Lee Reloader for almost all of my reloading because of its simplicity and reliability and effectiveness.

A FEW ACCESSORIES: The Lee Reloading manual tells you most anything you'll ever want to know about reloading for 98¢. The best reloading manuals are the Lyman ones, if you want to go big time, or load cast bullets, and they are \$3.95 for shotguns and \$4.95 for the combined Rifle-Pistol manual. Other worthwhile accessories include:

- The Lee Powder Measure Kit (\$3.95) includes enough different scoop type measures that you can load many more different loads than you can with the single measure in the Reloader Tool.
- The Lee Priming Tool, \$3.95 for rifles and pistols is quieter and easier to use than the system in the tool itself. You can get interchangeable bases too so you can then use the tool for many calibers.
- The Lee Crimp Starter for Shotgun Shells (95¢) is a MUST if you load shotgun shells with plastic bodies (and you shouldn't bother messing with paper shells unless you have to.) You will need two, the six- and eight-segment crimp starters.

While you don't really need other tools, there are two accessories that I like. One is the Pacific MESUR-KIT (8.95) which is a portable powder measure that is accurate to ± .2 grs. which is pretty good. You get a lot of versatility through combining charges (DO NOT FORGET THAT FOR EACH OPERATION OF THE MEASURE YOU SHOULD ADD ANOTHER .2 Grs. Probable Error), and it's good for large scale operations or quantity reloading and more convenient than the Lee dippers. A bullet loading block (out of plastic with holes big enough for your cases to sit in) helps operations by keeping cases segregated according to what step you are on. Finally, if you are a true accuracy enthusiast, the Target Model Lee Reloader at \$24.95 contains everything you need to reload ammunition that will be about as accurate as any in the world.

Finally, a note of caution and a suggestion: Don't use powders unless you know what they are, and don't buy advertised surplus powders unless they are sold by B.E. Hodgdon because otherwise they may not be what they are advertised and you might lose your head over the deal— literally! For advice, suggestions, and pretty solid opinions on reloading and shooting, the NRA has experts who will provide about all the answers you need for \$6 a year. It's a good investment, and like the man said, they do try to protect your right to have guns legally.

A SECOND SUGGESTION: Dempster on Good Gun Buys.

All right, so you've decided you've got to get a gun for some reason or other, including just the joy of owning a good tool. What you get depends on what you'll use it for. Here are some suggestions for some really good gun buys for the subsistence— dare we say pot?— hunter, the commune, and the guy who just wants a good gun.

There are two kinds of .22's and both are useful. If you only want target practice and an occasional squirrel or rabbit for the pot (yes a .22 will kill mouse but don't try it), get a .22 Long Rifle. If you want a cheap varmint rifle that really does enough power for anything smaller than deer up to 125 yards, get a .22 Winchester Magnum Rimfire (.22WMR) which up to 50 yards in a rifle with a careful chest hit will (illegally) do a deer in. For cheap target practice since the magnum ammunition is expensive, use .22 CB caps made by CCI. These CB caps and .22 Winchester Special are the only other kinds of ".22 ammo" that you can safely use in a Magnum. The best and cheapest buys in .22's are the Savage-Stevens 34 (.22 Short, long, and Long Rifle) at \$39.95 or 34-M (.22 WMR) at \$44.95.

If I could have only one gun, it would be the Savage 24-S which has a .22 Magnum (also available in .22 LR) rifle barrel over a 20 gauge 3" magnum barrel (will fire 2 3/4" shells also). These cost \$63.95, usually discounted, which is less than the price of separate rifles and shotguns. The shotgun patterns well and a 20 gauge shotgun is big enough for any bird, rabbit, etc. or even deer with readily available rifled slugs while the .22WMR gives you a pretty decent rifle. I'd get a Lee Reloader in 20 gauge to go with it.

If you reload, forget a pump or automatic shotgun. They aren't sporting or pretty or anything else anyway. A double costs a little more in a bare model, but handles better, and while digest your handloads (this is not a problem for rifles and pistols) without a bobble. The best buy is the Savage-Stevens 311 at \$109.95, usually discounted, and also available more cheaply under Western Auto and Sears brand names.

Big Game Rifles: With good shooting, a 30/30 will do fine up to 150 yards on deer (black bear, antelope) and with good bullet placement, will kill an elk up to 100 yards pretty well. While the lever action Winchester 94 isn't very accurate unless you pay

Golden Age Arms

This company offers reproductions of muzzle-loading firearms (pistols and rifles— BOTH percussion cap and flintlock). All parts and accessories offered.

i.e., Flintlock rifle— overall length 55 1/2", weights 8 1/2 lbs., .45 caliber 7 groove 13/16" barrel mounted curly maple stock. \$295.00 plus \$3.00 shipping.

All kinds of powder horns, flasks or the components to make your own. Bullet molds, stag slabs for knife handles or pistol grips.

Sheffield knife blanks, requires handles only. Highly polished and handhoned.

6" Bowie \$3.50

4" Skean Dhu \$1.50

Tricorn hats \$12.00

Deerskins, patterns, tools for making hunting shirts, moccasins

Books on firearms.

The best buy is tomahawk kit, hand-forged head, hardwood handle, wedge, thong & decorative brass tacks. \$4.95 postpaid. Perfectly balanced for throwing and an excellent light belt ax as well as an efficient weapon.

Tomahawk heads cast steel \$5.50
cast brass \$6.50

A catalog is available for \$1.00 from:

Percussion \$94.50 Postage \$5.00

Contains Grade-B stock; barrel and breech plug; single trigger; Hamm or Robbins lock of your choice; hand-forged butt plate; trigger guard; ramrod pipes; underpinning strip.

All This Information

All this information comes to life at the twice-summerly National Muzzle Loading Rifle Assoc. shoots in Friendship, Indiana. It is truly weird and magnificent to see a bunch of right-wing gun nuts dressed up in fringed buckskin and long hair and impossible to distinguish from visiting freaks also dressed in... well, you get the picture.

Carl Fleischauer
Morgantown, West Virginia

about \$8 for a peep sight which you can put on yourself, and are willing to hand-load with the aid of the Wilson Full-Length Sizing dies and the Lee Reloader, for \$55 to \$75 (it lists at \$99.95 but is widely discounted) it's not a bad buy, especially if you combine it with a Savage 24-S for a good two-gun battery. The best buy in a .30/30 though is the Savage 340 bolt action which will be priced from \$78 to \$89 depending on discount— the cheaper Springfield 840 is the same gun for less money. A more accurate but action repeater in .30/30 than the Winchester is the pump action Savage 170 which is usually discounted to \$75 from \$99.95. Don't ever bother with a scope for any .30/30.

If both deer and smaller game are your would-be bag, get the Remington 788 bolt-action repeater in .243 Winchester for \$109.95 with a 4X Universal scope. (\$99.95 or less without). If Elk or Moose are a regular thing with you, get the 788 in .308 Winchester— same prices. This is a very strong and accurate gun. Elk will fall to a .243.

The best 'expensive' all-round rifle if you hand-load and want to make do with only one rifle for everything that is good-looking is the Winchester 770 in .270 or (later this year) .25-06. The Remington competitor, the 700 ADL lists for \$110 more but sometimes is discounted to a lower price. The very best Deluxe rifles are the Ruger 77 Bolt Action (\$175), the Sako Finnbar bolt action (\$220) and the Ruger Number One Single Shot (\$285). The only surplus rifles that I would ever trust are the British Enfield .303 British which comes in a variety of styles, from a long rifle-musket to a jungle carbine (price \$35-60 depending on model) and the US Enfield and Springfield (if marked Springfield Armory, the serial number should be above 880,000 or so) about \$45-60. My own rifle is a Springfield which I restocked myself, and I've been very happy with it.

Good luck, good living, good hunting, and good shooting,

Shalom,
Cliff Dempster
Missoula, Montana

KER—PLOW! Gottim

Deer Friends,

In one issue of W.E. I saw a riff about weapons, can't recall when/where but mentioned stuff re: crossbows, guns, flintlock/percussion muzzle loaders. Well, as it turns out if you want a weapon that's powerful fun and pretty legal there's only one way—

***** Black Powder (rifles & pistols) *****

See, these can be sent thru mail with no restrictions (check local laws tho) to anyone. To get a pistol you have to say you're 21. Big deal. Anyway, muzzle loading longarms (flintlocks and percussion) are reasonably accurate, make one fuck of a big beautiful noise. Same for pistols. Also very cheap, like maybe 1/10 cost to shoot than cartridge weapons. Calibers .36 **** infinity (flintlocks & shotguns). These guns are modeled after old timey (thymey?) type guns like model .36 cal Navy percussion revolver or Kentucky type squirrel guns, as examples

Sources: get a gun mag. like *Shooting Times* or *Guns & Ammo* and look at prices, descriptions, and pictures. (fetishists take particular note). OR

Centennial Arms Corp.
3318 W. Devon Ave., Lincolnwood, Ill. 60645
(price list \$1.00!) ("You can't always get what you want...")

OR

Dixie Gun Works
Dept. 1, Union City, Tenn. 38161
catalogue \$2.00—250 pages!!! Lots of good stuff

OR

Any other places you might see in a gun mag.

- Notes: (1) Dixie's cat. is VERY far out. There's they are honest!!! (2) Centennial is good and cheap and has nifty pistols. Their pistols (Italian & Belgium) are well made for the price—like \$39.95 for a steel frame 36 cal percussion pistol. Beware of pistols over .36 with brass frames, steel is stronger. (3) NEVER, NEVER, NEVER use smokeless powder— if you do YOU will be blown to shit. USE BLACK POWDER ONLY. It is very safe—smash it with a hammer and it won't go off. Only ignites by spark (from flint or percussion cap) (4) Make sure the weapon you buy has been "proofed" (tested) so that you can be sure it won't blow up—beware of "trade" guns. You get what you pay for. (5) Clean your gun regularly. Black powder is CORROSIVE and can make a mess of your weapon. These guns ain't too hard (or too much fun either) to clean—find out the best way from someone who knows—or make up your own way. (6) When a flintlock goes off it's the most far-out. There's a snap, whoosh and a BOOM. Percussion ones just go BOOM*. Anyway if you want to stay on friendly terms with your neighbors, tell them when you're going hunting, target shooting, poaching so they don't think you're playing Lawrence of Arabia blowing up trains. (* like a cherry bomb in a 50 gal. oil drum.) (7) For all types of guns get a copy of *Guns Illustrated 1970* by the editors of *The Gun Digest*. It has everything legal in it. All types of guns, pistols, derringers, etc. Unfortunately it costs \$2.95. If you're serious it's worth it. (8) Join the NRA. The NRA establishment freaks want to repeal gun laws. They're all perverts but join them it's a good cause. (9) What the world needs now is a better Anarchy.

Peace,
Crazy Bill

NRA

National Rifle Association is a bogey man to many people, and this is perfectly understandable. There are a lot of flag-freaks and super-patriots involved in it. They are against gun legislation. If you can stand reading any further, good information is coming.

The NRA, for all its faults, provides many valuable services, many of them free. If you must supplement community food supplies, hunting is a good way to do it, if you are not morally opposed to that sort of thing. Most of the people in the NRA are pretty reasonable types— either target shooters who damage only paper targets, or hunters who eat what they kill. Their needs are catered to in the American Rifleman, a monthly magazine that is paid for by your club dues. This journal will, every month, teach you things about hunting and shooting, cooking, storing, skinning and preparing game, the advantages and disadvantages of different pieces of equipment, field techniques, and it will keep you up to date on gun laws in all areas— even abroad. Any member needing help with something to do with guns can write to the NRA and get personal help— good help— free. Membership is \$7.50 a year. National Rifle Association, 1600 Rhode Island Ave., N.W., Washington DC 20036

Karma

Note.

We list Shotgun News with the expectation that all you're interested in shooting is inanimate targets and food. If you buy a gun through this source for any other reason, you're loading our Karma as well as your own.

Shotgun News

In case you can't get samples, here is our latest copy of "Shotgun News". Because of gun laws— some of the guns offered must be bought through a licensed gun dealer. In a small town such as ours, this can be done through a dealer who carries firearms as a sideline (i.e. Hardware Store) and they will do it as a courtesy and no money involved. I sure in larger cities some sort of a deal which keeps both the dealer and the buyer happy can be worked out since they are mainly a pick up point for the gun and may have to do a little paper work to satisfy the man. But of course you will see, Shotgun News is not limited to guns.

More on the Dixie Gun Works catalog. They carry parts, machinery, books on making guns as well as antique guns. Also black powder ball and cap guns are for people who feel the animal should get half a chance in the hunt since they take a little skill and find a bow not their game. They are good hunting rifle but you only get one shot.

Indian Ridge Traders Knife Blades

An outfit called Indian Ridge Traders in Ferndale Michigan. IRT's specialty is a line of unfinished knife blades made by Hopkinson in Sheffield, England. IRT is a small neo-co-op organization which I have dealt with over the last couple of years. Their prices are low, the service fast and friendly, and best of all unlike other knife firms, no far right political bullshit.

Their blades are almost strictly high-carbon steel which although not as classy as 440C stainless is easy to work with and can be sharpened by hand in a finite amount of time, a characteristic not included in 440C's properties. A knife which I made for my own use from one of their blades, a rigger's knife, has seen use in and around fresh and salt water for over a year now with negligible rusting and pitting with only a minimum of care.

Their catalog lists a large variety of blades, mostly tools with only a few weapons, if you can dig the difference. Their line of kitchen blades is especially good. They also list some knife finishing materials and suggest sources for others. One source which they suggest for a variety of weird hardwoods is the back of your friendly neighborhood Oriental motorcycle dealers. Nearly all his throw-out crates are a made of a variety of Eastern hardwoods. Their catalog is free from:

Wrist Rocket

"My God! Is that far-out!", was the reaction given to a demonstration of the power and accuracy inherent to my "Wrist Rocket", an example of an old innovation, the sling shot, the creative application of a scientific principal, leverage, and a little practice can produce.

The "Wrist Rocket" is an expertly crafted piece of hand weaponry far superior to all others I have ever encountered, short of the firearm. It is completely rust-proof and, if in time the rubber sling should break after hard, long usage, it is easily replaceable with two matching lengths of surgical rubber tubing obtainable from your local drugstore.

Price— around \$2.50 from

Ruana Knives

Made by a stern old fellow in his blacksmith shop in Bonner, Montana, these knives are as good as you will find anywhere. He used to make them out of old Chevrolet springs, but Chevy went to coil springs and now he has to buy his steel elsewhere. None of that dude business with stainless steel or chrome blades, however, these knives are strictly for cutting. If you look closely, you may see some honest hammer marks on the blades, but they are as good as the high priced prestige models favored by knife snobs everywhere. Handles are cast aluminum over elk horn and a full length tang, as tough and functional as you'll find. If you're in the woods and lose all your tools but one, better make it one of these.

Ruana Knife Works
Bonner, Montana 59823

Sharpening

To really sharpen knives, axes, and the like, with a razor edge that stays sharp you should have three sharpening stones and a piece of leather. The stones should be: a coarse or medium corundum stone, a fine India stone (these two are usually fused back to back and sold as a combination stone), and a hard Arkansas stone (expensive but worth it). Follow the directions with the stones for soaking them in oil for this prolongs the life of the stone by filling up the spaces between the particles of the stone so metal particles from the sharpening process do not lodge in these spaces and render the stone ineffective. Also oil applied to the surface of the stone while sharpening helps float the excess metal away. The purpose in going from a coarse to a fine to a hard stone is not only to form the edge but also each successive step polishes out the scratches of the previous step, and the polish is the key to edges staying sharp since the scratches are the cause of the blades getting dull fast. For a dull knife, start with the large scratches from the coarse stone are worn away and the blade has a sharp edge. The knife could be used at this point but would not be razor sharp or stay sharp long. So go to the hard Arkansas stone and stay with it till the edge takes on a mirror finish. Then strop it (draw the blade back and forth) on the leather to remove the wire edge and further polish the blade— then you're done. It takes a lot of words to write it, but from dull knife to sharp knife takes only about ten minutes. Maybe this is more than anyone wants to know about sharpening.

THE DISCOVERY

D.R. was crawling now, on hands and knees and sometimes on his belly like a worm, squirming through the weeds and briars and piles of ancient trash away from David toward the far side of the hollow. He was crying now. He tried to fight it but the tears insisted and they flowed in little channels down his muddy face. By the time he stopped to rest and get his breath behind a pile of old boards and rotting beams and rusted mining cable, D.R. was bleeding from cuts and scratches all over his face and arms. He heard David thrashing through the weeds behind him, coming closer, but he was too worn out to move. He lay down across the front seats of the bus to keep Mrs. Godsey from seeing him and listened to his footsteps running through the weeds. He ran until he fell, exhausted, so tired that only his torn hands could move. As he lay there crying, his hands started working on their own, burrowing in the earth at the edge of the old junk pile. The ground beneath the rotted boards was so dry and crumbly he pulled it loose in double-handfuls and pushed them to the side. It was like sawdust, like leaf-mold beneath an oak tree that had never been disturbed. Whole sections of rotted board fell away before D.R.'s clawing hands, until he had made a place large enough to worm his body through. Pushing with his toes, D.R. squirmed into the center of the mound, then lay still to breathe and rest his raw and aching hands, and discover something so profound and unexpected it blew a little hole right through his mind.

D.R. lay in an opening in the earth. He had crawled into the drift mouth of an old, abandoned mine. His arm was through, inside it, and now his head and shoulders, he could smell it, he felt the dark space opening out around, he felt the wind from deep inside the earth.

Knives
Nomadics **277**

"Primitive Weapons"

Compared to firearms, the so-called "primitive weapons" have several advantages: they are simple, light, cheap, and versatile in use. They require no ammunition you can't make yourself— and although you can reload some kinds of firearms ammunition, you will eventually run out of powder and primers. Except in places like New York City, you have no legal hassles over ownership or registration with "primitive weapons". These weapons are perfectly adequate for hunting (or our ancestors would not have survived), if you will practice with them. They are silent in use. In some cases, they exhibit amazingly advanced understanding of technically advanced concepts and principles—the boomerang operates on the principles of the airfoil and gyroscopic precession, etc. They are fun to play with, and if you use reasonable care and do not endanger others, you can usually play around with them in a lot of places where it is illegal to practice with firearms.

Boomerangs— As mentioned, the boomerang works on the principles of the airfoil and gyroscopic precession. This is not a toy, but a hunting and fighting weapon which works very well on small game, especially birds in flight. More fun to play with than a frisbee, but don't ever forget that it strikes with tremendous force due to the rapid rotation of the blades. The best ones I know of are made by Colonel John M. Gerrish, 4409 S.W. Parkview Lane, Portland 1, Oregon. These are plywood booms that weigh the same as a baseball, and he also makes a heavier hunting type with lead weights set into the blades. His booms are about five dollars depending on the model.

Blowguns— Not to be confused with a kid's peashooter. You don't need poison darts either, at least on small game. A four foot length of half-inch aluminum tubing develops enough velocity with a light dart to give results about like a .22 rifle up to 25 yards or so. This is silent, as accurate as a rifle, and with practice can develop a high rate of sustained fire if you care about that. This weapon is so simple that you can make your own very easily— using half inch tubing and making darts out of lengths of steel (like cut off knitting needles) set into golf tees for bases. Use a mouthpiece of wood or rubber, etc. for your lips to press against. If you prefer to buy one, try Survival Research Company, 71 Ridge Crescent, Manhasset, New York 11030. Another source: the Wham-O Manufacturing Company, 835 E. El Monte Street, San Gabriel, California 91778.

Crossbows— The modern resurgence of interest in regular bows and arrows is well known, but the crossbow has been neglected for some reason. This is strange, since the crossbow is, in its usual form, much more powerful than conventional bows, more accurate (for anyone except experts with the conventional bow) since you do not have to exert muscular effort while aiming the arrow, and considerably easier to learn to use than is the conventional bow. Crossbows with steel bows cut from automobile leaf springs may be made to pull at several hundred pounds, while the conventional hunting type bows seldom run much over fifty. This means that if you are good enough, you can use a heavy crossbow to pot at that deer two hundred yards away or so. Light crossbows may be comfortably set by hand and are sufficient for small to medium game. They are silent and can be nearly as accurate as a hunting rifle within their range, which is nearly as great as that of a firearm in many kinds of terrain.

If you want to make your own crossbow, you might try to locate the "C" volume of the old Popular Mechanics Do-It-Yourself Encyclopedia, which had an excellent article under "Crossbows". This is a fairly complicated job, however, so unless you are a skilled craftsman in wood and metal, you might prefer to buy a crossbow. Wham-O Manufacturing, listed above, sells one in the \$30-\$40 price range. Another source: George Stevens, Huntsville, Arkansas, or Dave Benedict, 20601 Covello Street, Canoga Park, California. The crossbow is one "primitive" weapon which is efficient enough to be subject to a certain amount of legal restriction— so you might check out your local situation in that regard. Also, some states now have seasons and areas reserved for hunters using bows or crossbows, and if you are a meat hunter this could be important.

THE AMAZING COMPOUND BOW: The most remarkable new development in bows is an imposing-looking device called the Compound Bow, illustrated here and described fully later on in our bow section. It is just like a regular bow in principle of operation, except that the relatively stiff limbs work together, rather than separately, by means of cables strung around a pulley at the end of each limb. Because these pulleys are eccentric (axle not in center of pulley), peak draw weight comes at the middle of the draw rather than at the end. In other

words, a fifty-pound bow would reach fifty pounds at mid-draw, then actually decrease to about 38 pounds at full draw! Result? Well, it's obviously a lot easier to hold thirty-eight pounds instead of fifty pounds. Or, thirty pounds instead of forty. But the significant feature is the blazing, unbelievable arrow speed! The Compound Bow is fifty percent faster than any other bow of comparable weight. A standard, unmodified, fifty-pound Compound Bow shot a legal broadhead nearly a quarter-of-a-mile in a recent National Flight Shoot. And, you can adjust the draw weight of a Compound Bow! This bow may very well revolutionize archery—particularly bowhunting, where penetration is so important.

ARROW REST—SIGHT WINDOW—CENTERSHOT DESIGN: In addition to simply supporting the arrow, the arrow rest keeps the arrow away from the shooter's hand, prevents arrow feathers from hitting the shelf, and positions the arrow the same way every shot. Better bows are usually factory-equipped with an arrow rest, even if only a silencing pad of wool felt or leather covering the arrow shelf.

There are many types of arrow rests, but basically they fall into two groupings: those for hunting or all-purpose shooting, and those for serious tournament shooting. The feather rest, made with four or five pieces of feather set vertically and cut to a curved shape, is almost universally popular as a hunting or all-purpose rest. The tournament rests are too numerous to mention, but you'll find one of your choice listed in the Arrow Rest Section of this catalog.

What's wrong with modern archers is that many of them don't know the history of their sport, one of the oldest in the world.

In my collection of bows and arrows which date back to 500 BC, I have an arrow with a bone insert neck of a snap type shape identical with the Bjorn neck, a recent invention which is the favorite of many of today's experts.

I have a broadhead that is three blades with a five-degree taper insert for the shaft. It is made of bronze, and has been authenticated by museum experts as being over 2,500 years old. We rediscovered that five-degree taper, three-bladed broadhead about twenty years ago.

I have one ancient arrow with a superb broadhead. It is one-eighth-inch thick in the center and bevelled to a sharp edge from the center toward the point. It is of hardened steel, three-quarters-inch wide and one and a half inches long. It could not possibly bend if it hit a bone and was probably designed to pierce armor or chain mail. The shaft is a hollow bamboo reed similar to our modern hollow glass or metal shafts.

The twenty-two Oriental bows in my collection are from five hundred to two thousand years old. Their basic design of sinew on the back of a wood or bamboo center, with horn on the belly, dates back about 2,500 to 3,000 years ago, and is much the same as our modern bow except for the materials.

BOD-KIN, MODEL "A"— 3 blade design, rounded corners as illustrated, but without slotted blades. Tool steel, spot-welded and furnace braced. Holes in ferrule for pinning or forming glue rivets. 11/32" x 125 grains. #BP-104 \$3.95/dos

BOD-KIN, MODEL "B"— Same as "A", but rear corners of blades cut to sloping angle so it will back out of hay bales when practicing. 11/32" x 112 grains. #BP-105 \$3.95/dos

BOD-KIN, MODEL "C"— Same as model "B", but 5/16" x 90 grains. #BP-106 \$3.95/dos

BOD-KIN, MODEL "D"— Same as model "A", but with slotted blades for lightness. 11/32" x 115 gr. #BP-107 \$3.95/dos

BOD BOD-KIN— Designed to cut and rip; hunting small game, birds, etc. 11/32" x 130 grains. #BP-100 \$4.50/dos

BOOKS

HOW TO MAKE BOWS by Tom Jennings & Doug Kittredge: Contains complete plans and instructions for building the custom ULTRA BOW. A "must" for every bow maker who wants the latest information on building modern laminated fiberglass bows! #BB-260 HOW TO MAKE BOWS \$1.95

HOW TO MAKE MODERN ARCHERY TACKLE by Tracy Stalker: Contains information about how to make bowstrings, arrows, bows, with a minimum of store-bought tools. Only book telling the old way of making wood bows of the "long bow" design. #BB-700 HOW TO MAKE MODERN ARCHERY TACKLE \$1.00

HOW TO MAKE ARROWS by Doug Kittredge: Complete, detailed information on building your own arrows of wood, fiberglass and aluminum. Many tricks and secrets of the trade never before published. Fully illustrated. #BB-252 HOW TO MAKE ARROWS \$1.75

SHIPPING WEIGHT FOR ONE OR ALL BOOKS— 8 oz

Our "PROFESSIONAL ARROW KIT" will make the finest set of Port Orford Cedar wood arrows money can buy! Factory finished shafts insure that "custom" look.

PROFESSIONAL KIT

KIT CONTAINS:

- 13 — #1 MATCHED P.O. CEDAR SHAFTS, Factory finished, 2 coats lacquer, any color: Clear, White, Yellow, Red, Blue, Orange, Green. Rock Taper Included.
- 13 — SPED NOSES, your choice of color.
- 36 — FEATHERS, Die Cut, any color or length.
- 13 — FIELD OR TARGET POINTS, state choice.
- 1 — FLETCHING AND NOCKING CHEMIST
- 1 — SET OF ARROW NUMBER DIALS, 1 thru 12
- 1 — INSTRUCTION BOOK: "How To Make Arrows", fully illustrated, complete detailed instruction.

IF BROADHEAD OR TAPER-HOLE FIELD POINTS DESIRED, show head wanted and add cost to arrow kit price, less 80¢

#PK-501 PROFESSIONAL ARROW KIT \$7.95
White or Dyed White feathers, extra 1.50

Bowhunting for Deer

A serious technical book. For successful bowhunting you've to be a lot closer to the deer, in every way. Most states have a long bow & arrow season for deer.

Bowhunting for Deer

or **WHOLE EARTH CATALOG**

Vital Areas for Point of Aim
The heart and main anterior and posterior arteries, including the femoral artery, are shown in dotted area; while the liver, lung and behind the heart, is shown in striped area, with the spine shown as the broken line from head to tail.
Vertical line (A) designates the maximum forward defective line of sighting which puts the arrow in the center of the heart-lung cluster as well as the top exit of the aortic arteries. Hits to the left or forward will strike the shoulder-bone which will prevent penetration. Vertical line (B) designates the maximum defective line of sighting to the right or rear of line (A), which is about nine inches in distance. A hit between (A) and (B) if low or at cross-hair line (L) will result in either a heart or liver hit. If hit between (A) and (B) center at cross-hair line (L) the hit will be in the rear of the lung lobe. If hit anywhere along cross-hair line (S) between defective line (A) to (C) the arrow will strike the spine. A hit where (H) and (A) intersect means a dead center heart shot. If the arrow enters where (L) and (A) intersect, the center of the lungs will be hit, and also a possible severance of the posterior aortic artery as well. An arrow that hits in the area of defective line (C) down through the center of the hind ham will sever the femoral artery. With the exception of the spine hits all the other vital points will produce sufficient hemorrhage to drop the deer within reasonable yardage.

Tools for Field Repairs

A simple kit that will enable you to make minor field repairs can be carried in a small compact container. The tools and other items listed below are sufficient for changing heads, replacing broken or cracked nocks, for wrapping a nocking point on a new string, sharpening broadheads, and repairing damaged fletching.

Quantity	Item
1	Mill file (flat), 1/8-inch, with shank broken off and taped for handling protection
1	Duco cement, tube
1	Ferrule cement, stick
1	Candle stub
1	Pliers, slip-joint style
1	Dispenser, dental floss
6	Pins, common
3	Broadheads, spare
6	Nocks, spare
-	Extra bowstrings

All of the listed items will fit in an ordinary cigar box or in a small metal box of similar size. Such a kit takes very little room in your gear and is very handy in camp.

Just a note of warning. If this early-bird deer happens to be a little fellow, be cautious! Many times such a young deer acts as a sort of scout sent out by the old doe of the group to see if all is clear. If this be the case, this little guy will roam around under the tree and nip an apple or two. Then, after looking around for a while, he will bounce back into the timber. And invariably, if you have not betrayed yourself, the other deer will then step out, one by one, a few minutes later.

The Venison Book

In my experience, getting the deer is the easiest part, if most written about. The rest of the action—*butchering, storing, cooking*—is the subject of this economical little book. *-SB*

Bear Archery

A glossy catalog of good archery stuff. Seems like everybody up in my part of Michigan likes Fred Bear. The catalog tells what your local dealers should have.

Catalog from:
\$0.50 Bear Archery
Rural Route 1
Grayling, Michigan 49738

7160 Fred Bear Camouflage Make-Up Cream
Kit of three colors. Camouflage your face, hands and bow with Bark Brown, Glade Green or Shadow Black Cream. Applies easily. Cold Cream base. Contains insect repellent.

-SB

7670 String Peep Sight
Attaches into string; serves as rear sight for perfect alignment. Unbreakable hard vinyl. Weatherproof.

3000 Bear Converta-Bowfishing Rig

Now you can take any Bear bow, from a Take-Down to a Grizzly, fishing. The new Converta fish reel fits right into the accessory insert on all new composite Bear bows (except Bearcat and Little Bear). Outfit comes complete with reel, 50 ft. of 90 lb. test braided Nylon line, fiberglass arrow with harpoon head and instruction booklet.
3005 Same as **3000** except with 3060 easy-off point.

7138 Bow Cover Camouflage
Two piece cover slips over bow limbs. Does not hamper shooting.

Professional Guide's Manual

If you're eating meat, deerhunting is about the most honest and economical way to go about it. This bargain book from Herter's—*amazingly unhysterical for them*—has all the information you need to find, shoot, and butcher your deer. It's also chock with tips on fishing, camping, storing stuff, and other sundry. *-SB* *[Suggested by Peter Rabbit]*

Figure 10.

To use the "Back Carry" method as shown in Figure 10, slit the skin through each hind leg as the illustration shows. Through these slits put the corresponding front legs. Put sharp sticks through the front legs to lock them in place. To get the deer on your back, set the deer up on his rump in a sitting position. Spread the hind legs apart and set between them. Grasp a front leg in each hand, lean backward and swing the deer up on your back. Put both arms through the loops formed by the legs. Now go on your hands and knees and lean forward. Bring up first one foot then the other until you are erect. **Whistle and sing as you carry out the deer when using this method so no one can possibly mistake the deer on your back for a live one.**

Home Tanning and Leather Making Guide

Best information on tanning we've seen. If you're eating deer or calf or dog or whatever and throwing the skin away, you don't need this book. Meathead. *-SB*

TWO HANDED SCUDDING KNIFE
Used like Slicker, curved to fit beam. Brass, copper or slate edge, to avoid rust.

One of the first things some hunters feel obliged to do is to stab or slit the throat to bleed the carcass. This is called "sticking." Consensus among people who have experimented is that this process is entirely unnecessary, and, in certain instances, definitely detrimental.

You can use any cut of meat to make "jerky." If you are just trying it on for size, though, you won't be wasting superior meat if you cut your strips from the flank.

Cut the meat with the grain into strips 1 inch wide and 1/2-inch thick. Make them any length you can. Prepare a brine of 6 quarts of water to 2 pounds of salt (the brine should be salty enough to float an egg in its shell). Soak the strips for 2 days in the brine. Remove and wipe dry. Hang the strips of meat in the sun to dry; they may be pinned to the clothesline with spring clips. When they are dry they may be smoked or simply stored as is, in an airtight place well protected with netting.

PROPER RIPPING OPEN CUTS FOR A CORRECT PATTERN
The dotted lines show the path of the knife, and the solid lines show the appearance of the hide when spread out.

I'm in a coal mine, huddled at the face with no light, it's total black around. I can breathe all right but the air is sulphuric and stale, I have to adjust, grow a kind of gills in my neck, become a kind of fish in order to live this deep underground. It's so dark I believe I don't have eyes any more, until a prick of light comes toward me through the pitch black dark of the mine. It's like foxfire. It's like a spark from two thoughts striking one another. It's like the first star that ever was. Slowly it floats toward me, bearing a promise to bore my forehead like a breast-auger, like a mine drill. Shavings coil out like old memories, and form shapes around the light. They form my father with a carbide lamp on his head, spewing a long, thin flame. They form my mother with a shiny brooch at her throat, and then they become Jesus carrying a candle that becomes a minnow and swims away through the mine's dark river. I can't see it but I hear the river gurgling toward the drift mouth, and I panic trying to decide whether to follow or stay where I am. I huddle against the face of the coal, wondering if my eyes are open or closed. The coal is cold and hard, like a huge black diamond, my face against it, rough and cold. I think of ancient ferns, tall as tipple, a million years ago beneath the sea, fish gliding among the very ferns that have hardened into the coal my face is pressed against. In the midst of the waters I see a firmament arise, a lovely wilderness of plains and valleys and high mountains with low wavy foothills. And there in the side of one of the hills is a wound, bleeding coal that I have cut with my own hands and crawled inside for rest and safety.

by Michael Athay
Rocky Hill, New Jersey

ANGLING: For trout: with artificials.

def.: A trout fly is part fur, feather, floss, tinsel, and sometimes horsehair; secured with black thread (in the jargon, 'tied') to a fishhook in hopes of replicating a bug accurately enough to fool a trout into eating it; and thereby getting caught.

Tyers of trout flies, like their quarry, come in schools. Three predominate (the authority for this classification is myself): (1) the 'exact imitation' school; (2) the 'follow a pattern' school; (3) the 'tie a pretty fly' school. The division is normative. Adherents of school (1) definitely are the elite, because they not only build bugs—they spend hours and hours crawling along muddy river and stream-banks peering at the principles through large magnifying glasses and telephoto lenses. Their object is to find out personally what insects the trout are eating this evening. They want a fur-and-feather copy of the real thing. Entomology first; fill-the-creel later. Pattern followers, on the other hand, are content to turn to pages 88 through 96 of Herter's *Professional Fly Tying Manual* (revised condensed edition), where they find explicit instructions for Bumblepuppies, Nymphs, Woodruff Spent Wings, and a few score other standard fish-favorites. This a priori method obviously has its disadvantages: A standard fly pattern modelled on the pale watery dun common to Southern England's Chalk Streams may or may not have much to do with the day's hatch on Big Lost River above Mackay, Idaho. As for school (3), well, they just aren't serious fly fishermen. I've known these types to show prodigious technique, but how can you expect to catch real live fish on a green-hackled, purple-bellied absurdity, however 'aesthetic'?

If I've managed to get you thinking along 'exact imitator' lines, you'll have to know something about 'fly-fishing entomology', as the initiates call it. This is an informal version of what one kind of biologist does—viz., determine, describe, and classify the kinds of bugs fish eat in different seasons and locales. The best book I've seen on the subject is John Goddard's *Trout Fly Recognition*. Unfortunately for us, Mr. Goddard is an Englishman who writes about English insects. Even so, a lot of the information is of use to fishermen on this side, especially as a good introduction to insect classifications, techniques of observation, and so on. (More than one author in this area intimates that many of the bugs British fish eat have near or exact counterparts on American streams.) The best thing about Goddard's book is plate after plate of color photographs of the insects he discusses—all of them large enough and detailed enough to serve as models for tying. A little field work, or a visit to your biologist friend, will quickly establish the relevance of this book for the streams you like to fish. Goddard also provides instructions on photographing live insects, and detailed photographs and drawings of insect wings—the hardest part of the fishing fly to reproduce well.

Several good books on insects common to American streams have been published, but they tend to go in and out of print rather quickly. Ernest G. Schweibert, Jr's *Matching the Hatch* is one sound treatise currently available. Schweibert describes common trout flies found both in the Eastern and Western parts of the country. This alone makes the book valuable, for most books tend to deal only with East coast streams. He provides classifications of flies according to the approximate season of their appearance, and includes four color plates of drawings of mayflies. The plates are good enough to reproduce flies from.

The classics of American fly fishing entomology are Preston Jennings A Book of Trout Flies and Art Flick's New Streamside Guide to Naturals and Their Imitation. The first is a handsome hard-cover volume, with copious and detailed illustrations of insects. It deals mainly with the East coast. My objection to the Flick book is its diminutive size, poor binding, and (relative to what you get) large price.

These books will only get you started, though. If you come to take this side of fly fishing seriously, you will have to do your own entomology, for another man's investigations of his favorite streams probably will not apply very exactly to yours. Goddard's book is by far the best model for your own field work.

Pictures of bugs won't tell you how to tie imitations of them. If you are a beginner who wants instructions in the basics, I suggest the Herter's manual afore-mentioned (available, of course, from Herter's Inc., for a mere 89 cents in the condensed version—which is all you need) and J. Edson Leonard's *Flies*. Herter's gives you the basics, with George L.'s usual remarks about the impossibility of doing it any other way, plus a list of patterns. Leonard's book is very detailed and complete (340 pp.), including chapters on hook design (you will be surprised how many sorts of eye, point, shank, and shape are to be found in the common fishhook), tools, and materials, as well as construction. He gives good tips on tying technique which you won't find in the Herter's manual. His dictionary of fly patterns runs some 80 pages and could keep you tying for decades. He also includes a 50-odd page chapter on entomology which serves as an adequate introduction. If you want just one book on fly tying, this is it.

I can't imagine anyone wanting more patterns than Leonard lists, but if you do, a series of books by Britisher W. H. Lawrie certainly should suffice. Most notable is his *Reference Book of English Trout Flies*, and his *International Trout Flies* (which includes some American patterns). Both are published in England, but should be available through Blackwells. The predominance of British bugs does not make them irrelevant, assuming you've given up becoming an amateur entomologist, because most of the standard patterns you find in the local tackle shop are of British origin anyway.

Let's suppose you've done your field work on the native insects, become a master at tying technique, and stocked up on as many of the standard patterns as you can use for the next three seasons. You're all ready to go out and catch a limit, but you don't know how to cast a fly. Well, there's a book for this too. Indeed, a legion of them. I recommend just one, however, because it is excellent: *The Angler's Cast*, by Capt. T.L. Edwards and E. Horsfall Turner. This book has more information on every kind of fishing rod casting—bait, spinning, ocean, etc., as well as fly casting—than you can possibly remember. The authors discuss everything from physical theory of rod action to the kind of tackle you ought to buy. The account of fly casting is detailed and pleasingly un-dogmatic—you needn't conform to any ideal casting patterns in order to catch fish—a bit wordy. Pictures and diagrams show you how to do what the text tells you.

Spin Fishing

I'm a nut on survival and this spinning reel gadget is a beauty. Called a handline spinning reel it's a hard plastic, 6" diameter like a wheel. You hold the thing with one hand, and darter fashion, cast with the other. The line spins off the reel as on a regular open faced spinning reel, but since this handline reel is 6" in diameter compared to 2" or 3" of a fresh or salt water reel, the line spins off faster, with less fouling, and also the retrieve is much faster. Naturally there is a lot against handline fishing. No rod to play the fish and to take the punishment the fish gives out. The pull is directly on the line and not on the rod so the line must be stronger. But I'm talking now about a cheap rig to carry anywhere with you and one that will land all kinds of fish. I've had more fun with the thing than any rod and reel combination.

As you know spin fishing (where the fish line pays off the face of the spool instead of the reel) is a very old way of fishing. Even before the invention of the bottle or can, indians fished in the spin off style using a kind of wooden shuttle. People throughout the world spin fish off bottles and cans. In Mexico it's called the Dos Equis reel after that famous dark beer. In Australia they use handline spinning reels similar to this Boone Bait Co product in three sizes going from a five inch to a ten inch. I bought one of these in Trinidad as Trinidad imports from Australia. The word on this Boone reel is that years ago the Japanese dropped off such a reel in the West Indies. The Cubans then got onto the thing and it made its way through Key West and now to Winter Park.

I like to use 25 lb monofilament line on mine although you can use from 15 to 50 lb. Fill it up (25 lb test will take about 300 yards) to within a half inch of the flange, whirl the lure along side or around your head and cast. Retrieve smoothly or in short bumps.

I'm speaking now of lure fishing. With lead and bait of course you just let it lie in position until you feel the nibble-strike. As I say I'm hung up on survival but I'm also a purist about fishing. I never use bait, only lures, and only single hooked lures, perhaps a spoon or two, but I prefer jigs. Leadheaded jigs. My favorites are: 1. The Bill Upperman bucktails. 2. The chrome headed Japanese feather jigs.

Ten years ago off a beach just north of Puerto Vallarta I was casting a Japanese white feather jig off a "Dos Equis" reel and picking up a channel bass or two and snook. But it was hot and I had already drank the beer in order to use the reel and so I took to the sea, carrying my beer can reel and line and lure with me. Thus began the most pleasure I've ever had. I call it Swim Fishing. Now these days I take the Boone reel out with me, 25 lb test mon on it, and a bucktail (1/2 oz) on the end. Off the beaches in Santa Monica Bay I've caught halibut, skip jack tuna, small blue shark, leopard shark, bonito, mackeral, sand bass, calico bass, white sea bass.

For bottom feeders I merely kick (using swim fins) along slowly and let the lure bounce off the bottom. For bonito, etc. I swim flat out, holding the reel in one hand and in this way giving the jig action with each stroke. When the water is clear and in the kelp beds of Point Dume or Laguna Beach I wear a face plate and snorkel, dive and look for the fish. I've been in a salad of kelp and into a school of calico and placed my yellow Upperman right on the table of sand before them. Letting out line I kick to the surface. Then yoyo the lure. Wham, a strike.

I've caught great barracuda and mangrove snapper in the Bahamas, snook in Trinidad, Pompano in Cozumel and the Virgin Islands, Ulua in Hawaii and the Tuamotus, flounder off Hong Kong, jack in the Philippines, and once I foul hooked a two ton Manta Ray off Yelapa, Mexico.

The beauty with swim fishing is that you swim the water the boats can't work. You also work ten times the water that a surf fisherman can because you present your lure parallel to shore, fishing it all the way. One of my finest experiences swim fishing was when a surf was running off Ft Lauderdale, Florida. I had my lure out behind me, resting on the bottom. I held onto my Boone reel. Here comes a wave. I body surfed it in and on the way got a big strike. I rode the wave to shore and reeled in a three pound Jack Crevalle.

Available for \$2.00 plus shipping from Handline Spinning Reel, Boone Bait Co., Inc., Box 571, Forsyth Road, Winter Park, Fla. 32790

I've got another good gimmick for you. You ought to check it out. You can't buy it in retail stores, and I don't know why. I've never seen it for sale, always send to the source for mine. Over the past ten years I've had four of them and they are by far the best and cheapest barq outfit on the market.

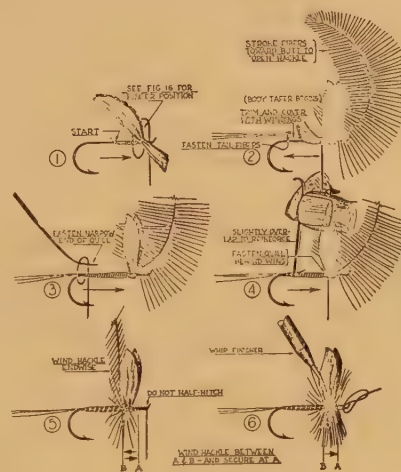

OLD SMOKEY. Looks like two galvanized tin pails sitting mouth on top of mouth. Hot smoke oven (better than that expensive but chic Japanese cooker) with two drafts for control (as good if not better than Weber and much cheaper).

I use ours for everything. No burn. No flare ups. If fat on meat does flare, just close drafts somewhat. I cook whole turkeys and chickens. Set them on lemon slices in foil boat and on grill and pop on cover and leave. No turning. Baste some. No spits needed. Sometimes I use wet smoke chips. Fabulous for salmon which I have cooked whole or in steaks. I've got both size Smokey's but use the No. 14 (14 inch diameter) more often.

OLD SMOKEY, Burkhead Mfg Co, 1920 Harrington, PO Box 4, Houston, Texas 77001

No. 14 is \$9.95, No. 18 is \$14.95. No shipping charges.

4A-1R1B Doc Shelton\$1.35

Thompson Professional Fly Tyers Vise—Quick acting, cam-type lock holds hooks securely without damage. Deer hair tyers will appreciate this extra firmness. Full rotating jaws, adjustable height.
No. 4B-6R6A Professional Vise \$7.98

GARCIA MITCHELL No. 300 \$18.60

GILL NET NYLON—1/4 lb. Spools

NYLON CORD for making and mending gill nets has certain advantages over linen—the former material. Nylon will not rot or decompose—has many times the life of linen. It is much, much stronger but best of all it "fishes" better as a result of its fineness of thread and lack of bulk. Ideal too as utility sewing and whipping cord wherever strength and lightness are desired.
No. 2B-10R6A1/4 lb.\$1.99

THE EIGHTH FATIGUE

There is space, but no time. There is distance, but no direction. And both space and distance are riddled with twisting shafts and caverns underground. There is endurance, but no duration. D.R. can say, I am here, but he cannot say where, and he cannot say for how long either, for that would place it in time and where he is there is no time. There is only endurance to move by, there are only fatigues to measure by, and he is eight fatigues inside the earth in a narrow, vertical shaft no larger than a hand-dug well.

The first fatigue was lined with rails and posts along the sides, and now and then a roof-bolt in the ceiling. The rails were gone by the second fatigue. The shaft dipped low to a widening curve which curved again and further on it curved and curved again. The third fatigue was when the shaft divided. Two tunnels opened off the shaft that he'd just crawled through, and a little way inside of one it divided yet again. But one of these divisions was closed off by a slate fall near its portal, and the other narrowed to a point so small D.R.'s folded hands would not pass through. D.R. backed out and probed the second tunnel. It's floor was ice-cold water that seeped above his ankles and reached up for his knees. D.R. waded blind a full fatigue, the fourth one, until the water deepened at the entrance to a chamber divided into rooms by so many pillars D.R. was quickly lost among their maze. Clinging to the rocks like a salamander, his lower body swimming through the water, he felt along the ledges of the rooms. When he could find no exits up above he dived deep into the blackness feeling for an opening in the bottom of the walls. On his third dive he found space enough to flow through, and he swam into another, stranger dark: the fifth fatigue. He could stand there. He felt the water level falling down his body to his toes as he walked out on higher, drier ground. He was going up, but not as direction, for there is no time where D.R. is, and no direction. It was up as shape, configuration, rising in the mine. There were no holds or ledges in the sixth fatigue, but once into the seventh the ascent became a gradual ramp of stone, the walls beside it coarse, like sandstone, and porous, with wind blowing through the larger holes. D.R. put his arms into the holes, he felt them out to see if they were shafts he should explore. But none were large enough for him to crawl through and he continued up the ramp the seventh and then half the eighth fatigue.

Introduction to Caving
John Thraikill
1962; 30 pp.

\$1.00 postpaid

from:
Alpine Rec.
Box 54
Mount Vernon, N. Y. 10552

It is quite an experience to visit a cave that is heavily decorated with speleothems, and it is quite a temptation to remove just one or two small ones as mementos of the trip. Surely, you think with all these stalactites no one will ever miss just one or two. Obviously you are right, no one will ever miss just one or two. But after a hundred people have removed just one or two, the loss of one or two hundred is all too apparent. Something beautiful has been destroyed. Utterly destroyed, for it will take many lifetimes for even the smaller stalactites to be replaced.

Falling rocks are one of the greatest hazards of spelunking. For this reason, hard hats should always be worn in caves where there is any climbing to be done. A falling pebble can be a murderous weapon, and extreme care should be taken to avoid dislodging loose rocks if there are people below. It is obvious that boulder piles should be treated gently, since they are often precariously stacked and a slide could prove disastrous to persons on and below them.

Basic Fly Tying

If it's not too late, I am sending a copy of a "book" that I produced which has had good acceptance while I was selling it through Amberg & Fitch in San Francisco. This was a couple of years ago and they no longer have the claim to exclusive distribution.

I would like to offer my humble work, which in its original state (this is a xerox copy and a poor one at that) is a series of pen & ink sketches on parchment. If your people and readers are interested I will be glad to mail them a copy for whatever they consider righteous.

This is a fascinating hobby and I have devoted many years to perfecting my techniques. I also want to share this with others. Thank you.

Dick B. Miller Jr.

Pole, Paddle & Portage

A Complete Guide to Canoeing

By Bill Riviere

Figure 18 (A) Maine Guide blade; (B) Sugar Island blade; (C) Beavertail blade.

Because the flat surface of the paddle blades rest on the shoulders, this type of yoke is one of the most comfortable. Photo by Eleanor Riviere.

One of the most frequent questions is, "How big a canoe shall I buy?" There is only one answer . . . the biggest one you can lift gracefully.

Dozens of uses are found for the rope: tying gear into the canoe, guying the tent against a stiff blow, rigging a clothes line, lining the craft through turbulent pitch, hanging food supplies out of reach of hungry critters, tying packs for portaging and emergency towing—to name only a few.

The Yukon's canoe routes are long and remote. With the reduction of commercial river traffic—most of this now going over the highways—the rivers are once more deserted. Waters in the Yukon average about 50 degrees even during a hot summer; lakes may not be ice-free until the middle of June and freezing temperatures and snow can be expected by the first of September. The rivers are large, supply points are few and far between. A canoe cruise should, therefore, include at least two, preferably three craft. Early September sees grizzlies feeding on salmon in the shallows so that the Department of Travel suggests that a rifle be carried during this period, to be used only in emergency.

There are compensations for the difficulties, though. From Whitehorse to Dawson City, via the Yukon River, there are no portages during the 450-mile run and the river gradient is only 1 foot per mile! Since this is a former route of the majestic sternwheel steamers, there is available a published log of the river between Whitehorse and the Tanana River (see Appendix).

Eskimo roll. Apart from the direct satisfaction that it brings, mastering the roll has some specific and important benefits. Since you can cheerfully court an upset when practicing bracing strokes and crossing currents, your practice and subsequent style will not be cramped through fear of capsizing; your ability to use the paddle for balance in rough water will be much enhanced; and finally, you will be able to recover from at least some upsets on the river.

Rolling is not the rare feat it was once thought to be. In a well-designed kayak little strength is required for a properly executed roll, and some experts can roll without a paddle using two hands alone, and in some cases, only one hand.

Birchbark canoes, good price

For a long time, friends have recommended that I write to you about getting a listing in your catalog. I have been building, for several years now, Indian birchbark canoes. These canoes are entirely handmade of natural materials which I collect in the woods, the same as Indian builders. The bark is from the paper birch, and the woodwork is split and worked of white cedar. The sewing is done with split pine roots and the sealing of the seams with pine pitch. All of my work is done with handtools, basically the froe, drawknife, spokeshave, and plane.

I have built canoes of several different tribes. The two in the picture I sent are an Abnaki canoe on the left, and a Malecite canoe.

I would like to sell my canoes for about \$400, as it takes over a month's work to build one. My friends and myself have used my canoes on trips to Maine, and they stand rough usage remarkably well.

I also make hand carved Indian paddles which I sell for about \$25. In making canoes and paddles, I would like to say that I can make these things to order if desired; the buyer can design for himself the canoe or paddle.

Sincerely
 Henri Vaillancourt

Grumman Canoes

Generally considered the best aluminum canoe on the market. Costs about \$50-\$75 more than other makes but workmanship is far superior. It's well worth the price if you intend to use the boat heavily. Very durable; I got mine at a discount after it had been blown down a wooded hill during a tornado and it was fine after I pounded out the dents. Can be equipped with a sail which you can buy complete at considerable expense or buy the basic parts and make the rest yourself. Catalog also lists rowboats and sailboats, with which I've had no experience. Grumman sends along a complete list of franchised dealers in your states; it's wise to check with several before buying as reductions from the list price are not uncommon.

THE SAND ROOM

He is in the well, inching down, supported by his back and feet pressing into opposite walls. His legs are aching terribly, sharp protrusions gouge deep furrows in his back, but there is no way he can reverse and climb back out again. He can't stop himself from slipping down. Every time he presses hard enough to stabilize his thighs swell with cramps and make him shift his feet around, which drop him down another inch or two. Once when he released a foot to shift he lost all control and fell scraping several feet before he caught himself again. Down. Sliding down, lowering through the tight, round passageway, pain all through his legs and back, inch by inch along the jagged walls behind him... disappear... falling falling free through empty air!

Texas Dory

Texas Dory Boat Plans Catalogue, by Capt. Jim Orrell. \$2.00, I think, from Texas Dory Boat Plans, Box 720, Galveston, Texas 77550

A catalogue with illustrations and line drawings of plans for boats 15 to 45 feet, sail, outboard or inboard. Plans cost \$10 to \$15 but by careful drafting you could make your own from the line drawings.

By following one of these plans even you and I can build a strong, seaworthy boat of plywood for less than it should cost to power it. These designs are mostly modifications of the traditional dory workboat. The angular shapes make for relatively easy boatbuilding. You need a skill-saw, mitre box, a copy of Stewart's *Small Boat Construction*, a whole mess of clamps and a place to do it. I used my living room.

Tom Tarr
North Vancouver, B.C.
CANADA

Cheaper Inflatables

A suggestion. Avon makes the best inflatable rubber boats (see page 114, Spring 1970) but they are way over-priced. Recommend best buy for the money are WFR rafts (price: 4 man-\$60, 6 man-\$80.) Good solid construction— neoprene coated canvas as opposed to the rubber coated nylon (marketed by Sears and Wards) which is less rigid, more susceptible to tears and slippery when wet. WFR rafts are available from: Lee's Outdoor Stores, 37 West St., Annapolis, Md 21401 (phone 301-269-0600). Rafts don't have an inflatable internal cross member, but if added support is needed for white water work, a medium large inner tube works fine (on your lunch break, take the inner tube out of the boat, walk up stream and float by your friends in grand style.)

A recommendation for anyone that lives between Albany and Washington: the Youghiogheny River. One of the best stretches of white water on the East Coast. Start at Ohiopyle, Pa (20 miles east of Uniontown on U.S. 40, then 10 miles north on pa. No. 381) and get about 10 miles of great river. (Ask anyone in Ohiopyle where "they take the rafts out" and you'll get directions where to leave your second car down-river)

For the less-than-experienced, Lance and Lee Martin take groups (or individuals) down the same stretch. For about \$10 a head, you get a raft, a good lunch, expert guides, and real wet. Even for the experienced, not a bad idea just to learn the river. Call Wilderness Voyageurs, 412-329-4752 (Lance's mother-in-law usually answers the phone.)

Warmest Regards,
David Abrahamson

Water Charts

If you're travelling on the water, you're going to need something more than an Esso roadmap to tell you where you are. For United States waters the best charts (the only ones, really. All the others say something like "refer to the appropriate C & GS chart for navigation data") are the ones issued by various government agencies.

Where to get the charts depends upon where you want to go. Charts of the Atlantic, Pacific, and Gulf Coasts, and the Intra-coastal Waterway come from the Coast and Geodetic Survey. The Mississippi River and its tributaries are on Army Corps of Engineers charts, and the Great Lakes are handled by the Lake Survey.

Cost of individual charts varies, most run about a dollar or two, except for the rivers, which come in books. The Missouri River, for instance, comes in two parts and costs \$2.00 a book.

Index maps for the lakes and coasts are free from the appropriate agency. It's easier for the rivers—you tell the Corps which river you want, and they sell you the whole book.

Charts are frequently revised, and you should be using a current one, because the changes can sometimes be big ones. Catalogs are available free from:

House Boating

If you're shopping for houseboats this magazine will help. Houseboats are pretty nice to live on. I lived on a grounded barge with a board & batten cabin on it in Sausalito till the fleas chased me out. Probably these aluminum and fiberglass jobs don't have that problem. I bet they have others. A home to fuss with, where weather and tide concerns you, that's houseboating. Live like in a movie.

The Old Boathouse

let me recommend the old-fashioned wooden rowing & sailing dinghies sold by "The Old Boathouse", 2770 Westlake No. Seattle, 98109, as beautiful & seaworthy craft.

The Norwegian "rana" boats range in size from 9 1/2' to 16 1/2'. They are cap-strake, copper riveted & oak framed. They are light, yet very strongly built. The 16 1/2' sloop is an open dinghy with a full-length skeg as well as dagger-board. This gives a directional stability lacking in fiberglass racing boats. A rana boat will beat or reach all day without a touch of the helm. She can carry as many as 6 adults comfortably & still not be overloaded. She is a great, safe family boat that sails well in all conditions & rows quite well. (Oars come with the boat.) The rana boats are a real bargain, costing far less than anything comparable in fibre-glass.

"The Old Boathouse" also sells a traditional, fine lined, cap-strake rowing skiff on the lines of the famous "whitehall" skiffs. This boat is built in Minnesota & is a wonderful example of a dying art. These boats are undoubtedly one of the most easily rowed boats in the world. The construction is white cedar planking, oak frames & copper clench nailed throughout. The boats are beautifully finished in varnish inside & out. The prices for this boat are quite high, but the craftsmanship is the highest quality.

D.R. was falling but because he couldn't see that he was falling his sense was one of sudden weightlessness, of sudden freedom from the limits of the well, from pain from cramp from gouge in his torn back from crawl and slide from run from try to make his body pull beyond its power. Free, D.R. flew into a black he couldn't see before he landed hard enough in dry loose sand to take his wind away. Windless he felt more euphoric than hurt or terrified. He landed on his back and empty as it felt throughout the lower reaches of his lungs it was peaceful lying in the black, and he just lay there. Lying, resting. His body rested in the sand so deeply it had no wish to move even when his lungs had filled and breathed again. Except to stretch. There was rest. The longest, deepest rest upon the blackness of the sand and then: a stretch, a reaching of the sinews, utter luxury of move and stretch and feel it lengthen out the spine until the yawn and yawn and yawn from the very bottom of his spine.

Skin and Scuba Diving

Don't expect to read this book and start scuba diving in a month or so. Scuba diving is fun and rewarding sport. But without proper training, it is very dangerous.

This book has grown in time along with the sport of scuba diving. Now in its newest edition, it is more complete than any other book ever written on this subject by anyone. So if you're interested or planning to be involved in this art, you would be best to buy this book; if you don't get it now, your instructor will tell you to later.

U.S. Navy Diving Manual

the navy probably knows more about water things than any other institution on earth, mainly, sadly, because they have been making war on the oceans for longer than you and i can remember. this is the manual they use to train their divers. good introductory stuff about pressure, buoyancy, anatomy, safety principles, and heavy portions of deepdiving techniques. the gear illustrated is generally navy issue equipment, but it is easy enough to make the connection between government and private manufacturing.

The buoyant effect of liquids is expressed by Archimedes' principle. This states that any object wholly or partially immersed in a liquid is buoyed up by a force equal to the weight of the liquid displaced. Figure 1-17 illustrates the following example: A diver, with his helmet and dress, weighs 384 pounds. If he inflates his dress so that he displaces 6.5 cubic feet of water, we will be buoyed up by a force equal to the weight of 6.5 cubic feet of water. Because sea water weighs 64 pounds per cubic foot (1.24 (10)), the buoyant force acting on this diver would be 6.5x64=416 pounds. This force is 32 (416-384) pounds more than his total weight. Such an excess of buoyant force is called positive buoyancy.

Diving without breathing apparatus requires breath holding, and methods of prolonging the length of time the breath can be held are always of interest to skindivers and the like. The discomfort which forces a man to resume breathing arises largely from the two main mechanisms concerned with the control of breathing. Rising carbon dioxide tension directly stimulates the respiratory center, while falling oxygen tension stimulates it via the chemoreceptors. As the degree of stimulation increases, it becomes more and more difficult to restrain the urge to breathe; and at some point, the individual will break and resume breathing.

Surfer

A very well produced magazine, well ahead of its imitators, and miles ahead of most other sport/hobby magazines. Has anybody ridden clean up and around inside a curl, vertical 360, and come out standing?

How much planning do you do before you start into a ride?
I hardly ever organize what I'm gonna do on a wave. The only thing I do organize is probably my first turn. After that I flow with the wave, and if an opportunity comes up to try something, I do it. It's just a matter of getting onto the wave and going and seeing what happens. I like to get into the rhythm of the wave and see what comes out of it.

What do waves represent for you?

Well, they're definitely not football fields, though there are athletes in the sport who look at them that way. But then there are the other people that aren't looking at it as a sport at all. They sort of see it as an art form. To me it's a lot like dancing. I get the same feeling from moving to music as I do with moving on a wave. As a matter of fact, I went dancing last night.

You are often associated with "power surfing," but is that really your thing?

I don't try to be powerful. To me, to be powerful is to overwork the board and the waves. I don't think of myself as a power surfer, because it's the wave that's got me in its power. Like with skiing, the speed comes from the hill. The skier just tries to maintain.

New England Divers

Skin diving (with mask, snorkel, fins, etc.) and/or scuba diving (with tanks of air) are healthy recreation which allow one to see and enter a completely different world where he is surrounded by a different medium (water) and different flora and fauna from those which he has experienced in his lifetime.

I have found the best place to buy equipment on the east coast, and I think the west coast. It is New England Divers Inc., Beverly, Mass. They are the distributors of diving equipment to the eastern sports shops and will sell to individuals, in small or large quantity, all brands of diving equipment at the same price that they sell it to the sports shops. They sell over their counter, by mail, or by phone (one can call collect from anywhere in the continental U.S. for an order over \$50.).

The "salesmen" in the store are all extremely experienced professional divers. They have given me knowledgeable and honest advice with their low prices. Last spring I was preparing to go to Turkey on a deep diving underwater archeological expedition sponsored by the National Geographic Society.

When I went to their shop to discuss some personal equipment purchases with them I found they already knew about the expedition and what kind of work I'd be doing. They brought up and discussed with me the pro's and con's of various equipment, convincing me not to buy some items and to buy some others. When I was in Turkey this summer, isolated from any diving shop, I found they had been right in every detail.

One of the things I bought was a U.S. Divers Calypso "J" regulator which can be purchased in any sports shop at \$110. These people sell it for \$73.70, brand new, with guarantee (this is one of the most expensive but also the most reliable regulator).

Calypso "J"

The Calypso "J" regulator epitomizes the ultimate in regulator design. The completely balanced and adjustable first stage provides effortless inhalation, no matter what the depth or tank pressure. The second stage has superior magnum exhalation which allows a diver to exhale with complete ease from any position. These two stages, coupled with the "fail-safe" reserve system and the high pressure port provide the diver with the finest breathing combination available. Patented.

D.R. rolled over and buried his face in the sand, loose, smooth, clean as the purest beach. He felt it scrape the crusted mud and sweat and slime and blood from his face and neck, his forehead and his hair. He was bathing. He was a snake shedding old and stiffened skin. Grinning D.R. sat up and peeled off his matted shirt. When he pressed his chest into the sand again it felt like touching breasts with some warm woman. Smiling in the deepest pleasure he sank both arms into the sand and when he pulled them out he scraped the sand up into piles like breasts and then lay down upon them. Exalted, now, he leaped to his feet and wrestled off the remnants of his clothes. Falling forward naked he spread-eagled himself upon the clean invisible sand, embraced it close with every surface of his body. He rolled and rolled again, then wiggled, pulling through it like some amphibious creature joyous to be on land. When he was tired he stopped and nestled wiggling till he'd formed impressions for each contour of his body. Sand was under every arch, his lower back, the hollow of his knees, relieving every tired place in him, sending streams of rest through every isthmus, his mind as dark and peaceful now as the inmost silent chamber of the mine.

U.S. Divers

U.S. Divers— for scuba is the only co. I would recommend. In 8 years of scuba diving I have used their gear time and time again and find it to be reliable and durable. Their regulators and wetsuits are for my money the best on the market. They aren't cheap but most dealers give pretty good discounts.

For shallower water (75'), which is arbitrary as to depth, Desco, Inc. makes an open-circuit-surface-supplied face-plate (the same plate is used by the U.S. Navy) that is out of sight but slightly limited as to vision for about \$120. Desco also makes a complete line of heavy gear from air-hats to commercial diving dress and accessories, none of which I can say yea or nay about as I have only used their shallow water mask.

The best deep-sea hard-hat is one made by Kirby-Morgan. (A Division of U.S. Divers) and is called their Standard Air Hat. If you are buying or need to buy heavy-gear, I recommend (and have bought for myself) their Standard Air Hat above all others. It has the increased port area of most commercial hats for better visibility with the ruggedness and reliability of the Navy Mark V Hat.

As far as training facilities go for commercial diving there are two in Southern Cal. and one in Oakland. I investigated all of them before enrolling and finally wound up going to Universal Divers Ltd, in San Pedro. Universal is the only school that trains a man in all phases of commercial diving. Their instructors are all commercial divers of 10 or more years diving experience each and their facilities include a fully equipped commercial grade diving barge, a 40-50 foot ocean diving boat and complete classroom facilities. The course runs 10-12 weeks and at present costs \$795. It will go up to \$1000 as they will be adding a section on commercial abalone diving in the near future. This is still about \$250 cheaper than the other schools. As to periodicals and books on commercial diving there really is only one book and that is the U.S. Navy Diving Manuals. They are available at most dive shops and are the final authority on all phases of diving. The manual is a must for all divers, commercial or otherwise. Only one periodical is out that specializes in commercial diving and it is called Undercurrents. It is so new I haven't got its address yet but as soon as I do I will send it along.

The Chinese gybe:

If the sail manages to gybe before it is amidships, the bottom half of the sail gets across, while the upper half gets hung up by the cross-trees or by a batten catching on something, and stays on the original side. You can easily tear the sail. If this mishap befalls you, there is one thing to do, and only one— gybe back to get on the original tack. Anything else is bound to fail and will risk tearing the sail. (It may be noted that the term Chinese gybe is not a reflection on Oriental seamanship, which is of a very high order; the junk rig is designed to carry out a gybe in this manner without unpleasant consequences.)

Liberty Communes

According to AD (p. 88), Brand Griffon at Washington State University has schemes to convert mothballed Liberty Ships into community environments for 600 dwellers. The plans include use of sea resources such as plankton. —SB

Ocean Living from:
William Taylor, ed. Ocean Living
Box 17463
Los Angeles, CA 90017

Dear Ocean Living People: We have received your OL issues via a friend. It is right on what we need and are interested in. For my objection to the Vietnam war I could choose either exile or jail. I chose "exile" in Sweden where I'm now living with my family. We are opposed to all war, a tragic human-sickness, and we wish to affirm life and peace as much as we can. Therefore we are building a boat here, a James-Wharram-designed, 40-ft catamaran, poly-nesian style, of plywood. I am familiar with Charles Greene's Bungay boat kit company as you have talked about in one of your issues. This boat I'm building, called "Narai", appears, from all our study, a very good boat. It won't capsize (except in a hurricane with full sail out), has a number of safety features not found in most boats, will be our family, living-boat in which we'll cruise around the world looking for our own paradise. You can write to Miss L. Scrutton, S/C Rongo, Poste Restante, Deganwy, N. Wales; for plans of these catamarans. Mike Romano & Family, Osthamar, Sweden.

A washing machine designed for underprivileged peoples in foreign lands, the Colgate Wash 'n Go (as it is marketed in America to campers and boaters) is not in mass production—but the last we heard a limited number were still on hand in the company's New York warehouse, selling for \$11.95. This one-moving-part gadget combines the principle of automatic washer rotation with the energy source of a Chinese hand laundry. We sent for one (and postage is included in the price) and Cara says it is much easier than competitive manual wash facilities—such as washboards and wringers or rocky river banks. It holds four to five gallons, three pounds of clothes, and a cup of detergent. Operation is something like churning butter. Made of extremely light-weight semi-flexible plastic. It ain't Westinghouse, but think of the electricity you save.

Kerry Thornley

It's a bit hard to bullshit the ocean. It's not listening, you know what I mean?

David Crosby 1970

Knight's Modern Seamanship

If there's a single book to have on board at sea, this updated classic is probably it. Everything from mooring to an ice shelf to port-tack-yields-right-of-way to minimizing hover time for boarding helicopters.

HANDLING WIRE ROPE

CIRRUS and cirrostratus. "Mare's tails" is the popular name given to well-defined cirrus clouds that thicken into cirrostratus, and then gradually lowering into water droplets aloft. The clouds may resemble a mare's tail and may often be the forerunner of a storm as indicated in the old rhyme: "Meckrel sky and mare's tails, make tall ships carry low sails." The more bush-like the cirrus, the stronger the wind of that level.

American Practical Navigator - Bowditch

There's an episode in Kenneth Roberts' Lydia Bailey where Albion Townsend, having helped lick Napoleon in Haiti, is sailing across the Atlantic with his common-law bride, Lydia, and they're out on deck a lot at night doing sex with Bowditch's book in hand, teaching each other navigation.

This book is big, probably lots more than you care to know about navigation, but it's authoritative, THE word, and it's cheap. Dating origins back to 1799, it has romantic associations to go with its practical lore.

or WHOLE EARTH CATALOG

While I have tried to give a clear picture of the necessary geometrical relations, I have avoided astronomy as much as possible. The U.S. Nautical Almanac, in giving S.H.A. and G.H.A. directly, entirely disposes of the former Right Ascension which immediately removes the most confusing part of the study of navigation. Therefore the discussion of Time, except in relation to Meridian Altitude, has been reduced to a minimum.

The greater ease and accuracy of navigating by the stars has been stressed and navigation by the sun has been put in its proper place as a special case of stellar navigation.

This book makes no pretense of being an exhaustive scientific study of navigation. It is not intended to discipline the mind nor train the character. It does claim to give the essentials necessary for intelligent navigation.

THE LIGHT

D.R. did not intend to leave the Sand Room, and he wouldn't have for anything less than light. It was safe in there, and dry, and warm. He would and his journey on that sand rather than go into another hopeless maze of watery caverns.

But feeling along the high, smooth walls D.R. found an opening a vertical break that led into a narrow, winding hallway, and because the floor was also sand he decided to check it out a ways, and just beyond the second curving of the hall he saw a light.

At first he was certain it was just an image in his mind, and to be sure he closed his eyes, expecting to see the light still hanging in his mind just as he had seen it in the mine. But when he closed his eyes it went away, and when he opened them again, there it was before him, a tiny star in the farthest galaxy. Close. Open. Close. The light went out and came again as D.R. blinked his eyes, and stayed there when he held them open wide and stood still.

Breathless, he started walking toward it down the hall. Leaving the Sand Room D.R. had been careful to keep his two hands on the opposite walls, but now he was so excited he forgot to touch them, and when he thought and felt for them again the walls were gone. The hall was gone, the sandy floor had disappeared, his bare feet were on hard rock again. But the light was there in front to lead him on, growing larger as he walked headless now of where he put his feet or kept his hands.

International Marine Publishing Co. By the way, they have the best boat-book catalog anywhere. 21 Elm Street, Camden, Maine 04843. Put their catalog in your catalog.

OK, here's a list of good books on basics of sailing, cruising, design, and boatbuilding, with hasty comment.

On elementary sailing:

There's a flock of new books I haven't looked at. The old (1930s) classic, and I suspect still the best in many ways, is *Learning to Sail*, by H.A. Calahan, MacMillan, \$5.95. Calahan is clear and painstaking on rudiments, but also far wider in scope than most primers. Good material on peripheral but important matters from maintenance to moorings. Out of date with respect to modern materials (fiberglass, dacron), but that just means the old materials (wood, canvas, manila rope) are thoroughly covered. A rare virtue nowadays.

On *cruising* (assuming you have the rudiments of sailing covered):

Calahan has a sequel, *Learning to Cruise*, which is just as good. Again, oriented towards traditional boats, materials, and methods. You can get both Calahans (and *Learning to Race*) in a single volume called *Yachtsman's Omnibus*, MacMillan, \$9.95.

If I had to recommend only one book, it would be *Cruising Under Sail*, by Eric Hiscock, Oxford University Press, \$12.75. Hiscock and his wife have spent their adult lives making long voyages, including twice around the world. This is *the* book on how to do everything, a fantastic wealth of detail given in an orderly and practical manner.

If bread for books is a problem, you can at least begin with *Cruising*, by Peter Heaton, Penguin paperback, \$1.95. This is a sketchy treatment, but a bargain. Some nice boats pictured in both plans and photos.

About money: cruising boats are very expensive. The very cheapest boats discussed in Hiscock, Calahan, or Heaton, for instance, might easily cost ten or fifteen thousand dollars to build new today. Prices of old boats vary with age and condition. There are some good bargains around. However, the novice can get started pretty cheaply, since you can cruise, after a fashion, in very small craft. You'd be wise to start small anyway, regardless of expense, because small size reduces the scale of the mysteries to be mastered.

The smallest possible is very small indeed. Robert Manry crossed the Atlantic in a thirteen-footer. This wasn't a stunt, either, but in most respects a well-planned and competent passage. It's worth mentioning that he knew nothing about sailing beforehand, but he used his good head and systematically read every book he could find. (Many have put to sea ill-informed and ill-equipped. They always fail and are sometimes lost altogether.) *Tinkerbelle*, Robert Manry, Dell paperback, 75¢.

The Hiscock of very small boats is *Cruising Boats Within Your Budget*, by John Jacob Benjamin, Harper & Bros. This covers almost everything a beginner can learn from a book about owning, cruising in, maintaining, and loving his own very small ship. Published in 1957, and dated on materials and costs. I fear, I sadly fear, that it may be out of print, but is worth looking for. In any case, I don't know the price.

My favorite manual on cruising in very small boats is *The Small Boat Skipper and His Problems*, by Eugene V. Connett, W. W. Norton Co. This too appears to be out of print, but is too beautiful to neglect mentioning. This, like Benjamin, is about life aboard boats so small that pulling on your pants in the cabin becomes a logistics and engineering adventure. Much less systematic and comprehensive than Benjamin, and so perhaps less useful. But Connett, quite unconsciously, no doubt, was a Zen master, and this book is about love.

The *Compleat Cruiser*, by L. Francis Herreshoff, Sheridan House, \$7.50, is a Victorian-style fiction in which a cast of tediously stuffy characters enact some cruises in various boats. Some of the dialogue is unintentionally hilarious. But Herreshoff is a cranky genius and a great yacht designer, and much lore and wisdom comes out of those improbable mouths. Don't make this your first book on cruising, but don't miss it either, somewhere along the way.

Piloting, Seamanship, and Small Boat Handling, by Charles Chapman, published by Motor Boating magazine, \$11.95, is a really essential encyclopedic reference, used as a textbook for Power Squadron courses. Not much on sail (written primarily for motor boats), but the best single book on piloting, with excellent stuff also on weather, marlinespike seamanship, ground tackle, signalling codes, and everything else imaginable. With Hiscock and Chapman you can get pretty far.

On design and construction:

These subjects, especially design, are important to anybody who is about to actually lay out money on a boat, even if he will never do any designing or building. As in skiing, mountain climbing, playing a musical instrument, or any such subtle and beautiful skill, you will be severely limited and inconvenienced by poor equipment. In this field, change is not always progress, and the older boats are often better than the latest fiberglass models. Many of the contemporary mass-produced, mass-marketed fiberglass racing-cruising boats have design defects as cruising craft, and your only defense is knowledge.

The real beginner could start with *Understanding Yacht Design*, by Edward S. Brewer and Jim Betts, Yacht Design Institute (Brookline, Maine 04616), 8 1/2 x 11 paperbound, \$3.95. This is non-technical and elementary, in fact sometimes oversimplified at the cost of clarity and precision. There are a few controversial points which are not labelled as such, but offered as gospel.

The *Sailing Yacht*, by Juan Baader, W. W. Norton & Co., \$15.00, covers an enormous range of subjects from principles of design to storms at sea, though this range leads to some superficiality. It's in part a pretty good introduction to the grosser aspects of design, with chapters on hull forms, rigs, and aerodynamic and hydrodynamic theory as applied to sailboats. Particularly useful for the large number of plans given of boats of all types.

A somewhat more technical and far more detailed and elegant treatise is *Sailing Yacht Design*, by Douglas Phillips-Birt, Adlard Coles Ltd. (London), \$13.95. This may be the most useful single volume for the amateur who is really interested. Other books get deeper into certain specifics, but this covers the subject in a most lucid and orderly way, touching on history, theory, shapes, types, rigs, construction, drafting, measurement rules, and calculations.

Yacht Designing and Planning, by Howard I. Chapelle, W. W. Norton & Co., \$10.00 reflects the state of the art in 1936, and conservatively even for then. Very good if you want to get into the actual process of designing, with a sample design worked out step by step through the book. Along the way you get valuable comments on many matters from an empirical and commonsense point of view. No theory. Superb drawings.

Cruising Under Sail

I love any book that has the balls to fully annotate its bibliography. This one does. I can see why it's the standard cruising text.

Cruising Under Sail

American Small Sailing Craft, Chapelle, Norton, \$12.50, is the standard work on the history of all important types of small sailing craft and their evolution during the years of working sail in America. A great classic. More superb drawings.

The *Common-Sense of Yacht Design*, by L. Francis Herreshoff, Caravan-Maritime Books, \$25.00, is another classic. Herreshoff, one of the great designers, is an eccentric artist, and this work is rambling, anecdotal, opinionated, insulting, entertaining, personal, and endlessly instructive. Also occasionally wrongheaded. It covers sooner or later and somehow or other most subjects of importance. Some exquisite drawings.

Boatbuilding, Chapelle, Norton, \$15.00, is the standard text on traditional wood construction, and *Boatbuilding Manual*, by Robert M. Steward, Poseidon Publishing Company (Lakeville, Conn. 06039) is a useful and more modern supplement.

Peace,
Mait Edey
Edey & Duff

Mattapoisett, Mass. 02759

Edey & Duff build a nice fiberglass and wood cruising boat, the *Stone Pony*. Info: \$1.

Cruising teaches a man to rely on his own judgement and skill, and it is one of the few worthwhile things that can still be enjoyed today by a man or woman of independent spirit, for there are no restrictions, no organizing body is needed, and the sea is open and free for all who have the inclination to sail on it and a suitable vessel for the purpose. It may cost as much or as little as one is prepared to spend, for an old and cheap yacht, provided she is sound, may be just as suitable for cruising, though perhaps not so convenient or such fun to sail, as an expensive one of modern design and build, and a small yacht, though not so comfortable, may be just as seaworthy as a large one.

There are many different forms of the sport. One man gets his pleasure by making short day sails along the coast, spending each night at anchor, sharing with his wife and family the peace of the creeks and the novelty of life in their compact and mobile floating home. Another, who can spare the time, gets his satisfaction by making long passages in the open sea, taking the weather as it comes, and driving his yacht day and night until she fetches up in some foreign land.

Meeting steamers do not dread!
When you see three lights ahead
Starboard wheel and show your red.
Green to green and red to red,
Perfect safety, go ahead.
If to starboard red appear,
'Tis your duty to keep clear;
Act as judgement says is proper,
Port or starboard, back or stop her.
But when upon your port is seen
A steamer's starboard light of green do,
There's not so much for you to do
For green to port keeps clear of you.

Sailing Hydrofoils

Very far out boats. All manner of designs and lore on home-makeable boats that rise up and go like a son of a bitch. The cutting edge of sailboat design. The Amateur Yacht Research Society also has literature on Self Steering, Multihull Design, Sailing Aerodynamics, Dinghy Design, etc.

Woodacres, Hythe, Kent
England

At the moment, we are on the very verge of seeing some remarkable hydrofoil craft which fall into two classes, namely (1) the Flying hydrofoil craft where the whole boat lifts off the water, leaving only three foils to sustain it and (2) the Hydrofoil Stabilised craft, where a long lean boat is stabilised against the capsizing moment of the wind by a hydrofoil placed to leeward.

The fully flying hydrofoil sailing boat may, or may not, achieve speeds of 40 knots. Due to the limitations of hydrofoils in "cavitation," ultimate speeds of more than 45 knots are very unlikely indeed. Some development is needed, however, before such a craft is seaworthy.

The hydrofoil-stabilised sailing boat, on the other hand, if some 50 feet long could be ordered tomorrow. If built lightly enough such as in PVC foam and fiberglass sandwich, it will have a better "lift to resistance ratio" than the fully flying type up to speeds of 30 knots. It might well do 40 knots and be a fully seaworthy craft capable of righting herself from the upside down position.

Bill Prior's second flying hydrofoil

National Fisherman

The saltiest publication I know. Fishing, boatbuilding, ocean conservation, oceanography, sea news. A trade publication with a dignified nod to the sea buffs. Damn good newspaper.

By D. Karl Hoppe

The Dept. of Defense in Washington has begun an investigation into the apparent dumping into the ocean of a can of DDT, a highly toxic pesticide — which may have come from a military installation.

The DDT can, painted an olive drab military color, was pulled from water 20 miles west of Bodega Bay, Calif., by Ferndale, Calif., fisherman Thomas C. Webster Jr., owner of the dragboats Havana and Franklin. Webster said that during the same trip to the southern fishing area, he and a crew of three on the Havana also netted a 2.75" aircraft rocket, which was immediately thrown overboard for fear of possible explosion.

Fish Catching Methods of the World

definitely not about sportfishing, brandt concerns himself with harvest fishing, food fishing, money fishing, desperation fishing, corporation fishing, nets, spears, traps, explosions, harpoons, diving equipment, and fishing with bare hands and teeth. its an expensive book, but i don't know of another that runs through everything the way this one does. it would be of particular use if you are going to try circumnavigating the earth on a surfboard.

London EC4, England

Fishing with hand grenades as practiced after both World Wars was particularly damaging. The hand grenade was actually called "soldier's fishhook". When a hand grenade was exploded in an experiment a diver brought up from the depths ten times more fish than was gathered on the surface.

Fishing by dynamite in Greece became rather notorious, but there it has now also been prohibited for the reasons mentioned. It happens, however, that sharks are attracted by such explosions since they have learnt that the acoustic stimulant meant that they could easily get fish for themselves! Dynamite explosions are therefore now used in some places to attract sharks.

Dynamite in small quantities, however, can be very useful for frightening the fish. Purse seiners in California use small bombs to frighten the fish before the gear is completely pursed and closed. These bombs are called "cherry-bombs" according to their original form. In the Philippines, where fishing with large dip nets is practised, a small explosive is used to stun the encircled fish and so prevent their escape when the net is lifted. This too, however, is illicit, although it is well known that the use of dynamite may possibly determine whether any particular operation is a success or not. If the fish are not bodily damaged, they are stunned only temporarily and will soon recover. This fact also explains why the loss of fish can be relatively small after underwater explosions by blasting, bombs or by firing at a lake during wartime.

Oceanography in Print

A Whole Oceans Catalog! This pamphlet is certainly of use to anyone wanting to learn about the sea. It gives access to information ranging from "elementary" to "adult technical" interests. The preface makes a claim about the ease of obtaining most of the books listed from public resources—checked out, they are easy to get.

Marlinspike Seamanship

Several additions to your books on knots and sailing: (all of these are published by Brown, Son & Ferguson, Ltd. 52 Darnley Street, Glasgow, S. 1. Costs are post-paid in USA) Marlinspike Seamanship by Leonard Poppel is the classic text on wire-rope splicing. While he is more concerned with 1-inch diameter cable, I've used his technique on the 3/8 in. halyards on my sailboat. Since professional splicing is about four dollars per, there's more than just snob appeal involved, especially since the book costs \$1.30. His other book, Advanced Ropeworking (\$3.80) discusses splicing large hemp rope, making fenders, etc. and is most valuable as a discussion of tools and techniques, rather than as a cookbook. Three books by Blandfords (see p. 57 of the Spring Catalog): Rope Splicing (.75), Working in Canvas (1.00), and Netmaking (.86) are all well worth their prices. The latter two should be quite valuable to any tent-living commune that either plays tennis or poaches. A friend of mine who sailed on a five-masted bark, Antara, mentioned that the ship was completely re-rigged recently. As an "instruction book" they used Harold Underhill's Masting and Rigging of the Clipper Ship and Ocean Carrier. He used the book to re-rig a Baltic Galeas (schooner with mainsail aft). Along with several other books by Underhill, these are excellent introductions to how these sailing ships "worked". (It costs \$8.62) Their catalog "N" is free.

Martin Minow
Bromma, Sweden

or WHOLE EARTH CATALOG

As one of its manifold functions, UNESCO has traditionally served as a foster home in Paris for sciences in need of a place to hang their international hats, offering a maximum of independence as long as they were willing to accept a minimum of money. (This is true of science everywhere—the amounts of independence and money are inversely related.) It is something like those little French country cafes that post signs announcing they will take customers who bring their own provisions.

The pendulum of scientific inquiry keeps swinging between observation and synthesis. Aristotle had to resolve such a conflict: according to Sir John Murray, editor of the reports of the Challenger Expedition, Aristotle threw himself into the whirlpool of the Strait of Euripos, separating Euboea from the Greek mainland, because he was unable to explain it.

ADORATION OF THE LIGHT

Beyond those looming shapes is brilliant light but here are only shadows reaching out across a vast and empty plain. I'm crossing an enormous floor, an ancient oceanbed so smooth I didn't even stumble when the light was far away. I'm near it now. It pours down in a shower from up above. It streams, it falls, it's a column made of light, a light that's shaped like stone and stone with light inside.

The light's a mass of molded stone hanging in a chamber like a frozen waterfall.

It's a stalactite shaped like some cathedral spire, hanging upside down, a perfect pearl of stone with light inside, shining out through jewels that cling like beads of moisture on a melting tower of ice. Above, it widens and is lost in the high, vaulted ceiling of the chamber. It narrows to a tip that points into a pool of water down below the rocky ledge where I now stand. It shines so bright above it blinds me to look up, but in front and down along the falling spire its light is soft, a comfort to my eyes. Above, the light is blinding white. Below, it's tinted by the jewels to soothing amber.

I can gaze into the amber without blinking. It bathes me in its amber, in its glow, in its love so sweet a subtle sense of danger can't intrude.

Danger tries. It makes a scraping sound behind me. But the love will not allow me to turn away.

I hear it clearly. The sense tries hard to penetrate. It bangs and clamors for attention, but my eyes will not be moved from this love they finally see.

It scrapes behind, and now it hisses, I feel it, coming close, my skin is warned and thrilled by some enormous hostile force behind. My flesh responds in tingling fear but my eyes are bathed in love and soothed by light, and in my breast is perfect adoration, without fear.

But my body must respond. My body feels it and turns itself around to look at David lurking in the shadows of the ledge. My eyes see his eyes shining in the murky dark. My stomach turns, my hair feels wild, but my adoration of the light remains serene. It's only David's eyes, and lower forehead. The rest is monster, the mouth of dragon teeth, the chin and jaws and head leading into short, thick neck and shoulders are horns and scales and fur. Oh it's true all right. He's the monster-guardian of the light. But adoration is quiet in my breast. My love can know no fear.

Leave fear to the flesh. The flesh is better terrified, stronger for the wars. Scared flesh can attack, a quick advance into the very teeth of monsters of the deep, throwing dust into their eyes swinging wildly human fingernails as claws. Oh yes, my friend. It's joined now. Slink back goddamn you hide back in your lair. My flesh is eager and my love serene. It's time, old friend. I'm here.

Boatbuilding

This is the book for the man who wants to put together a boat he can live in and with. Chapelle is full of ideas for getting the maximum use of the limited space on a boat. He is also the easiest way to avoid all the miserable pitfalls one can encounter: leaking hatches and deck seams, toilets that don't work on one tack, or back up and fill the bilge, storage that rots its contents or dumps them on the deck at the first wavelet. There is even a chapter on hand tools and how to use them. The book is generally considered the standard reference of the boatbuilder. Its single drawback is its age (first published in 1940) so it misses the latest developments in materials. Still, it's the best I've seen for staying out of trouble.

Royal Oak, Michigan 48072

Sanding—

1. Wear a gauze mask. Most paint dust is toxic, especially dust from bottom paint.
2. Don't use steel wool. Tiny particles embedded in the surface will eventually rust through the paint.
3. Sand with the grain.
4. Don't leave bare wood exposed too long; it absorbs moisture.
5. If you have never used a machine sander, practice on scrap wood. You'll be glad you did.
6. Don't use a machine sander between paint or varnish coats.
7. Don't apply too much pressure with a machine sander as it may glaze the surface; also, frictional heat may soften the paint or varnish and "load" the sandpaper.
8. Don't sand if your neighbor is about to paint or varnish.

Boatbuilding Manual

With this in combination with Chapelle you've got boatbuilding technique just about surrounded.

Silicon Bronze

For every structural fastening in a boat it is hard to beat a copper silicon alloy sometimes called Everdur. It is about 96% copper and is so strong that seldom are fastenings wrung off when being driven, and, of major importance, it is highly resistant to corrosion from sea water. The use of this metal removes the risks involved with the brasses and galvanized steel fastenings and is well worth the difference in cost. When it is considered that it takes no more time to drive a bronze screw than other kinds the difference in cost is not as much as the price of the screws alone might indicate, and a point to be remembered is the resale value of a bronze fastened boat.

Chapelle

I suggest the inclusion of a book called American Small Sailing Craft, by Howard I. Chapelle. The book was published by Norton in 1951 and although it's out of print, copies can be obtained from Caravan Books still available from W. W. Norton 87-06 168th Place Jamaica, N.Y. 11432 55 Fifth Ave. New York, N.Y. 10003 \$12.50 ..Price will vary according to condition of book, but expect in the 10-20 dollar range.

Howard Chapelle is the W.F.A. (World's Foremost Authority) on the design, construction and evolution of sailing vessels, although he presents an obvious historical-antiquarian bias. He's a marine architect and a professor of maritime history (Harvard) and is now one of the directors of the Smithsonian Institute.

His best-known works deal with large sailing ships of the XVIII-XIX centuries, and his two books on design and construction are outdated (dealing entirely with wood, pre-fiberglass and ferrocement) but American Small Sailing Craft is a book no boat freak should be without.

It is interesting, chavism notwithstanding, that coastal North America has produced more and better types of small sailboats than any other culture in history. This is the importance of this book. SOMEWHERE in these pages there is a design for a sailing or rowing (auxiliary power not impossible) boat which is PERFECTLY suited for whatever work load and weather and sea conditions any sailor, boat builder or water freak may have to face. If you want to buy, build or have built your IDEAL boat for work, travel or pleasure, this is the place you should look first. There are lake boats as well as deepsea craft, Pacific and Gulf Coasters as well as Down East types discussed; and there is a detailed drawing (at least) of every type mentioned. Which is EVERY TYPE. If you happen to live in, say, Casper, Wyoming, it's a hell of an interesting book anyway. Bear in mind that marine construction techniques are applicable in many ways to land structures.

It's probable that many of the designs included in the book could be executed in ferrocement. I'm sure any of them could be done in fiberglass.

James H. Lawton
Paynes Creek, California

A portlight blank and a scupper in position ready for plastering day. The ends of the wires holding the blank in place are carefully turned in to prevent catching on a trowel. The hole in the hull is cut with an acetylene torch around a 3/4" plywood disc which was used as a template. The disc was conveniently held in place by a single 1/4" eye screw that passed through a hole in its center and screwed into the mesh. The scuppers were prefabricated from stainless steel half-oval, and short 1/4" rods were welded to them on the welding table.

Miscellaneous Comments About Plastering

Obviously, not everyone wanting to build a ferro-cement boat will live in an area where there are professional plasterers with boatbuilding experience, readily available. For an individual in such a situation, five courses of action come to mind:

- He could move and build his boat in an area where experienced boat plasterers are available.
- He could transport a crew of experienced boat plasterers to his job site.
- He could transport the foreman only of an experienced boat plastering crew, and fill out the crew with local plasterers (Not cement finishers who are unused to working on vertical surfaces and who do not normally use a hawk in their work.)
- He could employ a local crew of professional plasterers who have had no boat experience, use whatever printed material he can find on the subject as a guide, and hope for the best.
- He could call in a crew of inexperienced friends and proceed as in d.) above.

As one proceeds down the above list of possibilities, the probability of producing a hull with an acceptable finish diminishes. Although it may be possible for a group of careful, hard-working, inexperienced builders to plaster a hull without professional help and make it structurally sound, the finished product might be an abomination to look at.

As ferro-cement technology advances, it may be that techniques will be developed which will allow the amateur to produce an acceptable, smaller hull with only the help of some inexperienced friends. The probable sequence of this technique would be to:

- produce an exceptionally fair armature,
- plaster in the usual fashion,
- scrape and broom both the inside and the outside of the hull,
- cure, and
- after the vessel has cured, glaze the outside of the hull with a glazing compound which can be sanded and shaped.

Ferro-Cement Boat Construction

The establishment book. If I were building with f.c. I'd want every book on the subject. This one has excellent technical information on treating concrete, mixing procedures, curing, design factors, etc. No nonsense.

Ferro-Cement Boat Construction

or WHOLE EARTH CATALOG

When comparing the weight of a ferro-cement hull with that of a similar wooden hull, remember both will be the same weight at around the 30-foot length. If one progresses beyond the 30-foot length, then the ferro-cement hull becomes some five percent lighter than a similar wooden one. Going the other way, the ferro-cement rapidly gets heavier than wood, unless one uses less hull thickness. The average hull thickness for this discussion will be about one inch, though on hulls smaller than 30 feet one can certainly go to a thinner hull.

Ferro-cement hulls larger than 30 feet in workboats, power cruisers, or sailboats are most economical to build when compared to wood, steel, aluminum or fiberglass. Ferro-cement gives an increase of interior space when compared to wood construction, something on the order of 12 percent. This is due, of course, to the elimination of thick beams and frames, and to greater planking thickness, especially in larger hull sizes.

Luger Boat Kits

Luger makes a line of boat kits intended for assembly by the inexperienced amateur. They have powerboats from 14 to 32 feet, sailboats from 14 to 20 feet, all in fiberglass, and a 22 foot houseboat of wood.

The basic kit consists of all the parts needed for a bare boat. These parts are pre-cut to size and shape so no layout and cutting is necessary. This saves you about a quarter or a third of the effort necessary to build a boat from scratch. The quality of these parts is very high and they will make a strong, safe boat. However, pay no attention to Luger's estimate of time for building the bare boat. I put in 500 man-hours on my houseboat, they predicted 125.

The instructions must be carefully read and reread, because they do contain mistakes. For example, I found I had to drill holes through a laid-up fiberglass job (Step No. 17) in order to install a bracing member (Step No. 32).

Their prices for the bare boat kits are reasonable. Their bare boat doesn't contain such "accessories" as windows, galley hardware, head, latches, hinges, trim and upholstery. Luger sells these as extras. They are generally not of the same quality as the boat itself. In fact they are mediocre and overpriced. I would advise getting your accessories from a mail order discount hardware dealer.

Luger's Customer Service Dept. is slow and inefficient, but they do stand behind their guarantee. They'll gladly give you a "no-questions-asked" refund on anything you wish to return.

Best of all, their catalog is free. It's well worth looking at it if you're seriously considering building yourself a boat.

P.S. Presently, I'm living on my boat in a marina. I think living on the water is one alternate that many people overlook. The rent is cheap (averages about \$2.00/month for every foot of boat length. 22 foot boat cost \$44/month for slip.) The people are friendly (they're all boat freaks, or they wouldn't be there). My 22 foot house boat cost me about \$2600 to build and finish without power, which is a fairly inexpensive home. It's a good life.

The dragon drew away when D.R. rushed him, but then came biting back and swiping with his claws. The dragon's rush maneuvered D.R. toward the wall, then pinned him there with furious snapping of his knife-like teeth till D.R. fell and rolled beneath the claws and came up past the monster, running for the edge. The monster howled in rage and turned but D.R. had already leaped and gained a foothold on the stalactite, and broken off a slender, jagged spire. He started to climb up the stalactite then, but the dragon slithered onto it above and trapped him on the lower, thinning levels of the shaft. D.R. braced his feet in solid clefts and held his weapon ready in his hands. When the dragon reached down to claw him D.R. stabbed it through the scales and made it scream in furious pain and slither lower to bring his teeth in range. It bit and clawed but each time D.R. struck it back, drawing blood from wounds in the monster's face and head and paws. The dragon's tail extended back across the ledge, its endless body still wound deep among the shadowed labyrinths above. The monster's writhing pushed small stones and grains of dust off the ledge into the pool below, making the green water come alive with squirming creatures. Tails and fins cut along the surface, long snake-like tentacles reached into the air and felt along the edges of the pool. The monster coiled along the folds and clefts of the stalactite up above, pressing down and down, D.R. fought back as long as he had room to stand, but the monster pressed him down and down and he retreated until there was only the smooth, thin tip of the stalactite left between him and the pool. The dragon swiped at D.R. with his claw, then swiftly struck again and caught him hard upon the shoulder. D.R. thrust his weapon, but already the chamber was turning, he was falling, he felt the water close around him and the creatures thrashing as he sank deep, deep, the monster's head behind him, biting for his legs.

D.R. felt the teeth sink in, then something stirring, burning in his veins, a stinging venom. D.R. twisted and tried to pull away but the monster held him fast between its teeth and dragged him down and down. D.R.'s legs were numb now but there was strength yet in his back and arms. He saw the monster clearly in the light his spire gave off, and he maneuvered till he had a proper angle. With both hands he swung the spire and stabbed the monster in the eye. He stabbed again, and sunk the spire so deep into the second eye he couldn't pull it out again. Black blood spurted and darkened the churning water as D.R.'s own mind darkened into sleep. In his deaththroes the dragon plunged, carrying D.R.'s body and its own through endless fathoms of the deep.

ALACRITY

Well maintained and in excellent condition. 18ft. 6in. L.O.A., Beam 6ft. 11in, Draft 1ft. 10in. 3 berth, Fibreglass, pulpit, pushpit, rails and dodgers, Gaz cooking/lighting, Seagull Century Plus outboard, 2 foresails, Chemical toilet, navigation lights. Many cruising extras. Can be stored until required. £690, Dukes, Antrim Road, Belfast.

FOLKBOAT. Built in East Germany of Carvel Mahogany Strip Planking on Oak in 1967. 4 berths in 2 cabins with W.C., Galley, Hanging Locker, etc. 10 H.P. Volvo Penta 2 cyl. 4-stroke petrol engine with electric start gives good 6 knots. Hollow spruce mast with S/S fittings. Good inventory includes Echo-sounder, Clock, Barometer, Avon Dinghy, etc. 12 volt battery. Laid up ashore Hants. £1,950 o.n.o.

Used Sails

Bacon & Associates, Inc. 616 Third Street, Annapolis, Maryland 21403, are the best source of used sail boat sails in the United States. Bacon & Associates, on request, will send you a list or lists of used sails they have in stock. The lists run as follows.

List "AC" For centerboard type boats, sails up to 25' luff size.

List "AK" for keel type boats, Mainsails from 25' luff to 45' luff, appropriate jibs, mizzens, genoas, staysails, spinnakers, to 45' luff, all thru 7 oz. weight.

List "B" Big sails, over 45' luff; and heavy working & storm sails, of all sizes, 8 oz. or heavier.

Low \$ List: Mains, Jibs, Genoas, Spinnakers, for keel boats and other large boats. Damaged Dacrons, some excellent cottons, much used synthetic & cotton sails. All sizes, weights.

"Gaff" list: Gaff-Head, gunter-rig, 4-sided sails, all sizes, all fabrics. (Usually a 1/2 page sheet as this listing is small)

Bacon & Associates, is a quality outfit and able to save the sailor lots of \$'s. They give an excellent description of the sail for sale and allow you a ten day examination.

A quote from their "AK" listing:

Main, 6.5 oz. Dacron by Ratsey. Luff 33' 10" x 37' 6" x 13' 9" foot. 5/8" slides on shackles on taped luff & foot. One shag patch on batten pocket. Leach draft line. 3 draft gussets on foot. Numbered. Flattener reef at foot. With bag. Excellent. \$175.00

Their lists generally run 10 to 15 pages of good, clear descriptions. The sails will be just as described and their service is prompt. If you know anything about sails you can read a lot into the listing and you will save money.

I hope this is a satisfactory review. If you are going to send me ten bucks for it, I will be so appreciative of the gesture that I will use three of the ten to purchase a Spring 1970 Catalog, so you can just send me \$7.00 and the Catalog.

Thanks,
F. Harris

Wharram Polynesian Catamaran

I noticed in the Fall Catalog you carried a notice on Jim Brown Trimarans, which I believe are excellent designs. (They were among the three or four I would have liked to build myself.) However, there were three considerations which weighed somewhat against them in my case, and might be serious factors for other Catalog readers. No. 1— They cost much too— lots of fiberglass, lots of resin, lots of high class lumber & fittings. No. 2— They take skill, equipment, and time to build. and No. 3— They could be pretty exciting to dock singlehanded.

For these and other more positive reasons I finally bought a set of plans from Wallace Cookson.

I believe that if someone is unstable enough to want to cross a large ocean in a small sailboat in the first place, a Wharram design will probably provide the best, most economical, and most enjoyable, chance of survival.

Keep up the good work, and stay loose.

Sincerely,
Ed. J. Kytta

Fabulous ORO can be built and equipped for £1,000 in 1,000 working hours, designed to sail at speed averages of 8-10 knots (peak speed of 15-20 knots).

ORO has 4 private bunk cabins, each with a double bunk and an 18" deep and 6" wide wardrobe.

The 2 "working" cabins, galley and chartroom/library/office, are 7'6" long and 7' at deck level wide. Provision for 3 extra single bunks.

The main hatches lift off as on a cargo ship, so that air and sun can enter the ship in warm weather. Designed for fast, all-weather weekend sailing for 6-8 people, ocean-voyaging for 4-6, suitable for charter work, beach chartering, sailing guests or a small expedition ship.

13959	12-inch Sudbury Sky-Vent — each	71.25	54.95	6 lbs.
13960	18-inch Sudbury Sky-Vent — each	99.95	74.95	10 lbs.

Sailing Clothes

VICTORY SWEATERS, made in England, distributed in U.S. through Fulton Supply, Fulton Street, New York City. \$18.95 (?)

These sweaters are made of wool with the oil left in—are very good for sailing, cruising through rain forests, or just plain potting about in. Those who have them live in them. Like a sweatshirt (with high, rolled collar), but for colder weather. Fulton supply, which puts out a free catalog, outfits both commercial fishermen and sailing people. Good place.

"TOPSIDERS," which are sailing shoes (leather & nylon & canvas), boots; both with special tread. Supplied by Sperry, somewhere in Conn. (Streeter & Quarles West in San Francisco carries the brand, and can tell you the home base) Various prices.

These shoes seem to cost twice as much as those put out by the competition struggling to break Toppers' corner on the market. For example 11.95 for the canvas, 12.95 for the nylon sneakers. Don't know how successful the competition has been; Toppers seem to be the universal sailing shoe. Have used them; they work.

FOUL (OR WET) WEATHER GEAR, made by Helly Hansen of Norway, distributed in U.S. by Canor Plarex, Inc.

- 4200 23rd Ave W.
Seattle, Wash 98199
- 36 Bellewood Ave.
Dobbs Ferry, N. Y. 10522
- 41 Alexander Street
Vancouver, B.C., CANADA

This seems to be the best gear around. Used by many deep water sailors. Have seen it (felt it? touched it? etc.) and it works. Very good stuff. (see p. 262)

PART SIX

LET EVERY SOUL BE SUBJECT UNTO THE HIGHER POWERS

Mrs. Godsey was in the post office in the far corner of her store, sorting through the Tuesday morning mail. As if people had known it would be a puny delivery that morning, only Mrs. Thornton was there waiting for Mrs. Godsey to hand the letters out. Most days the store was half full of people waiting on their mail, five, six, sometimes as many as a dozen of them, sitting in chairs or leaning against the soft drink cooler, waiting and talking while Mrs. Godsey organized the mail for distribution. But this morning there was only Mrs. Thornton, and to Mrs. Godsey's mind that was just as well. The only mail in the whole batch that was in the least bit personal was a post card to Wendell Hall from his daughter in Detroit, and she was asking for money. Mrs. Back's copy of The Upper Room came, and Barry Berry got a statement from the Famous Writer's School. Old Mr. McClanahan got a brown envelope from the Social Security Administration but you could tell just by looking that it didn't have a check in it. Circulars, statements, bills, and fourteen identical blue envelopes with white writing on it, promotional literature from the Stewart Kesey Soap Company in Chicago addressed to "Boxholder", Trace Fork, Kentucky, and that was it, as sorry a batch of mail as Mrs. Godsey had seen in all the years she'd been postmistress.

"I declare it looks like that Charlene would write me," said Mrs. Thornton. "I written her twice this last month and narry a peep have I heard. I begun thinking she don't much care about her old momma any more."

Mrs. Thornton wiped a tear from her eyes with the cuff of her long sleeve. "Now honey, you know that aint so," said Mrs. Godsey as she came out of the little cage that was the post office. "You know it aint like Charlene not to write."

"Sometimes I believe it is," said Mrs. Thornton. "Sometimes I know for sure it is."

(continued)

Stick and Rudder

Subtitle: 'An Explanation of the Art of Flying.' This book was written in 1944 and is still, I understand, the basic flying book. Writing, illustration, comprehensiveness—it's a full-throated classic. I've never flown a plane, but I've flown other stuff, and every page glimmers with useful hints for every kind of flight. Maybe some Sufi pilot would like to do an allegorical review of this profound book.

or WHOLE EARTH CATALOG

Stick and Throttle. The so-called 'elevator' is really its up-and-down control. This is hard to believe but is one of the keys to the art of piloting.

On wings it is safe to be high, dangerous to be low; safe to go fast, dangerous to go slow. Generally speaking, if you want the airplane to go up, you point its nose up; but point its nose up a little too much, and you go down in a stall or a spin. In landing an airplane, to make it sink down on the runway and stay down, you move the controls much as for an extreme upward zoom. In the glide, if you want to descend more steeply, you point your airplane's nose down less steeply; if you want to descend less steeply, you point the airplane's nose down more steeply! And—most spectacular contrariness of all—in emergencies, when the airplane is sinking toward the ground in a 'mush' or falling in a stall or a spin, and you are afraid of crashing into the ground, the only way to keep it from crashing is to point its nose down and dive at the ground, as if you wanted to crash!

The adverse yaw effect. Ailerons have two effects. White arrows: rolling effect is what pilot wants. Black arrows: yawing effect is an undesired by-product of rolling effect. Here, the pilot banks to (his) left, presumably in order to turn to the left, but the airplane at the same time yaws to (pilot's) right. That's why this yaw effect is called "adverse." Pilot must kill this effect by using rudder.

Hence the Angle of Attack cannot be seen simply by looking out the window; in fact, it cannot be seen at all! For remember, Angle of Attack is the angle at which the wing meets the air—and we can't see air. That is perhaps largely why flying is so much an art. In baseball the batter keeps his eye on the ball that he is going to hit. Flying is the art of batting the air down with our wings; but in flying, our trouble is that we can't see the air; hence we often fail to hit it right, and hence so many of us break our necks.

Take your hands off a good airplane's stick, and it will do a good job of flying all by itself. Take your feet off its rudder as well, and many airplanes will even then do a fair job. The airplane has a built-in will of its own, and generally speaking it wants to do whatever is necessary to maintain healthy flight.

In actual practice most airplanes have a tendency to hunt. This means that with the controls released, the ship will not fly at constant speed but will oscillate up and down, now dropping its nose, building up speed, diving for perhaps 10, 20, 30 seconds. Then, with its essential stability and better self asserting itself, it will catch itself, raise its nose, try to get rid of its excess speed, and go into a climb. In this climb, a bit too much speed is lost, and the ship noses down again, to repeat the process.

Flying is done largely with one's imagination! If one's images of the airplane are correct, one's behavior in the airplane will quite naturally and effortlessly also be correct.

The pitfall of glide control: when doing the right thing, you get the wrong result first, the right result only later. Nosing the airplane up steepens the descent, but first causes a temporary ballooning. Nosing the airplane down shallows the descent, but first causes an extra sink. Be patient for a few seconds.

As you approach the ground you must keep your vision relaxed and look all around; you must take in the whole scenery, the perspective of the hangars on the side of the field and the other airplanes on the field, the parked automobiles, the trees, the telegraph poles all around, the grass, the horizon; for it is from the perspective and apparent motion of such things that you will get a vivid perception of your height; and a staring eye will not see what matters. When you get tense, you will almost certainly stare; approaching the ground, most students do get tense; that is largely why the landing is so difficult for most beginners.

If an untutored person tries to fly an airplane and uses the controls in the manner that seems most "natural" to him, responding most energetically and most quickly to those disturbances that "naturally" impinge most sharply on his consciousness, the flight will almost certainly end in a spiral dive and crash.

Weather Flying

It's a good title. You don't fly in the sky, or in just air, you fly in the weather. This book takes you through what that means, how to recognize and know ahead what you're in for, how to handle it, what to avoid, and how to survive your mistakes. A good companion book to Langewiesche.

or WHOLE EARTH CATALOG

The nature of the brain is such that we see what we have seen before, and what we have a name for. We are blind to things which have not been properly introduced. People had fronts passing over them for thousands of years, but nobody ever saw a front as front—i.e., as boundary between contrasting air masses. Then, 50 years ago, the Norwegians first recognized the cold front, described it, named it. Now everybody can plainly see many frontal passages every year. In this sense, some descriptive meteorology helps the pilot fly the weather.

Lows that slow down are the nasties that really ruin a forecast. There isn't anything more difficult to figure out than a stalled front. If a cold front was supposed to go right through the East Coast but slows down and stops instead in the New York area, things go to pieces. Instead of clearing, the skies remain cloudy; wind hangs limply around the southerly quadrant, getting over to southeast perhaps; and fog and low ceilings prevail. With such a situation a kink may develop on the stalled front, a wave form, and a new low pressure area move up along the coast following the stalled front's line and putting out a lot of weather.

We've mentioned that scared or not a weather-flying pilot has to control his emotions and keep his imagination subdued or used only to advantage. The pilot has to fly carefully and thoughtfully even though his knees may tremble.

The toughest place to keep this fear under control is a thunderstorm. It is dark, it is turbulent, rain comes down in a deluge, lightning flashes close, and occasionally ozone from a nearby lightning passage can be smelled. A lightning discharge may make a brilliant flash and loud bang as it goes off the airplane. An irritating hashy noise may be tearing at our eardrums from static in the radio. It's a hell of a place for a man to be! It takes a strong will to say, "I'll watch the horizon and keep it level. I'll hold that heading and it will all turn out okay." But that's it, and the only way to do it.

If we summed up one weather rule it would always be: *Have an out!*

Fly above this kind of cloud. Beneath these cumulus it will be rough and uncomfortable; while on top the air will be clear, smooth, and cool.

The Air Almanac

Here's a book of pure data. If you need to know where sun, moon, planets, stars are, or where you are, this book is prime source. It is published quarterly for the forthcoming 3 months. —SB

Aeronautical Charts

Mack Taylor is a friend who has a fondness for the blank places on other people's continents. He walks into them in his tennis shoes and makes friends with the chief and walks out and tells stories about how the main hazard in the jungle is dead-eye monkeys who shit on you from the trees. Mack says that often the only maps with information in the blanks are the ONCs—Operational Navigation Charts, available for 50 cents apiece. The Coast and Geodetic Survey Catalog of Aeronautical Charts has a map index for ONCs and sundry other flight maps and publications.

Yay

Now, here's why I'm writing, private aviation is beautifully compatible with the life style of WHOLE EARTH readers and not at all the straight, statusy thing many think it is.

You can get a good two passenger plane for under \$2,500, a good four passenger plane for under \$3,500. You can get 35 mpg and travel at more than 100 mph for about 5 cents a mile. You can be free as a bird, see the countryside as no earthling can, camp away from crowds and fuzz, be welcome on farmers' landing strips and even work on the farm for a while.

You can trade learning to fly for the instructor's use of your plane—and do the same flying-time-for-labor trade with a mechanic for maintenance. But maintenance isn't as high as generally supposed anyway. If you have a four passenger plane you can share expenses with other couples and travel almost free since their share covers gas, oil, food, etc. for the owners (the owners share covers maintenance, depreciation, insurance, tie-down— so it's really a fair (or should I say fare), (sorry about that, it was pretty bad), bargain.

I have enclosed a copy of *Trade-A-Plane* (\$4.00 per year), and some aviation charts which show how many airports and landing strips there really are. I have marked some plane prices in *Trade-A-Plane* just to give you some idea of costs.

I can not here do justice to the truly far out places we've been—the deserted beaches where we've walked and slept naked in the sun, the rivers we've followed like footpaths only to land at their edge and camp when they turned to gold in the afternoon sun, nor the islands, idyllic and "ours" where we've floated and swum in water whose clarity was only surpassed by the crystal clear sky above us. We have encountered the scent of orange blossoms half a mile over Florida at night and visited Mexican villages and out of the way towns no tourist chained to a Cadillac ever will see.

To come down, pilots are kindred souls welcome at flying farmers' landing strips. (It's almost impossible to be more than 15 miles from a landing strip in the midwest— see Chicago chart). Most airport operators will lend you a car to go to the grocery store, and many airports keep several beat up VW's or similar cars around that you can use for no more than a couple of dollars placed in a cigar box in the glove compartment. Not long ago the operator at Lancaster, Pa. apologized for being out of cars and gave me the snow-plow to drive into town.

Quite apart from the bare bones super economy kind of mostly nomadic flying, one of the best buy planes for more settled and regularly working couples or singles is the early Cessna 172. A four passenger, all metal, 120 mph, tri-cycle gear plane, it can be bought for about \$5,000. On time payments that would be about \$500 down, \$100 a month. Maintenance is low and you travel 120 miles for 8 gallons of gas at .42 a gallon.

Don't be turned off by age of planes advertised, age really isn't a factor with a reasonably well maintained plane.

Peace,
Don Biggs
Arlington, VA.

Boo

In light of what you state as your purpose (which I wholeheartedly endorse,) I think you are way off base on a good part of your information on flying. 99% of all flying is directly government controlled, is very big business, and demands and requires formal education and training. Modern flying has been described as long periods of boredom punctuated by moments of sheer panic; if you knew what was going on in the cockpit as you circled in solid overcast for a rush hour approach to Kennedy you'd never fly again. You haven't gotten far enough away from the crap yet in the CATALOG.

Try soaring. The Schweizer's are the only major manufacturers of sailplanes in the US. All of their ships are very tough, and while very short of performance compared to the German fiberglass ships, a lot of fun and an awful lot cheaper. The I-26, a classic sailplane, (Steve McQueen flew one in "The Thomas Crown Affair,") can be built from a kit for around \$2500.00. It will be worth more than you paid for it when finished.

I'm getting very hot on ballooning, but know nothing about it. Worth looking into.

I suggest dropping the So You'd Like to Buy an Airplane and Used Plane Buying Guide. You only need two things to buy an airplane: a copy of "Trade-A-Plane" for current prices, and an A&E mechanic to check it out. All that crap about checking the fabric for wrinkles doesn't mean squat if the spars are rotten. The best places to look are the little grass filled fields and short strips around your home. There are invariably perfectly good 15 and 20 year old planes sitting around for \$2000-2500. Great fun and you can sell it a year later for what you paid for it.

Stick and Rudder definitely keep in. Indeed a classic; not a bit outdated and never will be. There are several flying magazines available. If you've read one you've read them all. ("How to make safe landings ANYWHERE!" turns out to be the same old rehash about power and attitude.) There is one exception: "Private Pilot." Relatively new, struggling I suspect, and very exciting. Also very nicely put together, from a technical and design point of view. I hope they make it.

Drop the BD-4. Its not really a home-built in the "pure" sense, but a kit. It's not really a very good plane (no wing dihedral, i.e., lousy longitudinal stability, tiny tail, and flimsy gear.) It's not really cheap either. It appeals to insurance salesmen who always wanted a four seater of their own to fly the kids and the missus up to the folks but never could afford it, and never finish it. It's a bummer really. Soap inside your chocolate bar.

Pertinent addresses:

Mrs. Godsey sighed. She wanted to commiserate with Mrs. Thornton about Charlene, and maybe pick up some late news on her in the process. But sorting the mail, as little as it had been, had given her such a headache the world was starting to spin before her eyes. She sat down on the bench facing Mrs. Thornton's chair, and appeared to go instantly to sleep. But in a little bit she opened her eyes and looked up at Mrs. Thornton and said, "Honey, I wonder if you'd do me a favor."

"Why sure," said Mrs. Thornton. "You just tell me what it is." "Get me a R. C. out of the cooler, and some of them Goody Powders off the shelf. My poor old head feels like it's about to come apart."

Mrs. Thornton was a big woman and she had to struggle to get to her feet. She was sweating just sitting there and as she walked to the cooler Mrs. Godsey invited her to help herself to a soft drink, on the house. Mrs. Thornton said she didn't think she wanted anything right then. But once she peered into the cooler and saw the bottles standing cold and lucious in the dark water she changed her mind and took out a Dr. Pepper for herself. She opened them and got a package of Goody's off the shelf.

"I don't know what I'd do without my Goody's," said Mrs. Godsey as she fumbled with the wrapper. "Them and R. C.'s is about all that'll keep me going any more."

BD-4

All reports are that this is the best homebuilt airplane on the market. With the 150 hp engine it seats four, has a useful load of 870 lbs, cruising speed 170 mph, take-off run over 50 ft. obstacle 900 ft., maximum range 1,200 miles. For a new tailormade with similar performance you'd pay \$10,000 more. The kit is intelligently designed.

The main hangup at Bede is slow delivery of materials. We've been waiting months for wings and engine on the BD-4 we're building at the Truck Store. Most of the kit is indeed straight-forward bolt-together, but welding on the landing gear needs professional work.

Bede is now bringing out a BD-5 kit. Very radical airplane.

-SB

NEW PLANE FROM BEDE Jim Bede has designed a new single-seat "everyman's plane" to sell as a package, materials plus construction drawings, at a "fantastically low price," he says. Called the BD-5 Microplane, it's an entirely new approach to homebuilts that can be assembled in double-quick time. The new Microplane will use a two-cycle, two-cylinder pusher engine, will be able to climb about 4,000 fpm, and will have unique construction features. Bede said that wings will be easily removable for storage. There will be two sets of wings, long ones for soaring, short ones for powered flight.

Air Progress November 1970

Aircraft Components

If you're thinking about buying a plane, Aircraft Components, Inc., can probably save you more money on instruments, parts and accessories than any other single source in the U.S. Things you should have for anything beyond the closest to home kind of flying cost about one third less through Aircraft Components as through many local airplane dealers.

THE BASIC IDEA

The glider's angle of bank and pitch attitude should be fairly well under the pilot's control, and the glider should be equipped with a variometer, airspeed indicator and altimeter. Thus prepared, the pilot can try his hand at thermaling. When the variometer reads up, the pilot commences circling, keeping a sharp eye on the instruments, the attitude of the glider and the position of other traffic. After a full turn he will know at what point of his circle the lift was best and where it was weakest. Mentally, he draws a line through these points, and then moves his circle toward the stronger lift to improve his rate of climb. When the variometer shows a constant rate of climb for a full circle, the glider is perfectly centered in the lift, so the rate of climb is best. Oh happy day! (It seldom happens.)

Bat Glider Plans

Supplier: Quest Publishing Co.
P. O. Box 7115
Amarillo, Texas 79109

Additional Information:

These are plans for a man carrying glider for soaring down from the heights. I know nothing about these particular plans yet, but the concept is quite sound. (I am a senior aerospace engineering student.) If the military doesn't find me, I will build one of these gliders and write an evaluation for you. To quote a review in March, 1970 *Sport Flying*,

How about a glider for a total outlay of about \$20.00 cash? Well, if this sounds like fun, you might try this simple hand glider. It goes together in hours and will supply hours of endless fun. All you need is some bamboo or aluminum tubes, reinforced plastic tape, some plastic sheeting, and a gentle slope with a tad of breeze. A quick flying lesson is incorporated on the plans. Sounds like a gas for the adventurous. *No flying certificate required. [my italics]*

This must be the grooviest way to get high since Harry Anslinger discovered grass. Hope you can use the tip.

Around 10:00 a.m. the first ship stayed aloft. By the time he was well into the second turn of a thermal, I knew it was late. Time for the sneaky rush to get the ship up to the tow line before too many people saw the light. By 10:45 I was aloft and sampling the 300-fpm lift of the early thermals. The winds were all that had been promised. With thermals topping at 8000 msl (4700 feet above ground level), it would have been a chore to stay near the field. At the southeast end of the Minden Valley, Mount Siegel and surrounding ridges rise to about 9000 feet. I drifted that way and worked each thermal to its limit. Gradually, as the ground level rose, so did the thermal height, until it was possible to clear the hills and drop over into the next valley south. I sent my crew (wife Eunice and sons Bob and David) south on Highway 395 and immediately dropped below the ridge and lost direct radio contact.

Chatter on 123.3 indicated lots of activity back at the field— all of it being directed to landing the gliders aloft because of an approaching dust storm and sharply increasing winds. It was obvious that I didn't want to return in that direction even if I could— much safer and a lot more fun to outrun the front.

19-METER HP-14, N1051. Completely equipped. \$7300. Phone George Thomas, (714) 646-9248; or Ned Jacoby, (714) 673-4374, evenings.

BEAUTIFUL CHEROKEE II. Sell or trade for as little as \$625, \$833.33, \$1250 per share (1/4, 1/2, 3/4). (213) 328-7476.

Mrs. Thornton took a drink of Dr. Pepper.
"They say Joyce Jennings is taking tranquilizers now," she said. "They say since Billy Joe left she can't get any rest a tall without taking one of them pills."
"I never knowed Joyce to get any rest even when Billy Joe was home," said Mrs. Godsey. "I never knowed her to be home any night of the week before one and two o'clock in the morning."
Mrs. Thornton sighed and dabbed her eyes again. "It's her poor old mother I feel sorry for. I declare but children is a trial. They're nothing but a burden to be borne."
Mrs. Godsey nodded. "About the only one I ever knowed that wasn't is my Leonard," she said.
"He's the exception all right," said Mrs. Thornton. Him and Roxie's both good. You're lucky to have them, Mrs. Godsey. You are, now."
Mrs. Godsey was having trouble taking the cellophane off her package of Goody's. She'd been picking at it ever since Mrs. Thornton handed it to her, but her hands were so stiff and arthritic she hadn't made a tear in it yet.
"Honey, let me undo that for you," said Mrs. Thornton.
"Never mind," said Mrs. Godsey. "I may be old but I aint plum helpless yet."

(continued)

The Explorers Trademart Log

This magazine is a couple years old now. After a period of initial cuteness, it's begun to focus directly on usefulness. Like, exactly how to buy good surplus jeeps. Design of the Eskimo igloo. Economics of a private plane. How to buy public lands. Evaluation of canoes. Encouraging wildlife. Winterizing your tipi.

—SB

The Explorers Trademart Log
\$3.00/year (bimonthly)

from:
Explorers Trademart, Ltd.
Post Office Box 1630
Annapolis, Md. 21404

In summary, then, you can expect to get a Jeep which is close to running condition for around \$600 at an open auction. In the closed bid sale, which is the usual type, you can expect to get a Jeep for around \$400-\$500 with a few sizeable chunks missing or around \$200-\$300 with some major stuff missing, like say, the engine, or an axle and the transmission. In all sales, you can expect that a lot of minor stuff like bolts, brackets, cover plates, gearshift levers, and the like, will be missing.

The address to which to write is:
DoD Surplus Sales
P.O. Box 1370
Battle Creek, Michigan 49016

First tier of snowblocks laid in place. Note how tops of blocks are beveled inward. Hole has been dug before laying blocks to allow builder entry into igloo.

To the perennial question, "Is cheaper to fly your own plane?" the answer is, "It can be, under certain selective circumstances." According to a new FAA report, "General Aviation Costs", if you own a single-engine four-seater and use it 200 hours a year with all seats occupied, the cost per passenger-mile (5 cents) may be slightly cheaper than almost any form of airline transportation. It is still about twice as expensive as operating an automobile (2.75 cents/seat/mile) assuming there are four persons in the vehicle.

Fibre Cases

The last catalog should have Ikelheimer—Ernst's FIBRE PRODUCTS DIVISION reviewed. I wanted a tool box for all my VW idiot tools and couldn't find one of those old aerial camera boxes. So I bore it in mind and one day I noticed (made real, realized) Victor Lassiter's tool box and all those telephone installer's tool boxes and all those cases with wheels that city salesmen have and then I found FIBRE PRODUCTS DIVISION. I called all the people listed under sample cases in the Yellow Pages under Sample Cases. FPD sent the most useful and most complete catalog. Some others had a few lower prices but had really messy and difficult or too specialized an interface (wouldn't want to call some of them catalogs).

We sit around and read the catalog and prices to each other. Just like the good old days only now. I remember hitching across country during the 50's and seeing the sturdy black suit-cases cowboy's traveled with; they're the same item and they are STRONG.

(WOW). The tool box I bought cost me \$11.40 including NYC tax and is on p. 5, no. 228A, 16" x 10 1/2" x 5 1/2" and works just fine. Large screwdriver and ball pen hammer fit perfectly. The leather knob handles are the best. The sell a line of photographer's cases too but are reluctant to give out the catalog at this point for they are dropping some items from the line. The main line catalog is free but it's worth the stamps or whatever you can put together for a copy. Corduroy lining on the suitcases is nice and cheap.

I priced a custom made box for storing my prints; I need 6 of them and they quoted me \$18.50 each. Note prices on the 10' leather straps. And web straps are worthwhile extra. The fibre is tough clean stuff and the fastening system used is strong (brutal) and flexible. I haven't researched the fibreboard itself yet but it has lots of promise: light weight, glueable, rivetable. I've been thinking of fitted luggage for a VW bus, liners for buses and vans; it might work real well for Domes.

The Amateur Archeologist's Handbook

There I was, digging around in an Illinois cornfield with an archaeologist who had hair down the middle of his back. There under the hot sun in the dry dirt we found Kickapoo Indian potshards, a clay pipe, and aha a trusty flintlock hammer. All the Illinois history bullshit I had in school simply faded. Who had lost his flintlock hammer? What was on his mind at the time?

This is a good introduction to careful archaeology (any other kind really is graverobbing, shrine-wrecking) in North America, good technique, good scan of what kind of stuff you'll find, and what to make of it.

or WHOLE EARTH CATALOG

Excavation of the Poole Purchase grave revealed the remains of a chief accompanied by the trinkets with which the land had been bought—a copper kettle of beans, several iron hoes, a mirror, and glass beads.

Digs

The Council for British Archaeology, 10 Bolton Gardens, London, S.W. 5 publishes *Calendar of Excavations*, c. 50 cents per year monthly March through September. This bulletin lists archaeological digs (and field schools) planned or under way in Britain with details of salary, type of work, qualifications wanted, etc. With no previous experience a digger can often get paid 10 shillings per day by the Ministry of Works—enough for room and board. More, if you can camp. There's usually opportunity for weekends or weeks off work for hitching around. Digs generally run during the four summer months, and you can usually work all or part of the summer and thus live in England free—often in a sort of camping commune which lets you get to know people and places. With \$50 cash I flew a charter flight New York-London round-trip for \$210 and returned with some of my cash. Part of the plane fare investment was made up by the fact that I could buy a few "permanent" possessions there for about half what they would have cost here in the U.S. Thus the trip really cost about \$100 more than living in the U.S. without an income—but living here I would have had expenses (and no job). You can quickly find out all sorts of free places to crash, travel, eat, etc. once you have a "base" in Europe. But if you want to get paid, make arrangements in advance. You may be able to get "room" (or tent) free if you simply show up at a camping dig, but the Ministry of Works money has to be arranged for. At the least the *Calendar* may provide a travelogue of crash pads—probably in return for volunteer labor; it's better to get a little pay, though—and fairly easy. (Digs in America are generally much less interested in volunteers or employees—they have more field student-slaves available) University anthropology departments and various state archaeological societies and *American Antiquity* may be of some help, but paying jobs are few.)

Lincoln, Nebraska

Outdoor Schools and Trips

Wilderness trips require equipment, skill, and usually, someone to go with. The best way to get into the wilderness is to find a friend who has all these, and is willing to loan you equipment and to share his knowledge with you. The next best thing is to go with a group organized by a club or professional school, camp, or guide service. Groups are organized to do every conceivable thing in the wilderness; this approach has a lot to recommend it. If you don't know people who have the skills necessary for what you want to do in the outdoors, going on a group trip will provide them and give you the opportunity to get together a few people and go off on your own the next time. Aside from not being much fun, some wilderness activities are pretty dangerous if you do them alone.

The organization that runs the trip will usually handle all the equipment and transportation problems; this can be important, particularly on long trips, foreign trips, or on trips where a lot of specialized equipment is needed. The outdoor schools also do an outstanding job of teaching you how to cope with outdoor problems, and may push you to do some things you had never thought yourself capable of doing. You will develop the skill and confidence necessary to put together your own trips.

Schools and group trips have their drawbacks, too. Most distasteful is the regimentation that is usually necessary when a group of people do something together; you are not completely free to set your own schedule and to go where you want to go. You should weigh this against the advantages before you go along on any trip. Be sure that you are ready to commit yourself to going along with whatever the group does. It can be difficult and dangerous to split from the rest of the group in the middle of the wilderness. You will probably find, though, that you have a lot more freedom than you had imagined.

The cost of a trip may range from nothing to a sizeable amount of money, depending mostly on the amount and quality of the instruction you get. Some schools, particularly the "character building" ones, have scholarships available.

Another problem caused by organized trips is the rape of the wilderness caused by hundreds of people using it. If you organize your own trip, keep the group small.

Mountaineering

There are a lot of climbing schools and guide services, each one specializing in techniques applicable to their local mountains. They're expensive at first glance, but they supply a lot of equipment, feed you while you're there, and give you excellent instruction and a healthy outlook towards the sport. Mountaineering often presents the only way to get away from people; most wilderness valleys are overcrowded. Mountain summits are getting that way, too, but more slowly. Unless you know someone who has a lot of experience, you should probably get some professional training. As a general rule, climbing schools are better than guided climbs, since guided climbs tend to be oriented to just hauling people up a mountain rather than to encouraging them to learn how to lead the party themselves. The schools listed below are oriented to developing understanding as well as skills.

California:

Rockcraft is a school run by Royal Robbins, one of the Yosemite rock climbing pioneers. The school is located near Lake Tahoe—away from the crowds and hassle of Yosemite. He teaches big wall rock climbing techniques, but won't let you put in a whole route with bolts. (You can get a fine in Yosemite for cutting down a tree; why should drilling a hole in the rock be any different?) Write for a brochure.

Rockcraft
906 Durant Street
Modesto, Calif. 95350

Northwest:

Mt. Hood Meadows School of Mountaineering runs the most comprehensive program around. The school is run by Lute Jerstad, who climbed Mt. Everest in 1963, and also has Tenzing Norgay, the Sherpa who made the first ascent of Everest in 1953 on its staff. They run ice climbing seminars, rock climbing schools (instructed by Tom Frost, another Yosemite climber), and climbing excursions which climb 3 peaks in a week. Write to:

Lute Jerstad Adventures
9920 SW Terwilliger Blvd
Portland, Oregon 97219

Wyoming:

Jackson Hole Mountain Guides has a program of guided climbs and instructional camps in the Teton mountains. They have literature describing both their programs and philosophy of mountaineering.

Jackson Hole Mountain Guides
Teton Village
Wyoming 83025

Personal Trips or Character Building

There are a number of organizations which make use of the unfamiliar situations encountered in the wilderness to build character. It's really a great approach if you are into that sort of thing. If you go on one of these schools, you will learn to feel at home in the outdoors and will have the confidence that you can survive in whatever situation you find yourself. **Outward Bound** runs programs at five locations throughout the U.S. Their concept is that you can and should learn to rise to an emergency situation, so they often place you in a "sink or swim" position. They assume that you have no previous experience, yet by the time you complete the course you will have developed enough skill to spend several days alone in the wilderness. The programs are expensive, but the results are incredible. One thing you should be aware of is that they have a tendency to treat the outdoors as a foe to be conquered rather than a friend to coexist with; this is a very different concept from most of the other outdoor programs. A really turned on brochure describing all of their programs is available from:

Dartmouth Outward Bound Center
Box 50
Hanover, New Hampshire

National Outdoor Leadership School trains teachers, instructors, and counselors for outdoor programs. They also accept people who want to learn skills for their own outings and expeditions as well as those who just want an extended wilderness experience. They stress conservation and ecology during a five week summer course in Wyoming. The school is run by Paul Petzoldt, an outstanding mountaineer and outdoorsman, a Grand Teton Guide, and from all reports, a great person. Write directly to him for more information.

Paul Petzoldt
National Outdoor Leadership School
Lander, Wyoming 82520

River Trips

River running is both easy and exciting and usually takes you through wild and remote country. One of the best reasons for going on an organized river trip is that they take care of a lot of the hassle; they provide boats, life jackets, waterproof bags for your gear, etc., and get you back from the end of the river to where your car is. Otherwise you have to either find somebody who isn't making the trip with you up, or hitchhike—but many rivers start in remote country where only a few cars a day travel.

American River Touring Association is one of the oldest operators of river tours. ARTA are a non-profit organization which runs first class trips. ARTA uses special rubber rafts rowed by one of their guides on the Colorado and a lot of other rivers. Prices are reasonable, but you have to pay extra to have your car shuttled to the end of the river. Write for a brochure listing all the rivers they run or request a separate brochure for a specific river.

American River Touring Association
1016 Jackson St.
Oakland, California 94607

Grand Canyon Dories is the most unique of the many groups that run the Colorado. They use small wooden dories similar to the ones used by Powell on his first trip down the river. They provide air transportation back to your car.

Grand Canyon Dories
P.O. Box 5585
Stanford, California 94305

Lute Jerstad Adventures runs trips on several northwest rivers in six man rubber rafts that they teach you to row yourself. Transportation is provided from Portland, which overcomes the car shuttle hang up. Write for river trip information.

Lute Jerstad Adventures
9920 SW Terwilliger Blvd.
Portland, Oregon 97219

Bicycling

You probably won't get too far into the wilderness on a bicycle, but you can move incredible distances on one and still be outdoors and not cause pollution. Several clubs run bicycle tours through all sorts of country; they usually are accompanied by a "sag wagon", a car that carries all the baggage, which saves a lot of effort. Write to:

International Bicycle Touring Society
846 Prospect Street
La Jolla, Calif. 92037

or

League of American Wheelmen (LAW)
5118 Foster Ave.
Chicago, Ill. 60630

Backpacking

Get a copy of *The Complete Walker*, rent a pack and a sleeping bag, and go do it! Organized backpack trips are one of the major causes of deterioration of many wilderness areas. The Boy Scouts run an unbelievable number of trips, and many outdoor clubs run frequent trips with 10 to 50 people in a group. Backpacking is really an opportunity to find solitude and wilderness; don't destroy that experience for yourself and others by marching up a trail with a crowd. One of the largest conservation organizations asked that their outings not be publicized because the impact on the environment from the trips they run is becoming critical, and they would prefer that no more people attend them.

Foreign Trips

There is a lot of wilderness outside of the United States, some of it virtually unexplored. Many groups run expeditions and wilderness outings to such places as the South American jungles, the Andes, Alaska, Iceland, Antarctica, and the Himalayas. Two major problems occur on a wilderness trip in a foreign country: logistics are incredible—if you don't have experience, you can get really hung up in problems of customs, transportation to remote areas, language, hiring locals to carry your gear, and finding food; the other problem is that you may be traveling in primitive areas where westerners don't usually travel. This is a fantastic opportunity, but you have to be careful not to destroy the area for both the locals and the next traveler. Many places operate on a subsistence level economy; they don't have spare food to sell, and they probably spend most of their time raising their own food. If you hire somebody at an outrageous salary, or pay \$5 for a 10¢ item, you have blown the whole economy all to Hell. Try to make arrangements for food and be as self sufficient as possible; leave your culture and economy at home. One way to be self sufficient is to travel with a group which makes all the arrangements for you.

Mountain Travel is one of the largest organizers of foreign wilderness trips. They have a catalog which lists more than 25 trips and expeditions to incredible places all over the world. Their trips are really inexpensive—usually about 20-25 dollars per day plus airfare. One way they keep prices low is by not paying their leaders a salary (they just come along for free) so they sometimes get non-professional leaders. They take care of all of the details overseas, but pre-trip information assumes that you have a lot of previous experience. Free catalog from Mountain Travel (USA)

6201 Medau Place
Oakland, California 94611.

Lute Jerstad Adventures runs climbing expeditions, and is getting into running treks to the Mt. Everest base camp and throughout the Himalayas. All trips are lead by a professional mountain guide with Tenzing Norgay accompanying the Himalayan treks; this provides an opportunity to get acquainted with the local culture—particularly in the region of Tibetan Buddhist influence near Mt. Everest where Tenzing was born. Trips are a little more expensive than Mountain Travel's, primarily because of the leadership; pre-trip information includes a lot of cultural background and detailed information on what to expect on the trip. Write for trek information to:

Lute Jerstad Adventures
9920 SW Terwilliger Blvd.
Portland, Oregon 97219

—Stan Armington
Lute Jerstad Adventures

The ladies hushed talking until Mrs. Godsey got the wrapper off the package. There were four doses in it, each folded in a paper. Mrs. Godsey took out a dose, laid the box aside, then, very carefully, she poured the white powder into her R. C. Cola.

"I use to just dump it out on my tongue," said Mrs. Godsey. "But here lately it gags me to do that, so I just mix it in a dope now, and sort of sip on it as I go along. I think it's better that way. Seems to stay with me longer."

"When I was in the hospital they fed me through the veins," said Mrs. Thornton. "I laid over there three weeks and never got a bite to eat. I hated it. I've done and told Wheeler he need to expect to ever take me to a hospital again. I told him I'd as soon pass out right there at the house as put up with that outfit over in town."

"I'm just like you, honey," said Mrs. Godsey. "I've got terrible things wrong with me, but I aint about to go to no hospital for them. I told Leonard if I get down sick to just prop me up in bed, give me some sassafras tea and let the Lord take care of the rest."

"Amen to that," said Mrs. Thornton. "The Lord's better'n any doctor I ever had anything to do with."

Overland Guide To Nepal

An overland trip East can be a beautiful experience, but a lot of work as well. Here I attempt to give you a factual outline to make this experience even more pleasant and less confusing than it was for me.

WHEN TO GO

Firstly, it is well to start the trip in late summer from Europe: August, September and October as starting dates will give you the advantage of the best possible weather all the way to Nepal; arriving Nepal circa xmass. NOTE: The weather along the route I outline is mild from August to xmass. Eastern Turkey is cold at night in the mountains. It can be cold with light snow crossing the mountain ridge out of Ghazni just before dropping into Kabul, Afghanistan. It would be impossible to cross the Hindu Kush after November and difficult to get to the ruins of Bamiyan, north of Kabul. Shrinagar, the city of houseboats in Kashmir will be very cold and possibly snowbound late November. Kathmandu valley is mild year round with a couple of weeks of freezing weather in January.

HEALTH

It is of utmost importance to keep in good health. First, a smallpox and cholera vaccination are mandatory as you will not be allowed to cross frontiers without a World Health Certificate. A large supply of multiple vitamins is strongly recommended: Your diet will lack in vitamin C. Also Intro-vioform are some help against diarrhea and dysentery. If you become seriously ill go to U.S. Consulate and a reliable doctor will be recommended. NOTE: At U.S. Embassy in New Delhi there is a clinic in the main building, and they will treat you without question.

CLOTHING

Of course, you are going to travel light. Itemizing everything isn't necessary, but it should be noted that you will need a dark sweater and windbreaker. That everyday stuff you wear, take one spare. I dye my underwear dark colors; white will never be white again and there is nothing which looks worse than dirty drawers when stripping down in front of a room full of fellow travelers.

Same goes for the girls, and pants are quite acceptable for the girls. One dress and a few tops are all that is necessary. GIRLS: Mini skirts only attract remarks and trouble. You can visit holy places in pants, but dresses right above the ankle will bar you from many mosques.

PAPERS

Bartholomew maps are the best, but you can get shell and local tourist maps along the way. Take all the credentials you can get. International Student Card, \$3 from Nat. Student Association, 265 Madison Ave., N.Y. A youth hostel can be obtained at any hostel in Europe and cost less than here if you tell them you want one only for foreign travel and void in U.S. hostels. A PRESS card. Try having an official looking I.D. laminated with PRESS stamped in large red letters across the whole face.

MONEY

Take some cash and save it for the Eastern money market. Some travelers checks are good for the time spent in Europe and stable currency countries. Money is unstable in: Pakistan, India and Nepal. My summation will give you an idea of expense.

GETTING TO EUROPE

Cheapest way is Icelandic Airlines: \$167.50 thrift season one way to N.Y. to Luxembourg. So call work away and other fantastic stories of cheap boats don't exist except for 1% of total travelers hunting for these bargains.

You've arrived in Luxembourg or some seaport, take my advice and start immediately for the East. Even if you have never been to Europe before save your cash for the East. If you are hitching, or driving get on the Autobahn for Munich. Now that you are on the road there are a couple of essential items for all travelers: an air mattress and a good sleeping bag. There are two things about the overland trip to Nepal which are very important: good food and good sleep. You can make the whole trip sleeping on hard floors and eating rice, but once your body resistance falls there are a number of maladies awaiting entrance to your system. An Army type poncho is also a very handy item, and a small one-burner gasoline cook stove should be seriously considered.

MUNICH

Choices for Hitch-hikers:

1. Europa bus direct to Teheran for \$75 plus overnight hotel expense. A ten day trip.
2. Train direct to Istanbul, \$40, a two day ride. Be sure to take food on train.
3. Hitch-hike on to Istanbul, three to ten days. Do not try to hitch the Dalmatian Coast. Route: Munich to Salzburg, Klagenfurt, Ljubljana, Beograd, Skopje and from Skopje through Bulgaria to Istanbul, or to Thessalonika and on to Istanbul. I prefer through Greece. DRIVERS: If you're not in a hurry you would do well to consider driving down the Dalmatian Coast. There are many campsites and late September or early October will still be sunny days. The route from Dubrovnik goes to Titograd, then Kolasin. Careful not to miss the turn off into the city of Kolasin and out the opposite side of town runs an unbelievably potholed dry road. This will be the worst road of the entire trip to Nepal. It is very bad to Pec, then you continue to Prizren, and you can depend on a modern new campsite in Prizrin, then Skopje and the main road. From Skopje you can go either through Bulgaria or on to Thessalonika, Greece. In Thessalonika is a very modern campsite with free hot water showers and a private beach. The camp is actually 25 ks out of the city and signposted by International camp signs. NOTE: All travelers who plan on transiting Bulgaria will have to pay \$4 for a visa at crossing point. The train transits Bulgaria to be sure and get a Bulgarian visa at a Bulgarian Consulate before starting out. Visa costs \$2 at Consulate.

(Revision: Delete reference to going through Kolasin. From Kolasin you can stay on asphalt by going direction Bijelo Polje and back down to Andrijevica. When you look at this on a Yugoslavia map you will see that it is twice the distance as from Kolasin direct to Andrijevica, but that road is extremely bad. Take your pick. For those of you who are really serious about getting to India with the least amount of expense, then follow the main road through the center of Yugoslavia.)

TURKEY

Arriving from Greece, there is a campsite at border crossing in Ipsala.

These modern campsites in Turkey are located at BP gasoline stations and called BP

Mocamps. Arriving from Bulgaria there is a BP Mocamp at crossing town of Edirne.

ISTANBUL: BP Mocamp is on your right 8 ks before city and near airport. It is the main road leading into Istanbul so you can't miss it. This camp has a swimming pool as well as free hot water showers and free GAZ cook stoves. Cost varies depending on size of car and tent My wife and I, motorcycle and small tent ran \$1.25 per day. For those arriving by public transport or hitching without tents, cheap hotels are located around the train station and the Blue Mosque. A room for two will cost from 5 to 10 lira per person per night. You may change money at the banks for an official 12 lira to \$1. NOTE: if you are going to buy a ticket on an international carrier then you must change your money at the rate of 9 lira to \$1 and produce receipts. Get your visa for Iran; U.S. passports: no charge. For those who elect to follow route to Trabzon, you can get a visa for Iran in Trabzon and avoid the huzzle of Istanbul.

If you are continuing by automobile the direct route is Ankara, Kayseri, Sivas, Erzurum, Erzurum, then Mako, Iran. After Ankara the roads are for the most part loose gravel to the Iranian border. NOTE: Watch out for six inch deep pot holes in surfaced road 20 or 30 miles before border.

HITCHERS: You have several choices.

1. Take boat from Istanbul to Trabzon, \$4 with student discount, two nights without food. If any are on motorcycles freight is \$2 and well worth missing the uninteresting drive over bad roads through central Turkey. The ship, EGE, leaves once a week on Tuesday and the office for the company is Denizcilik Bankasi located to your right just after crossing the Galata Bridge from old to new Istanbul. For student discounts you must get a Turkish student card obtainable from any of the many student organizations in Istanbul: cost \$1. NOTE: if you are over 26 you might be refused student discount, but argue.

2. Train from Istanbul to Erzurum \$6.50 with stu. dis., and that is a very nice second class.

3. TBT bus from Istanbul direct to Teheran \$30, a four day trip with nightly stops in hotels. Expect to spend about \$1.50 per day for food and lodging. Bus driver will not allow you to sleep on bus.

(Revision: Camping 50% cheaper and olympic size swimming pool at Londra (London) Camp 200 meters past B.P. east, same side of road.)

If you are continuing by automobile: Istanbul-Izmit-Bolu-Ankara, then north to Samsun-Trabzon-Erzurum. This is a little longer, but the road and scenery are much better than the center road.)

TRABZON: There are several mini bus companies which will take you to Erzurum.

ERZURUM: One connects here with either a Mihan Tour or TBT bus to Teheran for \$12. One can camp at the BP station.

NOTE: Where student prices quoted non students figure 30% more. If student rate not quoted then rate is fixed to all.

IRAN

You can expect to find only two more campgrounds from here on; one in Tabriz and one in Teheran. Otherwise those traveling by car can pull off the road most anywhere to overnight camp. The camp in Tabriz is signposted and easy to locate. The one in Teheran is about 10 ks out of town on the road to Saveh. It is on your right and called Camp del Sol. Cheap hotels are located in Teheran around the train station ranging from 30 to 50 rials per person per night. \$1 equals 75 rials. Rials are also spoken of as Tummin. One Tummin equals 10 rials.

TEHERAN: Get your visa for Afghanistan; U.S. Passports, no charge. Afghanistan consulate is currently asking the rougher looking travelers to show their money, but one can pass without one person's roll. For those of you who might need a good Western type meal you can get an excellent lunch for 150 rials at Sandys Restaurant located next door to the American Express office on Takht-e-jamshid street. From Teheran the route is north to Sari and on to Meshad. This road is bad, dirt and washboard, from Shah-pasand to Meshad. For those going public transport there are both trains and buses running to Meshad. By bus it takes between twenty and thirty hours and prices vary from 150 to 400 rials. Be careful of overcharging and short changing in Iran. Gas pumps do not ring up the price. Find out the price by liter and figure up bill yourself. Price is standard as gasoline is state controlled. Iranian numbers to ten are:

1 2 3 4 5 6 7 8 9 10
۱ ۲ ۳ ۴ ۵ ۶ ۷ ۸ ۹ ۱۰

MESHAD: Cheap hotels run 30 to 50 rials. There are transit beds in bus stations but they cost as much as a place downtown. Twice a week a bus runs from Meshad to Herat, Afghanistan. If you don't want to wait for that connection you can take a bus daily to the border town of Taiebait, Iran; 75 rials. From Taiebait you can hitch a ride with a tanker truck to Herat; you'll be expected to pay truck driver. If the taxi from Herat happens to be in town it will cost, after bartering, 200 Afغانies per person. (75 Afs to \$1.)

DRIVERS: You will leave Meshad on the road to Torbat-haydriyeh and go on this road 38 kilometers and on your left will be a dirt road leading down into a dry river bed with an old washed out bridge. That is the road to Afghanistan and til now there is no sign post. This road is badly washboard for 190 kilometers to Taiebait.

HIKERS: If stuck in Taiebait you can sleep in tea house across street from customs house for one Tummin. Keep in mind that you can sleep in most roadside tea houses.

AFGHANISTAN

(Revision: Change \$1 for Afgan currency in Iran. Rate is not good, but before you get to Herat there is a toll station and you cannot pass without paying a toll of 30 Afغانies (.40\$) and the toll man's rate of exchange is incredible!)

From Herat you get a bus direct to Kabul with an overnight stop in Kandahar. You may break your journey in Kandahar if you wish. The price varies from 215 to 300 Afغانies Herat to Kabul. Bus leaves daily. Hotels in Afghanistan will run from 30 to 50 afs. per person per night. If you want to buy skins Herat is actually the best we saw. Afgan coats are running between \$10 and \$30.

KABUL: The bus will let you off in front of the Khyber restaurant. This is where most travelers first come and you can meet other people coming from the East and exchange information. In Kabul is the money bazaar. Here you will get 40% more for your money than the official rates of India and Pakistan. This is all illegal and you should check with current travelers as to what's going on. You can expect about 12 Indian rupees to \$1 (Official rate 7.40) and 8.50 Pakistan rupees to \$1. (Official rate 4.75). Get your Indian and Pakistan visas; no charge to U.S. passports. NOTE: No matter how you travel through

Pakistan you will need a road permit. The two best cheap hotels are Sakhi, and Bamiyan. A bus runs daily to the Pakistan city of Peshawar for \$2.

PAKISTAN

In Peshawar the youth hostel is very good and costs 1.50 rupees. It is located on your left at the University on the main road coming into Peshawar from Afghanistan. Trains run regularly to Lahore. Interclass is \$2. Side note: you can fly from Peshawar to Gilgit and then trek to Hunza. Flight cost \$6.

LAHORE: There is a youth hostel on Ferozapore road. A bus runs daily to the Indian border. Save 1.75 rupees for bus fare.

INDIA

After crossing the frontier you take a tonga, a horse drawn cart, to Ferozapore. Don't take a bicycle as the ride is 12 ks. Train to New Delhi costs \$1.50. The best way to get around India is by train. Now your student card will come in handy as students get 50% reductions and no age limits. The best class for long journeys is third class two tier sleeper. To get the reduction you go to the main administration building in major cities. For example, in New Delhi you go to the office of the Northern Railroad and tell them where you want to go and they check your student card and give you an authorization for reduction which you then take back to the railway ticket office and present it to the window of the line you wish to buy a ticket on. He will then sell you a ticket. Tickets should be reserved for a week in advance, but if you find the train sold out, then apply for a special tourist quota. For this you return to the administration building for the authorization, and most times these buildings are several kilometers apart. In other words affairs in India are complicated with forms and papers to fill out, but this is part of a rich experience. NOTE: Mail trains are faster than express trains.

NEW DELHI: Hotels in the center of town will run about 7- to 10 rupees per person per night. There is a 1 rupee youth hostel, but it is very difficult to find and out of two several ks. If you are approaching New Delhi by car keep asking directions to Connaught Place; the center of town. Indian meals will run 1 to 2 rupees and the best thing on the menu at Wengers restaurant, Connaught Place is 6 rupees. Wengers is a place to meet other travelers and get excellent Western meals while your tummy is getting used to Indian fare. Don't shy away from expensive restaurant hotels in India. You can usually get a full lunch and eat as much as you like for 7 to 10 rupees and you need to keep body fit on this kind of trip. We would stop at one of these luxury places once a week to rebuild our bodies with the comforts of hot water in the toilets, etc. For those travelling by car there are DAK bungalows or PWD Inspection houses scattered all over India. These cost 1 to 3 rupees a night per person, and some a room no matter how many people are in it. Get your Nepalese visa in New Delhi.

NOTE: Way out hip types are being refused visas to several Eastern countries. That doesn't mean one can't have long hair and a beard, but if it is shoulder length and you are barefoot wearing robes you might be mistaken as a hippy.

Take the train to Raxual, the border town before Nepal. There is a government rest house there for 1.50 rupees. Begin the trip to Kathmandu early in the morning as it is a ten to twelve hour trip by truck. DRIVERS: Leave early and fill up all gas cans in India as gasoline is double priced in Kathmandu.

NEPAL

There are several hotels which are cheap. Prices vary from sleeping on the floor for 15¢ to 30¢ a night to a nice double room and patio at the Camp Hotel for \$1.25 for two. Currently the blue Tibetan restaurant and Camp hotel are hangouts for travelers. However, there are many fine little hotels and the valley is not difficult to go around in. Bicycles are renting for about 75¢ a day.

SUMMATION

Public transport cost from Europe to Nepal and back circa \$200. The whole trip with food and lodging should realistically cost you about \$400 to \$500 Europe-Nepal-Europe. Many people do it for less, but my cost estimate is based on good food and good sleep; your only health insurance in the East, Remember Europe is the expensive place.

MAIL DROPS

These are the best for a variety of reasons which six years of travel have dictated to me:

Istanbul:	Post Ristante
Kabul:	Post Ristante
Kathmandu:	Post Ristante
Teheran:	American Consulate
New Delhi:	American Express

NOTE: American Express charges \$2 for forwarding mail. American consulate forwards promptly free. Post Ristante is slow to forward. Having money sent to India should be avoided, but if you need this service have your U.S. contact go to American Express office and get a demand for money which will be forwarded to American Express in Bombay or New Delhi. In any case you will not be allowed to receive foreign cash.

Liquor permits are given to tourist by the tourist office and can be illegally sold. Check with travelers as to where and going price.

No insurance is required from Turkey onwards so don't bother to get any for your vehicle. A Carnet De Passage is the easiest way to cross borders with a car. Automobile club can assist you in getting one. Not necessary for a motorcycle as you can have it entered on your passport when crossing all the borders. India, however, requires a letter from the Consulate as to your promise to re-export machine from India. Currently the U.S. Consulate in Kabul is issuing such letters, which you then take to the India Consulate in Kabul for an authorization to cross the border with the cycle.

(Revision: The U.S. Consulate is no longer giving letters certifying that you swear to re-export your machine. A Carnet de Passage is mandatory if you plan to continue to India. Carnets are only issued by the country where your machine is registered, so get it before you start out. Local Automobile clubs handle the paper work.)

A good all purpose guide is: Golden Guide to Southeast Asia.

Do not be sold on buying a dozen or more visa photos in U.S. at high cost. Cheap photos are available along the way. You can use 2 doz. small two inch photos.

My gasoline expense from London to Nepal was \$65. Driving a BMW R60.

Cheap Travel

Two undistinguished but helpful books on international travel at low cost. —SB

[Suggested by Nancy Schimmel]

Icelandic Airlines has been the pioneer of low-cost, Trans-Atlantic air transportation. Since 1952 Icelandic (Loftleidir in the Icelandic language) has consistently offered the lowest fares of any regularly scheduled airline between the U.S.A. and Europe.

I feel Icelandic's regular round-trip New York-Luxembourg fare of \$319 offered from August 4 through May 31 (to Europe) and September 25 to July 21 (returning) is a remarkable bargain and one of the best buys available anywhere. This bargain is good for a year with no minimum stay or weekend restrictions.

Air Travel Bargains

Air India Boeing 707

The new Japan Air Lines \$400 round-trip Bulk Inclusive Tour fare from the U.S. West Coast to Tokyo is an incredible bargain. There will be some real money saving tours to Expo 70 based on this fare.

free at sensible libraries everywhere

"What people don't understand is that you've got to trust the Lord before He can do you any good," said Mrs. Godsey.
"But people aint willing to do that any more," said Mrs. Thornton. "That's what's wrong with the world."
"Let every soul be subject unto the higher powers!" Mrs. Godsey quoted. "For there is no power but of God: the powers that be are ordained of God. That's scripture, sister. Romans thirteen, one."
"People just wont accept it," said Mrs. Thornton. "People just turns away."
"They turn away from God and toward Satan," said Mrs. Godsey. "Old Satan's got a arm-lock right around ever one of their necks."
"That's the pure truth," said Mrs. Thornton. "That's the pure truth if it was ever told."
After a little pause for a sip of their drinks, Mrs. Thornton said, "But you know, Mrs. Godsey, if there is anybody that ought to be in a hospital it's surely poor old Emmit Collier. I think it's just pitiful, him a laying up there on that old hillside by himself. Me and Wheeler was talking about him just yesterday, wondering what anybody could do."
"Why honey," said Mrs. Godsey. "You're behind the times."
Mrs. Thornton's face said what do you mean?
"Emmit aint by himself no more."
"You don't mean he's died!" gasped Mrs. Thornton.
Mrs. Godsey grinned. "Oh no," she said. "His nephew David come in and's gone up there to stay with him. Drove in from Cincinnati yesterday in the paintedest-ud old bus-of-a-thing you ever saw. Went right straight on up there to take care of him."
"Well I'll swan," said Mrs. Thornton.

Shipping Out

Reply to a letter in the March issue in the "Other People's Mail" section, p. 22.

P.G. asks "Who's got the Straight Skinny?" concerning shipping out on merchant ships.

Firstly — get your passport and have your occupation listed as Merchant sailor (or seaman).

Second — to ship out on U.S. vessels you need a Coast Guard document which is a plastic I.D. pass with your photo and a "Z" number. You can only obtain this pass from Coast Guard Merchant Marine Documentation offices in all major seaports. Look in the phone book under U.S. Government.

Third — here is the hangup! The Coast Guard won't issue new documents to anyone unless they can prove that they have a job. Acceptable proof usually consists of a letter written by the personnel manager of the company who will hire you. Most companies won't hire you without you already having the required document. I include maritime unions in with companies as they, these days, are trying to limit union membership.

Fourth — your chances of shipping out on U.S. vessels are quite slim. Many people were hired to man the ships that ran to Vietnam and the Far East hauling war or war-related cargoes during the last five years. Now they are reducing the war effort and many sailors will be out of work as the government lays up ships.

Fifth — to hire out on U.S. vessels your best bet is to pester the hell out of the maritime unions —

Sailors Union of the Pacific — Seattle, Portland, S.F., L.A. (Wilmington)

Sea Favers International Union — East Coast & Gulf Ports
National Maritime Union — East Coast & Gulf Ports.

Also try tug boat companies — they hire a lot of men and pay very well. Your best bet is to play a "straight" roll. Most personnel managers and Union dispatchers are straight and anti-anyone who does not also appear straight. Having got the job and the required C.G. documents and entered into the seafaring life you will find that sailors don't give a damn what you look like, or how you act.

Sixth and last — shipping out on foreign vessels is a matter of chance. Contact the consuls of each maritime nation — Norway, Denmark, Sweden, Italy, Germany, England, Panama, Liberia, Greece — in each major port city of the U.S. leaving your name, address, and phone number.

Also go to a seaport and go aboard foreign ships and ask for a job.

Also contact Steamship agents (phone book again) and drop a card to the operations manager with name and phone number.

Kevin Mercer
Seattle, WA

How To Get A Job Overseas

Most of the openings are pretty imperialistic if your conscience is sensitive to that score. The book does cover the field okay. Mainly it comes down to this, if you have a needed skill (like nursing, metallurgy, veterinary) the door is open. Otherwise you're welcome to either spend or starve but not compete with local labor.

The agency likes to get you while you're young, but older people—with special backgrounds in the sciences and technology—have made the grade, too. If you're now a highly regarded cartographer, mathematician, anthropologist, or engineer, you can also ask for application forms (write CIA, Office of Personnel), or report personally without prior appointment to 1820 N. Fort Myer Drive, Arlington, Virginia. CIA draws its staff from many racial and ethnic backgrounds, which means that you'd encounter no obstacles on that score. But don't expect to earn as much as you would in private industry. Salaries start at a low \$3,889, and go up—in rare cases—to a limit of \$25,044 a year.

Peace Corps

We've got fine vacation news for suburban guerrillas, or for that matter, anybody up for a trip. Make Peace Corps your local travel agency at no expense to you.

If you want some time to think, adequate salary, easy and fun job, free medical care, free dental care, many profusely illustrated publications, and other gratuities, take advantage of the free offer. The U.S. government can be penetrated "like cheese-cloth". It's full of holes to breathe through.

Chances of acceptance are high, especially for people who can make things grow. If you can't make things grow you probably qualify as an English teacher. The more under-developed the country, the more loosely defined the job. If you want to make a big deal out of what you find yourself doing you can, but if you're not that type then let the Peace Corps be your reality trip. You might end up with a Maharishi in your own neighborhood.

Training usually amounts to a 6-10 week commune. Our program trained on a ranch near Rocky Mountain National Park — an instant plastic community with coop general store, nightly dancing, feasting together, mountain climbing, even our own mythology. We also learned a foreign language. The same kind of language course we got would cost a couple thou at Berlitz. Other training programs have taken place in Mexico, Canada, the Virgin Islands, and all over California. The trend in Peace Corps training programs today is to choose a salubrious place where volunteers will feel a sense of oneness.

Peace Corps employs thousands of volunteers in countries all over the world — Morocco, Afghanistan, Nepal, Micronesia, India, Peru, Sierra Leone, and other places you might like to know. It's usually no problem enjoying the better aspects of the natives and retaining what you are at the same time. If you don't dig the natives you can work along with them anyway.

Peace Corps volunteers get two days of paid vacation for every month of service. That means 48 days accumulated vacation for two years of service. During vacation you get nine dollars a day just to subsist on. One volunteer visited five countries his first year of service — Spain, Tunisia, Sicily, Italy, and Greece, spending no less than two weeks in any one country. A skillful volunteer could easily beat that. Counting local holidays, Christmas vacation, summer vacation, spring vacation, and unexpected surprises like International Moon Day or a sudden coup, a volunteer could easily push five months in days-off during a single year.

Despite recession in the states Peace Corps salaries have been going up recently. In less than a year's time our salaries have increased by 33%. With our excess subsistence allowance we've bought a lot of hand-made rugs and blankets worth thousands in the states if you need retirement money.

The necessary information is available through Peace Corps, Washington. When you read Peace Corps material, use your imagination. Don't be turned off by jargon like "volunteer spirit" and "effectiveness". In most countries lack of communications make bureaucracy virtually impossible. You are necessarily left alone. Improvise. Take a stereo and plenty of books you've been wanting to read. If the Peace Corps charters an airplane to fly your program to its site, there is practically no limit on baggage weight.

Regardless of when you leave the Peace Corps you get 75 dollars for every month of service abroad or about 1500 dollars after two years, plus free air fare back to your suburban camp. The Peace Corps will even find you another job.

And the whole two years is a free-trial period. If for any reason you don't like what you're doing, Peace Corps will pay your way home at any time.

Write Peace Corps in Washington and ask for a hand-book. Ask for special information on the country of your choice. Inquire about training programs and fields open to volunteers. Everything is free of charge. The whole trip costs you nothing.

Quotations from Peace Corps literature:

The change in attitude many Volunteers have after the initial novelty of living abroad has worn off is sometimes striking. The fire of enthusiasm they brought with them turns to ashes not long after they encounter the first misunderstanding, the first reluctance to change traditions based on the heritage of generations. Instead of attempting to affect the attitudes around them, however slightly, they begin in some respects to adopt these attitudes.

Going from the ordered routine of training to an unstructured job overseas has sometimes been compared to running off the end of a pier. Suddenly there is no solid footing underneath; often there is not a staff member or an instructor in sight, and it's up to you to sink or swim.

The work of a volunteer is largely a matter of individual definition.

Emergencies: The best advice here is to use your common sense.

Neither volunteers nor staff members may pilot air-craft during their service with the Peace Corps.

OUT OF PRINT

Small gifts say more than "thank you" to someone who's helped you along your way. Ingenious traders also manage to subsidize their travels by importing reasonable quantities of locally scarce personal goods for distribution in non-industrial countries. Gifts and goods needn't all be hauled from home. Duty-free shops at ports of exit, or free ports en route, invite bargain purchases as well as personal restocking.

Premium items vary with country and times. Likely to continue popular in major blocs of the world are: Kennedy half-dollars, U.S. jazz records, unusual flower seeds, nylon shirts and stockings, instant coffee, transistorized equipment, watches, cameras, liquor, lipsticks, ballpoint pens, and photos of yourself and family.

Student Railpass

I have just read your Fall catalog and I noticed that you didn't have anything about the greatest bargain in traveling in Europe, i.e., Student-Railpass. For \$125 you can ride 2nd class for 2 months on the railroads in 13 countries.

If you wish to see some more evidence of this bargain read the August 14, 1970 edition of Life Magazine.

Thanks,
Jay Buster
Peoria, Ill.

2 months/\$125
Talk to a local travel agent

Youth Hostel Pass

The Youth hostel pass costs from \$2 to \$50, depending upon age and number in the group. It is required when staying at most of the European and American Youth hostels. The hostels in Europe generally charge from \$1.50 on down per night per bed and often offer either the use of a kitchen or very cheap meals. If you plan to visit any of the bigger cities (Copenhagen, Stockholm, Amsterdam, etc.) you should reserve a couple of weeks ahead of time. When you buy your card you should also buy the guide for the area you intend to visit. They offer a fairly complete listing and rating of each hostel, and tell how to get to them via public transport in the larger cities. You do not have to sleep in a hostel to eat, wash, loaf, etc. there. Also it is a good place to use as a mailing address. I used the youth hostels in northern Europe and noticed that whole families often stayed at them. They also converted many schools into hostels during the summer. As I have written above hostels are very cheap. I stayed at the Luxembourg hostel and paid \$1.25 for breakfast, supper and bed. I could have paid 50¢ more and gotten a packed lunch. The German hostels charge two marks a night or 60¢ but are very strict but clean. For more information write:

American Youth Hostels Inc.
20 West 17th Street
New York, N.Y. 10011

I am a member of the Potomac Area Council and they have lots of ecology oriented outings.

P.S. Travel light and swift.

Visit USA

Another overseas bonus, "Visit USA" airline tickets. Even if you're an American citizen, as long as you reside so-many miles outside the U.S., you're eligible. The \$150, 21-day deal is the best — on the feeder airlines. Forget those big promotional jobs on the trunk lines. The feeders are good and cover more ground. Since the ticket must be started within 30 days from your arrival in the U.S., get two of them and get 42 days of bombing-around for \$300. There are no hitches or anti-double-back gimmicks. When you get tired, jump on the longest flight you can find. When you're hungry, look for one with a meal coming up soon. A big bonus — as of last year, Alaska Airlines was in the deal. So my kids and I flew from NYC to Nome, Alaska and back for \$300 (kids are half fare until the age of 20 or 21). We even made a side trip from Seattle to Portland and back to buy cigarettes — they're cheaper in Oregon.

or WHOLE EARTH CATALOG

P-R-O-V-O-Y-A is a number you dial in Paris if you want a ride out of town bound for anywhere in Europe. This is an organization that arranges rides for hitchhikers for a \$2 registration fee. Get details from: Provoya, 16 rue de Provence, Paris 9e. I've heard of this several times but haven't used it and don't know anyone else who has. Anybody?

Drivers pick you up because they want something from you. Short list of wants:

- 1) They're bored — you're to entertain them or vice-versa;
- 2) They're curious — you're to provide information about something, usually yourself;
- 3) They want to feel charitable — you're the chosen recipient;
- 4) They need something tangible — you're to share expenses or help drive, etc.

Europe This Way by James Steffensen Jr. and Lawrence Handel (Atheneum; \$7.95). New edition each year. Never mind that it's intended for students — ETW is the best all-around guidebook I've seen. The cost is high and the book is bulky, but both these disadvantages result from one considerable advantage: it is packed with information. More of it on more countries than any other guidebook, and particularly important, the information is all useful and sensible. It covers trip preparation, working or studying abroad, transportation, food, lodging, entertainment, and the advice given by the authors is consistently excellent. Its country-by-country listings are the best available between one set of covers. If you get it, consider tearing it apart to carry only the pages you need. It's too bulky to carry whole.

Hitchhiking, the homilies:

- Use a sign. Have a map.
- Look like who you want to pick you up.
- Wait where it's easy for drivers to see you and stop.
- Be of use to the driver, or at least no bother.
- Don't take it personally when they don't pick you up. See it as their problem.
- Stay on the curb, and off freeways. Don't rob or murder anybody; it makes it hard for the next guy.

-SB

Temporary Car

If you have a little bread, a good way to move from city to city is by driving a car for an **Auto Transport Agency**. In most big cities there are usually a number of agencies. Call up and ask if they need any cars driven near to where you want to go. If they say yes, you go to their office to fill out an application. Requirements are generally, but not necessarily, 25 years of age or over, some references, a valid driver's license, and supplementary identification. They will ask how many are driving with you. Depending on the vibes you can either tell them or say that you are driving alone. (I don't know if there are any **insurance complications** in this respect.)

Usually they require a deposit of \$40 to \$50. At the end of the trip you are reimbursed for the deposit, any **gas allowance** permit fees, and repair expenses you might have incurred on the road—if they were not the result of negligence. Be sure to keep your receipts. It pays to shop around. Often one car will have a larger gas allowance. Also, if you are low on cash, you want to get a car which is less likely to break down, or one that uses less gas. Rattle traps usually mean trouble. Waiting a couple of days and checking regularly with the agencies will often turn up a car.

About five western states have a commercial vehicle tax which you are required to pay upon crossing the state line. If you are stopped and do not have a sticker you are liable for a large fine. If you obey all the laws and slow to 25 when passing through the small towns, the chance of being stopped if you are driving a car is very slight. Worse odds if driving a truck, van, or obvious commercial vehicle (get a larger gas allowance for these—dicker a little, they are anxious to move them). I keep my agency sticker in my pocket. If stopped, tact and a hard luck story are advised.

Should you run out of gas money before, you can telephone collect to destination and have cash wired to you as a deduction from your deposit. Another angle is to check the Greyhound Bus Stations and see if someone cool will pay for your gas. This will usually save them cost of half a ticket. **Watch out you don't get picked up for soliciting.** Plan ahead.

Peace and good luck,
Arn
Sherman Oaks, Calif.

Cheap Meal in a Strange Place

Landing in a strange city with very little bread is rough; rougher than *living* in one with very little bread. Eating is always important and should not be put off for too long in any circumstances. I may have a rung for your ladder. A good meal can be had in any hospital cafeteria in the land for from 60 cents to one dollar. Meat or fish, vegetable, salad, milk and dessert at 1/3 the price of any restaurant. No one cares what you look like either, they assume that you're a visitor and leave you alone. More often than not you might be invited into a friendly conversation since people in hospitals share a common bond. If you are looking for a good spot to eat in San Francisco, I recommend St. Mary's Hospital on Hayes and Stanyan—excellent ****

Dana McDill
San Francisco, Ca. 94133

Travelers Directory

Travelers' Directory is the international registry of hip travelers who enjoy meeting others everywhere, whether around the corner or around the world. The book lists their names, addresses, telephones, ages, interests, and offers of hospitality to other travelers passing through. The upcoming Spring 1971 edition will list almost 1000 addresses in its 96 pages. New listings are now being accepted in Directory headquarters in New York City. **EQUALITY** readers are especially welcome, because they obviously share common interests with those already listed.

Prospective listees should submit the above information about themselves for publication in the Spring edition. (Published annually since 1960, **Travelers' Directory** is now being published every six months to keep pace with its rapid growth.) As always, copies of the new edition will be sent only to those travelers listed in that edition, so only listees will know who else is listed. No extra copies are ever printed, so none is available to anyone not listed. Each copy of **Travelers' Directory** is numbered, bears the listee's name, is neither transferable nor replaceable, and acts as each listee's "underground passport" to identify him to all the others in the book.

Ever since its first edition ten years ago, **Travelers' Directory** has been a non-profit labor of love. The costs of printing and mailing the Directory are shared by the editor and all the listees. Each listing is submitted with a donation of at least U.S. \$3 (about 10DM) to defray some of the production expenses of the editor, who receives no remuneration at all. Donations may be sent in any currency, or by check or money order made out to **Travelers' Directory**. Listings arriving by 28 February will be included in the Spring edition, to be sent to all listees in March, in plenty of time to make plans for summer traveling.

Even before the new edition of the Directory is published, listees will start receiving the Directory's magazine, **Trips**, as a free bonus. This amusing publication is written by and for the listees themselves. It features articles on their travel experiences, invitations to all listees for free weekend Directory parties in different cities, and solid advice on such subjects as hitching free rides on planes and ships, or which companies will pay you to drive their customers' cars across the country.

Such bonuses, though, are incidental to the primary purpose of **Travelers' Directory**. People decide to be listed mainly because they enjoy meeting others with similar interests wherever they travel. They know they have friends to welcome them in any city in the world where there are Directory listees, and that seems to be just about everywhere: London, Paris, Frankfurt, Rome, Stockholm, Bombay, Tokyo, Sydney, you name it. Listees live in almost every major country on every continent, even in such uninviting areas as Antarctica and Viet Nam. One listee recently toured much of Africa, staying with other listees in Tanzania, Uganda, Ghana, Liberia, Sierra Leone, Spanish Morocco and the Canary Islands. The country best represented in the current edition is the United States, with hundreds of listings, ranging from one to 55 addresses in each city. Although listees collectively speak dozens of languages, every one speaks English, the international language used throughout the Directory. No listee ever visits another, of course, without first phoning or writing to be sure he's welcome.

Because each listee must submit his listing himself each time he wants it published in the next edition, all addresses and offers of hospitality to compatible listees are current. No listing is ever carried over to the next edition automatically. Despite that policy, many current listees have managed to be listed in every edition since 1960. **Travelers' Directory** can't be all bad. Welcome aboard.

P. Kacalanos, Editor, **Travelers' Directory**, 51-02 39th Ave., Woodside, New York 11377

Canadian Rail Cheap

I have a couple of suggestions which I hope you can use. (You probably know about this one). You can travel on the Canadian Pacific Railroad from Montreal to Vancouver for \$51.00 (Canadian or \$49.00 (American), coach, no meals. (For three days—who cares). I really didn't believe this so I wrote to the company and it was verified. That is so incredibly cheap & what a trip, through the Canadian Rockies, etc. Right now some friends are travelling this train and I'm dying to hear how it goes.

Love & Peace—
Margaret Cherran
Providence, R.I.

Freight Hopping

You do o.k. by hitchhiking but hardly a mention of freight hopping. In the U.S.A. this is technically illegal, but in many areas, particularly in the west, it is allowed in order to have cheap labor available for the big farmers. For example, you can catch a ride from Seattle's Interbay to Minneapolis or on to Chicago in 2 or 3 days respectively. Also from Chi-town (if you're very careful in the yards) and Minneapolis you can go down to St. Louis or Kansas City and thence to L.A. via the southwest and thence up the coast to Seattle again. There are spots where you have to be cool and awake to avoid getting kicked off a train, but you soon learn where and when. One sees a part of America few people see anymore, too. Some roads (like U.P. and a lot of southern and eastern lines) won't let you ride, but then again, this is always a relative thing, depending on who knows you're on a train, and who you ask. I advise caution in order to keep from an avoidable 30 days in the city jail and also to avoid getting cut in half or wiped out by a switch standard (if you are gonna mess with a train when its moving, you better know what you're doin', otherwise stay on or stay off till it stops). You can get up to Prince George & Prince Rupert, and east and south as you find possible. I've heard good & bad things about Dixie and Mexico (RE: freights) and don't know. Information is half of your ticket—ask the workers (particularly the switchmen in big yards) where and when a long shot is being made up for your destination. Be cool with RR dicks, they exist but sometimes you meet them in spite of intentions otherwise. "innocense" is helpful in such cases; tell 'em you didn't know you were doing anything wrong and don't want to... etc. I find empties (opened boxcars) the best, except in very good, warm weather. Sometimes you might even get a ride in the caboose ("crummy" its called) for a division or two. There are a lot of things that are "dangerous" like shifting loads crushing people etc. that I can't ever completely cover. Sensitivity and awareness about how the train functions is the other half of your ticket. Bring your own food, water and warmth. I guess there's a lot to it, but no more than a lot of other things. Well, as they say at Suwa-no-se Jima, Sayonara, you all! Keep on truckin'.

Shanti to Alan who was able to write a personal letter about a gristmill we ordered.

Hope to see you all
Daniel G. Leen
Fairbanks, Alaska

"His bus is out behind the house right now."
"Well I'll swan. Now what nephew would that be, honey? It aint Jenny's boy is it?"
"Jenny's boy'd be too young, honey. He's Royce's. You remember Royce."
"Got killed in a car wreck," said Mrs. Thornton.
"That's right. It was his woman Eva that took up with that Davenport everybody hated so bad."
"Why yes. I remember that family. Their girl went to school to my brother-in-law's wife Rona, when she taught over yonder at Hemlock."
"That's Marcella," said Mrs. Godsey.
"Well now," said Mrs. Thornton. "I remember Marcella real good, but I declare I can't picture a boy."
"He's nearly grown now," said Mrs. Godsey. "I wouldn't of recognized him if he hadn't told me who he was. You'd think he was one of them hip-eyes on television, to look at him. Kind of queer-acting but I tell you now. That child sure meant business about taking care of his uncle. I called up there to Cincinnati Sunday to say how sick Emmitt was, and he answered and said he'd come as soon as he could. Just like that. Stopped in here a few minutes, then took off up that creek lickety-split. His bus is out behind the house right now. Leonard pushed it around there."
Mrs. Godsey took a sip of her R. C.
"I tell you now, honey," she went on, "I've been praying for Emmitt. I've been asking a blessing for him ever since he come down sick, and I declare if it don't look like the Lord's done sent him one."
"I hope it's so," said Mrs. Thornton. "I say God bless the boy if he don't do no more than make Emmitt feel like somebody cares a little something about him."
"That's right," said Mrs. Godsey, and she started to get up then. Struggling to rise, she said, "Well young'un, I don't mean to run you off, but it's my nap time, and I'm going to go in yonder and lay down in the bed a while."
"I don't blame you," said Mrs. Thornton, and she started getting up too. "I've got to get on home myself. Wheeler'll probably kill me for being gone this long."
Mrs. Thornton was as fat as Mrs. Godsey was old, and it took them equally long to work out of their seats and stand. When they'd made it, Mrs. Godsey said, "You come back to see me, now, you hear?"
"I will," said Mrs. Thornton. "And you come up and see us some time."
"Ohh, I don't know," said Mrs. Godsey. "I guess I'm too old to be out gadding about."
Mrs. Thornton said, "Psshht. You tell that Leonard I said for him to load you in the back of that truck of his'n and haul you up to our house for dinner next Sunday."
Mrs. Godsey laughed and said she'd tell him.
"Where's Leonard at, anyhow?" said Mrs. Thornton. "I've been wanting to ask him something."
"I don't know where he's at today," said Mrs. Godsey. "But he's on the Grand Jury next week."
"The Grand Jury!" exclaimed Mrs. Thornton.
"Yep. Two weeks of it, starting Monday."
"Lordy," said Mrs. Thornton. "He'll come back thinking he's a big shot."
The women laughed again and waved as Mrs. Godsey went through the curtain that separated her house from the store. Mrs. Thornton picked up the empty soft drink bottles, put them in a case beside the cooler, and then went out the door.

Communications

Diagrams

A diagram is a conceptual map. Elegantly done it can ease comprehension. Thoroughly done it can aid analysis. Done with originality it can remake your internal world. This book, the first of its kind, is a splendid survey of the range and usefulness of diagramming.

Chart from a book, showing chief schools of European painting from Giotto. Devised by Eric Newton who explains that it attempts to indicate relative importance of schools (areas of shaded masses), approximate dates, principal artists (circle), relative importance (size of circle), threads of influence between schools and artists. Eric Newton, *European Painting and Sculpture*, Faber and Faber

There is no attempt to give this book a historical perspective, although some of the pioneers in the effective presentation of information in visual form are included. The pioneers include magazines such as *Fortune* and *Scientific American*; firms such as the Container Corporation of America, and particularly the Isotype Institute, London, whose approach and achievement has affected all designers of diagrams even though they may not be aware of their debt.

Map from a business magazine showing the size of direct US investments in foreign countries at the end of 1968. Size of countries distorted in proportion to amount received. Original in colour. Extract.

Diagram from an advertisement showing proximities (considered 'near' together and confused, or 'far' apart and seldom confused) of ten vowel sounds. Air-brushed spheres in space.

Mapping

A map is the meeting ground of drawing, writing, and geometry. No other medium carries such a wealth of critical information at glance readiness. Students of brain and thought design are lately placing more and more emphasis on the matter of Where-Is-It—apparently much of the mind's store, retrieve, and relate systems are based on position relationships in mental space.

This book is a well-made introduction to map use, map construction, and something of the meaning of maps.

Land-form map. Accurate information shown with vividness and grace. Drawn by Erwin Raisz for a geography textbook.

We can scan the history of civilization as well as of mapping itself simply by observing which direction has topped the map. Erwin Raisz, the Harvard authority on cartography, says, "It seems to be a tendency among map makers of every country to put at the top of the map the direction toward which national attention is turned."

The Romans headed their maps as they so often did their empire-stretching ships, eastward. So did the Crusaders trying to recover the Holy Land. Many medieval wind roses have a cross as an east-mark.

Maps and charts—you may have noticed in this chapter the repetition of these two words. What's the difference in their meaning? Charts are maps with a special, practical purpose such as navigating, weather forecasting, and population studies. A chart is a map on which to work with protractor, compass, dividers, and gauges—even a densitometer.

This connection between local pinpoints and cosmic points is one of the majestic relationships recognized by science. Considering how much the mere idea of a map encompasses, maps are probably more unconfusing than anything else put down on paper. A map should be regarded as an antidote to panic.

The meaning of a message is the change which it produces in the image.

Between the incoming and outgoing messages lies the great intervening variable of the image. The outgoing messages are the result of the image, not the result of the incoming messages. The incoming messages only modify the outgoing messages as they succeed in modifying the image.

I have never been to Australia. In my image of the world, however, it exists with 100 per cent certainty. If I sailed to the place where the map makers tell me it is and found nothing there but ocean I would be the most surprised man in the world. I hold to this part of my image with certainty, however, purely on authority. I have been to many other places which I have found on the map and I have almost always found them there. It is interesting to inquire what gives the map this extraordinary authority, an authority greater than that of the sacred books of all religions. It is not an authority which is derived from any political power or from any charismatic experience. As far as I know it is not a crime against the state nor against religion to show a map that has mistakes in it. There is, however, a process of feedback from the users of maps to the map maker.

There is a strong tendency for authoritarian organizations to use violence or the threat of violence in support of the role structure, that is, in order to gain acceptance of the role on the part of the persons occupying the lower role. For a time this may be successful in maintaining the organization. It is usually, however, self-defeating because of the corruption of the communication system which it entails. The case is somewhat analogous to that of the schizophrenic or the extreme paranoid. His sense receptors are so much "afraid" of him that they merely confirm the products of his heated imagination. The terrorized information sources of the tyrant likewise tell him only what they think will be pleasing to his ears. Organizations as well as individuals can suffer from hallucinations. It is the peculiar disease of authoritarian structures.

At the other extreme, democratic structures in which there is no adequate leadership, that is, in which the feedback is destructive of the decision-making process on the part of higher roles are likewise unstable and incapable of maintaining themselves. If discussion is to be a successful process of decision-making it must exhibit a degree of convergence toward common images of the whole organization. If the feedback from the followers destroys the image of the leader instead of merely modifying it, the process is likely to be self-defeating.

The image acts as a field. The behavior consists in gravitating toward the most highly valued part of the field. It does not follow from this, however, that the consequences of behavior are in conformity with the image which produced them. Disappointment and surprise are a common lot of both organisms and organizations. We behave according to some image of the consequences of our acts. When, however, these consequences are reflected in information fed back to us, we find very often that feedback does not confirm the original image. Under these circumstances, as we have seen, the image may be modified or it may not.

In tracing the effect of images on the course of history, peculiar attention must be paid to the images of time and especially the images of the future. Curiously enough, it may not be so much the actual content of the image of the future which is important in its effect, but its general quality of optimism or pessimism, certainty or uncertainty, breadth or narrowness. The person or the nation that has a date with destiny goes somewhere, though not usually to the address on the label. The individual or the nation which has no sense of direction in time, no sense of a clear future ahead is likely to be vacillating, uncertain in behavior, and to have a poor chance of surviving. Those images of the future which are most persistent and which have had the greatest impact on human history seem to be those which are impenetrable to feedback and which maintain themselves by their own internal beauty and consistency.

Cybernetics

McLuhan's assertion that computers constitute an extension of the human nervous system is an accurate historical statement. The research and speculation that led to computer design arose from investigation of healthy and pathological human response patterns embodied in the topological make-up of the nervous system. Insights here soon expanded into generalizations about communication that permitted the building of analogous electronic devices physically separate from the Central Nervous System. But they're just one artifact of these new understandings about communication. Society, from organism to community to civilization to universe, is the domain of cybernetics. Norbert Wiener has the story, and to some extent, is the story.

—SB

To predict the future of a curve is to carry out a certain operation on its past.

The central nervous system no longer appears as a self-contained organ, receiving inputs from the senses and discharging into the muscles. On the contrary, some of its most characteristic activities are explicable only as circular processes, emerging from the nervous system into the muscles, and re-entering the nervous system through the sense organs, whether they be proprioceptors or organs of the special senses. This seemed to us to mark a new step in the study of that part of neurophysiology which concerns not solely the elementary processes of nerves and synapses but the performance of the nervous system as an integrated whole.

The feedback of voluntary activity is of this nature. We do not will the motions of certain muscles, and indeed we generally do not know which muscles are to be moved to accomplish a given task; we will, say, to pick up a cigarette. Our motion is regulated by some measure of the amount by which it has not yet been accomplished.

I have spoken of the race. This is really too broad a term for the scope of most communal information. Properly speaking, the community extends only so far as there extends an effectual transmission of information. It is possible to give a sort of measure to this by comparing the number of decisions entering a group from outside with the number of decisions made in the group. We can thus measure the autonomy of the group. A measure of the effective size of a group is given by the size which it must have to have achieved a certain stated degree of autonomy.

Thus small, closely knit communities have a very considerable measure of homeostasis; and this, whether they are highly literate communities in a civilized country or villages of primitive savages. Strange and even repugnant as the customs of many barbarians may seem to us, they generally have a very definite homeostatic value, which it is part of the function of anthropologists to interpret. It is only in the large community, where the Lords of Things as They Are protect themselves from hunger by wealth, from public opinion by privacy and anonymity, from private criticism by the laws of libel and the possession of the means of communication, that ruthlessness can reach its most sublime levels. Of all of these anti-homeostatic factors in society, the control of the means of communication is the most effective and most important.

The mongoose begins with a feint, which provokes the snake to strike. The mongoose dodges and makes another such feint, so that we have a rhythmical pattern of activity on the part of the two animals. However, this dance is not static but develops progressively. As it goes on, the feints of the mongoose come earlier and earlier in phase with respect to the darts of the cobra, until finally the mongoose attacks when the cobra is extended and not in a position to move rapidly. This time the mongoose's attack is not a feint but a deadly accurate bite through the cobra's brain.

In other words, the snake's pattern of action is confined to single darts, each one for itself, while the pattern of the mongoose's action involves an appreciable, if not very long, segment of the whole past of the fight. To this extent the mongoose acts like a learning machine, and the real deadliness of its attack is dependent on a much more highly organized nervous system.

To use a biological analogy, the parallel system had a better homeostasis than the series system and therefore survived, while the series system eliminated itself by natural selection.

We thus see that a non-linear interaction causing the attraction of frequency can generate a self-organizing system. . . .

OBJECTIVELY

Objectively, here's what happened: D. R. crawled under the ruins of the old coal tippie and about fifty yards back into the old abandoned mine.

And there in the dark and the moist cool he went ahead and freaked out completely.

That really happened.

Late that afternoon, Leonard, Mrs. Godsey's son, decided he'd walk up Trace Fork and see how Emmet and his nephew were getting along after their first day together. Leonard had been going up to see Emmet every day or two since he'd been sick. Even before he was sick he went up just to visit Emmet a couple of times a week, to take him the things he needed, and talk a while, and now and then to sip a little moonshine with him, or wine that Leonard's cousin Daniel made.

And now the nephew was there, and Leonard thought he'd just stroll up and say hello, and see if they needed anything.

And found D. R., filthy dirty, sitting in the weeds there by the fallen timbers of the tippie of the old Blair Brothers mine.

He looked like a casualty of war.

If it had been anybody besides Leonard that found D. R. like that they would almost certainly have handled it wrongly. Probably they would have run to the nearest telephone and called the doctor, and maybe even the magistrate. But Leonard was a very special man. In ways his old mother who admired him so could never in a hundred years imagine or believe, Leonard was a very special man.

A lot is said about Leonard by the fact that he could appreciate and be friends with a man as strange and eccentric as Emmet Collier. There were people around who thought of Emmet as actually crazy, but they would never have said so around Leonard, because they knew Leonard would defend Emmet, and not many people were inclined to argue with Leonard, or contradict him. Not that they were afraid. Leonard did not inspire fear in anyone. Trust was the feeling most people had toward Leonard. Trust, and confidence in him as an honest man, and strong.

He was the kind of man, the kind of mountaineer, who inevitably makes sergeant in the military, simply because it is so apparent to everybody around from private to Captain that he's the man for the stripes. The assumption happens automatically in the minds of everybody who's looking. Some men are just born with the qualities it takes to impress other men as a leader, and Leonard was one of them. During World War Two he served four years and five months in the Army, and came out a First Sergeant, with a year and a half in grade.

I mention these details about Leonard to give some indication of the kind of fellow he was. His story is as rich and complex as Emmet's or D. R.'s, and it will have to be told some day. But for now, let this much be enough, and observe him as he deals with his bizarre discovery of Emmet's nephew, sitting bewildered and filthy by a pile of rotting logs half-way up a creek that except for one old man has been abandoned by humankind.

Leonard speaks to D. R. gently, and looks into his eyes.

D. R. looks back into Leonard's eyes, and when Leonard says who he is, D. R. recognizes him, and understands where he is.

Understanding Media

Everybody talks about McLuhan, and everybody does something about him, and that makes it subjectively harder to get at him. He's got other insights than what you hear about, so it's worth the trouble to track him down, both his current sayings and his prime collections. An excellent set of recent sayings was in a *Playboy* interview a few months ago (he foresaw the imminent demise of language into global telepathy: "The body of Christ"). For prime collection the primest is *Understanding Media*.

—SB [Suggested by Gerd Stern, then.]

Said the Duke of Gloucester to Edward Gibbon upon the publication of his *Decline and Fall*: "Another damned fat book, eh, Mr. Gibbon? Scribble, scribble, scribble, eh, Mr. Gibbon?"

As W. B. Yeats wrote of this reversal, "The visible world is no longer a reality and the unseen world is no longer a dream."

Not only does the visual, specialist, and fragmented Westerner have now to live in closest daily association with all the ancient oral cultures of the earth, but his own electric technology now begins to translate the visual or eye man back into the tribal and oral pattern with its seamless web of kinship and interdependence.

Meantime, the countryside, as oriented and fashioned by plane, by highway, and by electric information-gathering, tends to become once more the nomadic trackless area that preceded the wheel.

Eventually the method of the counting board gave rise to the great discovery of the principle of position in the early centuries of our era. By simply putting 3 and 4 and 2 in position on the board, one after another, it was possible to step up the speed and potential of calculation fantastically. The discovery of calculation by positional numbers rather than by merely additive numbers led, also, to the discovery of zero. Mere positions for 3 and 2 on the board created ambiguities about whether the number was 32 or 302. The need was to have a sign for the gaps between numbers. It was not till the thirteenth century that *sifr*, the Arab word for 'gap' or 'empty,' was Latinized and added to our culture as 'cipher' (ziphirum) and finally became the Italian zero. Zero really meant a positional gap.

'Work,' however, does not exist in a nonliterate world. The primitive hunter or fisherman did no work, any more than does the poet, painter, or thinker of today. Where the whole man is involved there is no work.

If the phonetic alphabet was a technical means of severing the spoken word from its aspects of sound and gesture, the photograph and its development in the movie restored gesture to the human technology of recording experience.

Man the food-gatherer reappears incongruously as information-gatherer. In this role, electronic man is no less a nomad than his paleolithic ancestors.

Everybody experiences far more than he understands. Yet it is experience, rather than understanding, that influences behavior, especially in collective matters of media and technology, where the individual is almost inevitably unaware of their effect upon him.

It is a principal aspect of the electric age that it establishes a global network that has much of the character of our central nervous system. Our central nervous system is not merely an electric network, but it constitutes a single unified field of experience. As biologists point out, the brain is the interacting place where all kinds of impressions and experiences can be exchanged and translated, enabling us to react to the world as a whole.

Communication Arts

a slicky for graphics freaks, and ad men, people who cut things out of magazines, to paste them on walls, christmas cards, kleenex boxes, and catalogs. expensive but pretty.

Hess: Products very definitely have a life span. Proctor and Gamble knows this, and they have very tightly documented projections on each one of their products. They know two or three years in advance when they can expect that product to peak out and start its eventual decline. Perhaps some studies should be made. It would behoove publishers to take that same point of view that the package goods manufacturers do and schedule a new product or some kind of revitalization of the old product to coincide with that peak before the decline.

Coyne: You mean fire the publisher and the editor and start over?
Hess: It's an idea.

By the Late John Brockman

John Brockman, though dead, is in his late twenties and agile in New York. His book is an interpretation of recent work in brain-study, information theory, and art. It proposes that man is dead, replaced by a superior being—once he learns this—called invisible.

—SB

Man is dead. Credit his death to an invention. The invention was the grasping of a conceptual whole, a set of relationships which had not been previously recognized. The invention was man-made. It was the recognition that reality was communicable. The process was the transmission of neural pattern. Such patterns are electrical, not mental. The system of communication and control functioned without individual human awareness or consent. The message in the system was not words, ideas, images, etc. The message was nonlinear: operant neural pattern. It became clear that "new concepts of communication and control involved a new interpretation of man, of man's knowledge of the universe, and of society." Man is dead. "We're talking."

Every movie is the first movie. The brain goes into its stereotyped movie program even before the ticket is purchased. The information received by the brain from the experience of purchasing a ticket may be enough to activate the hormonal responses of the movie experience. Buy your ticket: See the movie.

The concept of ecumenical technology provides a frame of reference which points to clues about the invisible stage of evolution. The ecumenism of technology is the unitive force that can make all brains perform the same operations simultaneously. Ecumenical technology is the key to the simultaneous universe of electronic communications. Consider that in the pre-electric age the operations of multitudes of brains in the world would function on different frequency bands. With electronics, an important event on television will mean that on the neural level millions upon millions will have a ray projected onto their retina, providing their brains with the information needed to maintain continuity. This information measures a change in the brain's activity, a frequency modulation. Every brain working the same way, on the same frequency, the same wavelength, performing the same operations simultaneously. Not brotherhood, but unity. Ecumenical technology.

It was all invisible to man. The clash of generations, the crashing down of institutions, the divisiveness—it was all invisible. Man never knew what was happening. To the invisible, it was a question of nonsynchronization of frequencies, where certain brains were unable to adapt to new rhythms of the information received within parameters consistent with continuity. It became a question of phylogenetic suicide. To the invisible: out of phase. To man: out of mind. Who's crazy?

It is not necessary to say Yes to life. No one is there to listen; no one is interested in your words.

Culture is Our Business

McLuhan's best format. Each pair of pages has a reprint of an ad on the right, and fresh McLuhan aphorisms, quotes, and misquotes on the left. The resulting energy across the spread is economic and multi-directional—i.e. you make it. Pound's statement (next p.) about Chaucer and Shakespeare applies as well to McLuhan.

To me he is as valuable. His news stays news.

Ads are the cave art of the twentieth century. While the Twenties talked about the cave man, and people thrilled to the art of the Altamira caves, they ignored (as we do now) the hidden environment of magical forms which we call "ads." Like cave paintings, ads are not intended to be looked at or seen, but rather to exert influence at a distance, as though by ESP. Like cave paintings, they are not means of private but of corporate expression. They are vortices of collective power, masks of energy invented by new tribal man.

Since Sputnik there is no Nature. Nature is an item contained in a man-made environment of satellites and information. Goals have now to be replaced by the sensory reprogramming of total environments and DNA particles, alike. The earth is an old nose cone.

Today, through ads, a child takes in all the times and places of the world "with his mother's TV." He is gray at three. By twelve he is a confirmed Peter Pan, fully aware of the follies of adults and adult life in general. These could be called Spock's Spooks, who now peer at us from every quarter of our world.

Poets and artists live on frontiers. They have no feedback, only feedforward. They have no identities. They are probes.

Shine

John Cage's seminal work that initiated us all to the uses of audible darkness. How to be undefeated. Also how to enjoy mushrooms, zen, famous people, and space-time crossword puzzles. I've never met a person who liked John Cage's music, or disliked his sunny books.

I BELIEVE THAT THE USE OF NOISE

Wherever we are, what we hear is mostly noise. When we ignore it, it disturbs us. When we listen to it, we find it fascinating. The sound of a truck at fifty miles per hour. Static between the stations. Rain. We want to capture and control these sounds, to use them not as sound effects but as musical instruments. Every film studio has a library of "sound effects" recorded on film. With a film phonograph it is now possible to control the amplitude and frequency of any one of these sounds and to give to it rhythms within or beyond the reach of the imagination. Given four film phonographs, we can compose and perform a quartet for explosive motor, wind, heartbeat, and landslide.

Psychically, art is valuable only when new.

COMMERCIALLY, NEW ART IS KOOKY AND WORTHLESS.

The gap between the kooky and the commercially valuable is closing fast.

"We'll return to our commercials after this brief word from the program..."

May be the world's oldest television program is also its most interesting. For 50 years, it has been on the air. It is called "Good Housekeeping." Suppose you're a housewife. It's a magazine "hand-out" but about the things you have become interested in. And that's true in an advertisement and one of those advertisements as your very persistence very experience continues? How persuasive can your message be if it is provided by another commercial and immediately followed by your message? And in light of the code, how effective? In the last five years, daytime television rates have risen an estimated 62%. That's why you should have wanted, say, \$40,000 to make a commercial on TV. It's not so much a commercial as it is a highly effective advertising medium. No one will deny that. But the more reading, the better. It has now had the point where its effectiveness and efficiency must now be questioned. You can't saturate a magazine. For one thing, magazines can print as many pages as they want. And they can increase their editorial content to maintain a good balance between editorial and advertising. And magazine ads don't intrude. People can read them when they feel like it. Come back to them. Tear them out. In fact, most people actually look forward to seeing ads in magazines. Every month, for example, almost 13 million adult women look forward to seeing your advertising in Good Housekeeping. What's more, they're predisposed to believe it. Our believability combined with our rather impressive statistics, has caused a number of thoughtful businessmen to consider a better balanced media mix. With Good Housekeeping as a prime ingredient. We now return you to your morning moment.

Good Housekeeping

Invention is the mother of necessity.

GOING, GOING, GONG

When the evolutionary process shifts from biology to software technology the body becomes the old hardware environment. The human body is now a probe, a laboratory for experiments. In the middle of the nineteenth century Claude Bernard was the first medical man to conceive of *le milieu interieur*. He saw the body, not as an outer object, but as an inner landscape, exactly as did the new painters and poets of the *avant garde*.

If nature didn't, Warner's will.

One of the hundred young things you will do it for 47. One young thing you will do it for 12.

Don't do it!

Political Buttons

Lowest prices to movement organizations. Best quality we've seen. Fast delivery—faster if requested. Union label on all. Open account privileges: About 150-200 stock buttons (not run-of-the-mill slogans) for immediate shipment. Nice people to deal with. Very personal attention to all orders.

And when Leonard says why don't you come on with me, David, and wash up some, D. R. is more than glad to follow.

Leonard leads D. R. on up the hill to the place where Emmitt's water-pipe from the spring empties into a fifty-gallon barrel, the water point for Emmitt's little garden and rabbit scene, above the old falling-down barn.

And he pours water on D. R. and D. R. washes himself all over the best he can.

Then Leonard leads D. R. around the hill and down a ways, past the barn, and along a path now to the old main house of the home-place, where old bearded, feeble Emmitt sits on the porch in a rocking chair.

Leonard speaks to Emmitt, quietly. D. R. can't hear what he says, nor can he hear when Emmitt nods and quietly replies.

Emmitt gets up and leads D. R. into the house, into a bedroom, and smoothly without an interruption into a sleep so deep that for a long time there is no dream.

NBC and CBS could easily become the political "parties" of the future, just as the New York Central and the Pennsylvania railroads were once the political parties of the nineteenth century.

"Wiretapping," quoth the raven, "is a threat to identity. Why not beat 'em to the wire? Get rid of your identity now."

After a long and arduous journey a young Japanese man arrived deep in a forest where the teacher of his choice was living in a small house he had made. When the student arrived, the teacher was sweeping up fallen leaves. Greeting his master, the young man received no greeting in return. And to all his questions, there were no replies. Realizing there was nothing he could do to get the teacher's attention, the student went to another part of the same forest and built himself a house. Years later, when he was sweeping up fallen leaves, he was enlightened. He then dropped everything, ran through the forest to his teacher, and said, "Thank you."

During a counterpoint class at U.C.L.A., Schoenberg sent everybody to the blackboard. We were to solve a particular problem he had given and to turn around when finished so that he could check on the correctness of the solution. I did as directed. He said, "That's good. Now find another solution." I did. He said, "Another." Again I found one. Again he said, "Another." And so on. Finally, I said, "There are no more solutions." He said, "What is the principle underlying all of the solutions?"

In the space that remains, I would like to emphasize that I am not interested in the relationships between sounds and mushrooms any more than I am in those between sounds and other sounds. These would involve an introduction of logic that is not only out of place in the world, but time-consuming. We exist in a situation demanding greater earnestness, as I can testify, since recently I was hospitalized after having cooked and eaten experimentally some *Spathyema foetida*, commonly known as skunk cabbage. My blood pressure went down to fifty, stomach was pumped, etc. It behooves us therefore to see each thing directly as it is, be it the sound of a tin whistle or the elegant *Lepiota procera*.

The Elements of Style

Watch a craftsman work. With a few well cared-for tools and direct unshowy motions he keeps the work moving steadily toward completion. The result looks as if it must have been easy to do, 'surprisingly inevitable'. You can write like that. Here are the tools.

10. Use the active voice.

The active voice is usually more direct and vigorous than the passive:

I shall always remember my first visit to Boston.

This is much better than

My first visit to Boston will always be remembered by me.

The latter sentence is less direct, less bold, and less concise.

11. Put statements in positive form.

Make definite assertions. Avoid tame, colorless, hesitating, noncommittal language. Use the word *not* as a means of denial or in antithesis, never as a means of evasion.

He was not very often on time.

He usually came late.

He did not think that studying Latin was much use.

He thought the study of Latin useless.

12. Use definite, specific, concrete language.

Prefer the specific to the general, the definite to the vague, the concrete to the abstract.

A period of unfavorable weather set in.

It rained every day for a week.

He showed satisfaction as he took possession of his well-earned reward.

He grinned as he pocketed the coin.

18. Place the emphatic words of a sentence at the end.

The proper place in the sentence for the word or group of words that the writer desires to make most prominent is usually the end.

Humanity has hardly advanced in fortune since that time, though it has advanced in many other ways.

Humanity, since that time, has advanced in many other ways, but it has hardly advanced in fortune.

This steel is principally used for making razors, because of its hardness.

Because of its hardness, this steel is principally used in making razors.

The breezy style is often the work of an egocentric, the person who imagines that everything that pops into his head is of general interest and that uninhibited prose creates high spirits and carries the day. Open any alumni magazine, turn to the class notes, and you are quite likely to encounter old Spontaneous Me at work— an introductory paragraph that goes something like this:

Well, chums, here I am again with my bagful of dirt about your disorderly classmates, after spending a helluva weekend in N'Yauk trying to view the Columbia game from behind two bumbershoots and a glazed cornea. And speaking of news, howzabout tossing a few chirce nuggets my way?

This is an extreme example, but the same wind blows, at lesser velocities, across vast expanses of journalistic prose. The author in this case has managed in two sentences to commit most of the unpardonable sins: he obviously has nothing to say, he is showing off and directing the attention of the reader to himself, he is using slang with neither provocation nor ingenuity, he adopts a patronizing air by throwing in the word "chirce," he is tasteless, humorless (though full of fun), dull, and empty. He has not done his work. Compare his opening remarks with the following— a plunge directly into the news:

Clyde Crawford, who stroked the varsity shell in 1928, is swinging an oar again after a lapse of thirty years. Clyde resigned last spring as executive sales manager of the Indiana Flotex Company and is now a gondolier in Venice.

This, although conventional, is compact, informative, unpretentious. The writer has dug up an item of news and presented it in a straightforward manner. What the first writer tried to accomplish by cutting rhetorical capers and by breeziness, the second writer managed to achieve by good reporting, by keeping a tight rein on his material, and by staying out of the act.

ABC of Reading

In grade and high school I was taught how to hate Shakespeare, most novelists, and all poetry. College merely burnished my ignorance, adding the ability to hate in French. Ezra Pound, where were you when I needed you? Through Pound, literature becomes a place to revel, confirm, maybe even grow.

It doesn't, in our contemporary world, so much matter where you begin the examination of a subject, so long as you keep on until you get round again to your starting-point.

Language is a means of communication. To charge language with meaning to the utmost possible degree, we have, as stated, the three chief means:

I throwing the object (fixed or moving) on to the visual imagination.

II inducing emotional correlations by the sound and rhythm of the speech.

III inducing both of the effects by stimulating the associations (intellectual or emotional) that have remained in the receiver's consciousness in relation to the actual words or word groups employed.

Literary Essays of Ezra Pound

Someone was set on a trip (Spring, 1970 Catalog) when she found that Ezra Pound had delivered unto man the only good mind-blower on language and literature in the ABC of Reading. In the ABC, though, E.P. only elaborated on a much more concise and potent *pronunciamento* he handed down in the New York Herald "Books" supplement in 1927 or 1928 under the title "How to Read." That reading lesson is available in the company of thirty-five other vigorous and iconoclastic forays by E.P. in the Literary Essays of Ezra Pound (also New Directions ppbk: NDP250; \$3.25). For less than three times the bread for the ABC, E.P. will spring open your mind and ears as he lets go with some sharp barbs at "institutions for the obstruction of learning" and their inhabitants, while he lets you see and connect with those men, from the Medieval troubadours to Brancusi, who knew where and what it was and how to put it together long before we even were.

A civilization was founded on Homer, civilization not a mere bloated empire. The Macedonian domination rose and grew after the sophists. It also subsided.

It is not only a question of rhetoric, of loose expression, but also of the loose use of individual words. What the renaissance gained in direct examination of natural phenomena, it in part lost in losing the feel and desire for exact descriptive terms. I mean that the medieval mind had little but words to deal with, and it was more careful in its definitions and verbiage. It did not define a gun in terms that would just as well define an explosion, nor explosions in terms that would define triggers.

Misquoting Confucius, one might say: It does not matter whether the author desire the good of the race or acts merely for personal vanity. The thing is mechanical in action. In proportion as his work is exact, i.e., true to human consciousness and to the nature of man, as it is exact in formulation of desire, so is it durable and so is it 'useful'; I mean it maintains the precision and clarity of thought, not merely for the benefit of a few dilettantes and 'lovers of literature', but maintains the health of thought outside literary circles and in non-literary existence, in general individual and communal life.

No one wants the native American poet to be *au courant* with the literary affairs of Paris and London in order that he may make imitations of Paris and London models, but precisely in order that he shall not waste his lifetime making unconscious, or semi-conscious, imitations of French and English models thirty or forty or an hundred years old.

Style results; it does not precede.

Nothing so fits a person for a life of dedicated useless unhappiness as four years of majoring in English.

—SB

(phanopoeia, melopoeia, logopoeia)

Incompetence will show in the use of too many words.

The reader's first and simplest test of an author will be to look for words that do not function; that contribute nothing to the meaning OR that distract from the MOST important factor of the meaning to factors of minor importance.

'Literature is news that STAYS news.'

The man who really knows can tell all that is transmissible in a very few words. The economic problem of the teacher (of violin or of language or of anything else) is how to string it out so as to be paid for more lessons.

Men do not understand BOOKS until they have had a certain amount of life. Or at any rate no man understands a deep book, until he has seen and lived at least part of its contents. The prejudice against books has grown from observing the stupidity of men who have merely read books.

Chaucer and Shakespeare have both an insuperable courage in tackling any, but absolutely any, thing that arouses their interest.

The sonnet was first the 'little tune', the first strophe of a canzone, the form found when some chap got so far and couldn't proceed. Steadily in the wake of the sonneteers came the dull poets.

How to Need a Catalog

Wendell Berry says this letter is a fugue, It's a real letter written by a man who says what he means. It came to us through Gregory Norman.

Dear TV Star Editor

I am writing you this letter for some help from this TV Show. That I am a single man looking for a wife. I am 61 years old not never been married. I am trying to look for some women of any age and near my age 61 years old and as tall as I am tall. I am even 6 feet tall weigh 198 lbs. I am looking for some just about as tall that would weigh from 289 to 298 or better with extra very nice wide large full breast with such a pretty nice large heavy extra wide round well built legs and extra wide full size hips and very pretty well stout and filled around her legs and waist line I would like to get married to some of the colored widow and to some white German and to some Indian women. I would like to join in and go with the wild west show. I like to ride these montana and North Dakota North Western wild unbroke horses. And mares. I have been with the rodeo show since I was 13 years old. I cannot get no other kind of work around here or no construction work or any other kind of work. Because I am not a married man. But I will tell you that I am a real good man yet that can go out and do a good days work yet. I like my wild and tame mare horses and I like also my women twist and extra wide and large full size breast I would like to get some naked women without anything on there bodies. Just there bare skin. I would like to see there naked full size breast and there extra wide waist and extra round heavy legs above there knees and extra wide fat arms. There full lenth of there stout heavy naked body. Will you please send me a free book of all kind of women that are colored White German Spanish Indian race and all different race widow women. I do like to get acquainted with them all black white red widow women. I want there names and address from them and from you. I would like to ask you if you please help a poor man out as long as he is sick in the hospital. I am looking for some help till I could get back on my feet again. I will soon get my discharge this hospital next month in August or in the month of September of this year in 1962. I am looking for some help from you and from the widow women. I need some writing paper envelopes and some stamps so I can write you also to the women. I want them to be red extra stout and well heavy set around the legs above the knees. That would have a very nice big farm ranch plenty of wild tame hereford cows and hereford white face heifers tame and wild mare horses and if they have about 375 head of there red heavy sows and hogs and also some real heavy laying red chickens that weigh 75 up to 98 pounds. I like all my women real extra heavy with full wide large breast also with extra large full wide extra round fat legs above the knees and there widest part of the thickest of the waistline hip bones. That do measure 74 around there breast and a 78 there widest and the thickest of there thighs above the knee. And the waist line hips and extra round fat arms. Above there fore-arm extra round fat calf and the thighs of there legs. That would not weight less than 298 hundred to 398 hundred pounds, or over that weight. I want women that are extra stout full large size breast and real extra wide across there large size part of the hips and the waist line extra round fat legs down to the ankles shoe slipper of there feet. Extra round fat arms to the wrist of the hand. I do like to have some of the widow women to help me and each of them could send me about \$5.00 or more. I want to come to the state of New York Because I was not in New York state at all I wish to come to New York and find myself some colored and some white also some of the indian widow women. That I could get some farm and ranch work and live with all the colored Indian white widow women I want a home with every one of the white women colored widow women and with the red Indian widow women. Will you please answer on this letter. Please send me a widow woman catalog of all colored, white and Indian women.

The Story of Language

We are ensorcelled by language. I am coming to believe that halting the all-too-unified construction of the Tower of Babel by dispersing the communication system was a good idea. Pluralism may be a nuisance, but juggernaut unanimity is a curse. One escape from the bonds of one's own language is excursion into another, or into very variousness of language usages, as this book encourages—it's a good, richly exemplified trip. [Another escape is silence.] —SB

The use of Indian sign language for international purposes has repeatedly been advocated. Sir Richard Paget and the American Tourist Association, in recent times, have both advanced the possibility of "handage" to replace language.

Very close to the spoken language is also the whistling language used by the natives of Gomera, in the Canary Islands, who communicate by means of it over very long distances (some say six miles); it seems established, however, that this whistling language is based on Spanish rhythms and pitch. A similar type of whistling language is employed by the natives of Kusnoy, a village in Turkey. The sounds are described as formed with tongue curled around the teeth and lips not puckered but tensely drawn, with the palm of the left hand cupped around the mouth, and high pressure applied from the lungs. The villagers are said to speak, argue, and even woo in whistles.

Hoboes and gypsies have a way of carving symbolic messages on the bark of trees, or scratching them on rocks, for the benefit of their fellows who may follow. A pair of spectacles, in gypsy symbolism, means "Beware! Danger and trouble here!"; but a small circle inside a larger one spells out "Very kind people. Don't impose on them."

Perhaps the phonetic system of writing is not the acme of perfection after all. There is at least a talking point in the arguments of those who advocate that we go back to the picto-ideographic systems of our remote ancestors or simply adopt the ideographic writing of the Chinese. At least all the peoples of the earth, regardless of their spoken tongues, would understand one another in writing.

Economic relations depend on numerals to a greater extent perhaps than on any other factor. It therefore does not surprise linguists to find that numerals are among the oldest and best-defined words indicating connections among the languages of a given family. A word indicative of a given numeral (say "four," or "ten," or "hundred") can usually be traced without difficulty through all or most of the languages of a given group. It is as little subject to borrowing as are names of family relationship.

There are in existence only thirteen languages with 50 million or more speakers. They are, in order of numerical importance, Chinese, English, Hindustani, Russian, Spanish, German, Japanese, Arabic, Bengali, Portuguese, Malay, French, and Italian. The roughly approximate figures, which include non-native as well as native speakers, are as follows:

Chinese	700,000,000
English	350,000,000
Hindustani	200,000,000
Russian	200,000,000
Spanish	160,000,000
German	100,000,000
Japanese	100,000,000
Arabic	90,000,000
Bengali	90,000,000
Portuguese	85,000,000
Malay	80,000,000
French	80,000,000
Italian	65,000,000

Primitive Means Complex

That there are no primitive languages is an axiom of contemporary linguistics where it turns its attention to the remote languages of the world. There are no half-formed languages, no underdeveloped or inferior languages. Everywhere a development has taken place into structures of great complexity. People who have failed to achieve the wheel will not have failed to invent & develop a highly wrought grammar. Hunters & gatherers innocent of all agriculture will have vocabularies that distinguish the things of their world down to the finest details. The language of snow among Eskimos is awesome. The aspect system of Hopi verbs can, by a flick of the tongue, make the most subtle kinds of distinction between different types of motion.

There is no one; there are no people. It is desolate; it lies desolate. There is nothing edible. Misery abounds, misery emerges, misery spreads. There is no joy, no pleasure. It lies sprouting; herbs lie sprouting; nothing lies emerging; the earth is pressed down. All die of thirst. The grasses lie sprouting. Nothing lies cast about. There is hunger; all hunger. It is the home of cold; there is freezing; there is trembling; there is the clattering, the chattering of teeth. There are cramps, the stiffening of the body, the constant stiffening, the stretching out prone.

(Aztec)

Before a noise., may become a symbol, something must exist for the symbol to symbolize. So the first problem of symbolism should be to investigate the problem of 'existence'. To define 'existence', we have to state the standards by which we judge existence. At present, the use of this term is not uniform and is largely a matter of convenience. . . . It is extremely important, semantically, to notice that not all the noises., we humans make should be considered as symbols or valid words. Such empty noises., can occur not only in direct 'statements' but also in 'questions'. Quote obviously, 'questions' which employ noises., instead of words, are not significant questions. They ask nothing, and cannot be answered. They are, perhaps, best treated by 'mental' pathologists as symptoms of delusions, illusions, or hallucinations. In asylums the noises., patients make are predominantly meaningless, as far as the external world is concerned, but become symbols in the illness of the patient.

Further

If the roots and by-products of language intrigue you, two trusty guides for further travel are Benjamin Lee Wharf (Language, Thought & Reality, \$2.95, MIT Press), and Noam Chomsky (has a new book out, said to be complete introduction to his work, I don't know the title).

ALL LIVES, ALL DANCES, & ALL IS LOUD

The fish does . . . HIP
The bird does . . . VISS
The marmot does . . . GNAN

I throw myself to the left,
I turn myself to the right,
I act the fish,
Which darts in the water, which darts
Which twists about, which leaps—
All lives, all dances, & all is loud.

The fish does . . . HIP
The bird does . . . VISS
The marmot does . . . GNAN

DRAGON TRACKS

Emmit says, drink this, it's good old 'sang tea, it'll make your insides feel good.

He says, I'm going out to look at the stars, bud. Come on out if you feel like it.

D.R. would have taken him up on that if there hadn't been so much work to do. He was helping his dead grandmother with her wash day. And it would be a while before he was free.

His grandmother pulled a pair of overalls out of the churning water and started them by the bib through the black and white rubber wringers. He caught the overalls as they came through, and guided them into the tub of warm rinse water sitting on the bench beside the old machine, flat

Flat and stiff they floated like a dead man till D.R. punched them loose with his stir stick. He punched until their life came back, until they spread out soaking in the water, until the soap was rinsed away and it was time

and it was time to send them through the wringer once again, then hang them on the line outside to dry.

Let me do it.

Let me do it, D.R. said.

Let me

Get away, said his grandmother. You can't even reach the line.

Science & Sanity

Korzybski aims to help you train yourself in new semantic reactions: literally to get your head— and your whole nervous system— together. All too often we think and speak in ways that are structurally false to the events we are trying to describe, analyse, and deal with, ways that are harmful to our ability to function semantically. We use artificial aristotelian divisions such as body vs mind, objective vs. subjective, and ignore half a century's work in physics by operating on Newtonian assumptions.

Korzybski conceives all knowledge in terms of the functional structure of your nervous system, and he explores the consequences of this idea in Physics, Math, Chemistry, Neurology, "Psychology" and Education. Synthesis of this approach with newer ecological studies should provide a real start toward a gestalt understanding of the universe.

With 10^{11} stars in our Galaxy and 10^9 other galaxies, there are at least 10^{20} stars in the universe. Most of them, as we shall see in subsequent chapters, may be accompanied by solar systems. If there are 10^{20} solar systems in the universe, and the universe is 10^{10} years old—and if, further, solar systems have formed roughly uniformly in time—then one solar system is formed every $10^{-10} \text{ yr} = 3 \times 10^{-3}$ seconds. On the average, a million solar systems are formed in the universe each hour.

Almost any other of the many accounts of alleged contacts of human beings with the crews of flying saucers—accounts which regale the flying saucer societies—follow the same pattern and stress the same points. The extraterrestrials are human, with few even minor physical differences from local cosmetic standards. (I know of no case of Negro saucerians, or Oriental saucerians, reported in the United States; but there are very few flying saucer reports made in this country by Negroes or by Orientals.)

Radio astronomers may be interested to know that the so-called "brightness temperature" of the Earth at television wavelengths is some hundreds of millions of degrees. This is 100 times greater than the radio brightness of the sun at comparable wavelengths, during a period of low sunspot activity.

Taken at face value, the legend suggests that contact occurred between human beings and a non-human civilization of immense powers on the shores of the Persian Gulf, perhaps near the site of the ancient Sumerian city of Eridu, and in the fourth millennium B.C. or earlier. There are three different but cross-referenced accounts of the *Apkallu* dating from classical times.

"Well, ladies and gentlemen," Struve concluded, "it was pretty dull on Epsilon Eridani and Tau Ceti eleven years ago."

FIGURE 30-1. A hypothetical interstellar message due to Frank Drake. The 551 zeros and ones are representations of the two varieties of signals contained in the message. The problem is to convert this sequence of 551 symbols into an intelligible message, knowing that there has been no previous communication between the transmitting and receiving civilizations

1. Decode this →
2. Into this →

The existence of more than one universe is impossible, by definition.

3. Now decode this for physiological, astronomical, chemical, mathematical, social, historical and linguistic information.

But how can a natural satellite have such a low density? The material of which it is made must have a certain amount of rigidity, so that cohesive forces will be stronger than the gravitational tidal forces of Mars, which will tend to disrupt the satellite. Such rigidity would ordinarily exclude densities below about 0.1 gm/cm^3 . Thus, only one possibility remains. Could Phobos be indeed rigid, on the outside—but hollow in the inside? A natural satellite cannot be a hollow object. Therefore, we are led to the possibility that Phobos—and possibly Deimos as well—may be artificial satellites of Mars.

So, by an interesting coincidence, the distances between the stars in interstellar space, relative to their diameters, are just about the same as the distances between the atoms and molecules in interstellar space, relative to their diameters. Interstellar space is as empty as a cubical building, 60 miles long, 60 miles wide, and 60 miles high, containing a single grain of sand.

Extraterrestrial Civilizations

A technical discussion by Russian scientists.

We have no doubt whatsoever that life and civilizations exist on a multitude of celestial bodies, but we must go in some detail into the question of possible technological disparity between these civilizations. Although the Earth civilization, in the broad sense of the word, is a few tens of millennia old, the modern technological civilization has its origin no more than two hundred years in the past. It is moreover highly significant for the problem under consideration that the present-day notions on stellar systems, i.e., the conceptual approach which has suggested the multiplicity of inhabited worlds, have arisen and developed during the last two centuries. And yet, the ages of planets may differ by as much as millions of years. Hence the apparent conclusion that different civilizations in the Universe may differ by millions of years in their respective development. It seems that the Earth civilization is not yet past the diapers age, and that there should be enormous disparity between extraterrestrial civilizations.

Charles Fort

SUGGESTION FOR WHOLE EARTH CATALOG

Name of item: The Books of Charles Fort. 4 volumes:
The Book of the Damned; New Lands; Lo!; and Wild Talents.
from: Ace Books, 1120 Avenue of the Americas, New York, N. Y. 10036

Review: Reading Charles Fort (1874-1932) is like getting a foretaste of Buckminster Fuller, so I asked Fuller if he had known Fort. He hadn't, but it turns out he was writing the introduction to Damon Knight's forthcoming biography of Fort. Ace has recently reprinted Fort's works in paperback; they are stacked with the psychic-and-saucer books. But don't overlook Fort. Each of his books is laden with reports of unorthodox, widely recurrent, phenomena—but he uses the material as a tongue-in-cheek, comprehensive philosopher. He throws galactic theories at you like paper airplanes, laughing at himself as often as at dogmatic orthodoxy. Some examples of his style:

Much of the argument in this book will depend upon our acceptance that nothing in our existence is real. The Whole may be Realness.
—*Wild Talents*

Mineral specimens now in museums—calcsites that are piles of petals—or that long ago were the rough notes of a rose.

An early stage within the shell of an egg—and a protoplasmic line of growth feels out through surrounding substance—and of itself it is lost. Nourishment and protection and guidance come to it from the whole.

Or occasional falls of "manna", to this day, in Asia Minor, may be only one factor in a wider continuance. . . .
—*LO!*

Gene Keyes
Carbondale, Ill.

Thought Forms

Well, for once I'm truly sorry our reviews are limited to illustrations in shades of grey. The power of these 58 extraordinary images is mostly in their color, unexpected, unearthly, delicious. The images were seen by the authors as clear representations of human states of mind. Pioneer work.

Three general principles underlie the production of all thought-forms:

1. Quality of thought determines color.
2. Nature of thought determines form.
3. Definiteness of thought determines clearness of outline.

Thought form of high ambition.

Thought form of selfish ambition.

Human Biocomputer

BACK IN PRINT. After a year of absence, this landmark paper is back at a lower price (formerly \$7.95, now \$1.50).

John Lilly has worked for a long time with sensory deprivation, pursuing the notion that relieving the computer (mind) of many of its environmental-survival chores frees it to attend more fully to self-investigation. Of late he's added LSD to the process and has found ways to flourish and discover within this doubly floating condition.

The paper **HUMAN BIOCOMPUTER** is the best internal guidebook I've seen—far more practical and generalized than transcendent Eastern writings or wishful Underground notes. Though it's not the whole story by any means, it makes an open start on fresh language and powerful technique for the frontier.

An additional advantage the paper offers is the opportunity to learn and explore computers without requiring money or administrative approval. You inherited and grew everything you need, and it's free. —SB

[Suggested by Ralph Metzner]

In the analysis of the effects of LSD-25 on the human mind, reasonable hypothesis states that the effect of these substances on the human computer is to introduce "white noise" (in the sense of randomly varying energy containing no signals of itself) in specific systems in the computer

The increase in "white noise" energy allows quick and random access to memory and lowers the threshold to unconscious memories ("expansion of consciousness"). In such noise one can project almost anything at almost any cognitive level in almost any allowable mode.

The noise introduced brings a certain amount of disorder with it, even as white noise in the physical world brings randomness. However, the LSD-25 noise randomizes signals only in a limited way: not enough to destroy all order, only enough to superimpose a small creative "jiggling" on program materials and metaprograms and their signals.

Programming and Metaprogramming in the Human Biocomputer—Theory and Experiments

The boundary of the brain, of course, may be considered as the limits of the extensions of the central nervous system into the periphery.

Later with higher motivational energy the subject returned to the problem of the lock, the doors and the rooms somewhat refreshed by the experiences in the other realms.

In the complete physical absence of other external computers within the critical interlock distance, the self-directed and other-directed programs can be clearly detected, analysed, recomputed, re-programmed, and new metaprograms initiated by the solitudinous computer itself. In the as-completely-as-possible-attenuated-physical-reality environment in solitude, a maximum intensity, a maximum complexity and a maximum speed of re-programming is achievable by the self.

For example, the term 'reprogramming substances' may be appropriate for compounds like lysergic acid diethylamide. For substances like ethyl alcohol the term 'metaprogram-attenuating substances' may be useful.

The major problems of the research of interest to the author center on the erasability, modifiability, and creativity of programs. In other words, I am interested in the processes of finding metaprograms (and methods and substances) which control, change, and create the basic metaprograms of the human computer. It is not known whether one can really erase any program.

I believe that by using certain methods and means some of which are presented in this work that truly talented and dedicated individuals can forge, find, and devise new ways of looking at our minds, ways which are truly scientific, intellectually economical, and inter-actively creative. Consider for example, the case of the fictitious individual created by the group of mathematicians masquerading under the name of "Dr. Nicholas Bourbaki"

This group of mathematicians in order to create a mathematics or sets of mathematics beyond the capacity of any one individual, held meetings three times a year and exchanged ideas, then went off and worked separately. The resulting papers were published under a pseudonym because the products of this work were felt to be a group result beyond any one individual's contribution.

In the maximally attenuated environment (92 to 95 degrees F., isothermal skin, salt water suspension, zero light levels, near-zero sound levels, without clothes, without wall or floor contacts, in solitude in remote isolation, for several hours), the addition of LSD-25 allows one to see that all the previous experiences with "outside screens" are evasions of deeper penetration of self (and hence are "screens" in the sense of "blocking the view behind", as well as "receiving the projected images").

The essential features and the goals sought in the self-analysis is the metaprogram "make the computer general purpose". In this sense we mean that in the general purpose nature of the computer there can be no display, no acting, or no ideal which is forbidden to a consciously willed program. Nor is any display, acting, or ideal made without being consciously programmed.

"Mathematical transformations" were next tried in the approach to the locked rooms. The concept of the key fitting into the lock and the necessity of finding the key was abandoned and the rooms were approached as "topological puzzles." In the multidimensional cognitive and visual space the rooms were now manipulated without the necessity of the key in the lock.

The Mind of the Dolphin

Lilly knows that it is to everybody's advantage for one kind of computer to link up with another, and that's his program with dolphins. This book reports his speculations and experiments with dolphins in recent years. Included is a thorough account by a girl, Margaret Howe, who lived alone with Peter Dolphin for 10 weeks. As usual with research on communication, everything discovered has broad implications. —SB

Sometimes I feel that if man could become more involved in some problems of an alien species, he may become less involved with his own egocentric pursuits, and deadly competition within his species, and become somehow a better being.

We are often asked, "If the dolphins are so intelligent why aren't they ruling the world?" My very considered answer to this is—they may be too wise to try to rule the world. The question can be easily turned around, Why does man or individual men want to rule the world? I feel that it is a very insecure position to want to rule all of the other species and the vast resources of our planet. This means a deep insecurity with the "universes" inside of one's self. One's fears and one's angers are being projected on others outside of one's self; to rule the world is, finally, to rule one's inner realities.

Thus a given dolphin can carry on a whistle conversation with his right side and a clicking conversation with his left side and do the two quite independently with the two halves of his brain.

Conservatively, we estimate that the dolphin can put out ten times the sonic physical information per second that a man produces.

The information does not exist as information until it is within the higher levels of abstraction of each of the minds and computed as such. Up to the point at which it becomes perceived as information, it is signals. These signals travel through the external reality between the two bodies, and travel as signals within the brain substances themselves. Till the complex patterns of traveling neuronal impulses in the brain are computed as information within the cerebral cortex, they are not yet information. Information is the result of a long series of computations based on data signal inputs, data signal transmissions to the brain substance, and recomputations of these data.

By long and hard work I found that the evil label "negative" should not be tied to any mode or any kind of thinking at all.

I found that bodily sources of discomfort, pain, or threat tend to program the mind in the negative mode and keep it there as long as the discomfort continues. As long as pain, even at a very low level, continues, the computer (which is one's mind) tends to program a negative pall.

Once one has been through deep experiences in tune with the vast forces of the universe, the vast forces within ourselves, we see that the need for conflict, the need for hostility, and the need for hatred become less intense. One finds the universe inside and the one outside so vast and so lonely that any other living thing that loves or shows any signs of loving is precious and close.

The human participant's assumptions, i.e., those of Margaret C. Howe, in her own words are as follows:

1. Dolphins are capable of communication with man on the level of high intelligence.
2. Dolphins are not only capable of this communication but are eager for it and are willing to cooperate with man to achieve it.
3. Possibly the best way to go about establishing this communication is to set up a situation where the man (woman) and a dolphin live together as closely as possible for an extended period of time.
4. This is a long process and involves many steps, each of which must be recognized and encouraged. The attempt to communicate with a dolphin in English involves two main parts: (1) the dolphin must learn how to physically say the words, and (2) he must learn the meaning of what he is saying. These two parts may be worked out individually or simultaneously.
5. One first step is the creation and the maintenance of the mutual trust and reciprocal rewards one for the other

She filled the clothesline full, twenty yards of overalls and work shirts, sheets and towels and socks and underwear, a few dresses of her own, his own small clothes sprinkled in between. They hung there all afternoon, flapping in the wind like ghosts of an entire family.

Emmit coughed into the curtain of the dream. D.R. heard him in the kitchen, building a fire in the coal stove.

He could tell by the way Emmit handled the stove lids he was being as quiet as he could to keep from disturbing him. But it was morning now and D.R. was awake before Emmit was. It was too dark yet to see but he heard him putting his clothes on across the room. He heard the spring on the screen door whine when he went outside to pee. Then he heard him in the kitchen building a fire and putting water on to boil, and D.R. lay there watching the room take shape as the dark gave way to the growth of light in the window.

Here he comes.

Eye and Brain

I can't think of another book as well-made as this one. It is well designed, illustrated, and diagrammed. The writing is excellent, the subject matter important and new. The book is inexpensive. Altogether Eye and Brain lets you see how crappy most books are.

Stratton went on to perform other experiments which though less well-known are just as interesting. He devised a mirror arrangement which, mounted in a harness, visually displaced his own body, so that it appeared horizontally in front of him, and at the height of his own eyes. Stratton wore this mirror arrangement for three days (about twenty-four hours of vision) and he reported:

"I had the feeling that I was mentally outside my own body. It was, of course, but a passing impression, but it came several times and was vivid while it lasted. . . . But the moment critical interest arose, the simplicity of the state was gone, and my visible actions were accompanied by a kind of wraith of themselves in the older visual terms.

Why should the perceptual system be as active in seeking alternative solutions as we see it to be in ambiguous situations? Indeed it seems more active, and more intellectually honest in refusing to stick with one of many possible solutions, then in the cerebral cortex as a whole if we may judge by the tenacity of irrational belief in politics or religion. The perceptual system has been of biological significance for far longer than the calculating intellect. The regions of the cerebral cortex concerned with thought are comparatively juvenile. They are self-opinionated by comparison with the ancient striate area responsible for vision.

-SB

A fit, even the grossest major convulsive fit of epilepsy, is many things happening at once. Fits are patterns of awareness and action, combinations of knowing, feeling, and doing. They are episodes of behavior and experience put together by the brain during crises in the continuity of living. Such crises are characterized by a sudden coming together of a complex of conflicting and disparate ideas, images, and impulses; fits are syntheses of such complexes that both resolve and represent their otherwise unthinkable contradictions and ambiguities. By providing more or less fitting resolutions of crises, fits serve to maintain or restore the crisis-disrupted continuity of transactions between organism and environment.

184 *The Concepts of Dysjunctive Situations*

314 Sense Communications

An elaboration of the television technique makes it possible to displace retinal images not only in space, but in time. Temporal delay of images is a new kind of displacement, and promises to be of the greatest importance. The method is to use a TV camera and monitor, with an endless tape loop so that there is a time-delay between the recording from the camera and the playback to the monitor. The subject thus sees his hands (or any other object) in the past; the delay being set by the gap between the Record and Play-back heads.

This situation is not only of theoretical interest, but is also of practical importance because controls used in flying aircraft, and operating many kinds of machine, have a delay in their action: if such delay upsets the skill, this could be a serious matter. It was found that a short delay (about 0.5 seconds) made movements jerky and ill co-ordinated, so that drawing became almost impossible, and writing quite difficult. Practice gives little or no improvement.

Held found that only the active kitten developed perception, the passive animal remaining effectively blind. He thus suggested that active touch is essential to perceptual development.

The Intelligent Eye

R. L. Gregory continues, this time with a book rich in visual illusions which suck the reader (viewer) into many a flickering illuminating trap. The thesis is that visual imagery is made intelligible by the eye itself. 3-D glass included with the book.

2. This is seen sometimes as a face, sometimes as something else. Perception fluctuates between two clearly defined possibilities. This is an example of visual 'reversal', by the Danish psychologist, Edgar Rubin.

Retinal images are patterns in the eye— patterns made up of light and dark shapes and areas of colour— but we do not see patterns, we see objects. We read from pictures in the eye the presence of external objects: how this is achieved is the problem of perception. Objects appear separate, distinct; and yet as pictures on the retina they may have no clear boundaries. In this photograph of a spotted dog, most half-tones have been lost (as in vision by moonlight) and yet we can distinguish the spots making up the dog from similar spots of the background. To make this possible there must be stored information in the brain, of dogs and thousands of other objects.

Brain Storms

Dr. Barker presents a fascinating argument that epileptic fits and fits of creativity are very closely related and both are brought on by unusual threats to continuity in brain function, requiring a massive "storm" of re-organization in the brain. The fit is an attempt to in fact fit together incompatible considerations which have collided. I believe it, in part because Barker makes his case so well, in part because it sounds like what I've experienced.

-SB

A fit, even the grossest major convulsive fit of epilepsy, is many things happening at once. Fits are patterns of awareness and action, combinations of knowing, feeling, and doing. What we need is to let the fitting-together capacity of the human brain operate at least occasionally in freedom from the narrow, provincial, egoistic concerns of "I" and "Us." The essence of our contemporary crisis is simple: Most people in the world want to have modestly human food, shelter, and an opportunity to care decently for their children. The technological and material means for satisfaction of these wants exist. Not much of a "dream" is required to get it done. No longer will any conventional evasion or caricatured "solution" suffice. The only possible outcomes now are convulsive or creative. It all depends upon our commitment.

... if we can endure confrontation with the unthinkable, we may be able to fit together new patterns of awareness and action. We might, that is, have a fit of insight, inspiration, invention, or creation. The propensity for finding the answer—the lure of creating or discovering the new—no doubt has much to do with some people's ability to endure tension until something new emerges from the contradictory and ambiguous situation.

Pleasure is not in the skin being caressed or in a full stomach, but somewhere inside the cranial vault.

Watching a rat or monkey stimulate its own brain is a fascinating spectacle. Usually each lever pressing triggers a brief 0.5- to 1.0-second brain stimulation which can be more rewarding than food. In a choice situation, hungry rats ran faster to reach the self-stimulation lever than to obtain pellets, and they persistently pressed this lever, ignoring food within easy reach. Rats have removed obstacles, run mazes, and even crossed electrified floors to reach the lever that provided cerebral stimulation.

The brontosaurus became extinct because of their extremely limited mental powers; faced with an increasingly unfavorable climate and diminishing food supply, these animals were incapable of adaptation and could not survive in the changing environment.

The fate of these giants may have symbolic value for twentieth century civilization, which is also attempting to direct tremendous potential with disproportionately small brains. While our mental faculties are incomparably superior to those of the early land animals, we still lack adequate self-knowledge and control, and natural history teaches that when underdeveloped brains are in charge of great power, the result is extinction.

In my opinion, without stimuli (or without the brain), the mind cannot exist; without behavior, the mind cannot be recognized. Because of its essential dependence on sensory inputs, both at birth and throughout adult life, the mind may be defined as the intracerebral elaboration of extracerebral information. The problem is then focused on the origins, reception, dynamics, storage, retrieval, and consequences of this information. The basis of the mind is cultural, not individual.

The newborn brain is not capable of speech, symbolic understanding, or of directing skillful mobility. It has no ideas, words, or concepts, no tools for communication, no significant sensory experience, no culture. The newborn baby never smiles. He is unable to comprehend the loving phrases of his mother or to be aware of the environment. We must conclude that there are no detectable signs of mental activity at birth and that human beings are born without minds.

... the microneurons of the cerebellum, which serve as association elements, develop after birth under the influence of the infant's behavioral activities. Therefore it can be said that the environment is absorbed as a structural part of the neurons in the developing brain.

When the patient was warned of the oncoming stimulation and was asked to try to keep his fingers extended, he could not prevent the evoked movement and commented, "I guess, Doctor, that your electricity is stronger than my will."

(1) Lack of predictability: When a point of the brain is stimulated for the first time, we cannot predict the effects which may be evoked. . . .

(2) Lack of purpose: In some cases the evoked response is directed by the animal in a purposeful way, but the movements and sequential responses are usually out of context, and there is no reason or purpose for yawning, flexing a hand, or walking around, apart from ES. . . . [Electrical Stimulation of the Brain]

(3) No robot performance: Brain stimulation activates cerebral mechanisms which are organized for motor performance, but it cannot replace them. With the present state of the art, it is very unlikely that we could electrically direct an animal to carry out predetermined activities such as opening a gate or performing an instrumental response. We can induce pleasure or punishment and therefore the motivation to press a lever, but we cannot control the sequence of movements necessary for this act in the absence of the animal's own desire to do so.

One of the moving pictures taken in this study was very demonstrative, showing a patient with a sad expression and slightly depressed mood who smiled when a brief stimulation was applied to the rostral part of the brain, returning quickly to his usual depressed state, to smile again as soon as stimulation was reapplied. Then a ten-second stimulation completely changed his behavior and facial expression into a lasting pleasant and happy mood. Some mental patients have been provided with portable stimulators which they have used in self-treatment of depressive states with apparent clinical success.

The Machinery of the Brain

Some is known about the brain, but not much. Woolridge's book is the best intro to the subject we've seen. For richer detail, get Pribram's two-volume **Brain and Behavior** (each volume \$2.95 from Penguin, 7110 Ambassador Rd., Baltimore, Md. 21207).

If monotonously repetitive stimuli are provided, such as a regular series of clicks or staccato tones, the nonspecific-brain-potential measurements will display the property of *habituation*: the pulse of brain potential induced by each audible stimulus will, with continuing repetition, gradually diminish and ultimately disappear. If we consider these nonspecific brain potentials as being somehow related to the degree of attention the subject is paying to the stimulus, their gradual decline correlates nicely with subjective experience: noises that initially interfere with concentration or keep us awake may ultimately recede into the background of our consciousness and lose their effectiveness if they are monotonous and repetitive in character. Such habituation must be regarded as another basic form of learning. It is in effect a kind of negative learning, perhaps antonymous to the essentially positive learning of conditioned responses. Habituation is found throughout the animal scale, from protozoa to man. The indication is that, as in the case of learning by conditioning, habituation derives from some fundamental property of nerve tissue and does not necessarily require special complex neuronal circuits.

Experiments have been reported with a six-month-old baby to determine how many trials would be necessary to condition it against reaching out to touch the flame of a lighted candle. (The experiment of course was so arranged as to block the child's hand each time before injury was sustained.) The number of trials required was the same as for training the earthworm, approximately 150!

The optical mapping system of the human brain is of special interest and importance. Through the more than one million fibers of the optic nerve of each eye, the pattern of light and dark formed by the lens on the retina is transmitted to a specific set of neurons in the *occipital lobes* of the cortex. Although the picture that is produced by the pattern of voltages reaching these positions at the extreme back of the head is a highly distorted one, topological continuity is preserved, in the sense that adjacent points in the retina are represented by adjacent positions on the cortex. The application of an electric stimulus to any of these cortical points causes the subject to see flashes of light at the corresponding point of his field of view. Similarly, the illumination of the retina by a single bright spot of light results in the arrival of the usual train of voltage pulses at the corresponding spot of the visual cortex.

If subsequent work confirms the preliminary indications that pleasure and pain centers occur together, it will be interesting to learn what kind of pleasure is the negative of what kind of pain, in electrical neuronal terms.

A Model of the Brain

Inside every brain there is a model of the world. How does all the elaborate wiring help us, or any other creature, make our model of the world? A noted British anatomist, J. Z. (Jay Zed) Young has spent many pleasant summers in Naples studying the behavior of octopuses, and has also done a great deal of work on the anatomy of their nervous system. The result is a fascinating picture of how to teach octopuses to do things, and some interesting—though not yet very deep—speculation on how cybernetics might help us to relate brain structure to external behavior. Especially interesting are the many hypotheses about the building of networks which can learn. At this early stage all such models are wrong, but we learn from our mistakes. One approach to all this is mental introspection. Here, on the other hand, we learn what we can learn about learning by *literally* introspecting: looking inside the head of an octopus to see what networks there could possibly change as the animal learns.

FIG. 107. Signal flow diagram of experimental automatic pattern-recognition apparatus.
The inputs to the nine detail filter terminals are amplified by photoelectric multipliers arranged in a 3x3 matrix. Patterns are coded automatically by combining outputs of the detail filter to form position controls. The filtered inputs are then connected to eight 'A2 units', one of these will show a maximum amplitude for each pattern (Fig. 108) and this is selected by the first maximum amplitude filter. The outputs of these supply eight pulse generators and these in turn sixteen capacitor storage units.
During the teaching process the switches S1 and S2 are closed manually or by means of some artificial external classification system. After learning the switches are closed by electromagnets supplied by the outputs of maximum amplitude filter 2. In both cases the closed switch applied the voltage V to one of the output terminals O1 or O2. The same voltage is also connected to an input of the information-storage unit. (After Taylor, 1959.)

Emmit walks

stoop-shouldered, bent and drawn

Through the curtain Emmitt walks, carrying a steaming cup in his hand. He stops at the window to look out and to scratch himself deep down in his pants somewhere, way down along his thigh needs scratching and Emmitt gives it a good one before he goes on over to sit down on the bed and sip from his hot cup.

The amazing

The amazing thing is Emmitt's beard. The whole shaggy mass of hair, all over his head. It falls across his forehead and down across his ears, sticking out in little tufts. His beard starts at his ears and covers his entire face except for his eyes and nose and cheekbones, a great thick Santa beard that hangs down like a waterfall across his mouth.

Design for a Brain

This is a reputation review. Ashby's book is found prominent in the bibliography and footnotes of every text we've seen on computers and the mind. It's technical going to read but worth it for the insights of prime work.

This is the learning mechanism. Its peculiarity is that the gene-pattern delegates part of its control over the organism to the environment. Thus, it does not specify in detail how a kitten shall catch a mouse, but provides a learning mechanism and a tendency to play, so that it is the mouse which teaches the kitten the finer points of how to catch mice.

The development of life on earth must thus not be seen as something remarkable. On the contrary, it was inevitable. It was inevitable in the sense that if a system as large as the surface of the earth, basically polystable, is kept gently simmering dynamically for five thousand million years, then nothing short of a miracle could keep the system away from those states in which the variables are aggregated into intensely self-preserving forms.

Finding an optimum is a much more complex operation than finding a value that is acceptable (according to a given criterion). Thus, suppose a man comes to a foreign market containing a hundred kinds of fruit that are quite new to him. To find the optimum for his palate he must (1) taste all the hundred, (2) make at least ninety-nine comparisons, and (3) remember the results so that he can finally go back to the optimal form. On the other hand, to find a fruit that is acceptable he need merely try them in succession or at random (taking no trouble to remember the past), stopping only at the first that passes the test. To demand the optimum, then, may be excessive; all that is required in biological systems is that the organism finds a state or a value between given limits.

Remarks on Ashby

RE: Chis Smith's letter, January Supplement p. 42

I must rally to the defense of a valuable information source: W. Ross Ashby. *Design for a Brain* may not satisfy those who seek physiological correlates of behavior but it is an excellent formulation of a very general adaptive system. It could also be called *Design for an Ecosystem*. I highly recommend, not only that you retain the listing, but that you add Ashby's *Introduction to Cybernetics*.

Ashby understands general systems & cybernetics and does a great job in careful explanation. *Intro. to Cybernetics* reviews all the math you need to understand the heavies like Shannon & Weaver.

General system theory is the new paradigm for understand ourselves scientifically. It will eventually provide for the synthesis of science and magical systems like astrology and the I Ching. Its very important to have a clear understanding of the basics, and Ashby is an excellent place to start.

An *Introduction to Cybernetics* by W. Ross Ashby. \$5.75 trade edition, or \$3.95 paper text edition. From Barnes & Noble, Inc., 105 Fifth Avenue, NY, NY 10003.

Brains, Machines and Mathematics

Take the theoretical-neuron work of McCulloch & Pitts, the Perceptron, von Neumann and Shannon's communication theory, Gödel's incompleteness theorem, and Wiener's cybernetics. Blend, and see how far along we are toward a "biological mathematics". The answer is not far; this is a tidy survey of how far we aren't.

Embodiments of Mind

I'm not competent to review this book. I can recognize McCulloch's wisdom and humor. I can report his high standing as an Old One in the field of brain research. I can assert I've revelled in some of his insights. But I can't tell you how far he takes us toward full accountability in how nerve nets yield mind, except that he makes the question appear answerable and worth answering.

Modern evidence indicates that all our acquired ideas, or learned generalizations and specifications are carried on for nearly half an hour by regenerative activity, of which there is beginning to be some electrical evidence. If this activity is interrupted during that time, no memory remains. From the evidence to date it seems that if the process had not been interrupted, and if one looks at the appropriate neurons half an hour later, one finds that there is a great rise in ribonucleic acid, and protein synthesis is under way. So, while we do not yet know how or where this building material will be distributed, we may see nature using the same trick as in the immune reactions.

In these pages we coerce what is essentially still the mathematics of the physicist to help our slowly dawning comprehension of the brain and its electromechanical analogs. It is probable that the dim beginnings of biological mathematics here discernible will one day happily bloom into new and exciting systems of pure mathematics.

Reinforcement rules: There seems a great deal of evidence that humans have two kinds of memories—"short-term" and "long-term." It further appears that we have to retain an idea for quite a while in short-term memory before it is transferred into long-term memory. The time taken for this transfer has been variously estimated—one estimate is 20 minutes. It appears that if someone goes into coma, his memories of the 20 minutes or so prior to this are lost forever, i.e., they were not transferred to his long-term memory. It is now commonly believed that short-term memory is precisely that type of memory we gave our modular net—the passage of complicated patterns of electrical impulses through the net. It appears, then, that if such transient activity persists long enough it actually changes the net.

The Perceptron group has had three main modes of investigation: mathematical analysis, simulation on a digital computer, and construction of an actual machine. Each method has its own advantages. One important result of using an actual machine is that it has been found that neither precision nor reliability of the components is important, and the connections need not be precise.

Another interesting result is that the perceptron can "learn" despite trainer error.

Morgan's Tarot

Just as we were glad to see a guy invent a new language (aU)—see Fall 69 CATALOG, we are delighted by this thoroughly practical tarot deck based on traditions dating back nearly eight years. Two years from now it will be unusable. Twenty years from now it will be as venerable as the medieval Tarot, if anybody notices. The main limitation I see with tarot cards, astrology, any language, is that the systems close on themselves. They offer no exit, except finally an attenuated exhaustion, frustration, possible cause to bust out. Some systems are more open, more immediately and fractionally self-frustrating—science; evolution; human life... and the market, where these cards are for sale.

An Introduction to Cybernetics

We are migrating from a world governed primarily by the laws of thermodynamics to a world governed primarily by cybernetics—a weightless world (Fuller says “metaphysical”) whose events are the impinging of information on information, whose basis is survival and direction is growth. Thought, society, economics, media, evolution

The two main entries to understanding in this realm are Norbert Wiener (see pp. 16 & 307) and Ashby. Wiener’s books are wider, more inspiring. Ashby is more thorough.

Thus there exist factors, such as “height of threshold” or “proportion of variables constant”, which can vary a large system continuously along the whole range that has at one end the totally-joined form, in which every variable has an immediate effect on every other variable, and at the other end the totally-unjoined form, in which every variable is independent of every other. Systems can thus show more or less of “wholeness”.

This earth contained carbon and other necessary elements, and it is a fact that many combinations of carbon, nitrogen, and a few others are self-reproducing. It follows that though the state of “being lifeless” is almost a state of equilibrium, yet this equilibrium is unstable, a single deviation from it being sufficient to start a trajectory that deviates more and more from the “lifeless” state. What we see today in the biological world are these “autocatalytic” processes showing all the peculiarities that have been imposed on them by two thousand million years of elimination of those forms that cannot survive.

The organisms we see today are deeply marked by the selective action of two thousand million years’ attrition. Any form in any way defective in its power of survival has been eliminated; and today the features of almost every form bear the marks of being adapted to ensure survival rather than any other possible outcome. Eyes, roots, cilia, shells and claws are so fashioned as to maximise the chance of survival. And when we study the brain we are again studying a means to survival.

One way of blocking the flow (from the source of disturbance D to the essential variable E) is to interpose something that acts as a simple passive block to the disturbances. Such is the tortoise’s shell, which reduces a variety of impacts, blows, bites, etc. to a negligible disturbance of the sensitive tissues within. In the same class are the tree’s bark, the seal’s coat of blubber, and the human skull.

At the other extreme from this static defence is the defence by skilled counter-action—the defence that gets information about the disturbance to come, prepares for its arrival, and then meets the disturbance, which may be complex and mobile, with a defence that is equally complex and mobile. This is the defence of the fencer, in some deadly duel, who wears no armour and who trusts to his skill in parrying. This is the defence used mostly by the higher organisms, who have developed a nervous system precisely for the carrying out of this method.

What is an amplifier? An amplifier, in general, is a device that, if given a little of something, will emit a lot of it. A sound-amplifier, if given a little sound (into a microphone) will emit a lot of sound. And a money-amplifier would be a device that, if given a little money, would emit a lot.

Such devices work by having available a generous reservoir of what is to be emitted, and then using the input to act as controller to the flow from the reservoir.

Information

The September 1966 issue of Scientific American was devoted entirely to the new technology of information. Now available as a paperback book, it is the best introduction we’ve seen to computer science. Articles include: “Computer Logic and Memory”, “Computer Inputs and Outputs”, “Systems Analysis and Programming”, “Time-sharing on Computers”, “The Transmission of Computer Data”, “The Uses of Computers in Technology”, “The Uses of Computers in Organizations”, “The Uses of Computers in Education”, “Information Storage and Retrieval”, and “Artificial Intelligence”.

The computer is almost exactly what man is not. It is capable of paying undivided attention to unlimited detail; it is immune to distraction, precise and reliable; it can carry out the most intricate and lengthy calculation with ease, without a flaw and in much less than a millionth of the time that would be required by its human counterpart. It is emotionless, or so we suppose. It suffers neither boredom nor fatigue. It needs to be told only once; thereafter it remembers perfectly until it is told to forget, whereupon it forgets instantly and absolutely.

Simulated waterfall spills over the edge of a cliff and splashes into a pool in this computer experiment performed by John P. Shannon at the Los Alamos Scientific Laboratory as part of a study of dynamic behavior of fluids with the aid of numerical models.

Critical Path Method

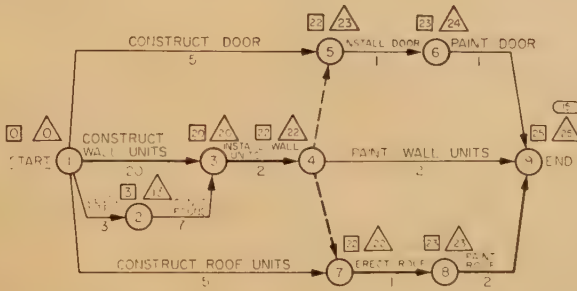

Most construction I’ve been around was under conditions of “The rains are due next week” or “If we don’t get the dome covered by the first snow, we’ve blown it for the winter.” Time pressure. At the miraculously complete and on-time Expo 67 in Montreal the magic ingredient was CPM—Critical Path Method. It’s the analysis of what must be done in sequence (foundation, then floor) and what can be done concurrently (while the foundation is being dug in, the girls can cut the roof panels). The maximum necessary sequence is your minimum construction time, and is the critical path. Any delays on it slow down the whole operation. A clear CPM map, using now-standard symbols, can vastly simplify coordination. The technique is useful for any group operation that’s time-bound. This book is the briefest clearest on CPM.

In the above example, the required time for completing the project is 25 days and the project end-event time is calculated as “day 25”. Assume that the owner is anxious to complete the garage before a new car is delivered on “day 15”, it will thus be necessary to reduce the critical path by 10 days if this scheduled date is to be achieved. In this case it may be a simple matter of doubling the labour on activity 1-3 “Construct wall units” in the hope of reducing the duration by 10 days.

For example of CPM in use, see p. 300.

Systems Thinking

Well, this should be in “Understanding Whole Systems”. It’s an excellent introduction to systems theory. It’s here so you can connect it up with cybernetics and your own bodily and social open-system functioning. In the light of systems thinking statements like “He not busy being born is busy dying” have precise truth.

In physics, the theory of open systems leads to fundamentally new principles. It is indeed the more general theory, the restriction of kinetics and thermodynamics to closed systems concerning only a rather special case. In biology, it first of all accounts for many characteristics of living systems that have appeared to be in contradiction to the laws of physics, and have been considered hitherto as vitalistic features. Second, the consideration of organisms as open systems yields quantitative laws of important biological phenomena.

It is events rather than things which are structured, so that social structure is a dynamic rather than a static concept. Activities are structured so that they comprise a unity in their completion or closure. A simple linear stimulus-response exchange between two people would not constitute social structure. To create structure, the responses of A would have to elicit B’s reactions in such a manner that the responses of the latter would stimulate A to further responses.

But the rim of his cup finds his mouth in there somewhere and he drinks.

And then he wipes his mouth and drinks again.

“I’m awake.”

Emmit raises

Emmit lifts his head, like a bird alerted.

He raises his bearded head and looks at his nephew in the big bed across the room.

He looks. For a long time he looks, and doesn’t speak.

But then he lifts his cup in a neat salute and says you had a right smart of sleep, old bud. How long

How long have I been sleeping? D.R. asks.

About a day.

Then silence. Do I remember coming here?

Mathematics

As far as we're concerned, these are the pick of self-education math books. From them you can learn delight as well as method in the universal language.

Mathematical Snapshots operates by visibility. What's going on mathematically is plain as day in the diagrams and illustrations. It's like learning history by anecdotes.

Mathematical Models is a classic of 4-D technique. The whole purpose of the book is enabling you to make your own geometric forms in the world. Like learning history by psychodrama.

[Suggested by Sim Van Der Ryn]

The World of Mathematics IS history and anecdotes, an infectious multi-faceted telling of math stories—pure, applied, ancient, recent: a fine and complete collection. Math seen from outside.

Mathematics: Its Content, Methods, and Meaning. Math from inside. A Russian-compiled technical run-down of everything of concern in mathematics today.

The Graphic Work of M. C. Escher is geometry set at its own throat via the images of dreams. The subjective frontier.

The New Mathematics Dictionary and Handbook is the handiest of handy reference books.

30 20 12 120 180

POLYHEDRA

3.9.4. Great stellated triacontahedron. $V(3 \frac{1}{2})^2$

FIG. 153

The exterior perimeter of a net of a polyhedron which is all in one piece becomes a 'tree' of edges on the solid. This tree may be branched, but every edge is double and occurs twice on the perimeter of the net. It is evident that if these edges are numbered consecutively round the net every even edge will be joined to an odd edge in the final solid. This means that tabs need only be attached to the even edges. In the nets which follow, tabs are not shown unless there is special need to do so. In all other cases the rule is: attach tabs to alternate edges round the net.

There is an exception in the case of the last face, which is best left free of tabs. The missing tabs must be added to the other edges, and are best made large, so that a platform can be built up to which the last face can be stuck.

Obviously, for any model which is to be at all permanent, cardboard will be used.

The card should be white with a good surface, and fairly thin, about the thickness of a plain postcard. Thick cardboard makes ugly corners, and allowance ought to be made for its thickness in drawing the net. It is useful, however, to cut flat sheets of thick card for internal strengthening in some of the stellated and interpenetrating polyhedra.

FIG. 137

When the dimensions of the model have been decided on, the net can be constructed on the cardboard. In the case of a complicated net this is facilitated by pricking through vertices from a template drawn on tracing paper, but it must be done very accurately. Tabs are then added to alternate outside edges, care being taken to ensure that the angle at the shoulder of the tab is small enough to admit of the tab's being cemented to its appropriate face. The net can now be cut out with a razor-blade and the edges scored half-through for bending. (Where edges have to be scored on the back—in the stellated polyhedra—this is indicated in the diagrams.) The face of the net becomes the outside of the polyhedron.

For joining, a quick-drying cement, such as balsa-wood cement as used for model aircraft, is essential. After the cement has been applied to a tab, the edges to be joined are brought together, and the tab can be held down with a small wire paper-fastener while the cement dries. This is particularly useful in small models when the fingers cannot easily get inside, and near the finish of any model when there are several edges to be joined at once. A thin wire probe is sometimes useful in getting the last face to adhere.

2.5. Curve-Stitching

One very old method of expression work in mathematics, and one which affords a welcome change from "the tyranny of pencil and paper", is that of curve-stitching. It seems to have originated in a book by Mrs. E. L. Somervell, entitled *A Rhythmic Approach to Mathematics* and published in 1906. The idea has recently been revived, both in America and in this country. Basically it consists of constructing straight-line envelopes by stitching with coloured threads through a pattern of holes pricked in cardboard.

The patterns we observe on the shore of a river when the mud has been dried up by the sun (98) seem to be quite irregular; nevertheless as a rule they show right angles. This can be explained by assuming the cracking to be an effect of contraction; the line appearing as a fissure has, by a principle of mechanics, to make the work of disjunction as small as possible. The work is proportional to the areas of the sections and the lines must have a course such as to minimize the surfaces laid open by the fissure. This procedure gives right angles if the clay is homogeneous; the varying thickness of the layer accounts for the curvature of the lines. This remark supplies in many cases a means of deciding which line appeared earlier and which later: the older of the two splits passes right through the point of junction. Thus we can follow the genealogy of splits and eventually find the ancestors of the whole system.

Suppose the pattern was composed initially of two regions, A, and B. A new line appears, joining two points of two already existing arcs and giving rise to a new region C (100); since the new line breaks up two arcs into two parts each, the number of arcs increases by three. After *n* steps we have *n* more regions and 3*n* more arcs. Since there were initially two regions and three arcs, we now have *n*+2 regions and 3*n*+3 arcs.

III. There exists neither a point nor a line in the plane that is carried into itself under all the transformations of the group. Groups of this type are called **plane Fedorov groups**. They are the symmetry groups of infinite plane ornaments. There are altogether 17 of them: five consist of motions of the first kind only, and twelve of motions of the first and second kind.

In Table 3 we have given examples of ornaments corresponding to each of the seventeen plane Fedorov groups; every group consists of precisely those motions that carry an arbitrary flag drawn in the diagram into any other flag of the same diagram.

It is interesting to note that the masters of the art of ornamentation have in practice discovered ornaments with all possible symmetry groups; it fell to the theory of groups to prove that other forms do not exist.

Crystallographic groups. In 1890 the eminent Russian crystallographer and geometer E.S. Fedorov solved by group-theoretical methods one of the fundamental problems of crystallography: to classify the regular systems of points in space. This was the first example of a direct application of the theory of groups to the solution of an important problem in natural science and made a substantial impact on the development of the theory of groups.

57. DOUBLE PLANETOID, wood-engraving, printed from 4 blocks, 1949, diameter 37.5 cm

Two regular tetrahedrons, piercing each other, float through space as a planetoid. The light-coloured one is inhabited by human beings who have completely transformed their region into a complex of houses, bridges and roads. The darker tetrahedron has remained in its natural state, with rocks, on which plants and prehistoric animals live. The two bodies fit together to make a whole but they have no knowledge of each other.

...AS our mental eye penetrates into smaller and smaller distances and shorter and shorter times, we find nature behaving so entirely differently from what we observe in visible and palpable bodies of our surrounding that no model shaped after our large-scale experiences can ever be 'true'. A completely satisfactory model of this type is not only practically inaccessible, but not even thinkable. Or, to be precise, we can, of course, think it, but however we think it, it is wrong: not perhaps quite as meaningless as a 'triangular circle,' but much more so than a 'winged lion.'

Here (Figure 45) is a page from Haeckel's *Challenger Monograph* showing the skeletons of several Radiolarians. Numbers 2,3, and 5 are octahedron, icosahedron, and dodecahedron in astonishingly regular form; 4 seems to have a lower symmetry.

1 This Book has 597 Pages
2 The Author of this Book is Confucius
3 The Statements Numbered 2 and 3 are all False

FIGURE 10—Which points of the plane are inside this polygon?

Problem 36 of the papyrus begins: "Go down 1 times 3, 1/3 of me, 1/5 of me is added to me; return 1, filled am I. What is the quantity saying it?"

SET INTERSECTION
The shaded area represents that set of all elements that are both elements of *A* and elements of *B*.
Example: If *A* is the set of all students who take chemistry, and *B* is the set of all students taking physics, the shaded area is the set of all students taking both chemistry and physics.

UNION OF SETS
The shaded area in the second diagram represents the set of all elements that are in *A*, or in *B*, or in both *A* and *B*.
Example: If *A* is the set of all men who own boats, and if *B* is the set of all fishermen, the shaded area indicates the set of all men who are boatowners or fishermen, or who are boat-owning fishermen.

VENN DIAGRAMS. Diagrams using overlapping circles to show relationships between sets; developed by John Venn (1834-1923), English logician. Each circle represents one set. Two or more may be overlapped. The areas of overlap (lens-shaped areas) indicate subsets which may contain elements common to both or all of the indicated sets. Some authors shade or cross-hatch the areas that contain members of a set; other authors use shading or cross-hatching to indicate emptiness. In the diagram below, shading indicates content.

Number Words and Number Symbols

There's lots of ways to invent things—two big ones that this CATALOG promotes both involve the return to rudiments, but in different ways. Invention-By-Usefulness is People's invention—a flock of people go live a different way: the new methods that arise to aid their different living are their inventions (subject to no prices, patents, marketability, or even notice usually). Invention-by-Inventor, on the other hand, involves a double perception by an individual—he perceives a potential usefulness for something, and he perceives the roots of a set of tools that may be adapted or combined to perform the new usefulness.

"Academic" study, of little use to the flock of pioneers, is essential to the inventor, especially the study of the origins of crafts he's working in. Take numbers. Suppose you want to help human communication to re-understand itself. So much of that understanding is wrapped up in numbers that if you penetrate the one you may have a foothold to tweak the other onto a new course. Invent language and you invent man.

This book penetrates numbers.

Fig. 222 Chinese fork coin, with the number 34 written in abstract place-value notation. Ca. A.D. 20.

In the seaports and market places of the Red Sea, Arabia, and East Africa, merchants have evolved a finger language that is understood in every market of every country in the region. Buyers and sellers come to terms underneath a cloth, a fold of garment or a strip of muslin from a turban, by touching the fingers of each other's hand and thus bargaining in complete privacy.

Indecks Information Retrieval System

What do you have a lot of? Students, subscribers, notes, books, records, clients, projects? Once you're past 50 or 100 of whatever, it's tough to keep track, time to externalize your store and retrieve system. One handy method this side of a high-rent computer is Indecks. It's funky and functional: cards with a lot of holes in the edges, a long blunt needle, and a notcher. Run the needle through a hole in a bunch of cards, lift, and the cards notched in that hole don't rise; they fall out. So you don't have to keep the cards in order. You can sort them by feature, number, alphabetically or whatever: just poke, fan, lift and catch. Indecks is cheaper than the McBee system we used to list.

We've used the McBee cards to manipulate (edit) and keep track of the 3000 or so items in this CATALOG. They've meant the difference between partial and complete insanity.

320 Organization
Communications

When Buddha reached the age of manhood he courted Gopa, the daughter of the Prince Dandapani. But he would be rejected unless he could show public proof of his abilities. And so, together with five other suitors, he was put through trials in writing, wrestling, archery, running, swimming, and number skills. In all these contests he brilliantly defeated his rivals. After the competition, Gopa's father commanded him to pit himself against the great mathematician Arjuna, who was to be the measure of Buddha's knowledge. Arjuna instructed him to list all the numbers (that is, the numerical ranks) above 100 kotis. Koti was the name of the seventh rank, meaning 10^7 or 10 millions. Beyond sahara (10^3), Indians at an early date had ayuta (10^4), niuta, also called lakṣa (10^5), and prayuta (10^6 = a million).

Buddha answered:

koti (10^7 , abbreviated 7)	hetuhila (31)
ayuta = 100 kotis (9)	karahu (33)
niyuta (11)	Hetvindhriya (35)
kangkara (13)	samaptalambha (37)
vivara (15)	ganaganagati (39)
akṣobhya (17)	niravadya (41)
vivaha (19)	mudrabala (43)
utsanga (21)	sarvabala (45)
bahula (23)	visandjagati (47)
nagabala (25)	sarvasandjina (49)
titilambha (27)	vibhutangama (51)
vyavasthanapradjnapti (29)	tallakṣana (53).

Fig. 242 Albrecht Dürer's year dates. In writing the dates of the years around 1495, Dürer illustrated the development of the 4 into its present form. From three of his drawings dated in successive years.

Fig. 90 Miller's knots used to indicate amounts and kinds of flour.

1 2 3 4 5 6 7 8 9 and 0 — these ten symbols which today all peoples use to record numbers, symbolize the world-wide victory of an idea. There are few things on earth that are universal, and the universal customs which man has successfully established are fewer still. But this is one boast he can make: The new Indian numerals are indeed universal.

Sorting allows you to retrieve the information that has been Recorded, Coded, and Notched (Steps 1, 2 & 3).

THE CARDS YOU WANT HAVE BEEN RETRIEVED

Align the Deck at the clipped corners...

Pass the Sorting Rod through the hole with the number which matches the listed code number of the category you wish to retrieve...

Shake gently...and all cards notched at this hole will drop.

A honeycomb is said to be quasi-regular if its cells are regular while its vertex figures are quasi-regular. This definition (cf. #2-3) implies that the vertex figures are all alike, and that the cells are of two kinds, arranged alternately. To find what varieties are possible, we have the same two alternative methods as in #4-6. Either we seek (as cells) two different regular polyhedra whose respective dihedral angles have a submultiple of 2π for their sum; these can only be a tetrahedron and an octahedron, where the sum is π . Or we look at the possible vertex figures, admitting the cuboctahedron, whose edge is equal to its circum-radius, and discarding the icosidodecahedron (for which the ratio of edge to circum-radius is $2 \sin \pi/h = 2 \sin \pi/10 = 2 \cos 2\pi/5$). From either point of view, we conclude that there is only one quasi-regular honeycomb. Each vertex is surrounded by eight tetrahedra and six octahedra (corresponding to the triangles and squares of the cuboctahedron).

Curta Calculator

The Curta Calculator (made in Lichtenstein, no less) is one of those machine things that it would be nice to just have one around because it is so beautiful. It's tiny, but made in a way that discourages errors. It'll take poor climates without failure. Adds, subtracts, multiplies, divides, squares, cubes, takes square root, accumulates multiplications, multiplies or divides by constants. Rally navigators dig em, but so will anyone that needs a small calculator. Super in every respect. I've never talked to anyone that would part with his. Two models, \$125 and \$165, both about 2-1/2" x 3-1/2".

Design and Planning 2

Incredible: you actually got your hands on a computer powerful enough to generate rich graphics, and you have an employer/patron rich enough to buy you some play time on the computer. In order not to waste his money too idly splashing around in your new pool, you might check this book for a beginning inventory of some of the things you and your computer can accomplish together. It's far the most practical book we've seen on the subject, and the subject is what wizards are about.

or **WHOLE EARTH CATALOG**

There are three possible ways in which machines can assist the design process: (1) current procedures can be automated, thus speeding up and reducing the cost of existing practices; (2) existing methods can be altered to fit within the specifications and constitution of a machine, where only those issues are considered that are supposedly machine-compatible; (3) the design process, considered as evolutionary, can be presented to a machine, also considered as evolutionary, and a mutual training, resilience, and growth can be developed.

I shall consider only the third alternative and shall treat the problem as the intimate association of two dissimilar species (man and machine), two dissimilar processes (design and computation), and two intelligent systems (the architect and the architecture machine). By virtue of ascribing intelligence to an artifact or the artificial, the partnership is not one of master and slave but rather of two associates that have a potential nad a desire for self-improvement.

Professor: What time is it?

Computer: I did not catch the last word. Or was it two words?

Professor: What is the time?

Computer: The dime is a copper coin worth one-tenth of a dollar. The word derives from the Latin decem, meaning. . .

Professor: No. No. What is the time? The time?

Computer: It is 8:30 p.m., Thursday, December 5, 1985. We have been having some trouble with your linguals recently. Sometimes I can't tell your d's from your t's. Let's practice them. Watch the display screen for the intonation pattern, and repeat after me: Teddy's daddy toted two dead roads to Detroit.

Professor: Teddy's daddy toted. . .

But there is just the silence of the old decaying room at early morning, no motion and no swirl. Just still and cool, the old uncle sitting on one bed, the young nephew lying in the other, craving something to drink now, feeling the pulse begin to quicken as he comes again into the world.

He says, I believe I'll have me a cup of that tea, Uncle Emmit.

And Emmit says this just hot water I'm drinking. I'll go fix you some tea.

I can

I can do it.

But Emmit is up

He's already up and gone to the kitchen to stir the fire and put the water on while he dies.

Cybernetic Serendipity

This book started life as an exhibit at the Institute of Contemporary Arts in London last year. Simultaneously it was an issue of Studio International magazine. It must have been an event. Certainly it is the best collection of computer art yet, the only one not dismissable as engineers kidding themselves. There's been talk for years (e.g. The New Landscape, 1956) of how art and science are gonna come together, and indeed communications have improved. But there was no direct avenue, no real mutual domain. Not until computers got common enough for funky hands to lay hold of them to do tricks for funky heads. That's happening now, and this book is good evidence. Ahead, deep space

-SB

(Art, if you want a definition of it, is criminal action. It conforms to no rules. Not even its own. Anyone who experiences a work of art is as guilty as the artist. It is not a question of sharing the guilt. Each one of us gets all of it.)

Desk-top Calculators

The Hewlett-Packard 9100A is now \$4400. If you have to deal with problems which require a considerable capacity then the Wang 700 should be a great deal better than the HP since its total memory under program control (core plus tape) will be about 70 times as much as HP's. For people that order a 700 before it is being produced Wang loans a 370 with two card readers, a system which in some ways is already better than the HP. Such a 370 system costs \$4700. Deficiencies of 370 compared with HP:

- Much slower
- Does not have wired in programs for trig functions and some other functions (but programs can be fed in on cards)
- Can not handle as wide a range of numbers (only from about 10^{-10} to 10^{+9} instead of nearly 10^{-100} to 10^{+100})
- Much less convenient to write and correct programs
- Results of a computation cannot be read out onto a magnetic card or tape for later use (this can be done on the HP altho the salesman may not realize it)
- Not as good a display

- Advantages of 370 compared with HP:
- Greater capacity (28 registers compared to 19 for HP with no program, with 160 step program 370 still has 28 registers but HP has only 7 - 160 steps is maximum size program for 370 with two card readers without feeding cards in manually, compared to 196 for HP but another card reader would bring it up to 240)
 - Ability to use subroutines (but not subroutines within subroutines)-with HP a subroutine must be rewritten every place it is used in the main program thus using up precious capacity.

The 700 should be as good or better in all these respects, except the display, as well as having some other big programming advantages-particularly indirect addressing of registers in which the computer decides which register to go to thus saving much capacity as well as making programs easier to write.

To co-operate or even to orient themselves and to engage their programmes, the mobiles must communicate. They do so in a simple but many-levelled language of light flashes and sounds. You may engage in this discourse if you wish to, though your goals may be alien to the goals of the mobiles; for example, you might be trying to achieve a configuration that you regard as pleasing.

Running cola is Africa

A sustained image of the visual world around us is maintained by the brain's continual coordination of a great flux of varying sensory input. Much of this co-ordination is achieved by the series of voluntary and involuntary eyemovements which serve to scan the image of the pattern across the retina. When these eyemovements are eliminated or controlled, a remarkable collapse of the perceptual process occurs in which visual patterns disintegrate-but in non-random fashion, and according to 'rules' which appear to be common to all humans. The device, which we have called the CYBERNETIC INTROSPECTIVE PATTERN-CLASSIFIER-because that is as good a description as any-is not really the exhibit itself: it is by means of this device that the human brain can be turned into its own exhibit. People looking into the CIPC will be given a brief, bright flash of a pattern which plants an image on the retina in such a way that it can be seen, with eyes closed, for one or two minutes. Since the image is fixed on the retina, eye movements are irrelevant, and the perceptual system collapses as described above. The pattern can be seen to fragment and change its form, and these forms are probably the basic perceptual units used by the brain in recognising the pattern. This exhibit therefore allows people to watch their own cerebral processes actually in action.

Data Study

Information that isn't organized isn't signal in your life, it's noise. You waste yourself searching the full length of a file for something, feeling as stupid as a driver in crosstown New York, and for the same reason: your access is brute linear and laborious. This book can help you if not New York. It presents theory and practice on how to keep stuff straight, at least in terms of organization. Display is another matter, however, in which the information sciences are still poor.

Intelligent Computers

I've been bumming around the country lately, trying to see where I would lead me. And of course one of the places I eventually would up was inside my own head, the primary content of which is a lot of scientific information that I'd never really sorted through before.

My latest flash was about computers, which I do know a little about already. Specifically about intelligent computers, which nobody knows anything about. It involved assembling what I know about neurochemistry (my main field of scientific interest) with a lot of stuff about animal behavioral psychology and the history of the development of mathematics and a dash of Zen. The result was that I scared the shit out of myself and quit before I had translated it all into machine language, which I don't know anyway.

The point is that it is too valuable to lose and too powerful to let IBM or the Pentagon come up with it on their own, especially since it looks like the only way an intelligent computer could remain sane would be if it believed itself to BE the planet earth.

I would like to sit down with a bona fide computer genius with an island psychology and a bit of stock in the human race and try to work this thing through with him.

There are many ways of controlling the amount of feedback. One method which has been used involves varying the physical position of the tickler coil with respect to the grid coil. If the coupling between the two coils is reduced by moving the tickler coil away from the grid coil, or rotating it so that its axis is at an angle to the axis of the grid coil, the amount of feedback will be reduced. When this method is used to control feedback, a potentiometer is not connected across the tickler coil.

You learned that a good way for you to picture the operation of a grid in a vacuum tube was to think of the grid as a valve in a water pipe. The British are so fond of this explanation that, to this day, they call a vacuum tube a "valve." When the grid of the tube is very negative, the "valve" is closed and there is little or no flow of electrons from the cathode to the plate. When the grid voltage is changed so that it becomes only slightly negative, the "valve" is nearly wide open and there is a large flow of electrons from the cathode to the plate.

Electronics Page

Graphically illustrated and intelligently sequenced, the *Basic Electricity (vols. 1-5)* and *Basic Electronics (vols 1-6)* sets from *Rider* are the easiest route from innocence to usefulness in electronics without an unnecessary load of math and physics. Good rudiments.

If you plan to go very far with electronics, you will need heavier math. *Basic Mathematics for Electronics* keeps matters practical.

If you're already somewhat into electronics the *Rider* sets will insult you. A better route into deeper work is the well-regarded *Elements of Radio*.

For work with *Silicon Controlled Rectifiers*, the handiest device for controlling AC power to lights, motors, heaters, etc., get the comprehensive *SCR Manual* from GE.

A simple, non-technical, concrete, lucid, complete user's guide to hi-fi is *High Fidelity Systems*.

Fig. 15-14. Diagram of the complete receiving set, using the triode as a detector. The symbol 2 MEG. over the grid leak stands for 2 megohms. The symbol 30 Ω over the rheostat stands for 30 ohms. *

Discrete transistors (where electronics was 10 years ago) are very easy to work with. It is far easier to get into construction and design with transistors than it ever was with tubes. No chassis, no heavy components to mount, no high voltage, power supply can be a battery, etc. Very cheap, too. Trying to work with "state of the art" components (wherever that is now) is very expensive, parts are difficult to get and information is often unreliable.

How to make a simple FM antenna which is very effective in favorable receiving locations.

Still simpler, and satisfactory in favorable reception areas, is the twin-lead antenna shown in the diagram. This can be stapled inside a closet, on the back of a cabinet holding high-fidelity equipment, along a baseboard moulding, or in any convenient location so long as it isn't very close to large bodies of metal.

One final note on hum: don't overlook the possibility that it may be mechanical noise. The power transformer of an amplifier can buzz at a hum frequency if the mounting bolts or the windings aren't tight. Cures include tightening the mounting bolts and shock-mounting the amplifier on a soft pad. Leave holes for ventilation, of course.

Acoustic feedback usually can be cured (or at least reduced to insignificance) by improving the shock mounts under the turntable. Putting the speakers on thick pads of foam rubber may help also, particularly if they rest on the floor. In some severe cases you may have no alternative to increasing the distance between the turntable and speakers.

High Fidelity Systems

D.R. saw that he was dying as soon as they went outside. They shouldn't have even tried it but the pulse was quickening now, Emmet wanted to go. He wanted to show D.R. how little there was left of what there used to be, and how many new things he had started.

Ten

Ten feet from the porch steps Emmet shook his head and said he couldn't go any further. His breath was failing. Half falling he turned and went back and sat down on the bottom step and then leaned back against the steps above, fighting for his breath.

ABC's of Short Wave Listening

I started listening to short wave when I was twelve on an old (1937) Crosley shortwave console radio I bought from Honest Ben's for \$5. I replaced a few tubes and then learned to count seconds listening to WWV.

You can receive much more than the WWV time signal. Voice of America. Radio Swan. Etc. (See p. 127, Popular Science) It is fun and can be very informative.

This book is a very basic introduction to short wave. You can spend a lot of money on a good receiver. Or make do with an old console. Depends on what you want.

[Reviewed by Fred Richardson]

ABC's of Short-Wave Listening

or **WHOLE EARTH CATALOG**

As the major piece of equipment in the hobby of shortwave listening, the receiver must convert the minute energy of a radio wave into an audible signal. How well a receiver can do this is mostly a measure of its sensitivity and selectivity. The first quality, *sensitivity*, is the ability to separate a signal from the ever present noise level created by disturbances in the atmosphere and outer space.

(A) Inverted-L antenna.

Table 2-1. The Radio Spectrum

Major Divisions	Frequency Ranges
VLF = Very Low Frequency	10 kHz to 30 kHz
LF = Low Frequency	30 kHz to 300 kHz
MF = Medium Frequency	300 kHz to 3000 kHz
HF = High Frequency	3 MHz to 30 MHz
VHF = Very High Frequency	30 MHz to 300 MHz
UHF = Ultrahigh Frequency	300 MHz to 3000 MHz
SHF = Superhigh Frequency	3 GHz to 30 GHz
EHF = Extremely High Frequency	30 GHz to 300 GHz

* Most SW listening is done in this part of the spectrum.

Selectivity describes how well the receiver can pick out a signal in a crowded frequency band. It is mainly by these two qualities that a short-wave receiver may be judged. A multitude of features may appear in a given set, but these are usually concerned with operating convenience rather than operating quality.

The Radio Amateur's Handbook

10 The Radio Amateur's Handbook

10a This has been the practical guide for radio amateurs for 43 years. It begins with the fundamentals of electric circuits and follows a simple development of the radio theory necessary to understand communications. There is brief section on laws governing amateurs and references to other books that are valuable aids in obtaining a license.

10b Throughout the book actual circuits are shown, always with enough information to build them. Later sections cover complete construction details for various transmitters and receivers but don't be misled by their apparent simplicity. It takes a lot of time and know-how to make these things work and unless circuit building is your thing you are better off to buy commercial equipment or kits. (Heathkit is one of the best sources for ham gear.)

The review to the left was prepared and printed on a computer by Bill English— as you can see, the fluidity of computer interaction makes spelling more casual than with direct hard print.

[Reviewed by Bill English. Suggested by Arthur Brand]

The *Radio Amateur's Handbook* may be of interest to the communities and enclaves who've been fantasizing an underground radio net. Like a night of the week or month when all the world's long-hairs are on the air, vibing to each other and the stars. —SB

Subscriptions limited to persons with active, professional, functional responsibility in electronics technology. Publisher reserves the right to reject non-qualified requests. No subscriptions accepted without complete identification of subscriber name, title or job function, company or organization, including product manufactured or services performed. Subscription rates: qualified subscribers in the United States and possessions and Canada, \$8.00 one year, \$12.00 two years, \$16.00 three years; all other countries \$25.00 two years. Limited quota of subscriptions available at higher-than-basic rate for persons outside of field served, as follows: U.S. and possessions and Canada, \$25.00 one year; all other countries \$50.00. Air freight service to Japan, \$60.00 one year, including prepaid postage. Single copies: United States and possessions in Canada, \$1.00; all other countries, \$1.75.

Radio

In the March \$1 *Catalog* you were wondering about how to fit electronics into your catalog better. It seems to me that electronics equipment is relevant to the very important business of communicating with one another. Radios, transceivers, hydrophones, ultrasonic translators, and tape recorders certainly are significant tools. However one of the most important communication tools, (in my opinion) is a shortwave receiver. Listening is the beginning of all communication. With even the humblest short-wave receivers one can tune in many different nations all around the globe. Americans have neglected shortwave radio but the rest of the world (mainly other governments) is broadcasting it's opinions, viewpoints, philosophies, music, literature and drama for anyone to examine. It is free to anyone with a shortwave radio.

The simplest way to start listening is to turn on any shortwave-ready radio you have. Reception is better if you attach a long antenna and a good ground. Reception is also better after dark. You may have a good shortwave receiver in your attic or a \$5 to \$25 Salvation Army Store radio will serve. Almost anything made after 1932 is liable to work well. Of course if you have more money a store-bought receiver or kit would be a fine tool. I hope some of your correspondents will be reviewing receivers and listening guides.

Besides ham radio it seems to me that souls interested in underground (and aboveground) radio and tv ought to check the radio & tv trade journals for the names of brokers in used broadcast equipment. With the introduction of color tv, multiplex fm and transistors a lot of good equipment has been obsoleted. Presently much of this stuff is sold to less affluent parties overseas. Also since many police and fire departments have changed from broadcasting on 1700 kc. (which is just on one edge of the broadcast band) to vhf and uhf bands I'd bet that there is some modest power gear on the market that would be fine for am broadcasting with merely a new crystal (like \$10 and a tune up).

Lee McKusick
Chimayo, N.M.

Get Your Ham Ticket

Okay, why push for all the whole earth types to get their tickets?

- A) When this country falls apart, all that portable equipment and practical electronics knowledge and all those established nets are going to be the tools to stay alive and coordinate with your friends.
- B) Intelligent roundtable discussion is not only possible but enjoyable, mainly because if someone is an obnoxious bastard you can tell him so politely or go off on some other frequency and start another roundtable.
- C) Organized amateur radio gets information spread fast. It doesn't matter what the information is or how far it has to go, witness Alaska hams during the big earthquake a few years ago and the more recent and controversial National Student Information Net.
- D) Ever see a ham tv roundtable?

Why don't more freaks and street people become hams? I think that most do not see amateur radio as the subtle tool that it is. The skills and discipline of radio in the telephone age are somewhat like the skills and discipline of the photographer who shoots 4 x 5 black and white in the Instamatic age. The price of versatility is knowledge and time.

The whopper in this whole discussion, though, is the relatively unknown but potentially enormously beneficial use of amateur repeaters. See the April 1971 issue of *TQ*, which lists six in the Bay area alone. With repeaters, ten watts of rf and a good antenna pointed at the repeater itself will get your signal out over the entire Bay, Los Angeles area, Chicago area, the entire state of New Mexico, most of Mass, N.H., and Vt, or coverage in most of the sizeable cities in the U.S. One at a time, of course. Repeater are relatively easy to license in most parts of the country, but require a lot of groundwork and a good, high antenna site. Also a couple thousand dollars unless you are the scrounger supreme.

Last summer I listened to the prime Chicago repeater for a couple days and heard fixed stations over the Wisconsin border and out more than thirty miles to the south chatting with a mobile unit watching the planes take off at O'Hare and a woman walking near the loop with a walkie-talkie. I understand that one can now drive through the northeast and scarcely ever be out of range of at least one machine. Mind you that all this is taking place more or less line-of-sight on frequencies tucked between the fm broadcast band and tv channel 7.

I'll QSO any of you after my part of the war is over.

Newark Electronics

If you are at all a serious buyer of electronic parts and equipment, industrial catalogs should be much more appealing to you than the standard consumer catalogs. Industrial catalogs dwell mostly on the facts rather than promotions. Each item gets its share of space, and no more. And of course the variety is extremely broader. When building your own projects, it makes a lot more sense to use a large, factual catalog full of components rather than the typical consumer catalog. Newark's catalog fills the bill well. Don't let the word "industrial" scare you. They're prepared to handle the same kind of mail orders as the firms whose catalogs fill their first 200 pages with color photos of hi-fi equipment (one item per page) and use most of the descriptive text for promotional purposes. Newark lets the facts sell you.

Edlie's Flyer

Beginners in electronics who don't want to be stuck with very beautiful but very unusable gadgets (and also experts who know what's-used-for-what) can get a lot of value from industrial (civilian) surplus electronics, these days.

For the "consumer" uses of electronics—music, p.a., TV, repair parts and instruments, experimenting—Edlie Electronics has the best selection and the lowest prices of any mail-order dealer I have found.

They handle everything from hi-fi components (e.g., an FM tuner from a discontinued console) to single resistors. Some of it is new, and some of it is sold "as is" (e.g. small radios and tape recorders returned to the store under a warranty.)

If you don't feel safe about repair work or experiments, though, better concentrate on getting electronic stuff with a dependable guarantee, maybe by buying from a repair shop.

Ten octaves
of sound!
150.00

Electrostatic Headphones give widest response

Model ESP-9. World's only self-energized electrostatic headphones. Give depth and breadth of sound for stereo at its best. You get the perfection of the original studio recording with no room acoustics problems. Electrostatic driver elements provide unbelievable response far beyond the limits of ordinary voice coils and cone-type driver elements. From 15-15,000 Hz, response is an amazing flat ±2 dB (full 10 octaves). Total response is a remarkable 10-47,000 Hz.

Special push-pull acoustical circuitry virtually ends distortion to give the clean sparkling sound of a live performance. Harmonic distortion is less than 0.2% at 110 dB SPL. No special amplifier or power supply needed. Separate energizer offers option of self-energizing for bias supply, or energizing through AC line. When energized through AC line precise level measurements can be made, in tape mastering machines and recording consoles for example. Energizer has speaker/headphone switch, on-off switch and AC pilot light.

Fluid-filled earcushions and lightweight design (only 19 ounces) let you listen in comfort for hours. Full 12-watt power capacity. Impedance, 4-16 ohms. With 6' conductor input cable that connects to amplifier output terminals. Energizer size, 4 3/8 x 3 1/2 x 8 1/2".
33 B 6515. Shpg. wt. 8 lbs. 150.00

11 Tektronix

11a Tektronix has become the electronics industry standard for oscilloscopes. They are consistently ahead of the competition and their attention to "user" features in functions and control design make the instruments a joy to use. This catalog includes the complete line of scopes and of their other test equipment, particularly pulse generators and amplifiers, all solidly designed.

Right there in front of D.R.'s eyes
Emmit was actually dying.
D.R. started to ask Emmit what he should do but Emmit waved his hand and shook his head. He knew what D.R. was about to say and he didn't want to
hear it
hear what? What old voice, old time
For sure, Emmit didn't want the boy to say anything he would have to answer, for he was barely breathing now, working hard for every little bit of air he got.

11b The equipment is expensive - \$735 for the cheapest scope - but well worth its price.
[Reviewed by Bill English. Suggested by Mike Brand]

Don't know whether the Catalogue is much into the Hi-Fidelity sound business. Hi-Fidelity is an imprecise term. It is a spectrum. But the smallest and least expensive speaker that seems to me to be entitled to call itself hi-fidelity is the new Dynaco. It is really quite extraordinary. I made A-B tests of it against a KLH-6, a very fine speaker, and though in some respects the 6 was better, deeper bass, somewhat more fullness—in other respects, I felt the Dynaco was quite definitely superior. In really dense textured material, large orchestral and choral passages, the sound is somewhat better defined. Anyway, it is a fine piece of work—list price \$80, discounts for less than that at some places in the east.

Some of the best European tape recorders can be bought much more cheaply from a London firm called C. C. Goodwin, Ltd., 7, The Broadway, Wood Green, London N22, England. The new Tandberg 1600X tape deck which sells here for \$250, they sell for \$172. To that you would have to add cost of shipping and some duty, but the total would not be as high as \$200, which is a useful saving.

Feeling rich these days. Bought a couple of Rectilinear X speakers. Tastes differ in these matters, but I haven't heard anything I like better at any price.

A portable tape recorder is a very good gadget for school. CONSUMER REPORTS recently recommended one from Sears. I bought one and have tried it out and it seems to work very well. Good sound quality.

An English audio outfit called Sinclair makes a little stereo amplifier called the Neoteric 60 Mark MK II. An outfit called Audio T, 16 RR, Dryden Chambers, 119 Oxford St., London W1, England, sells it for 46 pounds, which with shipping and duty it all comes to about \$125.00. I took it to one of our best local hi-fi places, and they were ecstatic about it. Not only is there nothing of comperable power and quality at that price in this country, but the little gadget is so tiny you can hardly believe it. A really elegant piece of gear. The manufacturers say it has 20 watts per channel, but this is *extremely* conservative.

Best,
John Holt
Boston, Mass.

Hi-Fi Tips

Read John Holt's hi-fi letter, and concur with his rave review of the Dynaco speaker. After about 13 years as a hi-fi buff, the last 8 of them writing about the field professionally, Dyna is one of those companies whose new products I tend to trust before I see them, but in the speaker, they've surpassed themselves.

Dyna also has discovered that a good step towards the effect of a four-channel system can be achieved with existing stereo recordings and broadcasts, using only one extra speaker. Connect it across the hot leads of both stereo channels, and any instrument that was recorded out of phase in the two normal channels comes out loud and clear from this 3rd speaker (which should be in the back of the room). Other than that, stay clear of four-channel for at least 6 months, until the smoke clears. There will be lots of pseudo-quad gadgetry and some good stuff coming out in a batch between now and Fall.

The Rectilinear X John Holt mentions has been replaced by the Xa, which Rectilinear (friends of mine) say is better, as does the guy who writes their ads, and uses them at home. There seems to be some opinion that the X (and Xa) beat the more expensive Rectilinear III; I haven't directly compared them, so can't confirm, but all 3 Rectilinears sound fine to me, and I prefer the RIII to the AR-3a for most (not all) material — especially prefer RIII for piano, but AR-3a for most pop.

If I were recommending a cheap component system right now, my choice would be:

- Dual 1212 changer or AR turntable.
- Grado FTR (\$10) cartridge — Shure M91E, if you want to spend lots more. (Also, listen to the Pickering's — I don't know how well they sound from personal experience, but the dust-brush feature is nice for people who don't clean records much)
- Sony ST-5600 tuner
- Sony TA-1100 amp (may be prejudiced — had them in the house while I wrote ads about them for Sony — but they seemed very good for the money: \$120 each)
- Dynaco A25 speakers.

Watch for Dolby-ized tape and cassette equipment later this year — it lets you get good quality on recordings you make at slower speeds (saving tape); KLH \$225 tape recorder has it now, others to follow, especially in cassette. Doesn't do anything for pre-recorded tapes, though.

Roy Allison's hi-fi book from Dover publications (sugg. by Fred) is best practical guide I know; Ed Villchur's companion volume (also Dover p.b.) is best, most lucid, most accurate guide to hi-fi theory.

Ivan Berger
New York, N.Y.

P.S.: Other companies I take on faith: AR, Shure, KLH (at least, until many of their top brains went out and started Advent — now I wait and see on both companies).

P.P.S.: AR speakers sound very bass-y when sitting on the floor. If you don't like that, they make a good, cheap speaker stand — or raise your speaker on a crate (good for other speakers, too, with the same problem).

Glyph

A big tough speaker, like a diesel truck, and tone as nice as you please. Built weatherproof. Easy to ship. The first loud sound I've heard that didn't make me want to run. I wanted to stay and shake.

How to Build Speaker Enclosures

In order to get the best response from a speaker, the enclosure needs to be carefully designed and engineered to match the speaker being used.

If you have some knowledge and skill in cabinet construction, you should be able to use this book to build excellent speaker enclosures. It doesn't tell you how to put them together, but it does tell you how to calculate size, design baffles, and properly brace the cabinet to keep it from vibrating.

Not for the novice carpenter.

Dynaco Kits

Dynaco Inc. of 3060 Jefferson Street, Philadelphia, Pennsylvania 19121 manufactures a line of high quality and excellent value stereo equipment. Their equipment represents some of the best dollar value in the stereo field. They do not change models very often (almost never) which means that parts are always available and that their equipment has good resale value. They don't even change prices with inflation as does everyone else. Added bonus! All the Dynaco line of components is available as kits at substantial savings.

Dynaco kits are easy to assemble and all the critical work is done by Dynacol. Their kits could more accurately be described as semi-kits as all the printed circuit boards are done by Dynaco and you just mount them and wire them in place. Dynaco has some of the easiest, plainest, clearest, most complete construction manuals to make sure that there is no problem in assembling their kits.

Dynaco doesn't sell and leave you on your own out in the cold, they also provide technical assistance and service for their equipment.

Ross Bernheim
Honolulu, Hawaii

Stereo Discounts

Did you recently pay full list price for stereo components or recording tape? If so, you got burned. Next time, a discount house can put a comfortable distance between you and the heat. Many discount houses advertise in *Stereo Review* and *High Fidelity*, but I've narrowed the list to 6 that give the lowest prices—which doesn't mean, of course, that some more equally good ones may not spring up. These discount houses, by the way, are NOT clubs and don't charge membership fees, although there are such clubs dealing in stereo gear. To my knowledge, these clubs don't match the discounts of the discount houses. The 6 discount houses mentioned above are:

Downtown Audio
17 Warren Street
New York, NY 10007

Dixie Hi-Fidelity Wholesalers
10530 Detrick Avenue
Kensington, MD 20795

Hi-Fidelity Center
239 East 149 Street
Bronx, NY 10451

Boston Audio Co.
1 Discount Drive
Randolph, MA 02368

Rabsons 57 Street Inc.
119 West 57 Street
New York, NY 10019

Carston Studios
R.D. 3, Route 7
Brookfield, CT 06804

I've personally had satisfactory dealings with the first three. I haven't ordered from the others, but they offer equally low prices. Here as with any purchase, it pays to check each house's price on a given component. Some of available discounts follow:

Component	List Price	Discount Price
Dynaco SCA-80 amplifier, wired	\$249.95	\$165.00
Shure M44E cartridge	34 . 95	10.50
Superech ST-Pro-B headphones	49.95	32.00
Garrard 40B changer with base, dust cover, less cartridge	55.50	33.48
Harman-Kardon HK-50 speaker system	95.00	55.00
Watts Dust Bug	6.50	4.95

Certain brands of equipment are fair traded and theoretically can't be sold below list price, but you can sometimes get around this by ordering a fair-traded component and a non-fair-traded component together. Discounts are even better on complete systems than on individual components.

In the market for a low-cost stereo cartridge tracking at 2 to 3 1/2 grams, such as the Shure M44-7, ADC 220X, Pickering P/AT, or Empire 909/X? Forget them—you want the Grado FTR at not \$24.95, not \$19.95, but \$9.95 from Grado Laboratories, 4614 8th Avenue, Brooklyn, NY 11220. Or a discount house may have it for \$5 to \$7.

In *Stereo Review* July 1969 survey of cartridges the FTR ranked a close third in sound quality behind the ADC 25 (\$100) and the Elac STS-444-12 (\$69.50), and ahead of cartridges costing up to \$69.50 (to keep things in perspective, some of the more expensive cartridges tracked at lower forces than the FTR). Not having a pile of test equipment, I can only add that I've been using an FTR for a year and that it does what it's supposed to.

Other Grado cartridges are the FTE (\$19.95 with elliptical stylus), FCR (\$25), and FCE (\$35 with elliptical stylus). According to Grado, the FC series cartridges are assembled more carefully than those of the FT series. However, I don't know of any test reports on them.

PLEASE NOTE: N. Y. RESIDENTS ADD TO THE ABOVE PRICES THE NEW YORK CITY OR STATE SALES TAX

D.R. lay his uncle down and helped him stretch out on his back. He started to take his shoes off for him but Emmitt pulled his feet away. He didn't want to be fooled with.

Leave me alone.

I'll be okay, just let me catch my breath, he said. He reached for the sheet and quilt and pulled them over his shoulders and closed his eyes and sank into the pillow, and D.R. took off running.

Running, down the path below the house, through some half-dead trees. Downhill he ran this time, past blasted rock and broken trees and piles of rusted trash along the ruined roadside.

Past what was left of people living there and

mining

old hulks of cars and shells of houses,

past the fallen tippie he had hidden under

past the door of one old house whose mouth said what's the hurry,

Down Trace Fork all the way across the bridge

and there he was again, pounding on the store door. And who should answer

Who should answer but Mrs. Godsey, her Bible in her hand, all smiling, glad to see him, then frightened by his story.

And Leonard came a running.

He wheezed and strained and bit for air and tried to ass himself up the steps, the second,

third

Moving and breathing a little now, some air was coming in.

D.R. put his arm around his uncle's waist and pulled Emmitt's arm around his neck and half-carried him up the steps across the porch and to the bedroom. That one, Emmitt said.

That one, over there. The bed D.R. just got out of. They were changing places, passing one another, going opposite ways, and the pulse of things was clicking right along.

More Stereo Discount

One other house that offers significantly discounts on the material they do carry (they don't seem to have as big a stock as others is

Audio Sales
2745 Erie Blvd. East
Syracuse N.Y. 13224

I bought my own equipment from them \$650 list. Cost me a little less than \$400 including shipping.

One other note for those who purchase tape

The Archer Av. Store
4193 Archer Ave.
Chicago, Ill. 60632

has the lowest prices for Sony tapes that we've been able to find in the country. Ex. 1800' 7" polyester PR-150-18 cost \$2.79 a reel. In Phila. this costs 3.69 + 6% sales tax. They'll pay all postage on orders of \$30. (That's just a doz. tapes—Get a group together) and on orders over 48 tapes offer another 5% discount if the tapes are in groups of a doz.; can be mixed as long as there's a doz. of each type. For a full list of prices just write them.

John F. Rakickas
Philadelphia, Pa.

db

For those interested in audio in either a professional or semi-professional way the best source of information on the state of the art is a magazine called "db—the Sound Engineering Magazine." This is not to be confused with the so called "consumer" hi-fi books. It is strictly devoted to the recording engineer, broadcast engineer, audio-visual, theatre sound, commercial sound type of person. It contains a wealth of design, operational and trade info that just cannot be found elsewhere. If you want to know how to install a sound system in an airport, or how to operate a recording console, or are worried about sound levels effecting rock musicians hearing, or any number of purely audio oriented subjects, then db is for you.

I have spoken to the editor of db who informs me that subs are \$6.00/yr in the US and \$7/yr elsewhere. Sample copies are available upon request.

Hope you can use this material. Thanks very much.

This article appeared April 4, 1969 in the Berkeley Barb.

We tried by letter and phone to get hold of the author Ed Denson to see if it was all right to reprint his piece but we couldn't find him. The article's good enough we'll just have to pirate it through and hope it's OK. What I really hope is that it's a part of a forthcoming book on music entrepreneurship; we'd CATALOG that in a minute. —SB

by ED Denson

(Editor's Note: ED Denson manages Country Joe and the Fish, and The Crabs, and other Rock bands.)

I - the band

First, of course, you'll need a band. There are over 100,000 rock bands in the United States at any given moment, or at least that's the number which participated in a national Battle of the Bands series last year. Not 1000 are making a living, so you should be a little careful when you pick yours.

More realistically, if you are interested in managing a band, probably you already have one. Deciding to be a manager is not a result of a serious conversation with your high school counselor, it's an accident like picking up the girl who is to become your wife. Probably you are sitting around one day with a bunch of your friends who are musicians and complaining. You inadvertently mention that Atrium Burlap and the Watercrossers are making \$200 a night somewhere else, and zap, you're a manager. In that case you'll want to read this to decide whether to keep going or to forget it.

Let's start at the beginning: you as manager want a band which will do three things—make good music, make good money, and stay together for three years. These three things follow from the nature of the business you and the band are in.

Now at this point I should explain something before some nitwit begins to say "Oh wow man, music is not a business it's too beautiful!" and that is this: if your band is not a business it does not need a manager.

Anyone can play the guitar in his room without a manager, and when he gets tired of that he can go out into the park and play without a manager. Not everyone knows this, and it is the cause of a great deal of wasted time and energy.

No matter what your band says to you about business, they are hiring you to make them money, and fame, and glory, and one day they are going to ask you where it is.

Now to amplify those three things which you want your band to do:

1. MAKE GOOD MUSIC: you, a human being, are a valuable person and your time is worth spending in such a way that you won't think it wasted later. If your band is not making music which you think is good, or as we say in the trade, promising, forget it. Even if you think they'll make a million, but their music is not your bag, forget it. No one is so lame as a manager who can say "It's just a business with me, like selling cars or canned peas." No one. And no one can do less for a band than a manager who feels that way. We Americans, due to a peculiar hangover from Protestant religion, believe in the back of our minds that sincerity is the touchstone of truth, and a manager who cannot sincerely say that his band is great cannot hope to get anyone to do anything for it.

Then too, no band is successful that does not make good music. But, you say, leaping to your feet in indignation, what about all those creepy straight bands with their press agent hype and record company bullshit who are regularly crammed down the unknowing throats of the American public all of whom are idiots except me.

Forget it. There are certain delusions which you, as a member of the hip record buying public and brilliant critic of American taste, have been living with. You as a realistic hard-bitten business manager had better clean the garbage out of your head before you get going, or else your hangups will fuck up the lives of a number of people including yourself.

Try this one: Any band which successfully manages to become one of the really popular recording and performing groups in the country, does it by making good music, on well done records, giving exciting stage performances, and especially, by projecting values which their audience likes with some militance. You probably do not like their cultural values, which is not the same thing as their

music being no good. However, a band, a guru, and a candidate for president all do the same thing and only those who are good at it make it.

But back to your band. Let's start with the basics. Is your band able to play in tune? And do they agree amongst themselves about rhythm? Most American bands can not both play in tune and together, and get really mad when someone points this out. If your band cannot do both it is going to take a great deal of luck, practice, and probably a couple of people fired to cure the problem. During that time nothing much can happen with their career, and they won't need you to hang around waiting.

Perhaps they can play in tune, together, and in public. Then we know they can make music, and now we wonder if they can make good music. Your taste is going to be the judge, but the question is not one that can be dodged with horseshit like "anything can be good music, it's all a question of taste." That's not true. If they are making good music, you can objectively show it.

First, there is the question of melodies, and chord and note choice. If there is someone in the band who is brilliant, and often there is, these things will be startling, and good. The band will be playing its own music, not anyone else's be it the Box Tops or Muddy Waters. If you want to work with musicians who are into playing other people's music, go work for the Symphony.

Are the songs any good? Do they make sense? Do they mean anything to you? Would you be impressed if someone walked up to you and said what these songs are saying?

Probably you don't know much about music. Probably you don't know enough to make final judge-

Electric Guitar Amplifier Handbook

For years my clearest image of impotence was the college student and the soft-drink machine: he has just watched his Pepsi flow by without benefit of the expected automatic cup, and he is kicking shit out of the machine. This image has gradually been replaced by the finer one of the rock musician and his audience of worshipful fans and his intermittent amp.

Avoid embarrassment, learn about the components of thy act. This is a remarkably adequate repair manual. —SB

Fig. 2-3. Operation of a magnetic pickup.

ments about the questions I've just mentioned, and if you are listening to a band in a small club, probably you can't hear the music well enough to tell anyhow. To serve as a double check on your opinion, if you think that they are making good music but you are not certain, go watch them per-

god given right to take drugs and drink anything anytime they want.

We're not talking about right, we're talking about putting on a shitty performance and boring or bum-tripping the audience. If your band puts on poor performances because your brilliant drummer is out of his mind on something,

your band.

From the onset everyone involved should realize that in the next three years some of the musicians are going to receive public praise for being the brilliant men who are really making the band go, and the private advice to dump everyone else. If they are a little nuts in the start, they'll do something destructive, or flip out under the pressure. There's not a lot you can do about this except try to avoid such people. Watch a couple of rehearsals and you'll know if they are present. Bon don't panic if someone there is doing most of the work, watch for ill humor.

Now if you've got your band, and they are making good music well and are all ready to go out and make music for the millions, the next step is to check your own head and be certain that you are capable of being a manager. You have no real way of knowing what you are getting into, any more than the band does at this point. All of you are babes in the woods, but there are few things you can predict.

You are going to have to work hard for three years, with few breaks and little respite. You will work more hours than your band, and you will have to be much more stable than the musicians. That's one part of your job—to be stable and to know what's happening when they forget. A good deal of money will be flowing thru your hands, and you should be able to account for it in some detail, which means you'll have to keep good records and be precise.

Moreover you are going to have to do business with a lot of people, talking about performances, equipment, recording contracts, booking agencies, etc., and usually you are not going to know what you are talking about. You have to recall that, while not letting it out. If you are one who believes that business consists of a lot of people with desks and good looking secretaries bullshitting each other and doing a lot of public relations, you are going to fail. The business you do will show up in a growing number of contracts passing across your desk and that will be based on facts. Facts like how many people came to see your band.

But the most disturbing, and dangerous aspect of management is that the band is never going to know what you are doing, or how well you are doing it. On the one hand you will be subject to their occasional paranoia, instability, incoherence, mistrust, and unless you are exceptionally fortunate, their almost complete lack of ethics. On the other hand you will receive considerable unearned praise, and in most of your business dealings with them you will have your own inexperience and ethical state to contend with. You will do things which are dumb and you may easily cheat everyone in sight for a few months. If you think you can work under those conditions, you're all set, c Copyright 1969 ED Denson

Tape Recorders

The top of the heap in sound recording is Nagra. Their prices start at \$1123.

For general purpose high-quality mobile recording, the Uher 4000 L is still in front of everyone else for reliability and economy (approx \$440.). The new Uher 1000 Report Pilot, designed for sound/film synchronization, costs about \$695.

For Uher:

Hervic Corporation
14225 Ventura Boulevard
Sherman Oaks, California 91403

Even if extensive opinion sampling were carried out, we would know only what listeners think now, based on conventional literature in conventional performance. There is no reason to believe that such judgments will remain unchanged after listeners have been exposed to much more synthetic sound. Perhaps they prefer 'imperfection' primarily because they have never heard anything else.

Music by Computers

Music by Computers. Goddamn right. When can we get our hands on them without having to tiptoe around some 18th century Department Chairman? This book and four records edited by the worthy Von Foerster and others assembles James W. Beauchamp, Herbert Brun, M. David Freedman, Lejaren Hiller, M. V. Mathews, J. R. Pierce, J. K. Randall, Arthur Roberts, L. Rosler and Gerald Strang. What I want to know is, can Frank Zappa use it?

-SB

Biologically speaking, all auditory systems serve primarily one and only one purpose: to infer from the sounds that are perceived the sources that produced these sounds.

In this example 'The British Grenadiers' is gradually converted to 'When Johnny Comes Marching Home' and back, a nauseating musical experience but one not without interest, particularly in the rhythmic conversions. 'The Grenadiers' is written in 2/4 time in the key of F major. 'Johnny' is written in 6/8 time in the key of E minor. The change from 2/4 to 6/8 time can be clearly appreciated, yet would be quite difficult for a human musician to play. The modulation from the key of F major to E minor, which involves a change of two notes in the scale, is jarring, and a smaller transition would undoubtedly have been a better choice.

Only the opinions of listeners can evaluate these factors. Limited opinion sampling, with both experienced and inexperienced listeners, indicates that professional performers prefer a higher level of regularity and accuracy than nonperformers. Neither type appears to approve of the maximum level of computer 'perfection.' Listeners object to the 'electronic organ sound' or the 'machine sound' and ask for more warmth or spontaneity.

Single spool of tape unwinds and rewinds onto itself. Avail in time playing from 3 min to 30 min. at 3-3/4 inches/sec. Used for sleep-learning and therapy, broadcasting, teaching, and sales. from \$6.15 to \$19.95. Free info.

FRAP

"Flat response audio pickup." Hmm. . . well, theoretically flat. It's response hasn't actually been measured on an instrument, but it would sound to be better than any other pickup.

The FRAP picks up the sound of the instrument, not the sound of the strings or any other part. Can be put on almost any acoustic instrument (flutes, guitars, etc.) and produces an output similar to that achieved in a studio using separate microphones.

I wish companies wouldn't use terms like "flat response" without defining what they mean by flat. Can be highly misleading at best.

Shipping delay seems to be a month or a little more.

Transducer, preamp, adhesive wax, \$150.

Walter Carlos on Synthesizers

Hi— This is probably either too late to write you, or my own personal ego trip, ergo: of no particular value to anyone, however, I've gotten myself off my other projects/ass long enough to realize that I've been wanting to write all of you for a long time. Also, since all those cliché cats out there keep telling me I'm like the ultimate sage in synthesizers, electronic music, and all that confetti, and since you always find at least a page to devote to "synthesizers", it does seem fair—right to write, and here it is.

If you haven't already thrown this one in that appropriate round receipt provided for broken goods or boring papers and other worldly goods, I'll pompously introduce myself:

I am Walter Carlos, creator of Columbia Record's *Switched-on-Bach*, and the *Well Tempered Synthesizer*, currently composing instead of merely performing up a 3rd & 4th album for Columbia (since I was always s'posed to be a composer all along and those two records are more or less "learning territories"). The next will probably be titled *The View Inside*, but I'm not looking for plugs or promos.

Actually, I know of no good lit. on electronic music, and I've been stuck in it for at least a dozen years. And that's the problem. You see, I'd kinda like to turn you on to some good text or paperback on the subject, but, frankly (and excluding only the short-lived *Electronic Music Review*, which had many shortcomings) they all stink, are axe-grinding with a vengeance (like the latest stuffy, fadist & sure-to-be-successful periodical *Synthesis*) and are few-to-the-point of extinction.

Granted, I'm as prejudiced as anyone can be— I make my life in the field— but hell, I've tried all the currently available synthesizers, and none of them matches a decent Steinway or Baldwin when it comes to subtlety. Sure, they've all got their own set of gimmicks, but really— that ain't where music's at. What about nuance, phrasing, or that particular gripe of mine: *control*? Most of the "magic boxes" purport to *simplify* electronic music. The ghastly thing is that they, as a group, all *do* — simplify to the point of an imbecilic device which is happy to engage in cranking-out a totally unpredictable series of musical "notes", sounds, "exciting textures", whatever— what a lot of bunk. After my first record gained all its "fame" everyone was out there, hustling to either buy a *Moog* (pronouncing it like a cow, to this day, despite the numerous printed corrections I've only casually spotted) or to build a "better synthesizer" & cut into this, quote: rapidly growing field, unquote. The former hyped-up a bunch of fantastically dull records, too eager to get out de produk', instead of payin' a little dues, the latter glutted the market with that dusty heap of clatter machines & wonder toys that even W.E.C. advertizes.

Unless "Music for Non-thinkers" (thank you, RCA Victor), is your bag, it seems that warnings rather than plugs & puffs is the *all* of the day. Sure, the pianola is lots of fun at the right party, out Nancarrow notwithstanding, it *might* be healthier if we had a little less, not more activity in E.M., at least for a period long enough to let the smoke screens either vaporize or settle down into a uniform dust film over all of musicland, ecology be damned!

Enough sour grapes. Of course none of my outrage is printable or ought be. You could certainly "preach the good word: (5 letters, first is "T") "Better than I in your beautiful "Bible-for-a-new-day" (thank God even as the Bible ceased publication at *some* point you choose to stop prior (by at least a margin of 5 yrs. to atrophy-of-purpose settling in on yet another "groovy mag") (remember *Mad*— the old ones, still in comic-book form—?)

Look, no real damage is going to come from a few sales of *Moog*, *Buchla*, and *Tonus* synthesizers. Most of the "mini" versions are simply cash-in on ignorance rip-offs, including the *Mini-Moog* (choke) and the *Muse*, and the *Putney*, I've tried these toys, too) although maybe these do serve a purpose, to groups as "local color" items of the right fashionable kind. I still use a *Moog*. Its grown since S-OB, and is basically bastardized to the extent that, unlike the products for sale, it is a crude but viable musical instrument. *Tonus* will get there too, if they shake off the cancer of advisory committees (formal or informal) which threaten to turn their machines into versatile musical automatons ("Sing Along with Hal," anyone?). *Buchla* is great for a certain limited but beautiful ambience-oriented E.M. and *Moog*, in all standard packaging, is workable, nasty to keep in tune (unlike *Tonus*) and ready for the right non-standard modifications if you're interested and have the time & the bread to personalize same (ditto for *Tonus*).

And, in the final analysis, it is time and bread that enable *any* music to come out of these "instruments". A multi track machine (pref: 8-track or more) is, in all truth, essential. The would-be synthesist had better invest in a good mixing console (size not too important, quality is), I've used a home-made, "10-in", stereo out one for many years, only now have I scraped up the bread for an all-dolby, "18 in", "6 out" quadraphonic version & 16-track 3M to go with it. This E.M. business can be idiotically expensive. (But 24-track machines still sound to me like a put-on). (Might be good to put a Dolby-ad along with the synthesizer pix. Even the small home "type-B" made by *Advent* will keep his down to at least *tolerable* levels.) Both my old console & the new Biggy used spectra sonic active components— they're in Ogden, Utah, if you're interested.

Also, if you can find the space, I think it might be ultimately best to list a few books on audio, acoustics, electronic organs, (even), and perhaps speech & so-called "visible-speech". I'm copping-out on you, since I honestly don't have the time to look up titles— so send me no \$, I insist. The point is, the very word "Synthesizer" (which is otherwise full of unfortunate connotations) suggests a fertile investigation of the whole world of sound— like: why does a trumpet sound like a trumpet & not a clarinet or a violin, etc. All I can tell you is this kind of knowledge, more than any particular hardware, is what enables me to obtain the sounds that I do.

Oh, a piece of philosophy here. Many people suggest to me that I constantly "limit myself to imitating real (sic) instruments". They say it is *freer* to invent "new, never-before-heard sounds". Bull shit. The easiest to obtain sounds (3 or 4 patch cords on the *Moog*, for ex.) are all those dreary "new" sounds. I've rarely tried to actually "imitate" traditional musical instruments— I've always used them as a *point of departure* & then veered off into subtly different areas. It's almost *more* fun to invent a *new woodwind* sound; one which

is, say, as flexible & musical as an oboe, but *better*, at least in context, for what you are doing at that moment. And these, be they obtained on *Moog*, *Tonus*, or whatever, are the very tedious, time-consuming many-interconnection-types of sounds that lead to my own bag (although to the average ear, they may be reinterpreted as "sounding-like"... a jet plane? a trombone? an electronic motor? "Gee, that Picasso paints weird "flowers", don't he?")

Ah well, ya can't work in a field and not get highly (or lowly) opinionated & I have contracted the disease, doctor, and right now it hurts to see charlatans show off how many suckers (gee that word sounds up to date again) are born every 60 sec.

But, guess it's safe to say that although music performs no true basic function, to wit: It don't plow the fields, it don't build shelter, weave clothing, but it does sooth the human mind at times, and during sex— enough, it shall endure, and no doubt not without some electrical or electronic assist, so, E.M., be it virus or antibiotic, looks like it has sneaked-in the life bldg. door marked "viva la" and thus my rapping here now, taking up your time & totally ruining my dreams to obtain the worst-letter-writer award for another year. But it's all your fault, you're the ones with the irresistible threat of "last call", last issue, or whatever, and since so many "blame" me & my big SOB for getting up all this E.M. interest I feel like it's only fair that I con you, at this zero (18th?) hour, to put aside a square inch or two of your valuable 500+ pages in service of this 4th or 5th order cause.

TELL THEM: That none of the existing hardware really does the job. Tell them that they should expect to get more than casually involved with the thinks behind schematic diagrams, those dumb cylindrical-bored valved up clarinet & flute & on why the gods decreed that medium-bright sounds with high energy content around 5KC (I *refuse* Khz, next thing rpm will be called, like 33 1/3 edisons, or eds for short; 15 ips will get 15 magnetophons or mags, for short, humbug!) should sound louder to humans but be more aurally fatiguing, and that they might prepare themselves to dissect any given musical phrase & figure out how to play only certain groups of the notes at a time, over & over into a sel-sync *Ampex* or 3M (If this be eden) so that the final mix-down sounds phrased & shaped with lots of timbral vibrations & tactile organic electronicism, despite (oh shit) the preparation of many hours for a mere handful of seconds of music (sure kills all the magic, I think) but that in E.M. as all art, the quickest short cut is a short circuit to: short on ideas but oh my long on wind (those monsters don't have to stop to breathe, remember?) music, be it on record or on stage. Of course on stage you could get away with less. Probably have to, but if some cat & chick pluck down several of those government issued rubber bands you'd better give them something more than *surface*, unless proper chemical assists are available to get them so high they think your yawns & electronic pharts are sublime & majestically musical.

So, I sound square & stuffy. A regular put-down artist in cognito. The W.E.C. is a "list of tools" and the tools are out there for those who've got. I started with *Viking* tape recorders & *Heathkit* oscillators, cause in those days I didn't have. But, with the two best tools I've ever come across: my hands, I built dumb things that got music (of sorts) down & done. A mention of all the auxiliary hardware that the promising new E.M. enthusiast will

Synthesis

Dear Whole Earth People,

Concerning your question about the relative merits of synthesizers, I think it impossible to answer in less than several hours.

The January issue of a new quarterly entitled *Synthesis* will have articles on the five major synthesizers.

Synthesis is a forum for electronic music and bru-ha-ha beginning in January, 1971.

A small, free complimentary copy can be obtained by writing:

Synthesis
1315 Fourth Street
Minneapolis, Minnesota 55414

Peace, William A. Johnson
(Editor)

need would give a much more honest description of the game than a few promo-photos of the big 5 (approx.). Good speakers (I stubbornly build my own) & amps are, of course necessary if your tape is to sound "as good" on someone else's stereo hi-fi. A friendship with an "editorial" block will prove invaluable. It's equiv. to the editor's blue pencil. Prior to the synthesizer every note (yes, Virginia, even the 16th & 32nd kind) were assembled by the edit block & by a musician/composer who either didn't own a watch or had absolutely no regard for the units it indicated.

And, oh yes, it helps to be a bit crazy. No, let's say a lot crazy. To be sitting here in my west side brownstone in upper 80's Manhattan contemplating the multi-thousand dollars of equipment Rae Elkind & I have been organizing into our new tempi studio & then writing all these put-downs to you, in her home town, makes me feel kinda strange (and being very broke helps). Perhaps that will help the new album. I wish you were closer-by so that you could see just how involved two "art with a capital (fingers crossed) A-artists" can become in this medium. And our only hope right now? Pay the bills & get ourselves a nice quiet geodesic dome (again, thanks to you & Domebook I) down on St. Thomas & get out of N.Y.C. except now and again when that urge/appetite for noise/dirt/culture/thinking/books/concerts/activity calls.

Frankly, you all sound like our kind of people, or vice-versa if that's more right-onish, we'll miss you. Many will. I hope determination, sweat, brains, adrenalin-push, etc. get that last one out. And, if it's not too late, please help get the confusion out of the E.M. scene. Objectivity here is mostly cop-out, but lack of time & help, that I understand. If anything in this garbled mess of a rap is useful, it's yours, no strings— first time I've ever left my hermiting to do it—so; but do credit it with a simple: W. Carlos. Otherwise, all warmest regards from but two more of your fans!

W. Carlos

A.P.S. page of specifics

THE MOOG— I know this unit the best— first met Bob (R.A. Moog's "R") at 1963 AES show. Purchased a small collection of his first 900 series modules & combined into my 1st prototype synthesizer. Paid most of the bill by doing a demo record for Bob & doing music & ex for T.V. commercials. Developed several ideas many now part of standard Moog units which are packaged with (sadly) no choice of components except on special order. The pix of the Moog III you show is 3-4 yrs old. Newer IV is more compact & less blank panels. Portamento & hold circuit originally my concept, but Bob improved it greatly. He built my two touch-sensitive keyboards to spec. and together we got them to work. They're far from good, but do allow the pressure (depth) and momentum (speed) touch of the performer to be used to give feelings of expressive & phrasing, either of the traditional kind or other kind (timbral-vibrotto expressivity, for ex.) Unfortunately, his keyboard supplier changed and the new kinds don't lend themselves to token sensitivity except in the horrid way the Putney does it (more on that later). He uses good controls (ohmiter or AB "pots") and sturdy construction, but relies on patch cords except for a few

basic switch available internal connections (keyboard pitch to voltage-control input on an oscillator, for ex.) in the toxic & polluted N.Y. air the cumbersome patch cords are more reliable than switches, making a Moog for city use a better choice than the Tonus which is nearly all crossbar/matrix switch—interconnected—near but fail unsafe. Moog's 904 filter best voltage controlled version around. I have 3. Also his envelope generators are great, but he underestimates their need. His largest Mark III has but 3 envelope generators on it. I use 8 & still run short. Also, he's great even if slow on custom gadgets; I've got several foot buttons and toe pistons/expression pedals that he built— all good stuff. Logical layouts, too. I also am a nut about all that pretty real walnut for everything, even the custom gadgets. We also concocted a "polyphonic" generator bank, an outgrowth of one of his earlier educational contracts. It's got 49 separate little oscillators—filters—envelopers & permits chords, arpeggios, and the like. It's another one-of-a-kind thing, although he now also supplies a bank of fixed oscillators with no voltage control or enveloping or the like, but it's good for pop-style "vamping" of chords, and at least he has it up for sale. I have two keyboards but despite the 6' x 6' mass of my machine I usually use up nearly all the components on one sound leaving the 2nd keyboard without any resources, so I almost always work one-note at a time. It does give the best control— you can concentrate on one part, like a soloist, and let multi-tracking provide the chords, the density, the orchestration, etc. so far, with only an 8-track I've gotten to 32 parts, with but a few "pre-mixes". That should be enough for anyone, but I'm still eager to work on 16 tracks, more for convenience than thickness.

THE TONUS has much better oscillators than the Moog & gives you 2 notes at a time, with reservations. Otherwise it isn't too different from the Moog. Al Perlemon admits being influenced by Bob Moog. I already mentioned the hazzards of Tonus' switching—"caveat emptor". Also, his walnut formica is a bit less "classy" than Bob's walnut wood veneers. He has a few new ideas— somewhat better wave shape variety, but his filters are not so great, and his envelopers have a more limited range than I could work with, although throughout that range they are good. The Arp, then, could be better than Moog but is not yet, and is about the same price. But again, the biggest is about seven grand and by now my unit is worth over double that, and Tonus doesn't grow larger as conveniently as Moog, so again compromises. But, for concert use, it's probably the best choice & operates about as easily as a Moog, and is quickly learnable (basic techniques, not philis., natch).

The "BUCHLA Box" was built mainly to Morton Subotnick's specs & his group originally at San Francisco. It's better suited to that type of partially aleatoric/partially contrived—planned music that Mort writes. The Electric Circus in town here uses one for ambience, and, with all its automated sequencers it's good for that. The construction and looks are good, but his patching is flimsy and breaks under less-than-cautious handling. Prices are reasonable. However, there is no playing-keyboard of the more or less traditional type, and along with oscillators less stable & less easy-to-tune than Moogs, is not a good device for traditionally oriented melody/harmony/rhythm. Also, unlike Moog's and Arp's sequencers, his are usually evenly spaced leading to, for my ears, a rigid, mechanical rhythmic quality which some people seem to dig.

The PUTNEY is a real toy. It's components are highly unstable/unpredictable, and the selection made is highly gimmick oriented, and does not by any stretch of the mind permit any subtle sounds & exp. to be constructed. It also has a so-called touch-sensitive keyboard, which has to be tried to be believed, it's that awful! No feel or physical feedback at all (as there is on a piano, for example); again, another great concept worked out in ignorance (and the one I tried worked backwards: softer touch—louder sounds!) But it is small & portable & groups might like it for special effects.

The same for several other mini-synthesizers. I won't go into details, but it is sufficient to say that they are not aiming at any degree of sophistication or control. I find the lot of them dull & not worth even their modest costs. Better to save up for a Moog or Arp of moderate size & build it up with time to as large a complexity (or compoundity) as you desire.

Most of these units are not easily compatible with one another, although the hybrid idea can be made to work if one has the necessary knowledge. I'm still waiting for a better state-of-the-art before I part with any more of my bread, however.

On top of this, one must realize that the money trip has just begun, even a used Ampex 4 track costs nearly 3 grand, and another 2 track (preferably) is usually necessary, for at least half that. Most home machines fall flat on their captans in this kind of work. Perhaps the small Dolby-B could help out the limited budget.

There is still a lot of garbage-talk out. The "technical—snow-session" is sadly typical. But who am I to put down folks who dig the magic/mysticism of what I feel is downright quackery? I was sorry to see that new publication jump into that fire. It's like everyone wants to join this or that "avant garde" movement, complete with secret-code type jargon & mathematics of the most pitiful sort (my B.A. in physics-math-music is showing) to "prove" that such and such a dull work is "really interesting". I'd like to see more pioneers of the independent sort, striking out with even makeshift gear to find some personal statement of truth, be it fashionable stylistically or not, but then this seems to be the problem of all music & all the arts in general; electronic music has no monopoly here.

I wish the name "synthesizer" could vanish. Who wants synthetic anything, especially music? The path we are on is (I hope) towards a useful, convenient new musical instrument which employs electronic components to do what physical-components have done for years. It ought to be an outgrowth of the past; I see no skyhook to a totally new music, and the attempts I've heard seem to prove this rigorously. In the meantime I can only hope not too much damage to the image & progress of E.M. will be brought about by the "nonsense-boys", and that some talented "saviors" will find the means & bread to show the way & expose the bull-shit artists for what they are, even to the uninitiated. So, there, my sermon is done. Sorry about that. It's just so damned hard to be objective anymore.

W. Carlos

Music Synthesizers

coming into california out of montana snow a couple of years ago the truck radio started picking up a strange, synchopated, alien, version of "cripple creek." sounded like some human metronome playing a banjo with a waawaa petal inside a boxcar. turned out to be a moog. seems like the synthesizer people should stay away from old standards like "don't step on mama's roses" and develop some sound that fits the tool.

-jd

The Putney looks to be a more modest, self-contained unit, with a lower price range (around \$1000). Write to:

Fig. 6-25. Chart showing the possible direct transformations of the four basic waveforms.

Breathe, Emmit. Suck you in a big lungfull.

Emmit heaved, he bit

Emmit heaved and bit and suddenly raised his head and sniffed and got some air. In, out, he breathed and breathed, and by the time they got him on the sled he had voice enough to argue.

I don't want to go to no hospital.

Well you're going to one whether you like it or not. I should have taken you in a month ago.

Who was that?

It was Leonard.

It's me, said Leonard.

Goddamn you for taking me, said Emmitt. And he looked at D.R. and said goddamn you too.

Oh it was moving swiftly now. Oh it was happening fast. Is this how fast it goes? It's so clear, so vivid, is this how fast it happens? Emmitt's final hours on earth were sweeping through D.R. like some fire, consuming him, filling all his cracks and empty spaces with its rush and flow and go.

There's so much work, so much to suddenly do. It's not about doing. It's not fretting doing. Not talking, nor remembering nor looking forward but DOING. Get him to the hospital, quick,

quick,
off this mountain, into Urge.

Exotic Delicate Harpsichords

I'm a sculptor, actually, but I've lately become involved in harpsichords and clavichords. I got to reading about them, and then started building clavichords, and concentrating on them. I might mention briefly some of the qualities clavichords have which draw me to them. They are, as you probably know, an early keyboard instrument, very simple in principle. When played, they are so quiet as to be drowned out by 2 people talking. They can't be played with another instrument, as they are too quiet, and I seriously doubt that they could be played very satisfactorily in a city, due to traffic noise. But (the delicious bit) they are the most sensitive of all keyboard instruments. You can play with a volume range down to nothing, and you can add vibrato to a note by pressing your finger gently up and down on the key. If you are sensitive, you can feel the vibrations of the string in your finger as you hold the key down. Now here's the thing. Almost everything you see on TV, or read in magazines, billboards, etc. etc. is designed to be seen or read by someone who is not too interested. Commercials must catch the guy just heading into the kitchen, must reach out and grab the listener. I guess one of the big things that turns me on about clavichords is that they make no attempt whatsoever to do this. You must come to them, and you must come on your terms, that is absolute silence. As you play, or listen to one, your level of hearing grows more acute. What sounded like a faint tinkling when you started becomes full, almost loud music. Then, if someone coughs, it sounds like dynamite. I like the idea of small sounds being appreciated, and of great sensitivity, which you must seek out, which is not rammed down your throat. If you approach a clavichord on its own terms, it has a tremendous amount to give.

Now for something of more use to you. In this whole bag of reviving old instruments, there are a number of sources of information. "Three Centuries of Harpsichord Making" by Frank Hubbard, Harvard University Press, 79 Garden Street, Cambridge, 02138, \$12.95, is simply a fantastic book. It describes the technical processes used to make harpsichords (he doesn't deal with clavichords at all) and it is so thoroughly researched it makes your head spin. He spends quite a bit of time with general processes of the time (1500 to 1800) such as how lumber was cut and sold, what sizes of boards could be bought, how common pins were made (you wouldn't believe it!) the tools used, etc. Another great book is "The Modern Harpsichord" by Wolfgang Zuckermann, October House, 55 W.13th St. N.Y., 10011, \$15.00. This deals with instruments being made today. He has good sections on old instruments and practices, then the main body of the book is a section listing modern makers, with addresses, photographs, cockeyed opinions, very good opinions, humorous anecdotes etc.

Makers of modern instruments are all in that book, but you might be interested in some of the more interesting among them, mostly those who make kits.

J. Witcher, Ancient Instruments, 17715 La Rosa Lane, Fountain Valley, California, 92708. This firm is a gas (run by 2 ex-underwater engineers) and they make harpsichords, virginals, clavichords, Gigue, Liri da Braccio, Citterns, Hurdy Gurdies, Epinettes des Vosges, Baroque Flutes, Baroque Oboes, Baroque Oboes d'Amour, Cornetti, mute Cornetti, Rackets, Curtals, and the famed Baroque Bassoon. Honest. Their dulcimers go for around \$30 and \$45. They also make a hurdy gurdy kit \$75 and a table model clavichord kit (\$95 or \$125). Neat guys.

E.O. Witt, Route 3, Three Rivers, Michigan, 49093. He makes a very serious line of harpsichords and clavichords (including fretted clavichords—the only man I've heard of doing that, and in this crowded world if you're the only man doing anything, it's something). He has a good line of clavichords from \$505 to \$1025, and he says he supplies them partially made (all the tricky parts done) for about 2/3 that price. Ditto his harpsichords, at about half price. They look very good.

Herbert Burton, 917 O Street, P.O. Box 222, Lincoln, Neb., 68508, makes a really neat looking harpsichord kit, \$590 complete with everything but liquid finishing materials. He says you can make it in 60 to 80 hours (not including finishing) using no special tools, and no clamps. It is a big, versatile, well designed instrument. He also says he ships kits the same day the order is received.

Zuckermann Harpsichords, 115 Christopher St., N.Y., 10014 is an address I'm sure you know. His harpsichord kit is \$150, produces a rather ugly, squat, unversatile instrument with amazingly loud tone. He makes a clavichord kit for \$100, but all you get is a keyboard, piece of plywood for soundboard, some wire and other odd bits and pieces.

Frank Hubbard, 185 A Wyman St., Waltham, Mass., 02154. Fantastic maker of instruments (all harpsichords). He makes a kit (\$700 for one keyboard, \$900 for two) which is difficult and exacting and only to be undertaken by experienced woodworkers, but which makes an instrument about as good as any you can buy (including the \$4000 ones!) Top of the line stuff, for serious people only.

William Post Ross, 791 Tremont St., Room 515, Boston, 02118, though mostly a serious maker of fine harpsichords, has a virginal kit (snicker snicker) for about \$560. Virginals are rectangular harpsichords, with a rounder, "tubbier", sometimes louder tone than harpsichords. They don't take up much room in a house. His kit produces a historically accurate 18th century Italian instrument.

S.R. Williams, 329 Olmeca Dr., Los Angeles, 90065, makes kits, for a small harpsichord, a triangular spinet, and one or two other things, but I've lost the brochure. They looked good, though, not too expensive.

More stuff. H.L. Wild, 510 East 11 St., N.Y., 10009, is a fantastic source for guitar supplies. He has all the woods (Deluxe German German Silver spruce etc.) necks, rosettes, fret wire, tools, books, everything. Really great. Banjo parts too!

I don't know if you want all this junk or not, but I suspect that the kind of people who want to stop killing, stop eating plastic food, stop building plastic relationships, get off the ladder of success, who want to smell trees, and hear the little noises in the world, would also like to hear and make music, and make their own instruments. If nothing else, out in the boondocks of Kentucky there is a clavichord freak (who would have thought...)

Harold R. Langland
Murray, Kentucky

The Art of Organ-Building

If you like the idea of combining architecture and musical instrument design, this book is the standard of pipe organ construction. Hey Baer, could we drive one with solar energy, or would it only work when the wind was blowing?

TRUMPET. Ger., TROMPETE. Fr., TROMPETTE.— This is probably, taken generally, the most important reed stop in the Organ, adding richness and dignity to every combination of stops into which it enters. So important and useful is a good TRUMPET, 8 FT., that no Organ of any pretension is built without one. The proper tone of the TRUMPET is imitative of that of the orchestral instrument; and there is almost unlimited scope for the skill of the reed voicer in the production of this stop. The tubes of the TRUMPET are of metal and of inverted conical form and normal speaking lengths.

Wooden pipe of a Principal or Open Diapason, 16 ft.

Three Centuries of Harpsichord Making

Have you ever heard a harpsichord? It'll make a gentleperson out of you. For some reason I have this conviction that harpsichord-makers aren't afraid of dying. This book revels in the 16th, 17th, and 18th century. The workmanship and music thereof.

Three Centuries of Harpsichord Making

or WHOLE EARTH CATALOG

In this book my purpose has been to record the traditions of harpsichord making as they might have been transmitted to young apprentices in any one of the several countries in which the craft flourished. I have intended to give enough information to make it possible for builders of harpsichords to base their work on certain knowledge of the designs and methods of earlier makers; to guide players of the harpsichord in their search for appropriate instruments, dispositions, and registrations in re-creating the music of the past; and to serve as a useful body of information for historians and editors of early keyboard music.

Building Electric Organs

Books: Electronic Musical Instruments by Richard H. Dorf (president of Schoeber) is available 1) from

Schoeber Electronics
43 West 61st St.
New York, N.Y. 10023

and 2) from libraries. C. 1968

Frequency Divider Organs for the Constructor (hardbound) and An Electronic Organ for the Home Constructor (hardbound) written by Alan Douglas, published in England by

Sir Isaac Pitman & Sons, Ltd.
39 Parker St.
Kingsway, London W.C.2
England

in preparation, same author and publ; Transistor Elec. Organs for the Amateur. Kits: from

Schoeber Organ Corp.

43 West 61st St.

New York, N.Y. 10023; literature and plastic demo record on request.

Electric Organs

I. "Electronic Musical Instruments" hardbound only, \$10 ppd., is 1) a buyers guide to commercially available organs and 2) an instruction manual on technical aspects of elec. organs generally. Dorf is a leading authority and received cooperation from all the companies whose organs were reviewed.

II. The two books by Alan Douglas are plans, circuit diagrams, etc. for home construction with parts bought at a radio supply store (a complete list of which is in the index). "An Electronic Organ for the Home Constructor" deals with an A.G.O. Standard organ with separate generators for all tones. "Frequency Divider Organs..." involves a more common modern system in which separate generators are used for the highest octave in the organ and all other lower tones are produced by division. Both books deal with tube and valve types; a solid state edition is said to be in preparation.

III. Kits: While the Douglas books all require a rather solid backing in electronics, persons who read English, solder, and have time, can probably manage any organ in kit form. HEATHKIT/THOMAS has two models with an impressive array of gadgets and questionable use musically. SCHOEBER ELECTRONICS has five models, with base prices from about \$500 to \$1850. Numerous money-saving (or cost-spreading) routes of purchase are open, including buying in pieces (in the order you will need them for construction), cabinet kits, buying no cabinet and receiving plans for use with lumber of your choice, addition at a later date of optional equipment (reverb, percussion, etc.) LP demo records available. Literature and plastic demo record free on request.

Zuckermann Harpsichord Kits

I'm an enthusiastic backer of Zuckermann kits for harpsichords and clavichords. Zuckermann levels with you about the difficulties involved, then makes it all easy with good, cheap kits and excellent instructions. The harpsichord weighs about 150 lbs and can hold its own as a solo instrument or in chamber groups. The clavichord is a suitcase-sized delight, very expressive but very soft, quick to assemble, and easy to carry along on trips or to have in a very cramped dwelling. There are more historically authentic kits available, but none that will get you into Renaissance and Baroque music more quickly, more cheaply, and with greater satisfaction. Harpsichord kits start at \$150, clavichords about \$125.

Classic Guitar Construction

This is the only adequate book on the subject in English: it is worth your money even if you don't intend to build a guitar. Every method and tool described actually works, and the design and illustration are of the quality to be expected from a professional designer.

If you can work up your courage to the point of actually starting in, the following is good advice—

- 1) Buy a good 18" straightedge: a 1/4" x 1" dimension-ground steel bar (available from industrial supply houses) is the cheapest way. You need it to get the fingerboard really straight.
- 2) The fret slots must be .025" wide for most fret wire. Ebony is hard and brittle so the slots must be accurate. Most saws sold as "fret saws" won't work, so beware when buying.
- 3) (a) Make sure joints fit as near perfectly as you can make them before gluing.
(b) If an operation doesn't come out right, do it over. Don't let yourself get away with any shoddy work.

The experience of building a guitar is guaranteed to change you, probably for the better.

[Reviewed by David Russell Young]

Guitar sales are soaring as factories in the United States and abroad work at top speed to fill the demand. Unfortunately, fine guitars cannot be made at top speed and mediocrity is the rule. In Spain, \$120 will buy a guitar of a quality that cannot be duplicated in the United States at any price except by a few private luthiers. Hand-made guitars start at about \$500.

Guitar Mold

Hope this isn't too late for the last Whole Earth Catalog. I have an item to suggest for guitar makers— an electrically heated mold with an electrically heated shoe for bending guitar sides and bindings quickly and accurately. They are made of cast aluminum and are thermostatically controlled. The molds were developed by Mr. A. E. Overholzer, 618 Orient Street, Chico, California 95926, who won the annual competition of the International Violin and Guitar Makers Association in 1969. The cost of the mold and shoe is \$150 plus shipping from Chico and insurance. Order from Mr. Overholzer. I can vouch for the mold— on my first try I bent vertical grain rosewood sides perfectly and easily.

Rose-Ellen Leonard
Chico, California

Tune Your Piano

You can do a good job of tuning your piano with a few tools and a little information. The information is in the book How to Tune a Piano by H. Staunton Woodman. The book and the tools are available from Tuners Supply Company, 94 Wheatland Street, Somerville, Mass. 02145. The book, Stock No. 288, is \$3.50. The tools are in Stock No. 5100 Basic Tuning Kit for \$8.00.

To be up to pitch and in tune a piano must be tuned often. How often depends on the amount of use, seasonal humidity changes, and moving of the piano. A concert stage piano may be tuned weekly, but in a home tuning every 3 to 6 months is usually enough.

The usual charge by a piano tuner is \$12 to \$18. This is for placing the instrument in tune with itself, not bringing it up to standard pitch. This takes about two hours work and includes no repairs. You will be able to do the same job in about 8 hours the first time and about 4 after a little practice. But a big saving is yours if the pitch of your piano is flat and you want it pulled up to standard pitch. A tuner will not do this unless specifically ordered as it takes 2 or 3 tuning sessions with a charge to match. You can do the job over a few weeks. All pianos built in this century are designed for standard pitch (A=440) and can be brought up to this pitch with a little work and care.

Refinishing or rebuilding an old piano can give you a good instrument for a small investment. Replacements for broken or missing parts can be purchased from Tuners Supply. Also they will rebuild parts of the action for you if you do not want to tackle this yourself. They do a beautiful job of recovering white keys, one thing that can make an old piano look a lot better.

R.C. Engle
Sioux City, Iowa

What's this you're a putting me in? Emmet wanted to know.
It's a bus, said D.R. I've come from California in it. It's got a bed and everything. Emmet said
He said goddamn you both for taking me.
The doctor said what's wrong? He said, what's wrong, old timer?
They say you can't breathe.
But Emmet wasn't saying. He was captured
He was a prisoner now, he reserved the right to hold his silence, to keep all that he knew to himself, goddamn them all
goddamn
And he said no more, except madly, through drugs and semi-sleep and through the haze of death.
He never said another word he meant to say the three more days he lived.

Up till about two months ago it would have been impossible to even consider listing ourselves in your catalog due to the fact that our instruments were very highly priced; with a long backlog of orders. We felt at that point that we had an obligation and commitment to people other than the large money-making groups and single entertainers (i.e. Bob Dylan, The Band, Richie Havens, John Sebastian, Jake Holmes, Judy Collins, etc.); so we reorganized the shop and started training people in building fine quality, handmade guitars.

We are now in the process of having our catalog printed. For the time being we have enclosed a description and price list of all our instruments: we will try to forward some pictures to you, so that you can see and judge for yourselves our high quality standard.

Yours faithfully,
Michael Gurian

- CL 3** Concert model; Brazilian rosewood sides & back; best quality European spruce top; black ebony fingerboard; Landstorfer machine heads, when available; price, \$525.00

Flamenco

In keeping with the tradition of the flamenco guitar, I have developed a guitar that possesses the brightness and clarity of sound sought after by flamenco guitarists. In addition, my guitars have the sound projection of a classical guitar. For this result, I use specially selected woods for the top, back, and sides. If preferred, the traditional Spanish cypress would be used. As in the classical models, Peruvian mahogany and black ebony are used for the neck and fingerboard. The head may be fitted with friction pegs or Landstorfer machines. This model also has a handmade rosette. The price of the flamenco guitar is \$750.00.

Lutes

1) Elizabethan: This model is constructed with either 7 or 8 courses, depending on personal preferences. Woods employed are Peruvian mahogany for the neck with black ebony for the fingerboard, curly maple for the boat and spruce for the top. Rosettes are designed and handcarved in the traditional manner. The price for this model is \$850.00.

Guitars

Friends: here are a few things you might want to include in your catalog:

C. F. Martin guitars: There are a lot of things to look for in buying a guitar. Some, like the feel of the neck, are really subjective and individual with different musicians. But you also want to know that the instrument will last and improve with time and use. This is where the Martin company comes in. For a long time, they've been making honest, workmanlike guitars. I've had a D-18 for the last 6 or 7 years and it continually amazes me. The tone improves every time I play it. Martins are about the best steel-string acoustic guitars made in any quantity. They're a joy to play. They're not too good for riding freights/bumming because they're relatively fragile, but they hold up with proper care, for a long time.

Gibson Electric guitars: I don't dig Gibson acoustics too much—some people find them really durable but I don't like their tone very much. Gibson electrics are another story. I've had a Gibson ES 335 electric guitar for quite a while. It has a beautiful neck, and will do almost anything in terms of tone production that you want from it. Things to look for in buying one are: 1) a good neck. Gibsons vary tremendously, so be careful. 2) "Hum-bucking" pickups are really the best on the market. Gibsons last forever. Mine's fallen off stages all over the country, & it's still good as new. If you buy a Gibson, try for one over 2 yrs old (pre-1968), otherwise examine the workmanship very critically.

V. C. Squier strings: These strings are really hard to find, which is a damn shame, because they're the best strings made in the U.S. They're smooth to play & will enhance the tone of any stringed instrument. I've only used your guitar strings, but I suspect the others they make (violin, etc.) are just as good. Bug your music store 'til they get some in. Here are some kinds they make: ES-2500: Top! these are smooth roundbound strings, \$5.75 a set (list) & worth it. Also in light gauge, ES-2550. They also make nylon wound electric guitar strings, which I haven't tried. These could be really beautiful strings (ES-8000) V.C. Squier Co. 427 Capital Ave, S.W., Battle Creek, Mich 49016

Stan & Jane Davis
Denver, Colorado

Squier Strings

the reason squier strings are so scarce (and perhaps the reason they are so good) is that v.c. squier co. is a very small operation— only 6 or 8 people. as stan says, though, they are indeed the best string-makers (?) around, and from what i've heard, they offer a service available nowhere else in the country (to my knowledge at least): they will custom-make sets of strings to your specifications. i know of a fellow who gets hand-made smooth round-wound strings with an elliptical core— easy on the fingers.

any guitarist who really knows what he wants will do well to send them a letter of inquiry.

from: Stewart-MacDonald Mfg. Co.
Box 900
Athens
Ohio 45701

They carry a full line of products, have a catalog, and operate entirely by mail. They also seem to give very fast service, and the quality of their products is very good. As they add new items, they publish supplements to their catalog which are apparently sent to everyone on the mailing list.

Stephen R. Monaghan

KROLL GEARED 5TH PEG

The best solution yet for keeping the 5th string in tune. 9 to 1 gear ratio eliminates slipping.

- No. 38—Polished Nickel \$14.50
- No. 39—Gold Plated \$17.00

With Five Star tuning knob and thumbscrew—add \$1.50 to the above prices.

The John Dubroff Instrument Makers List

This arrived late and unexpected, so we're jamming in a piece of it. Why don't you start a Catalog, John.

—SB

This list originally started out with the intention of being "The Great North American Musical Instrument Maker List", but intentions being subject to change without notice (what with area informants, and half the instrument makers contacted, not replying), it has ended up essentially a Promotional Directory to the Central California Way, with a few excursions to Elsewhere in the nation.

Wherever you are, there are a good many more makers of instruments near you than you think. Many of them are like mushrooms, they appear suddenly and don't stay in it, or around, long. Doesn't necessarily mean they do poor work. Scout around, go direct to the source— more fun than buying from a shop.

And catalog collectors, please spare these fellows listed here; none of them can afford your Habit.

cheers,
John

Electric Violin

California

R. Kent Albin
675 Golden Gate Ave.
San Francisco 94102

Guitars: classical, steel string, electric; Electric bass; Acoustic and electric Dulcimers; Electric Violins, violas, cellos, and quintons; Irish harps; Hummels; Lyres; Viol da Gambas; Harpsichords.

Also available are various accessories, wood, tools, and custom made cases. Catalog free. Mail order, yes.

Patrick Armstrong
3052 Telegraph Ave.
Berkeley CA 94705
phone: 549-1604

Harpsichords and clavichords made on order for rent or sale. Payments are around \$20-\$50/month; \$1000 for chavichords, \$2000 and up for manual harpsichords; also pedal harpsichords.

Capritaurus
Box 153
Felton, CA 95018
phone: (408) 335-4478

Appalachian Dulcimers, \$40 up to \$150; custom models also. African Thumb Pianos, \$8; made of mahogany or ash with ten keys. Dulcimer price sheet available; mail order, yes.

Haldon Chase
Rt. 1, Box 122
Paso Robles, CA.

Renaissance instruments: Lutes, Viola da gambas, Italian harpsichords. No catalog; prices vary with individual instruments. Mail order, yes.

John Dubroff
107 Grattan St.
San Francisco 94117
phone: 665-0783

Four-string Dulcimers: \$90; \$150. \$150 model comes with either carved animal head (pictured) or carved scroll. Both models are made large for volume, so that they may be played with guitar. Plucked Psaltries: 16 strings, \$60. Mail order, no.

The Dulcimer Works
1723 W. Washington Blvd.
Venice, CA 90291
phone: (213) 821-8514

Dulcimers: spruce face on all models. Walnut back and sides, \$99.50. Rosewood back/sides, \$150. Three or four strings. Mail order, yes. Steel string guitars soon available.

Childs Family
P.O. Box 482
Soquel, CA 95073

Traditional Appalachian Mountain Dulcimers. The two traditional shapes, three or four strings; \$50 to \$65. Mail order, no.

Steven Freegard
P.O. Box 377
Cambria, CA 93424

Woodwinds: flutes, recorders, double reeds. Exotic and native hardwoods are used for the woodwinds, which are made in any size or scale. When specified, they are fitted in carved wooden cases. Prices range from \$25 to \$100-plus. Catalog no, mail order, yes.

String instruments: All one-of-a-kind pieces, e.g. spike fiddle, large fretted drone, koto-type, etc. These are made from gourds, bamboo, hardwoods, and whatever else. Prices run from \$20 to \$500. Most of these string instruments are too bulky or delicate to mail.

Morris Freeman
P.O. Box 392
Paradise, CA.

Dulcimer: 3, 4, or 6 strings; electric also. Sizes vary, prices also from \$100 to \$200. Mail order possibly.

Dennis Grace
3052 Telegraph Ave.
Berkeley, CA 94705
phone: 549-1604

Dulcimers

I have noticed in the Supplement's to the Spring Catalog some questions Regarding Dulcimers. the following are Four Address which make Dulcimers & Dulcimer Kits.

Here Inc. 410 Cedar Avenue Minneapolis, Minn. 55404	Homer C. Ledford 125 Sunset Heights Winchester, Ky. 40391
---	---

Appalachian Dulcimer Corp. 232 West Fredrick St. Staunton, Virginia	The Dulcimer Shoppe Mountain View, Arkansas 72560
---	---

More Dulcimers

Here are some more dulcimer makers to add to your list in the January and March Supplements:

George Pickow
7A Locust Avenue
Port Washington, New York 10050

George Pickow is Jean Ritchie's husband and they make dulcimers in three shapes (teardrop, traditional, and semi-diamond) and with either 3 or 4 strings. The prices range from about \$40.00 to \$100.00.

The Magic Mountain Workshop
Box 614
Mill Valley, California 94941

[remarks omitted by request of Magic Mountain Workshop]

William Wallace
19 26th Avenue
Venice, California 90291

He makes hammered dulcimers on request for \$100.00. They come with 3 or 4 different types of hammers.

Lynn McSpadden
of The Dulcimer Shoppe
listed in the January Supplement also makes fretless banjos if anyone's interested.

If anyone is interested in making a dulcimer, Howie Mitchell's book, The Mountain Dulcimer— How to Make It and Play It— (After a Fashion) is very good. He's very good for understanding the fret structure and how the thing works. He also has stuff about chorded dulcimer playing and various instruments made from doors and a plan for making a "courting dulcimer" (one played by two people. It's available from Folk Legacy Records, either separately or with a record.

Estelle.

Dear Estelle,

Estelle, honey,

Dear Estelle, I'm sitting by my uncle's bedside in the hospital now. In Blaine, Kentucky. This sweet little hospital where believe it or not I was born about five centuries ago. And my poor old uncle is dying, and I am tending to him while he does. It's after midnight now. We've been here since this morning. And it's a strange

Dear Estelle, I'm sitting by my uncle's bedside in the hospital now. We've been here over twelve-hours, and he's dying.

Estelle

D.R. helped Emmit sit up to pee. He was having to pee every ten or fifteen minutes now. Or at least he thought he had to and each time he thought he had to D.R. had to help him up because Emmit didn't know himself until he sat up, and even if he did know he couldn't say so because he was so far gone in his mind. Drinking and pissing was the treatment. That was it, all right. Flush him out. He was drowning in his own internal fluids and the only thing to do was fill him up and pour him out and that was D.R.'s job and he tried to tell Estelle about it in between the pee times.

He yells water-time! it's water-time! and I look to see which one he means, put it in or take it out. Sometimes he doesn't know himself. Once this afternoon I held a glass up to his mouth and he peed all over the floor. And later after he'd let some out in the jar he turned it up to drink it. His eyes are yellow as lampshades now. I wonder what crazy point of view goes on behind them.

Leonard came and went. I don't know who you are! Emmit yelled. You're a mystery man, what are you doing here? Who's in charge?

I'm Leonard, Leonard said. I'm your friend. I'm your neighbor. I'm taking care of your rabbits while you're sick, do you remember them?

Kill 'em! Emmit shouted. I want all them rabbits dead, do you hear me?

Woodwinds, etc.

I enclose a sheet on my activities, if you can use it. Also an article on baroque shoes for your information.

I have several friends in this area who make harpsichords professionally:

- Sandy Fontuit (sp?), San Francisco
- Richard Mexandu, 1281 Hearst, Berkeley
- Thomas Haynes (my father), 1607 Webster St., Berkeley 94705.

Other early woodwind makers I can recommend:

- Friedrich von Huene, 59 Boylston St., Brookline, Mass. 02146 (I apprenticed with him)
- Sandy Lemberg, 42 Kincaid St., Cambridge, Mass. 02139
- Robert Marvin, 6 Main St., Hoosick Falls, N. Y.
- Hans Coolsina, Oude Gracht 305, Utrecht Holland (I enclose a sheet on his instruments we are importing. He also makes very good cheap recorders \$25. also)
- Klaus Scheele, 2854 Loxstedt, Dunenfahrstrasse 40, W. Germany. Hope this is of help to you.

Best wishes

- C5-24 Bass Gong, 30", w/stand & mallet \$195.00
- C5-25 Bass Gong Deluxe Mallet only \$ 10.50
- C5-30 7" Gong on stand with mallet \$ 15.00

Walton's Irish Harps

The kind of harp that is pictured on the front of the Guinness Stout bottle, on the label. The Irish Harp has had a number of interesting uses, including providing the accompaniment to which the Bard, an important part of the Celtic armies, would curse the enemy during battle. These harps were strung with steel wires, and probably sounded weird.

The Walton's company does not make steel-strung harps however, since we don't sing curses at the enemy in a war anymore. The harps they do make are very fine instruments, however. The quality is rather better than what one would expect of a comparably priced guitar. It is not necessary to be a hibernophile to like the Irish Harp, as it is very easy to learn to play, and adapts well to Simon and Garfunkel, and to most traditional Appalachian ballads. The Walton's company is all kinds of reputable, and it backs up its instruments with a degree of concern for the customer's satisfaction that I have never found in any domestic company.

TABLA DRUMS

— Most popular drum of North Indian classical and theatrical music. While more properly referring to a wooden drum, the TABLA is most often taken to mean a pair of drums, one wooden and one metal. Includes rings and tuning hammer.

- C6-17-1 Tabla Set. Professional \$75
- C6-18 Tabla Drum Case, Fiber \$39

Ceramic Drums

There are a couple of long time potters in Berkeley who have begun in the last year or so to direct much of their energies towards making ceramic hand drums of all kinds. Jill Neff and Peter Overton have produced Taraboukas, Dumbakis (belly-dancer drums), African Talking drums and many primitive, tuneable drums of their own design. I guess what excited me most about what they are doing is that they are into having you come to them with your own design—and working from there. At this point they use mostly goat skin heads, but then again that can be changed by you if you so desire. Prices range from \$15 to \$25 per drum, less shipping charges. Write to them at 2719 Stuart-St., Berkeley, Cal. for more info and a price list. Both Jill and Peter will be out of town until Sept. 1, 1971 but will accept orders after then.

Autoharps

i think autoharps are easier to play than guitars, mainly because the chording is done mechanically. thirty-six strings and twelve or fifteen bars of felt pads. push down a bar, and all the strings you don't want in your chord, are felt padded out, so you are left to figure out how to keep thirtysix strings in tune, and what to do with the hand that isn't pushing down bars. autoharps are cheap: thirty to forty dollars from Wards or Sears.

Bagpipes

For those who may be interested in bagpipes—acquiring them or playing them, there is an excellent company in Scotland:

Hugh MacPherson Ltd.
17 West Maitland Street
Edinburgh 12, Scotland

Importing them yourself is about 4 times cheaper than buying one over here. Furthermore, the quality is better and the service is extremely courteous (although slow). It takes 3 months to get your bagpipe after ordering it. It is worth it however. A full sized bagpipe—full mounted in imitation ivory costs about \$84.52 in American money (at the current rate of exchange) (That's another thing they'll do for you. They'll translate their prices into recognizable money symbols for Americans). In California, a cheap Pakistani imitation Scottish bagpipe costs \$150.00!!! Since MacPherson's things are made of selected African blackwood and constructed with an old fashioned pride-of-craftsmanship, there can be no comparison. Their fanciest, a full mounted model in H.M. silver either chased or engraved costs 170 pounds. (let someone else translate that into dollars.) I asked them for price translation of the low priced models.) Furthermore, they even offer a miniature bagpipe suited for indoor playing for about \$50 (£22 10 0). They sell also practice chanters, instruction books, collections of the Ceol Mor, maintenance accessories and even superfluous goodies like highland costumes for performers. They will send you a catalogue (of sorts) if you write them. I highly recommend the practice chanter for starting. It costs about \$8 for the simplest and will teach you the notes and let you play tunes. An excellent beginners instruction book is the College of Piping Tutor Book I, by Seumas Masneil and Thomas Pearson. Also order extra reeds with your chanter. The plastic types last a long time.

—Tiny Alice
Los Angeles, California

Mittenwald

I suggest the Mittenwald Co. of Chicago, importers of fine recorders and other instruments. The recorder, as most everyone knows, is one of the easiest instruments to learn to play while still remaining a challenge to the virtuoso. They are great fun to play in groups (in "consort"). There is a vast repertoire of music for them. They take up little room and aside from an occasional swabbing and oiling of the bore are practically maintenance free. While cheap soprano recorders are available for two or three dollars, for the person serious in getting going with them, I recommend the Adler or Moeck line of recorders. For really ambitious people there are reproductions of baroque and renaissance oboes, bassoons, shawms, rackets, comets, serpents etc. available on special order.

Shakuhachi

I make shakuhachi flutes. The shakuhachi is Japanese in origin, an end-blown flute tuned to a pentatonic scale. Its music— one of the major genres of traditional Japanese music— flourished during the Edo Period (1603-1867) and lasted well into the Meiji Era. It faded, finally, into relative obscurity when challenged by the pervasive absorption of Western classical forms. Only recently, in Japan, has there been a revival of traditional shakuhachi music. The effect of Western imperialist penetration on indigenous Third World cultures is especially apparent in the case of Japanese music. By the Twenties and Thirties the majority of contemporary musicians were firm in their preoccupation with Bach and Beethoven. Attempts to integrate classical Japanese forms into this scheme resulted in such perennations as grandiose emulations of Western symphonic music. Perhaps less pretentious, but just as perverse, was the incorporation (or exploitation) of traditional music into Pop Culture in Japan. Just the other day I came across a recording entitled something like The Shakuhachi Goes Latin. Well, perhaps Xavier Cugat does play an occasional gig at a zen monastery.

Historically, the shakuhachi went through a number of heavy trips. During different periods it was favored by men of diverse temperaments and ways of life: from mendicant Buddhist monks to lower-class Samurai (who, disarmed of their swords by the Emperor, carried the Shakuhachi as a weapon, a club) to merchants. The appeal of its subtle qualities is near universal.

Before I tell you of my experiences with this flute, I'll quote a very concise description of it by Kishibe Shigeo in The Traditional Music of Japan: "The instrument is made from the lowest section of the bamboo. The average diameter of the pipe is 4.5 cm, and the inside of the pipe is almost cylindrical. . . . The standard length of 1.8 (Japanese feet) or 54.5 cm is used for solo pieces (when played in ensemble with Koto and Shamisen its length is varied according to the pitch of the other instruments) and the pitch of the open pipe, *d*, is regarded as the standard pitch. Five fingerholes, four in front and one in the back, give the following six tones in the standard pipe, *d* (closed), *f*, *g*, *a*, *c*, *d'*. By various fingerings, half-holing, and controlling the angle of the mouthpiece against the lip, all of the twelve tones can be produced. The mouthpiece at the top of the pipe is made by cutting the edge diagonally toward the outside. This type of mouthpiece makes it possible for the player to control the pitch by changing the angle, which in turn produces a delicate change intonation not possible on a Western recorder (blockflute) having a whistle type of mouthpiece. As well as the delicate changing of intonation and various kinds of portamento, the noise of blowing on the edge of the mouthpiece creates an artistic effect. Of course the mellow timbre of the rather thick bamboo pipe is the basic characteristic of the instrument." The inherent dissipation of any attempt to describe the sound of the shakuhachi is brought home forcefully only by the sound itself. In short, one must experience it and then create it himself. My own experience of seven or eight months has been a love affair with this sound. At times, still, it eludes me and laughs at me; at other times it carelessly me. Always, however, it reflects some fundamental aspect of my being. The shakuhachi is a barometer for the soul; it cannot be cheated. It never lies. That is, unless I do.

To get down to business: I was turned on to the shakuhachi by some friends in Berkeley. It was magnetic: a whirlwind romance. This experience, I later discovered when selling shakuhachis, was typical. Before it was introduced to me, I had never heard of it nor read of it in books. Soon after purchasing my first flute, I tried my hand at making one. Other people who came around saw my flutes and went through the same trip I did. The idea of selling them, however, seemed absurd. Most people find it difficult to play at first, usually have never heard of it before, and are otherwise skeptical about this thing which is so simple yet so mysterious. For most people, purchasing one is more often than not an act of faith. (Out on the street selling them I can see that faith in the eyes of those few who fall in love with the sound. The look is one of assurance and certainty. About what I cannot put into words. I have no idea.) In any event, my skepticism proved mistaken. In the months that I have attempted to sell shakuhachis several people have expressed a desire to own one. There seems to be a sizeable demand for good but inexpensive flutes of this kind. But not much of an outlet. I myself know of only one or two such outlets, and they deal with a small clientele on a selective basis. The waiting lists are long; the prices are expensive. What I am proposing to do is provide good inexpensive shakuhachis to those who desire them. It's as simple as that.

One final thing which I would like to emphasize. The flutes I am presently making are not authentic shakuhachis. Avoiding semantic hassles this merely means that they are not made of the root end of the bamboo. Such root pieces already aged (the optimum length of aging is three years for a piece of bamboo that is to be fashioned into a shakuhachi) are very difficult to come by. As such I have been using pieces close to the root. As far as I am concerned the basic difference between such flutes and root-end flutes is largely aesthetic. Of course, the tonal quality of a shakuhachi varies with a number of factors: the size of the bore, the length of the flute, the texture and density of the bamboo, etc. The flutes I have made resemble, in their tonal quality, the mellowness of the root-end shakuhachi. They are fashioned and tuned like authentic instruments. I am presently in the process of trying to score better quality bamboo root pieces which I can age properly, then fashion into shakuhachis. (Perhaps I can run a request in the Catalogue.)

That's about it. There are also a number of books about and recordings of shakuhachi music which I think people may be interested in. These too are kind of obscure and difficult to track down through regular channels. I can provide a list of them if desired.

Violin Repair

I learned violin repairing from a guy right out of a Breugel painting in Boston. Information which he passed along also is useful if you desire to repair a guitar. So— some how to and some where to.

1. Cracks in top or back. on a violin you can take the top off and pull the split together— I would not suggest trying this on a guitar because of various construction differences. Best thing to do is fill crack with shaped splinters of wood (shaped to crack), spruce, or whatever the top is made of. These should be stuck in with a white glue Elmers is O.K. but "Tirebond," (which is slightly yellow (otherwise like elmers) is Best. Can be gotten at some hardware store— look around for it. More expensive but waterproof and strong. If can't find it is made by:
The Franklin Glue Company
Columbus Ohio U.S.A.
eight fluid ounce container (like elmers) @ \$1.40

2. Tiny cracks can be filled with "Tirebond."
3. Broken neck. (guitar) where neck joins body. glue on with epoxy— drill hole and insert 1/2 inch wood (birch usually) dowel. coat the dowel with "tirebond" before you stick in. DO NOT fill hole with glue and drive in peg (dowel) this will give neat demonstration of how hydraulic pressure can split wood. If tremendous strength is necessary use a thick metal screw. (drill out first)

Broken neck other places.
Never have done it but some kind of pin, peg or dowel between the two pieces is highly recommended for finishing materials and glue of other types for use in guitars or furniture (either main business)
H. Behlen Bros. Inc.
10 Christopher St.
New York, N.Y. 10014

ask for catalogue and price list (they are separate) They are prompt. 1-2 weeks. (on east coast anyhow) they make a really beautiful white shellac.

- Home recipe No. 1 for a good violin/guitar varnish
1. combine their "sandarac" resin in a jar with alcohol (rubbing type) enough alcohol to cover the sandarac and 1/3 more.
 2. leave it to dissolve for a week (until it all dissolves)
 3. drain through cheesecloth
 4. combine with equal part of good quality white shellac
 5. Powdered colour can be used with it. (get this at some art stores)
 6. Thin with alcohol

Stephen Till
Concord, Mass. 01742

Then it was water-time again and Leonard went outside while D.R. helped his uncle up and held the jar.

Leonard wanted to know if there was anything he could do. I'll stay with him tonight if you want me to.

D.R. shook his head. I'm okay. I sleep a little, off and on. If you feed his animals I can take care of this end here just fine.

Leonard handed D.R. a ten dollar bill. You'll need to eat, he said. D.R. took it and thanked him and started down the hall. Hey Leonard!

Hey Leonard, I wonder if you'd mind calling Marcella.

Momma already has, said Leonard. She called her this morning.

I'll see you later, D.R. said.

And then it was time to shave him.

Two orderlies came in to shave Emmet, young fellows, not particularly eager for the job. The doctor wanted it done, they said. And D.R. didn't argue. I'll do it.

I'll do it, D.R. said, and he took the tools from the orderlies and they went away.

Scissors.

Comb.

Razor, shaving cream. I'm going to give you a haircut and a shave, Emmet.

Hunh?

Horns, Strings, and Harmony

This is a very clear and fairly comprehensive introduction to musical physics, with suggestions for experiments to be performed by the reader at home. It is a paperback of 260 pages with a good bibliography for further study. The author is a physicist and musician; the book is written for musicians and amateur physics teachers.

There are three main divisions of subject matter:

- 1) Theoretical discussions of the principles of vibration, Chapters II, III, and VII
- 2) Practical applications, Chapters IV and V — the physics of hearing, Chapters VI, VIII, and IX — instrumental design (strings, brass, woodwinds)
- 3) Homemade wind instruments, Chapter X.

Familiarity with algebraic concepts is necessary throughout; access to musical instruments is helpful. Most of the experiments can be done with too much difficulty or expense (whistles, string, beads, etc.). The chapter on homemade instruments is for accomplished wind instrumentalists who are also confident with hand tools.

Fig. 64. Over-all layout of machinery for a Boehm-style flute. The large arrows show the finger and thumb holes, while the numbers refer to particular hole positions as explained in the text. The right-hand part of this diagram also applies to the clarinet.

Thus we see that the real test of a good violin is not in the ears of the listener, but rather in the hands of the player. If he can get the range of effects he wants, without strain, then he has a good instrument. Except in a minor way, by clearing away some of the most obvious stupidities, physics has not been able to help him very much more than has the witchcraft that has grown up lush and rank around this beautiful instrument.

Once again the flute is different from other woodwinds; it needs no bell for two reasons: first because the vibration recipe of any flute, old or new in style, is so lacking in the higher components that very little sound energy is present above the change-over frequency, and, second, the very large holes of the modern Boehm flute serve to cut off the tube so effectively that all the notes think of themselves as coming out of the end of an ordinary pipe!

Fig. 46. The size of a side hole affects a pipe's vibrational frequencies. The extent of the effect is illustrated here by comparing different hole sizes with pipe lengths that give matching frequencies. Each pipe in the lower row has a frequency matching that of the holed pipe immediately above it.

The Acoustical Foundations of Music

Here it is, folks! The hard-core treatment of the physics of music. You'll get the most out of this one if you enjoyed high-school physics. If you hated physics, skip this one and try Horns, Strings, and Harmony by Benade. You may end up with this one later.

Backus put everything into this book that he would like to cover in a college course (for musicians) but couldn't because there is too much of it for one semester. He likes to play with equations, and gives a lot of them, but I couldn't use them to compute the power output of a guitar string. Designers of instruments who want to start from the ground up should read at least parts of this book. A theoretical tool if you're into theory-building; I haven't had it long enough to see if it serves as a useful reference source.

Improvising Jazz

An exceptionally clear explanation and analysis with original examples of the concepts basic to modern jazz composition and instrumental improvisation. But the title is deceptive. Modern jazz is 20th Century harmony superimposed on traditional types of chora progression, and this book should be of use to any student (or teacher) of musical practice.

The fundamental ideas of chord structure, notation, chord progression, modulation, and variation of motivic and thematic material, including a simplified chord symbolism, are presented in edible portions. The discussion of the more exotic concepts of chord/scale relationships, chord superimposition, and functional chord substitution, are among the best I have seen, including college texts. This book is a solid value that becomes more and more useful with every rereading.

What is the soloist doing when he attempts to "build"? Actually the ideal process hardly ever takes place—that is, it is hardly ever the case that a conscientious soloist plays a thinking solo for a hard-listening hearer—but when this does happen, the key process is memory. The soloist has to establish for the listener what the important POINT, the motif if you like, is, and then show as much as he can of what it is that he sees in that motif, extending the relationships of it to the basic while never giving the feeling he has forgotten it. In other words, I believe that it should be a basic principle to use repetition, rather than variety—but not too much. The listener is constantly making predictions; actual infinitesimal predictions as to whether the next event will be a repetition of something, or something different. The player is constantly either confirming or denying these predictions in the listener's mind. As nearly as we can tell (Kraehenbuehl at Yale and I), the listener must come out right about 50% of the time—if he is too successful in predicting, he will be bored; if he is too unsuccessful, he will give up and call the music "disorganized."

Kord

i can plunk an autoharp some,
whistle a little,
used to have a trumpet lip,
but i'm tone theory blind.
Kord is a new music theory practice magazine,
for people who are trying to understand music
while they are plunking and whistling.
looks pretty useful.

Oak Publications

I was interested in your inclusion of autoharps, dulcimers, etc. As an old folkie this warmed the cockles of my otherwise hibernating heart. Well, if'n folks is gonna build or buy these kinda things, they's gonna hafta learn ta play em, I reckon. And for that may I suggest Oak Publications. Their list of books just keeps on growin like Topsy. Among the ones we've used and found valuable are "Note Reading & Music Theory for Folk Guitarists"—a most amazing book. Taught what and why a chord is, also how to create 'em. "Beginning the Folk Guitar," "Folk Singer's Guitar Guide Vol. 1 & 2," "Folksingers Guide to 12 string, as per Leadbelly," "The Art of Folk Blues Guitar," "How to Play 5-string Banjo by Seeger," and "The Dulcimer Book by Ritchie" have also been pretty nice to have around. Frankly, Oak's instruction books are the only ones I've ever seen that I could even RELATE to, let alone learn from, straight forward & well done.

In addition to these fine funky instructo manuals they have lotsa song collections (in case your memories a little fuzzy) for all shades of people. "Reprints from Sing Out" goes on for volumes & volumes, some better'n others (I mean where else can you find the words to "Plastic Jesus"?) and in addition they carry some off-the-wall collections from Russia, France, Egypt, etc. plus books on playing steeldrums (& how to make em), dulcimer, recorder, fiddle, blues harp (another goodie!), even sitar. Most of em are paper, usually illustrated, and around 2.95-3.95. But for my money Oak is THE publisher when it comes to down home funky music. Their address, by the way, is Oak Publications, 33 W. 60th St., New York, N.Y. 10023.

or **WHOLE EARTH CATALOG**

A good final warning in economics is this: things are often not what at first they seem. The following true statements provide examples:

1. If all farmers work hard and nature cooperates in producing a bumper crop, total farm income may fall, and probably will.
2. One man may solve his own unemployment problem by great ingenuity in hunting a job or by a willingness to work for less; but all cannot necessarily solve their problems in this way.
3. Higher prices for one industry may benefit its firms; but if the prices of everything bought and sold increased in the same proportion, no one would be better off.
4. It may pay the United States to reduce tariffs charged on goods imported, even if other countries refuse to do likewise.
5. It may pay a firm to take on some business at much less than full costs.
6. Attempts of individuals to save more in depression may lessen the total of the community's savings.
7. What is prudent behavior for an individual may at times be folly for a nation.

Let us emphasize: Each of the above statements is true; but each is outwardly paradoxical. In the course of this book, the seeming paradoxes will be resolved. There are no magic formulas or hidden tricks. It is typical of economics that anything which is really correct must seem perfectly reasonable once the argument is carefully developed.

At this point it is just as well to note that many of the above paradoxes hinge upon a single confusion or fallacy. It is called by logicians the "fallacy of composition." In books on logic, this is defined as follows:

Fallacy of composition: a fallacy in which what is true of a part is, on that account alone, alleged to be also necessarily true of the whole.

Why study economics, is a famous one given by Lord Keynes. The final lines of his 1936 classic, *The General Theory of Employment, Interest and Money*, consist of a famous passage:

The ideas of economists and political philosophers, both when they are right and when they are wrong, are more powerful than is commonly understood. Indeed the world is ruled by little else. Practical men, who believe themselves to be quite exempt from any intellectual influences, are usually the slaves of some defunct economist. Madmen in authority, who hear voices in the air, are distilling their frenzy from some academic scribbler of a few years back. I am sure that the power of vested interests is vastly exaggerated compared with the gradual encroachment of ideas.

Unless proper macroeconomic policies are pursued, a laissez faire economy cannot guarantee that there will be exactly the required amount of investment to ensure full employment: not too little so as to cause unemployment, nor too much so as to cause inflation. As far as total investment or money-spending power is concerned, the laissez faire system is without a good thermostat.

Limitation in the supply of money is the necessary condition if it is to have value. If currency is so unlimited in amount as to become practically a free good, people would have so much of it to spend as to bid up all prices, wages, and income sky-high. That is why constitutional powers over money and banking are never given to private groups, but are always vested in government.

Many writers have tried to read into economic history a linear progression through inevitable stages, such as primitive economy, feudalism, capitalism, and some form of communism. The actual facts have not agreeably stuck to such timetables; in particular, the mixed economies that dominate the Western world came into being without the permission of social prophets.

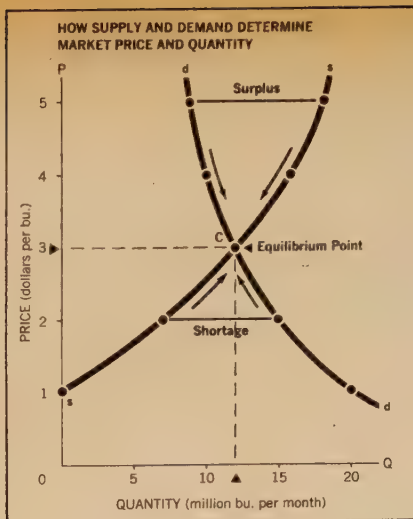

FIG. 4-3. At the C equilibrium intersection, the amount supplied just matches the amount demanded.

At any lower P, the excess amount demanded will force P back up; and at any P higher than the equilibrium, the amount supplied will be excessive and P will be forced back down to the equilibrium level.

Beyond Economics

Since so many of you dwell on the fringes of society, I thought you might be interested in the fringes of economics where Kenneth Boulding thoughtfully paces. Those places where economics meets religion and ethics, meets general systems, social science, learning theory, evolution, and (watch it) politics.

Similarly atoms come and go in a molecule, but the molecule remains, molecules come and go in a cell, but the cell remains, cells come and go in a body, but the body remains; persons come and go in an organization, but the organization remains. What "remains" in the midst of all this flux of components is the "role," the "place," and the relations of roles one to another. A role is a hole, an organization is a related and orderly set of holes, and one sometimes catches a fleeting and slightly night-marish vision of the scientific universe as a set of holes bounded and defined by other holes! The significance of almost anything, like that of a word, is derived largely from its context; everything, however, is the context for other things; context creates itself, *ad infinitum*.

Energy and matter can only be exchanged: knowledge can be produced.

The Communist society is a "one-firm" state—that is, a society organized hierarchically into a single economic organization. It is simply General Motors (or perhaps more realistically, the Pentagon, which is in terms of national income the world's third largest Communist society) expanded to include the whole economy, with the possible exception of a few Nepmen and some surreptitious private trade. A capitalist society by contrast is "ecological" where the Communist society is "organic." A Communist society is a true Leviathan, a vast social whale; a capitalist society is more like a pond with a great multitude of interacting organisms bound together in a system of mutual exchange, or markets.

If a genuine learning process—the continual elimination of error in our image of the world, as well as the enlargement of this image—is to take place, there must be safeguards against rejecting inferences or rejecting the image of the past.

Fleshfeather wants to know

what is postmonetary economy?

fleshfeather

Good question.—SB

Supply and Demand

A briefer, more classic, and earlier account of economic theory is Henderson's *Supply and Demand*.

Bear in mind that economists are created by economies, not vice versa very much. Who does create economies? You. If you don't like the one you're in, invent and perform a better one. Do it informed or do it innocent, either one beats passive complaint.

[Suggested by Steve Baer] —SB

- I. When, at the price ruling, demand exceeds supply, the price tends to rise. Conversely when supply exceeds demand the price tends to fall.
- II. A rise in price tends, sooner or later, to decrease demand and to increase supply. Conversely a fall in price tends, sooner or later, to increase demand and to decrease supply.
- III. Price tends to the level at which demand is equal to supply.

It has become an axiom of business men that, while Governments can manage with more or less competence a safe and routine business like a Postal Service, their success would be unlikely to prove conspicuous in undertakings where the element of risk is great. There, it is said, we owe everything in the past to the enterprise of individual men (for even joint-stock companies have not been notable as pioneers) adventuring their own fortunes in accordance with their own unfettered judgment.

I said I'm going to trim you up a little. Cut your hair, shave all that beard off.

You do and I'll chase you from star to star,

You can't catch me, Emmit, D.R. laughed. I'm one of them crabs, I'm on the moon, too fast for you to catch.

You'll see, said Emmit. You'll see how far your threats and bribes get from star to star.

But Emmit's eyes closed, he fell into a fifteen minute dream, and swiftly D.R. cut his hair, not much, just as much as he felt competent to do with comb and scissors. And then he cut the beard away. Scissors. Comb. And as he worked D.R. saw his father's face take shape before him. The mouth, the little cleft in the chin. They'd looked so much alike, Emmit and D.R.'s father. Royce. Somewhere there was a picture of them together in their Army uniforms, taken about 1944, home on furlough before going overseas, sitting on the front porch of the homeplace, their arms around each other and their cheeks pressed together, mugging for the camera. And they looked so much alike you couldn't tell them apart except that Emmit had on paratrooper boots and Royce didn't. Emmit jumped into Holland, around Eindhoven, with the 101st Airborne, and got wounded there. A head wound. The scar is probably right down there in his hair, D.R. thought. But he had finished with the hair. There was just the beard now. Scissors, comb, he snipped and snipped, and then as Emmit slept D.R. covered his face with lather and carefully shaved him, stroke by stroke, pausing now and then to feel the smooth, clean skin as he cleared it of the stubble.

Technological Checks and Balances

As the 200th Anniversary of the American Rebellion, Declaration of Independence, Constitution, etc. comes by, we can expect some useful reappraisal of the splendid old instruments.

They were an astonishing balance of utopian and cynical, the Federalist Papers, ready to try something new in a big way, and ready to acknowledge and use the omnipresence of unenlightened self-interest.

For politics, for establishing a politically cybernetically stable system, they're still effective.

But for controlling technology, for stabilizing the economy and the drain on the environment, the American Constitution hasn't helped much. Neither has anyone else's.

Fuller suggests that by amassing the technological and resource information and computer-relating it, on-going solutions will be self-evident. I doubt if that will be adequate.

There are inter-relation forms, formulae, missing. Inventions of information structure not yet made.

Since the early 1800's economics has been fiddling around intelligently with self-balancing mechanisms, but still hasn't done the job. Economics by itself is no more of a solution than politics by itself.

It has got to be acknowledged that technology has some self-propelling dynamics of its own that unless turned on themselves will accelerate to destruction like an un-governed motor.

Saying the machine ought to slow down does nothing. The machine must be given the ability to address itself.

The whole machine: from which economics, politics, ecology, computers, and we...are not separate.

If that means new and more encompassing Constitutional models, let's get cooking.

All we have so far is the old perpetually recurrent stabilizing system of internal rivalry. Our technology addresses itself by means of war. That's cool: all systems go in for it. Stable systems have rules, however, and accomplishable tokens of victory and loss. Our present World War system is short on these.

Perhaps our effort should be to civilize war rather than eliminate it.

—SB '71

Fortune

I started reading Fortune magazine after reading a lot of Buckminster Fuller because it was the only periodical with regular informative articles on his level of thinking (world shipping, construction, new industrial processes, natural resources, etc.). What I found was editing and reporting that made the contents of most popular American magazines look like so much paste.

THE WEALTH AND POWER OF THE OVERSEAS CHINESE

Millions of expatriate Chinese knit a strong web of commerce through Southeast Asia, from Burma to the Philippines. They dominate the economic life of villages, cities, and even nations in a part of the world where the native populations, because of cultural attitudes and historical colonial policies, often lack the experience and lust for profit that the Chinese bring to business. In many of the countries where they operate, the Chinese must deal with political instability and corruption, and racial hostility that sometimes erupts into violence. Some hostility also springs from the envy of less successful local residents because the Chinese, by their very enterprise, often preempt the available business opportunities. But as a group they survive and prosper, and many international banks and corporations find the overseas Chinese to be invaluable as managers and allies.

Many of the most prominent members of this international expatriate community, some of whom are pictured in the accompanying portfolio, are men who have been driven from one country to another by war or xenophobia, and who have had to start all over again in a new setting. This ability to build a new fortune in still another strange land is a telling testimonial to their extraordinary determination, and to their acumen.

The Money Game

I have been a close stock market observer for about five years and I am still amazed at the low level and inanity of writing about the stock market. Most books are so narrow and confined as to be virtually useless.

The Money Game is the first really good book about the market that I have found. It doesn't try to tell you how to make money or even how to play the game, but it certainly may help you avoid losing. Its great value is in stimulating the reader to think about himself and his own relationship to gambling and about mass psychology and the way it influences price movements on the market. And it is funny and enjoyable besides.

Really big money is not made in the stock market by outside investors. That may come as a shock to you. You may not even care, since by "really big" I am talking about multiples of millions rather than just, say, one lousy million. It is certainly possible to make ten or twenty times your money as an outside investor in the stock market given enough time, enough intelligence, enough emotional detachment, enough luck, and somebody smart on the other end of the phone. It is possible because a lot of people have done it.

Who makes the really big money? The inside stockholders of a company do, when the market capitalizes the earnings of that company.

Prices have no memory, and yesterday has nothing to do with tomorrow. Every day starts out fifty-fifty. Yesterday's price discounted everything yesterday. To quote Professor Fama, "the past history of the series (of stock price changes) cannot be used to predict the future in any meaningful way. The future path of the price level or a security is no more predictable than the path of a series of cumulated random numbers."

Randomness as a way of beating the market is not limited to academics, of course. Senator Thomas J. McIntyre, Democrat of New Hampshire and a member of the powerful Senate Banking Committee, brought his dart board in one day. Senator McIntyre had tacked the stock market page onto his dart board and thrown darts at it, and the portfolio picked by his darts outperformed almost all the mutual funds. (Senator McIntyre's darts thus supported the random-walk testimony of Professors Paul Samuelson of MIT and Henry Wallich of Yale, given when the Senate was considering mutual-fund legislation.)

Herman Kahn, the wide-ranging savant who heads the Hudson Institute, has observed: "When you ask a European what he does, instead of saying he's a clerk, he is likely to say, 'I'm a motor driver,' or 'I'm a mountain climber.'" Americans are tending in that direction; what a man does with his leisure is perceived, increasingly, as a key to his identity. Boating enthusiasts—nearly nine million Americans own boats—identify themselves as a breed apart from golfers, and neither resembles bowlers or Sunday painters; among boating men, moreover, the sailing fans see themselves as distinct from (and superior to) the outboard-motor crowd.

The psychiatrist Erik Erikson of Harvard, who is perhaps America's leading student of adolescence and youth, has suggested forcibly that the new behavior patterns of the young in the 1960's may not represent any wave of the future at all. Erikson believes that "the available inventory" of pleasure-seeking experience will be tried by the young and found only moderately satisfying, and "new boundaries will then emerge from new ways of finding out what really counts." Their judgment about what it is that "really counts" is perhaps the largest of all the uncertainties about the U.S. economy in the years ahead.

An Alternative Future for America II

What's different about this book of economics is that it was designed by graduate students. Though Theobald is the soloist, the voices of the young generation can plainly be heard. It makes you wish that every author who writes about new ways of coping with the changing world would be forced to immerse himself in the lives of those for whom he purports to make predictions.

Because it reads like a collection of class notes and uncompleted journal articles (all of which is probably true), the book pulled me into wanting to add a chapter or two of my own. That is a delicious feeling, when you have been so many times bored by economics texts.

In fact, the book abruptly ends with a specific invitation to its readers to take some further action. I would hope subsequent editions will continue to have such an open-ended design.

The stuff to "wow" over in the book includes Theobald's high-headed insights into computerized decision making ("There is no doubt in my mind that the computer has been one of the factors that has led us into the present disastrous situation in Vietnam"), and his list of the five traps we've laid for our social system: the war trap, into which we have put all our ultimate sanctions for solving international disputes; the efficiency trap, in which we place man's human value to lie measured against the efficiency of machines; the consumption trap— if it's good, it must have a sales price and be advertised; and the education trap, in which we cement our behavior to the past. The fifth trap never gets listed—see what I mean: "unfinished journal articles"?

Theobald's most orderly work has to do with his persuasive case for a guaranteed income, about which he has written for many years. The potentiality for his ideas during this distressed period of history are ever more dazzling. And in this book, the dazzlement is fully let loose in a series of far-out proposals for experimenting with altered life styles. It may be weeks before I stop trembling. That's why I wanted to add another chapter or two, when I got to the end of the book.

"Our key problem stems from the fact that we have made the value of a man synonymous with the economic value of the toil he performs: we fail to recognize that people should have a claim on resources even if they do not toil. The measure of destruction of our values is, I believe, shown in the fact that those living in an industrial society find it natural that people do not receive an adequate amount of food, clothing and shelter even though there is surplus food in storage and the possibility of producing more housing and more clothing if we gave people the money to buy them. We can contrast this view with that of the so-called primitive societies; in many of these it was literally impossible to starve unless the whole community was starving. George Peter Murdoch, the celebrated anthropologist, described the reaction of one group of natives when he tried to explain the problem of the poor in Western countries. There was stark disbelief: "How can he have no food? Does he have no friends? How can he have no house? Does he have no neighbors?"

We can anticipate the organization of what I have called "consentives": productive groups formed by individuals who will come together on a voluntary basis, simply because they wish to do so. The goods produced by these consentives will not compete with mass-produced products available from cybernated productive organizations; the consentive will produce the "custom-designed" goods and services which have been vanishing within the present economy.

How To Become a Non-Profit Tax-Exempt Corporation, and Why, and Why Not

It's not as hard as you think.

A lot of people come to Portola looking for shelter here for their educational or other do-good project. Mostly we advise them to start their own scene.

We asked the Law Commune in Palo Alto to write up the basic information, which follows. —SB

SOME PRELIMINARY QUESTIONS AND ANSWERS ABOUT NONPROFIT CORPORATIONS*

What is a nonprofit corporation?

A corporation is a separate legal entity which the law allows to be created for the purpose of doing business. In the eyes of the law, a corporation is a separate "person" who has its own debts, owns its property, and pays its own taxes, and who, unless dissolved by its owners, lives forever. Nonprofit means that none of the owners, or "members" receive any financial gain or profit from the work being carried on by the corporation. This does not mean that officers and employees of the corporation do not receive salaries, it means that a nonprofit corporation does not have "investors" who in the case of a regular corporation would buy stocks or bonds in the corporation and receive a dividend or some other financial return on their investment. Instead of selling stock to stockholders, who are the "owners" of a regular corporation, a nonprofit corporation sells or gives "memberships" to members. These members do not receive dividends but they do perform the acts of ownership normally carried out by the stockholders, such as electing the board of directors. The Board of Directors has the duty of watching over the business of the corporation, making the major decisions, and of hiring the officers of the corporation such as the president, general manager, and executive secretary who carry out the day-to-day business of the corporation.

What are the advantages of forming a nonprofit corporation?

The advantages of operating through a corporate structure are all based on the concept of the corporation's being a separate person. As a separate person the corporation remains no matter what individuals come and go. Most important, the corporation's liabilities are separate from those of its owners or employees. Thus the corporation's debts cannot be collected from any of the individuals connected with the corporation, unless a creditor can persuade a court that somebody set up the corporation for the sole purpose of dodging personal debts. If the corporation goes broke nobody can get at the personal possessions or money of the corporation's members. If an employee of the corporation causes serious damage in a traffic accident, the corporation will have to pay damages, but none of the other employees and none of the owners will have to pay the damages, even if the corporation itself is unable to pay.

The advantages of making the corporation nonprofit has to do with tax status. As a separate person, a regular corporation must pay its own taxes on its income, but if a nonprofit corporation qualifies under Federal standards, it does not pay income taxes. Thus if a labor union or an educational magazine, both of which are nonprofit corporations, have more money coming in than is going out, neither will have to pay the usual corporate income tax. Again, this corporate income shouldn't be confused with the salaries of individual employees which are still subject to personal income tax. Another tax advantage is that individuals who donate money to certain nonprofit corporations can receive personal tax deductions for their donations.

Another advantage of a corporation is that its very existence lends stability and respectability to your enterprise, especially in the eyes of people like bankers and local storekeepers who hand out things in credit.

What are the disadvantages of having a nonprofit corporation?

You will have the initial expense of forming the corporation. Although there are manuals available most groups will have to hire a lawyer to do the legal work and he/she will charge a minimum of several hundred dollars unless you can persuade him/her to do the incorporation as a public service (not likely). As a corporation you will have to keep careful financial records and file detailed tax returns concerning the corporation's finances. Incorporation means that you must in some way show proof of observance of specific regulations and formalities, for example, regular meetings of a board of directors; it also means someone will be watching to see that you do things like make payroll deductions, pay unemployment insurance taxes, etc.

There are other less tangible drawbacks. Persons working for the corporation will have to act with a high degree of care, since their actions can put the assets of the whole corporation at stake, for example in the traffic situation described above. Incorporation means your enterprise will have a higher degree of visibility both with the community and the government. The existence of a corporation may increase the likelihood of its being sued. For this reason, most labor unions are not incorporated. Certain people such as internal revenue agents and the state attorney general will have the right to be snooping into your affairs, if they think you are violating the purposes stated in your Articles of Incorporation or to check out any information in your tax returns.

What exactly is involved in formation of the nonprofit corporation?

As was already stated, you will almost always have to hire a lawyer to do the formation, but you should have a clear understanding of what he/she is up to. First you will have to select a name for your corporation and register it with the state—in California, specifically the office of the secretary of state. You will have to choose three or more people to act as "Incorporators". Their duties are to sign the articles of incorporation, and act as the board of directors at the first meeting of the board of directors. They may then resign and elect a new set of directors who will act as the board from then on, or they may themselves continue to act as directors. It should be noted by any potential directors, that they are required to exercise reasonable care in running the corporation and if they fail they may be held legally responsible for mismanagement.

You will also draw up Articles of Incorporation. The law requires that these articles contain the name of the corporation, the names of the incorporators, and the county where the principle place of business is to be located. Most important these articles must state the specific primary use or purposes for which the corporation was formed. These purposes must be carefully chosen since they are the most important consideration in determining whether the corporation will be granted

nonprofit status for Federal tax purposes. Some time during this period, a set of by-laws will have to be drafted. The by-laws set out the rules for governing the corporation, for example, how are the directors to be elected, how are the meetings of the board called, when are meetings of the members to be called, what is the price of membership, what classes of membership are there to be, etc. In a small corporation, such questions are mostly formalities and standard forms can be used. The Articles of Incorporation should be done first since the corporation's life begins when the Articles are filed with the appropriate state agency. Sometime during this period also, you will want to apply to the Internal Revenue Service and to the appropriate state agency for a determination that the corporation will be exempt from taxes. On the average, if there are no complicated tax problems, these procedures will take about (ask Charlie).

This answer, and subsequent answers do not apply to charitable organizations such as the March of Dimes, whose regulation is both different and a great deal more detailed. Also, California considers co-operatives to be a special type of nonprofit corporation, and has special rules concerning their formation. Unlike other corporations, the state does not give the parties freedom to choose their own Articles and by-laws, instead it specifies such things as what type of officers there will be and how they are elected. However, a co-operative is also allowed to distribute some types of dividends to its members. There is another special incorporating procedure which allows the head of a religious organization to act himself in a corporate capacity. It is called a "corporation sale".

Once the corporation has been formed, you will not have to file any continuing types of reports other than tax returns. The only exception is if it becomes necessary to amend the Articles of Incorporation, which shouldn't happen unless the corporation goes through some type of major changes in its purpose for existence.

Could you explain more about the tax angles?

As was mentioned before, the Internal Revenue Service will tell you before you begin operating as a corporation whether you qualify for the various tax exemptions available to nonprofit corporations. This saves you the trouble of going through the whole procedure of formation, if you aren't going to get tax advantages.

Federal exemptions for nonprofit corporations are set up in specific categories. The most advantageous category is for "religious", "charitable", and "educational" organizations. Not only is the income of corporations within this category tax exempt, but unlike all the other categories, persons making donations to these corporations may receive tax deductions on their personal income tax. However, corporations in this category have a very important limitation on their activities; they may not participate in any political campaign, lobby for specific legislation, or otherwise engage in active political activity. This is the reason that the IRS has taken away the Sierra Club's tax exemption.

All the other categories allow the tax exemption for the corporation's income but do not allow donors to deduct their contributions. These categories include organizations dedicated to "social welfare", business leagues, social clubs, labor and agricultural organizations, credit unions, and farmers cooperatives. Exemptions from state income taxes usually are modeled on the federal laws. For most of these categories, any "unrelated business" carried on by the corporation as a subsidiary to its main purposes, for example a college bookstore, is subject to tax on its income. (Whole Earth pays taxes on its store and mail-order operation.)

In California, a few types of nonprofit corporations are also exempt from property taxes, these are, religious, hospital, charitable, scientific, and some types of higher education institutions. For all of these tax exemptions, the corporation will be required to file detailed informational tax returns showing that the corporation is not violating its exemption. Of course, if the IRS or state agency feel that the corporation has violated its exemption, it will investigate further and if not satisfied will remove the exemption for a period of time until the violation has ended.

How much of a problem is it to dissolve the corporation?

A corporation remains legally alive unless the formal procedures of dissolution are carried out. Thus if you form a corporation and later it ceases to do any business or carry out any activity, that in itself will not dissolve it. Since the members are considered the owners of the corporation voluntary dissolution can only occur when 50% of the members vote to dissolve. A formal certificate must be filed with the appropriate state agency showing that such a vote has occurred. The Board of directors must then follow a set of procedures spelled out in the laws. This process is called "winding up" and includes terminating business relationships, paying all bills, and dividing up whatever is left over among the members. The corporation then ceases to exist once a certificate of winding up and dissolution has been filed with the appropriate state and county agencies. Like formation, you will probably have to hire a lawyer to do your dissolution.

There are also several types of procedures for getting a court to order dissolution. These are generally termed involuntary dissolution, and are of course expensive since they go through a court. The directors of 1/3 of the members may ask the court to dissolve if the corporation has not done any business for a year, if there has been serious mismanagement, or if there is a serious deadlock among the directors.

What alternatives to formation of a nonprofit corporation are there?

The most important alternative form of enterprise is a nonprofit unincorporated association. The main difference is that the association has no separate legal existence. Thus any debts and other liabilities of the association can be collected from the individual active members of the association. As was noted in the case of labor unions, this may be an advantage. Furthermore, the modern trend of the law has been to give associations many of the advantages formally held only by corporations. For example, associations can now own some types of property in their own name, and can sue and be sued in their own name. Associations may apply for the various federal and state tax exemptions in the same way that a corporation would.

Law Commune

Palo Alto, Ca. 94301

Ayn Rand says the dollar sign insignia was arrived at by superimposing the U and the S of United States. Means US.

"If there are no complicated tax problems, the attorney should complete incorporation procedures within a month. A ruling from the IRS should take about three weeks more, once incorporation is completed. The most important factor in determining the length of time everything will take is how quickly your attorney works."

—Charlie

One Dollar Lawyer

Some of us choose to deal with money. The best book I have found on the subject is *How To Avoid Financial Tangles* by Kenneth G. Masteller. This book is not quite as good as having a lawyer, but then I talk to a lawyer frequently and I learned a lot reading this book. (I have the one volume edition so the following may be a little mixed up.) Volume I is on property, joint ownership, Automobile and Fire insurance, and financial relationships. Volume II is on Wills (including directions for making, signing, and witnessing a will), life insurance, and Income, Estate, Inheritance, and Gift taxes. Volume III is for widows. You can do most of the legal bit yourself with this book, and if you need to see a lawyer, you know why and what to talk about. \$1.00 per volume from American Institute for Economic Research, Great Barrington, Mass. 01230. Please note I am not recommending their books on investing. The only complaint I have is that this used to be available for \$1.00 total, and these people are always screaming about inflation.

Walter Groch
Berkeley, Calif.

Emmit felt his face. He rubbed his cheek with his hand, then both cheeks at once with both his hands, and finished smiling. Did you do that? he asked.

Yep.

Are you the one in charge here?

D.R. said he was.

Can I dream away the sky?

You can dream away the sky and fill the gap with blossoms, Emmit. You can do anything you feel of a mind to do, old friend.

I'll dream the sky away and think about the honey-pond and fritter-tree, Emmit said. That's a land, you know.

I might dream along with you after while, said D.R. I'm pretty sleepy.

Don't go to sleep, said Emmit. That'd violate the other custom.

What custom is that, Emmit?

A trustworthy man on guard! said Emmit, and for the first time since they'd been there, he laughed.

D.R. tried to tell Estelle about it, the shave, and Emmit's face, so much like his father's. But that was too particular, too precise a thing for him to have enough words for. What he did have words for was an image of how it felt to be there in that hospital like he was. He said, one of the men in Emmit's ward has been here four months now, and another almost three, and I know that to them a day and a half can't seem like a very long time. But it's some kind of infinity for me. I haven't slept at all except little naps in my chair, and once last night for about an hour lying on a gurney in the hall. It's very informal at night. It's a small place, and nobody ever comes on heavy muck. You can stretch out where ever you can at night and nobody seems to mind. I have the keenest sense of this place as a secret city hidden from the world. And all the people in it are perpetually stoned on the activity of the city, which is suffering, and coping with suffering. Some of the suffering is birth and some of it is death, and endless different points in between. After a day and a half here, round the clock, I feel as if we've all been here all our lives, together, as if we're all warm and comfortable inside this strange cloak. It's like I'm wearing this hospital, as if its atmosphere and its routines, night and day and day and night, people coming and going, the change of shifts, the long passing of the night and then the day, is all some kind of magnificent garment I've put on. And Emmit is in it with me. We're all in it, doctors, patients, nurses, visitors, secretaries, everybody, and it's as if we all like being here in one another's company, collectively.

* Except for tax questions, which concern the federal government, each state has its own laws regarding corporations. These answers are based on California law, but at least in regards to these general questions, the reader can assume that his state has similar or analogous laws.

ECONOMIC\$

Nineteenth Century Token Coinage
W.J. Davis
1969; Seaby, London

A Tool for Experimental Economics

TOKENS

In Las Vegas and Reno, tokens (called "tokes") are the money of the casinos. On the tables and the slots they work like dollars. Turn your cash into pretty bits of plastic, and easily spend your plastic. With the forthcoming return of "silver dollars" (like dollars this summer), the token traffic may subside a little.

In Nevada, tokens aid irrational behavior. At a mental hospital in Illinois, tokens have proved to be a powerful incentive to sanity. By putting the patients of one ward (a picked set of "incurable" or "incorrigible" ladies) on a token economy, the experimenters found they simply solved 2 basic problems of treatment—how to reinforce (reward) sane behavior, and how to encourage real transaction between a sick patient and the real world. The patients were paid for small items of self-care (grooming, bedmaking, etc.), for chores on the ward (filling the coffee urn, setting table, assisting nurse, etc.), and for off-ward jobs (cooking, clerical, laboratory, etc.). With their tokens they could buy privacy (personal cabinet, screen, rent on preferred room, personal chair, etc.), goodies from the commissary, leave from the ward, exclusive use of the TV, etc.

The book, *The Token Economy*
A Motivational System for Therapy and Rehabilitation
Teodoro Ayllon, Nathan Azrin
1968; 288 pp.
\$4.95
from:
Appleton-Century-Crofts
440 Park Ave. South
New York, NY 10016
or WHOLE EARTH CATALOG

is a dry technical book but sensational if you're interested in miracle cures, social cybernetics, whole-system education, or experimental economics. It's like an X-ray of economic civilization. The crazy ladies—and all of us, once you notice—are seen to swerve their behavior enormously with minor easily made shifts in assigned values and transactional opportunities in the ward. Yet much of what goes on is determined by derived value, by what the ladies really want. They gain a power in their formerly powerless environment. I'm grateful to Jay Baldwin for telling me of this book.

If a school or a community goes onto a token economy, they suddenly become much more of a single entity, more inter-related, and more distinct from the rest of the world. The closeness has little to do with space. One of the qualities of money is the way it spans distance and time.

Companies used to pay workers in tokens that were only good at the company store. The company profited twice. That system inside out might be a community co-op which sold at cost only to token holders, that is to sustainers of the community.

Reportedly, schools that have gone in for simulation games have had considerable success with economic games involving token money. They gradually expand from one class to incorporate the whole school and eventually the kids' homes.

I know of no examples of tokens being used for economic experimentation. But how quickly you could establish a sub-economy, directly related to the big economy, yet differently structured. It would be completely measurable, and therefore precisely adjustable. You could know exactly the relation of your mutant economic system to the normal, and gauge your wholeness and independence, or balance and success.

As for legality, the only regulations I've been able to find are: your tokens can't resemble US currency (that's counterfeiting), and they can't have a dollar and cent value indicated on them. There may be other regulations.

One good source I know of for beautiful money is Remson Wood of Riderwood, Maryland. He makes diffraction grating disks with whatever imprint you want. Rainbow money, cheap.

Subway tokens. Subculture tokens.

—SB

A state mental hospital is a severe testing ground for any theory of human behavior. Almost every conceivable behavioral difficulty can be seen there, often in its most extreme form. Senile disorders, neurological disorders, adolescent problems, employment problems, sexual difficulties, addiction, alcoholism, general disculturation, intellectual retardation, and neuroticism converge and interact in one community. To gaze upon this multiplicity of disorders and problems is to be overwhelmed by a sense of hopelessness and helplessness. Any simple answer that one might consider for the problems of one patient seems irrelevant for other patients. Theories of human behavior which have been so relevant in treating neurotics, such as psychoanalysis and non-directive therapy, flounder when encountering the institutionalized psychotic. It seems that every type of explanation has already been proposed, applied, and found wanting in its general application, including psychotherapy, group dynamics, recreation therapy, vocational therapy, drug therapy, etc. One feels compelled to do something—anything—to assist this forsaken segment of humanity. One might feel that if only the individual could be made to talk out his problems, then some cure might be achieved. Yet, a large segment of the patients will not listen, much less respond, to any conversation. How can we achieve therapy by having the patient reach an insight into the meaning of his hallucination when there is not even sufficient motivation for him to listen to the therapist? How can a vocational therapist pry a patient loose from his psychosis by interesting him in learning a vocational skill when it is not even possible to interest the patient in eating to stay alive? Where does one begin in imparting a sense of personal identity and worth to a patient that has been inconceivable for 10 years?

...Psychologists and psychiatrists alike have fled from this graveyard of psychological theories, leaving only a small but extremely dedicated group of psychologists and psychiatrists to deal with these problems. The ratio of patients to psychologists or psychiatrists in a mental hospital, where the need is greatest, is often in the order of 1000 to 1.

...The large mental hospital is a testing ground for psychological practice as well as theories. Any general procedure that is found to be effective with the great range of problems encountered in a mental hospital will probably find great applicability in many different disciplines concerned with human behavior. A method of controlling the aggressive outburst of the destructive patient would seem to have great relevance for the control of criminal behavior outside the hospital. Similarly, a procedure that could motivate a vegetative psychotic who has been hospitalized for 20 years might be appropriate for motivating a high school dropout to return to his school. A procedure that motivated a withdrawn patient to seek out the company of other patients will probably have some relevance in building social habits in school children. A course of action which enabled a congenitally retarded child to function in some fashion should surely have some message for developing improved methods of teaching a normal child the multiplication table in a more efficient manner. From this point of view, the mental hospital provides a challenging opportunity to devise totally new psychological and educational procedures in spite of the adversities that such an environment seems to present...

The procedure for adjusting the earnings for each job was in terms of supply and demand. Those jobs for which many patients volunteered were assigned a smaller number of tokens. The jobs for which few patients volunteered were assigned a sufficiently large number of tokens to ensure the selection of the job by at least 2 patients. Periodic examination of the number of individuals who selected each job led to periodic revision of the number of tokens given for it. Other considerations such as the presumed difficulty or the duration of the job were not factors in assigning a given pay to a job. In fact, some jobs that were fairly demanding physically and that required about 3 hours through the day for completion, such as sweeping the floors, earned only about 5 tokens since many patients volunteered for those positions. A job that earned a large number of tokens but for which there were few patients who qualified for it was the job of tour guide. This job required only about 10 minutes for completion yet earned 10 tokens. The procedure minimized the dangers of personal idiosyncratic evaluation of what a given job should pay. If a particular job involved certain features that were considered highly desirable for a given individual, the earnings for that job were arbitrarily adjusted upward in order to ensure exposure of the patient to that job....

Prices for each of the reinforcers were based primarily on supply and demand. Some kinds of reinforcers were necessarily limited because of considerations of space. Not all patients could sleep in the same well-furnished dormitory room. The opportunity to go by bus to a nearby town was necessarily limited by the size of the bus. Because of time limitations not all patients could speak to the ward psychologist or the social worker as frequently and as long as they might care to. In such cases, the cost was adjusted upward to the point where the number of patients selecting the reinforcer did not exceed the supply of the reinforcers. If the reinforcing items or activities were available in a greater quantity than was being utilized by the patients, the cost of that item was revised downward. Periodic and regular review of the number of patients requesting each item was made in order to assure the full use of all available resources and reinforcers. Some reinforcing activities had no limitation of availability. For example, as many patients as wanted could go to the movies and dances, attend religious services go on walks, etc. Consequently, most of these items were given a cost of only one token to provide maximum opportunity for the patients to obtain these reinforcers. Sometimes therapeutic objectives dictated that a given individual should be exposed to a reinforcer that he could not afford. In such cases, the cost to that individual was reduced to an amount that was sufficient to motivate the individual to select that reinforcer. For example, at one time to encourage a mentally defective patient to have more interaction with the supervising ward psychologist, the usual cost of 20 tokens for an interview was reduced to one token.

...The primary function of the tokens was to bridge the delay between the response and the delivery of the reinforcement. The tokens also provided an objective record of reinforcement delivery and permitted an objective check by the supervising personnel on the appropriate occurrence of the conditioned reinforcement procedure. Also, the attendants did not have to be concerned about voice tone or facial expression as they would if they were delivering a social or a verbal type of reinforcement. From the patient's point of view, the token provided an unambiguous indication of approval independent of the attendant's particular mood or whim at the time of delivery. Further, the token procedure limited the need to discover what reinforced the patient when the response occurred. It was necessary only to deliver the tokens and allow the patient complete self-expression of her individual preferences at a later time when the token could be exchanged for a wide variety of different reinforcers. (Ferster, 1961). Most important, the objectivity of the procedure guaranteed that the patient would be reinforced even for minimally useful responses, thereby freeing the attendants and the staff from the need to define what was normal or worthy of being rewarded. The effectiveness of the reinforcers program was not restricted by any identifiable trait or characteristic of the patients...

Token (A.S. *racen*, a sign, symbol): (i) A token in numismatics is a piece of metal, in size, shape, and type resembling a coin, issued usually without government authority, and generally at a time when coin of the realm is in short supply; it is intended as a pledge to be redeemed either in goods to the value it represents or in corresponding coin of the realm. It is usually of lower intrinsic value than a coin. In the Middle Ages base-metal spurious coins were imported into England from the Continent (see *Sparious*) and the brass *Jatons* or *Nuremberg Tokens* (q.v.) would serve as small local change in the neighborhood of a monastery. Owing to the growth of trade in the sixteenth century, considerable inconvenience was experienced in the lack of small change. To remedy this, traders themselves started to strike small token coins in base metal.

In the time of James I, the Government took things in hand, and issued *Harrington farthings*, as an official token coinage. These, however, were extremely unpopular. They showed a handsome profit to the instigators and no small loss to those who had to use them. During the whole period of the Commonwealth no copper coins were issued, but an enormous number of private tokens were struck by municipalities, traders, tavern keepers, etc. It is estimated that over 20,000 different types were issued from 1648 to 1672. In Evelyn's *Diary* we read of the tokens issued by every tavern "payable through the neighborhood, though seldom reaching farther than the next street or two."

Such common inscriptions on them as FOR Y^o BENEFIT OF Y^o POORE show that they were essentially a poor man's coin. They are usually circular, but square, heart-shaped, lozenge-shaped, and octagonal tokens are common. Penny tokens are known, but the usual values are halfpennies and (more frequently) farthings. They are usually dated, and give the name and town of the issuer. Often they bear the initials of the issuer and of his wife, sometimes joined by a "true-love" knot. In 1672 Charles II issued the first regal copper coins, and the making of private tokens was prohibited by proclamation, in August of that year.

(ii) *Eighteenth-century Tokens*. Between 1755 and 1769 no regal copper coins were struck. Halfpennies and farthings were struck 1770-75, but in no great quantity, and no more copper coins were struck until 1797. In 1787 local issues by private companies and corporations began with the Anglesey penny and halfpenny (q.v.). About the same period, John Wilkinson struck his well-known "Iron-Master" Tokens, bearing his portrait, and on the reverse, a steam forge.

Eighteenth-century tokens abound in mythical types (Bladud, Prince of Bath, Lady Godiva), historical (King Alfred, John o' Gaunt, Queen Elizabeth, Isaac Newton), contemporary notoriety (Nelson, Earl Howe, William Pitt), literary characters (Shakespeare, Dr. Johnson), politicians (Thomas Hardy, Horne Thomas).

On the social side we find bathing machines, mail coaches, and ships of all types depicted. Some tokens are in the nature of advertisements (Lackington the Bookseller and his "Temple of the Muses"), vendors of boots, gloves, umbrellas, fireplaces displaying their wares. Some are architectural in type (cathedrals, shire halls, guild halls, bridges, canals, town crosses, Newgate Jail). Many of these were evidently struck more as collectable curiosities and souvenirs rather than as currency. For this reason it is easy to find pieces in uncirculated condition. PRIVATE TOKENS were also struck in limited numbers by individuals as numismatic oddities, and for gifts to friends. The large issue of regal pennies and twopenny pieces in 1797 brought the series of eighteenth-century tokens to an end.

(iii) *Nineteenth-century Tokens*. As the Industrial Revolution swept over the country, so supplies of copper coins, needed to pay the thousands of workers entering the new factories, dwindled, and in 1811 a number of private firms began striking the larger penny tokens. Such tokens were declared to be illegal in 1817, though tokens of the Birmingham Workhouse and Sheffield Overseers of the Poor were allowed to circulate for some years after this date, owing to the great quantity which had passed into circulation. Silver tokens began to be issued as early as 1804, but most of these are dated 1811 and 1812. They are mostly sixpences and shillings, though pieces of higher value were sometimes issued. (See also *Bank of England Dollars; Dollars; Countermarked*.)

In the United States large quantities of privately issued tokens were struck during the economic distress of the 1830's (see *Hard Times Tokens*). Several decades later thousands of different kinds of tokens made their appearance during the Civil War because the official coinage was hoarded (see *Civil War Tokens*).

Private tokens were widely used in Canada even after the introduction of official coinage in the nineteenth century (see *Canadian Tokens*).

Two-Factor Theory

There is a conspicuous void in the arguments and the programs of the counter-culture groups of this country, in that they have produced no well-formulated economic theories.

Unfortunately and ironically, Lou Kelso, who has some very imaginative economic proposals, has been offering them for many years to the establishment, the dinosaur culture.

Kelso has long ago perceived the obsolescence of prevailing economic doctrine that deifies labor as the single component of capitalism. He correctly argues that machinery, land, structure (that is, capital), produces wealth in the same way that human labor does. He calls this insight "two factor" economics or "universal capitalism", and since it recognizes the emerging importance of technology, and accepts the diminishing necessity of human labor, it is an economic theory that is beautifully tailored to the values and beliefs of most CATALOG readers and those seeking alternatives to dinosaur existence.

Kelso's book struggles manfully with practical solutions, including a Second Income Plan, a Capital Diffusion Insurance Corporation, and even a proposed Full Production act of 19—.

These proposals have been laid on presidential candidates, congressmen, newspaper publishers, leading economists, and nearly all key decision makers of the establishment over and over again.

So either Kelso is a lousy salesman or the dinosaurs are convinced their own designs will see them through.

My advice to Lou is: "Come on, Lou, grow long hair, drop all that establishment costumery, immerse yourself in the now generation, and start to work with a constituency that wants you and needs you. If you don't some bright young radical economist certainly will."

or WHOLE EARTH CATALOG

The theory of universal capitalism makes two assumptions about the good society. One is that its most important value is freedom. Any society seriously caring about freedom must structure its economic institutions so as to widely diffuse economic power while keeping it in the hands of individual citizens. Nor can freedom in an industrial democracy be long maintained unless the economic well-being of the majority is reasonably secure. Never in history has universal suffrage been built on a sound economic foundation; it is this defect, not the ordinary man's inability to cope with freedom, that accounts for the notorious fragility of democratic institutions.

Secondly, it is assumed that leisure is essential to a civilized definition of affluence. To venerate collectively what every intelligent man eschews individually, namely unnecessary toil for the goods of subsistence, makes no human sense. Today, in Western industrial society, we see toil advancing totalitarian claims on the whole of life at the very moment in history when technology offers liberation. Leisure and the liberal-arts tradition are giving way to the totalitarian work state which has no place for whole men, only "human resources" and servile functionaries.

As Harold Moulton of the Brookings Institution first pointed out in 1935, new capital does not have to be financed exclusively from past savings. It can just as easily and logically be financed from credit, by means that create new capital owners simultaneously with new capital assets. Capital produces wealth. Unlike consumer goods, it is inherently financeable. With very slight alterations the same techniques being used today to finance the acquisition of non-income-producing consumer goods can be employed (1) to vastly expand the existing economy—to build a Second Economy—and, (2) to enable noncapital-owning households to buy equity interests in new capital as it is formed, paying for it precisely as the capital owner (with rare exceptions) has always done—out of the income the newly formed capital produces.

Alternative is indeed the crux of the matter, and here it is that youth is vulnerable. For as the elders point out, the posture of moral superiority is easy to maintain from the sidelines, particularly when one's livelihood and education are being provided for by others. But would the young do any better under the same circumstances? Will they do any better when their turns come? The answer is that youth would not and cannot, given the financial and economic framework within which the elders are operating. While the moral convictions of individuals are important in the long run, it is institutions that determine the immediate course of events—particularly the institutions of finance.

Not an evil conspiracy, but defective financial institutions and the lack of alternative institutions have delivered us to the door of the total work state. This book has attempted to present the alternatives, founded on the missing logic of an industrial economy.

Not-money Money

Your piece on tokens interested me. Contrary to what you indicate, there is a law making it illegal to "utter coins intended for use as money" in the U.S., with a similar provision for paper bills. However, these provisions can be avoided by printing disclaimers like those appearing on the enclosed certificates ("Not Legal Tender For Any Purpose," "Not Intended As Current Money"). There's no effective way to prove any other intent.

These bills were the result of a weekend spent tinkering with play money and a Monday morning visit to a local fast-print place. The denominations are in decagrams of silver (One decagram equals ten grams, 454 grams equal one pound, 37 plus gram equals one troy ounce). The decagram is currently worth 50¢ to 60¢. Although silver is subject to considerable short-term price fluctuation, it is fairly invulnerable to radical, runaway inflation, and hence is a good base for an alternative unit of value to the dollar.

To validate the certificates (which are sold at retail by Lisa Dawn, P.O. Box 90913, Worldway Postal Center, Los Angeles, CA 90009 on something like 1¢ or 2¢ or so per note), the issuer has only to sign them and put his address on them. If he is issuing a large quantity of these notes, and wants to protect himself against radical changes in the price of silver, he can make an appropriate deposit with the Atlantis Commodities Purchasing Service (ATCOPS, RD 5, Box 22A, Saugerties, NY 12477). This is a "silver bank"

Money, Honey

Your comments about a depression further stimulated my thinking organ. Nearly every financial analyst who correctly called the 68-69-70 stock market slump and associated phenomena now predicts a major depression, coupled with a runaway inflation and eventual devaluation of our now worthless dollar. Variations on the theme are that an increasingly intense cycle of "regression/inflation" will precede the deluge. It is also universally agreed that the best hedge against said deluge is 1. savings account in a Swiss bank in Swiss francs (more than 80% gold backed, if the dollar is devalued you will earn much, much more than the 5-6% they pay on savings); 2. silver coins (for cash you can buy coins in \$1000 bags or less from Deane S. Jones, PO Box 8414, Reno, Nevada 89507), preferably in dimes and quarters (circulated) for which you will have to pay a premium over face value because the silver content is worth more than the face price. 3. leveraged silver coins, if you have a bit more to invest, the Pacific Coin Exchange, 3520 Long Beach Blvd., Long Beach, California 90807, will loan you \$1100 on each \$1000 bag of coins and charge you 9% interest. This means you can leverage your own \$1000 up to about \$5000 and risk only the premium (about \$250) and interest. This risk is almost nonexistent—except that it is not at all unthinkable that the USFeds will make ownership of silver illegal as they did gold in 1933. You'd get your money back anyway. It is possible to buy silver, leveraged, through a Swiss Bank and Economic Research Counselors, Box 368, San Diego, Ca., 92112 are specialists in helping you do this.

If you buy silver coins as a hedge against the deluge (anyone will take a good hard silver coin) it will be best to store them in a safe deposit company, NOT IN A BANK. Bank Holidays close the whole bank, and when silver is called in, goodbye! Or you can dig a hole in the ground. The lowest prediction for the price of silver (which sold for \$1.78 and ounce at the close of the market the end of July) is \$3.00 by the end of '71. Many factors make other predictions much, much higher.

The important thing is that WHEN (not IF) the public finally loses all confidence in its politicians and their funny paper money, dimes will spend. You must have pre 1965 coins or you will get funny copper/nickel tokens called money.

At \$1.80 an ounce your coins are worth 34% more than face value; at \$3.00 an ounce they are worth 121% face value.

If you have a lot of bread, and want a more easily stored and stable piece of wealth you can buy British Sovereigns (pre 1933) from Jones. Today they will cost you about \$10.50 each or about \$44 an ounce, which is an excellent buy. They could be used as a source of land purchase, etc., or to trade for more respectable silver. Many might think these little anxieties are the mark of old fashioned reactionary nits; however,

1. the government always degrades money
2. politicians always lie
3. people always accept silver and gold which can be tested easily for its integrity
4. nobody has found a politician integrity test yet.

Silver and gold have become good buys because the USFeds have given all theirs away and can no longer depress the market.

Cheers,
George von Hilsheimer, himself

PS. Unless your crystal ball really works stay out of the silver commodity futures market. Only about 1% of contracts are delivered on, which means the futures games is a legal way to play craps.

is so far the cheapest interest on silver coins bought on loans (you pay the difference between face value and market value of the silver on dimes and quarters) at 7%.

To reiterate. Silver, for lots of reasons, is becoming dearer and dearer. In the event of atomic catastrophe or a quite probable economic debacle in the USA, genuine silver dimes and quarters will spend at silver value when paper or cupronickel coins will not get you anything but laughs.

A bag of silver buried on the old homestead is the nicest security blanket.

Mildly speculative investments in silver coins is about a 85% winner, in fact, my own personal attitude—measured by what our commune does with its surplus and where we have our employees retirement banked—is that its closer to a 99% winner.

In short, silver can be stole, but it can't be changed to clay by politicians promises.

George von Hilsheimer, himself
Orange City, Florida

(current assets about 85,000 decagrams of silver (Decas), or \$40,000 to \$50,000, backed by the personal faith and credit of the owners, who are worth several hundred thousand to several million dollars). That is, it takes your dollar deposits, converts them into an equivalent number of Decas (on paper), pays 3% annual interest in Decas, and, when you want to withdraw your money, they convert it back to dollars and pay you. Thus you earn 3% plus (or minus) any change in the price of silver, and, in any case, you needn't worry about any price changes of silver screwing you vis-a-vis any outstanding decagram notes you have.

This outfit also mints Deca coins, but, by the time you add sales tax, shipping, the fact that the coins are sterling (92.5%) silver but are priced at the price of 99.9% silver, etc., etc., these are of interest mainly as curios. ATCOPS is a part of Operation Atlantis, a group that is planning to found its own country in the Caribbean this fall. They put out a four-page newsletter (theoretically semimonthly, but often late) at \$4.50 for 24 issues. They also have, for \$1.00, a pamphlet describing their premises (The Story of Operation Atlantis). All from the address above in Saugerties.

Sincerely yours,

TRIBUNES ON THE MARCH

Tribunes are mobilizing to the defense of the people in the Nation's capital!

A group of Kelsonians here calling themselves the "Ninety-five Percenters" has begun an ambitious social action program designed to achieve the goals of Universal Capitalism as outlined in The Capitalist Manifesto by Kelso and Adler. Rejecting all forms of concentrated ownership—whether in the form of class capitalism, mixed capitalism, or state capitalism—as the inevitable result of defective economic systems, the Ninety-five Percenters will appeal to the capital-less masses, and to potential allies among the five percent who enjoy exclusive access to capital ownership today.

Starting from a nucleus of a Washington Area Free University class, this "new movement" has organized into bands of three people called "Tribunes". With "Economic Power to the People" as its rallying call, the group will take steps to construct history's first democratic economic foundation for a free industrial society. It will strive to connect corporate economic power directly to every person in society through new ownership shares and by updating and revitalizing the institution of private property, an institution that has eroded and become misunderstood and abused as access to capital ownership was denied to the vast majority of people.

The groups chose the name "Tribunes" for its original meaning, "defenders of the people". Through bold yet constructive challenges on many fronts, they will expose the failures of the Nation's decision-makers to achieve economic justice. The Tribunes will promote the three Kelsonian principles of economic justice:

1. Everyone should have equal opportunity to participate in production through both labor and ownership of capital. (The input or "participation" principle.)
2. Everyone is entitled to the rewards of his production. (The "private property" principle of distribution.)
3. No one should produce radically more than he can consume, if this would deny others the right to participate in production. (The anti-monopoly or "limitation" principle.)

Each of the three members of a Tribune assumes the personal responsibility for forming another Tribune, to which he is an observer for communications purposes. As their numbers increase throughout the United States, the Tribunes will be organized along regional lines to conform with the Federal Reserve and Congressional districts. Each Tribune in the network will develop its own action and educational programs, guided by the spirit of the First Amendment and based on non-violence.

Separate and distinct from the Institute for the Study of Economic Systems, the Tribunes are political and social-action oriented. Their aim is to develop the political base for spreading the philosophy and programs of Universal Capitalism.

The Tribunes will bring together the expertise of individuals from varied professions and fields of interest. Regular meetings will effect a continuing exchange of information and ideas and result in practical planning for effective activism.

For information about forming your own Tribune, write to:

My job is to get liquids into Emmet, and then help him get them out again. His throat is so messed up, and his breathing, and now, since they've doped him up, his senses as well, that he can't even handle as much as a spoonful of water at a time. So what I do is sink a straw into a glass of water, or juice, or Coke, than cap it with my finger, hold the straw to his lips, than take away my finger to let it run into his mouth and down his throat. About once a minute I do that, take the water into the straw, hold it to his mouth, then let it out again. It's like feeding some little animal with a nipple. I manage less than a glass full an hour, but still it adds up because his kidneys continue to function, and Doctor Robinette says that's the key to any chance that Emmet has, which isn't very much of a chance no matter what we do. But it doesn't matter. I just keep dipping it up and dropping it into his mouth, strawful after strawful, and then a little while later here it'll come, it'll be water-time, Emmet will yell out water-time! water-time! and I'll tug him to a sitting position and help him leak it out, then lay him down again and go on dipping in and letting out.

How many times.

No one knew.

That was one statistic no one kept.

The thousands, surely. Maybe millions.

Maybe billions, D.R. thought. Maybe this has been going on for years and years. If you don't count the times, how can you know how many? How can you know for sure? They count the stars. The stars

Capitalism & Freedom

A New Radical's Guide to Economic Reality

Government-managed economy. Or laissez-faire. Both ends are right theoretically, wrong practically, and the middle where we live is no prize either. I personally lean with these two toward the Let It Be end of things, but I got nothing more than glands to back my arguments, which are the economics of a quack biologist: evolution is continuity plus unfettered mistakes.

Milton Friedman, distinguished Chicago-school economist, and Angus Black, hairy power-to-the-people. Both find government management of the economy consistently unjust, unfreeing, and usually in the dark about what's going on. They have some proposals; specific, radical ones.

We could say to the rest of the world: We believe in freedom and intend to practice it. No one can force you to be free. That is your business. But we can offer you full co-operation on equal terms to all. Our market is open to you. Sell here what you can and wish to. Use the proceeds to buy what you wish. In this way co-operation among individuals can be world wide yet free.

Which if any of the great "reforms" of past decades has achieved its objectives? Have the good intentions of the proponents of these reforms been realized?

Regulation of the railroads to protect the consumer quickly became an instrument whereby the railroads could protect themselves from the competition of newly emerging rivals— at the expense, of course, of the consumer.

An income tax initially enacted at low rates and later seized upon as a means to redistribute income in favor of the lower classes has become a facade, covering loopholes and special provisions that render rates that are highly graduated on paper largely ineffective. A flat rate of 23-1/2 percent on presently taxable income would yield as much revenue as the present rates graduated from 20 to 91 per cent. An income tax intended to reduce inequality and promote the diffusion of wealth has in practice fostered reinvestment of corporate earnings, thereby favoring the growth of large corporations, inhibiting the operation of the capital market, and discouraging the establishment of new enterprises.

Monetary reforms, intended to promote stability in economic activity and prices, exacerbated inflation during and after World War I and fostered a higher degree of instability thereafter than had ever been experienced before. The monetary authorities they established bear primary responsibility for converting a serious economic contraction into the catastrophe of the Great Depression from 1929-33. A system established largely to prevent bank panics produced the most severe banking panic in American history. . . A housing program intended to improve the housing conditions of the poor, to reduce juvenile delinquency, and to contribute to the removal of urban slums, has worsened the housing conditions of the poor, contributed to juvenile delinquency, and spread urban blight.

In the 1930's, "labor" was synonymous with "labor union" to the intellectual community; faith in the purity and virtue of labor unions was on a par with faith in home and motherhood. Extensive legislation was enacted to favor labor unions and to foster "fair" labor relation. labor unions waxed in strength. By the 1950's, "labor union" was almost a dirty word; it was no longer synonymous with "labor," no longer automatically to be taken for granted as on the side of the angels.

Libertarian Periodicals

From Ayn Rand to bushy anarchists there is an occasional agreement on means called libertarianism, which is a faith in laissez-faire politics/economics. It's damn near the only specific set of radical economic proposals around. The Jan. 71 issue of A is A has a directory of libertarian periodicals, scads of them. How to hate your government on principle.

Let's quit fooling ourselves. Get rid of the progressive income tax. In its place put a flat 20-percent tax on all income over a certain minimum, while eliminating all escape clauses. We'll end up getting more from the rich than now, for it will no longer be worth it to them to cheat and look for legal loopholes with the aid of lawyers. As an added attraction, those high-paid tax lawyers will then be out of their jobs. Their salaries may suffer, and so more legal aid might be funneled to defending the poor in our rich man's system of "justice".

Getting rid of our present income-tax mess would also save taxpayers a wad. How? By eliminating the time and effort that they and their accountants spend on filing returns. In a recent study the American Bar Association came up with the estimate that we had put a preposterous \$1.3 billion of effort into filing 1967 returns.

A highly respected member of the Budget Bureau got the figures together on how much was being spent on all poverty programs. He then calculated the total cost of direct payments to all families necessary to bring everyone above the "poverty line." The conclusion he reached was that direct income payments would add up to less than half the present poverty-help outlays! Even the Wallace asshole around the corner may be convinced by the tax savings to him that unworthy niggers, hippies, artists, and bums should all get a minimum income, too.

Another important benefit of direct minimum-income payments would be a renewed sense of dignity for the current welfare poor. We also could eliminate the numerous political connections so often tied to welfare and other such programs (as occur daily in Daleyland, U.S.A.). Think, too, of all those snooping social workers who will be forced to do something worthwhile for a change.

The minute you accept censorship of advertising you're paving the way for government Fascists imposing their uptight, puritanical outdated values on the rest of society. Being unduly deprived of bare tit on the tube is one thing. Big Brother is another.

Why don't building codes work? The answer is easy. Special-interest groups, like producers and repairmen, have concentrated, well-defined goals. They can attack with vigor any changes in legislation that will harm them. Consumers, on the other hand, have millions of goals as the buyers of products. They are a diversified group of people who cannot collect forces easily to fight legislation that may affect the production of only a small aspect of what some of them are buying.

For anarchy to work, however, all members of society must be fairly homogeneous. There would be open season on wops, wetbacks, kikes, niggers, hippies, polacks, redheads, and cripples if the Constitution didn't exist. Many more of us would end up like Captain America and Billy. I happen to want to keep my hair long and curly. You may not want ever to wear shoes. The only way to prevent the majority from forcing us to change is to have some guarantee of our rights enforced. Anarchy is not the answer. We should therefore keep government, but reduce its power over our economic, moral, and social lives.

What should we do, then, to solve our problems? Demand only a few simple realistic programs from the powers that be— enforcement of contracts, protection of constitutional rights, a minimum income, and the distribution of educational taxes by way of certificates. Anything more complex will only give every rotten profiteer in the country a chance to fatten his purse at our expense.

My plea is clear:

less government today
even less tomorrow.

If you want something for nothing, go jerk off.

Bob Weir 1970

The RSVP Cycles

The RSVP Cycles is a scoring guide, a technical manual, highly illustrated and explicated in everyday language. It is a self-defining, singing, swinging score (S) of Halprin's own performance (P), his electric, focused stash of resources (R) from the I Ching, to a controversial Northwestern-Minnesota football play and his conscientiously objective valuations (V)— a term he coined to suggest action and decision aspects of the RSVP cycles.

Profusely graphic and photographic, excellently designed by Barbara Stauffacher Solomon. The RSVP Cycles is a collector's item, a conversation piece of resistance, a real-time information/ slice delicacy. . . The "Driftwood Villages" story and photographs depicting experimental scoring and building of a community from available beach materials, provides precise images of the Halprins' own creative in-process use of RSVP cycles and frames perspective for the assemblage pot-latch of world-wide historical goodies in the book.

Using splendid examples such as his own project at Sea Ranch, a 10-mile long ecologically scored development on the Northern California coast and Lovejoy Plaza and Cascade, a public space in Portland, Oregon, scored for people participation, Halprin superimposes the natural geometry of his RSVP cycles against the functional perspective of his experience.

One of the gravest dangers that we experience is the danger of becoming goal-oriented. It is a tendency that crops up on every hand and in every field of endeavor. It is a trap which goes like this: things are going poorly (in the realm of politics or religion or building a city or the world community or a personal relationship or whatever). As thinking people we must try to solve this problem that faces us. Let us set ourselves a "goal" upon which we can all agree (most goals after all are quite clearly moralistically based and incontrovertibly "good ideas"). Having set ourselves this goal we can then proceed posthaste to achieve it by the most direct method possible. Everyone can put his shoulder to the wheel, and systems engineering, technology, and our leader (or whatever) will get us to the agreed goal.

It doesn't work! The results of this oversimplified approach, now coming into general vogue, are all around us in the chaos of our cities and the confusion of our politics (or other politics—fascism and communism are clear statements of this approach.) It generates tension in personal relationships by burying the real problems; it avoids the central issue of education, which is why today's young people are dropping out; it is destroying the resources and physical beauty of our planet; and it avoids the basic issue.

The relationship of the Tarot cards to the I Ching hexagrams is remarkable; both deal with universal ideas and problems facing us all in life situations. Both connect us with the subconscious activities of the human mind and with natural processes. Both deal with archetypal examples of what Jung has called the "collective unconscious." In both the divination process itself requires a letting go of the intellect—an acknowledgement of the rhythmic and unconscious forces at work in the universe. If we can give way to these forces and think of ourselves as part of the universal processes of living, of time in space, then we can release ourselves from preconceptions and hangups which prevent and block creativity. One of the important functions of scores is to make possible and accepted nonrational means of "getting at" problems. Both the Tarot cards and the I Ching have been used by musicians such as Pauline Oliveros and Morton Subotnik as compositional devices. Pauline Oliveros has said "I mix chance and choice somewhat scandalously" (Notations, John Cage).

Radical Software

We get letters—saying how encouraging, enspiriting, possibility-expanding the Whole Earth Catalog is—embarrassing amount of gratitude in these letters. Well, it's how I feel about Radical Software; A double handful of fast young heads have entered do-it-yourself TV and gotten acquainted with each other, and now started a tabloid of mutual read-out, aiding each other's scuffle for equipment, audience, comprehension, concepts, values. They sense power (95% of U.S. homes have TV) and unexplored territory (broadcast TV still scarcely seems to know what it is) and the hard cider of dwelling on evolution's imploding edge (maybe. [always maybe.]) In a way it's about time we have head radio, head records, head books, magazines, newspapers, head movies; very little head TV. [Beware beware of controlling all your inputs lest ye become your own caricature.] These are TV heads, getting restless, with a fine access publication. I hope it stays solvent and publishing. High content goods.

"Water systems engineers must build city water supply systems to accommodate the drop in water pressure occasioned by the toilet-flushing during television commercials.

Vic and I recorded a conversation between us using full body shots on a split screen. We were seated facing each other. A week later we played the tape back using slow motion and no sound. We both sat facing the screen imitating the kinetics of the other on the screen and verbalizing how we felt from going through those motions. It was extraordinary. Holding my head and rocking back and forth in imitation of Vic. "Yeah, I'm listening to what you're saying, Ryan, but I'm really getting ready to strike back." Following a diminutive hand gesture "Let me make it nice and small, Ryan, so that you can understand it." Vic was scoring on me in a similar way and we were laughing our heads off. What was even more extraordinary was when I woke up the next morning, I felt like I was wearing his body. That I had it on. I called up Vic and started telling him how I felt about the relation between his/my stomach and shoulders, stomach and head, torso and legs, etc. etc. Each time Vic confirmed I was right on. For the next few weeks I found I could recall this sense of his body when I wanted.

Design Intelligence: The Akai has two major differences which set it apart from the other Porta-Paks. One, it uses quarter-inch tape. All the others use half-inch.

The advantage of quarter-inch videotape is that it's fabulously cheap compared to other standards. Quarter-inch is the same size as audio tape (for reel-to-reel machines) and lists for \$7.95 for twenty minutes as compared to \$14.95 for twenty minutes of Sony videotape. The disadvantage of quarter-inch is that it has less information storage capacity as reflected in the 200 lines resolutions of the system, the lowest of any.

The other unique feature of the Akai is that it has a small detachable monitor which clips onto the recording deck. The camera itself has an optical viewfinder which means reduced weight. Overall this means that Akai is the first system not to place a tiny TV screen between your eye and the lens in imitation of a film camera.

GUNS, KNIVES OR VIDEOTAPE* works this way. Two people, each with a portable pack and camera, face off fifteen feet apart. At a given signal they start "shooting" each other. Both roll tape continuously for five minutes. Then both tapes are played back simultaneously on two monitors set up side by side. The area should be large enough so that participants can move around. Variations are possible. Doubling up in teams of two, doing it in a mirrored room, setting up a third camera on a stationary tripod to catch the whole duel for playback with the participant's tapes.

*executed in Pontiac, Michigan

The Techniques of Television Production

I'm coming to believe that good how-to writing mostly depends on good diagramming. Millerson has mastered that, so you're inclined to believe that he knows his television. Certainly he covers the ground in a thorough fashion: studio layout, TV picture and camera, TV lighting sound, film reproduction, sets, make-up, organization, imagery, camera control, editing, sound composition, production method, titling, effects, and color. The book can make a more critical viewer of you. Or it can give you some skill to go with the power when you demand and get some control of the half-hour educational program about your scene.

D.R. was outside now, breathing and looking at the stars. When Leonard was there in the afternoon he left D.R. a half-pint whiskey bottle with about three drinks in it, and about midnight he stepped outside and downed them, one, two, three, and then stood around a while, looking up and breathing. Emmit had fallen into one of his rare sleeps about midnight, and the hospital was quieting, quieting down. The lobby was half-lit and silent except for Mrs. Hubbard shuffling papers behind the admissions desk. Dear Mrs. Hubbard. This was their second night together. It was like some kind of combat tour they'd been on, and it had drawn them close, her and D.R. He's very nice, she thought. She hadn't paid much attention to him the night before, but tonight she thought: he seems like a very nice young man, taking care of his old uncle like that. Not many people take that kind of care of dying old folks. Most just dump them on the hospital to live or die and here's one sure to die, and soon, and yet that young man is caring for him as if it was his own life at stake. The first night she hadn't offered him any coffee from her electric coffee pot, but tonight she did, a couple of times because tonight they're both into it together, staying up, awake, on the graveyard shift. D.R. drank two cups of Mrs. Hubbard's coffee, and then later went outside and sipped the whiskey Leonard brought him, and as he looked up at the stars, and smelled the coal dust in the air and listened to the trains clanging across the river in the yards, he thought about how kind all the people were. Leonard, Mrs. Hubbard, Doctor Robinette. This big cloak, he thought. This marvelous garment. As he walked back inside he picked up a corner of the garment and settled it about Mrs. Hubbard's shoulders and she smiled at him and said there'd be more coffee later on.

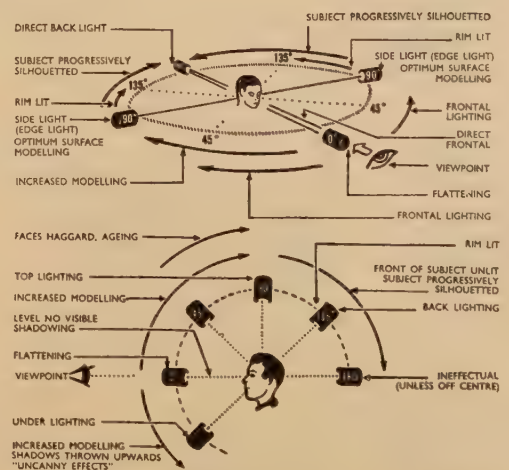

At nine thirty the next morning D.R. called Marcella from the drug store on Main Street. Marcella said it's bad news aint it. I'm afraid so, said D.R.

He could hear Marcella crying, not much, a sudden flash of tears, then snuffles. She could talk okay. She said how long has he been gone, David?

Just a few minutes. He died about ten after nine.

Sony

Video is not cheap film, or a new gadget for TV "professionals." It's an information-processing tool with a built-in capacity for feedback, in all forms. Which opens up entirely new arenas of cybernetic work, and play.

Sony may not be the best 1/2" portable system around—don't hesitate to look into Panasonic, Shibaden, others, or wait for Ampex coming in the fall—but it's the most available, and most people into video use it. The electronics are dependable, and the source of its magic, but you can count on exasperating mechanical flaws. Such as: short-life batteries, tape snagging during recording, handles or straps breaking, tape drop-out (with every brand). Editing presents problems, too, if you're a perfectionist. A good engineer friend is a god-send.

evaluation

In March we taped a meeting of the film-VTR sub-committee evaluating the use of the video equipment. The following are quoted from that discussion.

effects on the individual

- "We were not very interested in ourselves when we started."
- "But it helped me a lot to know myself. You see how you function."
- "It helped me gain more confidence in myself. It's important to know who you are."
- "It develops your critical senses, You become two people - he who acts, and he who watches himself act."

Graphic Terminal

Enclosed is information (circled) for a review of Tektronix. The Tek 7000 series will be the popular 'scope for the predictable future (i.e. on the order of 10 years); 'scope users would be years ahead to learn the new 7000 series rather than the 500 series. Graphic input-output remote computer terminals (as in "2001") are the way to trip, yes? They beat teletypes and CalComp mechanical curve plotters (or pladders) for speed and interaction. Graphic terminals are currently the best (the little used) computer-human interface for scientific/engineering (vs. accountant) problems; and graphics should replace catalogs, sales personnel, trips to the store, & maybe option-designers in the 1970's, as a home tool. Tek's T-4002 and other graphic terminals using Tek's storage CRT (TV screen), are far cheaper means of displaying large quantities (3000) of alpha-numeric characters or high-resolution drawings, than the commoner conventional CRT plus magnetic core or other storage unit.

Tektronix seems a nice environment for electronics engineers (me): lots of freedom & informality (work when the mood strikes, 24 hr. access to buildings, no suit &/or tie image), active in education of employees & community (gifts & heavy discounts to schools), as well as the usual excessive pay and excessive equipment to play with. (The universities which I know irradiate the community with free/cheap information (software), whereas they should be distributing tools/games/toys/hardware (photo film computer everything that must be actively used not passively sat-at), to everyone who enjoys playing with tools).

Video Cassettes

Home video playback/record systems will soon extend a visual data bank to your personal control. Create your own television with portable recorders or watch when and where you will by simply plugging in the cartridge.

You'll get hit for an uncomfortable amount of money—looks like about \$400 for the playback deck alone and at least \$10 for cassettes at the beginning— but it is hoped that the content will be worth it.

Color flashes and other psychodelevision, organic video magazines and esoteric films will be coming at you—perhaps over giant wall screens. But it's all at least three years away from the home market. The early technical battles, fought by a plethora of giant corporations, will be waged in industrial and educational applications. Technical standards, distribution and maintenance support systems should be further along by the time the hardware gets to us.

-Richard Kletter

"The people we interviewed on the street - I really felt they wanted to get a message across. They wanted other people to hear about their problems, to share them. People feel pretty isolated."

"I think the people hoped their message would reach the powers-that-be. They had never had the chance, before."

"When we watch the tapes, we don't just learn to know ourselves better; we also come to understand others better. After that, it's much more fun to work together."

Video 1000

A dense monthly fruitcake of tips about TV state-of-the-art and the future. Aimed mainly at TV advertisers, but of use to any media cowboys. Swap them info they can use for a subscription.

Now seeking information about corporate activity not in the public interest: the new Clearinghouse for Professional Responsibility (Box 486, Washington, D.C.) via Ralph Nader. Washington is aware that the organization could develop into something big— if the Clearinghouse idea appeals to many UNEMPLOYED professionals with a newly stimulated social conscience. Such as engineers and advertising men.

The revolution is starting. First U.S. catalogue of videocassette programs— 600 titles, about 50% in color— is now available. From CBS Electronic Video Recording Div. (For a copy, write Norman Ober at CBS EVR, 51 W. 52 St., NYC 10019.)

2-way cable TV is being tested in New York— with 10 subscribers of Manhattan Cable television. (Part of one test: viewers were asked to indicate their choice of vacation trip after watching a commercial for Eastern Airlines.) In 6 to 9 months: 500 subscribers may have new converters with special buttons to signal their "votes".

Pornography on Japanese TV. It's happening. But not officially. "Transmission leaks" from closed-circuit systems of some Japanese inns— which show porno films and tapes— are now being picked up by home TV sets in the Kansai region

This year in Japan (next year in the U.S.): a color TV camera for about \$1000. Next: perhaps \$500. Sony's marketing plan for its 1-gun "Trinicon" now under development. A "professional" version, reportedly suitable for broadcast television markets, will be introduced at about \$3000.

Video verite'— by Annette & Lesley. New, fact-packed newsletter about cartridge television: CTV News Digest. Published by Billboard Publications, 165 West 46 St., New York, N.Y. 10036. One of the best bargains in the business. For a sample copy, write Stephen Trainman, Editor.

Fast way to edit videotape to the beat of a sound track. Transfer the track to videotape via equipment that lays down a "frame count". Feed the audio to an oscilloscope to get a visual indication of the audio. Find location of the beat on the tape, note the frame count. . . For more information, ask for the report, "Instant Replay No. 4" from National Teleproductions, 5261 North Tacoma Avenue, Indianapolis, Indiana 46220. (One NTP job: 32 edits in 10 seconds of tape.)

Cable Television

A Community Antenna or Cable Television system (CATV) consists of:

1. super antenna to pick up broadcast signals,
2. a "head" or "headend" which processes these signals and can serve to process locally originated signals,
3. coaxial cable which is strung via telephone poles or city ducts to home TV sets.

As many as 40 (soon to be 80) channels can link your tube with all sorts of information-entertainment systems—the street, libraries, a tape bank of almost anything. New systems may adopt two-way capabilities permitting individual feedback into the system. (Big brother possibilities loom large as files of individual uses are stored on central computers.)

Half-inch video is cable-castable and systems with more than 3500 subscribers are now required by the FCC to program a "significant" amount of locally originated material.

Everyone can be a source of local life data affecting a media inversion that may clear the air.

If the actor, by setting himself a challenge publicly challenges others, and through excess, profanation and outrageous sacrilege reveals himself by casting off his everyday mask, he makes it possible for the spectator to undertake a similar process of self-penetration. If he does not exhibit his body, but annihilates it, burns it, frees it from every resistance to any psychic impulse, then he does not sell his body but sacrifices it. He repeats the atonement; he is close to holiness. If such acting is not to be something transient and fortuitous, a phenomenon which cannot be foreseen in time or space: if we want a theatre group whose daily bread is this kind of work—then we must follow a special method of research and training.

When I take sides against half-heartedness, mediocrity and the easy-come-easy-go attitude which takes everything for granted, it is simply because we must create things which are firmly orientated towards either light or darkness. But we must remember that around that which is luminous within us, there exists a shroud of darkness which we can penetrate but not annihilate.

Contact is one of the most essential things. Often when an actor speaks of contact, or thinks of contact, he believes that it means to gaze fixedly. But this is not contact. It is only a position, a situation. Contact is not staring, it is to see. Now I am in contact with you, I see which of you is against me. I see one person who is indifferent, another who listens with some interest and someone who smiles. All this changes my actions; it is contact, and it forces me to change my way of acting.

Scenery for the Theatre

me and carl were stage carpenters
once upon a time

and we built a good part

of what's in this book,

flats, traps, platforms, risers,

doorways, windows, parallels,

bartables, machineguns, crossbows . . .

the standard procedures, tools,

and tricks

for the grand illusion are here.

A cantilevered balcony

Characteristics of the Craft. Scene construction is chiefly a specialized type of joinery. The materials and technique of the woodworker are adapted and other techniques and materials introduced for the manufacture of structures which differ from the ordinary product of the carpentry shop, cabinet shop, or woodworking mill. The nature and uses of scenery impose requirements which make scene construction a craft by itself with which the ordinary carpenter or cabinet maker is unfamiliar.

Scene carpentry differs from other forms of carpentry and cabinet-work in several respects: 1. The objects built must be demountable and portable, and yet when assembled they must show no evidence of joining. 2. Scenery is built for use during a short period of time, as compared with furniture, dwellings, etc. 3. Scenery presents only one finished side or face to the audience. 4. Scenery is never seen or examined at close range.

Scenery which has to be demountable and portable must be built in pieces which fit neatly together and which are strong enough to withstand intermittent and often rough handling. The frames must hold their shapes rigidly so that the fit is assured each time they are assembled. There can be no cutting to fit when the scenery reaches the stage. Each piece must be constructed exactly to size and shape as planned. Rebuilding of scenery, when it reaches the stage, is costly.

The fact that scenery is used for a shorter period of time than other carpentered objects allows the use of lumber of smaller cross section than is generally used in weight-bearing structures, since deterioration and constant use do not enter into the determination of the safety factors. For the same reasons and for reasons of workability, softwoods are used in scene carpentry, where hardwoods would be used in ordinary carpentry and cabinetwork.

Akropolis: Masks created solely by the facial muscles (Zygmunt Molik, Zbigniew Cynkutia, Rena Mirecka). Photo: Teatr-Laboratorium.

The costumes are bags full of holes covering naked bodies. The holes are lined with material which suggests torn flesh; through the holes one looks directly into a torn body. Heavy wooden shoes for the feet; for the heads, anonymous berets. This is a poetic version of the camp uniform. Through their similarity the costumes rob men of their personality, erase the distinctive signs which indicate sex, age, and social class. The actors become completely identical beings. They are nothing but tortured bodies.

The inmates are the protagonists and, in the name of a higher, unwritten law, they are their own torturers. The merciless conditions of the extermination camp constitute the milieu of their lives. Their work crushes them with its size and its futility; rhythmic signals are given by the guards; the inmates call out in screams. But the struggle for the right to vegetate and to love goes on at its everyday pace. At each command the human wrecks, barely alive, stand up erect like well-disciplined soldiers. The throbbing rhythm of the play underscores the building of the new civilization; the work expresses the inmate's stubborn will to live, which is constantly reaffirmed in every one of their actions.

Stage Make Up

In San Francisco in the days when everyone was painting their faces, it was strictly favee: My face is gobs of color, let's ball. Except for Page Browning. Page was a Merry Prankster who wound up doing time in jail with Kesey. His particular outlaw talent, besides dope, was his face. In the Boy Scouts he'd learned the rudiments of makeup/war paint, and that skill blossomed into: Page at the Acid Tests. A black and white streamlined living skull wearing a cape. A red and blue face, one side red, the other blue. A face of flames.

I wish this book had been around then. Somebody would have got one for Page and let him go for the next higher level. He could have come as Kesey, as President Johnson, as an infant, as himself enlightened.

Makeup bases

The makeup base is a cosmetic that creates the desired skin color. There are many kinds of bases manufactured in a variety of consistencies: hard grease sticks, soft grease paint, liquid, and pancake. In this book, you will be using practically all of them.

Hard grease paints These are available in a complete range of colors. These paints come in stick form and are approximately 5" long and about 1" thick. Although this base requires a bit more effort to apply, when done properly it has the best and longest wearing quality of any of the others.

Soft grease paints These are available in a complete range of colors for use as makeup base. Manufactured in a toothpaste type tube, soft grease paint has a creamy texture and is quickly and easily spread. Soft grease paint tends to shine excessively because of its cream content and, moreover, does not survive body heat as well as the hard grease paint.

Pancakes These are also available in a complete range of base colors. This paint is supplied in a compressed form in a flat, round container, and is applied to the face with a moistened sponge. Pancakes dry quickly and have a matte finish and, therefore, form a difficult surface for further detailed makeup work. This base is the least effective for theatrical use because it dissolves under heat and perspiration. It is much more practical for film work because it can be repaired continuously.

Liquid base colors These are available in bottles and used primarily as a body— as opposed to face— base. Liquid base dries quickly, which makes it impractical for use as a facial base.

Well honey, you've done a wonderful thing, being there with him, I know you have. And me and Doyle'll and the kids'll be on down tomorrow. When do you think

I figure about two in the afternoon, Marcella. Might as well. There won't be that many people to come, and we might as well get it done.

Well honey, listen, said Marcella. What we'll do is leave here real early in the morning, and be there about one. Does that sound okay?

That sounds fine, said D.R. I'll take care of whatever arrangements. And Leonard'll help me.

Marcella told D.R. she thought he was wonderful. They hung up then, and D.R. went to Olney's Funeral Home to buy a casket.

That happened fast too.

Expanded Cinema

We're moving out of a universe made up mostly of physical objects and emerging into one formed of a flux of energy, electromagnetic waves and invisible changes and communications. All the world's television and radio broadcasts are constantly moving through our unaware heads, along with a lot of things we've not yet tuned in to. This book is about this new universe and about learning how to live in and participate in its changing patterns.

Expanded cinema isn't a movie at all: like life it's a process of becoming, man's ongoing historical drive to manifest his consciousness outside of his mind, in front of his eyes. One no longer can specialize in a single discipline and hope truthfully to express a clear picture of its relationships in the environment. This is especially true in the case of the intermedia network of cinema and television, which new functions as nothing less than the nervous system of mankind.

... But when you're really involved with the thing you want to experience, you stop conceiving it. Art finally becomes a barrier to accepting what IS. Art stays within its closed circle and reality never does. Art is all symbols of reality. Symbols are never going to free you. But it would be foolish to say "Stop making art."

James Whitney

The individual's ability to apprehend, capture, generate, transmit, duplicate, replicate, manipulate, store, and retrieve audio-visual information has reached the point where technology results in the rebirth of "cottage industry" as conceived by the economist William Morris during the Industrial Revolution in England— the autonomous ability of the individual to generate his own industry within his own local environment. The primary difference between Morris' pre-industrial view and today's post-industrial reality is that cottage industry and global cybernetic industrialization interpenetrate each other's spheres of influence synergetically, each benefiting from the other.

... However, means have been devised through which even the hologram may no longer need "reality" to exist. . . . Moreover, the ability of holography to record natural phenomena that exist beyond the range of human perception— shockwaves, electrical vibrations, ultraslow-motion events— could contribute to an experience of nonordinary realities totally beyond the reach of conventional cinema or television.

Theatre House

Lovely junky stage stuff. Reminds me of Prankster trips to Serbin's in SF to stock up on fringe, da-glo feathers, costume jewelry, face paint, tigerskin fabric, and the two trouperette spotlights that made the Acid Test Graduation work.

Clouds and Fog to Order

We thought you might be interested in knowing about our company, which makes clouds.

Thomas R. Mee
Mee Industries, Inc.
Altadena, CA

Clouds, fog and mists have many applications in display, decoration, advertising and special effects. Mee industries can produce these phenomena in size, quantity and even color to meet your requirements.

This firm of cloud physicists has made some major breakthroughs in cloud generation so that these special effects can now be tailored to meet your requirements. One exclusive Mee Industry capability is the generation of real cloud or fog banks from pure water. This can be used to advantage where chemical additives are undesirable.

One of these "natural" clouds will grace the dome of the spectacular Pepsi-Cola pavilion at the Expo '70 Fair at Osaka. Other interesting Mee Industry capabilities include stabilization of natural fog by seeding with hygroscopic nuclei and fog making by chemical means.

Mee Industries will work with your designers, engineers and contractors to put clouds to work for you. Call for a quotation on any job with a cloud in its future.

Creative Theatre

Kelly Yeaton's pick of quotes:

... the stage is not a picture, it is a place.

... a new world in which every application of science has contributed to human loneliness. Our teeming presses, the motor car, the phonograph, the radio have given an enrichment that has been paid for by isolation.

... the new dreamers have watched the efforts of a world to restore community and have caught a vision of the theatre as peculiarly the art of community.

... we have for several centuries failed to discern that the theatre's essential art is motion, and that we can have no great theatre until we find it and cleave to it through all distractions.

... We must reaffirm our belief that the theatre has its source in the highest of mysteries and however incompetent we may be to utter these highest truths, there still dwells in it as great prophetic voice as in any other human institution.

... We must learn to see Shakespeare and Kalidasa as prophets no less than Job and Isaiah, and to say that Aeschylus, no less than Enoch, walked with God.

... They say it is a law of life that every creature is at once pupil to someone higher than himself and master to some lower, a link in a great sequence, each instructed in the measure that he instructs, and spiritually nourished in the measure that he nourishes. He is a conduit. If he is stopped below he must stagnate and can receive nothing from above.

... a theatre in a village at the end of the Sacred Road outside of Athens was called the Theatre of the Advent of the Earth Mother. One did not say of that theatre, "I think I'll run out to Eleusis tonight and see what they are doing." One said, "If I am patient and worthy, please God, I shall one day be admitted to that theatre."

... Emperors, kings, poets, philosophers and soldiers came to it from all over the known world. Its theme was the vicissitudes and triumph of the soul of man. . . and it ran on this policy for eight hundred years. When I think of that theatre all things seem possible.

Creative Theatre, by Roy Mitchell. John Day, N.Y. 1929, now reprinted by Kindle Press, Westwood, N.J. Obtainable only from DBS Publications, 150 West 52nd, New York City. Paper \$4.95, Cloth \$7.50.

The Film Director As Superstar

If you've always hated Pauline Kael anyway and you've been mildly freaked because your 5 yr old kid sister just completed her 3rd on-the-street-every-inch-true-to-life documentary, then you will find comfort as well as real hope between these covers. This is one of those rare books on film that actually comes out and says: what up till now you felt only you and Godard understood: that *Film is Revolution not A Wave* and its credo is the novelty of just going out and doing it. Now that we have been amply and repeatedly assured that we are on the threshold of a technological and aesthetic revolution in movies which will inevitably restructure human consciousness and understanding, this book says that the new sensibility obviously would be awfully nice in 70mm Panavision but that it will work in Super 8 too. Which is just another way of saying, Hey, remember 2001 is probably the most awesome underground movie ever made (\$10,500,000) before, lean and crazed, you sell your soul for a jr. apprenticeship on Mary Poppins. The 16 interviews that follow are a cross-section of independent directors— all of whom are just as interested in finding a new life style as a new film style. They are all, in one way or another, outsiders from Jim McBride (Greetings) whose \$2500 1st film still hadn't been shown theatrically 2 yrs. after he made it, to Roman Polanski who says definitely that he's not obsessed with the bizarre and that his next film is going to be about the Donner Pass Cannibals, to Andy Warhol who says that he's still learning how to use a camera and that they haven't really made a "movie" yet. The book is not a defense of cinema vs. movies nor does it go through the theoretic/aesthetic trauma of *The Underground vs. Hollywood*. What it says is that personal films are not sprung full-blown from the head of the inspired amateur with his 16mm Arriflex and Nagra tape recorder slung over his shoulder.

[Reviewed by Barbara DeZonia]

Everybody's looking for young talented directors. But what they all do is: they'll take you, a young talented director, and take a young talented writer, and a young talented producer and they'll give you young talented property about young talented people and they'll put you all together and you'll make a young talented film." So they've called me up and said, "We're interested in you." And I say, "Well, I'm interested in doing this movie. I'll send you a script." And they say, "Well, we've got this famous book," or something like that. So I say, "Forget it."

[Jim McBride]

I don't think that it is possible for a man to spend a number of hours discussing himself and his work and his life without revealing a kind of personality profile . . . one man's evasiveness can be as eloquent as another man's candor."

A director's job in this period of filmmaking—and I know this may change as it has in the past—is to be an absolute dictator and produce a personal vision on a subject that he has chosen. He is paid too much because he has that responsibility, but what the people are buying is that personal vision."

P. Yes. The older I grow, the more I value simplicity. The more difficult it seems to me to make a simple film. I want my film to be done so the people who see it have the impression it was done without any effort. But, of course, there is a lot of effort behind it, a lot of struggle. And as for realism, the only way to seduce people into believing you—whether they want to or not—is to take painstaking care with the details of your film, to make it accurate. Stoppiness destroys emotional impact.

[Roman Polanski]

Take One

TAKE ONE is a bi-monthly no nonsense film magazine that reviews a good number of low budget films, documentaries, and foreign releases which generally escape the notice of the big slicks. It has information on film festivals and some new product material . . . so it is directed toward both the filmmaker and the filmwatcher.

[Reviewed by Ron Carraher]

computers as amplifiers of human imagination . . . graphic display systems using "light pens" . . . at which the artist can draw, ask the machine to rotate his drawing, (move it in many ways) . . . and put it on film . . . simultaneously making an electronic sound track . . . animation of drawings of great detail done in minutes . . . computer sensing systems that study the eye's movement over research material and when the eye rests on an image, the image automatically enlarges; if the eye rests for a longer time on the same material, the image changes . . . (imagine a french lesson on an electronic page full of words that are going by rapidly, you are reading from a display scope or tv screen, if a word is doubtful to you, by looking at it for three seconds it will enlarge itself above the other words; if you are still looking at it three seconds later, it will automatically change into English . . .)

JM: Would you like to have a contract that gave you the final cut?
SP: I don't think I need one. I don't make a picture by myself, I make a picture with other people's ideas, other people's minds, other people's bodies. We make a picture together and if they don't like to work this way, then I fire them.

Filmmakers Newsletter

The Filmmakers Newsletter is a clearing house for all and any information pertaining to filmmaking. As such, it's without any competition and fills a real need for the independent filmmaker. Regular features include a nationwide calendar of special film showings (both underground and classics), free classified ads, detailed information on film festivals, a technical question and answer column, and ideas for building cheap film equipment. They also print interviews, essays, and word of any film workshops, conferences, and schools. They claim to accept paid ads only from companies willing to do business with low-budget independent filmmakers. Only one complaint: a regular \$5 subscription brings the "Newsletter" bulk mail— and the news is often out of date. If festival application dates and film showing times are really important, add \$3/year for first class mail.

International Film Guide

Well, as it says right on the front, this is a "record size survey of film in 32 countries with at-a-glance guide to Festivals, films on 16 mm, film books and magazines, shorts and animation, film schools and art houses." Hard to beat that except by the Saturday Review's comment: "eminently informative." Well, and then too it has lots of nice stills, in-depth articles on Anderson, Chabrol, Ichikawa, Pasolini, and Skolimowski, a world production survey with articles on new films from everywhere from Israel to Romania to Bulgaria, a list of all current film co-operatives and operating theatres around the world, and a review of all new magazines and other publications dealing with film, plus a list of film archives and film services. . . and all sorts of other stuff crammed in these fat little pages. Make friends with someone who reads sub-titles well and you'll be set no matter where in the world you are.

Mr. Olney didn't recognize D.R. but when D.R. identified himself he remembered. He had buried D.R.'s father and both his grand parents. And now there was Emmitt's body following theirs through the same treatment in the same treatment rooms. Let it happen, D.R. thought. I hate it but let it happen anyway, there's nothing else to do.

Mr. Olney was a nice old man actually, but D.R. had trouble with him. He said how much is this one? and when Mr. Olney said eleven hundred dollars D.R. laughed and asked to see the cheapest thing he had. This one's two hundred and twenty, Mr. Olney said. It's our cheapest model. D.R. said I'll take it.

Mr. Olney sold suits and shirts and ties for thirty five dollars a set. D.R. said he couldn't afford that much, that what he'd like to do is help dig the grave and maybe get the suit half price. Mr. Olney said he believed he could manage that, and suddenly D.R. was sorry he'd acted weird toward Mr. Olney. He's just an old undertaker, D.R. thought. Be kind to the old and the dead.

I'll be old myself before long.

I'll be dead myself some day.

Guide to Filmmaking

ed pincus is a careful man, once a logician of sorts, now a cameraman. he's taught still work at the visual arts center, harvard, and now is at the mit film department.

his book is carefully done, thorough, nicely indexed, easier to use than the american cinematographers manual, and probably more useful to the student.

and it only costs a buck fifty.

its good, ed.

The book is intended to give a fairly precise idea of how much it costs to do various types of films and the way to go about making these films. It is a production manual, including all the information the serious filmmaker will need about the technical side of making movies.

A whole breed of filmmakers and potential filmmakers is appearing for whom 16mm is the professional film and super 8mm a serious amateur gauge which someday may be a professional gauge. Much of the information for one gauge is relevant to the other. This book discusses them both, emphasizing 16mm, pointing out the differences in the narrower film.

The unedited footage is called *rushes* or *dailies*. Almost invariably there is a considerably greater amount of rushes than there is of final film. The ratio of film shot to final footage is usually between 5:1 and 10:1. But the ratio varies tremendously depending on the type of film being made and the method of filming. Peter Emmanuel Goldman's underground classic *Echoes of Silence* was done using a ratio of less than 2:1 for an hour-long film. At the other end of the spectrum, documentary filmmakers who use no script often shoot ratios higher than 40:1, which means shooting over 90,000 feet to end with an hour's length of film. Often one of the most difficult tasks in writing up a budget for a film is to estimate the amount of footage that will be needed.

When there is a script for a film, a great deal of additional footage is shot to give the editor a selection of shots and to guarantee that there will not be any continuity gaps either within scenes or in the story line. It is not unusual, when two possibilities for a story line exist, for both to be filmed and the final choice delayed until the film is being edited. Often the same action is filmed several times in several "takes" to get different camera angles (positions) and to guarantee that the actors have performed their task well.

In much black and white photography, correct exposure for the subject will give you a pale, washed-out, and cloudless sky. A sky darkened too much (by using a heavy filter) will have a phony, heavily dramatic quality. The bluer the sky, the easier it is to darken it and the less filtration needed. When the sky is overcast or misty, filters will not be very effective. The sky near the sun and on the horizon is often almost white and does not respond to filtration. If the film is overexposed, the filter effect may be largely lost.

If you wish to bleach a blue sky, a blue filter will do the trick.

As in all things, it is often hard to find yourself in film. For some, the way is to make their films alone. For others, film is essentially a group enterprise. In film you may be able to find yourself, understand the world, show others what the world really is, and, finally, change it.

The 180° rule: If we draw a line through the main action, any camera position on one side of the line will preserve screen direction.

American Cinematographer

Accurate, specific information on what's new in equipment, techniques, standards, and the attitudes of technicians using them. Also gossip and news about who's doing what where. Covers all aspects of professional filmmaking from Hollywood Super Panavision 70mm to 8 mm educational loops.

The ads, fully as important as the text, are mouthwatering for those with an appetite for Eclairs and such.

If you read it regularly you'll never need Baddeley—you'll know how it's really done. Often the information is directly and simply usable; sometimes it stimulates visions of the super-cinema of the future. When in school I consulted back issues for a psychology paper on perception. The articles are really interesting and, best of all, there is no film criticism so you avoid all those negative emotions.

(LEFT) The Handiola is a device for achieving instantaneous positive interlock sync. Once picture and track start-marks are aligned in their respective units, sync is maintained by simply sliding tape transport assembly 1/4-inch toward viewer. Shaft engages the viewer's sprocket for positive interlock between both media, running forward or backward; movement of either medium causes the other to move in sync. Note inching knob on front of tape transport, for precise cuing without handling tape or film. Accessory frame counter is shown installed at right. (RIGHT) Pen points to interlock shaft, at point of connection with viewer. 1/4-inch movement of tape assembly establishes and releases interlock.

Q. How can I produce a night effect in the daytime using color film?

A. This is the question we most frequently receive, and though the answer has been given many times, still the key to the question is to *underexpose two stops*. Additional techniques which assist the illusion are to photograph the scene in back-light, using lights or reflectors as fill lights on the players. When such are not available, use front cross-light. By all means avoid any white sky in the scene. You may use a 85N6 filter, but disregard its factor. The N6 (Neutral density—6 transmission) portion of this filter will reduce the light transmitted by two stops. Therefore, you judge the exposure as if you were using the normal No. 85 filter for a *day* exposure; the N6 portion cutting two stops will produce the underexposure necessary for a night effect.

It will further the illusion if you can include in the scene some light source— such as lighted windows or street lamps. These must be boosted by using photo-flood lamps— using tracing paper or Bon Ami on the glass of the windows to diffuse the light from the naked globes.

Oh far out, far out, far out. It happens with such speed, it swooshes by with such perpetual haste. There he was already, him and Leonard, helping the two guys from Olney's Funeral Home dig poor Emmit's grave. There in the family graveyard, one corner of it buried by overburden from the mining on the slopes above, rocks as big as people's heads scattered over the graves. One headstone (Daniel Hutchins Collier, D.R.'s grandfather's brother, born 1887, died 1932) had been knocked over and broken straight across the middle by a rock from the mining up above. The graveyard was at the edge of the pasture, when there had been a pasture. D.R. used to pass it all the time, going to get the cow, out walking with his grandfather on Sunday afternoons, or just in the pasture by himself at any odd time, for no reason. D.R. had been visiting that graveyard of his ancestors as long as he could remember, and now here he was again, helping to dig this time. How strange that was. How swiftly it moved along.

Leonard finished his turn digging and sat down beside Royce's grave to smoke a cigarette. Royce was buried just uphill from where Emmit was going to lie. Royce Collier, his gravestone said. Among The Angels Now. Beside Royce were his sister Blanche, and his father, who'd outlived him, and beyond his father, his mother, who'd outlived them both. D.R.'s mother wasn't in the Collier graveyard. She had died a Davenport in Illinois somewhere. Leonard sat near where she might have been if fate had willed it so, and smoking he looked up the hill toward the curve of the slope and told D.R. how the strippers had come, from left to right, peeling the trees off first, then the cut, then the blasting and finally the exposed coal seam. The only image D.R. could get was of road builders indiscriminately hacking through the pasture, and Leonard said that was pretty close to how it was.

D.R. asked Leonard if the overburden above the cemetery was stable, if rain would loosen it and let it slip on down across the graves. Leonard said there was a chance of it. He said that down behind the main house it was definitely going to slip some more but up there, maybe not.

What if it does, D.R. thought.

What difference would it make?

In the corner of the cemetery where the slide had broken through the picket fence, D.R. picked up a piece of shale that had some fossils in it, little shells of ancient creatures that millenia ago had been alive. Buried all this time and now uprooted, D.R. thought. And he thought of his father's bones, and his grandfather's.

And he thought of his own bones, too. His living hand held the ancient shale. Some day that hand itself would fossilize, and what difference does it make how deep it's buried down.

Down, they went down with Emmit's grave. Down, down. Three feet. Four. Four and six inches. Five. Right on through supper time, into evening they dug, taking turns, resting, going on again.

D.R.'s hands were blistered bad when at five feet eight inches Leonard said boys that's good enough, let's quit.

Total Picture Control
Zone System Manual

Three teachers and two books taught me photography. John Collier showed me the objective power of photographs (anthropologists with a Polaroid start far more informative conversations than anthropologists without). Minor White showed me how to go into mild trance to see directly. Jack Welpott showed me that the main obstacle to good pictures is my own ideas and arrogance (an entire class of us shot better pictures— better by every standard — blind-folded than we did in the usual way).

Total Picture Control, a good technical unimaginative book, showed me how to use lenses, filters, view cameras, settings, print papers, the whole tool kit, to get what I wanted. It displayed the basic range of possibility.

Zone System Manual, by Minor White, gave me Ansel Adams' zone system of photography in distilled form. The key is previsualization, which is looking at reality through an accurately imagined photographic print, then knowing how to make the calculations and mechanical and chemical adjustments so the print has what you saw, plus any divine grace that happened by.

—SB

The composite picture at the left illustrates why straight lines must of necessity appear curved in all super wide-angle renditions. Each of its three components was taken with an ordinary camera and a lens of standard focal length. The perspective of each is "normal": with the camera in level position (center), verticals are rendered parallel; with the camera pointed upward (top), verticals converge toward the top of the picture; with the camera pointed downward (bottom), verticals converge toward the bottom of the picture. Each of these photographs encompasses an angle of approximately 47 degrees. Now, if all three were combined in one single shot encompassing three times 47 degrees, or approximately 140 degrees, how would perspective be manifest? It would appear as in the Panon shot on the opposite page which encompasses an angle of 140 degrees in which the actually straight verticals of the skyscraper are rendered as curves.

(Total Picture Control)

ZONE

as a visual unit of measurement is arrived at by altering a standard exposure by one "stop" more or one "stop" less. For example all the values in a scene exposed at f/11 at 1/25 second would print one "zone" lighter than a print of the same scene exposed at f/16 at 1/25 second. (Providing

of course that the two negatives were given identical development time and the same exposure time in the enlarger.)

This "one Stop" or "one Zone" alteration, links the "zone" to the classic 1:2 exposure ratio used in photography to calibrate shutter speeds and diaphragm openings or "stops."

(Zone System Manual)

LIFE Library of Photography

Recently I enjoyed an airplane magazine in which all the articles were illustrated by the authors. What a difference. Instead of glamorous eye candy, the pictures were frank, densely informative, thoroughly tied in to the articles. Photography, especially professional photography, is best in the hands of skilled amateurs. Sharper than words photography is a reality medium. No specialist elite should monopolize that kind of power.

I believe these are the beginner's books I've been looking for ever since we started the CATALOG. They cover the territory— camera, printing, film, history, photojournalism. They have sensational pictures (and price to match), and fine practical information like "Camera Buyer's Guide," "Darkroom Equipment," etc.

Get a Polaroid Swinger and play around for a while. If you like the pictures to where you want to use the medium, get a 35 mm and some used darkroom equipment, develop your own film and prints, and mention the LIFE photography books to relatives in November.

—SB

Polaroid Land Camera. Sometimes thought of as an instrument designed purely for amateurs, the Polaroid Land Camera is a cherished professional tool on hundreds of weeklies and small dailies. Its almost foolproof operation enables reporters with little photographic training to get

good pictures. The 3 1/4 x 4 1/4 pictures are large enough for a hurried editor to judge without a magnifying glass, and most important of all, the instantly available prints can be sent directly to the engraver without darkroom processing—an obvious advantage under the pressure of

deadlines, aside from being a cost saver. A special film pack, usable on some models, can produce not only positives but negatives to make additional prints for presentation to local celebrities—a good-will practice sometimes followed by small papers.

DUANE MICHALS: The Illuminated Man, 1969 The Print

There is a lot of bullshit about photography; it is easily (and usually) a subject for egoistic subjectivism and it is much in the hands of the people that push consumption. But like any other art form, the thing is to shut up and get dirty learning, working feeling it. I've come this way and perhaps can help. There are a few good books:

The first book is Chas. Swedlund's A Guide to Photography. When I last heard the book was available from him (address: 5019 W. Blemont, Chicago, Illinois 60641) for about \$5. It is the best starting book; it is as simple, direct and complete as the Domebook. Women and children can use it. The mechanics of the beast are explained by a working photographer and teacher not by a streamlining book designer. Basic.

It will get you out of the Popular Photography bullshit of one thing, one issue, another, the next. It will be enough for the person who wants a simple image— getting that consistently isn't easy. So the beginning booklist is one title.

There may come a time, though, when you wish to make love with it, form koan, fix energy. The process is capable; photography can be an art form with just as much subtlety of creation as pottery glazes, dyeing, weaving. Go to the index of the Life series on photography and look up the photographs of Ansel Adams, Brett and Edward Weston, Paul Caponigro (these are my favorites) and . . . and . . . This is the business of the fine print. And consider that reproductions almost always run a poor third to the original print.

You can do it. Hell, you can do it to yourself!!

You may want to do 35mm, perhaps large format— negatives 4" x 5" up to 11" x 14". It involves the use of the zone system of exposure and development. The knowledge won't be wasted even in 35mm. As for printing the negative you get, the more esoteric information comes largely from the same sources that will tell you about the zone system. There is one book (or rather a series) that has compass, the Ansel Adams series. True they were written nearly twenty years ago and are \$5.98, but this man must know more than any other one (or many) person about da modemploi. Some find him confusing but those who work his books find it the teachings of a master— seemingly contradictory and incomplete but rich for those who will try it, work it, re-read it, understand some more, work some more. It is a book for application, not a neatly wrapped set of answers that spoil your appetite. The core of the series are The Negative, The Print and Natural Light Photography. There are others in the series. In The Print for example there is a chapter devoted to developers, on what goes in them and what those ingredients do. At the back is an appendix with a table of nearly twenty developing formulas that you can mix yourself— and play tones, print colors and contrast ranges like stops on an organ. Maybe there is space age chemicals in cans these days but a) lookit the man's pictures b) I want to fucking know the stuff I work with.

These books are the richest single source of information on how to fly with this set of wings; there is even a good part of The Negative devoted to "miniature camera", i.e., 35mm and 24 square. ACCESS. This man is a concert pianist, a photographer and a master. See his photographs and books. He knows how.

The Life series— it has the best set of pictures around, bar none, everything is represented. But I don't dig it. My hassle perhaps, but I find it a bit sterile. It is complete, complete, complete and very rational. Streamlined. And the questions are generally posed and answered. Spoils that appetite like a jr. high physics book. For those interested in a specific tag end to chew on, to learn from— very little. Such a thing is not a tool but an intellectual candybar. How do I make platinum prints, eh? Where do I get the chemicals, what precautions do I take? Well, maybe you'll pick up on something— and do your seeking elsewhere. It does have a damn good set of pictures.

If you wish your prints to last forever, there is the East Street Gallery permanence publication. 50¢, available from 1408 East Street in Grinnell Iowa, 50112 in numberland. Says you might make it last 3000 yrs; I wish I was that important.

For those who want to get into the alchemy of mixing their own funny chemicals, you can still order most everything through Kodak via your local photo store and get a week's delivery. For the really weird stuff such as Amidol or Pyrocatechin, try Dignan Photographic, Inc. 12304 Erwin Street in, yes, North Hollywood, CA. They also have an excellent publication, Booklet No. 8, Photographic Chemical Facts and Formulas. Tells you what chemicals do, is more complete and up to date (but is technical only) than Ansel. \$2.50.

The Zone System hasn't been fully explained yet. Minor White's book is the most complete account, Ansel has some information about it in The Negative. Both of them are talking from the application viewpoint and it's a bit like describing the Elephant. They don't tell you how else it might be done (e.g. Minor figures development times off of zone eight, Ansel off of six) and why. Try Minor but pulleez don't get the idea it's all that clanky. I've worked with Paul Caponigro: a lot of the time he'll merely take one or two readings and make the exposure. Fast. Simple. And you get a lot more room for creation, expression and like that.

There is a book for telling you how to do platinum, palladium and gum arabic prints. Other processes, too, all of days gone by. Interesting. They're powerful, could be a heavy trip if you've got the negatives to print out. A platinum print is a rich brown (not sepia) or glowing silver color and has an incredibly rich swimming misty depth to it. You make the paper, that is, make the emulsion and then coat a stock (of your choosing!) with it. I haven't yet done it but imagine it would be as hard as making DMT (which I haven't either). And gum arabic prints are made without silver (it's getting scarce and may disappear from the private market) and can be of any color (not just black and white). I don't know the price. It is A Handbook for Contemporary Photographers by Arnold Gassen who is an assistant professor of Art at Ohio U. in Athens, O. The Handbook is distributed by Light Impressions, Box 3012, Rochester, N.Y. 14614.

And for the technically minded, there is Todd and Zakia's Photographic Sensitometry (Morgan & Morgan, publ.) (\$9.95 list, I bought for \$7.95 at the Rochester Inst of Tech. bookstore). This is a well rounded scientific treatment of light sensitive materials. Micro and macro physics, statistical mathematics, etc. While it will tell you more than you want to know, it may have valuable information. For instance, the graphics-oriented person may wish to know primarily how to twist the critter's tail in the darkroom, being less interested in the reproduction of a visual experience than he is in the manipulation of the materials. This book would tell him a good bit about 'effects', as they're called scientifically, that he could use.

Good luck to make it happen.

Stewart Dean
West Cornwall, Conn.

Camera

Aperture

Two magazines have consistently outstanding photographs, Camera, from Europe, has every issue a whole different kind of photographs. Of all the magazines we see at WHOLE EARTH this is the one that gets cut up and pinned to the walls. Aperture, Minor White's magazine, carries camerawork as a mystical tool, not O Boy! God!, but how to see and see until you see through and back.

Duane Michaels, Camera

Conclusions

1. That the photographer is in a poor position to forecast how others will respond to his pictures. (a) Because he was there at the moment the exposure was made, or at least thinks that he was there. (b) Because he assumes that as soon as his camera is paid for that the pictures emerging from it are his.
2. The remedy is to learn to look at his own photographs as if they were made by some other photographer.
3. The remedy, if applied, becomes a discipline that separates the men from the boys.
4. In learning to predict responses it is better for the photographer if he has the direct experience of gathering responses to his pictures than to read extensively about such matters. It is better because the direct experience gives an opportunity to study himself and his work in relation to the world.

Richard A. Egli, Camera

(Aperture)

(Aperture)

On their way off the hill Leonard stopped off at the homeplace to show D.R. how to feed and water Emmitt's rabbits and his chickens. There were forty rabbits in eleven hutches, and about a dozen banty chickens to feed, a half hour chore even when you knew what you were doing. D.R. worked along with Leonard, and listened to him, he wanted to learn this work.

But his mind was still on Emmitt's grave.

Leonard invited D.R. home with him to eat supper but D.R. said he didn't feel like eating.

He said he wanted to be by himself a while, and Leonard understood.

As soon as Leonard was out of sight downhill D.R. went back around the hillside to the grave.

A grave.

That is a grave.

That dark opening

That dark there is a hole in the ground for Emmitt's body. It's Emmitt's body's home now. We're going to put it in a box and put the box in that hole tomorrow afternoon and cover it with dirt and leave it there for years and years and years. Worms are going to eat his flesh and devour the casket, and in time even his bones will turn to dust. We're going to plant Emmitt here tomorrow like a seed.

He's worm-food now.

D.R. was sitting on the mound of dirt they'd thrown up, looking at the hole. Above him was his father's grave, and all around were other graves of long-dead people who had sired him, and it was dark and overhead some early stars were shining as they had the night before, how many nights before? In the ground, D.R. thought.

In the ground.

Out loud, D.R. said: in the ground.

And without really deciding to in his mind, D.R. scooted to the edge, then bracing across the corner of the grave he lowered himself into it, and lay down on his back and closed his eyes.

This is Emmitt's wake, he thought.

This is Emmitt's wake. I am waking here for Emmitt.

East Street Gallery

The East Street Gallery, a cooperative community located in Grinnell, Iowa. Photography, publishing and the making of photographic equipment provide the economic base of the community.

They put out an extremely honest and thorough as can be booklet . . . it contains the results of their tests, and organizes the scattered information relating to the processing and storing of pictures for maximum permanence . . . an issue neglected by too many photographers who otherwise care about that they are doing.

They also describe in detail their high cost, but very high quality and efficient film and print washers and timing device . . .

[Suggested & Reviewed by Will Endres]

Nearly all the negative filing devices now on the market are very destructive to silver based film emulsions. This is especially true of the common "kraft paper" and glassine sleeves. These negative containers contain excessive amounts of sulfur and other harmful chemicals. Also, many of these containers contain glue in the seams which over a period of time may cause severe damage to negatives. It may currently be assumed that no paper or glassine container is safe for long-term storage of negatives or prints.

Cheap Kodachrome

For use in my teaching and for pleasure I buy a lot of Kodachrome for slides. And, after fifteen years, I've decided that Kodak is the best operation to do my developing. I order 35mm K11 36 exposure cartridges with Kodak developing mailers from an outfit in New York City. For \$36.47 I get ten rolls (360 pictures) at a cost of less than a dime per slide counting postage, film, developing, and even 6% sales tax. Order from outside New York and they don't even charge sales tax.

I used to buy film at discount stores and camera shops which charge, typically, 200 per cent of my present cost and for the same product.

I order from 47th Street Photo, Inc., 67 W. 47th St., New York City, 10036. I like them. They even charge my order to my credit card number (Master Charge, or BankAmericard) and save the price of a check.

James Oswald
DeWitt, N.Y.

Dignan Photographic

If you try to find information on the chemistry behind color processing you soon discover that it is hard to come by and the chemicals are equally hard to locate or purchase. Dignan Photographic can help you solve both problems. They publish a monthly newsletter which is full of information and formulas for both color and b&w. Many formulas are simplified versions of commercial brews which make them easy for the novice to use. Their C-22 for developing Kodacolor or Ektacolor film and their unicolor print paper formulas are easy to mix and use. Not only is it interesting but you can easily save 40 to 60%, sometimes more, on your chemical costs. Mixing your own also offers the possibility of doing things not possible with the commercial chemical kits. Dignan Photographic sells most of the chemicals you will need for color or b&w by mail order. Their newsletter covers many major products of Kodak, Agfa, GAF, Fuji, etc. It began being published Sept. '68 so you will want to order back issues. If you are a photographer who wants control over a large and important segment of photographic technology Dignan can help you.

Kodak Ektagraphic Carousel

I've been working with tape-slide shows, and if audience involvement is any measure, tape-slide is fully as effective a medium as film. I use two Kodak Ektagraphic projectors, with the lamp circuits rigged so that one image can be dissolved into the other. The speed of the dissolve is controlled by a switcher-fader that I designed and built from two household light dimmers and a Spirograph game. I would be happy to share my invention with any other media freaks who are interested. Just write.

You reviewed the Kodak Carousel projector in Fall 69. Please tell everyone that the Carousel is good, but not as good as its big brother, the Kodak Ektagraphic. Advantages of the Ektagraphic: 3-connector power cord is permanently attached; Model AF has remote focus control, autofocus, timer, tungsten-halogen lumenized optics, and all other features of the Carousel 860; all Ektagraphics are built more ruggedly than the Carousel; all Ektagraphics will center each slide horizontally, as well as vertically, for precise projection of lap-dissolve slides (important in tape-slide shows); all Ektagraphics have an extra fuse in the lamp circuit. The Ektagraphics are a light gray color, rather than the black of the Carousel. Cost is about the same as the Carousel. Ektagraphics are only available through audio-visual supply houses, and other establishments that supply equipment for auditorium, school, business, and industrial uses. See your local school district, or write to Kodak for dealers. Most audio-visual houses give up to 20% discount to schools and other good liars, so you can frequently horse-trade an Ektagraphic for less than the Carousel. The Ektagraphic AF has got to be the finest slide projector on the market.

I also want to tell you about the finest 35mm camera on the market—the Nikkormat FTN. I've used a lot of different 35mm cameras, including the Nikon F (\$150 more than the Nikkormat), and find the Nikkormat superior to all of them. Camera buyers should ask these questions at least: How complete is the selection of lenses and accessories (who can beat Nikon, Vivitar, Soligor, etc)? How easy is it to change lenses (Canon and Pentax fall down here)? Do I have to move my trigger finger to change shutter speed? Is the thru-the-lense (the only way) meter accurate and dependable? How bulky and heavy is the camera? Is the shutter cloth, or titanium? Does the camera fire quietly and smoothly (the Nikkormat could be a little better in this category)? With a little hunting, you can get a Nikkormat with f:2.50mm lens for under \$220.

Jim Mitchell
725 West Margaret
Pasco, Washington 99301

I agree about the Nikkormat. Best prices are Hong Kong, see p. 232. A good buy on Carousels is on p. 227.

-SB

Spiratone

If you don't have much bread, or don't want to spend much, don't be put off (or put on) by Nikon prices when shopping for new photo gear. Spiratone handles almost every piece of equipment the 35mm enthusiast could want, under their own brand name. They sell lenses from a fisheye to a 500mm mirror, and virtually all lens accessories. Their prices are ridiculously low. For the same money you'd pay for a Nikon 24mm lens, you can get a Spiratone fisheye, 200mm, 300mm, and 28 mm lenses. I have owned a Spiratone 200mm lens for three years. It's gone through a lot of heavy trips—never broke down—never been to the shop. I doubt if you can differentiate, with the naked eye, my Spiratone lens prints from my Nikon prints. Even the arch-deacons of the Nikon-Leica-Hasselblad cult, Popular and Modern Photography, have periodically applauded a low-priced Spiratone innovation. (e.g. See Pop. Photog. May 1970 on Spiratone 500mm mirror lens). When I returned a defective lens, it was replaced by a brand new one, no questions asked, within five minutes.

Spiratone also sells cheaply the most complete line of photo special effects equipment I've seen anywhere, including day-glo enlarging paper, right angle lenses, starlite and multiple image attachments, and focal length and lens angle multipliers. Before you buy high, get high, and write to Spiratone for a free catalog.

The Art of Color

"If you, unknowing, are able to create masterpieces in color, then unknowledge is your way. But if you are unable to create masterpieces out of your unknowledge, then you ought to look for knowledge."

The same goes for seeing masterpieces. This beautifully made book is more than a text—it is a powerful tool that can help you realize the physical act of seeing as a creative act. A way to open your mind and eyes and make the connections to the world more direct and immediate. The plates are so good that there is tangible physical pleasure in seeing them. Worth the giant price if you work with color at all—worth at least a trip to the library if you don't.

Yellow is the most light-giving of all hues. It loses this trait the moment we shade it with gray, black or violet. Yellow is, as it were, a denser, material white. The further this yellowed light is drawn into the denseness of matter, of opacity, the more it is assimilated to yellow-orange, orange and red-orange. Our red is the stopping point of yellow, with which it is not visibly tinged. In the center of the yellow-to-red band, we have orange, as the strongest and most concentrated interpenetration of light and matter. Golden yellow suggests the highest sublimation of matter by the power of light, impalpably radiant, lacking transparency, but weightless as a pure vibration. Gold was formerly much used in painting. It signifies luminous, light-emitting matter. The golden domes of Byzantine mosaics and the backgrounds of the paintings of early masters were symbols of the beyond, the marvelous, the kingdom of sun and light. The golden aura of saints is the token of their transfiguration. The attainment of this state was conceived as an envelopment by light. This heavenly light could not be symbolized except by gold.

Foundations of Modern Art

Full of pronouncements to make you urp ("There are only three billion seconds in a century. Art? To make us forget it"). This 1931 work still serves by odd illumination. Every third pronouncement or so scratches an itch you didn't know you had. The pictures (226 of them) are splendidly peculiar—battleships, native masks, a survey of military formations, a fat lady, cubist paintings, an ancient Egyptian with glasses. I don't know if the book has much to do with art: it has plenty to do with the tension of environment and anti-environment.

The early youth of a man marked out for greatness reveals his later quality. His middle age is often characterised by work that is not truly representative, for self-criticism often obscures his natural virtues. Often works of this period, when technically he is most accomplished, mirror a malaise due to the fact that his intellect has not yet established full harmony with his instincts. The greatest works of art are those produced in the fifties. By then the master has drawn from his intellect all it can give, and is reaping the reward of his experiments. He discovers or rediscovers his own well-springs. Michael Angelo, Tintoretto, Renoir, Cezanne.

SUSPENSE

Our mind always tries to organize what appears unorganized or not organized enough. It also tries to resolve the discontinuous in continuous. Our mind tends to complete the incomplete or interrupted forms. We feel first suspense, then satisfaction of completion. (Phenomenon much in use in music.)

Negress seeing herself for the First Time in a Good Mirror.

Assume for the moment that the gentleman in the bowler hat insists that he is the sole reality, while everything else appears only in his imagination. However, he cannot deny that his imaginary universe is populated with apparitions that are not unlike himself. Hence he has to grant them the privilege, that they themselves may insist that they are the sole reality and everything else is only a concoction of their imaginations. On the other hand, they cannot deny that their fantasies are populated by apparitions that are not unlike themselves, one of which may be he, the gentleman with the bowler hat.

With this the circle of contradiction is closed, for if one assumes to be the sole reality, it turns out he is the imagination of someone else who, in turn, insists that he is the sole reality.

The resolution of this paradox establishes the reality of environment through evidence of a second observer. Reality is that which can be witnessed; hence, rests on knowledge that can be shared, that is, "together-knowledge," or *con-scientia*.

Heinz Von Foerster

I'm awake.

And suddenly D.R. felt Emmit in the air above him, looking down into the grave. He was flying in the cool night air, he was walking on the broken slopes above.

That's silly, D.R. thought. He's not flying. He's not walking. He's not even

He's not even Emmit any more.

For Emmit's lost his name now. He's gone free of names.

And in the cooling dark, feeling the walls of earth on either side, D.R. wondered what that could feel like, what it could possibly feel like to have no name.

To not be David.

To not be Collier. Or Davenport or Divine Right, or even D.R. I have no name, he thought.

No name, no name. I've joined the earth and turned to no-name stuff downhill from the bones of Royce, my father.

Father. I remember you, my father, lying through this wall of earth above my head. You played the guitar and sang and drove us around. I remember seeing you carrying groceries on your shoulder in a box, and one time on the courthouse lawn in Hyden eating crackers and sardines, the two of us together. Now you are bones and I am bones, and let the dead bones lie. Old fish that used to swim here have no names. Old cows that used to pasture here forgotten, without names. And people that once lived here, Indians in the rockhouses, digging hominy holes, dead, and only remnants of their living here remain, and no names. A few names fading in the headstones maybe, stones already sinking, leaning, eager to lie down. I am lying down. Down, down in Emmit's bed, trading places with him as a wake.

In which sense reality indeed exists for a self-reflecting organism will become clear by the argument that defeats the solipsistic hypothesis. This argument proceeds by *reductio ad absurdum* of the thesis: this world is only in my imagination; the only reality is the imagining 'I.'

The Natural Way to Draw

Drawing is a deeper and wider kind of writing. It's better communication in many ways than writing, and it's much closer to your mind. (The same goes for music and speech.)

This classic work by an outstanding art teacher is not only the best how-to book on drawing, it is the best how-to book we've seen on any subject.

—SB

[Suggested by Roy Sebern]

The job of the teacher, as I see it, is to teach students, not how to draw, but how to learn to draw.

YOU SHOULD DRAW, NOT WHAT THE THING LOOKS LIKE, NOT EVEN WHAT IT IS, BUT WHAT IT IS DOING. Feel how the figure lifts or droops — pushes forward here — pulls back there — pushes out here — drops down easily there. Suppose that the model takes the pose of a fighter with fists clenched and jaw thrust forward angrily. Try to draw the actual thrust of the jaw, the clenching of the hand. A drawing of prize fighters should show the push, from foot to fist, behind their blows that makes them hurt.

In contour drawing you touch the edge of the form.

In gesture drawing you feel the movement of the whole.

THE SOONER YOU MAKE YOUR FIRST FIVE THOUSAND MISTAKES, THE SOONER YOU WILL BE ABLE TO CORRECT THEM.

The first exercise, which you are about to attempt, is planned consciously to bring into play your sense of touch and to coordinate it with your sense of sight for the purpose of drawing.

Look at the edge of your chair. Then rub your finger against it many times, sometimes slowly and sometimes quickly. Compare the idea of the edge which the touch of your finger gives with the idea you had from merely looking at it. In this exercise you will try to combine both those experiences — that of touching with that of simply looking.

or **WHOLE EARTH CATALOG**

A gesture drawing is like scribbling rather than like grinding sculpture — think more of the meaning than of the way the thing looks.

Exercise 1: Contour Drawing

Materials: Use a 3B (medium soft) drawing pencil with a very fine point (sharpened on sandpaper) and a piece of cream-colored manila wrapping paper about fifteen by twenty inches in size. Manila paper usually comes in large sheets which may be cut into four pieces of that size. You may use, also, the kind sold as "shelf paper" provided it is not glazed. Fasten the paper with large paper clips to a piece of prestwood or a stiff piece of cardboard. Wear an eyeshade. Do not use an eraser until you come to Exercise 28.

Sit close to the model or object which you intend to draw and lean forward in your chair. Focus your eyes on some point—any point will do—along the contour of the model. (The contour approximates what is usually spoken of as the outline or edge.) Place the point of your pencil on the paper. Imagine that your pencil point is touching the model instead of the paper. Without taking your eyes off the model, wait until you are convinced that the pencil is touching that point on the model upon which your eyes are fastened.

Then move your eye slowly along the contour of the model and move the pencil slowly along the paper. As you do this, keep the conviction that the pencil point is actually touching the contour. Be guided more by the sense of touch than by sight. **THIS MEANS THAT YOU MUST DRAW WITHOUT LOOKING AT THE PAPER,** continuously looking at the model.

Exactly coordinate the pencil with the eye. Your eye may be tempted at first to move faster than your pencil, but do not let it get ahead. Consider only the point that you are working on at the moment with no regard for any other part of the figure.

TWO TYPES OF STUDY. The way to learn to draw is by drawing. People who make art must not merely know about it. For an artist, the important thing is not how much he knows, but how much he can do. A scientist may know all about aeronautics without being able to handle an airplane. It is only by flying that he can develop the sense for flying. If I were asked what one thing more than any other would teach a student how to draw, I should answer, "Drawing—incessantly, furiously, painstakingly drawing."

Probably you realize already that contour drawing is of the type which is to be done "painstakingly". On the other hand, gesture drawing, which you will begin today, is to be done "furiously". In order to concentrate, one can act furiously over a short space of time, or one can work with calm determination, quietly, over a long-extended period. In learning to draw, both kinds of effort are necessary and the one makes a precise balance for the other. In long studies you will develop an understanding of the structure of the model, how it is made—by which I mean something more fundamental than anatomy alone. In quick studies you will consider the function of action, life, or expression—I call it *gesture*.

Some students become self-conscious and confused as soon as they attempt to draw a face. Don't think of the head or the face as something different from any other part of the body. Draw it as you would draw a hand or an elbow or a knee.

Don't try to "get a likeness" of your model. The tendency of the beginner is to separate likenesses from drawing. Draw strangers if you can because you care less what they look like. Do not draw members of your family— or at least do not show them your drawings— because their one reaction will be to look for the likeness. Keep it clearly in mind that **YOU ARE NOT MAKING A PORTRAIT.** You are making a study of a head.

CHANGING THE POINT OF VIEW. It is well known that the printed or spoken word has a tendency to take on authority once it is printed or spoken. To get away from it almost takes a revolution. The same thing is true with your own drawing. The very mistakes you make, as they linger on the paper, have this tendency to become authoritative. To combat it, move about the room during the long pose, making occasional scribbled drawings. A thing is factually the same from whatever point of view you see it, but seeing it from different points of view will illuminate the meaning of the forms and lines you have been looking at.

Whenever you are uncertain as to how to begin a study think of the movement.

Art and Illusion

So much art criticism is so much a vapid waste of time that a book like this one is thoroughly a shock. Every page yields fresh information (did you know that the comic strip was singlehandedly invented by a Swiss gent named Töpfler in the 1820's?) and worthwhile hypotheses about how art and artists gradually teach themselves energies of effect. Furthermore the book is a bargain—it has 319 fine illustrations, 18 in color. —SB

Only in the realm of dreams has the artist found full freedom to create. I think the difference is well summed up in the anecdote about Matisse. When a lady visiting his studio said, "But surely, the arm of this woman is much too long," the artist replied politely, "Madame, you are mistaken. This is not a woman, this is a picture."

202 STEINBERG: From "The Passport"

Max Friedlander tells the revealing story of the bank official who insisted that German bank notes should retain a portrait head in their design. Nothing, he said, was harder for the forger to imitate than precisely the right expression of these artistically quite insignificant heads, nor was there a quicker way of discovering a suspect note than simply observing the way these faces look at you.

Rabbit or duck?

But no tradition of art had a deeper understanding of what I have called the "screen" than the art of the Far East. Chinese art theory discusses the power of expressing through absence of brush and ink. "Figures, even though painted without eyes, must seem to look; without ears, must seem to listen. . . . There are things which ten hundred brush-strokes cannot depict but which can be captured by a few simple strokes if they are right. That is truly giving expression to the invisible." [170] The maxim into which these observations were condensed might serve as a motto of this chapter: "i tao pu pu tao"—idea present, brush may be spared performance."

True, we can switch from one reading to another with increasing rapidity; we will also "remember" the rabbit while we see the duck, but the more closely we watch ourselves, the more certainly we will discover that we cannot experience alternative readings at the same time. Illusion, we will find, is hard to describe or analyze, for though we may be intellectually aware of the fact that any given experience must be an illusion, we cannot, strictly speaking, watch ourselves having an illusion.

Art in America

The only periodical I know that consistently makes art seem like something worth bothering with.

Walter Evans talking:

It's a very exciting, heady thing. It happens more when you're younger, but it still happens, or I wouldn't continue. I think there is a period of esthetic discovery that happens to a man and he can do all sorts of things at white heat. Yeats went through three periods. T.S. Eliot was strongest in his early period, I think. E.E. Cummings seemed to go on without losing much. After all, poetry is art and these fields are related. It's there and it's a mystery and it's even partly mystical and that's why it's hard to talk about in a rational pragmatic society. But art goes on. You can defend it in spite of the fact that the time is full of false art. Art schools are fostering all sorts of junk, but that's another matter. There are always a few instances of the real thing that emerge in unexpected places and you can't stop it; there it is. Even in a puritan, materialistic, middleclass, bourgeois society like America. Because the country is like that, the artist in America is commonly regarded as a sick, neurotic man. (And tends to regard himself that way.) Until recently, true art in America was sick from being neglected. Now of course it's sick the other way: too much is being made of it. The period that's just finishing, of fame and fortune for a few artists, is outrageous. It's outrageous for a few to make hundreds of thousands of dollars while a number of very good artists cannot even make a living. It makes you sick to think about it. The art world is part of our very sick society. Think of what a man of letters is in Paris or in England and what he is here. Here he's either outrageously famous and rich, or treated as less than nothing, never understood, never honestly appreciated. In those countries everyone understands that there are many excellent, poor, almost starving artists, and they are very much respected, just as old age is respected. The unappreciated artist is at once very humble and very arrogant too. He collects and edits the world about him. This is especially important in the psychology of camera work. This is why a man who has faith, intelligence and cultivation will show it in his work. Fine photography is literate, and it should be. It does reflect cultivation if there is cultivation. This is also why, until recently, photography has had no status, as it's usually practiced by uncultivated people. I always remember telling my classes that the students should seek to have a cultivated life and an education: they'd make better photographs. On the other hand, Eugène Atget was an uneducated man, I think, who was a kind of medium, really. He was like Blake. His work sang like lightning through him. He could infuse the street with his own poetry, and I don't think he even was aware of it or could articulate it. What I've just been saying is not entirely true. Since I'm a half-educated and self-educated man, I believe in education. I do note that photography, a despised medium to work in, is full of empty phonies and worthless commercial people. That presents quite a challenge to the man who can take delight in being in a very difficult, disdained medium.

Turner, of course, is played by Jagger— or rather, Turner is Jagger— or rather, and much more interestingly, Turner is the future of Jagger as seen by Donald Cammell and Nicolas Roeg, the codirectors of the film, and most likely by Jagger himself. Burned to a metaphysical crisp by his years in the radioactive spotlight of pop superstardom, Turner has become a glassy-eyed avatar of decayed dreams and rancid drives. He potters about his house, playing with his massive electronic equipment, exhaustedly having sex with his hip hetaira, turning on, reading Borges. Turner is a new genus— Standoff Man, a creature caught and confounded between the extreme energies that dominate contemporary life. He mumbles Nietzsche and sings the blues; he swaggers with cockney machismo and paints his vulvate mouth; he gives off sparks of violence and an effluvia of torpor. And all of this comes together in a brilliant passage when he sings *Memo from T*, the ultimate Jaggeresque dithyramb, in which Turner catapults through a series of identity changes and gender blurrings, accomplished by Jagger's satanic singing and the kaleidoscopic camerawork and editing. In this Brechtian anthem Jagger becomes the Lotte Lenya of our nihilist time.

The Way of Chinese Painting

chinese painters do more with brush, ink, inkstone and paper than western gadgeteers accomplish with their complicated mixing formulas, apprenticeship programs, and didactic traditions. this book can provide you with good access to the tools and ideas of eastern brush painting, things you can carry around in your hip pocket as you move; you provide the practice.

—jd

Kenneth Rexroth and Minor White had me use this as a photography book.

PURIFYING WHITE

In paintings, the areas where white is used often darken. Chew the heart of a bitter apricot seed, and with the juice wash these spots once or twice. The dark spots will then disappear.

Lu Ch'ai says: Among those who study painting some strive for an elaborate effect and others prefer the simple. Neither complexity in itself nor simplicity is enough. Some aim to be deft, others to be laboriously careful. Neither dexterity nor conscientiousness is enough. Some set great value on method; others pride themselves on dispensing with method. To be without method is deplorable, but to depend entirely on method is worse.

You must learn first to observe the rules faithfully; afterwards, modify them according to your intelligence and capacity. The end of all method is to seem to have no method.

For good supplier of Sumi ink brushes and materials (Aiko's Art Materials Import), see p. 175.

The Très Riches Heures of Jean, Duke of Berry

Omitting the useless is as important as including the essential. Aristotle stated a fundamental truth when he said that everything which does not add will detract.

Practical drawings are mental tools. Once you have learned to make them, you will find that they are as useful in solving problems as saws and hammers are useful in carpentry.

But then the night and then how soon the daylight comes, how endless are the details of the work. Busy. Busy. It's ritual time, it's tending to the dead.

D.R. rolled out of bed — Emmitt's bed, the big one he had slept in the first day he was there — at six a.m. and by six thirty he was sitting in Leonard's kitchen, his wife Roxie's kitchen, eating eggs and ham and biscuits covered by thick gravy.

This is my wife Roxie, Leonard said. This is David, Emmitt's nephew.

I been hearing about you, said Roxie, and Leonard said you just help yourself now, David, you make yourself right at home.

D.R. ate. He ate, and ate. He ate like some great tanker taking on a load of fuel.

We've all been hearing about you, said Roxie. Ma Godsey said your coming to take care of Emmitt was a blessing from the Lord.

Ma thinks everything's a blessing from the Lord, said Leonard.

Catalog of Art Prints

Since 1949 UNESCO has been trying to update and internationalize the world of Art Prints. They have a central archives of prints, and a committee of experts who decide which prints to include in their catalogs. The criteria are: quality of print, significance of the painter, and importance of the painting.

There are two UNESCO print catalogs: Catalogue of Colour Reproductions of Paintings Prior to 1860 and the same of paintings from 1860 to 1965. Both are understandably limited in scope by what quality prints are available, and the choice of painters and paintings is often poor. Too much trivial or repetitive work by minor painters takes the place of better paintings by major artists. The catalog does function as a useful access device, and includes reproductions of many inspired paintings, not all of which are expensive. Each entry includes the artist's name, dates, a black & white photo of the painting, its title, date, medium, size and collection in which it rests. In addition, there are lists of publishers and printers, and information on purchasing prints.

Catalogs are trilingual in French/English/Spanish and print dimensions are given in both inches and centimeters. But price conversions are not given so you must deal with each foreign price.

[Reviewed by Joe Bonner & Annie Helmuth]

These emulsions have been employed by experimental painters, but because no standard tradition has been established they must be closely observed and tested before being used, to make certain that they are homogeneous mixtures miscible with solvent and that they will dry well. The presence of finely divided pigments is helpful in the formation of water-in-oil emulsions; tube oil colors can be used in their preparation.

The presence of much turpentine in an emulsion recipe definitely favors the formation of the regular, or oil-in-water type; on the other hand, formation of the water-in-oil type can be aided by omitting all volatile solvent from the mixture. I find that whole egg gives far superior results than egg yolk, in every respect.

Painter's Companion

After searching through all the books in libraries & bookstores on painting technique, methods & materials, & finding nothing but superficial, wordy, popularized presentations after the order of the Walter J. Foster series I decided that if I must I would put out the \$20 or \$30 necessary to buy a definitive & authoritative work on the subject. Imagine my surprise to find my every hope satisfied in a \$1.95 find! It is The Painter's Companion by Reed Kay. Published in paperback by Webb Books, Inc., Cambridge, 1961. It deals with pigments, binders & diluents, oil technique, supports & grounds, water paints, tempera, casein, encaustic, cold wax techniques, fresco painting, synthetic resin paints, pastels, gilding, has a good bibliography & addresses for supplies. It has all the formulas and step by step instructions. 264 pages. A must for anyone working in painting.

FIRST - APPLY A PIECE OF SOLVENT-ADHERING CUTTING FILM, AMBER OR BLUE FILM IN THE USUAL WAY USING NUMBERS 8-10 OR 12 TAFFETA WEAVE SILK.

STRIP AWAY BACKING SHEET

NOW - GIVE THE INSIDE OF SCREEN A QUICK WASH WITH A CLOTH DAMPENED WITH SOLVENT

THIS SETS THE FILM FIRMLY IN THE MESH

NOW - CLEAN FACE OF FILM WITH NAPHTHA AND WHITING AND RINSE CLEAR

NOW - MAKE A SUBSTRATUM BY MIXING THE WHITE OF ONE EGG OR EQUAL AMOUNT OF DRIED ALBUMEN INTO 20 OZ. COLD WATER, AND APPLY TO FILM

SOAK 3 OZ. GROUND HIDE GLUE AND 1/2 OZ. BORAX IN 12 OZ. COLD WATER OVER NIGHT

THEN HEAT IN DOUBLE BOILER and ADD 1 OZ. BICHROMATE

STRAIN THE HOT EMULSION AND FLOW ONCE OVER, UPON FILM SIDE

PLACE STRIPS MASKING TAPE AT BOTTOM AND TOP

IMMEDIATELY AFTER FLOWING HOT EMULSION, PLACE SCREEN IN FRONT OF HEATER AND DRY

PLACE SCREEN ON PRINTING FRAME

EXPOSE 7 MIN. AT 20 IN. WITH #2 PHOTO FLOOD

NOW DEVELOP OUT FACE SIDE OF FILM IN MEDIUM HOT WATER

THEN RINSE AND CHILL IN COLD WATER

DRY USING A FAN TO HASTEN

NOW - UPON INSIDE OF SCREEN, PAINT A COAT HOT LIQUID GLUE, FREE FROM BICHROMATE

SMOOTH UP WITH A CARD SQUEEGER AND LET DRY.

REPEAT BOTH ABOVE OPERATIONS AND DRY

THE LACQUER FILM DEVELOPER

MIX 10 DROPS OLIVE OIL INTO 8 OZ. BUTYL LACTATE

WITH THIS SOLUTION ETCH LACQUER FILM, NOT PROTECTED BY PHOTOGRAPHIC RESIST.

KEEP SWABBING FRESH SOLUTION WITH CAMEL HAIR BRUSH UNTIL LACQUER IS COMPLETELY ETCHED OUT

NOW - REMOVE THE PLAIN GLUE COATING, FROM INSIDE OF SCREEN WITH MEDIUM HOT WATER

THEN LET DRY WITH FAN OR HEAT TO HASTEN

NOW - POUR DENATURED ALCOHOL INTO SOFT CLOTH AND WASH BOTH SIDES OF SCREEN - THIS REMOVES ANY REMAINING TRACES OF LACQUER FILM LEFT IN THE OPEN PORTIONS.

IF THE PHOTOGRAPHIC RESIST IS TO BE REMOVED, USE EITHER A WEAK CAUSTIC SOLUTION OR 1/2 OZ. 28% ACETIC ACID MIXED INTO A 32% SOLUTION FORMALDEHYDE.

Leonard was putting on a tie. He looked strange in a suit, and yet it belonged on him too. He was tall and roughly-cut, big-boned and lean, a powerful man. Leonard was in his fifties, he was a grand-father as a matter of fact. But nobody ever deferred to him because of it. People deferred to him but it wasn't because they thought he was old or beyond his prime. He was right in his prime, and so was Roxie. Roxie was large and getting round, but she was some years younger than Leonard, barely forty. Their children were grown, most of them already married, living away in Indiana and Illinois. Their youngest son Glenn had left home just the year before. He was in the Army, over in Vietnam now. Leonard showed D.R. his picture when D.R. went in the bedroom to try on Glenn's graduation suit.

A perfect fit.

Close to it, anyhow.

Why yes, said Roxie. That suit looks fine on you.

And Leonard and D.R. went up to the church to talk to Reverend Bagby about the service.

Reverend Bagby had it all planned. Mrs. Thornton's niece Dorothy had agreed to sing Abide With Me, and Mrs. Bagby would play the piano. The message would be short, said Reverend Bagby. It was hot, and there was the work of getting the casket up on the hill to bury. It all sounded fine to D.R. He liked Reverend Bagby. He liked Mrs. Bagby. He liked Leonard and he liked Roxie. D.R. tried to hide it as best he could, but the truth of the matter was, he was really enjoying this day so far.

And then there Marcella was to help him enjoy it more.

How good, just plain good it was to see her. And Doyle and Herschel and little Debbie, my what a pretty family. Doyle grabbed D.R.'s hand and shook it as Marcella gave him a powerful hug, and Herschel began tugging at his coat pocket. Debbie hung back, and D.R. lifted her into the air as a reward for being demure. Lift me! Lift me! Herschel shouted, and Doyle took him by the hand and led him off to one side to explain why he ought not be yelling like that. Leonard stood among them as a greeter. It was proper that he do so. Everybody felt it, and in their separate ways they thanked him for it. Doyle held his hand out to Leonard and said you may not remember me, Leonard, but I'm Doyle. Leonard said why Doyle, I remember you good. You fixed a car of mine one time, a Mercury, back in the days when I drove Mercurys, don't you remember that? Doyle looked a little puzzled, then embarrassed. Now I'd plum forgot about that, said Doyle. A maroon car. Put a new coil in it for you, down there by your all's store.

Printers' Supply Book

A look at the Whole Earth Catalogue or any other piece of printing (especially "Movement" stuff) confirms that the items sold by the Kelsey Co. are obsolete—today good, cheap quick printing is done offset. And Kelsey sells only letterpress equipment. But they have a full line—everything. Good and reasonably priced.

For the holdout who still prints letterpress and wants to make some cash from stationary, business cards, billheads, invitations and announcements or just fiddle in the basement, Kelsey has the supplies. I wouldn't suggest buying a hand press from them. They are costly, especially since good used Chandler and Price or other motor-driven hand fed presses can be gotten cheaply. But they do sell all sizes of paper and will custom cut. This is a help to the person who is not employed at a printing office where he can get off-cuts or paper at cost. And they have the whole range of equipment—bodkins, line gages, composing sticks, type cases and stands, galleys, quoins, furniture, reglets—the works. A nice range of inks is listed, and they are ready to answer your letter about inking problems.

Their types cover a wide range. The job printing standbys are all there—Copperplate and Bond Gothics; Caslon, Goudy, Caramond; Egyptians; and the whole mess of ugly cursives you need to do social stationery for your aunt. Several are worthy of note. Steelplate Shaded is one. There isn't much use for this, but it is well-designed and fine-looking. A rather mundane range of sans-serif wood type is listed. Two lines of type are sold—New England and Connecticut. With the Connecticut faces (more expensive) spaces and quads are included. Fonts are sold in regular, large or all cap.

Service reputed to be good to East Coast. Can't say about other areas.

Fox Etching Press

I think that the equipment about which I am sending you information will surely interest a certain subset of your readers, namely, paracting artists and printmakers. The FOX I LEVIGATOR is a unique stonegrinder. the FOX I ETCHING PRESS is far more portable, versatile and by far less expensive than any comparable professional etching press in the field. (Its closest competitor costs \$500 more.)

Parchment

The William Cowley Parchment Works, Newport Pagnell, Bucks, England, supplies Sheepskin Parchment & Calfskin vellum for about 1.2¢ to 2.5¢ a square inch. This is 1/2 to 1/3 less than anything I have found in the US. & the quality is extremely fine.

Richard F. Wheeler
Portland, Oregon

Graphic Chemical & Ink

The best place and the cheapest to get printmaking (lithography, etching, etc.) supplies.

They supply schools and colleges around the country, also art supply stores which mark everything up 1000% or so.

What they sell is everything from Korn's litho crayons, Arches paper, and Sennefelder's Asphaltum to a \$1000 Dickerson combination press.

Most of their orders are filled through the mail and are pretty big. We went out on a Saturday and purchased a staggering \$30 worth of supplies, but they treated us like fuckin kings man and showed us all over the plant, where they do everything: they make their own inks from raw pigment, they manufacture or at least assemble their own presses, but most of all they seem to dig on showing people around. We spent at least an hour just feeling all the different kinds of paper one extremely nice dude showed us.

Hand Bookbinding

There's hardly anybody around nowadays who can teach you how to bind books. Hand bookbinding is a fairly simple process that requires patience and the art of pains-taking. Although machines long ago took over the commercial phase of binding, good hand-bindings are still stronger and more durable, and almost always more beautiful.

I took a course in hand bookbinding at San Francisco State College from Dr. Green, a cantankerous craftsman who would prod, cajole, and insult us into taking time for details and caring about the work enough to redo it two or three times until it was perfect. While that kind of discipline isn't in this book, the basic processes are clearly described and illustrated with lucid drawings by the author himself.

Principles of bookbinding have scarcely changed at all in the 1,800 years since Roman scrolls got cut up into pages, sewn together in signatures and bound between boards wrapped in leather. Most of today's books are constructed in exactly the same way. Watson presents these techniques in a series of projects, starting with an easy dust jacket and ending with slipcases— to me, one of the most difficult jobs, requiring absolute precision measurements. The first binding project is a simple one— signature book with paper covers. The most fun projects are the blank books— which make perfect journals or gifts for friends— and repairing and rebinding old books (when word gets around that you're into bookbinding, your friends will bring you all kinds of favorite dog-eared volumes, coverless and tattered and worn out from countless re-readings.)

Watson also covers handmade headbands and has a whole chapter on making your own tools and equipment, like awls, sewing frames and presses.

You, Too, Can Write Legibly

Short-Cut Shorthand

Writing is slower than talking, and thereby hangs a lot of problems. If you need to write fast you have approximately three choices of method: Gregg (the fastest, but really hard to learn), Speedwriting (slowest, a cinch to learn), and this (medium fast, medium easy to learn). The book is well designed for self-teaching.

PHONETIC SYSTEM. Unlike other shorthand systems, Short-Cut Shorthand follows a purely phonetic system. It has no hieroglyphic-like forms or subtle differences in lines that need to be learned and interpreted. The forms are distinctive and clear cut. Once you learn the character for a particular sound you continue to use it throughout. You just write down what you hear.

And the mention of the store caused Marcella to interrupt and ask Leonard how his mother was.

She don't change, said Leonard. I swear, she aint a bit different than when you all use to live here, Marcella.

Well, said Marcella, I've been talking to her on the phone, but it's been so long since I've seen her.

She'll be to the church after while, Leonard said. And she'll be glad to see you all.

Then there she was, old Mrs. Godsey, with a hat on now, a great, white wide-brimmed hat, and a kind of cream-colored dress that reached to her ankles nearly. Her daughter-in-law Roxie was walking with her, holding her by the arm. But when she saw Marcella the old woman moved out by herself and walked toward Marcella with her arm stretched out, to shake hands. Only instead of shaking hands she hugged her, and the two women pressed their cheeks together briefly, then stood back to look at one another.

And these are my children, said Marcella. This is Debbie. And that's Herschel. Herschel, come and say hello to Mrs. Godsey. She's an old neighbor-friend of ours.

D.R. said, Mrs. Godsey knew your mother when she wasn't as old as you are, Herschel. What do you think about that?

Herschel didn't think much about it one way or another, but he shook hands anyway, and then retreated behind his father.

And then they got to talking about Emmit, how he died, and D.R. being there with him.

He wouldn't go to the hospital for me, said Leonard. I argued with Emmit a month to go to the doctor.

And then here comes this boy and packs him off the first day, said Mrs. Godsey, patting D.R. on the shoulder.

He didn't like it one bit either, said D.R. He cussed me and Leonard all the way to Blaine, and up two flights of stairs.

It had to be done though, said Leonard. It just had to be done.

A Study of Writing

Colour does not seem to play an important role in our modern writing. Although colouring schemes are occasionally used to differentiate meaning, as in charts, it is normally the black or dark colour that predominates, whether in our handwriting or book print. In older times, when all writing was done by hand, colour differentiation was found more frequently. Both the old Mexican writings and the more modern writings of the American Indians frequently employ a method of colouring the signs. Among the Cherokee Indians white colour is used for peace or happiness, black for death, red for success or triumph, blue for defeat or trouble.

HIEROGLYPHIC	HEROGLYPHIC FROM SCRIPT	HERIATIC	DEMOTIC

The retrograde evolution of individual writings was frequently facilitated whenever they fell under the control of a priestly or political caste. In such cases the systems gradually became so overburdened with various artificial and baroque deflections that they grew too difficult for large masses of people to master. The final result of such degenerated writing was frequently its total rejection by the people and its replacement by an entirely new system introduced from abroad.

Bookmaking

A textbook for book designers.

Should enable anyone from author to customer to communicate intelligently about any aspect of the design or production of a book. Probably the only existent reference for someone who needs to deal with printers and publishers, and isn't quite sure he knows an offset from a castoff. Perhaps the best thing that can be said about this book is that it is beautifully designed, but by the time you finish reading it you'll probably know enough to start criticizing its design.

Circular screen

Four kinds of development in sequence.

To reconcile the sometimes divergent needs of the various aspects of bookmaking, decide first on what should be done creatively, then modify these decisions as necessary to accommodate the practical considerations. In other words, plan the ideal first and retain as much of it as you can. This works better than any other procedure because the creative process functions best when it is free of practical considerations. The moment you accept mechanical or economic limitations, your imagination tends to freeze. Not that it merely restricts itself to the practicable—it tends to act as though the limiting walls were made of glass, and it swings in a cramped arc far short of those walls. This is a safe enough procedure, but it precludes any chance of extending the possible.

()		Less space	
()		Push space down to avoid printing	
#	inline with the text to which they refer.	Add space	in line with the text to which they refer.
eg.#		Space evenly	
¶	Place marks carefully.	New paragraph	Place marks carefully. Paragraphs may be
¶¶	Paragraphs may be	No new paragraph	

The readability of a page is affected by no less than 9 factors:

- typeface,
- size of type,
- length of line,
- leading,
- page pattern (which includes "margins"),
- contrast of type and paper (which includes color),
- texture of paper,
- typographic relationships (heads, folios, etc.), and
- suitability to content.

Color has 3 aspects: (a) hue, (b) intensity, and (c) value.

Hue—This is the 'color' of the color (red, blue, yellow, green, orange-red, etc.).

Intensity—This is the purity of the color (intensity is lowered as the color is grayed or 'softened').

Value—This is the darkness of the color (even in pure primary colors there is variation in value—yellow is lighter than blue, blue is lighter than red, etc.; however, an intense yellow may be darker than a blue whose intensity [and value] has been lowered by the addition of white).

There are many considerations involved in matching printer to job, but the main ones are:

- the kind of presses he has (letterpress, offset lithography, gravure),
- the size presses he has,
- the number of presses he has (this relates to capacity to produce),
- the kind of work he has done,
- the quality of his work,
- his schedule, and
- his prices.

Arden

Advertising Graphics

Who wants to make a book of just type and a few clunky illustrations? [If you do, see Bookmaking, above.] A richer palette is offered, and well described, by Advertising Graphics. Drawing, rendering, indication, type, layout, and on through the production process. McLuhan says that ads are good news. Since good news is boring, it's put the burden on advertisers to acid-coat their sugar pill. If we'd had this book back at our beginning, I suspect our \$1 Catalogs would be a lot livelier to look at.

—SB

[Suggested by Stephen Sulka]

Windowing. If your ad includes a few rectangular halftones either same size or reductions, rectangles of black or the red artist aid can be pasted in position on the black plate or base of the pasteup. When the black (line) copy is shot, the rectangles will appear as transparent windows in the black negative. After the halftones are shot they can be positioned under these windows and burned into the printing plate right with the line work. Of course if the halftones are to be reduced, the artist must figure the scaling to make certain the width and length of the pasted rectangles are proportional to the reduced halftone neg. Using a mechanical scaler is one of the quickest ways to do this.

A Lucy (Camera Lucida) is another device for proportioning—enlarging or reducing on a ground glass plate. The artist or stripper can then trace, draw, or measure from the image.

Cut out your initial or a symbol from a block of wood or art gum eraser. Use it to stamp your prints or stationery as your identifying "chop".

INDICATION

The layout artist must be able to imitate or simulate typography, lettering, and the human figure quickly and clearly.

Type is usually indicated by using chisel-point pencils of varying width.

Also check out Basic Graphics (p. 321).

Underground Press Syndicate

1. We, The Free Ranger Tribe, have published this booklet called, "How To Publish Your Very Own Underground Newspaper", which contains just about all the basic information you need, such as—printing, type setting, layout, advertising, subscriptions, distribution, mailing, the police, etc. It is distributed through the Underground Press Syndicate, Box 26, Village Station, New York, New York 10014. It is a compendium of other, smaller booklets on the subject plus the combined experience of the Underground Press Syndicate. \$1.

2. Enclosed is a list of all the Underground Press Syndicate papers, their addresses, and subscription rates. I can't imagine why this has never been run before in the Catalog since this is one of the most basic things for people to plug into. Not only for subscriptions but to advertise in, to send out information and publicity to and to obtain papers from for distribution. An updated list is published periodically, available from U.P.S. A quarter and a self-addressed, stamped envelope would be nice.

3. The Free Ranger Tribe publishes the U.P.S. Directory which lists papers, editors, addresses, phone numbers, advertising rates, advertising deadlines, copy deadlines, mechanical specifications, subscription rates, bulk rates, etc. \$2.00 from U.P.S.

Writing and Illuminating and Lettering

Publish your own book and let the New York madness go choke. Photo-offset on newsprint is incredibly cheap. To make up CATALOG pages we spent \$150 a month for an IBM selectric composer and \$850 for a Polaroid MP-3 camera with half-tone kit, and that's high-rent. With this \$7 book and loving care you could hand-make a publication more personal than speech. —SB

Laying & Burnishing Gold

Note: The rubbing paper is held steadily by the left hand and not allowed to shift during the time that the

gold-leaf is being pressed on to the size. See figs. 106 & 107.

FIG. 107.

BURNISHING THE GOLD

OF QUILLS GENERALLY

For ordinary use the nib may be cut with a fairly steep angle, as shown (magnified) at a, fig. 36.

But it is better for all careful work and fine, sharp writing that the angle be made very sharp: the knife blade is laid back (much flatter than is shown in fig. 29) and the quill is cut quite thin; the knife blade is then held vertical and the extreme tip of the nib is cut off sharp and true (b, fig. 36).

For very fine strokes the nib has a sharper angle (b)

For large writing (a broad nib) (magnified) gives a full stroke

(a) Section of barrel of Pen. (b) the nib forms an arch, giving a hollow stroke.

FIG. 36.

Printing Up The Revolution

An outline for a handbook instructing those who need printing done inexpensively and who want to do as much of the work as possible themselves. The manual deals mainly with printing on small offset presses, and particularly with methods of preparing paste-ups for offset printing. The stress throughout is on saving money without losing quality, and on building equipment and using hand work to save on the high costs of machinery and labor. Also included is a brief survey of movement printers in the San Francisco Bay Area, and their approach to these problems.

1/Basics. The kinds of printing that might be needed, and that this book will deal with (leaflets, pamphlets, posters, etc.). Terminology. How to recognize possibilities. Content and intended use determine form. Stressing what the finished product will be used for. Design.

2/Processes. Offset printing in general, and the small offset duplicator in particular, as the most convenient and cheapest method for most work. The mimeograph machine, its possibilities and limitations, and the electronic stencil device. Some thoughts on letterpress (more to come under "starting a Shop").

3/Camera Ready Copy. Advancing the notion that a tremendous amount of money and time can be saved by preparing good pasteups, and by learning tricks that can be done at the paste-up stage rather than by highly paid printers and camera men. Discussion of the nature of "photo" "offset" and the need for care and patience in producing the original, camera ready copy.

4/Materials and Equipment. Setting up a paste-up studio. What you can build; what you have to buy. The IBM typewriters. Art-Type and related transfer lettering. Typewriter correction techniques and materials. General paste-up techniques and materials. Comparison of various pasting materials— rubber cement, wax, spray adhesive, etc.

5/Aspects of the Paste-Up. The problem of photographs. Multi-color separations. Paste-up niceties, such as Bendays, acetate reverses, white lettering, etc. The use of line drawings for inexpensive art work. Advanced equipment, such as the IBM Composer, headliner, Varytper, etc. Justified margins versus ragged.

6/Aspects of the Paste-Up: 2. Fine points. The use of ruling pens, rapidograph pens, sign pens, etc. and their possibilities. Calligraphy as an innovative and inexpensive way to do titles and headlines. Lifting printed work, starting a clip file, and recognizing problems in using printed work.

7/Paper and Ink. The right colored paper can salvage a pedestrian leaflet. The right colored ink can make it exciting. Buying paper. The understanding of paper sizes and cutting. Avoiding waste, and the uses for waste paper. The cheapest paper is not always the best. The PMS ink color system, and how and why to use it. Planning second color printing. Color ink versus color paper.

8/Binding. An area in which all time and no money can be an advantage. The reasons for not owning bindery equipment. Small office folding machines, staplers, collators, etc. Methods. How to sew a pamphlet by hand, and decorative possibilities. How to dress up stapled pamphlets. Perfect binding, spiral binding, etc.

9/Planning Print. How to talk to printers. Know what you need, and what is possible. "Instant" printing franchise shops and how they work— why they are cheap and how to prepare for them. Rough sketches. Copy fitting. The preparation of copy for typesetting. Let your printer suggest possibilities. More designing. Printing is Practical.

10/Starting Your Own Shop. The camera as the basis of offset printing, and why it is more important to own a camera than a press. The homemade camera. Other homemade offset equipment, as seen in working shops in the Bay Area. What to look for in buying offset presses. The possibilities and economics of letterpress. Relative costs and capabilities. Sources of supply. Suppliers as sources of information.

Included within the book will be information about the availability and prices of equipment and materials, as well as rough prices for building certain pieces. These costs of course will apply primarily to the Bay Area, though an attempt will be made to include some regional comparisons.

Clifford Burke has been in the editing/designing/printing/publishing business for just over ten years. He started Cranium Press in the Haight Ashbury district in 1966, and his experience includes working as printer for the Associated Students of San Francisco State College just prior to the Black Student Union strike in 1968. He now works primarily as a book designer and printer, and operates a casual typographic beer drinking session on Saturdays.

Printing Up the Revolution will be published in October, 1971, and will sell for approximately \$3.00. It will be illustrated by Chuck Miller, and will contain approx. 128 pages.

Printing as a Hobby

Most books that deal with printing are of a highly technical nature; aimed at the professional printer, or someone aspiring to be one. This book, on the other hand, is aimed specifically at the beginner with very little money. With this book and \$10 you can set up your own private print shop. And if you want to graduate later to a small printing press, Mr. Lieberman explains the processes involved with that also.

THE WASHINGTON. The final statement in the development of the handpress. Manufactured in the United States from 1821 through 1910, thousands were produced, but today they are rather difficult to find.

Introduction. This manual is for serious amateurs and potential professionals who wish to operate a handpress easily but expertly. However, we will not discuss in detail operations which are basic to all forms of printing— such as design, typesetting, make-ready, binding. There are many competent books on these subjects— see the Bibliography.

One of the supreme pleasures available to man is knowledge, discipline, intelligence guiding the hand to create beautiful and intellectually desirable objects. This human and consequently expressive element is dominant in handpress printing. Such a press not only records, but glorifies because the hand-printed sheet emanates a unique liveliness and sparkle, and to the touch a sculptural character; it pleases the eye, the mind, the hand.

Presses. A handpress, like gold, is where you find it. Scan classified advertisements of used printing machinery in large dailies and trade journals; run a Want Ad. The best source of information is handpress printers. But the surest approach is through English companies which acquire and re-condition antique presses:

- Brett & Cox, Ltd., 15 Black Friars Lane, New Bridge Street, London, E.C.4.
- Cropper, Charlton & Co., Ltd., Trent Bridge Works, Nottingham.
- Excelsior Printers Supply Company and Frederick Ullmer, Ltd., 63 White Lion Street, London, N.1
- T. N. Lawrence & Son, 2 Bleeding Heart Yard, Londong, E.C. 4
- Harry F. Rochat, Cotswald Lodge, Stapylton Road, Barnet, Hertford.
- Frederick Ullmer, Ltd. (see Excelsior Printers Supply Company).
- F. W. Woodroff & Company, Ltd., 137 Mile End Road, London.
- (Prices run from about \$350.00 for small models, to \$750.00 for the large— FOB).
- Cylinder Handpresses. (Asbern). The E.G. Lindner Company, Ltd., 612 East Twelfth Street, Los Angeles, California 90015
- (Challenge). Gane Brothers & Lane, 1335 W. Lake Street, Chicago, Ill. 60607.
- (Vandercook). Vandercook & Sons, 3601 West Touhy Ave., Chicago, Ill. 60645.

And then everyone got quiet because Mr. Olney drove up in the hearse, and the two fellows who'd helped dig the grave the day before, Ray and Chester, started unloading the casket. Mr. Olney came and shook everybody's hand and looked generally solemn. What D.R. realized today that he had only sensed the day before was that Mr. Olney was a very sick man himself, pitiful-looking. D.R. shook his hand warmly today, and felt responsible for him in some strange way. Mr. Olney seemed to have a burden D.R. wanted to relieve him of, and he studied the old undertaker as he walked into the church behind Ray and Chester, who were wheeling the casket in.

from:
The Book Review
Box 14143
San Francisco, DA 94114

The most intriguing of the naturalistic justifications of death occurs in a book of short stories, entitled *T Zero*, by Italo Calvino (Harcourt). The argument, as presented by an unidentified narrator, may be summed up as this: *The risk we ran was living: living forever.*

Life, says Calvino, amounts to self repetition. When this self repetition is simple, as with the cell which does not die but merely divides and divides and divides, life extinguishes itself by overrunning the earth and exhausting the resources necessary for its continuation. Life continues only by evolving for itself the concept of seed. Once the seed has come into being, errors and improvements in genetic transmission can occur, giving rise to other species. To control these errors, life becomes sexual, in that genetic messages must to some degree 'match' before life will result. With the development of sexual reproduction, the first death of an individual occurs, and for the first time, reproduction entails bringing *another* into the world. Thus, death is to life as the concept of zero is to mathematics: it sets life free.

Impermanence. The sound and the fury of change. Mircea Eliade is a Rumanian, settled here in this country, who rounds out the feeling of a Merton and a Suzuki with a fine fire of fiction. The stories in this book—*Two Tales of the Occult* (Herder, \$5)—written in the personable manner of Conan Doyle's mysteries and Maugham's adventures, stories that bend reality back on itself. Eliade usually writes academic-intellectual books concerning societal mythologies. This is his first fiction translated into English (other stories and novels of his have not yet been translated)—and these tales never stop. Always in back of, say, a pleasant chat between friends, an outing, is the structure of the Social Delusion, the falseness of time, the impermanence of people and events.

'Nights at Serampore', the first story sees three Europeans wandering through a dense jungle near Calcutta, coming across a dream-like sequence of happenings between Indians, and slowly realizing that they're seeing the past, the past within the present time field, so that time itself is whipped into a different pattern in which the past comes out vaguely different and the present, too begins mysteriously changing. . .

For more books, the American Book Association, Publisher's Weekly, R. R. Bowker, etc., all the stuff the CATALOG has used, see the history/how-to section following p. 434.

WALTON, IZAAK. 1593-1683.

The Compleat Angler: or, The Contemplative Man's Recreation: 1653-1676. Dutton Everyman's 1906 \$2.45; ed. by John Buchan Oxford 1914 World's Classics 1935 \$2.75

"The Compleat Angler," one of the most famous books in English, was written by a self-educated ironmonger. Walton wrote it for his own pleasure as well as that of others; it not only describes the technique of angling, but is a contemplative essay on the peace and quietude attained by the fisherman. After its first appearance in 1653 there were frequent revisions adding new material during the author's lifetime. George Saintsbury called Walton's style one of a "singular and golden simplicity." In spite of Walton's background he became recognized as a "gentleman" of cultured tastes and learning. An Anglican and Royalist, he was overjoyed with the Restoration. In his own time, Walton was known as a biographer, author of the "Lives of Donne and Herbert" (Cambridge \$.90) and "Lives of John Donne, Sir Henry Wotton, Richard Hooker, George Herbert and Robert Sanderson" (Oxford \$2.75).

Kenneth Rexroth wrote a charming essay on "The Compleat Angler" in the *Saturday Review* of Sept. 16, 1967, which catches the secret of its enduring appeal—and that of its author shining through it:

"Izaak Walton, above all other writers in English, owes his enormous popularity to his virtues as a man, and these virtues are what condition his style and give his work its fundamental meaning. Millions have read him with joy who have never caught a fish since childhood, if at all. Indeed, . . . in America at least, most of the kinds of fish he talks about are left to small boys. The second half of the *Compleat Angler* was added in late editions and written by Charles Cotton as a guide to trout fishing in rough water. Those who want to know how to catch fish can learn most from Cotton's additions. We read Izaak Walton for a special quality of soul. . . for his tone, for his perfect attunement to the quiet streams and flowered meadows and bosky hills of the Thames valley long ago. . . . It may sound outrageous to say that Izaak Walton wrote one of the Great Books—and that about catching fish—because he was a saint, but so it is. . . . He is, in fact, an unusual embodiment of a quietly powerful tradition, that of the contemplative laymen, St. Thomas More, Nicholas Ferrer, William Law, Gilbert White. After the eighteenth century this type is more commonly found in the sciences than in religion. And like Gilbert White's *Natural History and Antiquities of Selborne*, Walton's *The Compleat Angler* is, in a sense, a scientific work, an outstanding example of the piety of science."

Izaak Walton. By Margaret Bottrall. Pamphlet. *British Bk. Centre* pap. \$.75

The Art of "The Compleat Angler." By John R. Cooper. Professor Cooper teaches English and the humanities at the University of Chicago. *Duke Univ. Press* 1967 \$6.00

Science Books

A quarterly published by American Association for the Advancement of Science (the people who publish *Science*). Most of the reviews are specific and quite nitty-gritty; if they don't like a book they often cite better books on the same subject. It reviews books right on down to kindergarten level; very helpful in locating non-anthropomorphic, factual, logical, and withal delightful books for young ones.

621.47 SOLAR ENERGY ENGINEERING.

HALACY, D. S., Jr. *Experiments With Solar Energy*. NY: Norton, 1969. 147 pp. illus. \$4.14. 69-18892.

Experiments with Solar Energy is a revised and updated version of the author's *Fun with the Sun* published in 1959. Being collateral reading, it might serve as a classroom or family science project manual. Directions are given on the selection of materials, approximate cost, the construction and operation of devices utilizing solar energy; solar furnaces; cardboard cooker; solar oven; water heater; solar still; radio; and a solar-powered airplane. Emphasis is placed on the utilization of solar energy in space vehicles and its potential use on lunar stations that offers opportunities to enterprising and imaginative young people. Its expanded usefulness on earth, particularly, in arid lands is not overlooked. The value of this updated volume is enhanced by the inclusion of clear diagrams and illustrative photographs, lists of firms engaged in solar-energy applications and a subject index. A more comprehensive bibliography would have been desirable. [See also *Solar Energy* by John Hoke; Watts, 1968; S/B 4(1) 59.] SH ★

Demco Library Supplies

After 3 years of handling books I've come to understand and appreciate library hardware— card catalog drawers, bookends, magazine protective covers, book tracks, book repair fabric, record-keeping cards. Noble stuff, right up there with fireman's hats as far as I'm concerned.

-SB

Synergy

Extraordinary publication. It's an on-going bibliography of the Subculture for libraries. Every two months there's an issue on a new subject—Women's Liberation, Communes, Ecology, Indians—with articles, pictures, and fine annotated bibliographies, the cheery fruit of solid research. As I understand it, the service is only available to libraries: free. So bug your local library, or, hmmm, I wonder what it takes to start a library. Back issues of Synergy are worth getting. Also they answer questions on research problems.

STEAL THIS BOOK

I grew up copping change from my mother's purse. In college I stuck a transistor in the telephone cord to get free calls. Then I entered the big time, became an Army officer, and was trained in advanced lying, cheating, and stealing until finally in disgust I turned honest. It was an abandoned act of rebellion, and lo, it freed me. I was just barely in the Army after that.

If you steal, you're in the Army. That's my perspective.

Popular theft is largely a matter of who's Fair Game. In parlous times everybody is, to somebody. In the 1770's American rebels righteously robbed Loyalists and vice versa. During the same period in stable Indian tribes theft was practically unknown within the tribe (encouraged sometimes outside the tribe). Are booksellers outside the tribe?

Most bookstores operate very near the financial edge. Reportedly one-third of all bookstores lose money, run at a loss. They're in the business for love, not money. I know enough now about book-making, selling, and using to assert that books are a fantastic bargain, like matches. Stealing books is a lot like robbing match girls, not exactly a far-out revolutionary gesture, just a lazy, military thing to do.

-SB

Wittenborn and Co.

When it comes to buying books by mail I've had few times when it's been really necessary. Mostly they've been when I've been away from New York and I wanted the book NOW. If the book involved the visual arts and came from anywhere in the world, I've sent the price or its approximation to Wittenborn and presto! They have always responded immediately and more than satisfactorily. They're the kind of book store that has most of the staff mailing or typing— busy— not getting in your hair if you want to browse but always helpful. We've never been able to think of a book they haven't been able to help us with; they are always ready to refer you to someone else if they can't help out. They have always been a regular stop for information re-charge with us. Introducing new customers is always a charge: they get kind of watery knees as they begin browsing and suddenly bank accounts fall.

Wittenborn publishes free lists of recent arrivals on their shelves; they are mailed irregularly. They give a 10% "courtesy discount" with some arm twisting. They are the best source in the U.S. for back issues of art and architecture magazines from both the U.S. and most everywhere else. They also publish and/or distribute many small publications such as Ed Ruscha's Royal Road Test and large publications such as Tantra Art. In short, it's a book freak's heaven.

free **TEACHING AND LEARNING AS PERFORMING ARTS** by Robert Filliou and the Reader
A multi-book, with the participation of John Cage, Benjamin Patterson, George Brecht, Allen Kaprow, Marcelle, Vera and Bjoessi and Karl Rot, Dorothy Iannone, Dieter Rot, Joseph Beuys. Spiralbound, space provided for the reader's use, German and English text, 228 p., wrappers, 1970 \$9.50

The reader is free not to make use of his own writing space, but it is hoped that he will enter as performer, for this is about permanent creation and audience participation.

Introductory Ripoff

A final suggestion for other tool-gatherers who've noticed the high cost of books in general and reference works in particular: At last! You can make the system work for you!

Yes, you too can manipulate the Establishment! How? Simple—through the intro offers of book and record clubs.

Most every book club has come-on offers to make your mouth water—seventy-three books, all for only thirty-eight cents and two boxtops. Seriously, though, there are some good buys. The condition, of course, is that you buy a certain number of books at member prices in a given time period.

What the clubs hope for is that you stay in. What you do is get out. Fulfill your minimum obligation and resign your membership. The next time a good offer comes up, join. (It helps if you've changed your name or your address in the meantime. If not, join your wife, your kid, your parakeet.) A friend has joined the Mainstream Book Club eight times.

Here's how he does it. Their latest ad offers five books for \$1, if you buy four more books in the next two years. That's worth up to \$85 when you send it in. There's almost no way four book-club books will cost you \$85, so you come out ten, twenty, forty dollars to the good.

(I'd just as soon you didn't put my name down for this, if you use it, because some of my book clubs may get your catalog.)

Detroit, Michigan

Hamilton Discount Books

This is the greatest source of in-print book discounts I've ever found. Just write Hamilton and ask for a bunch of order forms and his "List of Publishers." After getting them, merely hunt up the books you want in Books in Print or Whole Earth Catalog. Then make out an order form for each book (50¢ handling—no problems with anything but paperbacks). Most books from major publishers are 1/3 off list price; Lord of the Rings is \$17.50 from the publisher and \$12.42 (including handling) from Hamilton. Service is incredibly fast; I got one shipment one week from my mailing the order. And no foul-ups yet! Minimum discount you get is 15%.

Maggie Thompson
Mentor, Ohio

Edward R. Hamilton, Bookseller
Sherman, Conn. 06784

Government Printing Office

The best buys in books in the U.S. is the U.S. Government, who prints all manner of fascinating non-fiction. If you're interested in a particular area you might as well get the free list of publications in that area. Or you can get the (most useful, I've found) free biweekly list of Selected U.S. Government Publications. Or, for totality, for \$6/yr, the Monthly Catalog of U.S. Government Publications. All, all from:

Superintendent of Documents
U.S. Government Printing Office
Washington, D.C. 20402

Books from Britain

Larry Schwartz calls the readers attention to Blackwell's Books, England. (p. 2). Your readers might be interested in two other book dealers in Great Britain.

James Thin (53-59 South Bridge, Edinburgh, Scotland) is a bookseller dealing in new and used books. He can provide books in any area— he will send catalogs on request or the price of an individual book if not in a catalog— at considerably less than U.S. prices. Hardbacks cost 1/3 to 1/2 what they do here. Penguin paperbacks (for example) can be obtained at about \$3.44, including postage. You can open an account or send your personal check (Made out to Messrs Brown Bros. Harriman & Co., New York). Add 15% for postage & insurance (even so, still a big bargain).

Mr. Thin deals in antiquarian and other used books as well. Books dating to the 16th Century.

(The only books that are not cheaper from Mr. Thin are those published by U.S. University Presses.

The service is courteous, prompt, and personal. It takes about 10 weeks for books to arrive from Britain via surface mail.

For the "Book freaks":

The Folio Society (6 Stratford Place, London WIN OBH, England) publishes books on history, belles-lettres, biography, poetry, fiction, by the world's great authors, in boxed, beautifully bound (canvas, leather, wood veneer, etc.) editions. Some of the books have illustrations directly from the wood block or soft ground etchings. Presently, books average about \$3.44, including postage. The most expensive is the two volume Canterbury Tales at \$8.75. Send for their catalog. Members (there is no membership fee) must buy at least four volumes per year.

James E. Buhn
Penngrove, California

Ray and Chester came back out in a minute to get the flowers they'd brought in the hearse. The flowers had been delivered to the funeral home. Six wreaths: from Marcella and her family, Leonard and his family, Mrs. Godsey, the Thorntons, Reverend Bagby on behalf of the congregation (although only five people in the congregation came to the funeral), and one wreath that was signed, simply, "hospital staff." Ray and Chester took the flowers in and arranged them in front of the casket, and at the ends, and then as a final act they opened half the coffin lid and the people who had gathered in the church filed by for one last look at Emmitt, lying on the light-blue pillow, hardly recognizable without his beard, and in the suit and shirt and blue tie they'd dressed him in. His lips were puckered unnaturally but the whole thing was so unlike Emmitt that detail didn't matter much. The people filed by, some of them sniffing, and then they all sat down in the front two rows, fourteen people counting children and the Reverend Bagbys and Ray and Chester and Mr. Olney and the Thornton girl who was going to sing Abide With Me.

Mrs. Bagby played the piano softly for a while.

And then the Reverend Bagby, not a tall man, kind of pale but still strong in his impression, stood up and opened his Bible.

He read from Ecclesiastes. The third chapter. Sweetly, and yet with power and resonance in his voice he said that for every thing there is a season, and a time for every purpose under the heaven.

There is a time to be born and a time to die.

A time to plant and a time to pluck up that which is planted.

A time to kill, and a time to heal.

A time to break down and a time to build up.

A time to weep and a time to laugh.

A time to mourn and a time to dance.

A time to cast away stones and a time to gather stones together.

A time to embrace and a time to refrain from embracing.

He said there was a time to get and a time to lose, a time to keep and a time to cast away. A time to rend, a time to sew, a time to keep silence and let us keep silence now.

Personalized Bibliographic Service

If you buy more than one book a year, you want to join PBS. You sign up for various categories, and each month brings a computerized printout of all new titles in those categories, including dissertations, films, records and ??

There's more. The good part. To order a book, any book in the world, you just send a card or other written transmission, to PBS; they take care of all the crap of ordering from the publisher AND (it's coming!) they split their profit on each tome with you. . .in practice, this means 10-15% off on hardbacks! You may or may not get something off on softies, depending on what the trade discount is.

They will also conduct a search with used book stores for anything that tickles your fancy but is out of print.

After years of begging, pleading and lying to publishers in an attempt to convince them that as an ally of academe I should get a "professional" discount, PBS appeared and made it automatic. . .at a time when a lot of publishers are cutting off their discounts even to faculty!

Cost is negligible— you pay \$1 for the first category you sign up for, and 50¢ for the rest. . .that's your entire financial input FOR A YEAR. . .except for whatever monthly bill you manage to achieve, of course.

A very complete folder with all the poop will be sent (not exceeding promptly, because they use 3rd class mail a lot) from:

Personalized Bibliographic Service

Remaindered Books

These are books ye publisher got stuck with. After a few years in the warehouse, they are unloaded at astonishingly cheap prices— mere pennies on the dollar— to remaindering houses. Two reliable remainder services are:

Marboro Books
131 Varick St.
New York, N.Y.

Marboro deals by mail catalogs— huge ones— and a card should get you on their mailing list. They also insert their catalogs in the NY Times from time to time, as they have several retail stores in NYC. Their discounts are good and their books are usually in good shape. A little slow by mail, though. Records and posters, too. Prices from 5¢ to 10-15 bucks, depending on what they think they can get. Also, they sell some books at list prices. These books are marked in the catalog by a star. Remember this, because they have recently stopped telling people what the star means— or have found a really good place to hide that information.

Publisher's Central Bureau
33-20 Hunters Point Ave.
Long Island City, N.Y. 11101

About the same as above— often many of the same books in stock, prices about the same too. By mail only.

Bill Marsano
Radnor, Pa.

Learning

Dr. Spock

Baby and Child Care by Dr. Benjamin Spock is an excellent book to have handy, especially with a first child. The advice and explanations Dr. Spock gives regarding fever, rashes, coughs, inoculations and clothing for the infant is presented in simple language, somewhat wordy and repetitious, but in such a manner that you cannot misunderstand or confuse his instructions. Bathing an infant and sterilization of bottles, etc. seemed far too complicated. The chapters on illness, first aid, and special problems are excellent and probably the most read and re-read chapters in the book. Not only do you get lots of psychological guidance in the areas of toilet training, weaning, thumbsucking, and bed wetting but, as may be expected, there are sermons on aggressive children, no-war toys and growing up in a bomb-oriented world. You couldn't possibly agree with everything Dr. Spock says but after reading this book you are left with the feeling that you should relax, enjoy your baby, do what seems right and natural and that Spock is speaking from experience and common sense.

More babies are overdressed than underdressed. This isn't good for them. If a person is always too warmly dressed, his body loses its ability to adjust to changes. He is more likely to become chilled. So in general, put on too little rather than too much and then watch the baby. Best guide is the color of his face. If he is getting cold, he loses the color from his cheeks.

To some degree, the first pregnancy spells the end of carefree youth—very important to Americans. The maidenly figure goes gradually into eclipse, and with it goes sprightly grace. Both eclipses are temporary but very real. The woman realizes that after the baby comes there will be distinct limitations of social life and other outside pleasures. No more hopping into the car on the spur of the moment, going anywhere the heart desires and coming home at an old hour. The same budget has to be spread thinner, and her husband's attention, all of which has gone to her at home, will soon be going to two.

155. Gradual weaning from breast to cup in the middle of the first year. If a mother is producing plenty of milk, how long should she plan to nurse? Best of all, most natural of all, is to nurse until the baby is ready for weaning to the cup. Most breast-fed babies are becoming bored between 5 and 6 months.

A 2-year-old baby shouldn't be worrying about the consequences of his actions. This is the period when he is meant to learn by doing and having things happen. I'm not advising that you never warn your child in words, but only that you shouldn't always be leading him out beyond his depth with ideas.

It's a good idea to begin offering a sip of milk from the cup from the age of 5 months, so that the baby gets used to it before he is too opinionated.

Better to remove and distract him than just to say, "No, no!"

Between the ages of 1 and 5 years, children may develop fever as high as 104° (sometimes even higher) at the onset of mild infections, such as colds, sore throats, grippe, just as often as with serious infections. On the other hand, a dangerous illness may never have a temperature higher than 101°. So don't be influenced too much, one way or the other, by the height of the fever, but get in touch with the doctor whenever your child appears sick in any way.

How to Parent

So many child psychology books leave an unsure new parent more anxious or even guilty feeling. This one builds confidence.

How to Parent is both a practicable review of child psychology and an excellent catalog of toys, books, records, equipment, parental survival, and inexpensive do-it-yourself materials and projects useful in a child's physical, emotional and intellectual development.

The text concentrates on the different stages of development from birth to six years, offering the most basic findings of behavioral science in relation to each stage, and usable advice on how to help a child structure his self-concept to become a self regulating person. Most important, the author insists the application of these findings and advice be guided by the feel of childhood—a contact with the child within you that you once were, and that parents must have the wisdom to follow their own hearts, no matter what the "experts" say.

[Reviewed by Faye Kesey]

You may be able to toilet train a child who is less than a year old, but you are going to have to pay a psychological price for training that early. Personally, I don't think the price is worth it.

Let's be very clear: you cannot spoil an infant. Cuddle your infant as much as you want; you won't spoil him. Feed him as often as he's hungry; you won't spoil him. Sing and coo to him as much as you want; you won't spoil him. Pay attention to him as often as he cries; you won't spoil him. The best things that can happen to your baby, psychologically speaking, is to have as many of his needs gratified and to have as few frustrations as possible. His ego or sense of selfhood is too tender and immature to be able to cope with much frustration now. There will be plenty of time for life to teach him about frustrations when he is older.

Books are far inferior in effectiveness to what a mother can do to stimulate the language development of a child. Continue the "label the environment" game that you started in the stage of infancy. You can do this wherever you are with him. Point to objects in the house and name them for him. When you are riding in the car, you can point out and name objects that you are passing: truck, tractor, house, church.

We may say, "Now that was a bright thing to do, wasn't it?" or "How could you be so dumb?" or "Haven't you got any sense?" Each time we unleash one of these belittling statements we are chipping away at our child's self-concept.

Threats deal with the future, but children live in the present. Therefore, threats are useless in improving the future behavior of a child.

Mother is hurt and furiously accusatory: "Willie—you promised!" She doesn't know that promises are meaningless to children. A promise, like its older brother, a threat, deals with the future. But small children live only in the present. If a child is a sensitive youngster, extracting a promise from him will merely teach him to feel guilty if he breaks it. Or, if he is not so sensitive, it will merely teach him to be cynical, and substitute verbal behavior for true behavior change.

If you get upset and angry at a child's temper tantrum you will reinforce it. Then he will know that he can get to you any time with a tantrum. Don't try to reason with a child in the midst of a temper tantrum or try to talk him out of it. He is a boiling sea of emotions. He is in no mood to listen to reason or logic. Above all, don't try to get him over a temper tantrum by the threat of a spanking. Haven't you overheard parents say to a child in the midst of a tantrum, "Shut up, or I'll really give you something to cry about!" That's like trying to put out a fire by pouring gasoline on it.

What should you do when your first adolescent throws a temper tantrum? What you want to convey to the child is that this tantrum is something he apparently has to go through, but that it will get him absolutely nowhere. How do you convey this to him? You ignore the tantrum. Each mother has to find the ways which are most comfortable for her to do this. Some mothers can stand there and say nothing and wait until the tantrum runs down of its own accord. Others will want to say: "I know you're frustrated and mad, but you'll need to go to your room until you've finished crying. Then when you're through I have something interesting to show you." Others will say sternly: "Go to your room!" Find the method of ignoring temper tantrums that suits you best and use it. But most of all, try to help your child save face by giving him a graceful way out of the situation, if at all possible.

The time to start a child on the road to awareness is when he is a preschooler. A true awareness of the sensory world is his most basic foundation for thinking.

In addition to providing a wide range of sensory experiences for our children, we need to provide a variety of materials which they can use as stimuli for their thinking—materials which your child should have between the ages of three and six. He should have available lots of paper; crayons, felt pens or watercolor pens; scissors with blunt ends; stacks of old magazines; cardboard of various shapes and sizes; a blackboard with white and colored chalk; a scrapbox for collage, containing all kinds of scrap wood, fabric and paper; glue; wooden blocks of various sizes; dress-up clothes and costumes; a record player or tape player; inexpensive records he can play by himself; good records you play for him; Lego or similar types of construction toys; playdough and clay; books. Your child should have a set of plastic, magnetic alphabet letters and numerals and a metal blackboard they can stick to. Without the above-mentioned materials, your preschooler would be as handicapped in his thinking as a college student with no textbooks.

There is also no reason why your child cannot continue to have an evening bottle to go to sleep by, even at this "advanced age" of two or two and one-half. Many of your neighborhood "experts" will frown on you if you do this, and say: "What— he's two and a half and he hasn't given up the bottle yet?" So what? What's the rush? If he still likes it as a security device, is there any reason why we have to insist he give it up at this age? All three of my children had a bedtime bottle. They didn't give up until they were between two and one-half and three years of age.

One of the important things about the evening bedtime ritual is that it should be a time of pleasure for your child. We want him to look forward to going to bed. He should not feel that bedtime is something unpleasant, where he is banished abruptly to a dark room, while the rest of the family does interesting things. The evening bedtime ritual should not only be a time of pleasure for the child, but for mother and father as well.

DR. DODSON'S WHIZ-BANG, SUPER-ECONOMY PARENT'S SURVIVAL KIT

If you have skimmed over this entire list of books, your reaction right now may be: "Wow! I'd like to buy scads of those books, but my family budget won't stand it!" I have considered that very important financial factor and come up with the following list of thirteen paperback books which will form a basic home library for parents at the relatively modest cost (considering today's inflation) of only \$11.60 for all of them. Here they are:

1. *Baby and Child Care*, Benjamin Spock (Pocket Books), \$9.95.
2. *How to Give Your Child a Good Start in Life*, Leland Glover (Collier, 1962), \$9.95.
3. *The Intelligent Parents Guide to Raising Children*, Eve Jones (Collier, 1961), \$9.95.
4. *How to Guide Your School-Age Child*, Leland Glover (Collier, 1965), \$9.95.
5. *Between Parent and Child*, Haim Ginott (Avon, 1969), \$1.25.
6. *Child Behavior*, Frances Ilg and Louise Bates Ames (Dell, 1960), \$5.
7. *Your Child's Play*, Arnold Arnold (Essandess Special Edition, 1968), \$5.00.
8. *Play Therapy*, Virginia Axline (Ballantine, 1969), \$1.25.
9. *A Parent's Guide to Children's Reading*, Nancy Larrick (Pocket Books, 1969), \$5.00.
10. *A Parent's Guide to Children's Education*, Nancy Larrick (Pocket Books, 1963), \$5.00.
11. *Summerhill*, A. S. Neill (Hart, 1966), \$1.95.
12. *Accident Handbook*, Children's Hospital (Children's Medical Center [300 Longwood Avenue, Boston, Massachusetts], 1950), \$2.50.
13. *A Parent's Guide to Better Baby-sitting*, Faye Cobb (Pocket Books, 1963), \$5.00.

TOTAL COST: \$11.60

Playthings

The old standby who always comes up with nifty, new items, especially for infants is Creative Playthings. Catalog free.

Childcraft has a good similar line, with some more elaborate toys. Catalog free.

Preschool Things Catalog is a nice sideventure of Sesame Street (long live), with various toys and books. Catalog \$0.50.

Constructive Playthings has stuff especially for yards, schools and playgrounds, along with dolls, games, etc. Catalog free.

Childlife Play Specialities has strictly yard and playground stuff. Catalog free.

Polypops is a British outfit with extraordinarily nifty cardboard items—rollers, furniture, little houses, etc. Catalog free.

[Suggested by Jeremy Scott Wood]

Galt Toys has complex, civilized, inexpensive British stuff. Catalog free?

LUNARTRACK

Articulated caterpillar track propelled by one child power. The child gets in and crawls forward in a normal manner the tank revolving round the child. The tank like action is extremely realistic and the track sill surmount small obstacles. A certain degree of skill develops with use and familiarity. Sections can be omitted to make a circumference more adaptable for younger children. Dimensions: Width 15" Overall length 56" Carry Home Case: 35¼" x 2-3/4" x 28½" Price £3.0.0

And Reverend Bagby presided over a silent prayer with his arm upraised and his hand outstretched, till finally someone among the people said amen, and Reverend Bagby concluded with verse fifteen:

That which hath been is now; and that which is to be hath already been; and God requireth that which is past.

Reverend Bagby began to speak then, and remarks about Emmit, personally, were only a part of what he had to say. He gave a little of Emmit's biography. He said that he was born there on Trace Fork, that he'd grown up there, and had gone to Finley County High School. He said that he'd served in World War Two, and been wounded, and that after the war he'd gone into the coal business for a while. He talked about Emmit living a few years in Louisville, and about his year in the Veteran's Hospital and then his return to Trace Fork when his father died. But the remarks about Emmit personally were only little decorations on a larger statement he was trying to make that D.R. listened to very carefully. It wasn't a logical statement, it was better than that. He began with the reading from Ecclesiastes, and then allowed his words to spread up and outward into a kind of song. Half the time he spoke with his eyes closed. And now and then he'd stop suddenly, hushed by some inner command, and in the church a silence would build that he in turn would use to build his song upon, reaching higher and higher and lower and lower, sometimes bridging the high and the low by lapsing into an unknown tongue, never much, and never for very long, just little shines of the pure language of glossolalia, fah lan tah, mah nah lah, fa lan tah.

And D.R. listened.

Play and Playthings for the Preschool Child

This book will be useful to schools, and parents and teachers of children under eight. It was originally published under the title of *Play With a Purpose for Under-Sevens*, so the "preschool" in the title doesn't mean only 3 and four-year-olds. Since the author is an English nursery school teacher the book is written under English assumptions: you aren't going to run out and buy everything you need, and you're going to make use of anything you've got lying around the house anyway, like castoff car tires and coat hangers. Mrs. Matterson has a clear practical style of writing, and a lovely way of making things sound terribly easy to do. As a matter of fact, most of the equipment and toys in this book are easy to make. Besides giving instructions for making things, Mrs. Matterson says a lot about children's play: the kinds of play, its meaning to children, music, pets, natural play materials, books (there's a whole chapter on story-telling), and play for sick children. Her last two chapters are on planning a playgroup (that's an English co-op nursery school) and an open letter to child-welfare experts and school boards. There's an appendix at the end with a list of books suitable for children from 3 to 6 years old, and a list of sources of supply for play equipment. Probably the editor did the appendix, since it lists American sources of supply and information. She also must have weeded out the exclusively English terms and objects available only in England, because everything in the book seems to be universal and easy to get. In Evelyn Beyer's introduction she gives the American viewpoint on what seems to be a point of difference between parents and teachers here and in Great Britain— whether or not to read fantasy and fairy tales to young children. In England parents and teachers rarely seem to

worry about the effect on young children of wicked stepmothers abandoning children to starve, of the chopper coming to chop off your head when you play London Bridge, but here we're all awfully queasy about that sort of thing. Mrs. Beyer is in favor of "a story diet of here-and-nowness" for three and four-year-olds. (I disagree with her here— taken literally that would mean throwing out *The Three Bears* and *Peter Rabbit*)

Diary of An Early American Boy

A quaint account of life on an early American homestead. Its daily entries are so vividly portrayed by the author's word-pictures and ink sketches that you actually feel you are living with Noah and his family. With them, the forest is the marketplace, the creek is power, and Nature is ever in Command. With a knowledge of levers, use their ox to clear a field for corn. With a broadaxe and the help of your neighbors, erect a king post bridge over your creek. With flour ground in the mill you built, bake bread. With scraps of branches taken from fallen trees, make toys for children. And on Christmas Eve, as a blanket of snow glistens outside under the stars, sit by your warm hearth and give Thanks to the Forces that made you.

25: A cold and windy day. Neighbor Adams with son Robert stopp'd by. We drank mead and mint tea. No work done this day. Father is going to the woodlot behind the barn tomorrow for floor timbers. I shall assist him.

26: A light snow fell which Father believes will be the last of the winter. We fell'd a fine oak and rolled it upon rails for Spring seasoning. Mother is joyous at the thought of a good wood floor.

In the little forge barn half-way down the bridge, Izaak had earned most of the money needed around the homestead. Not that an early American had great need for cash, as most things were traded; but a good farmer always had a cash crop or some paying trade other than farming. Izaak was a nail-maker. He had taught Noah the art of making hand-wrought nails by letting him pump the bellows of the forge as a little fellow; now and then he actually hammered or broke the iron nail rods.

The BLAKE place some time after 1805.

With the help of Noah, Izaak Blake had created a workable homestead. The Indian Trail became a roadway, the brook became a source of power to grind corn that grew where once a forest stood. The shelter became home to an early American boy.

Children's Books

As an old children's book buff (I grew up in a family of four kids in which we read aloud every evening, and have a heavy-reading bunch of four kids myself) I feel moved to respond to your San Diego correspondent who in the January issue asks for "any sort of literature for our kids that doesn't constitute total propaganda for the establishment set." First, though, I'd have to say that I don't think it is possible to do very well on her specific request for stuff on families other than the Standard American model, since the books on "other kinds" of families (eg Reba Mirsky's *Thirty-One Brothers and Sisters*, Lois Lenski's stories about Okies and such) which are available and often not bad are written by people who are outsiders to the life they write about and have that flat and faintly didactic quality which goes with that. There are some autobiographies from other cultures which I remember liking (Yuel B. Mirza, *Children of the Rooftops*, Younghill Kang, *The Happy Grove*, Mme Sugimoto, *A Daughter of the Samurai*, Camara Laye, *The Dark Child*, Wright's *Black Boy*) but none of the ones I think of are for young children. I'd imagine that the main thing she wants and what we generally want is something which encourages kids to be open and to grow into the kinds of grown-ups who can laugh and cry and wonder. Now having, as is customary, re-defined the question to suit the answer I have, I will make some suggestions along those lines. Just things which come to mind.

If my list has an idiosyncratic character, so would any child's. For kids not only have their individual tastes but also use particular books for some particular thing in that book which speaks to their particular condition. One of mine, for example, loved a book by Robert McCloskey called *Blueberries for Sal* which is about a bear mother and child and human mother and child getting scrambled and then brought back together properly again, and at a time of great stress (she'd had to have part of a finger sewed back on) had it read over and over. She would wake at night crying, and I would hit her with the *Blueberries for Sal*, and she'd go back to sleep comforted. Also, kids, like grown-ups, like from time to time to rest or rot their minds with trash.

Anyway, some suggestions.

First, for pretty young kids:

Ruth Krauss' *Bears* is perfect play, and her book *The Big World and the Little House* is a beautiful statement about being at home in the world.

Antonio Frasconi's multi-lingual woodblock picture books *See and Say* and *More See and Say* are extraordinary, and even nicer is *The Snow and the Sun*.

The tiny, precise books by Beatrix Potter may seem too old-fashioned to parents who think of themselves as advanced, but I think should be looked at. The best known is of course *The Story of Peter Rabbit* but some others are more interesting. I like especially *The Tailor of*

Gloucester. (Beatrix Potter was a terribly cooped-up Victorian clergyman's daughter who wrote and illustrated these stories to keep alive; late in life she married, happily, and never wrote another line. Women's Lib take note.)

Maurice Sendak's *Where the Wild Things Are* is preferred by the Cambridge types.

I'm not sure if you can get in the U. S. Tove Jansson's *The Book About Moomin, Mylme and Little My*, but if you can get it you'll be amazed: Finnish surrealism.

Dr. Seuss, as is well known, writes splendid nonsense; for me, the one which comes off best is *If I Ran the Circus*.

For somewhat older children:

All the books by Laura Ingalls Wilder are wonderful. They should probably be read more or less in order, not only because they follow the chronology of her own life (they are autobiography) but because the scale of vision in each is that of the age level represented. The first one, *The Little House in the Big Woods*, is in its own way a sort of child's Whole Earth thing anyhow, full of careful descriptions of such things as how to make a smoke house and smoke meat in it and how to make a wood-and-leather door latch. My favorite of the lot is *The Little House on the Prairie*; the chapter in that on "Indians Going Away" is for me one of the most perfect pieces of writing in English for any audience.

E. B. White's *Charlotte's Web* is a wonderful book about the basic things—friendship, death and birth.

Randall Jarrell's *The Bat Poet* is a fine book about being a poet and has some great bat poetry; his *The Animal Family* is also the real stuff.

Saint Exupery's *The Little Prince* one might think is really for grown-ups, but my kids like it.

P. S. Beagle, *The Last Unicorn*. So sad.

Tolkien, of course.

Three books which we have loved which might not go for kids who don't know New York, are Jean Merrill's *The Pushcart War* (guerrilla warfare against trucks) Doris Plenn's *The Green Song* (about being a Puerto Rican, in this case a frog, in New York) and George Selden's *The Cricket in Times Square* (on being alive at all in New York.)

Two very old-fashioned books which might or might not go for some kids in this age are Frances Hodgson Burnett's *The Secret Garden* which is about a couple of terribly neurotic kids growing into health by working together to make a garden come back to life, and George MacDonald's *At the Back of the North Wind* which is a terribly strange book, I guess metaphorically about death.

Selma Lagerlof's *The Wonderful Adventures of Nils*; travelling around Scandinavia with a flock of wild geese.

Some children like fairy stories and some don't. Those who do usually need a big supply; readily available in paper are the red, blue, pink etc. fairy books. The stories of Hans Andersen are usually listed as fairy stories, but of course they are something else than "tales."

Then there are the Homeric epics. For kids I like best the Giant Golden Book of the Iliad and the Odyssey. I have burst into tears reading aloud the Iliad to a little boy who was mystified (and re-reading Simone Weil's "The Iliad: The Poem of Force" knew why it made me cry.)

Some really good collections of poetry are: Herbert Read's *This Way Delight*; Dunning (ed) *Reflections on a Gift of Watermelon Pickle* (can be got in paper, but the photographic illustrations are so good the hard cover is worth it if you can afford it) and C. F. Moule's *Miracles* (poems by children.) Carl Sandburg's poems, *Wind Song* can be got in paper.

Having listed all this fantasy, I would like to cite also one very good book about fact: Mary Eiting's *The Lollypop Factory and Lots of Others* which is about industrial organization, written in a nice non-nonsense style like those old books by Ilin. There is a Giant Golden Encyclopedia which doesn't tell you much about anything, but is the sort of thing it is fun to browse through.

I'd also like to list one stunning biography available in paper, which I have been giving away to friends of mine: *Journey Towards Freedom: The Story of Sojourner Truth* by Jacqueline Bernard.

If you are far from libraries or bookstores, Blackwell's in Oxford has a splendid children's book catalog, and the price of books in England is so reasonable that even with postage it may be cheaper than here; they are very obliging about letting you set up an account rather than paying for each order. If you write them they will reply (or have to me) via a handwritten letter.

Now for another department. If you are going to list books on such finicky crafts as macramé, I think you should list *Cookies and Breads: The Baker's Art* by Ilse Johnson and Nika Standen Hazelton, Reinhold Publishing Corp., \$6.95. Most of it consists of photographs of items in an exhibition of ornamental breads and cookies at the Museum of Contemporary Crafts, but it also has some how-to directions and we went absolutely wild here one Saturday making instant stained-glass with cookie dough and pounded-up sourballs.

I was rendered absolutely euphoric by your review of my book, *The View from the Barrio*, in the fall issue. Such a contrast to the *American Anthropologist*. They sort of liked it, but were made very uneasy by the lack of footnotes.

Loyally,

Lisa R. Peattie
Newton, Mass.

Indian Tales

About ten years ago a story went around that a beatnik girl in Sausalito wrote to Ezra Pound and asked him how to write poetry. Pound replied promptly. "Read Indian Tales by Jaime de Angulo. It is how."

De Angulo was a linguist at Berkeley, a bohemian personality in early Big Sur, and a good friend to the "primitive" Pit River Indians in Northern California. (His challenge to the notion of primitive may be found in his excellent article "Indians in Overalls", reprinted in The Hudson Review Anthology, *Vintage*, 1961). He wrote these stories for his children. They are made from odds and ends of his experiences with Indian stories, language, lore, and mysterious occasions. They are the best children's stories I know, and they are more simply Indian than anything else I've read.

(KPFA in Berkeley has superb tapes of De Angulo reading the stories. Maybe they've decomposed by now. If they were made into a record set, I'd buy them in a minute.)

"I don't want to, I DON'T WANT TO. I don't want to be a MAN; I want to be a Fox."

"Oh, the Ha-Has again. You are reverting."

Fox was laughing. He said, "Seriously, Oriole, why did we grow up so fast? Only yesterday, when we began our story and I started to see the world with my father, who was then a real Bear . . ."

Oriole interrupted. "No, you are mistaken. He was not a real Bear yet, he was only a beginning of a bear, he was a person-bear. Now he is a bearman—I mean a man-bear . . . I mean . . ."

"Oh, keep quiet. You are getting me all mixed up again."

"No, Fox, listen to me; I will explain. The man who is telling our story, it's his fault, he has done something wrong with the machinery of time, he has let it go too fast. You see, he was supposed to take a million years to tell our story. The poor fellow, he is too old, he gets all mixed up. He should go and take a rest in the country for a while."

"Oh, my, my, my!" sighed the Fox, "the only thing to do is to start again RIGHT AT THE BEGINNING." Fox looked curiously at Oriole. "What do you mean, a MILLION years?"

"Why, I mean an infinity of time, just as Tsimmu was telling in his story of the creation of the world, Don't you remember? Ten times ten times ten times ten years, *molossi molossi molossi tellim piduuiwi*. When Cocoon Man was floating around in nothing but air and fog he waited a million years for that cloud to come near enough so he could jump on it."

"Yes," said Fox. "Yes, just like Marum'da, who made the world and then he went to sleep. That's an infinity of time, but it must stop somewhere—it can't go on forever. It must stop somewhere."

Oriole asked, "WHY?"

Fox thought a moment then he said, "I dunno. But listen, Oriole, what's time anyway?"

Oriole said, "Why, it's ten times ten times ten times ten years. What else do you want it to be?"

Fox said, "I dunno, I guess it's growing old."

Oriole said, "All right, then, some people grow old faster than others. You know that yourself. Just as some people walk faster than others. It all depends on who is looking at it."

"Why, Oriole, you are crazy. It depends on who is walking, not on the man who is looking at the fellow who is walking."

"No, certainly NOT. Look at that man over there walking. He seems to be just crawling along, but if you were close to him, he would be going much faster. That's the way with the man who is telling this story. Sometimes he is closer and sometimes he is farther away, so for him that makes us go faster or slower."

Fox said, "Oriole, you drive me crazy. Now I don't know whether I am standing on my head or my feet. It's like that time when we first met you and your father."

"Listen, Fox, it is not I who started this idea that there was a man telling this story, it was you. For all we know, there is no such man."

"Of course, there is not, I invented him."

"That doesn't prove anything. Marum'da invented the people, and they existed whether he liked it or not. Maybe you invented the man who is telling this story, so now he exists. It's too bad, but now you can't get rid of him."

"Yes, I will. I'll destroy him the way Marum'da did the people."

"Then you know what will happen, Mister? You won't exist any more because he is the one who is telling the story."

"Oh, oh, oh, stop, Oriole!" Fox was holding his head in both hands. Then he laughed as he pulled Oriole to her feet and they both ran down the hill.

He heard a sweet voice sing Abide With Me.

And then he helped them carry Emmitt in his coffin outside to where the sled was waiting.

And he walked with Leonard leading the horse up Trace Fork, the others coming behind, not the old folks, not Mrs. Godsey nor Mr. Olney, just those who could make it in the sun over the broken road and then across the broken hillside up the rugged slope past yellow, yellow earth of the churned up land,

And he helped them lower the coffin into the grave

And he walked with Marcella and Doyle and Leonard and the rest back down to the homeplace

And Mrs. Thornton had been in the old house, cleaning up, and someone had brought food, fried chicken and cakes and pies and a great bowl of green beans cooked with a piece of fat,

And D.R. ate with the people and talked with them and Marcella and her family stayed that night at the homeplace and it was a marvelous, far-out time they had, talking about the old days,

That evening in itself's a story but I'm just too tired now honey to tell you any more. I'm crashing now, falling into sleep again, here in Emmitt's bed. I'll tell you the rest when I wake up, for there's oh so much to say.

Programmed Reading

If you have a pre-school or kindergarten age child who you feel is ready to learn to read but you don't know how to start, this series of programs may be your answer. The series of twenty-two books begins with a set of eight sound-symbol cards. Each 8 x 10" card has a picture and the sound (letter) it stands for.

When the child has learned all eight sounds without the help of the pictures, he is ready to begin the primer, which uses only the eight familiar sounds plus 'I', 'yes', and 'no'. Learning the sounds and getting into the primer may take a long time and plenty of help from you, depending on the age of the child and how much he can absorb in one sitting. Our children started short sessions before age four and it was several months before they reached the self-teaching level, about half-way through the primer. After that they were on their own, going through each book at their own rate and becoming fairly good readers by the time they started kindergarten.

The material in every book is presented in a highly entertaining way; drawings by Carol Andrews are funny and colorful so that learning to read never becomes a drag.

The main characters throughout the series are Sam, Ann, their little brother Walter, Nip the dog and Tab the cat. The beginning books are about their daily adventures and how they get into and out of trouble. In the more advanced books, when the mob is looking for adventure they visit the Roundabouts who live in a land where anything can happen. The last three books, also in the form of self-teaching programs, are stories from Greek mythology meaningfully written for seven and eight year olds.

Cynthia Buchanan has also written a three-part series, Programmed Geography (Macmillan) including The Earth in Space, Continents & Oceans, Latitudes and Climates. Our children were able to do this series successfully at eight years or so. Another excellent program by the Sullivan Associates is Programmed Astronomy (2 books).

The next thing Ann knew, she and Mr. Roundabout were swinging in his garden. "Oh," she said, hardly daring to breathe, "that was the most wonderful trip!"

"Trip?" said Mr. Roundabout, bringing the swing to a gentle stop. "Have you been on a trip, my dear?"

Cuisenaire Rods

The first rod is a small wood cube with a 1 centimeter side. The second is twice as long with the same cross section. The third is three times as long as the first. Each length has its own color. With these rods, a child can learn arithmetical operations and mathematical relationships even though he recognizes no mathematical symbols. (Children are capable of grasping mathematical concepts before they have the mechanical ability to write. Therein lies one of the great advantages of Cuisenaire rods.) For example, if a child puts the first (white) and the second (red) rods end to end he can see that together they are equal in length to the third (green) rod. Once he realizes that a white and a red always equal a green, he has learned something quite general about addition and equality. If, later, the numeral "1" is associated with the first rod, "2" with the second rod and "3" with the third, he will be in a position to grasp at once that 1 + 2 = 3. But the rods have no absolute numerical value so that if the value "1" were assigned to the third rod rather than the first, the truth 1/3 + 2/3 = 1 would also be forthcoming as "proved" by the general rule that the child discovered with the rods.

What is happening here is that algebra (the general case) is being learned before arithmetic (specific cases), as logically, it should be.

This is undoubtedly one of the best pieces of teaching equipment ever invented. But it is important that you don't show children the truths that the rods demonstrate. They must be allowed to discover these themselves or it won't work.

Initial Teaching Alphabet

As everyone knows, the English language is inconsistent. For instance, here are four different pronunciations of the letter A:

ape apple arm all

i.t.a. eliminates all such inconsistencies by spelling with a separate symbol for each "a" sound:

æp appl arm aul

Eliminating contradictions in spelling and pronunciation makes learning to read and write a logical process. Anyone whose mind can grasp logic—and this includes three and four year olds—can learn to read with i.t.a. There are none of the complicated rules of the normal alphabet. Capitals in i.t.a. are just the regular size i.t.a. symbols written or printed a little larger. Each sound has its own symbol; there are 44 altogether.

After learning to read in i.t.a., the switch can be made to the conventional alphabet easily. The irregularities are not troublesome at this point, because the reader can read whole words at a time—not letter by letter—he can read for content.

i.t.a. is great for pre-school age children who want to read. At that age, kids get frustrated easily. The i.t.a. alphabet prevents the frustration by its consistency. We taught our 4 year old the sound of i.t.a. letters. Then we showed him how words could be made by blending sounds together. It took a while before he was able to blend the sounds by himself. But when that happened, he was then able to read.

i.t.a. is also good for teaching English to foreigners (many foreign languages also have one symbol or one group of symbols for each sound) and for remedial reading instruction. It is also a good tool for writing: once all the sounds of the symbols are learned, one can write anything he can say.

Ladybird Books

I come from a family that reads a lot. I had two children, aged 5 and 6½ who could not read at all. I had pointed to their TOES and shown them all the Dolman words and read Beginner books and Dr. Seuss at them. One day an acquaintance of ours came for lunch and brought his 5 year old daughter. She found the Beginner books and the Dr. Seuss and read them to herself. We found out that she learned to read on Ladybird books. We started our kids the next day, September 17. By January 4 of the next year the 5 year old was on book 5b, and the 6½ year old on Book 11a, that is, the younger child could read books of the Beginner book variety, and the older one could cope with just about any children's book. We read to them from the books for ½ hour each night, and answered the questions. We saw to it that they got books as they were ready for them. That's all we did. So in 3½ months they learned to read, substantially by themselves.

"KEY WORDS... what they are, and how they are used. Some of the words in the English language are used much more frequently than others. These words which appear more frequently can be called Key Words.

Research shows that twelve of these Key Words make up one quarter of all those we read and write. One hundred of them form half, and three hundred about three-quarters, of the total number of words found in juvenile reading. Reading skill is accelerated if these important words are learned early and in a pleasant way."

Write for details to the publishers: WILLS & HEPWORTH LTD.
LOUGHBOROUGH Leics. ENGLAND

There are 36 small hardcover books in all in the Key Words set, 3 shs each. The set, bought on the spot in East Africa cost 15 dollars and 50 cents. I think it is good value. The only thing is that some words are very British—"sweets" instead of "candy" for example. A similar set using Standard American or ghetto language would be very valuable.

There are more Ladybird books than this, about 240 altogether, all 3 shillings, all good value— stories, factual information, anything that kids like.

Looking and Seeing

1. Pattern and Space
2. The Development of Shape
3. The Shapes We Need
4. The Shape of Towns

This series of 4 books was designed for use in British schools. They are absolutely first-rate.

As befits such books, they are filled with excellent illustrations and the text is very explicit. While it would seem to have the 12-16 year olds in mind, the books are packed with stuff of interest to anyone who wants to know about the visual world and isn't too proud to read simple English.

The author's view is,

We have learnt to exert a certain amount of control over our world, over our surroundings and the lives we lead within them. But although we have gained much we have probably lost even more. We no longer possess the knowledge and the understanding to judge the things we make: our houses and factories, our implements and machines, our cities and roads. Because of this failure in judgement, we often find ourselves surrounded with such ugliness as would have horrified men of past ages. . . . It is now more important than ever that we should learn to understand the basic laws of the world around us, the man-made world and the world of nature. (bk. 1, p. 2)

The illustrations are widely drawn, but are consistently relevant to man. Traditional crafts, modern building, technology, graphics, ergonometics, D'Arcy-Thomson-like discussion of structure, social influences and industrial design are all dealt with.

One small foible—not all the illustrations are fully identified, except in the teachers' handbooks which are put out as small companions to the 4 books. These also deal with the short exercises which are set at the end of each section in the books.

Tuning and Playing the Bowed Psaltery

The notes to which the strings should be tuned are given on the full size drawing on the inserted sheet. See also diagram 70 for the compass of the instrument. Tune the notes of the strings to the notes of a piano. In playing, rest the short side of the triangle against the body just above the left hip, and with the left hand, support the instrument towards the other end. Holding the bow in the right hand, bow the far end of each string. See plate 6. The diatonic scale of C is on the right. Reach over to the other side for the sharps and flats. It is necessary to lift the bow from string to string. True legato playing is impossible but it is easy to play sustained notes, and these are particularly acceptable when used with tuned percussion instruments.

SIMPLE STRING INSTRUMENTS

A pattern of instruments. In addition to showing many of the instruments described in the book, this photograph shows the frame and soundboard assembly of a Spinnet and also a Fidel with its bow. Nearby lies the template for a viola back.

PART SEVEN

THE TRACE FORK NEWS
by Barry Berry
(reprinted from the Blaine Herald)

Well, I know a lot of you were disappointed that there wasn't any news last week. It didn't mean that nothing was going on. Something's always going on around Trace Fork and up and down Rockhouse Creek, but I just felt too bad last week to write it up. I've had a virus going on ten days now. I don't know what it was, but it sure makes you feel awful when you get it. I'm not plum over it yet but I do feel some better this week although I'm still not up to making a full report. This time next week I intend to be well enough to write half the paper full, but I'm going to take it kind of easy this week because I sure don't want any relapse of whatever it was that I've been down with.

Dolly Huff told me that Mr. and Mrs. Dwayne Holcomb were down from LaPorte, Indiana over the weekend visiting her mother, who is 88 years old.

Aunt Eunice Bartlett and her son Denver went to Lexington to visit Ira Combs, who had surgery on his leg. They report the operation was a success and that Ira should be home in a week or two. Denver drove his new Chevrolet.

Mr. and Mrs. Joseph Cooney have also been to Lexington lately. Their daughter Sarah finished nurse's training at Good Samaritan Hospital and her parents went down to the graduation. Sarah is a registered nurse now. Seems like only yesterday she was here in high school, cheerleading. Congratulations, Sarah. Why don't you come on back home and be a nurse in one of our fine mountain hospitals? We need good nurses and doctors. We need all of our young people to come back home to live.

But it seems like there's just not enough opportunity here for young people any more. I'd hate to know the figures on just how many of our fine young people have moved away in the last few years.

(continued)

The Psychology of Children's Art

An elegant masterpiece on an inelegant subject, children's art. And they mean young children ages two through ten. Rhoda Kellogg, having analyzed some one million pieces of children's art, has categorized their early scribbling patterns into seven-teen consistently recognizable stages and basic shapes. She has found, and you'll see this with her through a startlingly clear picture essay presentation, that children from every part of the world go through the same artistic maturational stages in terms of the identical shapes, designs and symbols that they use. "If children everywhere are so alike, then it may be possible to build upon man's common heritage rather than to founder upon his differences." *The Psychology of Children's Art* is a visual treat and an educational rarity—it would be a welcome gift to new parents, old parents and non-parents.

[Suggested and reviewed by Carol Guyton Goodell]

Creative Drawing

Ernst Röttger has a fruitful technique for graphic exploration (or any other kind). He gives the students a medium— usually very simple— and some harsh constraints— usually very simple— and lets them find their own way out of fresh air. I suspect that this kind of medium exploration is better the more "useless" it is. Good book.

They were in a strange world of pools and craters. Here and there he saw tender green shoots. Clouds of steam rose towards the sky from gaping holes and it was raining, like on earth. Then they went on.

"If you still had the serpent Time in you," said the Lord, as they stood on another mountain top, "you would have to die and be born again as many times as there are drops of water in all the seas in the world. It would take that long before you could stand on this star with me."

BLOWN LINES

A thick line drawn on the paper with India ink. By blowing sideways at the line the ink runs over the paper at random, producing bizarre patterns. What at first seems to be an aimless blue becomes quite controllable after a little practice. If a drinking straw is used for blowing, the stream of air is concentrated and easily aimed. Patterns can be influenced in many different ways—the distance of the straw from the paper, the angle at which it is held, blowing straight, crooked, evenly or in bursts or by moving the tube. The best way of exploring the possibilities is to begin by free experimentation, then the results achieved by chance should be brought under control and used consciously. The few illustrated examples show the enormous potential variety. Formal patterns of this kind have a unique character which is quite unattainable by drawing. If colour is also employed the number of possible combinations is greatly increased.

Seasonal Lag

August is hotter than June even though the sun is more nearly overhead and the day is longest on June 22. In terms of solar radiation reaching the earth, May, June, and July should be our warmest months. But June, July, and August actually are. Why?

During the year the earth, as a whole, loses precisely the same amount of heat it receives from the sun. But as the sun moves north in spring, our part of the earth gains heat faster than heat is lost. On June 22 it is receiving maximum solar radiation. The heat gain continues to exceed heat loss until maximum warmth is reached, usually in late July. Heat gain continues to exceed heat loss, at a diminishing rate, until about August 31. Then our part of the earth starts to lose heat faster than it receives it, and begins to cool down. The process is like starting a fire in a stove: the roaring fire heats the room slowly, but the room will stay warm for a while after the fire has died down. The same heat lag accounts for the fact that the warmest time of day is usually about 3 p.m.—not noon, when the sun's rays are most intense.

Weather

Weather will generally remain fair when:

- The wind blows gently from west or northwest (p. 66).
- Barometer remains steady or rises (pp. 85-88).
- Cumulus clouds dot the summer sky in the afternoon (p. 20).
- Morning fog breaks or "burns off" by noon (evidence of clear sky above).

Rainy weather or snow may come when:

- Cirrus clouds thicken and are followed by lower clouds (p. 88). (Particularly true if barometer is dropping.)
- There is a ring around the moon (pp. 17 & 88). (Particularly true if barometer is dropping.)
- Puffy cumulus clouds begin to develop vertically (p. 20).
- Sky is dark and threatening to the west (p. 85).
- Southerly wind increases in speed with clouds moving from west (p. 85).
- The wind—particularly a north wind—shifts in a counterclockwise direction—that is, from north to west to south (pp. 85-88).
- The barometer falls steadily (pp. 85-88).

Weather will generally clear when:

- Bases of clouds show steady rise to higher types (p. 85).
- The wind—particularly an east wind—shifts to the west (p. 85).
- The barometer rises rapidly (pp. 85 and 88).

Temperature will usually fall when:

- Wind blows from—or shifts to—north or northwest (p. 85).
- Night sky is clear and wind is light (pp. 9 and 14).
- The barometer rises steadily in winter (p. 85).

Temperature will usually rise when:

- Wind is from south, particularly with cloud cover at night or clear sky during the day (pp. 9 and 88).

Effect of increasing power: At left is a 7" field in Cygnus as seen with 7x50 binoculars. At right, centered on the same star, is the reduced and inverted field seen through a small telescope at about 35X. Numbers on map indicate magnitudes of stars (decimal point before last digit omitted).

Setting circles: With these, a telescope is easily sighted.

Sky Observer's Guide

In summer, the surface water warms to well above 39.2°F. and floats on the heavier water below. Mixing ceases, and lake stratifies into 3 layers. Fish are found in warm top layer, which is rich in oxygen, and a few in or near the middle layer, a zone of rapidly descending temperature. The bottom layer is cold and low in oxygen.

Fishing

HOW TO SURF CAST

Before attempting a cast with a revolving-spool surf reel, wet your line. This prevents it from burning your thumb on the cast. Shift reel into free spool and put thumb firmly on the spool. Let out 2 or 3 feet of line, and hold the rod pointed low opposite the direction of your cast, the sinker resting on the ground. Now bring the rod up with a powerful overhead sweep, pulling downward with your left hand and pushing upward with your right. As the rod comes up past the vertical, ease your thumb pressure and let the spool turn. Let the line run out under your thumb; removing your thumb will cause a backlash. As the sinker hits the water, thumb spool hard. Surf spinning is done with same motions, using forefinger instead of thumb to control line.

Andrew Lang Fairy Books

Everybody suggests these books, but nobody wants to review them, which I take as a good sign: it's too rich a bundle to bag. I haven't read the series. I have been paging through, and it's clear the stories (gathered and published by Andrew Lang around 1905) are made of meat and potatoes and starvation and eagles and ladies and hermits and ogres and hard changes and not cotton candy. The turn-of-century illustrations by H. J. Ford are romantic.

Among the mountain pastures and valleys that lie in the centre of France there dwelt a mischievous kind of spirit, whose delight it was to play tricks on everybody, and particularly on the shepherds and the cowboys. They never knew when they were safe from him, as he could change himself into a man, woman or child, a stick, a goat, a ploughshare. Indeed, there was only one thing whose shape he could not take, and that was a needle. At least, he could transform himself into a needle, but try as he might he never was able to imitate the hole, so every woman would have found him out at once, and this he knew.

There was once a king's son who told his father that he wished to marry.

"Someone has told the king that I have prophesied that a child shall be born this night in the palace, who can speak all the languages in the world and play every musical instrument. I am no magician to bring these things to pass, but he says that if it does not happen he will have me dragged through the city at a horse's tail till I die."

"Do not trouble yourself," answered the stork. "I will manage to find such a child, for I am the king of the storks whose life you spared, and now I can repay you for it."

Mr. and Mrs. Elmer Hampton from Cutshin in Leslie County visited his sister, Mrs. Ruth Gordon on Ten Mile creek two week-ends ago.

Phyllis and William Sims have a new baby girl. Her name is Janell. Congratulations, Phyllis and William.

I didn't get to go to church the last two Sundays but Brother Bagby says attendance has been real good.

Hagen Banks made the honor roll at Morehead University the last semester. His mother, Theda, said this was the third straight semester Hagen made the honor roll. Hagen is going to summer school so he can finish college in three years. He is studying to be a biology teacher.

Sammy Kirk has been home on furlough from Fort Knox the past couple of weeks, but he has to leave Saturday for Vietnam. I know his mother, Mrs. Cinda Banks, will hate to see him go so bad. Readers will remember that it has only been a little over a year since Cinda lost her husband Artis in a mining accident. May the Lord watch over Sammy and return him safely to us as soon as possible.

Our community was saddened last week when Emmitt Collier died. Most people didn't even know that Emmitt was all that sick, till they took him to the hospital in Blaine. Leonard Godsey, who was a good friend of Emmitt's, said he was bad sick for a month or more, and that he tried to get Emmitt to go to the hospital, but he wouldn't. Emmitt lived by himself up at the head of Trace Fork and didn't get out much. I didn't get to go to the funeral but everybody that went said it was real nice. Brother Bagby officiated, and Dorothy Thornton sang. They buried Emmitt in the family cemetery up on the old Collier homelace. The road up Trace Fork's so bad any more they had to haul the casket up in a sled.

Relatives at the funeral included Emmitt's niece Marcella, and her husband Doyle Maggard, and their children, all from Cincinnati, plus Marcella's brother, David Ray, who was already here visiting.

Lee Sergeant said that his neighbor, Mrs. Lois Pope's application for a Black Lung pension on her husband, the late Kermit Pope, has been approved, and that Mrs. Pope will soon begin to receive the monthly benefits. As far as I know, Mrs. Pope is the first in this end of the county to have her Black Lung application approved. But there are many more who ought to receive those benefits if justice is to be done to all those whose health was destroyed working in the mines.

Well, that's all for this week. My head's starting to hurt again so I'm going to quit and go out on the porch a while.

Audubon

I'd call this the strongest ecological-call-to-arms publication we've got. Its illustrations (both photographs and paintings) have visceral impact. The articles are thorough and authoritative. Audubon Society is no longer just birds but all life and it's into appreciation as much as protection. Like National Geographic, it's healthy just to have around the house. I keep thinking of the canary the miners kept for warning of poison gas.

The fact is, however, that the sportsman's code of ethics just doesn't exist anymore. And if you don't believe it, examine the facts of a story that broke in *The New York Times* on Sunday, February 7th. And then watch the bang-bang books to see if they report this odious episode, complete with names and addresses of every hunter involved (which are readily available). If they do, perhaps there is some hope for the future of hunting.

The headline read, "35 Named in Raids on Bighorn Sheep," and the story told how rare desert bighorn rams were being slaughtered illegally on secret safaris into the Jacumba Mountains east of San Diego, California, not far from the Mexican border.

For fees as high as \$3,500 apiece, wealthy sportsmen from across the country— from Washington, California, Vermont, Oregon, Colorado, Idaho, Pennsylvania, New York, Texas, Oklahoma, Missouri, Hawaii, and Canada— were led into these sere hills to shoot an animal that has been totally protected in California since 1872. Three races of the bighorn were slain, and two are on the U.S. Fish and Wildlife Service list of America's rare and endangered species.

Their guide, according to state and federal wildlife agents, was a man who until recently had been a director (and a charter member) of the National Society for the Conservation of Bighorn Sheep, who had long been one of the organization's most ardent workers in seeking better food and water supplies for this vanishing species, who for years had aided the California Department of Fish and Game on its annual bighorn census— and thus knew all of the rams' haunts.

And he not only led the expeditions, but he mounted the trophies at his own taxidermist shop. A raid there uncovered 31 skulls of bighorns, plus hides, capes, and one fully mounted ram. Forty more ram heads from the Jacumba herd have been seized by federal wildlife agents in hunters' trophy rooms in thirteen states and Canada.

The take? Thousands and thousands of dollars over a period of three years.

Smithsonian

The good old Smithsonian Institution has a new magazine, similar to Natural History, plus more Americana. Some very original articles.

His chickens provide meat and eggs equally as good. The secret, Rodale is eager to reveal, is in their environment. They cluck contentedly in a chicken house unusually clean and almost odorless, thanks to another organic wrinkle. The chickens roost on a dropping pit primed with several layers of soil and rotted cattle manure. This culture, rich in bacteria, acts as a deodorizing agent on the droppings, which, as they are digested, provide a continuing source of loamy compost for gardens and fields.

Rodale also "fertilizes" with rocks and tin cans. In 16 Howard cylinders (1/1000-acre garden plots rimmed with low concrete walls), he has experimented with metals as growing aids, coming up with surprising results. For instance, he once planted string beans in all the cylinders, adding cans to four, wire mesh to another four, and cultivating eight plots normally as controls. The metal-enriched areas yielded 50 percent more beans—with higher vitamin content— than the control plots. Rodale borrows from the Chinese in growing vegetables among rocks. He bends to pull up a clump of parsley. Some of its roots cling to a rock, sucking out natural trace minerals, Rodale explains.

Natural History

The publication of the Natural History Museum in New York, this magazine covers wildlife, anthropology, science, archaeology, history, conservation, and more. It's always good, occasionally outstanding. Excellent bimonthly night sky map.

New York, New York 10024

The reef is perhaps the most complex community in all of nature, where plants and animals of infinite variety live together in seeming confusion. But even here there is an orderly balance and inter-relationship among organisms. The gorgonians provide concealment and shelter for fish, both hunter and hunted. Brittle stars and feather stars perch in their branches, and certain crabs and shrimps make their homes nowhere else. All the species of two important families of snails— the egg cowries and the coral snails— prey exclusively on the polyps of various corals. But the most fantastic relationship of all is the partnership, or symbiosis, between minute plant cells and the corals and most other coelenterates, whose living tissue they inhabit. These plants, known as zooxanthellae, need the carbon dioxide produced by the animal, which in turn utilizes the surplus oxygen and food produced by the plants through a complex enzyme system, increase the coral's ability to deposit calcium carbonate and so make it possible for them to produce the vast framework of the reef.

South Vietnam approximates the size of New England; the area sprayed is larger than Vermont; the area bulldozed almost that of Rhode Island. While none of Vietnam's 43 provinces has escaped, some have been attacked heridically with particular intensity and frequency. Among these are the Rung Sat region in Gia Dinh Province southeast of Saigon, Tay Ninh Province (War Zone C), which is northwest of Saigon, and Long Khanh Province (War Zone D) northeast of Saigon— the last previously contained major stands of South Vietnam's magnificent virgin tropical forest.

Most forest spraying has been done with a 1:1 mixture of 2,4-D and 2,4,5-T, Agent Orange in military terminology; some with a 4:1 mixture of 2,4-D and picloram, or Agent White; and small amounts with dimethyl arsenic acid, Agent Blue. The use of Agent Orange was discontinued in early 1970, largely in favor of Agent White. Agent Orange was applied at the rate of 25 pounds of active ingredients per acre; Agent White at 8 pounds; and Agent Blue at 9.

Naturalist Book Service

The North American Naturalist Bookstore
Box 133, Plainfield, Vermont 05667
"Postal access to readings in the natural sciences, natural history, and natural living".

A very tasty selection of books, all written around better use of and appreciation for our natural earth-home. It reminds me a little of the Whole Earth Catalog. Titles include Down the Colorado, Freezing & Canning Cookbook, The Sea Around Us, the Stalking books—everything from ants to ecology.

One Million

Working familiarity with large numbers is an acquired skill. (Until this gig I could never handle a concept like "twenty-thousand dollars" without sitting down— "How much is that in candy bars?" Or, this printing of the CATALOG is 600,000 lbs of paper; that's, let's see, 300 tons of cultural/ecological karma.)

This well-made book of dots and notes can make formerly impossible numbers relatable to each other and to life. It's fun. Godwork.

955,001—960,000

955,396—Dollars earned on costs totaling \$14,293 by Western Electric on a U.S. Government contract for checking over "launcher loaders"—a profit of 6600 per cent.

955,484—Vehicles recalled by automobile manufacturers in 1968 to check for potential safety defects.

This book is a yardstick, a ruler divided into a million parts instead of a dozen. The reader may use it to measure any quantity between one and one million: it will provide a visual equivalent thereof.

There are 5,000 dots to a page— 10,000 on each double-page spread. The progression is marked, and a little counting and multiplying will yield the dot that corresponds to any number one likes.

Notes are scattered— like mileposts— here and there in the inside margins. Each note corresponds to a number, and the dot signifying that number is readily identifiable.

Patterns of Survival

As far as I'm concerned education and evolution are conceptually indistinguishable. If you know how to evolve you're ahead of whatever game is going. For example, the way to be safe from dinosaur bites is to be little, fast, furry, warm-blooded, and smart. (The way to be in hazard of dinosaur bites is to be another dinosaur.) We're talking about education in the school of survival, which every school is, despite pastel walls.

This well-illustrated and personal book is the best introduction I've seen to the fascination of evolutionary perspective on the living and dying world we take part in.

or WHOLE EARTH CATALOG

Quite by accident I had pitched my tent within ten yards of one of the major paths used by the wolves when they were going to, or coming from, their hunting grounds to the westward; and only a few hours after I had taken up residence one of the wolves came back from a trip and discovered me and my tent. He was at the end of a hard night's work and was clearly tired and anxious to go home to bed. He came over a small rise fifty yards from me with his head down, his eyes half-closed, and a preoccupied air about him. Far from being the preternaturally alert and suspicious beast of fiction, this wolf was so self-engrossed that he came straight on to within fifteen yards of me, and might have gone right past the tent without seeing it at all, had I not banged my elbow against the teakettle, making a resounding clank. The wolf's head came up and his eyes opened wide, but he did not stop or falter in his pace. One brief, sidelong glance was all he vouchsafed to me as he continued on his way.

Apart from the fact that there are only a fixed number of homesteads available to the wolves, their abundance is apparently further restricted by a built-in birth-control mechanism. Thus it happens that when food species are abundant (or the wolf population is scanty) bitches give birth to large litters—sometimes as many as eight pups. But if the wolves are too numerous, or food is scarce, the number of pups in a litter may fall to as few as one or two. This is also true of other arctic animals, such as rough-legged hawks. In a year when the small mammal population is high, roughlegs will lay five or six eggs in a clutch; but when mice and lemmings are scarce, they may lay a single egg or they may not breed at all.

Peterson Field Guide Series

The thing that is so nice about these guides is that everyone of them has a lot of stuff in it. The books are easy to use and well-illustrated enough so that if you look carefully you can identify most any species of bird, flower, bug, etc. that you meet up with. Too bad they aren't all paperback so that you could put all of them in your pack.

[Reviewed by Terri Gunesch]

at present, there are 19 books in the series. they are generally \$5.95 each. here is the list:

- * 1. A Field Guide to the Birds (paper \$3.95) (eastern land and water birds)
- 1R. A Field Guide to Bird Songs (two 12-inch LP records)
- * 2. A Field Guide to Western Birds (\$5.95)
- * 2R. A Field Guide to Western Bird Songs (three 12-inch LP records)
- 3. A Field Guide to the Shells (Atlantic and Gulf Coasts)
- 4. A Field Guide to the Butterflies (Eastern North America)
- * 5. A Field Guide to the Mammals (\$5.95)
- 6. A Field Guide to Shells of the Pacific Coast and Hawaii (including the Gulf of California)

The entire forest was doomed, and all the great dependent community of living things had lost its food and shelter. This community too must go, simply because one of its smallest members had escaped its natural controls and found too much prosperity.

In a few years the entire forest, covering many thousands of acres, was dead or dying. Four thousand million board feet of timber stood rotting where it died, most of it wasted; for in this rough mountain country it was not worth building roads to bring it out. There was no young, productive forest left to justify the cost of these roads.

In the White River National Forest in Colorado a heavy wind blew down several groups of Englemann spruce trees. It broke many of the tree roots, weakening the flow of sap, but left enough roots in the ground to keep the trees alive. Thousands of beetles gained entrance to these weakened trees and found a paradise to work in; for the underside of each tree, buried in a mat of crushed branches, was protected from the hunting woodpeckers. The most effective of these woodpeckers, the arctic three-toed, hunts this area chiefly in winter, but now, with the fallen trees covered by snow, the beetles were completely safe from their chief enemy and they multiplied.

A good anecdotal introduction to ecology. —SB

We remember that Nietzsche said: "In the architectural structure, man's pride, man's triumph over gravitation, man's will to power, assume a visible form." But should we now go the extra step and imitate the successful corals? From them we could learn that defense against gravity is not enough to give us power for survival. We might build into our urban architecture an added wealth of plant partners to clean the air and give us extra food. Perhaps rows of wheat plants and a potato vine should join the geranium flowering on the window sill, as a first step in the right direction.

Flea powders containing poison deadly to fleas were puffed into the dirty clothing and dirty homes where the parasites were numerous. But poison proved to be just a new kind of dirt. It killed only 99 percent of the fleas, or slightly more. A few of the parasites were resistant, and so were their offspring. In just a few years the fleas became as numerous as ever and virtually immune to the poison in concentrations that previously had seemed effective. So long as the creature survives, it still has a chance to evolve a little more and make a comeback everywhere.

Not so very long ago the eminent British biologist Joseph Bancroft of Cambridge University set down his thoughts on what he called Features in the Architecture of Physiological Function. He was impressed by the number of ways in which living things have escaped "from the tyranny" of the chemical rule shown by the equation of Arrhenius. He saw how far-reaching was the change when, instead of just slowing down as the weather chilled, the ancestors of mammals and birds began to shiver inside their coats of fur and feathers. Here was "the cold-blooded animal successfully adopting ingenious mechanisms, first biochemical, then physiological, in order to adapt its heart to the variations of its environment; the warm-blooded animal discarding what its cold-blooded predecessor has laboriously beaten out, invoking the nervous system to reverse the normal biochemical relationship and gaining a new freedom by adapting, not itself to the internal environment, but the internal environment to itself."

DEAR FLASH

Well, man, it's far out. In the last ten days me and Estelle split up, I've gone crazy and an uncle of mine here in Kentucky has died. I tended to him the best I could but he died, and we buried him on the hillside last Saturday afternoon. I helped dig his grave.

And now I'm living here in his house, an old house my grandfather built about 1920, a house my father grew up in, and that I lived in a while myself when I was a boy. It's an amazing scene. This hill, and all the hills around here, were strip-mined a couple of years ago. I mean, man, they've been destroyed. Bulldozers pushed the tops of the mountains into the valleys so they could scoop the coal up with machines. About eighty per cent of my grandfather's farm here is under mud now, and out behind the house there's this incredible big mound of mud, this big wall of it, about fifteen feet high, waiting on a rain to loosen it enough to flow right on through this very kitchen. I wish you could see it.

In fact, consider coming to see it. I'm going to stay on here a while and look after things and get myself together a little. The Lord has sent me to a cool place at last. I haven't ridden in a car in almost a week now. The theme here is staying put. Being still. No freeways, please. No wheels, except maybe one at a time, on a wheelbarrow. About all I want to do at this point is rest and be real quiet, and what I'm finding is that the best way to do both those things is to work hard. I've been working full days since my uncle's funeral. If you feel like resting and being quiet, come on down here and work with me a while. You can shovel rabbit shit while I water the garden.

If you can't swing that, do two other things for me. Send me some money, and find out where Estelle is. I don't need a lot, and I don't need it all at once, and whatever you send, from now on, I intend to pay you back. (I mean, like, how many freaks mooching off you intend to pay you back, Flash? This may be the start of some whole new trend). If you could send me two hundred dollars now, and a hundred dollars a month till further notice, I'd be cool. I can live on a hundred a month here easy. Food for the rabbits and myself is the only really big expense. (My inheritance includes forty seven rabbits, all hopping around and eating and shitting in hutches out behind the barn. They're part of my uncle's scheme to save the world with rabbit shit, which I will describe for you in full detail in another letter. It's very far out). If I stay the rest of the summer, I'll owe you four hundred dollars by fall. But even if I wind up staying a whole year I'd only owe you about fourteen hundred next summer. I'll figure out something else by then. What I need to do now is get some money coming in so I won't have to sweat it for a while, so please let me know pretty soon if you'll be able to carry me for a while.

Estelle. I don't know what to say, where to begin. We got really fucked up in Cincinnati. Or at least I did. It was heavy, I was heavy, and it got heavier and heavier till I really couldn't carry it anymore. It's much better now. I'm much better. At least I think I am. I feel like I am. And what I want to do is get hold of her and tell her that. And a whole bunch of other stuff too. So please try to scout her out for me Flash, get an address or a phone number and send it to me as soon as you can. Maybe Angel's heard from her. I'm sure she didn't go back to her parents place in Grayling, although maybe she did at that. I'm sending a letter to her, in care of you. As soon as you get an address please forward it to her immediately, and then let me know.

Well, old hoss, many thanks to you. I'm not rapping with anybody here much, except a little with this one guy, Leonard, who was a friend of my uncle's and who comes up to help me now and then. So I'll be laying some letters on you for a while, probably. And if you feel like it, lay some on me in return.

Peace.

D.R.

Living With Your Land

If you're a kid in a family that has some land this book will help you get family support for projects to encourage wildlife, improve the soil, build a pond, live up the place.

Birdhouse construction is booming. Some factory and do-it-yourself sources are pressed to keep the supply in pace with the demand. People seem to want birdhouses as badly as the birds do. Here is a gratifying and constructive trend. Obviously the clearing of a million acres of land a year for the suburbs is having its effect on nesting practices. At a time when urbanization is depriving hole-nesting birds of nesting sites, it is but prudent to fill the gap caused by the scarifying of the countryside and the removal of old trees and fence posts. It is also wise to encourage population growth of useful and disappearing species, such as practiced by Dr. Heinz Meng of New Paltz, New York. To bolster the dwindling sparrowhawk population in his Hudson Valley area, he sets out large nesting boxes with entrance holes three inches wide. Thirteen of his 14 boxes were occupied in 1965.

Exotic Aquarium Fishes

More than 70% of the Whole Earth's surface is under water, with proportional animate population, our ancestral home. Some people immerse themselves in this ecological dimension swimmingly. Others box a bit of it and stash it in their pads for observation, education, fascination, fun. Aquarists have been long aware of environmental balances and such, playing god. Aquariums are communes. How you keep your tanks will show you to be curious, careless, callous, compassionate, concerned, or what.

The dean of American aquarists is Dr. William T. Innes, whose classic manual with its exquisite color photographs, updated by assistants and now published cheaply, unfolds scientific insight, practical lore, wry humor, and humane wisdom.

Lebistes reticulatus (PETERS)

Pronounced Le-biss'tees re-tik'you-lay'tus Popular names, Guppy and Rainbow Fish

MEANING OF NAME: *Lebistes*, probably from *Lebias* (= *Cyprinodon*), and *reticulatus*, net marked, or mottled

Also known as *Girardinus reticulatus*, *Girardinus guppyi* and *Poecilia reticulata*
Trinidad, Guiana and Venezuela Length—male, 1½ inches; female, 2¼ inches
Western Location Map x19 to A24
Artificially introduced into many other locations

"Missionary fish" would be a fitting name for this little beauty, for it far exceeds any other species in the number of convert aquarists it has made. And many of these converts who branched out and became aquarists in a big way still keep Guppies, and still feel that, with their infinite variety of colors, they are the most interesting of all aquarium fishes. Each male is as individual as a thumbprint.

Besides its beauty the Guppy has other great merits. Scarcely any other fish combines so many cardinal points in such degree. It is a live-bearer, the most popular type of fish. It is an extremely fertile as well as dependable breeder. It is unusually active. It will thrive in close confinement. It can stand foul water. It has an extreme temperature range of 40 degrees, from 60 to 100. It will take any kind of food. It does not fight. It is not timid. It matures rapidly, an important point for those aquarists breeding for special points. It is subject to few diseases. It can be had everywhere at prices available to everybody.

The activity of the male is extraordinary. Whether flashing about in pure joy of living, or paying court to a female, he is ever the embodiment of intensity. He might well be termed "the playboy of the aquarium."

The specimens chosen for use in our color plate were selected with the idea of illustrating certain color features. Five of these color standards are shown. The fish just below the head of the female displays two of them. He has the "Peacock" or "Lace" design in the tail. The fish in the lower left corner also embodies two definite points. First it is a "Chain Guppy." This refers to the irregular dark line from the head through the body. The eye in the dorsal also makes it a "Birdeye Guppy."

The large central figure, of course, is a "loaded" female. The gentlemen craftily approaching from the rear is in typical position for action, with his gonopodium brought forward for an instant thrust.

In highly developed stocks some females appear not only showing traces of color in the tail fin, but also shiny highlights in it, as indicated in the single illustration. It is believed, but not certain, that such females throw youngsters of superior colors. Any color in female adds value to a show pair.

Sometimes an individual fish, possibly of a peaceful species, learns that other fishes will flee if chased. This becomes a sport with that fish, to the misery of its fellows and the discomfort of their owner. It should either be disposed of, partitioned off, (perhaps in a corner, like a dunce), or placed in another aquarium with larger fishes, where, among strangers, it may reform. Like the rooster taken out of its own barnyard, it will not fight so well.

Inequality in the size of youngsters always puzzles the beginner. None can tell why it is any more than in human beings. Some fishes are no doubt born more vigorous than others. They get "the jump" by bolting the biggest and best food. Presently they become large enough to eat the smallest of their brethren. As these make the best of food, the disproportion increases. It is Nature's way. A plentiful early supply of the small live foods tends to equalize growth.

"CORESCREW" VALLISNERIA

An attractive mutation from the tall *Vallisneria spiralis*, but instead of growing from 15 to 20 inches and sprawling on the water surface of small tanks, its charmingly twisted leaves average only 7 to 12 inches. Very popular. Prefers hard water and fairly strong light.

Plants and Man

This is a terrific book about plants and agriculture. We haven't seen the other books in the Nature and Science series from Natural History Press, but if they're as good, they've got something.

The six principal types of maize. (A) pod corn, a probable ancestor of modern corn; (B) dent corn; (C) flint corn; (D) popcorn; (E) flour corn; (F) sweet corn.

As food for humans, corn is inferior to wheat and some other cereals because it contains very little protein. The absence of protein means that cornstarch does not form gluten when it is mixed with water, and so corn bread has a rougher texture than wheat and rye loaves made from the "stretched" dough (full of air pockets) that gluten provides. Even so, corn has formed the principal diet of many peoples in Central and South America for several thousand years.

Tropical Fish Essay

Dear Sirs:

Herewith is my essay about Tropical Fish for beginners. I obtained my information from The Innes Book of Exotic Aquarium Fishes, Copyright by Aquariums Incorp., Maywood, NJ. (19th Edition revised)

The hobby of tropical fish and plants is an old and fascinating one. The beginner however, must remember that he should start with the most simple and common types of fish to insure a successful project. The best fish for beginners to start with is the guppy. It is colorful, inexpensive, and easiest to breed. In fact, it is almost too easy to breed. Most hobbyists end up with more baby guppies than he can handle. So the best thing to do is to buy only one female, and have a dealer ready to receive the fish when you no longer want it. The next easiest fishes to have are the Mollies, and the Platys, orange or otherwise. They are lively and attractive and also inexpensive. But, if you are a beginner, do not attempt to purchase a soft-shell turtle, or frog or crab. My own experiences have led me to this conclusion. Soft-shell Turtles are prone to a deadly disease known as fungus. Caring for a sick turtle is messy, hopeless, and uncomfortable for the turtle itself.

Water used in the aquarium should be treated with Di-Chlor, which rid's tap water of its chlorine content. Make sure that the water temperature stays between about 67 to 88 for the fish mentioned above, but for other types of fish, consult your dealer for correct temperature ranges.

The most common and cheapest plants are: *Vallisneria*, *Cabomba*, and *Anacharis*. *Vallisneria* should be planted with the roots above the gravel, or the plant will gradually decompose and pollute the tank. One of the most common problems arising in tropical fish "communities" is the act of over feeding. This is the big mistake that many young aquarists make. Feed only once a day, and once in a while twice. You will just have to overcome the joy of watching the fish devour their lunch, breakfast, snack, dessert, etc.

The other problem that arises is diseases. If your fish is acting jittery, or lies down at the bottom of the tank, he most likely is ill. Treat him at once by placing him in a jar with about 1-1/2 teaspoons of salt, and 1 cup of water. (Float the jar in the tank). Then consult your dealer. But be sure you follow these guidelines: Do not overcrowd, do not overfeed, keep tank clean, keep the "Innes Book" on hand, keep temperature between 72 and 81, and always watch out for sick fish.

All About Telescopes

If you have been putting off building a telescope because you thought it was too expensive, too difficult, or too time consuming, this is the book for you. It is the next best thing to taking a telescope building class from John Dobson of the San Francisco Sidewalk Astronomers. A high quality astronomical Newtonian telescope (reflector) can be built in one weekend if all the materials are at hand. Most other books on telescope building make the whole process sound very complicated. Therefore, many would-be amateur astronomers get discouraged and give up before they get started.

This book has everything from basic optics to basic astronomy. The emphasis is on do-it-yourself and do it cheaply. Many different types of telescopes diagrammed. How about a 4 1/2" "sky beam", a reflecting telescope made from board? Old pipes, scraps of wood and metal, bottle caps, tin cans, cardboard tubes, etc. are the materials suggested for construction various parts of telescopes. Extremely informative diagrams give you many ideas for doing things in different ways. This book will take you from grinding and polishing your own mirror through building mounts to using your telescope. One of the best illustrated how-to-do-it books ever written.

Amateur Telescope Making

You left out the best books on telescope making, namely Amateur Telescope Making. The set (I, II & III) are \$5, \$6, \$7 from Scientific American Publishing. It gives explicit directions for making and designing almost any telescopic system— from 6" wooden mounted reflectors to Schneider optical systems on cast aluminum forks. They write even of how to set up your own foundry to cast the mounting. Much practical, some theoretical information, some history. One not-particularly impressive photo is one of a windmill, looking like a normally exposed photograph. Reading the text, it was Schneider's first photo with his newly designed camera, taken from two miles away in starlight with a two hour exposure. Then they tell you how to make a better camera than that one. Sort of a make-your-own-trip-through-the-universe book.

If we allow Star B to orbit for a longer time, something else occurs. Star B is falling into an elliptical orbit, but in addition, Star A itself begins to move. Why?

Star B responds to a bending of space caused by Star A. But Star B itself, by virtue of its very existence, causes an additional curvature in space, and this in turn affects Star A. Furthermore, Star B is moving, and it literally carries the additional curvature along with it. The shape of space is now changing constantly and the originally stationary star is thus set in motion.

DEAR ESTELLE

I've written you about fifty pages of letter since I've seen you but it's too big a mess to send. Some time I want to read those pages to you, or let you read them, and I'd like to talk to you a long time about what's in them. Some amazing things have happened since I didn't see you in Cincinnati any more and it's probably been the same for you. It seems like adventures keep on happening to me and you, and most of the people we know, even when we don't particularly want to have adventures for a while.

What I want us to do, Estelle, is get together and talk it over. I want you to come here where I am, and be with me a good, long while, and let's get into it again and see what happens this time. That's what I want us to do. If it's necessary, and you want it that way, I'll come where ever you are. I want to hang around here a while, but I want to see you more than I want to stay here, so if you want me to come where you are, just say so.

But let me tell you a little about this place, Estelle. Let me tell you how it is here.

Mainly, it's very quiet. It's not so lovely to look at because this is coal mining country, and the hills have been pretty much fucked over, but in its way this is the loveliest place to be that I've found in a long time. Of course I always thought it was lovely. I use to be around here a lot when I was a kid, and I've got a lot of sweet kid memories of how it was in those years. But the way it's lovely now doesn't have anything to do with memory. I'm surprised that it's that way. It seems very far out to be looking at this place from such a different angle. But I'm not spending much time on my surprise. I'm too involved in this other loveliness that's here that I can't describe very well, but that I feel really strongly.

What's here is an old house, and an old barn, both of them ruined. There's a small garden that's not ruined, and water piped down from a spring. There's some chickens, and there's just one hell of a lot of rabbits living in hutchies out by the barn. Most people would consider this a pretty grim and worthless place, but it holds a very large value for me that I haven't got completely figured out yet, but that emotionally I feel like I've got a pretty good grip on. There's no electricity, and you can't get a car up here, but those are both pluses as far as I'm concerned. I'm writing to you right now by the light of a coal oil lamp, and that's a plus. In a few minutes I'm going to go out on the front porch and sit in my uncle's rocking chair and look at the stars and feel the cool and enjoy this quiet Kentucky evening and that's a plus for sure.

But the really big plus would be if you were here with me. I want you to be. At the least, I want you to write to me and tell me where you are and that you're okay. I'll worry about you till you do. I'm pretty bored with worrying about myself so much, but I'll worry about you till I hear that you're okay. So please write to me just as soon as you possibly can.

Love,

D.R.

Sourcebook on the Space Sciences

If your plan includes getting off the planet, and you don't care to be just an inert passenger or dumb tourist, this book is the most useful—if a little outdated—single volume you'll find. Rockets, orbits, propulsion, guidance, Earth as planet, other planets, sun, extraterrestrial man. When you get out there where Nothing is, say hello to it, will you?

If a spacecraft is launched near to, i.e., within a few hundred miles of, Earth's surface into an elliptical orbit that extends out to 10 Earth radii, $R_{per}/2R_{apo}=1/20$, the required injection velocity (v_{per}) is then as much as 95 percent of the escape velocity. For a launch to the Moon, some 60 Earth radii distant, $R_{per}/2R_{apo}$ is about 1/120 and the injection velocity is over 99 percent of the escape value.

Worlds in the Making

We see all manner of books on the Future around here, and I can't think of a nicer one than this. It's a collection of readings aimed, pretty accurately, at teen-age readership. It presents the future not as a menace or a promise, but as a home, a hard and damned interesting place to live.

Behind every man now alive stand thirty ghosts, for that is the ratio by which the dead outnumber the living. Since the dawn of time, roughly a hundred billion human beings have walked the planet Earth.

Now this is an interesting number, for by a curious coincidence there are approximately a hundred billion stars in our local universe, the Milky Way. So for every man who has ever lived, in this universe there shines a star.

But every one of those stars is a sun, often far more brilliant and glorious than the small, nearby star we call the Sun. And many—perhaps most—of those alien suns have planets circling them. So

almost certainly there is enough land in the sky to give every member of the human species, back to the first apeman, his own private, world-sized heaven—or hell.

How many of those potential heavens and hells are now inhabited, and by what manner of creatures, we have no way of guessing; the very nearest is a million times farther away than Mars or Venus, those still remote goals of the next generation. But the barriers of distance are crumbling; one day we shall meet our equals, or our masters, among the stars.

Arthur C. Clarke,
2001: A Space Odyssey

Institutions established to prepare students for goals by specialist courses and credits are being rejected and even defied by their clients. The TV generation wants participation in the educational process. It does not want packages. The students want problems, not answers. They want probes, not exams. They want making, not matching. They want struggle, not goals. They want new images of identity, not careers. They want insights, not classified data.

Marshall McLuhan,
"The Reversal of the Overheated Image"

NEW COMPANY RULES

Office employees will daily sweep the floors, dust the furniture, shelves and showcases.

Each draftsman will bring in a bucket of water and a scuttle of coal for the day's business.

Draftsmen will each day fill lamps, clean chimneys, trim wicks. Wash the windows once a week.

Make your pens carefully. You may whittle nibs to your individual taste.

This office will open at 7 A.M. and close at 8 P.M. daily, except on the Sabbath, on which day it will remain closed.

Men employees will be given an evening off each week for courting purposes, or two evenings a week if they go regularly to church.

Every employee should lay aside from each pay a goodly sum of his earnings for his benefits during his declining years, so that he will not become a burden upon the charity of his betters.

Any employee who smokes Spanish cigars, uses liquor in any form, gets shaved at a barber shop, or frequents pool or public halls, will give me good reason to suspect his worth, intentions, integrity and honesty.

The employee who has performed his labors faithfully and without fault for a period of five years in my service, who has been thrifty and attentive to his religious duties, and is looked upon by his fellow men as a substantial and law abiding citizen, will be given an increase of five cents per day in his pay, providing a just return of profits from the business permits it.

A GRAND EXHIBITION
OF THE EFFECTS PRODUCED BY INHALING
NITROUS OXIDE, EXHILERATING, OR
LAUGHING GAS!

WILL BE GIVEN AT *The Madison Hotel*

Thursday, EVENING, 15th 1845.

50 GALLONS OF GAS will be prepared and administered to all in the audience who desire to inhale it.

MEN will be invited from the audience, to protect those under the influence of the Gas from injuring themselves or others. This course is adopted that no apprehension of danger may be entertained. Probably no one will attempt to fight.

THE EFFECT OF THE GAS is to make those who inhale it, either LAUGH, SING, DANCE, SPEAK OR FIGHT, &c. &c.

according to the leading trait of his character. They seem to retain consciousness enough not to say or do that which they would have occasion to regret.

N. B. The Gas will be administered only to gentlemen of the first respectability. The object is to make the entertainment in every respect, a genteel affair.

Those who inhale the Gas over, are always anxious to inhale it the second time. There is not an exception to this rule.

No language can describe the delightful sensation produced. Robert Southey, (poet) once said that "the atmosphere of the highest of all possible heavens must be composed of this Gas."

For a full account of the effect produced upon some of the most distinguished men of Europe, see Hapgood's Medical Dictionary, under the head of Nitrogen.

The CROTON DELTA of Glacial times

Present remnant of CROTON DELTA forming Croton Point

The clue to the origin of Croton Point is the Croton River. During the waning stages of Glacial Time, when this part of the continent stood somewhat lower than it does now, because of the great weight of ice upon it, the Hudson River was about 80 feet deeper in Haverstraw Bay than it is at present. The Croton River, pouring out from the melting ice front, carried great quantities of sand and gravel into Haverstraw Bay and built there a large delta which reached half way across the river. Like most deltas built into quiet estuaries, the Croton Delta was more or less round in shape, with distributary streams flowing outward in all directions toward its margins.

Following the final disappearance of the ice and the removal of this great weight, the crust of the planet in this part of the United States gradually rose above sea level. In the Croton Delta region the elevation was about 80 feet, with the result that the flat top of Croton Point stands now 80 feet above sea level. An important result of this rising was the invigorating effect it had upon the Croton River. This stream, therefore, flowed more swiftly, and eroded its valley extensively. Much of the delta was removed by the river, so that now only the northern half remains. This is clearly revealed by its present shape.

- Rock Books
- Hi, Mimi!
- Do you know of any good books on rock identification and rock use? Most mineralogy books don't talk about rock use. Know you are very busy, and thanks if you can help. Fred
- That isn't an easy question to answer; we've been debating for about a year which of two rock books to stock, as they are the only two in the field that are much good at all. One is *Kemp's Handbook of Rocks* by Grout, published by Van Nostrand (if it is still in print, I hope) and the other is *Rocks and Rock-Forming Minerals* by Pirsson-Knopf, a Wiley book (and again, hopefully still in print!) These are primarily on identification—I can't think of any book that deals with rock use per se.

or WHOLE EARTH CATALOG

Miss Arnow combines her talents of novelist and historian in Seedtime to produce a beautifully-written account of life among the settlers on the Appalachian frontier. Her geographical focus is the Cumberland River drainage, which begins in Eastern Kentucky and sweeps south-westward into middle Tennessee. The book is loaded with details of frontier life-style which provide pictures not only of the pioneers' daily life, but their psychology as well.

—Gurney Norman

Von Graffenried had chosen his people carefully, so that most needed skills would be represented, as many were required. There had to be carpenters, joiners, plasterers, and sawyers in order to build the only kind of home they knew to build on the rockless, clayless coastal plain—one of sawed timber. This, in addition to skilled workmen, demanded saws, hammers, nails, trowels, chisels, shingles, and lime that had to be got from the burning of oyster shells.⁴⁴ Such a house took time in the building that might have gone to clearing fields and fortifying against the Indians; and during the long weeks of its building the owner and his family had to live in some makeshift shelter such as a tent or even house of bark and boughs, thereby increasing their liability to illness through exposure to rain and cold.

The man who could with felling ax, broadax, drawing knife, auger, and froe ride into the woods and in a few days' time build an all-weather house of logs in which he could live decently, and in comfort when it was finished, was not there. The "house made of logs" such as the Swedes very often make in America,⁴⁵ was still very much a rarity on the Carolina coast.

The New Bern settlers had brought plenty of clothing, but soon they were almost naked. They had when food got low, bartered clothes with a nearby tribe of Indians for "wild meat, leather, bacon, beans, and corn." Less than a day's journey away were game-filled woods, but there were no hunters in New Bern, and nobody to teach hunting.⁴⁶ There were in North Carolina at that time famous hunters, who could, wearing the head and skin of a deer, stalk the living animal until they could get close enough for the kill; but these were Indians.⁴⁷ The white hunter, so proficient he could make money from the selling of skins, was not yet in America; the North Carolina planters paid the Indians to hunt for them.

Skills alone were not enough; it is true any man who would survive on the border had to be an artist in the use of the broadax, skinning knife, scraper, hoe, froe, auger, awl, adz, and other tools, but equally important or more so was a knowledge of the woods. All borderers who lived as farmers were woodsmen. The forest was only part enemy to be pushed aside for cleared fields. It was for the Virginia or North Carolina settler a vast and seemingly bottomless widow's barrel yielding up all manner of things from walink for the newborn baby's tea to dogwood for the weaver's shuttle. The settler had to know these offerings, where to hunt a slender hickory sapling for the corn pounder sweep, lightwood for a bit of tar, cane stalk for the weaver's sleigh, a small and crooked white oak for a sled runner, but a straight one for a splitting maul. He had to know his wood-poplar for hewing and gouging, but cedar for riving, and so for several dozen: what would sink and what would float, what would bend, and what was best for a shoe peg. He was dependent upon the woods around him not only for building materials for house, barn, fence, much of his furniture, and many of his appliances from pitchfork to gunstock, but the woods gave him fuel, drugs, dyes, and a good bit of food. All new-settled farmers, even the wealthy, had, until fence could be built, to use the open range so that meat, milk, and butter came from woods pasture.

Years ago before the days of consolidated schools and good roads, I taught in remote sections of Pulaski County, Kentucky now part of the Cumberland National Forest. My pupils were chiefly the children of small farmers, but all around them were the woods. At that date in that community most farm animals were still on the open range so these children like earlier generations spent much time in the woods; in rounding up the forever straying animals, in going to church, school, or to a neighbor's, and in collecting herbs, fruits, nuts, fuel, and in hunting and trapping.

They had no nature study or lessons in woodcraft, but on a Monday morning they could, with no apparent study of the either muddy or dusty road, tell all who had ridden or walked by the schoolhouse during the weekend, for they knew every shoe print, mule and horse "sign" in the neighborhood. They knew the common names as well as uses of several dozens of plants,⁴⁷ and they knew them winter as well as summer. One faint clink of a distant bell and they could tell whether made by horse, cow, or sheep, who owned the animal and what it was doing, grazing or sleeping or "hid-out." They could track a strayed mule or hog or cow for miles when there were no tracks I could see.

They, no different from the young hunters of earlier generations, ranged over rough lands and were never lost or hurt. They delighted in swinging out over creek or river and dropping into a pool of water; they climbed tall trees, explored sinkholes, caves, creek pools, rockhouses, yet I never had a school child hurt by a fall or suffer a snake bite, and though many of the boys started hunting alone at ten years of age I can recall no gun accident. Bred into them was the same caution the hunter had to have; a perch in the swaying top of a "slim" fifty-foot hickory made for good safe fun in a high wind, but only a fool would on a hot summer day stick his hand under a rocky ledge or into an hole where he could not see—that was a good place for a copperhead to be. They were forever cautious; they respected the woods, the caves, and the river as one respects honorable enemies; young children were constantly watched and guarded against the dangers there, and it was not until they were eight years old or so they were allowed to walk the paths alone.

Cabins In The Laurel

or WHOLE EARTH CATALOG

Cabins in the Laurel is a record of Mountain life in Western North Carolina during and before the 1930's. The area has changed in this past 40 years; only small pockets of the old simple life remain but what there is is worth knowing about. At first you might take it for Americana or funk, but you soon see that the people are really far out. There is a ballad in there sung by a woman named Frankie Silvers. The song is her answer to her executioner's question: "Do you have any last words?" There is a portrayal of an ecstatic scene inside a Holiness church wherein a woman becomes a saint by dancing and wailing until the congregation joins her. These are true stories.

[Reviewed by Dave Smith]

On Heroes

Daniel Boone had a land fantasy. He wanted to cut loose from the straight life of the settlements and go live someplace that made a greater demand on his talents and creative energies. He didn't like the economics of the settlements. Too much usury, too easy to get in debt, too hard to get out. His style and temperament were thwarted by people dealing only in the safe and known. The people in the settlements, the good burghers, were so bent on insulating themselves from the dangers of the unknown, they wound up insulating themselves from the pleasurable possibilities as well. In an essay the poet William Carlos Williams describes Boone as "a great voluptuary born to the American settlements against the niggardliness of the damning puritanical tradition." Boone was a sensualist, desperate to engage the raw, natural world directly. As a man of his own time, Boone performed the classic act of the truly modern person: he embraced the new world of possibility that lay before him, and didn't look back.

People who are truly of their own time are the result of a process, children of an evolutionary working that cannot much be hastened by artificial means. It took 150 years to produce Boone and the Long Hunters, men capable of looking at the wilderness face to face without flinching, without glancing back to the settlements, and to Europe, for assurance. They were the products of what Harriette Simpson Arnow, in her book Seedtime On The Cumberland, calls "the long learning." The long learning was a period of several generations in which descendants of the original coastal settlers gradually learned to get along away from the sea, farther and still farther inland. Gradually the grandchildren and the great-grandchildren of an ocean-oriented people came to acquire the skills and attitudes a mountain man had to have. It was a slow and reluctant process, but by degrees individuals were formed whose growing expertise in the woods matched the waning of their interest in the old world of their fathers.

There were many factors that accounted for this early "generation gap," but the crucial one was the willingness of the woodsmen to learn from the Indians. People before Boone's time went on expeditions in the woods, of course. But always with Indians as their guides. They hired Indians to hunt and track; it was nearly a hundred years before it began to occur to the coast-dwellers that they might learn the Indian skills themselves.

Williams says of Boone, "To Boone the Indian was his greatest master. Not for himself surely to be an Indian, though they eagerly sought to adopt him into their tribes, but the reverse: to be himself in a new world, Indianlike. If the land were to be possessed it must be as the Indian possessed it."

And so the metaphor is inescapable: today's middle-class consumer culture as a Mother Country to cut loose from; then a period of long-learning, in which modern frontiersmen gain the individual competence that allows them to do the necessary, practical things. Indians were the original teachers. They are with us still, their ways and attitudes remain as models, to emulate and learn from. But today they are joined by others who qualify as "Indians" of a sort, by virtue of their skills which allow them to function as teachers, as shamen, as knowers of The Way. Certain thinkers, certain mystics, certain far-out entrepreneurs, qualify, but so do certain small farmers and artisans, aborigines of a kind, native to their places, there on the land to be learned from by modern Long Hunters willing to range beyond the settled places in search of education and adventure.

The Long Hunter is the hero of his time, in any age. He is himself in a new world, Indianlike; sensuous in his relationship with the natural world around; one who has left the Mother Country intent upon being of as well as in whatever wilderness he encounters. I'm sure that's an oversimplification, but at least it's a handle on the definition. And definitions are important. As the new world unfolds around us, so a new mythology comes into being, peopled with new heroes, and new styles of heroic behavior. In trying to arrive at a new heroic definition, it's helpful to read up on heroes who have gone before. Seedtime On The Cumberland is filled with tales of heroes. The thing you begin to realize as you read about them is that in most cases they were in actuality complex, mortal people like you and I who simply rose to the occasion that was before them, and did what they were called upon to do.

—Gurney Norman

American Boys Handy Book

Dan Beard's American Boys Handy Book was first published in 1882. Out of print for a long time, Tuttle has finally reprinted it. This is barefoot-boy-with-cheek-of-tan stuff, detailed lore on how a boy may make his own world. Extraordinary book, highly recommended for funky schools or communities, especially if woods are handy.

Fieldbook for Boys and Men

The Scouts continue their tradition of excellent feedback from an increasingly enormous membership. The Second Edition (1967) of the Fieldbook may well be the best value around. Of course, the context is short term camping out in the continental U.S., but much more is afoot. In taking us sure-handedly from the root-hog-or-die survival situations through toward gourmet ecology, the Fieldbook shows how far we've come and certainly what to do next. The spirit of the Boer War appears to be giving way to that of enlightened naturalism (don't go blazing trees—the landowner will never have us back). Full of recipes, checklists, buying guides, patterns and plans, close-up photographs in how-to-do-it sequence. If you'll need to know something, it's there.

Having put us at home outdoors, the book opens up into biology, geology and astronomy, and what to do about them. I especially like two sections: one has pictures of wild plants to eat where you're starving to death, and the page that tells you not to apply the tourniquet except as a last resort.

[Reviewed by Dave Guard
Suggested by Eugene Schoenfeld]

there's some good information here, twenty years later. the fieldbook for boys and men is the most complete outdoorsy reference work at the cheapest price i know, and the merit badge series will teach just about anything from citizenship to hog production. learn from the scouts, maybe even become a den mother.

—jd

[Suggested by the Texas Hamiltons]

No time to wait to bring victim to shore. Start rescue breathing immediately. Tilt victim's head far back. Cradle his head with one hand and grasp his jaw with the other. Open your mouth wide and take a deep breath. Blow air into the victim through nose or mouth. Keep it up as you bring him to shore.

Rock Trip (Gyrophora obtusa) can be scrambled like egg in a little water or fat.

Nosebleed is usually from a small vein in the middle partition of the nose. Fold a clean piece of paper into a pressure pad and tuck it under your upper lip. If the blood continues to flow, add to the thickness of the pad and press your index finger across your upper lip.

Drownproofing

The product of most warnings about water is: "Well, I've fallen in the water, now I'm supposed to start drowning."

New program. "No need to drown." Sinkers, non-swimmers, cripples, children; cramped, exhausted, injured, no rescue in sight. "No need to drown."

The book is sufficient for you to learn or teach the techniques appropriate for floaters, sinkers, and sundry special circumstances. Good medicine for anxious parents. Teach your kids and yourself and stop worrying. —SB

Panic makes you throw your head back, reach up, make gurgling noises, horrible faces and kick and wave your arms frantically. None of these moves will do you the slightest good. Now is the time to learn the following, because this is what really makes drownproofing work:

Whether your nose and throat are full of water from lips to stomach, the stroke or the kick will always get you to the surface...

If you do it in the same manner as you had been doing it, if you blow out through your nose, with your lips clamped tightly together as you break the surface with another kick or stroke, whether air or water comes out, you will be somewhat relieved and you will be ready for the inhale.

If your eyes are open and if you inhale through your mouth, whether you end up with all air, half air and half foam, you will be better off, and if you continue the cycle, no matter how much water you shipped, things will get better much sooner than you think.

If this procedure is stuck to and mastered, 90 percent of those involuntary swallows of water will be forgotten three cycles (15 seconds) later. The other 10 percent may take 10 cycles to completely recover from, but if you force yourself to repeat the cycle properly, you are sure to be all right. What counts is that you get yourself out of trouble.

Scissors kick

Outward Bound

"I can't do that, I'll die."

But, if, for whatever horrid reason you do do it, and live, ah. Then right from your center out speculation is open about all the other things you knew you couldn't do.

This was one of the qualities of the Acid Tests administered by the Merry Pranksters. It was the only deeply useful thing I found in Ranger and Paratroop training in the Army. It looks to be the basic function of the Outward Bound school of the possible.

Tuition for 26 days of Outward Bound (schools in various harsh locations) is \$350-450 for people mid-teens to early twenties. There are courses for girls and older folks. According to a report in Reader's Digest, "No one who wants the Outward Bound course is denied for financial reasons." U.S. schools are at Concord, Mass., Morgantown, N.C., Denver, Colo., Minneapolis, Minn., and Eugene, Ore.

For information and application forms, write:

13	Solo Drop Off on an Island				

National Outdoor Leadership School

An item I believe you should consider for your catalog is the National Outdoor Leadership School located in Lander, Wyoming.

It is different from the Outward Bound Schools you list in your catalog since it teaches skills for living in the mountain wilderness rather than using it as an obstacle course or training ground. . . . it teaches for the environment rather than through it.

While limited to the Wind River Range of Wyoming, NOLS provides a better background for those wanting to learn about the mountain wilderness than the Colorado or Northwest Outward Bound School do. I say this from experience, having worked as an instructor at both schools. For more information you should write to:

Mr. Paul Petzoldt, Director
National Outdoor Leadership School
Lander, Wyoming 82520

Sincerely,
Dave H. Williams
Lake Forest, Illinois

For more information on Outward Bound and National Outdoor Leadership Training, see p. 301.

Indian Crafts and Lore

If Boy Scouts and Germans make better Indian gear than most Indians (it's true: ask at any pow-wow), this book may be why. Thorough research and splendid illustration trip you right on in. Good book.

Indian Craft Materials

Grey Owl has mainly inexpensive, wide range of quasi-authentic stuff for making Indian outfits. Good selection of records. Catalog free.

[Suggested by Pam Wright]

Four Winds has what looks like genuine Indian goods — moccasins, cradle boards, baskets, jewelry, etc. Catalog is an unillustrated mimeographed list, costs 25¢.

Del Trading Post supplies authentic raw materials for American Indian crafts, particularly northern plains. Excellent selection of beads. Catalog 25¢.

—SB

DEL TRADING POST has been in business over 13 years. Through the years our customers have mainly been Indians and Indian lore enthusiasts but with our listing in the Whole Earth Catalog our clientele has broadened to include a wide range of people. We appreciate the increased business these "new people" have provided, but please remember, we are not Wards or Sears and we don't want to be. Del Trading Post is still basically a one man operation, [I get by with a little help from my... wife.] I'm in this business because I enjoy it. If I wanted to work and make money, I would have stayed at General Motors.

Peace,
Dennis Lessard

Del Trading Post

41) **TRADE PAINT** — An early trade item used for coloring buckskin, painting parfleches, war shirts, pictographs, etc. They can be used dry or applied with a fixative depending on what you are painting. Our colors are exact duplicates of the old colors and are the finest powdered pigments available. Colors available: Vermillion, Yellow, Green, Blue, Black, White, Verdigris (bluish-green), Brick red (this is the color of red earth paint), and Ochre (this is the color of yellow earth paint).
.75 for 4 ounces of one color.

55) **BUFFALO HIDES** — These are full size cow and bull hides, winter killed. After they are skinned, the hides are heavily salted, rolled up and tied. This is the way we get them and the way we sell them. Because of the salt the hides can be kept for a long time without fear of spoilage or bug damage. Price is \$25.00 plus shipping. Note: Because of the large size we cannot ship these to Europe.

62) **CATLINITE PIPES** — Genuine Indian made "T" style red pipestone pipes with wooden stems.
Large, approx. 26" overall length — \$25.00
Medium, " 20" " " — 15.00
Small, " 14" " " — 10.00

CHIPPING techniques were used to shape flint and other dense, smooth-textured stones into weapons and tools. Techniques are described below.

PERCUSSION CHIPPING knocks off flakes with a sharp blow. The direction and force of the blow determines the size and

shape of the flake. Stone and antler hammers are used in direct percussion (1). A rest (2), to hold the flint in place, improves control. Indirect percussion (3) is used to strike off long blades with accuracy.

PRESSURE CHIPPING is used to shape and finish fine stone implements. A chipping tool of bone or antler (4) is pressed against the edge of the flint, breaking a small flake from the opposite surface (5). A crutch (6) may be used for increased pressure.

Secondary flaking is a finishing process (7). Rough pieces are retouched to even the edges and to give the blade a uniform thickness.

Pressure finishing is also used to form notches and barbs. The point may be held in the hand (7) or on a support (8) with a cushion of leather used for protection.

Nibbling with a notched antler (9) or prong (10) removes minute flakes from the edges of points and knives.

Indian House Records

Excellent LP recordings of American Indian Songs are available from INDIAN HOUSE, Box 472, Taos, New Mexico 87571. Each album contains representative songs from one tribe or one culture area. Some of the tribes now on this label are: Navaho, Taos, Ponca, Kiowa, Comanche, Kiowa-Apache, and Creek.

All sounds are recorded and produced on modern high fidelity equipment by Tony Isaacs, the proprietor of INDIAN HOUSE and a longtime student of Indian music. Isaacs has had many years of field experience recording Indian music on various reservations in the US.

An album titles, "Sounds of Indian America, Plains and Southwest", will be released shortly. This very inclusive album will have music that was recorded at the large Gallup Inter-Tribal Ceremonial, Gallup, N.M. The folding jacket will contain a color booklet with numerous photos and notes covering each of the ceremonial dances.

Sincerely,
Frank Turley

PEOPLE AT THE STORE

When D.R. went in the store to mail the letters to Estelle and the Anaheim Flash, Mrs. Thornton saw him and headed him off at the bread rack.

"Well I'll swan," she said. "Look who finally came down off the hill."

"Hello Mrs. Thornton."

"Hello yourself is what I say," said Mrs. Thornton. "What have you been doing all week, anyhow, hibernating?"

D.R. laughed and blushed a little and scratched his head. "No mam. I've been working pretty hard."

"I'll bet you have," said Mrs. Thornton. "Sorting through Emmitt's stuff I bet, God rest him."

"Yes mam. Trying to clean up a little. And keep his animals fed. There's a lot of work to do up there."

"I know just what you mean," said Mrs. Thornton. "It took us over a month to go through Wheeler's daddy's things when he died. We couldn't figure out what to do with it all."

"Is that him?" said a man's voice behind Mrs. Thornton.

"This is him," said Mrs. Thornton. And then to D.R. she said, "We've been talking about you, young 'un. Come over here and meet some people."

The man who had spoken was a pale and nearly bald fellow sitting in a wheel-chair. Grinning, he rolled himself outside of the little circle of chairs where the other people were sitting and came forward to meet D.R. and Mrs. Thornton.

"I'm Barry Berry," the man said. "I'm proud to make your acquaintance."

"Barry's the news correspondent for the county paper," said Mrs. Thornton. "He was asking me questions about you. I don't guess you've seen this week's paper yet have you?"

"No mam, I haven't," said D.R.

"Barry wrote you up," said Mrs. Thornton, and turning then she called out to Mrs. Godsey, who was in the post office cage in the far corner of the store, "Is that a copy of the paper around anywhere, Mrs. Godsey?"

"Is that what, honey?" Mrs. Godsey called back. She was reading someone's post card and did not look up when she replied.

"The paper. David aint seen Barry's article in it yet."

"I've got one in yonder," said Mrs. Godsey, still without looking up. "I'll get it for him when I get done here."

"Mrs. Godsey'll show you her'n after while," said Mrs. Thornton.

"I'd like to see it," said D.R.

"Well," said Barry. "It wasn't much, actually. I've been down with some kind of virus lately, and I didn't write much last week. It was just a little mention about Emmitt was all. I sure was sorry to hear about Emmitt, I'm going to miss him a lot."

(continued)

who loned it through the streets of Idaho seeking visionary indian angels who were visionary indian angels . . .

—Ginsberg, *How!*

The booklist that follows comes from two intense informal years (and five-slack ones) hanging around Indians, reservations, anthropologists, and libraries. Long may Indians, reservations, anthropologists and libraries thrive! They gave me more reliable information, and human warmth, than dope and college put together.

I'm sure that the books all by themselves cannot deliver The Native American Experience. For that you need time immersed in the land and neighborly acquaintance at least with some in fact Indians. Still, an amazing amount is in the books.

—SB

Book of the Hopi

If you're susceptible to tarot or astrology, you'll probably revel in this book. Its business is the esoteric lore and historical drama which lives and protects the Hopi Indians in Arizona. They were possibly the farthest out of the American tribes (in present times they are not as together as Zuni, or Taos, but they are larger and so is what they attempted). This is the mysticism not of change but of stability, of the year cycle, of one more winter of food obtained by the hard knowledge from uncounted prior generations of winters and, they say, travels from world to world and place to place to arrive finally at the center, these bleak mesas, to here sustain forever responsibility for the well-being of the world. Frank Waters was perhaps too eager to write a Bible, but I can't blame him. It's that kind of knowledge.

So the people emerged to the Second World. Its name was Tokpa Dark Midnight. Its direction was south, its color blue, its mineral *gochasiva*, silver. Chiefs upon it were *salavi*, the spruce; *kwahu*, the eagle; and *kolichiyaw*, the skunk.

It was a big land, and the people multiplied rapidly, spreading over it to all directions, even to the other side of the world. This did not matter, for they were so close together in spirit they could see and talk to each other from the center on top of the head. Because this door was still open, they felt close to Sotuknang and they sang joyful praises to the Creator, Taiowa.

They did not have the privilege of living with the animals, though, for the animals were wild and kept apart. Being separated from the animals, the people tended to their own affairs. They built homes, then villages and trails between them. They made things with their hands and stored food like the Ant People. Then they began to trade and barter with one another.

This was when the trouble started. Everything they needed was on this Second World, but they began to want more.

Parrot Clan maiden sitting on a plaque of seeds during Soyá Ritual.

Figure 55. Male-and-female páho

Every páho, simple or complex, is made with prayerful concentration and ritually smoked over. Then it is carried to a shrine, where it is stuck in a cleft of rocks or hung on a bush and left until the invisible vibrations of the prayer it embodies are slowly absorbed by the forces of life to which it is dedicated.

The Lost Universe

The book has anthropological rigor along with its very unusual completeness. Here is the whole life of the Pawnee, told in a way that you could go now and live it. Here are old solutions to problems we consider unsolvable and new.

The Pawnee child was born into a community from the beginning, and he never acquired the notion that he was closed in "within four walls." He was literally trained to feel that the world around him was his home—*kahuraru*, the universe, meaning literally the inside land, and that his house was a small model of it. The infinite cosmos was his constant source of strength and his ultimate progenitor, and there was no reason why he should hesitate to set out alone and explore the wide world, even though years should pass before he returned. Not only was he not confined within four walls but he was not closed in with a permanent group of people. The special concern of his mother did not mean that he was so closely embedded with her emotionally that he was not able to move about.

FIGURE 51-1. (1) A simple bow of ashwood. (2) A sinew-backed bow, *tskaistaxkasa*. Two pieces of sinew, crossed at the middle could be permanently pasted on when wet.

As they continued on the move, pressures might build up between individuals because of the closeness of the living conditions in camp and the strain of constant migration. This was particularly true between father-in-law and son-in-law. Theoretically, it was the first duty of the son-in-law to serve his wife's family, but when his father-in-law was quite old, the son-in-law often felt put upon by the arrangement. Sometimes in the camp one could hear people calling out, "Fight, fight!" and father-in-law and son-in-law would be grappling with each other in a tent. People all came running and a roughneck in the crowd would call out, "Who's underneath?" Someone who was close to the tent would say, "Son-in-law." In general the crowd would approve and say, "That's good," the sentiment being with the underdog, the old father-in-law. Such a quarrel would be ended when a brave or other person of high social rank put a hand on each of the combatants and said, "I want you to stop." Out of respect for his rank and eminence, they would separate at once and go in different directions. Should they not respond it would be a major insult and he would say a second time, "Didn't you hear me?" This would certainly end the fight. Any person known to be sensitive and to dislike violence could perform this same good office. Violence of this kind within the village or band was considered a serious social malfunction and people made every attempt to avoid it or put a stop to it.

Black Elk Speaks

The Pueblo tribes don't go in for visionary solitary mystical whizbangs. (Of all of them only Taos is into peyote very much.) The plains tribes are something else however. Their lives turned on their visions—solo manhood transports, dreams, name visions, sun dance ordeals, battle ecstasy, doctoring sessions . . . and later, ghost dance and peyote. This book is the power vision of one Oglala Sioux, and the extraordinary man it made. Black Elk's account, besides affording unusual insight into Sioux life and historical figures such as Crazy Horse, demonstrates the manner of recognizing a serious vision and being responsible for it, and the burden, joy and power of doing that.

Crazy Horse's father was my father's cousin, and there were no chiefs in our family before Crazy Horse; but there were holy men; and he became a chief because of the power he got in a vision when he was a boy. When I was a man, my father told me something about that vision. Of course he did not know all of it; but he said that Crazy Horse dreamed and went into the world where there is nothing but the spirits of all things. That is the real world that is behind this one, and everything we see here is something like a shadow from that world. He was on his horse in that world, and the horse and himself on it and the trees and the grass and the stones and everything were made of spirit, and nothing was hard, and everything seemed to float. His horse was standing there, and yet it danced around like a horse made only of shadow, and that is how he got his name, which does not mean that his horse was crazy or wild, but that in his vision it danced around in that queer way.

It was this vision that gave him his great power, for when he went in to a fight, he had only to think of that world to be in it again, so that that he could go through anything and not be hurt. Until he was murdered by the Wasichus at the Soldiers' Town on White River he was wounded only twice, once by accident and both times by some one of his own people when he was not expecting trouble and was not thinking; never by an enemy. He was fifteen years old when he was wounded by accident; and the other time was when he was a young man and another man was jealous of him because the man's wife liked Crazy Horse.

They used to say too that he carried a sacred stone with him, like one he had seen in some vision, and that when he was in danger, the stone always got very heavy and protected him somehow. That, they used to say, was the reason no horse he ever rode lasted very long. I do not know about this; maybe people only thought it; but it is a fact that he never kept one horse long. They wore out. I think it was only the power of his great vision that made him great.

... Then I was standing on the highest mountain of them all, and round about beneath me was the whole hoop of the world. And while I stood there I saw more than I can tell and I understood more than I saw; for I was seeing in a sacred manner the shapes of all things in the spirit, and the shape of all shapes as they must live together like one being. And I saw that the sacred hoop of my people was as one of many hoops that made one circle, wide as daylight and as starlight, and in the center grew one mighty flowering tree to shelter all the children of one mother and one father. And I saw that it was holy.

Black Elk said the mountain he stood upon in his vision was Harney Peak, in the Black Hills. "But anywhere is the center of the world," he added.

When a vision comes from the thunder beings of the west, it comes with terror like a thunder storm; but when the storm of vision has passed, the world is greener and happier; for wherever the truth of vision comes upon the world, it is like a rain. The world, you see, is happier after the terror of the storm.

You have noticed that the truth comes into this world with two faces. One is sad with suffering, and the other laughs; but it is the same face, laughing or weeping. When people are already in despair, maybe the laughing face is better for them; and when they feel too good and are too sure of being safe, maybe the weeping face is better for them to see.

I think I have told you, but if I have not, you must have understood, that a man who has a vision is not able to use the power of it until after he has performed the vision on earth for the people to see.

Custer Died For Your Sins

Vine is the perfect dude to write of current Indian politics. Son of a missionary, enough Sioux to be a Sioux, long experience getting Indian kids into good schools, revved up by The National Indian Youth Council stand-up-and-fight meetings of the late fifties and early sixties, levered into the key position of Executive Director of the major Indian lobby The National Congress of American Indians, and after all that he's thirty-five and still funny. He has what Alvin Josephy warned me about, "the traditional American Indian cut-throat zeal for politics." Add that to his humor and his thoroughness and you have an unusually clear summary of the Indian situation now. His recommended route for Indian survival is strong land-based tribal identity.

Since Vine addressed his book primarily to young Indians, I can't resist a remark to young white Indian-savers: you can't help anybody by saving them; that's a self-defeat program. Relax and appreciate. Custer died for your sins. Also your virtues.

A long-haired artist famous former-dope-fiend commune white person I know is busy learning from his Indian friends at the Taos Pueblo: manners. —SB

From 1860 to 1880, tribes were confined to reservations, the West was in its death throes. Churches began lobbying early in the 1860's at the Indian Bureau in Washington for franchises over the respective reservations. Thus one reservation would be assigned to the Roman Catholics, one to the Lutherans, one to the Methodists, and one to the Episcopalians. Other churches were prohibited from entry on a reservation once it had been assigned to a particular church and could enter only with permission from the other church. It always bothered me that these churches who would not share pulpits and regarded each other as children of the devil, should have so cold-bloodedly divided up the tribes as if they were choosing sides for touch football.

People have found it hard to think of the Indian Bureau without conjuring up the picture of a massive bureaucracy oppressing a helpless people. Right-wing news commentators delight in picturing the Indian as a captive of the evil forces of socialism and leftist policy. Liberals view the bureaucracy as an evil denial of the inherent rights of a free man.

It would be fair to say that the Indian people are ambivalent about all this. They fully realize that with no funds for investment in social services they are dependent upon the federal government for services which the ordinary citizen provides for himself and which other poor do not receive except under demeaning circumstances. Yet they are also fully aware that the services they receive are not gratis services. Many services are set out in early treaties and statutes by which Indians bargained and received these rights to services in return for enormous land cessions.

... the bureau should not be characterized as paternalistic. It should be characterized as "fear-ridden," for the circle of fear that operates within it is much more detrimental to its efficiency than is its desire to paternalize.

Peoplehood is impossible without cultural independence, which in turn is impossible without a land base. Civil Rights as a movement for legal equality ended when the blacks dug beneath the equality fictions which white liberals had used to justify their great crusade. Black power, as a communications phenomenon, was a godsend to other groups. It clarified the intellectual concepts which had kept Indians and Mexicans confused and allowed the concept of self-determination suddenly to become valid.

I remember spending a whole afternoon talking with a number of hippies who had stopped in Denver on the way west. They were tribally oriented but refused to consider customs as anything more than regulations in disguise. Yet it was by rejecting customs that the hippies failed to tribalize and became comical shadows rather than modern incarnations of tribes.

Hippies, at least as I came to understand them, had few stable clan structures. They lived too much on the experiential plane and refused to acknowledge that there really was a world outside of their own experiences. Experience thus became the primary criteria by which the movement was understood. Social and economic stability were never allowed to take root.

Robert Thomas tells a famous story concerning the Cherokee who had a white man kill his children, steal his wife, sell his cattle, and burn his farm. The Cherokee chased the man for ten years and finally caught him. "Are you the guy who did all those things," the Cherokee asked. Yes, the white man admitted, he was the one.

"Well, you better watch that crap," the Cherokee warned. And that is my greatest concern for the Indian people. That we will be so damn polite that we will lose everything for fear of hurting someone's feelings if we object to the way things are going.

Tales of the North American Indians

most anthropology always seemed a little like legalized graverobbing to me. this book does everything through a cross-reference bibliography-type distance from the content classification system, but the tales survive, it is a fine readable collection of farout stories.

The beaver and the porcupine were great friends and went about everywhere together. The porcupine often visited the beaver's house, but the latter did not like to have him come because he left quills there. One time, when the porcupine said that he wanted to go out to the beaver's house, the beaver said, "All right, I will take you out on my back." He started, but instead of going to his house he took him to a stump in the very middle of the lake. Then he said to him, "This is my house," left him there, and went ashore.

While the porcupine was upon this stump he began singing a song, "Let it become frozen. Let it become frozen so that I can cross to Wolverine-man's place." He meant that he wanted to walk ashore on the ice. So the surface of the lake froze, and he walked home.

Some time after this, when the two friends were again playing together, the porcupine said, "You come now. It is my turn to carry you on my back." Then the beaver got on the porcupine's back, and the porcupine took him to the top of a very high tree, after which he came down and left him. For a long time the beaver did not know how to get down, but finally he climbed down, and they saw that this is what gives the broken appearance to tree bark.

Hola Tso

Sacred Knowledge

Will you please reveal to me what knowledge of organization the Indians taught you. I have been wondering since the article in Rolling Stone a few months ago. Hope you will find time to answer.

Love,
Eileen O'Leary
Vancouver
B.C.

Anarchistic Indians, right? So I still thought until I attended a Navaho peyote meeting. The Roadman, Hola Tso, was in charge--sat at the center behind the altar, handled all the major ceremonial changes, was aware of everything going on, had full responsibility and authority, was strict, was humorous, said very little, let most of the administrative mechanics be handled by the other officers Fireman, Cedarman, Drummer, Peyote Woman--one hand on the helm, sharp crew.

I've been to glorious meetings, with big feeling and big learning. And to loser meetings: boring, depressing. The glorious were flexible, tight. The losers, loose, "democratic" wishful, weak. That's what I saw. The difference wasn't Indian, White; it was responsibility, or not.

"You know," Barry went on, "I don't guess I saw Emmitt more than once or twice a year the last five or six years he lived, but I tell you, I was always mindful of him living up there on that hill. I use to know about everybody that lived on Trace Fork. I watched 'em move out one by one, till they wasn't a soul living up there except Emmitt. Of course it's all ruined up in there now. But it seemed like as long as Emmitt stayed on, the place wasn't plum dead yet. I'd been wanting to get up to see Emmitt for a long time, but I just never got around to it. Of course, if I'd of known he wasn't going to be with us right on and on, I'd have made myself get around to it. But there you are."

"It really is a shame," said Mrs. Thornton. "I mean, me and Wheeler talked about going to visit Emmitt too, but we just kept putting it off. It's funny, how you'll put off things you intend to do, and put 'em off and keep on putting 'em off. And then all of a sudden it's too late to do it even if you tried. I feel bad about it, I declare I do."

"We all could have done better by Emmitt than what we did," said Barry. "We sure could have been better neighbors than what we was."

(continued)

Children's Games in Street and Playground

Suppose you were trying to replace war. Would you be interested in "games in which children may deliberately scare each other, ritually hurt each other, take foolish risks, promote fights, play ten against one, and yet in which they consistently observe their own sense of fair play." (dust jacket blurb). The games are not learned from adults but passed on through the generations of children. This study comes from England, which looks to have a much richer game cycle than American kids usually experience. A product of ten years' research, the book thoroughly describes the rules of play and the popularity of more than a thousand fascinating games.

World Wide Games

WWG is a small woodworking company that makes and sells games: mostly wooden; some expensive ones (up to \$55); mostly inexpensive (\$1 to \$10). About half of their games are American (old and new); the others originated overseas. For the games they make, they sell replacement parts. The woodworking is clean, smooth, and solid.

Our family has been buying WWG's inexpensive games for several years. Their mail-order service is fast. Their catalog is free.

KINGY

This fast-moving game has all the qualifications for being considered the national game of British schoolboys: it is indigenous, it is sporting, it has fully evolved rules, it is immensely popular (almost every boy in England, Scotland, and Wales plays it), and no native of Britain appears to have troubled to record it.

"Kingy" is a ball game in which those who are not He, have the ball hurled at them, without means of retaliation, and against ever-increasing odds, an element that obviously appeals to the national character. Anyone who is hit by the ball straightaway joins the He in trying to hit the rest of the players. Those who are throwing may not run with the ball in their hands, but pursue their quarry by passing the ball to each other. Those being thrown at may run and dodge as they like, and may also punch the ball away from them with their fists. For this purpose players sometimes wrap a handkerchief round their hand, as "fisting" the ball can be painful. The game continues until all but one have been hit and are "out," and this player is declared "King." When the contestants are skilled (and boys of fifteen and sixteen readily play the game), the ball gets thrown with considerable force; it shoots back and forth across the street or playground, and the game can be as exciting to watch as a tennis match.

As befits a sport in which so much energy is expended, the preliminaries are sometimes wonderfully ritualistic. At Bishop Auckland, for instance, one person shouts "King" to start the proceedings, and two others follow up by crying "Sidey." The players then form a circle round the King, with the two who shouted "Sidey" standing on either side of him like hairs-apparent. The players making the circle stand with legs apart, each foot touching the foot of their neighbour on either side. The King picks up the ball and bounces it— or, as they say in Bishop Auckland, "stounces" it— three times in the ring, and then lets it roll. Everyone watches to see whose legs it will go through. If it does not roll through anybody's legs the King picks it up and bounces it again, and if his second turn fails he has a third try. If the ball still has not passed between anyone's legs, he hands it to the first sidey (the "foggy-sidey") who, as necessary, repeats the performance— for the moment the ball does pass between someone's legs that person is "on," and everyone runs. At the end of the game whoever becomes King takes the place in the centre of the ring to start the next game, and the first two people to shout "Sidey" stand beside him.

The Rules. Although the ways of choosing the chaser are numerous, the game itself is played with little variation. Reports from more than fifty places have been so similar, it is as if a mimeographed sheet of rules was carried in every grubby trouser pocket. Such a set of rules would read as follows:

1. The number of players shall be not less than six or more than twenty: the best number is about twelve.

- The boundaries of the game shall be agreed on before the game begins. A flat area of 20 x 20 yards, or a length of street of about 20-30 yards, depending on the number of players, is ample.
- One person shall be chosen chaser, and the game shall start immediately he is chosen. The chaser shall, however, bounce the ball ten times before he throws it at anyone, to give the players time to scatter.
- The chaser may not run with the ball; but while he is the sole chaser he may bounce the ball on the ground as he runs.
- A player shall be "out" when the ball hits him on the body between his neck and knees (or, as may be agreed, between his waist and ankles). It shall be determined beforehand whether a hit shall count if the ball has first bounced on the ground or ricocheted off a wall; or whether only a direct hit shall count.
- As soon as a player is "out" he shall assist the chaser in getting the other players out.
- When there are two or more chasers they may not run with the ball, but may manoeuvre as they wish by passing it to each other.
- Players being chased may take what action they like to avoid being hit by the ball, including "fisting" it, i.e. punching it away with their fist. They may also pick up the ball between their fists and chuck it away.
- Should a chaser catch the ball when it has been "fisted", or touch a player while he is holding the ball in his fists, the player shall be "out."
- Should a player kick the ball, or handle it other than with his fists, he shall be "out."
- Should a player run out of bounds when trying to avoid being hit by the ball he shall be "out."
- The last player left in shall be "King," and shall officiate at the selection of the next chaser.

Some times I kill Some One and Some One kills me but my men release me and I release them Back.

Split the kipper

In this contest, which, as one boy admitted, "takes quite a lot of nerve, the two adversaries stand facing each other a yard or so apart, with their feet together. The first boy throws a knife, preferably a sheath knife, so that it sticks in the ground not more than twelve inches to the left or right of one of his opponent's feet. The other boy, without moving his feet, plucks the knife out of the ground, and moves his nearest foot to the place where the knife went in. In this position he makes a return throw (most boys specify that the knife must be thrown by the blade), and the first boy, likewise, moves his foot to where the knife stuck in. However, should the point of the knife not stick into the ground, or should it stick in more than twelve inches away from the person's foot ("if more than a span," says a Durham lad; "if over two knife lengths," says a Fife boy), the player does not have to move his foot, and the throw is lost. The object of the game is to force the opponent to stretch his legs so far apart that he cannot move them further, and gives in, or falls over while attempting the stretch. In this form "it is a short game and suitable for short breaks at school." But in many places, particularly in the north, a player is allowed to "split" his opponent. If a person's legs are uncomfortably wide apart, and his opponent's likewise, or at least moderately open, he may attempt to throw the knife so that it sticks between his opponent's legs, and if he succeeds in this, may close his own. Usually "splitting" is allowed only once, twice, or three times, otherwise the game can "go on for ages". Alternatively in Scotland, including the Isles, if the knife sticks between the opponent's legs, that person has to turn round, and thereafter throw less surely, and undoubtedly more dangerously, with his back to the other player.

This game, or ordeal, which is sometimes played with a dart, iron spike, or geometry dividers, has become popular only during the past decade.

The Johnson Smith Catalog

If you were ever a kid, you remember Johnson Smith. But you may have forgotten just how relevant Johnson Smith could be to your present happiness, not to mention your spiritual development.

Remember their ads in the inside cover of Little Lulu? Remember the lists you used to make of all the things you wanted? Well, surprise! You'll still want the same things: secret agent pen radio, juggling kits, X-Ray Spex, Beatnik Disguise, Magic Money Maker, joy buzzers and, of course, VENTRILO ("BOYS! BOYS! BOYS! Learn Ventriloquism and Apparently THROW YOUR VOICE!" Into a trunk, under the bed, under a table, back of the door, into a desk at school, or anywhere. You'll get lots of fun fooling the teacher, policemen, peddlers and surprise and fool your friends besides.")

Yes, Johnson Smith is alive and well in Detroit. Johnson Smith hasn't changed. But what about you? Get with it, kids! This is what you've been looking for and it's been on the inside front cover of Little Lulu all the time.

More war toys. —SB

Modern War in Miniature

We are enclosing a book, *Modern War In Miniature*, authored by our son in 1964 when he was nineteen. One of its great uses is at the Wargaming table, a place to learn and understand war and its horrible effects, without experiencing its dreadful waste.

It's also an excellent reference book and is in the libraries at West Point, the Air Force Academy, etc.

[Suggested and reviewed by
Leota Kornis]

Modern War in Miniature

The judges are very important. They are the only ones who need be familiar with the rules. The players only give orders as they would in actual combat. They are not allowed to see what is going on in the sand table or on the main flight board. They have only their maps with the positions of their own troops and planes, and they know only what the judge tells them that their troops can see or hear. In this way the judges are used to isolate the players within the confines of the knowledge of their troops.

J: THERE IS A SUB-MACHINE GUN FIRING ON THE BOARD.

J: Your schmeisser is kicking chunks out of the edge of the building all around him. It's hard to say whether you hit him or whether he pulled his head back.

J: an M-1 HAS FIRED ON THE BOARD.

J: That rifle round hit you in the side. It knocked you a little farther into the ditch; you're bleeding from the mouth too.

J: You can see who did it now. The American is on your left about 12 meters away running at you with his bayonet.

P: Can I still move?

J: Yes, but you are almost unconscious.

P: I'm turning around and firing the rest of my schmeisser's clip into him.

J: THERE IS A SCHMEISSER FIRING ON THE BOARD.

J: He's coming up fast. Your bullets are jerking around in an arc towards him as you turn. Seven meters, four meters, one meter. I'm afraid you're dead.

If a soldier is advancing on enemy positions and is under fire and his person is more than 20% exposed, his base chance of developing a transient reaction in any given two-second period is: $r = 1/12$. Of those soldiers who develop transient reactions while advancing, 30% usually exhibit manic symptoms and 70% disassociative symptoms.

If a soldier is stationary defending a position and is fired upon and is more than 20% exposed, his base chance of developing a transient reaction to stress in any given two-second period is: $r = 1/12$. Of those soldiers who do develop transient reactions, about 30% will exhibit manic symptoms and 70% will develop disassociative symptoms.

Strategy & Tactics

I was once an umpire at a huge war game at Camp Drum, New York, and had a wonderful time.

Unfortunately, this magazine seems to be limited to board games using historic battles. It looks to have a cult readership related to Sci Fi fandom. But its considerations of game design, nostalgia-stroking, and bloodless conflict may be worth investigation by inventors of whatever's gonna replace war. You can be sure that peace isn't. Conflict is too interesting. —SB

The Hand Game

Hand Signals

The Bone Game is a gambling game

To Play you need

Two Tribes

A Place divided by a line

Each Tribe puts up Stakes, displayed in a Special place

Each Tribe begins with five marker sticks to keep score

There are four Magic Bones

Each small enough to be concealed comfortably in a closed fist

Two of the bones are marked by wrapping thread around them

Two bones, one marked, one unmarked, form a Set.

One Tribe begins by hiding the bones

The Tribe chooses Two Hiders

Each hider holds a set of bones, one bone in each hand

The hiders stand in front of their tribe

Close to the Line, fists closed.

The other Tribe chooses one Shooter whose task is to find the two threaded bones.

The play takes place when the Hiders have hidden their Bones and present themselves facing the Line

Either Tribe may use any strategy they want in playing

Except the Line is not to be crossed

Nor may the Tribes touch each Other

Common Strategies Include

Chanting, Swaying

Singing

Music Making

Having Secrets

Casting Spells

The Shooter shows where he feels the threaded bones are hidden

By using a set of Hand Signals

There are four possible places the Bones can be hidden

When the Shooter is ready to shoot, he faces the Hiders across the Line, shouts HO and makes one of the Hand Signals

After the shout, the hiders open their fists displaying the bones

A shooter can capture no bones, one bone, or two bones

Every time the shooter fails to capture a threaded bone

His Tribe loses a marker stick; every time he succeeds

His Tribe wins a threaded bone.

The shooter shoots, until he has captured both threaded bones

Or lost all his Tribe's marking sticks

When the shooter has captured both bones

His Tribe chooses Hiders and hides the bones

The other Tribe chooses a Shooter

The clash is not only between the Shooter and Hiders

It is between the Spirits of the Two Tribes.

A clash is over when the Shooter has captured both bones.

A Round is over when one Tribe has taken all the Markers.

A Game is over when one Tribe has Won

The Agreed upon number of Rounds.

two bones

one bone

one bone

no bones

Possible Plays

All games to stay alive have to teach you something. Some games teach a lot. My three favorites are boffing, volley ball, . . . and the Hand Game, which is a form of mind-war common to nearly all the North American Indian tribes. I first saw it played between the Maidu and Paiutes on a mountainside near Reno. The games went on for two days and nights, with what seemed like half the money in the county riding on the outcome. I'd wake up at 2 am and hear the steady pounding stick beat of the Paiutes when they were hiding the bones, chanting a dreamsong hiding song that sounded like ANY day now we're flying aWAY-ay. ANY day now we're flying aWAY wayo maYA HA-ah ts-n-n-na-nah haYA-ah ts-n-n-na-nah! The Paiutes played men and women, steady and structured and controlled against the lolling drunken Maidu men-only team, opposite strategies evenly matched. Finally one Paiute woman single-handedly defeated the Maidu. No one could guess her. She was fantastic, a cool cruel queen of victory. She didn't hide her face like the others; she stared the shooter straight in the eye and crumpled him.

A few years ago I showed the game to Jim & Cynthia Nixon, and they showed it to Sim Van der Ryn, who came up with this nice set of instructions and illustrations on how to play. You may be able to get copies of the whole paper Blood Learning, from Sim at 1 Farrelones, Star Route, Point Reyes Station, CA.

—SB

D.R. said, "Well, the thing for you all to do is come up and visit me some time. It looks like I'll be staying around a while."

Mrs. Thornton and Barry both looked a little startled. "Are you really?" said Mrs. Thornton.

"Yep," said D.R. "I thought I would. A month or two, anyhow. Maybe even longer."

Mrs. Thornton said, "Well I'll swan. Now that really is news," and turning around again she called out to Mrs. Godsey, "Did you hear that?"

"Hear what, honey?"

"David said he's going to live at the Collier place a while. Said he was going to stay on up there a month or more."

"Oh yes," said Mrs. Godsey. "Leonard told me that a day or two ago."

"Well it sure is news to me," said Mrs. Thornton, and she turned to gush about it some more to Barry and D.R.

But Barry had led D.R. over to the circle of chairs to introduce him to the other people in the store. There were two, Mrs. Whitaker, who was so shy she could only nod and say hello to D.R., and Mr. McClanahan, who was not at all shy, but who was old and could barely hear.

"Do what?" he yelled, cupping his hand to his ear.

(continued)

Paper Airplane Book

"If we knew what it was we would learn, it wouldn't be research, would it?" was the title of an ad for Scientific American's project of an international paper airplane competition. The 20 winners are photographed in full page aeronautical glory followed by a tear-out pattern for imitations. No materials are needed other than the basic one referred to in the dedication —

The authors wish to dedicate this manuscript to Capt. Fear God Bascomb, out of New Bedford, Massachusetts, who brought the first known pad of lined 8 x 11" paper from China on May 1, 1743. It may well be said of Capt. Bascomb that without him, the paper airplane as we know it would not have been possible.

and scissors and infinite doodling type patience. As a school librarian with only two copies of this wildly popular book, I was finally reduced to tearing it up page by page for an eye level wall long display for group reading and a handy supply of tracing paper for pattern copiers. Our airborne climax was the North Hillsborough, California School Paper Airplane Olympics with appropriate contests and flyers, after which we were not able to cross the school campus without shuffling ankle deep in aborted and/or terminated flight materials. The school custodian was one of the few associates not turned on by this librarian's flight of fancy (or reason, depending on your bias).

Fishertechnik

One more item in the form of a suggestion to the Catalogue; there must be a few readers like myself who have kids (We have a six year old boy) and who travel and are often trying to answer the question of buying a worthwhile toy. Toys like art books are many and I haven't seen any in the catalogue. You ran the Tantra book because of it's obvious up front value and I feel the same way about a toy I want to tell you about.

We've taken our son everywhere we've gone and on our last trip we obtained a Fishertechnik building set which John played with day after day without ever tiring of the toy or destroying it and it took some abuse on our recent trip to Afganistan. This toy is not advertised, hence requires turning people on to it. I think it is the best building toy on the market with many applications for kids and adults. It's expensive and a German import. The sold importer is:

Model Rockets

Model rockets, you say, what are they... idealizations of instruments of war? Not at all. They are idealizations of one of man's primal urges, mastery of the skies.

In practice model rocketry is safe (remote control firing, parachute recovery), inexpensive (average costs: engines— 25¢, vehicles— \$2.50), scientific (limitless opportunity for creative one-man research), and great fun. Practical applications include smog sampling, weather studies and aerial photography. Model rocketry supplies became available as a safe and meaningful alternative to dangerous "Basement Bomber" activities of amateur rocket builders impressed by the first Sputniks in the late 1950's. The National Association of Rocketry was formed to promote safe and educational model rocketry activities among manufacturers and enthusiasts.

Brochure: Free
National Association of Rocketry
Box 178
McLean, Virginia 22101

The inexpensive NAR membership includes a subscription to Model Rocketry Magazine, an independent and outstanding monthly mag produced by MIT students during their free time. Coverage ranges from elementary How-To articles to the unbelievably esoteric. Standard magazine format and circulation but it is managed as a sort of commune. All profit goes to an informal fund used for research and financing field trips to regional flying competitions and NASA events. Typical articles explain model rocket applications in tracking systems, telemetry, aerial photography, and activities in the Soviet Union, a country which long ago realized the educational aspects of model rocketry. Subscription available separate from NAR membership.

There are nearly a dozen manufacturers of kits and parts to choose from, but ESTES and CENTURI are consistently the best. There are many similarities between these two, but their differences are striking. Estes is the venerable pioneer, but it stresses bold innovations such as flexible landing gear and unbelievably inexpensive kits for aerial photography cameras (Still camera: \$4.00!). Soon to come out with a motion picture camera suitable for use in flying models... less than \$20... WOW!

Centuri is noted for kits of handsomely detailed scale models and formidable power of their larger engines. Centuri, like Estes, has a well developed educational services program where free textbooks and discount prices are offered to any sort of reasonably legitimate educators such as teachers, Boy Scout leaders and Civil Air Patrolers. Both are mail order oriented, with excellent personalized service. The safe and inexpensive engines of all manufacturers are standardized and interchangeable. Estes and Centuri each send free newsletters to regular customers.

Model rocketry is a going thing, not only because it offers an opportunity for inexpensive creative research into the relatively unexplored field of sub-sonic rocketry, but because it is a fun way to participate in the Space Age.

The best known "general store" of kiting is the Go Fly a Kite Shop, 1613 Second Avenue, New York City 10028. An illustrated price list is available; much of their business is by mail. Surhendra Bahadur is the proprietor.

Kyte House, Richardson, Texas 75080, carries several makes and models but specializes in kite kits with which some unusual variants can be built. Kits cost about \$3.50; kite plans about \$2. It is run by R. E. Sanford, who issues a catalog called Kyte Lines.

Schubert's, 2135 Union Street, San Francisco 94123, is primarily a toy shop, but the owner is a kite enthusiast and carries a variety of ready-made models.

Kite Tales

For people who are into kite-flying as a hobby or a sport, I would like to suggest a listing of the American Kitefliers Association. Their mailing address is P.O. Box 1511, Silver City, New Mexico, 88061. They are the only true organization of kite fliers in the world, representing 40 states and nine foreign countries. They publish a quarterly magazine, "Kite Tales" which contains many articles of interest on building and flying kites, as well as advertising for all different sorts of kites, probably the biggest selection anywhere. Membership costs \$2 per year, which includes a subscription to the magazine.

Sincerely, Pax,
Robert Williams
Worcester, Massachusetts

Regardless of what other equipment you take along on a kiteflying expedition, one should always have some type of cutting instrument, preferably a sharp knife. Perhaps the second most important item of supply is a roll of some type of self-adhesive tape to repair fabrics.

Oh, I've slipped the surly bonds of earth —

(See also p. 131)

Boomerangs

For wonderfully complete information on construction, history, throwing, purchase, and appreciation of boomerangs, write to Benjamin Ruhe at The Smithsonian Institution, office of Public Affairs, Washington, DC.

Following are excerpts from his Boomerang Workshop.

I love The Smithsonian.

-SB

Making Your Own

Making your own boomerang is not difficult; all you need is a piece of "Three eighths" five ply (actual thickness is about five sixteenths, but to get this you usually have to ask for three eighths thickness), a sharp knife and a whetstone to keep it sharp, a couple of small "C" clamps, a sheet of 80 grit sandpaper, and a suitable saw to cut out the shape.

The boomerang illustrated is for right handed throwers. If you are left handed, all you need do is to look at the plans through a mirror so that everything is reversed from right to left.

The design of the boomerang shown below is a very simple one, selected as especially suitable for a beginner to make as it requires no previous experience and is foolproof (well, almost), giving a nice curving flight that should bring it back fairly close to the thrower. Also, because of its flexible design, it can be made with a large variety of plywoods, and the 18" size means it can be made from readily available off-cuts from a lumber yard, sparing you the expense of buying a whole sheet. It is NOT, however, a competition quality boomerang, but will give you hours of enjoyment nevertheless.

PROCEDURE

Obtain a sheet of aircraft or high-grade marine plywood (5 ply) and mark out the straight lines shown in the diagram. The actual elbow and tips should be rounded, however—do this by drawing a couple of circular arcs at the elbow with a 3-inch drinking glass or compass, and with a 6-inch dish or the equivalent. Draw the curves for the tips in freehand as shown in the figure and then cut it out, using a saw. Next clamp one arm firmly to a table or workbench, leaving the other one free to work. With straight, even strokes, slice off wood to attain the aerodynamic contours shown in the sectional drawings at the bottom of the main sketch. Make sure that the direction of the knife stroke is such that it makes an acute angle with the grain on the top layer of wood; otherwise this may tear or lift off. If you find this happening, cut from the other direction.

Do not be afraid to take wood off, but check from time to time that you are following the general sections shown in the drawing. When completed, the weight of the boomerang should not exceed four ounces. After the knifework is over, sand it down smoothly with 80 grit sandpaper and give it a few throws. If all appears to be well, finish the boomerang off by coating it with floor wax or brown shoe polish to waterproof it. If it does not return properly, but tends to run out of spin and drops in front of you, sand off a bit more material from the trailing edge of the dingle arm making the taper near "b" more sloping, until it works right, but be careful not to take too much off or you'll wreck the whole thing.

With regard to the balance of a boomerang, this is a fairly complicated thing. Suffice it to say that the important thing is not so much the static balance you see when you put it across your finger, but the dynamic balance of it when in flight. It should appear to have a hole about two inches in diameter when spinning rapidly, at the inside curve of the elbow. Actually, it is this hole that does the travelling when the boomerang is thrown, the fact that it is accompanied by the boomerang being more or less incidental.

Suitable Conditions

The boomerang should be thrown into a LIGHT BREEZE ONLY. Early morning or late afternoon usually offer the best conditions. Larger boomerangs can at times be thrown into fairly moderate winds, but generally the results are poor. Best results are obtained when a few blades of grass have to be used to indicate wind direction. Throwing into high winds even on a large clear area is dangerous, since these conditions cause the boomerang to climb steeply, and travel with the wind a great distance, and at a great speed.

The Throw

Grasp either end of the boomerang with the thumb and first two fingers of the right hand (special boomerangs are needed for left handed people) and hold it firmly with the flat side outward so that the plane of the boomerang is inclined at about 60 degrees to the horizon, then give it a gentle throw with plenty of spin.

It should curve around to the left and climb slightly, turning around and finally stopping to hover in the vicinity of the thrower.

The key to success in the whole operation is the imparting of considerable spin on the throw, and this is aided by holding no more than an inch and a half of the tip of the boomerang, and by not actually releasing it but by making it pull itself out of the hand by its own impetus, pivoting around the index finger when doing so.

Architecture

I don't know that architecture is a useful term or profession any more. This book gets a kid into building stuff and some of the traditional considerations in doing that.

PROJECT 4 — BUILD A CORBEL

Materials: Box of sugar cubes.

Procedure: Place cubes on top of each other with the end cube of each course (row) projecting about one third of its length over the front edge of the cube beneath it. You will notice that unless there are enough cubes behind the projecting end cubes the construction will fall forward. You will also notice that it is possible to stack the cubes higher if the projection is shorter. There is a relationship of projection to height in a corbel the same as there was in the column.

If you construct two such corbels opposite each other, ten or eleven cubes high and about five inches apart so that the top cubes meet each other, you will have a pyramidal opening. This is how corbels are used to span openings.

When you have made the structure, hold it in your hand and gently squeeze. If it does not feel rigid but moves in your hand look for the configurations that move. You will find that these invariably are not triangulated. Glue toothpicks across their corners to make them rigid.

Jonathan Livingston Seagull

A Blood woman told me "Behind the Sun is the real Sun." This book is about flight that way. Beyond perfection of technique is another perfection, a further freedom, another discipline. Jonathan eventually has to insist he is not the Son of the Great Gull.

Here he came this minute, a blurred gray shape roaring out of a dive, flashing one hundred fifty miles per hour past his instructor. He pulled abruptly into another try at a sixteen-point vertical slow roll, calling the points out loud.

"...eight...nine...ten...see-Jonathan-I'm-running-out-of-air-speed...eleven...I-want-good-sharp-stops-like-yours...twelve...but-blast-it-I-just-can't-make...thirteen...these-last-three-points...without...fourteen...aaakk!"

Fletcher's whistfall at the top was all the worse for his rage and fury at failing. He fell backward, tumbled, slammed savagely into an inverted spin, and recovered at last, panting, a hundred feet below his instructor's level.

"You're wasting your time with me, Jonathan! I'm too dumb! I'm too stupid! I try and try, but I'll never get it!"

Jonathan Seagull looked down at him and nodded. "You'll never get it for sure as long as you make that pullup so hard. Fletcher, you lost forty miles an hour in the entry! You have to be smooth! Firm but smooth, remember?"

And so they flew in from the west that morning, eight of them in a double-diamond formation, wingtips almost overlapping. They came across the Flock's Council Beach at a hundred thirty-five miles per hour, Jonathan in the lead, Fletcher smoothly at his right wing, Henry Calvin struggling gamely at his left. Then the whole formation rolled slowly to the right, as one bird...level...to...inverted...to...level, the wind whipping over them all.

The squawks and grockles of everyday life in the Flock were cut off as though the formation were a giant knife, and eight thousand gull-eyes watched, without a single blink. One by one, each of the eight birds pulled sharply upward into a full loop and flew all the way around to a dead-stop stand-up landing on the sand.

Wheels 1,2,5,6,7,8,11,12—Bevel gears,1:1 ratio
Wheels 3,4,9,10—Spur gears,1:1 ratio

The Chinese South-pointing Chariot

A full-scale machine of this kind was used in ceremonial processions in China between A.D. 120 and 250. It seems that its purpose must have been simply to cause awe and wonder in the onlookers since whichever way the chariot was turned the figure on the top always pointed in the same direction. This intriguing result was obtained by means of differential gearing, very similar to that used in the back-axle of the present-day motor vehicle. Possibly pin gears were used in the originals, though this is not certain.

"Home I have none. Flock I have none. I am Outcast. And we fly now at the peak of the Great Mountain Wind. Beyond a few hundred feet, I can lift this old body no higher."

"But you can, Jonathan. For you have learned. One school is finished, and the time has come for another to begin."

As it had shined across him all his life, so understanding lighted that moment for Jonathan Seagull. They were right. He could fly higher, and it was time to go home.

He gave one last long look across the sky, across that magnificent silver land where he had learned so much.

"I'm ready," he said at last.

And Jonathan Livingston Seagull rose with the two starbright gulls to disappear into a perfect dark sky.

"I said this is Emmet Collier's nephew," said Barry. "David's his name."

"Cecil Agnew!" the old man shouted. "Who? What did you say?"

"Emmet Collier!" Barry yelled. "That died the other day. This is his nephew."

Mr. McClanahan heard the word "died" and suddenly it all came together in his mind. He shifted his cane to his left hand and with his right he reached out and grabbed D.R. by the leg, just above the knee, and squeezed hard.

But when he spoke, he still addressed himself to Barry.

"I knew this boy's grandfather," said Mr. McClanahan. "Me and him use to log together. Hard worker. Knew his father, too. That was a good family of people."

"David here's going to live a while at the old homeplace," Barry said.

"Do which?"

"I said, David's going to live a while up there where Emmet did. He's taking care of the place."

Mr. McClanahan shook his head. "Trace Fork used to be full of people," he said. "But they aint nobody lives up there now that Emmet's dead."

Barry smiled and nodded and let it go at that.

(continued)

This book grew out of a smaller volume called *Suggestions for Science Teachers in Devastated Areas* whose production was sponsored by UNESCO right after World War II. It was meant for use in schools whose buildings and labs had been destroyed and soon found its way into the hands of people who had never had these things to begin with. This it solves the problem of schools, communities—people—who want to do live science without money or equipment. There isn't any experiment in it which would be too costly for any of us to do. The book tells you how to put together the equipment you need: real clever ways of making glass cutters, balances, burners, telescopes, microscopes, etc. A lot of what you need to do the experiments is just stuff you'd have around the house. The rest can be gotten [very low cost stuff] at the drugstore, hardware, junk yard, etc.

Also the book is unusually well written. There's no bullshit in it and it doesn't talk down to the reader. Just very straightforward instructions with illustrations that are highly readable. In most cases you aren't told the outcome of the experiment, an aspect which makes you much more interested in doing it.

An egg osmometer
Place some dilute hydrochloric acid or strong vinegar in a shallow dish, such as a saucer, to a depth of about one centimetre. Hold the large end of an egg in the acid until the shell has been eaten away on the end leaving the thin membrane exposed. Rinse the acid from the egg. With a sharp instrument work a small hole through the shell at the other end. Insert a soda straw or a length of glass tubing through the hole into the interior of the egg. Seal the opening around the tube with household cement or sealing wax. This must be absolutely tight. Place the osmometer in a glass of water and let it stand for a few hours.

Making smoke prints of leaves
Smoke prints of leaves may be easily made by following the four steps shown in the diagrams.

Cover the side of a smooth, round bottle with a thin layer of grease or vaseline. Fill the bottle with cold water and cork it tightly. Hold the bottle over a candle flame until it is covered evenly with soot. Place a leaf, vein side up, on a layer of newspaper and roll the sooty bottle over the leaf. Remove the leaf and lay it vein side up on clean newspaper. Cover the leaf with a sheet of white paper. Next, roll over the white paper and leaf with a clean round bottle or other roller.

Another way to show that water pressure increases with depth

Find a tall tin can. Punch holes up the side of the can about 3 cm apart. Put a strip of adhesive or plastic tape over the row of holes and fill the can with water above the top hole. Hold the can over a sink and strip the tape from the holes beginning at the bottom. Observe the streams and note the distances travelled outwards from the can.

Water pressure is the same in all directions

Punch holes around the base of a tall tin can with a nail. Cover the holes as above with a strip of tape. Fill the can with water and strip off the tape while holding it over a sink. Observe and compare the distance the streams shoot out from the holes all around the can.

Edmund Scientific

Edmund is the best source we know of for low-cost scientific gadgetry (including math and optics gear). Many of the items we found independently, such as Dr. Nim, 700 Science Experiments, Geo-D-Stix, Spilhaus Space Clock, etc., turned up in the Edmund Catalog, so we were obliged to recognize that in this area we've been preceded. They list 4,000 items —SB

EASILY BEND WIRE INTO USEFUL SHAPES

Turn wire, coat hangers, etc. into peg board hardware, stakes, springs, tools, toys, art. Cast aluminum jig with cutting blade, fulcrum & bending pins handles up to 1/4" steel wire. 100 illustrated projects.
No. 40,870 \$2.00 Ppd.

HIGH-OUTPUT SILICON SOLAR CELL

"ONE OF THE FINEST I'VE EVER SEEN," says our Engr. Small yet extremely powerful, this cell permits applications formerly impossible. Use in solar powered boats, toy cars, etc. Exposed to bright sunlight this cell delivers more than 1/10 amp. current. One alone operates our ball bearing motor (No. 40,902, Pg. 72) even under incandescent illumination. Open circuit voltage 0.5v; short circuit current 100 ma; output in excess of 20 mw. Color coded leads. Cell is 1/4" in dia. and less than 1/4" thick.
No. 30,538 \$7.50 Ppd.

NEW GAMES TEACH POLLUTION CONTROL
SMOG • Dirty Water

Smog and Dirty Water acquaint 2-4 players with many of the complexities and obstacles which an administrator meets in controlling water and air pollution in his community or lake. The player who best succeeds in controlling pollutants wins.

Smog illustrates the complex problem of air pollution. Each player is the "Air Quality Manager" in his city and learns about actual abatement techniques. The player who first earns 2,000 management credits is the best manager of his city's resources and wins. Smog includes 19 1/2" sq. gameboard; hundreds of pegs, smoke plumes, rings; "Outrageous Fortune Cards"; play money; die; pad; and 11-page informative instr. booklet.
No. 71,321 \$10.00 Ppd.

Dirty Water: Each player is a "Water Pollution Official" in charge of a lake that needs a proper ratio of certain organisms to be ecologically balanced. You learn about various types of water pollutants, each causing a specific type of pollution. You experience the problems facing real Pollution Control Officials... priority decisions, threats of pollution from an upstream community, finances, etc. The player who first stocks his lake with the correct ratio of organisms wins. You get a colorfully illus. gameboard (19" sq.); over 200 "Organism Places" including algae, weeds, bass, etc.; die; tokens; pad; abatement cards; charts; and informative 12-pg. instr. booklet.
No. 71,320 \$10.00 Ppd.

FIRST LOW-COST AIR POLLUTION TESTER
CO₂ CO H₂S NO₂ SO₂

Quantitative results in a few minutes!

Now a low-cost, quick, easy-to-use kit for sampling and testing pollutant gases in the threshold limit ranges set up by the American Conference of Governmental Industrial Hygienists. Sensitivity, accuracy, wide measuring range, and portability of this lightweight unit, make it ideal for use by safety engineers, industrial hygienists, pollution control officers, teachers, students, and all others requiring quantitative data on air pollutants. Kit contains sturdy plastic sampling pump; coupling tube; 10 ready-to-use, break-tip test ampoules (2 each for: CO₂, CO, H₂S, NO₂, SO₂); and complete instructions with scales for determining results. Pump draws air through ampoule containing impregnated chemical specific for pollutant. The length of the stain that appears indicates the concentration of the gas in the air. It only takes a few minutes to test for: Carbon Dioxide (CO₂) .01-10% by volume; Carbon Monoxide (CO) 10-3000 Ppm; Hydrogen Sulfide (H₂S) 1-800 Ppm; Nitrogen Dioxide (NO₂) .1-50 Ppm, and Sulfur Dioxide (SO₂) 1-400 Ppm. Kit includes enough ampoules for 2-4 tests for each gas above depending upon concentration. Replacement ampoules available below.

Complete Kit No. 71,349 \$16.50 Ppd.

(4) CO ₂ Ampoules	No. P-40,833	4.75 Ppd.
(4) CO Ampoules	No. P-40,834	4.75 Ppd.
(4) H ₂ S Ampoules	No. P-40,835	4.75 Ppd.
(4) NO ₂ Ampoules	No. P-40,836	4.75 Ppd.
(4) SO ₂ Ampoules	No. P-40,837	4.75 Ppd.

MINIATURE MAGNETIC MOTION DEMONSTRATOR

No matter what your age, the TOY MINI BOPPER will hold your attention for hours! Just arrange the 10 circular magnets into any pattern you choose, swing the magnetic pendulum over the pattern, and... WOW! It goes crazy as it reacts to the pattern's magnetic force field... circling, swinging, jumping, hovering, bouncing, accelerating, slowing and accelerating again. Make up games, try to outguess your opponent, demonstrate magnetic attraction and repulsion. Stands 7 1/2" high on a metal triangle base. Plastic tripod suspends pendulum. Includes instructions.
No. 71,279 \$2.00 Ppd.

HAVE FUN WITH SCIENCE OF SOAP BUBBLES
Create endless complex shapes, study and enjoy their fascinating behavior. Learn about liquid skins, pressures, jets, electrical conduction and the membrane theory of stress distribution. Chemist designed kit includes special, longer-lasting, lower-cost bubble formulation (makes several gallons). Sticks with metal connectors and wire bending jig to make bubble frames, plus 190-pg. book on subject by C. V. Boys. Complete instructions.
No. 70,742 \$6.00 Ppd.
Formulation only. **No. 40,782 \$3.00 Ppd.**

LARGE 9-FT. HOT-AIR BALLOON KIT

Have lots of inexpensive fun with these large, colorful hot-air balloons. When fully inflated (approx. 5 ft. in diam.), they rise to about 200 ft. on just hot air. With string tether attached, you can loft objects up to 1/2 lb.; model airplanes, parachutes, etc. Ideal for the 4th of July, science clubs, picnics, etc. Balloons can be used over and over again. If damage occurs, you can easily repair it. Kit includes 10 precut, red and white gores (No. 1 model paper); 6 feet of 14 ga. wire for bottom ring; top tie-off cord and instructions.
No. 60,691 \$2.00 Ppd.

An astonishing amount of conversation in the Western World is spent agreeing or disagreeing on the extremes of experience. Maybe it's some primordial urge to know where we are in the universe. Whatever, it's deep. This book is automatic conversation; whoever's reading it has to start reading aloud. And whoever's around has to listen and respond. Weird. Painless education though. —SB

Highest Income. The highest gross income ever achieved in a single year by a private citizen is an estimated \$105,000,000 in 1927 by the Chicago gangster Alphonse ("Scarface Al") Capone (1899-1947). This was derived from illegal liquor trading and alky-cookers illicit stills, gambling establishments, dog tracks, dance halls, "protection" rackets and vice. On his business card Capone described himself as a "Second Hand Furniture Dealer." Henry Ford, the first (1863-1947) earned about \$70,000,000 per annum at his peak.

HIGHEST HABITATION: This "silver hut," a prefabricated laboratory erected at an altitude of 18,765 feet in the Ming Bo Valley of the Himalayan mountains of India, was inhabited for four months in 1960-61.

Lowest Incomes. The poorest people in the world are the 42 surviving Pintubu (or Bindibu) found in the Northern Territory of Australia in July, 1957. They subsist with water from soak holes and by eating rats. In September, 1957, Chinese Government sources admitted that in some areas of the mainland the average annual income of peasants was 42 yuans per head. In 1964, China's average income per head was estimated at \$70 and the daily calorie intake at 2,200 (see page 298 for highest intake).

Return of Cash. The largest amount of cash ever found and returned to its owners was \$240,000 in unmarked \$10 and \$20 bills found in a street in Los Angeles, by Douglas William Johnston, an unemployed Negro, in March, 1961. He received many letters, of which 25 per cent suggested that he was insane.

Handshaking. The world record for handshaking was set by Theodore Roosevelt (1858-1919), as President of the U.S.A., when he shook hands with 8,513 people at a New Year's Day White House Presentation on January 1, 1907. Outside public life, the record is 37,500 hands in 7 hours 15 minutes 18 seconds by George Borkowski, in London on February 22, 1907.

Pill Taking
It is recorded that among hypochondriacs Samuel Jessup (born 1752), a wealthy grazier of Heckington, Lincolnshire, England, has never had a modern rival. His consumption of pills from 1794 to 1816 was 226,934, with a peak annual total of 51,590 in 1814. He also overtook as having drunk 40,000 bottles of medicine before death reverted him at the surprisingly advanced age of 65.

Hiccoughing
The longest recorded attack of hiccoughs was that afflicting Jack O'Leary of Los Angeles. It was estimated that he "hicked" more than 180,000,000 times in an attack which lasted from June 13, 1948, to June 1, 1956, apart from a week's respite in 1951. His weight fell from 138 lbs to 74 lbs. People sent 60,000 suggestions for cures, of which only one apparently worked—a prayer to St. Jude, the patron saint of lost causes.

Sneezing
The most chronic sneezing fit ever recorded was that of June Clark, aged 17, of Miami, Florida. She started sneezing on January 4, 1966, while recovering from a kidney ailment in the James M Jackson Memorial Hospital, Miami. The sneezing was stopped by electric "aversion" treatment on June 8, 1966, after 155 days. The highest speed at which expelled particles have been measured to travel is 103.6 m.p.h.

LIFE Science Library

After two years of looking at everybody's nifty books, I'd say that the two sets of books to have around your place for pick-up education of young and old are the Golden handbooks (see p. 373) and these science books from Time-Life. They're available only by mail, and they come one every month or so. If you don't like what you got, you can send it back. We haven't sent any back.

Most popular science books are badly behind the times. This series puts special emphasis on recent developments. —SB

TWO LENSES IN ONE

Bifocals—introduced to America in the 18th Century by Benjamin Franklin—help older people with rigid lens structure to focus at both near and far distances. The upper half of the spectacle lens gives slight correction for distant viewing. The lower half is for close-up work; it provides the increased refraction needed to compensate for the increasing rigidity—and the inability to focus—of the aging lens.

Light and Vision

THE EVOLUTION OF CORN to the modern fruitful version required 7,000 years of radical change, as indicated by these three samples. The inch-long ear of wild maize (left)—a Central American plant now extinct—dates from around 5200 B.C.; it has only eight rows of kernels with five to six kernels on each row. By 500 B.C. Mexicans were growing four-inch-long ears called Nal-Tel (center) that had some 11 rows of small kernels per cob. Today, one of the most widely cultivated corn plants in Mexico is Chalqueño (right), eight inches long, with 17 rows of narrow kernels.

The dangers of leaching were pointed out as recently as the 1920's, when public-health officials were puzzled by the strange pattern of malnutrition in the South. Impoverished sharecroppers there ate poorly—grits, corn mush and molasses, greens, with a bit of fatback. The diet for white and Negro sharecroppers was much the same. But, oddly enough, the whites suffered more severely from deficiency diseases; the Negroes, also ill-fed, were relatively unaffected. The mystery was not solved until the scientists learned that both whites and Negroes boiled their staple foods for long periods to improve the palatability of the somewhat tasteless provender. But then the whites threw away the cooking water; using the so-called potlikker was socially unacceptable. With the discarded liquid went the nutrients that had been leached away by long boiling. The Negroes, uninfluenced by the social stigma attached to potlikker, drank it and used it to soak corn bread, recapturing the essential vitamins and minerals.

WHAT'S WRONG WITH THIS PHRASE?

At first glance, seemingly nothing. But with closer reading the repetition of the word **THE** becomes obvious. Because we generally read rapidly in word patterns rather than slowly a word at a time, it is easy for the eye to skip over the extra **THE** and register the familiar phrase "correctly."

Light and Vision

How to Build a Working Digital Computer

Since computers are ever more centrally with us, it behooves us to allow them as few mysteries as possible. A kid who's built a computer out of paper clips has a healthy handle on his relationship with high technology.

The computer you can build from this book will operate with a program of 28-bit instruction works and has a ten-instruction repertoire. It adds, subtracts, multiplies, divides, and costs very little.

WFF 'N PROOF

The **WFF 'N PROOF** games came out of the ALL project (Accelerated Learning of Logic) at Yale Law School. This project was established in 1960 to develop materials to teach mathematical logic to elementary school students. The authors' first principle in designing the games was that they be fun to play.

WFF 'N PROOF is a series of 21 games. The first ones can be played by children (starting around age eight), the last ones are difficult enough to interest logicians. The first game can be bought separately under the name of just 'WFF.' It is the best game and children always like to play it. In it you learn what a **WFF** (well formed formula) is, and there is no nicer way of doing that. The rest of the games teach you about constructing logical proofs. They are more tedious and a good teacher can find ways of doing this which are more fun. There's no harm in getting the whole set, however, and using it as long as it works.

And about that time Elmer the mailman came in with the morning delivery. D.R. excused himself from the conversation and took his letters to Mrs. Godsey, behind the cage.

"He's about to miss the boat aint he Mrs. Godsey?" said Elmer as he traded mail sacks with her. "Yes sir. About to miss the last mail boat out of China."

"Oh no," said Mrs. Godsey as she held D.R.'s two letters up to the light. "These letters going to California, Elmer. We can't slow this mail down. Going to, what's this, honey? Anaheim? I can't make that out."

"Flash," said D.R.

"Flash. Now that's a queer name. And what's this one? Esther?"

"Estelle," said D.R. "Estelle Adams."

Mrs. Godsey stamped the postmark on the letters, then sat a minute, thinking. "Adams. That's not Felix Adams's girl from Leatherwood is it? That joined the WAC's here while back? Seems like they sent her to California."

"No mam," said D.R. "Estelle's not from around here. She's from Michigan."

"How come you're writing to her in California then?" asked Mrs. Godsey.

D.R. grinned. "Well, I was thinking she might be in California by now."

"But you don't know for sure," said Mrs. Godsey.

"No mam, I don't," said D.R.

"Sounds like this girl must be your sweetheart," said Mrs. Godsey.

D.R. laughed. "I guess I don't know that for sure either," he said.

"Well now, she either is or she aint," said Mrs. Godsey. "Aint that right, Elmer? Elmer here's a bachelor, but he knows more about women than anybody else around here, don't you Elmer?"

Elmer took the letters from Mrs. Godsey and stuffed them into the mailbag. When he'd drawn the strings on the bag together again, he looked up and pushed his cap back off his forehead.

"It's like this," said Elmer. "She either is or she aint unless you're on the outs, and then it all depends. Sometimes one can be your sweetheart but get on the outs with you, and then it's just all hurly-swirly."

Everybody in the store laughed at Elmer then, including Mr. McClanahan who hadn't understood what was said, but who was in the habit of laughing at Elmer every time he saw him at the store.

"Elmer's got more sweethearts than any man around here," said Barry.

"But I hear there's one he likes better than any other," said Mrs. Thornton.

Standing in the door now, about to leave, Elmer said, "If you all don't quit talking about me I wont bring you any more mail."

"You don't ever bring nothing worth reading anyhow," said Barry.

"I bring the Blaine Herald once a week," said Elmer.

"Well you know they aint nothing worth reading in that thing," said Barry.

Mrs. Thornton said, "Elmer, if you don't bring me a letter from Charlene pretty soon I'm going to wring both your necks."

"I'll bring you one tomorrow if I have to write it myself," said Elmer.

"I'll be looking for it," said Mrs. Thornton.

"So long," said Barry, and as Elmer went out the door, waving, Mrs. Godsey said, "We'll see you tomorrow, Elmer. You be good now."

Build-it-yourself Science Laboratory

My youthful science investigations went about as far as the tameability of wild animals and the thermo-dynamics of breaking glass. Some kids go a lot further, and this book is for them. Stay out of the lab unless invited.

HARMONOGRAPH

Purpose: Harmonic motion is a movement or motion that repeats itself. A pendulum is a good example of harmonic motion. When two forces work together, the result is a pattern of movement that combines the movements of both forces. The harmonograph records such movement in pleasing and unusual designs.

Materials: Wood for stand, piece of plywood, two wooden rods about 5' long, two metal collars, two cans, two clamps for the rods, four spikes, cement for the cans.

Figure 91

LIGHTNING CONDUCTORS

A lightning discharge is an electric spark between two oppositely charged clouds, or between a charged cloud and the earth. The discharge may pass through a building with disastrous results. To prevent this, a conductor such as a copper strip is well grounded at one end near a wall and erected as high above the building as possible. At the top, a number of sharp metal points are fixed to the conductor. When a charged thunder cloud comes over the house, there is a good chance that point action will neutralize the charge on the cloud. If a flash should occur, the straight conductor offers an easy and safe path for the electricity to the ground.

In a number of electrical machines, as described later, charges are collected by the action of points. On the other hand, charges can be lost by point action. Place the electrostatic as in Figure 10, and remove the balloon. Charge a grounded conductor within 1/8 inch of the points. Unless you are well insulated your hand will do as the conductor. The action is now reversed, and the electrostatic loses its charge, which is grounded.

Plate 11. An ethylene diamine tartrate crystal with unidentifiable crystals growing on its surfaces. Later they were identified as crystals of the monohydrate.

One of the touchstones to the true solid— a crystalline solid, in contrast to a merely "rigid" glass— is its sharp melting temperature. When you heat the crystal slowly, it remains rigid until it reaches its melting point. Then, if you keep it at that temperature, it will melt completely to a liquid. The temperature need not increase as the crystal melts; the melting point is a critical temperature for it, and there its orderliness suddenly collapses into disorder.

Permanent Bubbles

I'd like to recommend for review a publication of the Franklin Institute titled "True Plastic Bubbles and How to Blow Them". It's done by the same people who caused such a stir about a year ago with their giant long-lasting soap bubbles. The resulting excitement inspired them to greater heights. This report tells how to blow bubbles up to 4 feet in diameter! The bubbles are tough, waterproof, and being made of plastic film, have an indefinite life span. The report gives brochures and sources for materials. Ask for "Plastic Bubbles Report" (No. 1) available from the Franklin Institute, 21st and the Parkway, Philadelphia, Pa. — \$1.00

John Prentis
Utica, NY

Home Physics

Einstein once said that physicists first knew sin in World War II. Chemists had known sin in the First World War. By this he meant that the explosives and poison gases used in W. W. I were the work of chemists. The sin of the physicists was the atom bomb. There was a time before the physicists sinned. That was also a time before large grants and appropriations existed. Then physicists were poor. They built their research equipment from whatever was cheaply available. There is a how to do it book from that period. The title is *Procedures in Experimental Physics*. The author is John Strong of Cal. Tech. The illustrations are by Roger Hayward who does those fine drawings in the *Amateur Scientist* in "Scientific American". Published by Prentice-Hall the book costs about \$8.00. The same book is published in England under the title *Modern Physical Laboratory Practice*.

The first chapter in the book concerns working with glass. All the basics are covered. Several chapters have to do with making and testing mirrors, lenses, and telescopes. Others deal with heat and its measurement. Filters for light and special light sources are covered in still other chapters. If you want to go more deeply into photography than most amateur photographers do, there is a chapter for you. There are chapters on melting iron, silver, or gold and making castings with them. All these things are done with simple hand tools for the most part. In short the procedures for doing most of the things necessary to make something useful are explained in this book. In addition this book is one step above most do it your self type books, because all the procedures have references to the technical journals. With these you can go still more deeply into those items that interest you. This is an essential reference book for everyone who uses tools to make things.

Sincerely,
Daniel P. Norman

Figure 66

Electric Writing

Dissolve 1/8 teaspoon of sodium chloride in 2 milliliters of water. Divide the solution into two parts.

1. To one part add 3 drops of phenolphthalein solution. Using a bulb pipette, drop this mixture onto a 2 inch square of white blotting paper (or filter paper) until it is just wetted. Put the wet paper on a small piece of glass, and attach the alligator clip on one of your electrolysis leads to both paper and glass (Figure 66). Connect the plus end of this lead to the + pole of the battery. Fix a piece of pencil lead into the alligator clip of the other lead and connect this to the 6-volt pole of the battery. Hold the pencil lead in your fingers and write lightly on the wet paper. The writing will appear red because of the formation of alkali at the cathode. Do not go on with this experiment too long; chlorine gas is evolved at the anode which, besides being poisonous and unpleasant, will corrode the alligator clip attached to the edge of the glass plate.

Figure 46

THE PREPARATION OF AMMONIA

Place 1/2 inch of ammonium chloride and 1/2 inch of slaked lime in a small test tube. Mix thoroughly. Gently warm in a Bunsen flame. Cautiously smell the gas evolved by waving the gas toward you. Hold a damp red litmus paper near the mouth of the tube and note any changes. The gas is ammonia. Is the gas acidic or alkaline?

To make a larger quantity of the gas, set up as shown in the diagram (Figure 46). If a piece of cardboard is fitted over the delivery tube, it will help prevent too much of this gas escaping.

Put 1 inch of strong ammonia solution or household ammonia in the flask and heat gently. As the gas is lighter than air, it can be collected by upward delivery. Collect a jar and several tubes of the gas by holding the containers over the delivery tube.

1. Observe the color and smell of the gas. The odor is hard to forget.
2. Invert one of the tubes under water and note what happens inside the tube. What does this indicate?
3. Invert the jar of ammonia and put a lighted splint into the jar (Figure 47). What is the color of the flame just above the splint before it goes out?

Scientific American Offprints

Consistently the best science writing and illustrating appears in *Scientific American*. For 25¢ you can get a full color copy of any article. The catalog of offprints is well organized and gives a good capsule description of each article (some 700 to choose from).

Libraries

One of the things that struck me when I first encountered the catalog was that many of the books you have suggested or others have suggested are in the collection of even the tiny branch that I work at. The point being that Americans don't use or appreciate the libraries that their taxes support. A good strong plug for people to use the library first to find material (saves buying a book sight unseen and being dissatisfied) and reference to further material and places to look for it would be an aid to those needing information. Granted one in the wilds of the backwoods has little opportunity to stroll down the block to his local library however most people still have contact once and a while with some sort of town. Now many states have a complete regional library system that allows one to borrow books from anywhere in the state. This process is only as slow as the mail and the librarian's willingness to help. I know the average person's image of librarians is of a crotchety old maid etc. and this I would have to agree with. But things are moving pretty fast back there in the stacks (how many of us were conceived there), there are hundreds of younger hip librarians and library students invading these tombs of learning. One thing they've found is the older librarians are bitchy because they are frustrated radicals from another era. The resistance to suggestion and criticism from the youth in library circles has not only been low, but the most flaming radical has been welcomed as an ally by older librarians. The concept of librarianship as custodians of books is out the window. The job is now getting information and IDEAS to the people. The smaller the branch the more the librarian is eager to help. One, he's all alone and has few colleagues to help insulate him from the outside; two younger people don't enjoy the hack work that has in the past been the librarian's excuse for lack of time to service the public. It's a good feeling when you help a person take a step closer to knowing himself and his world and librarians aren't insensitive to this. We have all the modern technology at our finger tips though sometimes we have to be prodded to use it. Like, why buy BOOKS IN PRINT when your library has it (it isn't complete either; ask anyone in the publishing industry). Virtually all libraries are your entrance to the Library of Congress.

A Concise Guide to Library Research

In my hairiest dope-fiend days, whenever I drove past a library I'd experience waves of gratitude to those inside who were doing what I knew I could not: opening the library on time, keeping track of the books, patiently explaining again how to use the card catalog, daily dispensing invaluable free information, all without fanfare. This here is a book of what's in a library and how to get at it.

B238 General works and histories of science

- A Guide to the History of Science*, by G. Sarton, 1952, Chronica Botanica Co. Includes a classified bibliography of the subject.
- A History of Technology*, 5 vols., 1954–1958, Oxford. Scholarly and readable account of the development of technology from earliest times, chronologically arranged.
- Introduction to the History of Science*, by G. Sarton, 3 vols., 1927–1948, Williams & Wilkins. From Homer to the fourteenth century, including good biographies and bibliographies.
- McGraw-Hill Encyclopedia of Science and Technology*, 15 vols., 2nd ed., 1965, and yearbooks, 1961–, McGraw-Hill. Very comprehensive. One should use the index volume.
- Smithsonian Institution, 1847–* (annual). U. S. Government Printing Office. Very useful and authoritative.
- Van Nostrand's Scientific Encyclopedia*, 3rd ed., 1958, Van Nostrand.

An Introduction to Scientific Research

A practical guide for the scientific experimenter, covering experimental planning, design of apparatus, and analysis and reporting of results. Basic general information applicable to many fields. Extensive lists of references for further information. The book is clearly written and surprisingly enjoyable reading.

A completely free rigid body has six degrees of freedom: displacement in three perpendicular directions and rotation about three perpendicular

Fig. 5.13. Kinematic mounting for removable part which must be precisely located. Three ball feet make two contacts each with V-grooves

axes. The stool on the flat floor had only three degrees of freedom because its motion was restricted by three properly placed constraints, the three contacts of its ball feet with the floor. The stool (or platform) of Fig. 5.13 has no degrees of freedom because its supports make six suitable contacts, two for each ball foot. In general, a contact (or constraint) is needed for each degree of freedom which is to be eliminated. More may be used, as with the four-legged table, but then sag (internal strain) or rocking will occur unless the workmanship is very precise.

CREDIT

After Mrs. Godsey had sorted the mail and handed it out and chatted with the people a while, she told D.R. to come with her to the kitchen and she would show him Barry's article in the paper. D.R. followed and when she'd found the paper for him she asked if he wouldn't like to sit down at the table and have a cup of coffee or something while he read. D.R. said he'd like that fine, and before long he had finished reading the article and Mrs. Godsey had joined him at the table with an R.C. Cola of her own.

"That's a nice thing Barry wrote," said D.R.
"He's awful good at it," said Mrs. Godsey. "Barry's wrote books and everything."

"Has he really?"
"I don't think any of them's been printed. But he's writing one now that he says is sure to be printed, because he's made arrangements with the newspaper in town to have it done."

"That's very far out," said D.R.
"It's what, honey?"
"That's unusual. I'm impressed."
"Lord, honey, that Barry's a genius," said Mrs. Godsey. "He used to be a house painter till he fell and paralyzed himself. That's when he took up writing. He's a pure genius at it, everybody thinks so."

Mrs. Godsey took a drink of her R.C.
"Leonard told me you quizzed him about getting credit here at the store," she said.

"Yes mam, I wanted to ask you about it."
"Nothing to ask," said Mrs. Godsey. "Emmit had credit with me for years. He never missed paying a one of his bills, and I know you wouldn't either. You're welcome to anything in my store that you want."

"Now I appreciate that, Mrs. Godsey," said D.R. "And I appreciate you letting me park my bus out back, too."

"Why, that aint nothing," said Mrs. Godsey. "I like to look at it setting out there."

"You and Leonard have been a big help to me," said D.R. "I feel like I'm in debt to you both."

"We're glad to help you, honey," said Mrs. Godsey. "We're glad you're going to be with us a while. Leonard is, especially."

"How is Leonard?" said D.R. "I haven't seen him in a day or two."

"Well," said Mrs. Godsey. "I think that old grand jury business has thrown him behind in his work pretty bad. He's been to town ever day this week, and has to do it again next week too."

"I hope he comes up to see me when he gets a chance," said D.R. "There's some things I need to ask his advice on."

"You need to worry about Leonard coming up," said Mrs. Godsey. "Use to, they wasn't anything he liked better than to take off up that creek and hang around with Emmit half the day. He'll be up, you need to worry."

D.R. got up to go then. Mrs. Godsey followed him into the store to help him pick out a few groceries and write them into her account book. D.R. bought canned things mostly, corned beef hash, peas, beets, turnip greens, a bag of cookies and a loaf of bread and some milk. Mrs. Godsey put it in a bag for him, and when they had bid each other good day D.R. set out walking back up Trace Fork again.

Fig. 12.3 A graphical method of determining the area under a curve. The horizontal lines are drawn so that the areas omitted and those wrongly included in each rectangle balance, as judged by eye.

The Practical Cogitator

Every profession— science, politics, art, dope, revolution— has a fog of conventional wisdom that will narrow your life and your actions. This book can be a quick avenue out. It's not a collection of quotable quotes, but an anthology of whole ideas. If Marx or Whitehead takes six or seven pages to make his point, the editors don't mind. Neither do I.

We cannot think first and act afterwards. From the moment of birth we are immersed in action, and can only fitfully guide it by taking thought.

A. N. Whitehead

Montaigne 1533-1592

If you have known how to compose your life, you have accomplished a great deal more than the man who knows how to compose a book. Have you been able to take your stride? You have done more than the man who has taken cities and empires.

The great and glorious masterpiece of man is to live to the point. All other things— to reign, to hoard, to build— are, at most, but inconsiderate props and appendages.

The truly wise man must be as intelligent and expert in the use of natural pleasures as in all the other functions of life. So the sages live, gently yielding to the laws of our human lot, to Venus and to Bacchus. Relaxation and versatility, it seems to me, go best with a strong and noble mind, and do it singular honor. There is nothing more notable in Socrates than that he found time, when he was an old man, to learn music and dancing, and thought it time well spent.

John Milton 1608-1674

And as for you, citizens, it is of no small concern, what manner of men ye are, whether to acquire, or to keep possession of your liberty. Unless your liberty be of that kind which can neither be gotten nor taken away by arms (and that alone is such which, springing from piety, justice, temperance, in fine from real virtue, shall take deep and intimate root in your minds), you may be assured that there will not be wanting one who, even without arms, will speedily deprive you of what it is your boast to have gained by force of arms. For know (that you may not feel resentment, or be able to blame anybody but yourselves) that as to be free is precisely the same thing as to be pious, wise, just, and temperate, careful of one's own, abstinent from what is another's, and thence, in fine, magnanimous and brave— so to be the opposite of these is the same thing as to be a slave; and by the wonted judgment and as it were by the just retribution of God, it comes to pass that the nation, which has been incapable of governing and ordering itself, and has delivered itself up to the slavery of its own lusts, is itself delivered over against its will to other masters— and whether it will or no is compelled to serve.

Walter Lippman 1889—

It was in the mediaeval doctrine that to kings belong authority, but to private persons, property, that the way was discovered to limit the authority of the king and to promote the liberties of the subject. Private property was the original source of freedom. It is still its main bulwark. Recent experience confirms this truth. Where men have yielded without serious resistance to the tyranny of new dictators, it is because they have lacked property. They dare not resist because resistance meant destitution.

Thoreau 1817-1862

If the injustice is part of the necessary friction of the machine of government, let it go, let it go: perchance it will wear smooth— certainly the machine will wear out. If the injustice has a spring, or a pulley, or a crank, exclusively for itself, then perhaps you may consider whether the remedy will not be worse than the evil; but if it is of such a nature that it requires you to be the agent of injustice to another, then, I say, break the law. Let your life be a counter-friction to stop the machine. What I have to do is to see, at any rate, that I do not lend myself to the wrong which I condemn.

O. W. Holmes, Jr. 1841-1935

Continuity with the past is a necessity, not a duty.

Mathematics— A Human Endeavor

If I were going to teach mathematics, or learn it, I'd want this book. It's unusually enjoyable as well as big and thorough. Also see the goods on pp. 318-319.

12. Snub cube

Inventor's paradox. The more ambitious plan may have more chances of success.

This sounds paradoxical. Yet, when passing from one problem to another, we may often observe that the new, more ambitious problem is easier to handle than the original problem. More questions may be easier to answer than just one question. The more comprehensive theorem may be easier to prove, the more general problem may be easier to solve.

How to Solve It

This is the best book I know of for lining up a problem for a logical solution. The emphasis is on math, but it is simple logic and can easily be applied to all forms of problem identification and analysis. Better yet is that the methods shown really work even on personal decision-making binds. Essentially it's a head-straightener.

First.

You have to understand the problem.

Second.

Find the connection between the data and the unknown. You may be obliged to consider auxiliary problems if an immediate connection cannot be found. You should obtain eventually a plan of the solution.

HOW TO SOLVE IT

UNDERSTANDING THE PROBLEM

What is the unknown? What are the data? What is the condition? Is it possible to satisfy the condition? Is the condition sufficient to determine the unknown? Or is it insufficient? Or redundant? Or contradictory? Draw a figure. Introduce suitable notation. Separate the various parts of the condition. Can you write them down?

DEVising A PLAN

Have you seen it before? Or have you seen the same problem in a slightly different form? Do you know a related problem? Do you know a theorem that could be useful? Look at the unknown! And try to think of a familiar problem having the same or a similar unknown. Here is a problem related to yours and solved before. Could you use it? Could you use its result? Could you use its method? Should you introduce some auxiliary element in order to make its use possible? Could you restate the problem? Could you restate it still differently? Go back to definitions.

The Logic of Scientific Discovery

It has been powerful magick, the scientific method. Here is an authoritative much quoted investigation of its philosophical core. When Popper takes you around an abstruse corner, you can trust him to show you something interesting that you can keep and use.

Now in my view there is no such thing as induction. Thus inference to theories, from singular statements which are 'verified by experience' (whatever that may mean), is logically inadmissible. Theories are, therefore, never empirically verifiable. If we wish to avoid the positivist's mistake of eliminating, by our criterion of demarcation, the theoretical systems of natural science, then we must choose a criterion which allows us to admit to the domain of empirical science even statements which cannot be verified.

But I shall certainly admit a system as empirical or scientific only if it is capable of being tested by experience. These considerations suggest that not the verifiability but the falsifiability of a system is to be taken as a criterion of demarcation. In other words: I shall not require of a scientific system that it shall be capable of being singled out, once and for all, in a positive sense; but I shall require that its logical form shall be such that it can be singled out, by means of empirical tests, in a negative sense: it must be possible for an empirical scientific system to be refuted by experience.

I do not wish to suggest that the belief in perfection—the heuristic principle that guided Kepler to his discovery—was inspired, consciously or unconsciously, by methodological considerations regarding degrees of falsifiability. But I do believe that Kepler owed his success in part to the fact that the circle-hypothesis with which he started was relatively easy to falsify. Had Kepler started with a hypothesis which owing to its logical form was not so easily testable as the circle hypothesis, he might well have got no result at all, considering the difficulties of calculations whose very basis was in the air—adrift in the skies, as it were, and moving in a way unknown. The unequivocal negative result which Kepler reached by the falsification of his circle hypothesis was in fact his first real success. His method had been vindicated sufficiently for him to proceed further; especially since even this first attempt had already yielded certain approximations.

No doubt, Kepler's laws might have been found in another way. But I think it was no mere accident that this was the way which led to success. It corresponds to the method of elimination which is applicable only if the theory is sufficiently easy to falsify—sufficiently precise to be capable of clashing with observational experience.

The Structure of Scientific Revolutions

If you want to make a scientific revolution you might be interested in how it's done. Another well-used book.

Normal science does not aim at novelties of fact or theory and, when successful, finds none. New and unsuspected phenomena are, however, repeatedly uncovered by scientific research, and radical new theories have again and again been invented by scientists. History even suggests that the scientific enterprise has developed a uniquely powerful technique for producing surprises of this sort. If this characteristic of science is to be reconciled with what has already been said, then research under a paradigm must be a particularly effective way of inducing paradigm change. That is what fundamental novelties of fact and theory do. Produced inadvertently by a game played under one set of rules, their assimilation requires the elaboration of another set. After they have become parts of science, the enterprise, at least of those specialists in whose particular field the novelties lie, is never quite the same again.

Lavoisier, we said, saw oxygen where Priestley had seen dephlogisticated air and where others had seen nothing at all. In learning to see oxygen, however, Lavoisier also had to change his view of many other more familiar substances. He had, for example, to see a compound ore where Priestley and his contemporaries had seen an elementary earth, and there were other such changes besides. At the very least, as a result of discovering oxygen, Lavoisier saw nature differently. And in the absence of some recourse to that hypothetical fixed nature that he "saw differently," the principle of economy will urge us to say that after discovering oxygen Lavoisier worked in a different world.

Thinking Straighter

In an era when information is going to have to replace laws, it's increasingly important to be familiar with the anatomy of bullshit (manipulation by language). Everybody does it, and that's cool; it's just when you don't know it's happening that it gets hazardous. This book does vivid, organized analysis of ads, political statements, and other bubbles of our day. How to build your own shock-proof crap detector.

DRAWING THE LINE

Meaning: Sharp distinctions are drawn where no sharp distinction exists.

Example: "Either you tell the truth or you lie."

The motive is the reason behind the argument; the intent is the reason ahead of the argument.

QUOTATION OUT OF CONTEXT

Meaning: Quotation out of context is a fallacy when the effect of quoting a given statement without its context is to distort the original meaning in context.

Example: Someone quotes the Bible as saying that "money is the root of all evil" but leaves out the preceding words, "the love of."

REPETITION

Meaning: We buy or believe because we have heard or seen the idea or the product name so often.

Example: Radio commercial: "Get up with GET-UP. GET-UP's got get up. Got it? Get it! Get GET-UP!"

ATTACKING A STRAW MAN

Meaning: Your opponent either (1) restates your position falsely or (2) exaggerates the consequences that may follow from your position.

Example: (1) Smith: "I am opposed to capital punishment."
Jones: "I'm not."
Smith: "You ought to be; capital punishment is unchristian."
Jones: "I'm getting tired of people like you who oppose punishing criminals."
(2) Smith: "I am opposed to capital punishment."
Jones: "You fellows that are against capital punishment must want your daughters molested every time they leave the house."

Soviet Books

A thought. Soviet books; yes, written in Russian. One of the points the Soviets push with great and justifiable pride about their country is the easy accessibility of education—do-it-yourself or official—especially along certain lines, which includes beautiful detailed books about peasant architecture, graphic and detailed books about the medicinal and other helpful uses of wild plants, and so forth. Some of these are set up so you don't need to know Russian at all, and others a few minutes' work with a dictionary will give plenty of access to. They sell so cheap in the Soviet Union (part of making it accessible) that even with transport and markup, they are mostly tremendous bargains in the U.S. You can get them from only a few bookstores in the U.S., among them Schoenhof's, Harvard Sq., Cambridge, Mass., 02138; Kamkin Inc., 1410 Columbia Rd., NW, Washington D.C. 20009; Four Continents Book Corp, 156 Fifth Ave., NY NY 10010; (and there's one in San Francisco, I think whose address I can't find at the moment. Also, through any one of these stores you can subscribe to a weekly service called *Novye knigi SSSR* [*New Books of the USSR*] (52 issues for \$2.00!) which announces in advance the books that are going to be published during the coming months. Knowing Russian helps in making sense out of this, but isn't absolutely necessary—all you have to do is learn a few key words.

The bookstores themselves will send out price lists (though these are generally not broken down so much into categories, so knowing Russian is more important), and are mostly pretty good about answering questions like: "do you have anything on . . . ?"

Similar service for other Eastern European countries can be obtained from FAM Book Service, 69 Fifth Ave., Suite 8F, New York, NY 10003.

Brooktondale, NY

GETTING UP

About six o'clock Saturday morning D.R. heard somebody clamber up the front steps, stomp across the porch then pound on the door like the house was on fire. D.R. was already vaguely awake, but the weight of pure comfort held his body in the bed, and likely it would have lured him back to sleep again if the racket on the porch had not made him bolt up and reach for his pants and shirt.

"Who is it?" he called out.

"It's Leonard," came the reply. "I'm sorry to bother you this early."

D.R. said he'd be right there. Hopping with one shoe on and one off, and buttoning his shirt as he went, D.R. went out of the bedroom and faced Leonard standing in the kitchen by the door.

"How'd you like to work for me today, David?"

D.R. had never seen Leonard as restless and impatient as he was now. He followed D.R. into the bedroom, then paced out again and walked around and around in the kitchen.

"I'll be glad to try," said D.R. "What doing?"

"Building a hog pen. This goddamn jury business has thrown me plum behind. I thought if you wasn't busy we might try to build that thing today."

"Nah," said D.R. "Nothing up here that can't wait to be done."

"Good," said Leonard. "Come on down and Roxie'll fix you a good breakfast."

"I like it already," said D.R.

And when he got his shoes tied he stood up and followed Leonard out the door.

Piaget for Teachers

This is a super how-to-do-it book — Piaget's thinking made concrete and applicable to the teaching of children. The theory is rich, and clearly presented, and involves mainly a concept of intelligence far more integrated, exciting, and beautiful than what we're used to. About half the book is a presentation of scores of exercises, games, and ideas for stimulating the development of real intelligence in children. Furth appears to have a soft heart and doesn't get strident about how schools are fucking it up now; he just says how education could be done a lot better. I bet he's right.

A school that in the earliest grades focuses primarily on reading cannot also focus on thinking. It must choose to foster one or the other. Historically, it has chosen reading. Undoubtedly, it once could be tacitly assumed that a child's thinking had developed adequately before he entered school and continued to do so outside of school. These assumptions were perhaps not altogether ill-founded. Schooling in the past was the prerogative of a special class and only gradually broadened its base to include a school-minded and school-ambitious citizenship within a relatively stable social and physical environment that was generally conducive to spontaneous intellectual growth. But today these assumptions are largely irrelevant for a large segment of our population.

... ask a seven-year-old child to draw you a bottle half-filled with water. When he has done this, draw the bottle—without water—in a tilted position and ask him to add the water level. Or take a match, put it half over the edge of a table, and slightly tap the overhanging part. Let a nine-year-old child observe what happens. Give him a paper on which is drawn the table and the overhanging match with the head of the match marked in solid black. Tell him to draw the successive positions of the match as it flips over and finally falls on the floor. Look at the child's drawings of the water level or of the positions which a falling match is supposed to take. I do not see how any person can observe these kinds of behavior samples and still maintain that knowing is a passive copy of "objective" facts.

We know that educators in a long tradition have put primary stress on such factors as personal acceptance, and I would be the last to belittle them. However, I venture to suggest that sensitivity to the "hidden" environment is not enough for a successful school. "Love is not enough" for the hungry child; he needs wholesome food on the table. Educational theories have been on a perilous swing from an extreme that stressed discipline and learning to another that focused on emotional and social adjustment. I suggest that you cannot have one without the other. A viable theory of the development of knowing will also be a viable theory of emotional and social development. A school system whose goal is geared toward healthy intellectual growth cannot but be conducive to healthy emotional and social growth. For this reason alone, my professional advice on problems of educational adjustment or motivation would be first to check the objective program that is offered to the child. If this program is psychologically or socially unsuitable to a child's developing intelligence, we should be slow in looking for secondary, indirect causes.

These few observations merely sketch ideas on the vast topic of social thinking. All I want to show you is the close organic connection between intelligence and social reality. If the school is to be for real, intellectual food must be for real, too. . . .

How Children Learn

This rambling series of innocent everyday happenings to a bevy of pre schoolers is described, digested, and given educational depth by an extremely observant and articulate educator, Mr. Holt. The great strength of his book is its readability. His use of preschooler learning situations is ingenious, since it is a common reference point to all teachers and parents. Anyone who doesn't see toddlers in a different light after reading this book probably ought to write a book himself.

Teaching As a Subversive Activity

You may have noticed that schools are society's goat just now, and the blame machine revs on and on. The authors of this handy de-crisis book take a nice clean no-blame revolutionary approach to things: what works this minute and doesn't work this minute. In their experience (high-school), instruction in authoritative subject matter doesn't work very well. What does work is an experience-based inquiry approach to learning to learn and learning to selectively un-learn: i.e. basic survival strategy in an environment of change. What's nice is they aren't just threatening: they have gathered and published a strong collection of technique. —SB

The new education, in sum, is new because it consists of having students use the concepts most appropriate to the world in which we all must live. All of these concepts constitute the dynamics of the questing-questioning, meaning-making process that can be called "learning how to learn". This comprises a posture of stability from which to deal fruitfully with change. The purpose is to help all students develop built-in, shockproof crap detectors as basic equipment in their survival kits.

The teacher rarely tells students what he thinks they ought to know.

His basic mode of discourse with students is questioning.

Generally, he does not accept a single statement as an answer to a question.

He encourages student-student interaction as opposed to student-teacher interaction. And generally he avoids acting as a mediator or judge of the quality of ideas expressed.

He rarely summarizes the positions taken by students on the learnings that occur.

His lessons develop from the response of students and not from a previously determined "logical" structure.

Generally, each of his lessons poses a problem for students.

He measures his success in terms of behavioral changes in students.

PART I The basic elements

What we confront, at this juncture, is a most difficult problem in education: helping students to unlearn much of what they "know." Josh Billings said it almost a century ago: "The trouble ain't that people are ignorant; it's that they 'know' so much that they ain't so." What are some of the things these students know that 'ain't so'? Well, for example, they "know" that 1) the more "content" a person "knows," the better teacher he is; 2) that "content" is best "imparted" via a "course of study"; 3) that "content" is best kept "pure" by departmentalizing instruction; 4) that "content" or "subject matter" has a "logical structure" or "logical sequence" that dictates how the "content" should be "imparted"; 5) that bigger schools are better than smaller schools; 6) that smaller classes are better than bigger classes; 7) that "homogeneous grouping" (with students "grouped" on the basis of some real or fancied similarity) makes the learning of subjects more efficient; 8) that classes must be held for "periods" of about an hour in length, five days a week, for about 15 weeks in order for a "course" in a "subject" to happen.

It comes as a shock to the students that there is no evidence to support any of these contentions. On the contrary, there is massive evidence to confute them. It takes some doing, however, to help students to recognize the fact that most of their deeply internalized assumptions about "education" are based on misinformation rather than information.

The instructor brought to class a black attaché case. He told the students that inside the case there was a small computer which was capable of producing the answer to any question anyone asked. "What questions," he asked, "do you want it to answer?"

Teacher

Teacher is as unphony, warm, and appealing as the grubby, tear streaked face of a child; it is also an important technical notebook for educators. Miss Ashton-Warner's organic approach to reading and writing is a detailed enough account to be explored further by teachers anywhere. It is of especial value to teachers working with primary children. Students with a cultural or language barrier, and adult illiterates.

Noise, noise, noise, yes. But if you don't like noise, don't be a teacher.

But there are two kinds of order, and which is the one we wish for? Is it the conscious order that ends up as respectability? Or is it the unconscious order that looks like chaos on the top? There is a separate world on each side of this question mark.

Organic reading is not new. The Egyptian hieroglyphics were one-word sentences. Helen Keller's first word, 'water,' was a one-word book. Tolstoy found his way to it in his peasant school, while, out in the field of UNESCO today, it is used automatically as the only reasonable way of introducing reading to primitive people: in a famine area the teachers wouldn't think of beginning with any words other than 'crop,' 'soil,' 'hunger,' 'manure,' and the like.

Backward readers have a private Key Vocabulary which once found launches them into reading.

The power content of a word can be determined better from a backward reader than from an average reader.

Explanations. We teachers—perhaps all human beings—are in the grip of an astonishing delusion. We think that we can take a picture, a structure, a working model of something, constructed in our minds out of long experience and familiarity, and by turning that model into a string of words, transplant it whole into the mind of someone else. Perhaps once in a thousand times, when the explanation is extraordinarily good, and the listener extraordinarily experienced and skillful at turning word strings into non-verbal reality, and when explainer and listener share in common many of the experiences being talked about, the process may work, and some real meaning may be communicated. Most of the time, explaining does not increase understanding, and may even lessen it.

It is a remarkable business. We are so used to talking that we forget that it takes a very subtle and complicated coordination of lips, tongue, teeth, palate, jaws, cheeks, voice, and breath. Simply as a muscular skill it is by far the most complicated and difficult that most of us ever learn, at least as difficult as the skill required to master a serious musical instrument. We realize how difficult speech is only when we first try to make the sounds of a language very different from our own. Suddenly we find that our mouths and tongues won't do what we want. Yet every child learns to make the sounds of his own language. If he lives where more than one language is spoken, he makes the sounds of them all. How does he do it? His coordination is poor to start with; how does he manage to do what many adults find so difficult?

The answer seems to be by patient and persistent experiment; by trying many thousands of times to make sounds, syllables, and words; by comparing his own sounds to the sounds made by people around him; and by gradually bringing his own sounds closer to the others, above all, by being willing to do things wrong even while trying his best to do them right.

How to Live with your Special Child

No sweet romance here. Written mainly for teachers & mainly about children suffering from various forms of weirdness, it speaks to us all. Peculiar & powerful. Refreshingly skipping the theory in this book, he tells you what to do to make kids act better. Simple. Far out. Offensive! I ain't sure why, but I do think everyone should read it; in fact I downright ache for revolution in our schools, he makes it seem so possible, and because

I remember all those thousands of hours that I spent in grade school watching the clock, waiting for recess or lunch or to go home.

Waiting: for anything but school.

My teachers could easily have ridden with Jesse James for all the time they stole from me.

The Lives of Children

For some months, when speaking to teachers or to anyone else concerned with education, I have said that while there were many recently published books on education (my own among them) that I thought they should read, if they felt they had time for only one it should be The Lives of Children. It is by far the most perceptive, moving, and important book on education that I have ever read, or indeed ever expect to. For while I hope that in years to come we may learn much about human growth and development that we do not now know, I doubt that any one book will advance our understanding as much as this one.

It describes the lives of twenty-three children in the small private school in New York in which Dennison taught, and which has since been disbanded. They were black, white, and Puerto Rican in equal proportions. All were poor, half were on welfare, and about half "had come to us from the public schools with severe learning and behavior problems." . . . This school, spending no more money per pupil than the city's public schools, did not fail. The children got well, grew, learned.

[Suggested and reviewed by John Holt. This review is excerpted, at John Holt's request, from his review in Oct 9 N. Y. Review of Books.]

the
lives of
children
George Dennison

There is very good evidence that reducing the pressures on childhood and adolescent offenders reduces the incidence of their failures. For example, kids who drop out of school are arrested more often while they are in school. Dropouts do not commit more crimes than kids who remain in school. There are more juvenile crimes committed on school nights than on weekends. The evidence indicates that the successful middle class child who also commits crimes carries out much more destructive and serious offenses than dropouts and lower class offenders.

An ideal elementary classroom has at least two teachers, and often involves as many as ten at one time (by teachers of course I mean volunteers, aides and "real" teachers—all used to advance the transactions of learning and not just for janitorial, nursing and secretarial tasks). The number of students can be more than thirty or so. The room should be large and ideally has an easily accessible half-second-story for reading and solitary quiet study or withdrawal for sleep or sloth. ("Il dolce far niente"—sweet do nothing, is really useful in the class.) The main room is organized with formal foci—messy corners, neat book corners, production corners and display corners. A separated or semi-separated area for noisy, messy corners, neat book corners, production corners and display corners. A separated or semi-separated area for noisy, messy, destructive and constructive shop work, biology or what have you is also ideal.

We have been impressed by the almost total inability of troubling adolescents to express or accept positive emotions. We have been amazed to see how seldom such children touch themselves or others, at how limited is their ability at nonverbal kinetic communication, how poor their mimetic ability, and how congested their emotions. We are often sent children with histories indicating many rage experiences. We never see this behavior more than once or twice at our centers (probably because we simply restrain and ignore it in a very blunt and matter of fact way) and the few initiating times we do see it, it appears to us much more as display and histrionics than emotional expression. . . .

We believe that touching is so important that we actually run a "love-up" rota of staff in our elementary residential programs. Even the most wooden staff member is received with delight. Each child is tickled, rubbed, fondled, patted and kissed good-night with special words of affection and joy. I am always impressed at the willingness of otherwise tough and aloof teenage criminals to accept this "baby" treatment. Our experience is sufficiently convincing that we persist in touching those teenagers who strongly reject touching. The weaker staff is not encouraged to take on these kids but strong staff members will tease and ridicule the aloofness and pursue and persist in touching.

The important principle is to bring new experiences, or present old experiences from a new angle. Don't wall them in with words by talking about the experience, analyzing, or introducing. Encourage the children to talk, talk, talk, describe, describe, write, write, write after the experience. Don't grade the productions. What you are trying to teach is responsiveness, transaction with the environment, observation analysis, reportage. Accuracy, style and grammar will come. Very quickly too.

. . . [the children's] self interest will lead them into positive relations with the natural authority of adults, and this is much to be desired, for natural authority is a far cry from authority that is merely arbitrary. Its attributes are obvious: adults are larger, are experienced, possess more words, have entered into prior agreements among themselves . . .

When all this takes on a positive instead of a merely negative character, the children see the adults as protectors and as sources of certitude, approval, novelty, skills. In the fact that adults have entered into prior agreements, children intuit a seriousness and a web of relations in the life that surrounds them. . . . These two things, taken together—the natural authority of adults and the needs of children—are the great reservoir of the organic structuring that comes into being when arbitrary rules of order are dispensed with.

Here we come to one of the really damaging myths of education, namely, that learning is the result of teaching, that the progress of the child bears a direct relation to methods of instruction and the internal relationships of curriculum . . . To cite these as the effective causes of learning is wrong. The causes are in the child. When we consider the powers of mind of a healthy eight-year-old—the avidity of the senses, the finesse and memory of observation, the effortless concentration, the voracious energy—we realize immediately that these powers possess true magnitude in the general scale of things. . . . Why is it, then, that so many children fail? Let me put it bluntly; it is because our system of public education is a horrendous, life-destroying mess.

There is no such thing as learning (as Dewey tells us) except in the continuum of experience. But this continuum cannot survive in the classroom unless there is reality of encounter between the adults and the children. The teachers must be themselves, not play roles. They must teach the child, and not teach "subjects." . . . The continuum of experience and reality of encounter are destroyed in the public schools (and most private ones) by the very methods which form the institution itself. . . .

Difficult children can be induced to enjoy Basic English by giving them something pompously moralistic to translate; or first show them a translation of some pompous moralizing, then give them another to have a go at. Translating the ideas of politicians and educational philosophers is always great fun.

Conditioned Acceleration of Responses by Relief of Aversion (CARRA). We use CARRA with a simple electric stimulator. We tell the pupil that we are going to turn on a mild tingle and then increase it. We will turn it off when the pupil makes a new response to the category we are asking for. For example: "I want you to tell me something you might say to your mother when you wake up in the morning. Each time tell me something different."

When we get a response that is not a repetition we immediately turn the current off. It can be done without electric stimulation but no one seems to mind very much and it works a great deal more quickly. For many kids, switching on a red light seems to work just as well (inward kids who are quiet, with downcast eyes, and sullen kids mostly). For others, simply driving an answer with verbal encouragement and direction will work. The advantage of electric reinforcement is that it is simple, matter of fact, unavoidable, and does not require verbal skill on the part of the teacher or aide. Also we seem to build up a tolerance for electric stimulation which in general seems to correlate quite well with general stability in the nervous system. In addition, the conditioning model is more precise and we seem to get a spill-over of conditioning for anxiety relief and a sense of being in control of the anxiety-producing stimulus.

The routine goes only about five minutes and any category is stopped as soon as it becomes a bit sticky for the student to think of something new. We are not trying to punish the child or test him.

Charles Stack has been having Puerto Rican janitors (preferably with little or no English) bring teaching machines into cells with young criminals. The janitor gets it across that the machine is supposed to teach the kids. He also gets it across that since it is the machine's job to teach, if the kid makes a mistake the machine will give him a dime for having wasted his time.

Nearly everyone rubs their eyes at this point. *The machine gives the student a dime if the student makes a mistake* because the machine has not done its job and taught him. These young criminals do not work to make mistakes or to make dimes. No one has to con these kids into the advantages of knowing. They do quite well for themselves if the social consequences and structures of the teaching process are changed. Many of these hoods work for hours at a time on the machines and graduate from jail to college.

Making the Human Garden Work

BIOLOGICAL inventory and regulation. It is stupid if not immoral to fail a hypoglycemic patient by not regulating his glucose supply. His brain had better be able to function before we offer him the choice of setting his own bedtime, regulating his own diet or learning how to read. A remedial diet often tells the whole story.

BOUNDARIES that are firm, clear, consistent and real. The child knows what and whom he can depend upon. It really doesn't seem to matter very much if the boundaries are actually fair, although it is nicer if they are. Sometimes, as the farmer said, a muleheaded client requires an attention-getting device like a two-by-four applied suddenly between the eyes. Tough, honest language often does it. After gaining his attention we give him a list of things to do, and we say, "Choose one." (At last analysis about ten per cent of our students were mules.)

TIME to relax, regularize, recuperate. The patient is almost certainly under chronic high arousal, has difficulty sleeping, is quick to startle, overreacts and has a badly regulated metabolism.

A good deal of doing nothing is often the first prescription.

GOOD SLEEP.

COMPETENT people who are warm, touching, friendly.

Everything else is aesthetics.

Jose's reading problem is Jose. Or to put it another way, there is no such thing as a reading problem. Jose hates books, schools, and teachers, and among a hundred other insufficiencies—all of a piece—he cannot read. Is this a reading problem?

A reading problem, in short, is not a fact of life, but a fact of school administration. It does not describe Jose, but describes the action performed by the school, i.e., the action of ignoring every thing about Jose except his response to printed letters.

My own demands were an important part of Jose's experience. They were not simply the demands of a teacher, nor of an adult, but belonged to my own way of caring about Jose. And he sensed this. There was something he prized in the fact that I made demands on him. This became all the more evident once he realized that I wasn't simply processing him, that is, grading, measuring, etc. And when he learned that he could refuse—could refuse altogether, could terminate the lesson, could change its direction, could insist on something else . . . we became collaborators in the business of life. . . . It boils down to this . . . we adults are entitled to demand much of our children . . . The children are entitled to demand that they be treated as individuals, since that is what they are.

WATERING

Outside D.R. snapped his fingers and said, "Shit, Leonard. I've got to water the rabbits first."

Leonard looked pained. "Didn't you water 'em last night?" D.R. shook his head. "They all still had some water in their crocks. I fed 'em. I thought I'd water 'em this morning."

Leonard was plainly pissed off, but all he said was, "Always water your stock at night, son. Don't put that kind of thing off."

Working together, D.R. carrying the bucket and Leonard dipping, they filled the crocks in all eleven hutches in ten minutes and then went on down the hill to Leonard's house for breakfast.

How To Survive in Your Native Land

I like, enjoy, learn from this book of school adventures. I can see that teaching will drive a person either crazier or saner. This book may help on the sane end.

HOW TO SURVIVE IN YOUR NATIVE LAND

James Herndon
author of
The Way It Spelled It

... Couldn't have it! We soothed him, agreeing to tell Piston in no uncertain terms and so on. We walked outside with Lou, who had calmed down and had begun admiring the kite in retrospect, realizing that there was no way such a creation could fly (*aerodynamically speaking*, he said), and yet it did fly and this Piston or whatever his name was must be a pretty exceptional kid, and we were agreeing and realizing what a great guy Lou was for a principal even if, we reminded him, he had goofed up our schedule for this marvelous class we'd planned which had resulted in that extraordinary kite and other grand exploits, along with, we admitted, a certain amount of difficulty for him, Lou, and how well he'd handled it and supported us and . . . when Lou suddenly screamed Aaarrrghhh! and fell back. I thought he'd been stung by a bee—we'd had a lot of bees that year, which also interrupted Egypt quite a bit, flying in the classroom where kids could scream with fake or real fear or try to kill them by throwing objects, often Egypt books, at them, exempt from retribution by the claim that they were just trying to save some *allergic kid from death*—but then he screamed There it is again! and pointed up, and there was The Monster From Outer Space, seventy-five feet up, plunging and wheeling and lurching through the thin air, a ton of boards and heavy paper and ghouls and toothy vampires leering down at an amazed lunchtime populace of little seventh grade girls, all with mothers and phones. Jesus Christ, look out! yelled Lou, and rushed for the playground, just as the giant came hurtling down like a dead flying mountain. It crashed; seventh grade girls scattered. (Their mothers reached for the phones.) Kids rushed from every direction and hurled themselves at the kite. They stomped it and tore it and killed it in wild-

On Federal Help

July 20, 1970

Hon. John Brademas, Chairman
Committee on Education and Labor
Select Subcommittee on Education
U.S. House of Representatives
Washington, D.C. 20515

Sir:

Thank you for the opportunity to testify before your committee.

I am delighted by the spirit behind your Environmental Quality Education Act (H.R. 14753) and depressed by every measure in it.

I'm a former ecology student, and I can report that ecology as a science is pretty boring. Definitely not for everyone.

Ecology as a movement, as a religion, is tremendously exciting, and everyone can get a piece of the fervor.

However, this voluntary mass education could be poisoned by Federal "help", as highly-intentional over-specialized application of fertilizers and pesticides has damaged other natural growth processes.

In my experience, the whole apparatus of application, approval, and funding commonly introduces a dishonesty into an operation that can never be eradicated. And if the operation is educational, dishonesty is the death of it.

I see that the bill provides for preparing information specifically for mass media use. Involvement of Government with mass communications in this manner strikes me as dangerous as re-joining Church and State.

If Federal funds are to be spent on environmental matters, let them go to:

1) The space program which has given us the anti-environmental perspective to see our planet whole and alive and in hazard.

est glee. They lynched it and murdered it and executed it and mercy-killed it and put it out of its misery, and when it was over and Lou had everyone pulled off the scattered corpse of the kite and sitting down on benches and shut up there was nothing left of it but bits and pieces of painted butcher paper and 1 x 2 boards and clothesline rope.

The school's purpose is not teaching. The school's purpose is to separate sheep from goats. . . .

2) The World Game of Buckminster Fuller's. This computer operation is planned to perform for the Earth as NASA's computers did for Apollo 13. (Inventory resources, assess damage, compare alternative "futures", select the most promising, constantly.)

3) Contingency planning for environmental disasters comparable to long-range planning in the military.

4) A "wet" NASA to investigate the sea and treat it like Antarctica, as a fragile, trans-national environment. (Use of the oceans must be governed from a strictly environmental standpoint by an international body with a great deal more power to act than the U.N. has.)

5) Rehabilitation for ecological disaster areas such as Lake Erie and Appalachian strip mine country.

6) Ecology Action-type groups, but only for services rendered. Do not fund them, do not tax them, do not pass laws about them. When they perform a service to Government, such as investigation of environmental crimes, pay them for the information.

7) Follow-up reports by independent groups of Federal actions affecting the environment. Do this as a built-in part of initial funding. Appropriations for a dam or a war would include money to go to the National Science Foundation or the Audubon Society or whoever to study the environmental effects of the project and report on them.

I realize that practically none of the above are the province of an Education Subcommittee.

John Holt has suggested that if we tried to teach infants to talk, they would never learn. I suspect it is the same with ecology. It must be learned. It is being learned. If you try to teach it to people, you will only teach them to hate it.

Let it be.

Stewart Brand
Whole Earth Catalog
Menlo Park, California

. . . All of the talk about motivation or inspiring kids to learn or innovative courses which are relevant is horseshit. It is horseshit because there is no way to know if students really are interested or not. No matter how bad the school is, it is better than jail. . . .

A while back at Spanish Main School, it came to pass that *Immature* was out of style, and *Non-Achiever* was in. That is what drives everyone mad at a school, even if no one is aware that they are being driven mad. Humans like history, like to know why things start and end, like to have reasons for it, and the school never has any reasons. It doesn't have any because, in fact, it doesn't have any. . . .

Push Back the Desks

Every effective teacher has had projects and ideas which really turned kids on, but most of them don't take the time to write about just what it is that makes their classes remembered by former students as 'one of the best years ever.' Albert Cullum did, and his enthusiasm and involvement with his class of elementary kids over a twenty-year span spill over to the reader in a veritable flood of ideas, theories, and teacher war stories. He is explicit enough about his projects to make them instantly available to any admirer, but the major strength of the book is its ability to awaken a hundred or so related ideas in the teachers who read it. It is teachers like Mr. Cullum who epitomize the best aspects and possibilities of the self-contained classroom for elementary school children.

I have found that children are interested in two things—doing and doing now. Children are looking for the unexpected, not the safe; children are looking for noise and laughter, not quiet; children are looking for the heroic, not the common.

Shakespeare may be for scholars to debate and discuss and philosophize over, but he is also for Corky, a fifth-grader who died beautifully as Julius Caesar. There are 'murderers' galore in the elementary schools ready to help Macbeth kill Banquo; many a fifth- and sixth-grade girl can really whip up a moment of insanity as Ophelia.

Hooked on Books

If you've wrestled with ways to teach a non-reader as a teacher, if you've wondered what you could do as a businessman to help an obviously weak reading program in your schools, or if you're the worried parent of a Book Avoider, then you'll tear through *Hooked on Books* with a firelike fervor fed on rekindled hopes.

Fader's program involves the saturation of students' surroundings with newspapers, magazines and paperback books chosen because they are written on subjects relevant to the world outside a classroom. Diffusion of such materials among teachers of all subjects and the use of writing, writing and more writing as the primary ways in which to teach English is another important tenet of this program.

It is a detailed report on an exciting and practical way to teach reading, and it's laced with such well written anecdotes about the inmates of Maxey Boys Training School where this program was first tried that *Big Bill*, *Superduck*, *Hogman*, and *Lester the Poet* seem as real and as teachable as they were to the authors.

Those of us who participated in selecting the original 1,200 titles for the Maxey paperback library will never again have to be reminded how little we know about the students we teach. None of us will forget the untouched 700 titles that decorated our gleaming drugstore spinners while the boys read and reread the 500 they liked. . . . The 500 winners of our book Derby are included in the Reading List (pp. 148-173).

The boy turns, pulls out of his shirt Dick Gregory's *From the Back of the Bus*, waves it at the teacher, and shouts, "I bought it, man, I bought it!" Bought four more while I was home. Didn't steal none!" Bought or stolen, those five books were the first that boy had ever owned.

How To Change The Schools

. . . the moral which has been indelibly stamped on my brain is that community groups must not fight each other, because when they do, only the school system wins. When the black parents demanded integration, the system labeled them irresponsible militants. When the white parents demanded educational improvements before they would accept integration, the system labeled them irresponsible bigots.

Meanwhile, in Washington Heights, busloads of black children were being transported into our neighborhood schools, only to be completely abandoned once they arrived. The schools which "received" them were given no special services; the teachers were given no special training. The black children were left to learn as best they could, and having suffered years of educational neglect, they often failed. The white children watched the black kids fail, and had all their preconceived prejudices reinforced.

It seemed almost as if the bureaucrats downtown had arranged this thoughtless program so that the white parents could fight the black parents and the black parents could fight back. And the more the parents argued and fought, the more the professionals at the Board of Education could say, of all parents, "You see, those people cannot be given any authority; look how irresponsible they are."

You and other parents might organize a campaign to have all children who have been labeled "slow" or retarded retested by non-Board of Education specialists. Get a volunteer team of doctors to check their eyes. Hundreds of "slow" children have turned into geniuses overnight when they got eyeglasses. Insist that all Spanish-speaking children be retested in Spanish.

Principals will try to "buy off" the most articulate parents in your group by assigning their children to the top classes and best teachers, or offering to transfer them to a "better school." Don't attack parents who take advantage of this offer. Remember their children, too, have only one chance for an education. Find ways to include these parents in your committee so you can still work together.

The school system destroys many many children. But, just as important, it destroys most teachers. It does not care about teachers any more than it cares about children. It does not help teachers achieve any more than it helps children achieve. The system engulfs the hopeful, energetic, often idealistic young teachers. It rapidly dehumanizes them, squeezing and twisting warmth and compassion out of them, turning them into non-thinking machines which obey and enforce automatically the rules and regulations of the bureaucracy. . . .

Media & Methods

A slick good education magazine. I can see that running a soft magazine in the hard-sell education media market is difficult, but Frank McLaughlin is doing all right.

Zero for Conduct, (Brandon) \$32.50. (Dir: Jean Vigo) An innovative, poetic and surrealistic evocation of youth and its rebellion against the system.

Village of the Damned, (Films, Inc.) \$22.00. (Dir: Wolf Rilla) An eerie tale about a group of super-intelligent and hyper-bizarre blond children who freak a peaceful English village. A simple horror story or a significant allegory, depending on your mood.

Jean Shepherd's America (Sunday night at 8 pm, beginning April 11, on PBS) is a series of "sensual essays" on the feel cities in America have. It is not in any standard sense a documentation of the U.S.A., but is rather a personal odyssey of one man as he visits Milwaukee, Colorado Springs, Honolulu, Cheyenne, Nome, Hammond (Indiana) and other places. The shows will be sprinkled with the wit and humor that has won Shepherd four *Playboy* Humor Writing Awards. He is also author of *In God We Trust, All Others Pay Cash* and the man humorist Marshall McLuhan has called "one of our only truly electronic novelists." A much sought-after performer on the college lecture circuit, Shepherd embodies in a real way Kerouac's maxim: *Travel Equals Freedom*. He begins his free-wheeling journey April 11. Check local listings for exact date and time.

The Metaphorical Way of Learning & Knowing

It's very hard to understand, after reading this book, why everyone isn't doing it. Synectics Education Systems has workbooks for use in schools, and if the examples in this book are indicative, they are pretty far into the business of blowing (creating) minds. This one book is enough to keep an adult excited for hours, and the implications for using these trips with children are wonderful. For trips they are — based on a very sound and well-developed theory of learning, they playfully seduce one into forgetting the old rules, and one finds oneself sitting there mind-blown, consciousness-expanded, and high.

[Reviewed by Diana Shugart. Suggested by Linda Williams]

Also check out Gordon's original *Synectics*, on p. 236.

The Metaphorical Way of Learning and Knowing
W.J.J. Gordon, et al.
1966-1971; 263 pp.

\$12.50 postpaid

from:
Synectics Education Systems

Cambridge, Mass. 02138

Most learning situations involving substantive material call for Making the Strange Familiar, whereas most situations that require innovation, as in problem-solving, demand Making the Familiar Strange. When the objective is to digest new substantive material, a student's learning can be inhibited by metaphors that introduce too much conceptual distance between him and the subject matter. However, when the student's objective, in language arts for instance, is to produce innovative and imaginative material; then the more distance he can introduce, the better.

BE THE THING. Imagine that you are a great rock. You are afraid of nothing. You are so strong that the wind and rain can't even scratch you, although during thousands of years they have worn away lesser rocks. However, one day, toward winter, a harmless drop of water trickles its way deep into one of the cracks with which you were born. Having withstood the onslaught of floods, and hurricanes through the ages, what is your attitude toward this tiny drop of water? *Oh, you tickle! You can't hurt me though. I'm much stronger than you. You can stay there if you don't tickle me anymore. It might be nice to have company. Are you sure I won't hurt you?*

From what you just wrote, pick the ONE word that compresses all your feelings toward the drop of water. Write it here: *strength*. That night the temperature falls below 32°. The drop of water freezes. In freezing, it expands and hurts you. Nothing before in your life has been able to even mark you. How do you feel as the drop of water expands and cracks you in two?

Write a short story about the tiny drop of water defeating you, a great rock.

The feeling of contempt so many college professors feel toward high school teachers and high school teachers in turn feel toward elementary teachers is shot through with irony. What has been consistently borne out in my experience is that the best teaching takes place at the elementary level (especially nursery school through 3rd grade). The best environments for learning are reflected in these "elementary" situations, the most natural employment of media are demonstrated, and the most humane relationship between adult and child exist.

Improvisation for the Theatre

Somewhat like *The Natural Way To Draw* in its fundamental "process approach" to acting, games and plays. It is also similar to that amazing book in that the written instructions of the tasks are the primary method of instruction, and that the untrained person may read the instructions with reasonable confidence that they are accurate and have been tested.

Spolin's book is perhaps the one most in demand by young acting instructors today and because of its price is much stolen from libraries. It is just as much used by children's theatres and for professional training. The recent two-coast success of *Story Theatre* under the directorship of Paul Sills simply confirms the relevance of such training. (Spolin is Sills' mother and appears on the program as a consultant.)

The development of spontaneity and freedom in improvisation has applications far beyond the theatre or even the Esalen studies and psychodrama to which it has been applied. If you stop to think about it, improvisation is a necessary skill for us all... it is the way we all live our lives, isn't it? There is a technique used in speech training that is relevant here... they teach stutterers how to stutter voluntarily, to simulate their own type of stutter. By doing this they find that the stutterer develops a voluntary control over the process. Perhaps if we all learn to improvise consciously we may also attain greater control over our own lives?

A Schools Booklist

Brothers,

Enclosed is a book list for all interested in open, free, anarchic, holistic education—as well as behavior change technology that works. Those marked are anecdotal, practical, and excellent guides to both the problems of cranky schools and communes. *The Peckham Experiment*, Pearce & Crocker, was probably the answer to it all.

GREEN VALLEY SCHOOL RECOMMENDED READING LIST

Orange City, Florida

BREAKFAST

Roxie fed D.R. another big breakfast of ham and eggs while Leonard loaded his tools into his pickup truck. The barn they were going to build the hog pen onto was half a mile up the road from Leonard's house there behind the store. The barn sat on two acres of bottom land that an in-law of Roxie's had owned till he moved to Louisville two years before. The first year he was gone Leonard rented the barn and used it as a storehouse, and then later he bought it. He still used it as a storehouse, but this year Leonard decided to try keeping hogs up there. He had four, penned in a make-shift stall inside. But they were getting so big so fast they needed an outdoor place to be, and that was what he'd asked D.R. to help him build that day.

When he got the tools loaded and the truck turned and pointed out the drive-way, Leonard left the motor running and went to the back door and asked D.R. if he was ready.

Roxie said, "Let the boy finish eating, Leonard."
"I'm finished," said D.R. "One more biscuit and I'm ready to fly!" D.R. wiped the remaining egg yellow off his plate with a biscuit, stuffed it into his mouth, and washed it down with a drink of coffee as he got out of his chair. "Mighty good," he said to Roxie and she smiled at him as he went out the back door after Leonard, who was already half-way back to his pickup.

Catalog of Free Teaching Materials

The 7th edition of a constantly updated source book for teachers and other educators of free things for a class—maps written information, an occasional free sample from some company, filmstrips, charts. This edition good for 1970-73. The introduction says that "materials in this book have been evaluated by accredited teachers, and only those items which have direct bearing on the curriculum have been included." Items are listed alphabetically by subject, and annotated to provide for clear ordering instructions and information about the exact nature of the materials.

Dense, comprehensive, and clearly read.

Catalog for Learning Things

All manner of dandy low-cost tool kits, materials, animal cages, and funky classroom furniture. —SB

Catalog from:
The Workshop for Learning Things
5 Bridge Street
Watertown, Mass. 02172
\$50

Several years ago, the Workshop ran across triple-thick corrugated cardboard for the first time. We began to design and build with it, wondering how many conventional building materials—lumber, plywood, masonite—it might replace. Since then, we've used thousands of sheets of it, much of it in workshops working with people using it for the first time. It has given us all a part in shaping learning environments.

This laminated cardboard is three layers thick and comes in very large sheets. It is inexpensive, compared to plywood, yet it is strong. Used with a good eye for its strengths and shortcomings, it can be as durable in a classroom as more expensive materials. Furthermore, it can be worked with simple tools and requires few or no wood-working skills. The inventory of things made by teachers in recent workshops is endless... chairs, carts, tables, easels, play-houses, jungle gyms, boats, giant globes, cages, aquariums, desks, carrels, seesaws, sandboxes... This combination of cardboard, tools, techniques, and people we call Cardboard Carpentry

BASIC CARDBOARD CARPENTRY TOOL KIT

- | | |
|-----------------------------|----------------------------------|
| 5 10-point carpenter saws | 2 wooden wrenches |
| 2 keyhole saws | 8 dowels (3/4" by 36") |
| 3 double bladed hack saws | 1 die |
| 2 paring knives | 2 spring clamps |
| 2 wooden mallets | 40 threaded wooden nuts |
| 2 point hole punches (3/4") | 15 dowels (1/2" by 36") |
| 1 3/4" hole cutter | 10 threaded dowels (3/4" by 36") |
| 6 yardsticks | 2 rolls cloth tape (2") |
| | 1 bottle white glue |

"Misterogers" relaxed songs for children and their families; Parents Were Little Once Too, I Like To Be Told, I'm Taking Care Of You, Alphabet Song, Peace and Quiet. Words on jacket.

★ EC25 WON'T YOU BE MY NEIGHBOR?

12" L.P. Record 3.00
Childhood songs performed in easy style by "Misterogers"; Somethings I Don't Understand, I'd Like To Be Like Dad, I'd Like To Be Like Mom, When The Baby Comes, I Like You As You Are. Words on jacket.

Kaiser Aluminum News

Don Fabun is doing very well at his job of making Kaiser appear comprehensive and futuristic. The Kaiser Aluminum News that he edits comes out several times a year, each issue devoted to one large topic, such as communication, transportation, food crisis, etc. They are excellent compendiums of current thought, vividly illustrated and laid out. Best of all, they're free if you write Kaiser for single copies. —SB

Inquire for their list from:

Public Affairs Department
Kaiser Aluminum and Chemical Corporation
Kaiser Center 866
Oakland, California 94604

I have yet to see any problem, however complicated, which, when you looked at it the right way, did not become still more complicated.

POUL ANDERSON

A hundred years ago a chemical theory was uncovered that retains broad significance. It is known as the "Law of the Minimum."

Under ideal circumstances, a reaction will continue until restrained by exhaustion of whatever essential ingredient is present in least supply.

What is our essential ingredient in least supply?

And how much of it do we possess?

We do not know.

S. P. R. CHARTER / "Man on Earth"

According to legend... the Worm Ouroboros ate its own tail, and thus was a symbol of a world that survives by endlessly devouring itself.

A compendium of 6 issues of Kaiser Aluminum News about the next 20 years has been published in hardcover under the title *The Dynamics of Change*. The book costs \$8.95 from Prentice-Hall, Englewood Cliffs, N. J. 07632.

CR112 FLUTOPHONE or TONETTE90

Plastic — Key of C, Chromatic scale.

NICEM Indices to Educational Media.

The National Information Centre for Educational Media is a clearing house for information about educational films, motion cartridges, filmstrips, overhead transparencies, video tapes and records. Information is stored on computer tapes and print-outs of these are published in the form of indices. Each index is for a separate medium, contains an alphabetic listing by title and by subject heading. Each entry gives information about the technical dimensions of a title, that is size, black and white or color, with sound or silent, speed of rotation (for records), etc., etc. Also listed are the name and address of the producer and distributor of any item. About the only factors that are not mentioned in the catalogue are the price and an evaluation of the content of items.

The indices are available from R R Bowker Co., 1180 Ave. of the Americas, New York, N.Y. 10036.

Chip Chappell]

Educator's Guide to Free Films

1968; 784 pp; 49443 films

\$10.75 postpaid

from:
Educators Progress Service
Randolph, Wisconsin 53956

CONQUEST OF LIGHT (1964) 16mm Sound 10 min.

This film tells the story of the laser (sometimes called an optical maser), a device with almost unlimited potential in many areas. Although the film explains basically how a laser works and what it is, it does so in language clearly understandable to a non-technical audience. (Not cleared for TV)

Bell System Telephone Offices

CIRCLE OF THE SUN 16 mm Sound 29 min.

This film, in full color, records one of the last gatherings of the Blood Indians of the Blackfoot Confederacy. It shows the sun dance, but it also reflects the predicament of the younger generation—those who have relinquished their ties with their own people but have not yet found a firm place in the changing world. (Available from the Boston, Chicago, Detroit, Los Angeles, New Orleans, and Washington offices. See Source Index for addresses and areas served by each.) (Not cleared for TV)

Consulate General of Canada

Follow Through Project

Education Development Center has for the best list we've seen of recommended instructional aids, materials, and supplies for the primary grades. Prices and suppliers are given with the items. The list (36 pp.) apparently is free.

Cloth Diagram — Lewis Mahlmann

For those who like to sew — not the rag doll type but a shaped pattern that even permits you to change the profile of the face to change the character. Step by step, very definite instructions.

Price — \$1.00

Introducing Puppets Peter Frazier

Again, a book for the beginner, and yet a book for all.

Nothing new or unusual but the author has taken the best of many construction methods, gathered them together in a systematic way, and filled almost every page with clear, explicit drawings that anyone can understand and follow, - full pages in most cases, excellently executed.

Shadow puppets, rod puppets, hand puppets, and marionettes, - there are plans for construction of all, together with good stage plans, and many extras.

Perfect for new members just starting in puppetry.

8 x 8 — 120 pages \$6.95

Puppet Theater Handbook Marjorie Batchelder (full 69 pages of diagrams by Doug Anderson)

The Handbook covers practically every phase of puppet construction and production. Contributions from more than 50 outstanding puppeteers make this a complete manual of construction and production. Often referred to as the Puppeteer's Bible, Bibliography and Materials Supplement. If you can only buy one book, this is it.

6 x 9 — 293 pages \$6.50

THE PLAN

Leonard said, "What we want to do now, David, is fence in this place here where you see it's shady. This shade now's from the barn, but later on in the heat of the day those sycamores over there shade this same spot pretty good too, without keeping the sun out completely. I've studied this side, there's good sun late in the morning and then along about the middle of the afternoon it comes in from the road-side pretty good. If we do a good job fencing, those hogs'll have a good place out here.

"What we'll do, David, is just come right out from the two corners of the barn there, make it square on that end, come out about twenty feet on this side, and I figure about twenty six on that side over there because of that old stump. It won't be square on this end and we'll have to dig an extra posthole or two, but that'll be easier than trying to fight that old stump, and the hogs'll be glad of the extra room. I don't expect to win any architect's prize with this pen, but it'll be solid if we get the posts in good, and that's what we're interested in.

"What I'll do, David, is mark off where we want the posts to go, and work with you a little to get you posted. Then while you dig I'll take the truck into Blaine and get the posts and my one-by-sixes, shit I guess I better get nails too. I'm sorry I'm so disorganized this morning, but it's just piled up on me so bad I ain't thinking too straight yet. But we'll get lined out. It's a little after seven now. If we get the holes dug this morning and I get back with the fencing material by dinner time, we might not be in such bad shape after all. Get those diggers off the truck why don't you David, and I'll gouge around a little with my spade, and we'll just light right into it and hush talking about it.

The T-D loom, a simple loom for weaving narrow fabric, is made from tongue-depressor blades. The loom is rather limiting to the weaver, as it produces strips of cloth only five or six inches in width; but it is so inexpensive to build and so much fun to use that everyone should try weaving on a T-D loom. A belt woven on the T-D loom makes a good beginning weaving project.

Raising the T-D Loom to Open the Shed

Make a running stitch and then reverse the direction, filling in the spaces between. The straight running stitch can be used for thin leathers. For heavier leathers two threaded needles may be used at one time. They go through the same hole from opposite sides of the leather, exchange positions, and return through the next hole. This process fills in all spaces between the holes.

Crayons

"Stockmar Wachsfarben" (wax-crayons). I have used them both in school and privately for many years. They are very clean to use, especially important for children, and have the most pure colors I have ever seen. If you want to have a real color-experience & not only want to color objects pedantically, then these lend themselves to it. You can use them in many imaginative ways, many techniques. They come in a basic block-form or in sticks. They last a very long time.

Roma Plastilina

This stuff has been very good to me. I've used it for my own sculpturing and in educating kids - you can let them work forever without having the stuff dry out in their hands. The softest grade is good for small children; for older kids you might want to knead together some #1 and #2, in equal parts. Then when a kid puts together a masterpiece, you can either let it stand as is or make a casting of it - Plastilina is especially good for rubber moulding.

It's also completely recyclable - as they say, it never dries out, so there's no hassle about storing it airtightly. It does, really, get better with age and use.

The kids and I both love the feel - slightly greasy, not watery, and very workable. Seems made for hands, not artificial tools. You can leave a project out on the table when you get tired, and come back whenever the muse hits again - even if it's a year later.

I don't really know how good this price is in comparison to clay - I know it's more expensive than other plastilina, but the quality doesn't even compare. I've always got mine in a store, but I believe they sell quantities by mail, and cheaper than these little packages.

A great creative play medium.

CIDOC

Though your stated purpose is more inclined toward independent learning than formal schools, I would like to recommend to you the CENTRO INTERCULTURAL DE DOCUMENTACION (CIDOC) in Cuernavaca, Mexico. This school would, I think, provide an excellent base for those wishing to understand the third world role of Latin America. CIDOC is actually divided into 2 parts: an intensive Spanish language training school and a free form "Institute for Contemporary Latin American Studies" which includes many areas from Agrarian Reform to Youth in Cuba. Courses are taught mostly in English by men like Iuan Illich (who helped found CIDOC), Paul Goodman, John Holt, Herbert Kohl, and Edgar Friendenberg. To quote from the catalogue:

Cidoc is not a university, but a meeting place for humanists whose common concern is the effect of social and ideological change on the minds and hearts of men. It is a setting for understanding the implications of social revolution, not an instrument for promoting particular theories of social action. It is an environment for learning, not headquarters for activist planning. The main context of CIDOC is contemporary Latin America.

Cost by American standards is not great (\$135 per month for the language course - 4 months are recommended for fluency, and \$30 for each course plus \$25 registration fee). Living quarters are up to you, though there is a service which can help you locate all types of arrangements from a room with a Mexican family to "Hawaiian Suites" with heated swimming pools. Interest free loans are available to any student who has been registered for at least one month and who states in writing that he can't continue in school without one.

Cuernavaca is a beautiful place, though somewhat of a retirement area for large numbers of American executive types and their Mexican counterparts. It is one hour by car from Mexico City with its fantastic museums (esp. modern art and anthropology) and also within a couple hours drive from the finest scenery in central Mexico (around Taxco). The town itself is an old colonial capital noted for a constant spring like climate and such sights as the crumbling garden of Maximilian and Carlotta and a Diego Rivera mural on one side of the provincial assembly building. Mexico as a whole is a warm friendly CHEAP place once you get a day's drive from the border. I have not actually attended the school so I cannot attest to how CIDOC lives up to its purpose, but its credentials are impressive. An informative, minimal bullshit catalogue is free by writing:

CIDOC

Elementary Science Study

ESS has developed (and is developing), a number of interesting science units for elementary-school-age children. Some of these are in commercial publication through McGraw Hill. Others are in the form of highly informative and useful "working papers" available from ESS for nominal fees (i.e. \$.50). Even some of the commercial stuff is cheap. Those units—and there are several—requiring only teacher's manuals and some ingenuity in locating materials are frequently the most interesting and the cheapest. The manuals are usually \$1 or \$1.50. In addition ESS will send you their free newsletter. It usually has some feedback reports on the success (or lack of it) of their Science materials, good recommendations of books and stuff in the field of education, news of interesting projects tried by individual science teachers, and advance notice about ESS research. For any of the above, write to:

Film Making in Schools

A good introductory film book at last. What's remarkable is that it gives aid in thinking film as well as making film, and all the perspective is around kids and what trips them instead of what used to trip Hollywood. The book is edited and illustrated with good film sense; it moves, and it moves you. Every other page you want to chuck it and go make film. How many instructional books do that for you? —SB

Introducing the Single Camera VTR System

A "... basic manual designed specifically to introduce helical scan (1/2 inch, one inch) VTR."

If your school video equipment is run by that education anomaly — the "AV boy" — a hardware freak, fluent in electronics and as open as a programmed reader — this manual will provide talk-back ammunition.

Simple definitions, good sense operating instructions, and practical maintenance tips offer the resources necessary to operate the equipment smoothly and to convince even the skeptical of your knowledge about the machines.

The technical information and equipment specs and suggestions are also very useful in piercing the bubble of manufacturers hype. But most of the exercises and production techniques are heavily scripted — suffering the patterned dullness of imitation broadcasting.

The growing video head scene can probably pass this manual up but schools without portable equipment may find the information worth the purchase.

[Reviewed by Richard Kletter]

Introducing the Single Camera VTR System

Grayson Mattingly, Welby Smith

P.O. Box 31095
Washington, D.C. 20031

The purpose of this book is to examine the value of practical film study in the context of education. That is, to see how still cameras, movie cameras and tape recorders can be used to extend powers of observation and comment and to help young people develop an understanding of contemporary society.

RECORDING SLIDES AND MOVIES

Slides or movies can be transferred to video tape by projecting them onto a piece of smooth white posterboard or paper. If a projector screen is used the reflecting particles on the screen are picked up by the camera and will add a grainy appearance to the slide. This may sometimes be desired. Copying sound 16mm or super 8mm films in this manner will produce a slight flutter in the picture. The expense involved in a film chain projector system (\$1500 and up) will make you tolerant of the small flutter. If you have a silent film, or a sound film whose sound track is of no concern to you, you can eliminate the flutter by showing it back on a projector with a variable speed control and regulating the control to the proper speed. This will slow down the motion only slightly. Then, if your VTR has audio dubbing capability, you can add your own sound track. If you record sound from a film as you are taping it, try to feed the sound directly into your VTR. Most sound projectors have high impedance outputs which allow you to go from the 'aux audio out' on the projector to the "aux input" on the VTR via an RCA-to-RCA patch cord. If this is not possible, place the microphone in front of the projector speaker. Get the speaker as far away from the projector as possible, even in a closet or another room, so your microphone doesn't pick up the projector noise as it most likely will if you have to place the microphone near the projector.

The tape recorder is one of the most valuable tools in education today. Schools cannot have too many of them in service and young people should be able to use recorders with the same skill and ease that they exhibit when using bicycles for transport or power tools for woodwork.

Sound and Vision

First stages that link camera and tape recorder and yet cannot be considered as film production

Since 1

Students who have had little opportunity to use audio visual equipment can start by comparing abstract sounds and images.

STRENGTH OF SOUND

First by recording noises and then painting or drawing the visual equivalents when the recordings are played

THE WORK

They dug the first hole six inches from the corner of the barn. Leonard started it by scraping away some surface rocks and digging out some old leaves and crap that had accumulated under the eaves. Then he took the diggers from D.R. and started down. He dropped the diggers hard into the ground, spread the long handles and then lifted out the dirt in bites. The first few inches of the hole were easy, just dirt lying there waiting to be scooped up. But about a foot down the diggers banged into solid rock and Leonard told D.R. to hand him the sledge. It was hard to get at the rock with the sledge because of the narrowness of the hole, but after five or six licks he cracked it enough to get the end of the long crow-bar in to work. By the time they'd broken the rock into pieces small enough to pull out, both men were sweating and ready for a little rest. Wiping his forehead, Leonard looked at D.R. and grinned and said, "It aint like grave-digging, is it?"

D.R. automatically looked at his hands. It had been a week and a day since they had worked with Ray and Chester, digging Emmitt's grave. The blisters D.R. had worn that day had all broken and hardened in that time, although after he'd worked with the diggers a while the one on his left palm near the fleshy part of his thumb opened up again and started to bleed.

"Don't force your diggers," Leonard said. "You're banging 'em down a little too hard to suit. Just sort of try to help their own natural weight along a little, if you see what I mean. That's it. Easy-like. That's right. You're getting it."

Leonard worked with D.R. about an hour, sharing the work with him, trading on and off with the various tools. By the third hole they seemed to have worked beyond the shelf of rock that made the first two holes so hard. D.R. dug most of the third one by himself, and was starting into the fourth as Leonard got ready to leave.

"I'll be back by dinner time," he said. "I'll come and get you and we'll go to the house a while."

Without breaking his motion D.R. nodded and said good enough, and Leonard drove off to town.

This Magazine is about Schools

HOW TO HARDEN YOUR SOFT SCHOOL

- 1. ESTABLISH A SYSTEM FOR SUPPLYING THE SCHOOL WITH MATERIALS.** On several occasions I have walked into a free school and been bitterly disappointed by the lack of materials. No school dedicated to making a decent mess should open its doors before it has obtained two truck loads, say 5 tons, of begged, borrowed and stolen information in the shape of string, glue, magnets, records, magazines, books, paints, test-tubes, chemicals, transistors, advertisements, felt pens, catalogues, newspapers, fossils, rocks, microscopes, herbs, wire, acetate, slide-rules, typewriters, tapes, film stock, stuffed owls, old pieces of machinery, cloth, thread, animals, bones, fishing flies, photographs, paintings, slides and films. Treat information like water from a tap.
- 2. PUT YOUR FINANCES UPON A SOUND FOOTING**
- 3. ORGANIZE A FEW BOOKS.** Wade into the sea of information, clear a few shelves, and arrange thirty reference books in alphabetical order. Stick numbers on their spines, stamp them **NOT TO BE REMOVED** and chain them to the shelf. While you are in the mood, padlock a few doors and windows.
- 4. MAKE A HARD ROOM.** Set aside at least one room to represent the organized side of life. If you can afford it, build a laboratory with identical stools, gas taps, electrical outlets and small sinks for washing retorts. Have a ten-week course in the laboratory for which interested students have to sign in advance and attend at regular times. If you have no science teacher, immediately appoint a meticulous chemist.
- 5. STOP CHOOSING NEW STUDENTS** to fit the community. The next person whom you choose should be unlike anyone else you've ever had before.

This Book Is About Schools

"How do you change things?" asks Satu Repo in her forward to *This Book*. Change the schools or start new ones. Then start a magazine to help spread the word and try to find out what all the others out there are doing at their schools. *This Magazine Is About Schools* was started by a community of people in the Toronto, Canada area who were also working in a complex of free schools there. It is an exciting, widely-read publication and an important piece of scripture for the New Schools movement. *This Book Is About Schools* offers the best of the magazine and is a fine collection of essays on a wide variety of subjects. They are divided into three categories: growing up in America, the alternative school, and the institutional put-down.

Paper Edition
in Fall 1971
\$1.95 postpaid

The book presents few conclusions and perhaps more bravado than wisdom. It reflects the views of people who are pursuing a rather desperate search for life forces in our civilization. Whether it will be possible for us to combine our strong heritage of bourgeois freedom with the interconnectedness necessary to create a viable human community no one knows. The world may be pushing us too hard, forcing us to shift our priorities in such a way that the will to keep our schools together gradually is dissipated. But at the present time they give one answer — maybe too sane an answer — to the question: "What Can I Do Right Now?"

—Satu Repo

I can honestly say that for four months I did nothing, and I fell into my method of teaching those kids purely by accident. And it wasn't until I'd been doing this for six months that I realized that I had actually hit upon the best way of teaching them. Suddenly, after Christmas, I looked up and realized that I had created a beautiful second grade monster — fifteen of them, beautiful monsters — and I had done it by doing nothing. It wasn't because I had said, "I'm going to let them be free." They had to be free because I just, I just abated them.

Big Rock editors Sam Yanes, Hal Hershey, Cia Holdorf

I keep getting plaintive letters (many dittoed) asking for reading lists, histories, thoughts and other bull shit.

The way to open a free school is to open it.

The way to run a free school is to hand those parts which are kid stuff (learning) to the kids and ferociously plan and organize those things which are daddy/mommy stuff (food, shelter, tools, special care) without getting too tight about the separation.

The way to keep a free school open is to be compulsively sure you want it open, hardnosed about business, and WORK. America's most lamented four letter word.

This is all ex cathedra from

George von Hilsheimer,
himself

QUICK HARD SUMMARY OF HOW TO OPEN A FREE SCHOOL AND KEEP IT OPEN

People: If ten people will contract (written) to work to support one or two of their number to run a school, if necessary, you can open a school.

Money: Good books fanatically kept. Planned purchasing with ferocious control of buying and *nothing* retail. About \$2500 for day school and \$4000 for boarding. ETS in Princeton will sell you a weighting for scholarships or you can make your own simple one. *Everyone should pay something*. Get one semester up front— banks will loan readily to parents, but not to you. The nicest people will deadbeat, poor mouth, lie, cheat, and otherwise do you in. Conservatives pay their bills much more faithfully than liberals and forget about so-called radicals. Be warned. Don't go for or even want Federal or State money. It's not worth it. (Repeat 9 Billion times.)

Records: Print an honest transcript form that says you are an ungraded school and what follows are teacher rankings of grade and class equivalents. Give them names and credit hours on the usual 16 high school hours. Give a class rank equivalent. It is a waste of time to try to convert admission offices and you owe your brats an honest attempt at a prediction. Use **STANDARD TESTS** and give **HONEST** scores. Academic tests are a gas in a free school, a game. Don't cheat at soccer, why cheat at test? If the kid can't play you know he's trouble. Keep complete health records, make sure you have a waiver for hospital and doctor care on each kid from his mama and daddy. Keep an ongoing log of every sick complaint and every vitamin pill etc.

Food: make up a two or three week cycle of meals. Stick to it. Calculate from the cycle what you need and buy cheaper wholesale. If you change (you own plan not reverse) also change the plan. Expect to lose and buy two or three sets of tableware and dishes every year.

Work: teachers at a free school are mostly about cleaning, sorting clothes, carrying garbage and all that stuff most Am'i's hire niggers to do. America moves on invisible black grease and when you give it up, and give up the coercions that keep juniors in line, etch! Slime-o and bubonic plague unless you rotate the schlock work and don't hesitate to separate yourselves from people who won't do scut work. World is full of incompetents and lazies.

Curriculum: you've got to make a formal one for the State, urp. Otherwise, tons of books, magazines, newsprint, things. Hard areas. Reference room, serious art, library, labs run like SS training camp. Books are treasures not things to be left in rain— same for microscopes etc. As long as kids are free to have acres of soft areas and lilligag, what harm? They may learn that expensive equipment is liberating if kept operating, but tyrannical if schlocked up. And you may have exceptional free school that produces some grads with competence to help save Mama Earth with green technology instead of more editors and other paper and tree users.

Officials: write every conceivable agency and invite their inspection, supervision, admonition, guidance, etc. Be as open as your heart. Cooperate them to death. Of course, as soon as possible set aside legal fund for inevitable clashes when they want you to crucify babies on 5000 year old idiocies. But don't fight the health department, nor the fire, they are really on your side, if dumb at times. Question is, is shitting on the grass a more important freedom than having happy self regulating kids? Of course you get along with these parasites better if you wear straight uniform, but those struggles are up to you. Me, I'd rather the kids be free for their childish games and me have more time for goodies than have long hair etc.

Finally: Opening and keeping open a free school has much more to do with being touch, anal, compulsive, cantankerous and agile than with love. The real genius at Summerhill is Mrs. Neill who sees to the kitchen, housekeeping, bills and billing. I cannot too strongly tell you how all those nice folks you take in for nothing will be the first to run screaming to the fuzz about how vile you are— meantime owing you for the medicine, food and clothes you bought their brat.

Them facts ain't nice, but there aren't too many free schools around and I made about six of them. There is an illusion, created by Summerhill Society, New Schools Exchange and others that the woods are just full of free schools. What the woods are really full of is dreamers— and some bastards who want the publicity but make the kids play whatever their hanger happens to be. I know one "free" school makes the babes pray over their food— out loud. Man, Jesus said not to do that!

PERADAM

PERADAM was an event held at the 1969 Autumn Equinox to bring people from technological and long-haired worlds together. It was styled after ALLOY, the event organized by Steve Baer in New Mexico at the Spring Equinox, and some of the same people attended. (ALLOY is on p. 111.) Peradam was assembled by Dave Evans of the Augmented Human Intellect group in Menlo Park. The gathering took place in a wooded canyon near Santa Barbara. The 3-day meeting did not have a particular program, and suffered for the lack. Also Alloy was a tough act to follow.

Participants came from SRI, Zomeworks, Portola Institute, Pacific High School, Parnassus Institute, Hog Farm, Ecology Center, Southcoast, Beckwith & Langsner, Office Design, Placitas, and etc. Steve Katona cooked.

Here's some of what was said. The strongest stuff came from students and teachers from Pacific High School.

-SB

How do you continue to live a life of learning once you escape the institutions set up for learning?

Guerilla theater is usually about something that's already up that isn't satisfactory.

It's not enough to protest. We're trying exemplary forms.

Monks from the Zen Mountain Center.

It's the problem of being an American, to be sitting here with a full belly while the rest of the world starves.

In public high school I could sort of dig the idea of being a classroom Commando. But at Pacific it's obvious you're just fucking yourself.

It takes 500 people to incorporate into a community. 30 is about the carrying capacity of most communes.

The guys I went to high school with are just about running the country now. I didn't get along with them. Nobody here did.

At various times the situation has become very entropic. We seem to be taking the attitude this year that there are certain kinds of urgent things that need doing. . . . We have some 20 boarding students. All the staff are living at the place. If you want a place to live you better build it, and you better find out what the design considerations are.

It isn't enough to say I am a music teacher and my door is always open. We are going to do music at a certain hour on a certain day.

Yoga. Sociology. Math. Music French. Biology. Literature—those happen to be the fields of competence of the staff who are there.

The changes that can come down in like 10 days are just real. There may have been a revolution while we're away.

The least active students right now are the new students. I guess it's right. They're going through shock.

What's our policy on drugs? "You're not free to get the school busted." It's the same with sex.

We don't know whether we're on a 5 year thing or a 500 year thing.

It's all show. It's the life show and the show show and we're trying to get them till they're all one.

We've been forced again & again to the old religious truth.

We've become anal about our own gifts. We're afraid we might bruise ourselves.

Computers are beginning to give the mechanistic world a brain. And it's our job to give it a soul.

All I know is, when you fuck a robot, you gotta get a shot for lockjaw.

The machine doesn't solve all our problems, it gives us more problems than we'd have without it. Like the first airplanes. It'd be easier to ride a horse.

We're gonna choke on our own self-satisfaction. . . . Any of the things we do have an active life of about a year. It may be on the order of a natural law. Maybe people shouldn't have a sense of failure. . . . The things that sustain us are the trickle of information, but what pushes us on are the new surges. Get what you can out of it & move on.

They zoned Soleri's place as habitable sculpture.

We got a lot of myths we plug into.

Tires can be made into sandals.

Sex & violence are kind of related. (Girl in the audience:) No shit.

Something deeply in the heart of language is what's fucking us up.

Jail is the national monastic center.

You learn something different when you do it yourself.

They all crap in the same sewers. That ought to bring them together.

All that amateur radio operators do is talk about the weather and describe their equipment. Those media are really ripe for infiltration.

We're starting with an incredibly powerful technology, and what we've got so far is an incredibly primitive technique.

There's a whole mass of information stirred in the computer. It's a filing cabinet that's so fast and so together that it makes a whole different kind of difference.

We called our group at first Bum Academy.

Entrance requirements: You must walk from Tokyo to north of Japan to south of Japan, with no money.

Preparing the student for "the Future" High school will prepare you for college. And college will prepare you for a job. And a job will prepare you for retirement. And retirement will prepare you for death. We call that "The Sorrowful Round." It's based on the present, not the future.

It's really far-out to look at a teacher as an overgrown student, and a friend.

The students ask to graduate. It's a privilege of the staff to decide. We huddle in a smoke filled room. We get the student in there. We have certain criteria which we hold up against the student:

3 quarters of presence (we've graduated some at less) is 18 years of age clear idea of what he wants to do

The Open Classroom

The Open Classroom is written for anyone with the courage (or foolishness) to want to be a decent teacher within the public school system. It's a good book. It persuaded me that this is possible. It is surprisingly concrete. It describes exactly what "successful" teachers do to establish control over their classes. (These things are quite subtle, and worth knowing about. If you have a child who has to go to a typical public school, you can prepare him for the brainwashing he's going to get.) It also describes concretely what a teacher must do if he wants to have an honest relationship with his students, if he wants them to learn something (really), and he does not want to use authoritarian methods. (It's no: always so easy not to fall back on authoritarian methods, no matter how idealistic we are.) It goes on to describe and warn of the problems that an "open classroom teacher" will have with other teachers, principals, supervisors. They are almost certain to be severe. It gives ways of saving your job while maintaining an open classroom, and it discusses when it is wisest to sacrifice your job.

Herbert Kohl has been through all of this himself. If you don't know what it's like inside the system, his book can tell you some things that will make your hair stand on end.

If you want to be a public school teacher, The Open Classroom is an indispensable handbook. If you don't, it's an excellent critique anyway, and it will make you feel good, because it constitutes a realistic plan for recovering some value from the public schools—from within.

Apprenticeship Service Program

The program intends to give high school age kids an alternative to in-school learning by helping and encouraging them to find people near or far from home to study with them what they are most interested in. Once the teacher and student have met and if they feel they can work together, they can work out the details between them (length of time working together, expenses, hours, room and board or commuting, responsibilities, expected behavior—whatever they feel is important to talk over). We are interested in the traditional crafts and trades apprenticeships and apprenticeships in such things as farming, business, politics, . . . after which a student may be competent to work in that field, and in apprenticeships to people such as doctors or lawyers where the student might still have to go to college if he wanted to work in that field, but would have a sense of what it is like to be a doctor or lawyer.

To receive high school credit the teenager and teacher would have to send us quarterly reports on their work. To receive a full year's credit the student would need to work at one or more apprenticeships (maybe some school too) for at least 180 days of the year to meet the education code. Teenagers who wish to apprentice but do not want to be enrolled in high school can apprentice themselves and between the ages of 18-21 (it varies with the state) take high school equivalency tests, which upon passing gives them the equivalent of a high school diploma. (I do not know if there is a similar test in Canada.) The cost of this program for students who wish to be enrolled in high school is \$200. Scholarships are available. For those who do not wish to be enrolled we will charge \$5.00 IF we find you your teacher. Eventually we hope to cover these costs out of donations. (All donations are tax deductible.)

Since we have been working on this program we have received many letters from teenagers. Some are full of wisdom and life, some full of determination and life, and some very touching pleas for help and life. We need the help of people to share their skills and knowledge and/or help finding people who will. We need people all over to open up their lives to the young and to encourage those around them to do it. If you can be a teacher, or can help us find teachers in your area—write. If you would like to be a student in this program—write. We can create a network of learning—a whole nation, a whole earth people's school.

There are no simple ways to give up deeply rooted expectations. There are some suggestions, however:

- talk to students outside class
- watch them play and watch them live with other young people
- play with them—joking games and serious games
- talk to them about yourself, what you care about
- listen

In these situations the kids may surprise you and reveal rather than conceal, as is usual in the classroom, their feelings, fullness, and intelligence.

There is a way a teacher can experiment with non-authoritarian teaching and be free of other teachers and supervisors. That way is to work with problem students—those students the school system has given up on.

WANTING TO QUIT

After the sixth hole, D.R. wanted to quit. It wasn't his body that wanted to quit. His hands were hurting a little but his strength was flowing good and his arms and back felt readier to go on with it than when he'd started. It was something else, some longing, some invitation from somewhere deep inside him to lay down the tools and just arbitrarily quit.

Not stop to rest.

Not go sit down by the barn and lean his back against the wall and sip water from the half-gallon Mason jar Leonard had left.

But quit.

For the day.

Just stop right there where he was, ten inches deep into the seventh hole, and go down to the store and hang around a while, or else on back up to the homeplace for the afternoon.

It was like some kind of sour bile swimming through his head. His hands and arms and back worked on well, but his mind, his mind was terribly dissatisfied to be there with nothing to do but observe his arms and hand and back. His mind was a message to him, it was an argument from the very depths of itself to stop this work and, at the very least, take it easy for a while.

Look how much you've already done! It said. Six holes already, look at that! That's a morning's work for any man!

Not for Leonard, D.R. said.

Fuck Leonard! the message said. You've got the whole afternoon to dig these holes. At least go sit down and rest for a couple of hours.

All right, said D.R. Soon as I finish this hole, I will.

And he dropped the diggers hard into the ground.

I'll get a start on number seven and then quit, D.R. said. Let me start number seven and I'll stop a while.

And he said the same thing again when he had finished the seventh hole, and gone on to number eight.

And then nine, and then ten. Let me finish ten, he said. This one more, and then I'll quit for the day.

D.R. finished the tenth hole. He needed the sledge on that one. Eight inches down he came into thick rock, and he needed the sledge and the bar, and the sledge and the bar together, and then the diggers, little pinches of earth and rock at a time. That one hole took him over half an hour of solid work, but he finished it, and was starting the eleventh hole when Leonard came back with the lumber.

"You getting tired?" he said.

Not "wow! look how much work you did!"

Not, "Congratulations, David, you're the most fantastic hole-digger I ever saw."

Not even, "It looks like you've worked hard while I was gone."

Just, "You getting tired?"

"Not too bad," D.R. said.

"Do that one, and one more while I unload this stuff," said Leonard.

"Then we'll go see what Roxie's fixed us to eat."

A teacher in an open classroom needs to cultivate a state of suspended expectations. It is not easy. It is easy to believe that a dull class is dull, or a bright class is bright. The words "emotionally disturbed" conjure up frightening images. And it is sometimes a relief to discover that there are good pupils in the class that is waiting for you. Not reading the record cards or ignoring the standing of the class is an act of self-denial; it involves casting aside a crutch when one still believes one can't walk without it. Yet if one wants to develop an open classroom within the context of a school which is essentially totalitarian, such acts of will are necessary.

Slim, the trucker, wasn't as black-hearted¹ as he seems from these statements. Because he was sorry for me he bought me a meal of two t-bone steaks and offered me a motel room when we reached Ft. Worth. I accepted the meal gratefully. Ironically enough, just before he bought me the steaks the waitress told him that Red had died on the 1st of January. Men are such a curious mixture of good and evil; black and white. Who would have thought that a lanky, tough-as-nails truck driver would burst into tears upon hearing that his killer-friend had died?

Travel is the best education. The best way to meet people while traveling is to hitch. If you decide to leave school, jam a few paperbacks in your pockets, pack a bag and hit the road. It's nearly free. You'll learn about people and places.

Here's what you will need/want for a hitching trip:

- 1 A large army-type duffel bag or a heavy laundry bag (white to be visible at night)
- 2 About \$10 for every 1,000 miles you want to travel
- 3 A large piece of white cardboard (12" X 24") and a black, felt-tip marker
- 4 A plastic rain poncho and a good sleeping bag for long trips
- 5 New maps from gas stations with extra information about major cities to be traversed. Cities and national borders can be major obstacles. Persevere.
- 6 A few cans of sardines, some peanuts, candy, crackers, cheese, joints, etc.

Teacher Drop-Out Center

Teacher Drop-Out Center has identified (and continues to do so) schools — from pre-school to college, public and private — that have a relatively high degree of student-centered learning: few, or no, or non-compulsory classes; little, or no marking or grading; considerable student and teacher autonomy and independence; a low-pressure humane atmosphere where students can develop self-respect and a sense of dignity.

So far, they have come upon 500-700 such schools and they have established personal contact with these schools or are in the process of doing so. They have compiled a list of the schools and information about some is available from the Center.

Teacher Drop-Out Center acts as a clearinghouse of information on and a specialized placement service for teachers finding it difficult to function in traditional schools. They are interested in those who wish to make education relevant; those who truly believe in letting students grow into individual, alive, awake humans in an atmosphere of love and acceptance; those who breathe controversy and innovation and see schools as places for controversial ideas and innovations; those who want to be more than just babysitters or warm body in the classroom; those who feel they have to function freely as individuals with their own sense of style; those who believe that learning is an individual process best carried on by each individual exercising his own choice and going at his own pace.

They are open to inquiries from teachers or teachers-to-be. So far, they have helped and are helping hundreds of people get in touch with and find positions in schools.

Insurance

It's important to have liability insurance covering all operations of the school. A good private agent can get it for you for less than \$100 per year. You'll have to meet some standards to get it. Most states require workman's compensation insurance for employees.

And be sure your car is covered for whatever use you put it to for the school.

"Pacific runs on promises -- and the basic assumption is that when one makes a promise (even if only in his own self-interest), he will commit himself to that promise, and he can be comfortable in trusting that others will keep their promises as well. Everyone has to care at least that much. Thus, the whole fabric comes apart when, for reasons of apathy, or whatever, little promises are not kept. . . ."

one foot, one eye, sniff sniff is best can opener in the world. He eats worms, rats and his special food is fried lobster. Before they go to bed they sniff each other's nose 16 times.

Unsigned
Grade 6

"I told the teachers we'd proceed exactly as if I were doing a creative writing session and they were the students. I asked each person to complete on a piece of paper and then hand to me, anonymously, the following two sentences:

'Where I live . . .'
'Last night I dreamed . . .'

"Then we read some of them aloud, in random sequence, to form a 10 line poem (lines one and two from the same person, lines three and four from another person, etc.; each completed sentence treated as one line of the poem). We talked about the effects of the random grouping, then re-ordered the lines and talked about them. . . ."

Last Night I Dreamed

Last night I dreamed that I was a hippy in the circus and everyone laughed at me.
Last night I dreamed that I was a pro ball-player.
Last night I dreamed that I had all the money in the world and everyone had to listen to me and I owned all the buildings and houses and I was so happy that I couldn't even laugh.

Mary had a steagosaurous.
His fleece was none at all.
Instead he had sharp scotes.
on his back
And was very huge and tall.

It followed her to school one day,
Which there was no rule about.
It didn't help the school too much.
And everybody ran out.

Correspondence Schools

You asked for comments on correspondence schools in relation to a suggestion in your spring issue, and I happen to have a few. I worked with a reporter gathering information for a story on the subject, and the results were depressing. (The story appeared in the *New York Times* on May 31, 1970.)

The catalog suggestion was to write the National Home Study Council for information about courses. If someone is bent on taking a correspondence course, the Council is the best source of information for halfway reputable schools, because the Council is the only nationally recognized agency in the field. It has established minimum standards for business and educational operations and is supposedly held, by Federal law, to the same standards as the agencies which issue accreditation to resident-type schools and colleges. However, this does not hold up for there is little regulation by the states or the Federal government. Last fall, for example, the accrediting commission of the Council examined 6 Crowell-Collier institutions (remember your friendly Collier's Encyclopedia salesman?) and withdrew their accreditation. The major Crowell-Collier school is LaSalle Extension University of Chicago, and without its accreditation, the State of Illinois was required by Federal law to change its status. Among other things, this would have made LaSalle ineligible for any funds from any of the G.I. and Veterans education bills. But nothing was done. (An unknown number of LaSalle executives purchased tickets to a \$100-a-plate political dinner for the Superintendent of Public Instruction for the State of Illinois.) Crowell-Collier also filed an anti-trust suit against the Council. Having no funds for a court fight and no encouragement from any of the Federal agencies, the Council accepted the Crowell-Collier settlement out of court, reaccrediting LaSalle and the other schools.

So, although the National Home Study Council has set standards, it has no way to enforce them, thus leaving the question of quality up to the individual schools. Two schools which have maintained high standards are the advanced Trade School and the American School, both in Chicago and both offering a wide range of courses. These two schools run credit checks on applicants, administer valid admissions tests, actually turning away those who fail, and pay their salesmen a salary rather than a commission based on how many people they sign up.

Many schools don't have admissions tests, and those that do often make the tests ridiculously easy to pass. Many of the schools pay no attention to the results of their tests anyway. In other words, for many courses, if you can sign on the dotted line and make the down payment, you've met all the necessary requirements.

Many of the courses are very over-priced for what is provided. Private correspondence schools charge from less than \$100 to more than \$2500 and the average course costs between \$300 and \$600.

In many places, there are less expensive alternatives available to home study courses. Many universities, colleges, local government adult education programs, churches, YM and YWCAs, civic groups, etc., offer courses in a wide variety of subjects to the general public, usually for nominal fees and/or the cost of any materials. For instance, if you live in New York, check the Photography page in the

Directory of Accredited Private Home Study Schools

Care to study up on diamond-cutting at home? Electronic organ repair? Truck maintenance? Paper making? Penmanship? Radio? Tractor repair? Calculus? Welding? Concrete engineering? Sign lettering? Coast Navigation School, 418 East Canon Perdido, Santa Barbara, California 93101. Founded 1966. Courses in Air navigation; Coastwise navigation and piloting; Celestial navigation; Celestial air navigation; and the Elements of both handling, seamanship, and sailing.

Penn State Correspondence School

Penn State is Number One, at least in correspondence courses that have relevance to agriculture. Cornell University recommended them to me and I'm glad. All the courses have "x" pages of written material followed by a "test" that is "graded" by someone in State College (if you desire) and returned. Naturally, with so many courses, the quality is varied. I've read maybe two dozen of them. They are extremely valuable in areas where the reader has absolutely no knowledge. The Penn State introduction obtained with no small degree of authority enables one to more intelligently choose more advanced material (which is not always necessary) without waste of too much time and money in shotgun searches through libraries and/or bookstores. I recommend particularly their survey on Poultry Keeping. [Suggested and reviewed by John E. Schultz]

Catalog from:
Correspondence Courses
The Pennsylvania State University
202 Agricultural Education Building
University Park, PA 16802

Entertainment Section of the Sunday *New York Times* for locations, dates, and costs of beginning and advanced courses in photography. Your local U.S. Department of Agriculture extension office makes available a great amount of information and demonstrations on farming. Check with local companies in your field of interest; many run their own training programs. I also know of people who have actually apprenticed themselves to local craftsmen, one to a harpsichord maker, the other to a cabinetmaker.

It is much easier to check the reputations of courses offered locally, but if nothing is available then write the National Home Study Council for a list of schools offering the course you want. Send away to all the schools suggested, and from the ensuing, and never-ending deluge of promotional mail, pick the one which seems to be the most reputable and seems to offer the exact course or training that you want.

Finally, should you sign up for a course and then find out that it isn't what it was advertised to be, send your letter of resignation by registered mail.

However, if you want to get rich quick, which is the result promised by most of these schools, and you have no scruples about ripping off unsuspecting poor people, instead of taking a correspondence course, I suggest you try selling one. All you need do is follow the advice which a Dr. Richard S. Frazer gave to members of the Association of Home Study Schools. Dr. Frazer was head of the now-defunct Christy Trade School in Chicago and he received his doctoral degree from something called the "Neotarian College."

Dr. Frazer's suggestions: Immediately offer courses in 200 subjects and decide on public response to an advertising campaign which of the 200 is the most likely best-seller, and provide that one. Select a textbook on the subject and order a gross from the publisher, then have a bookbinder split these books into 20-page units of lessons (new covers should be designed, taking care to leave space for stamping on the title and number of each "lesson"). For your promotional campaign, Dr. Frazer recommends, for example, perfumed mailings and the use of "gadgets, gimmicks, premiums, giveaways, and special formats." Then when your sales begin to level off, begin preparation of your second course.

A quick look at the advertising layouts and promotional materials of most of the correspondence schools would lead anyone to believe that large numbers of them are doing exactly what Dr. Frazer suggests. And many of them go even further—they hire salesmen who are inadequately trained and paid only a commission based on their sales, with no reimbursement for expenses. In order to make sales, these men, whether instructed by their employers or not, misrepresent the courses they sell in many ways. In other words, they tell outright lies in their presentations. (The salesman from LaSalle who called on me informed me, when I told him I worked for the *New York Times*, that "a lot of the top men there got most of their training at LaSalle. I know of one—I can't recall his name right off—who got all of his training through LaSalle." Ha.)

I could relate other examples of misrepresentation by salesmen, if you want, but I doubt you have room to run this letter as it is. You may use what I have said here any way you can. I hope I have been of some help.

Sincerely,
Adrianne Burk

NAILS

Nail hammer whap whap nail. Set it and hit it, drive it whap hit it home and nail that board to the post.

Set it in here David. Throw in some rock, fill it and tamp it, hold on now, let's get 'er straight. Reach me the level there and we'll line this baby up. There. Tamp it down, hand me the end of that one-by-six and you take the yon.

Nail. Hammer whap whap and nail. Nail it in and drive it home. This one's warped, David, hold on, let's not get ahead of ourselves. Got your's nailed? Hit it.

Nail. Hammer whap. Nail, whap, set, whap, hit it and drive it, drive it and pound it and

Leonard bears his weight down on the loose end till the warp comes out and says drive it in now son, set it and hit it, that's right, we'll teach this wood to bow.

One time David I was carpentering with this old one-armed boy over in Owsley County. Fellow by the name of Calhoun. Building a school up there, back before the war. I'd tried mining and didn't like that, so my daddy said why don't you go up to Owsley County and help 'em build that school. The boss of that job was a friend of my daddy's and he took me on. He said I could work a week and if I could drive nails faster than this Calhoun he'd let me stay on. So we worked. Side by side with old Calhoun. Him with just one arm, I figured surely I could out-work a one-armed man. But you ought to of seen him, David. He'd set nails this way: hold the head between his two fingers like this, you see, brace the head against the flat of his hammer, go stick like that and set that nail in the wood just pretty as you please. Then he'd rear back with that hammer in that one good hand of his and go whap and about two whaps later that nail'd be out of sight. Drive a sixteen penny nail in three licks when he wanted to. I couldn't keep up with him with two hands. Nobody on that job could.

But the old foreman let me stay on anyhow.

Whap! Nail. Set. Hammer. Whap.

Sweat.

Sweat all down his neck and off his ears and in his eyes.

Get us another locust post and I'll deepen this next hole a little. Fill it. Tamp it down. That's right, stomp it right in there good. She level? Read it right, now, we want this fence preee-cise, looking too good to mess it up now. You finish here David and I'll go get us another one-by-six.

Up Against the Law

To be a teenager in the U.S. is approximately illegal. Nevertheless many survive. This revealing remarkable hard-working book can really help.

- Q:** You have been suspended from school for two weeks and don't know why. Do you have the right to be told what the charges are against you?
- A:** Yes. Any time school officials give you a punishment with serious consequences (expulsion, suspension for more than a few days — the number of days varies from place to place) they should notify you and your parents in writing of the specific things you have done wrong.
- Q:** If you've applied to and been accepted at a boarding school or college and your father refuses to pay the tuition, can he be forced to pay?
- A:** Yes, if he can afford it and the court decides it is in your "best interests."

AGE OF CONSENT: STATUTORY RAPE.

(If you are a girl under the age of this chart, anyone who sleeps with you may be considered guilty of statutory rape.)

Alabama	16	Montana	18
Alaska	16	Nebraska	18
Arizona	18	Nevada	16
Arkansas	16	New Hampshire	16
California	18	New Jersey	16
Colorado	18	New Mexico	16
Connecticut	16	New York	18
Delaware	7*	North Carolina	16
Florida	18	North Dakota	18
Georgia	14	Ohio	16
Hawaii	16	Oregon	16
Idaho	18	Pennsylvania	16
Illinois	16	Rhode Island	16
Indiana	16	South Carolina	16
Iowa	16	South Dakota	18
Kansas	18	Tennessee	12
Kentucky	18	Texas	18
Louisiana	12	Utah	18
Maine	14	Vermont	16
Maryland	16	Virginia	16
Massachusetts	18	Washington	18
Michigan	16	West Virginia	16
Minnesota	18	Wisconsin	18
Mississippi	18	Wyoming	18
Missouri	16	Puerto Rico	14

*Yes, seven is the age of consent on the books. But other sexual offenses against minors, such as harboring a male or female child under eighteen for purposes of sexual intercourse, are crimes though not technically considered statutory rape.

- Q:** If you're in a car that's stopped by the cops and there's dope in it, are you considered guilty of possession?
- A:** That depends on state laws. In New York, if drugs are found in a car, everyone in the car is presumed to have had the knowledge that the drugs were there—unless they were concealed on one person. This means that if the cops find dope in the glove compartment, everyone will be presumed to have known it was there; you may be able to present a case at trial that you did not, in fact, know the dope was there—but it will be up to you to disprove the presumption that you knew. If the dope is found concealed on one person, he's the only one considered guilty.
- Other state laws vary. In California there is a case-law precedent saying that cops may search only the inside of the car incidental to an arrest—that is, they may not search the trunk or engine area.

406 What To Do Learning

The Underground Guide to the College of Your Choice

A really fantastic amount of information packed in an honest, if somewhat clichéd style. The paradox about this book is that it seems to be written for freaks — or at least for those who are looking for alternatives to traditional academia; while the descriptions indicate how much traditional academia still prevails on most campuses. It does look very useful, though, especially in giving a real flavor and feeling for what's going on at different schools. A lot of the descriptions include how campuses are changing, too, which is very interesting in itself. I hope someone keeps it up to date, since one of its messages is that what it says now will be obsolete shortly. It makes it painfully clear that we need some new colleges.

University of Illinois Urbana, Illinois

Illinois is becoming more and more radical but still a Big Ten fraternity stronghold.

SERGEANT PEPPER SECTION:

31,267 students of which 8,500 are graduates. 15% out-of-state. Freshmen must have completed at least six semesters of high school, submit either SAT or ACT scores, and be in upper one-fourth of their class. As long as there is space open in his chosen curriculum, there is room for him.

ACADEMIC BULLSHIT:

The best departments are Engineering, Agriculture and Computer (the best computer school in the nation). In these departments the professors give the students a lot of individual help. No one seems to know of any exciting or particularly great courses or professors. Some Pass/Fail and all you need is a professor's sponsorship to get credit for a class you want to originate. If you can't get credit, it can be a Free U course. Third World studies started in various departments in 1970. The University requires that every student take a final examination in all classes. Some study abroad.

BROTHERS AND SISTERS:

Ratio cats : chicks—2 : 1.

They have their freaks here, but most of the kids are straight—the big thing for guys is jeans or slacks, button-down shirts or T-shirts and brown loafers without socks (in the spring). No one would be caught dead wearing white socks (very gauche). The straights' hair isn't especially long, but there is a beau brummel in every crowd who dares let a stray hair or two grow. The straight chicks wear their dresses and skirts and every now and then get into some pants. Lots of people wear those ugly University of Illinois T-shirts (which in the past were mainly gray but with the whole psychedelic craze are turning up in other colors). As to the freaks (who are very few), long hair, no bra, tie dyes, jeans, hair bands, shoeless and on strike. On the whole, there isn't that much dating (there are more than 10,000 more men than women on this campus). The Greeks are deeply into the dating game—maybe 25% of the campus dates—while most everyone else is spontaneous. A date consists of going to a movie, and then to a bar or an eatery afterwards.

As for the girls being liberated—"Any girl wants to do it, but is waiting for the right guy." The hip chicks will do it. Not that much shacking-up here. The chicks are either just off the farm or from Chicago (so they are either naive as hell or know it all).

Intervisitation in the dorms just started about a year ago on campus—more pregnancies have been registered with the health center than in previous years. It is easier to find a chick who will have sex now than it was two years ago when things were extremely difficult—all the sorority houses lock their doors at night.

SURVIVAL:

Getting easier. Plenty of dope, sex and politics are opening up. BC pills through student health and Planned Parenthood in area. No suicide prevention center. Draft counseling by student government, and the Draft Resisters Corps in the area. It's a Big Ten school so football is still important. The campus paper is the Daily Illinois—a bore. Two underground papers—Walrus and Greek. No health-food stores. The closest "big city" is Chicago.

The merchants in the area are big exploiters, especially around Wright, Green and 6th Streets. Two of the dorms have "had trouble with the black community" and so lock their doors at night.

Private Independent Schools

I've been to a liberal grade school, an Archie and Veronica high school, a prestigious prep school (Exeter), a glossy college (Stanford), and the Army (Infantry). The most education happened at the prep school and the Army. This book describes private schools throughout the U.S., Canada, and overseas. If I had a kid and the money, I'd use it. If I were a kid with parents with the money, I'd use it.

The Sidwell Friends School

WASHINGTON

THE SIDWELL FRIENDS SCHOOL is a coeducational day school, offering 14 years of education from Kindergarten through Grade 12. Administrative offices and the Middle and Upper Schools are at 3825 Wisconsin Avenue, N.W., Washington, D.C. 20016, which serves as the mailing address for the entire school. The Lower School (Kindergarten-Transition and Grades 1-4) is located on its own campus at 5100 Edgemoor Lane, Bethesda, Maryland. The telephone for all offices is 202-966-0953.

BUILDINGS AND EQUIPMENT. On the Wisconsin Avenue campus, separate buildings provide classrooms and study halls

for the Upper and Middle Schools. Administrative offices are in historic Zaitman House. Other facilities include the Activities Building and gymnasium, the George H. Scamner Science Building, and the Goodwin Library housing a collection of some 8000 books as well as audio-visual materials and periodicals.

FACULTY AND STAFF. Robert Lawrence Smith, the Headmaster, is a graduate of the University of California (Berkeley) and holds an M.A. from Columbia University. Before coming to The Sidwell Friends School in 1965, the Quaker educator was Assistant Dean of Columbia College; Jean Z. Jasperen, Assistant Headmaster, holds a B.S. from the University of Pennsylvania. Prior to assuming this position, Mrs. Jasperen was a teacher in and later Dean of The Sidwell Friends Upper School.

A Principal heads each of the School's three levels. In addition to administration and staff the faculty includes 77 full-time teachers (24 men and 53 women) and 23 part-time teachers, holding a total of 85 baccalaureate degrees and 35 graduate degrees.

STUDENT BODY. There are enrolled (1968-70) 937 students aged 4 through 18. Each of the 14 grades is divided into sections. Class size is 5 to 23 students; median class size in the Upper School (grades 9-12) is 15 students.

ADMISSION AND COSTS. The School seeks students who meet high academic and personal standards and will distinguish themselves in the vitality of the school community. The School also recognizes the educational value of a school community that includes a variety of economic, cultural, and racial backgrounds. Special consideration is given candidates who meet the school's requirements and are members of the Society of Friends, brothers or sisters of present or former students, children of alumni and faculty. Consideration is an important part of the school's tradition and life, and an attempt is made to maintain an even balance between the number of boys and girls in all grades. All inquiries regarding application for admission should be directed to Llewellyn W. Lord, Jr., Director of Admissions.

The Army

I am presently serving in the United States Army (Signal Corps) and would like to say that it (or rather certain schools it offers) is certainly relevant to independent education, your own personal feelings on militarism notwithstanding. It of course offers fine schools in electronics, diving and living off the land. If it wasn't for the war I would most probably apply for airborne training, officer candidates school and Ranger school. However, things being as they are in Vietnam, I can't see myself being a platoon leader in a Long Range Reconnaissance outfit. The thought of it scares me shitless, to be perfectly frank. I know Mr. Brand or someone who writes reviews was an airborne ranger, no offense intended.

I have the greatest respect for anyone who goes through just ranger school, I would look on someone with combat experience as a Ranger with fascination and awe.

Someone should probably review Vietnam, it is useful as a tool, since it is a medium where you can get stereo, and camera equipment, jewelry, clothes, women and VD rather cheaply.

John H. Kirck
Glenholzer, Pa.

I didn't make it through Ranger School. Quit. Too cold.

—SB

The New Religions

One splendid effect of ecumenical technology is our new and deep access to top scientists from the East such as Suzuki Roshi, Meher Baba, Bapak, Krishnamurti, Tarthans Tulku, and others. Jacob Needleman, young head of the Philosophy Department at San Francisco State, has perceived their various convergent messages and assembled a thoroughly useful catalog. He's as serious as any student, and he knows more than one thing at a time. I hope he will expand a later edition of the book to include Gurdjieff, the Native American Church, and the whole Sufi number.

The contemporary disillusionment with religion has revealed itself to be a religious disillusionment. Men are moving away from the forms and trappings of Judaism and Christianity not because they have stopped searching for transcendental answers to the fundamental questions of human life, but because that search has now intensified beyond measure.

It has been said that every time and place has its own despair. The despair of California is the despair of people relentlessly getting what they want.

At Tassajara, however, one comes to see monasticism not as a fight from society, but to society. The principle difference between the monastic society and ours is surely not that ours is more real, but that in this monastery everyone has a common aim. Moreover, this aim is for themselves: each to awaken to his true nature, each to find "his own way."

In such a community, there exists a constant danger that in the name of charity and kindness someone will find my way for me, will directly or indirectly tell me what to do, what is good and what bad. As a result, I may find a way, but not my own way; I will discover a nature, but not necessarily my own nature. . .

Some people say, "If we have a perfect social construction, we will not have these difficulties." But as long as there is human nature, nothing will help us. On the contrary, the more human culture advances, the more difficulties we will have in our life. The advancement of civilization will accelerate this contradiction in our nature. When we realize the absolute presence of our contradictory nature, the way-seeking mind arises, and we begin to work on ourselves instead of the material world. Most people who are interested in Buddhism are more or less critical of our social condition, expecting a better social framework.

Baba was sitting on his bed. Naked from the waist up. I think there were two other men in the room. And Baba just—beamed at me, man. I always have difficulty talking about Baba. I mean, I'm not given to having visions or hallucinations. For me, it was just this incredible, extraordinary light, like his head was the center of it, like emanating in all directions. It filled everything. To the extent that tears started forcibly coming out of my eyes like a reaction to all this incredible light.

Scholarships to U.S.?

An old problem just plagued me again. There are lots of smart students in a place like Ethiopia who want to go to school in the U.S. They often ask people like me (visible "Americans") how to find schools and/or money. For schools, accesses exist, in U.S.I.S. Libraries. But for finances (schools characteristically ask 1 yrs expenses to be paid by the student — a lot of bread for all but the aristocrats in, for instance, Ethiopia) they (the students) & I am stymied.

But I know there exist breaded people who see the value of getting minds in communion world round & would personally or thru foundations like to help bona fide (ie. all the test scores & recommendations) good students get it together. Is there some access info on this?

Keep your attention on a single point as long as you want. You have to learn how to be loose to do it, it's not a thing you can do if you're tight, cause if you're tight your attention will tend to fidget. You gotta learn how to be just a loose observer. You have to really not give a damn too much about what's going on out there in front. You know, you gotta just look at it and dig it and see what it is and get the informational quality of it . . . Like you're supposed to groove. You're supposed to just really be grooving as hard as you can. There's a Zen master thing that says, Although my heart is on fire, my eyes are as cold as ashes. You know. So then you can keep concentration really well when you're not attached. That's a loose place you have to be to play music or to ride a bike or any of those kind of places, where you have to have that loose no-mind. . . let it do it, concentrate it there, put it there in one place. Yeah.

We're all like little energy transmuters. You know those things that float in swimming pools and go sssshhhwck and suck down all the leaves and bugs and sticks and stuff. That's what we are. You wander around through the world and take in all the vibes, transmute 'em through serenity and what have you, good dope, and put 'em back out, all vacuumed. The way we do it is that we absorb the body energy at this level and then transmute it . . . We do other people's homework as if it were our own. We do the homework of all the people around us. That's how we help out, you know, by just refining those vibes everywhere we go.

In most square folks' ground rules it's considered impolite to notice that your conversational partner is neurotic. And what you do about that's another thing. Jesus, when he was giving the instructions to the apostles, told 'em when you go into a house, feel the house, and let your peace descend on the house, and if the house accepts your peace then you're cool. You stay there. But if the house rejects your peace go forth from that house and go forth from that town and shake the dust from your feet. Because there's a whole lot of folks aching to know. Don't bother arguing with somebody that don't want to know.

Laughing? I think laughing's just free good karma. You know, all the time that you're laughing you're wide open, you're non-linear, non-directional . . . It may be the highest form of communication that we can do by mouth. Cause somebody can drop your cut-glass vase on the floor . . . and you can laugh and it's cool.

And you really got to be careful about that kind of thing, cause when someone's drunk, a lot of their consciousness is knocked out, and they're running a lot on their subconscious . . . and they're pretty telepathic and stuff at that stage. Drunks and kids and people like that, don't ever lie to 'em. Don't lie to acidheads either. It's a waste of time.

Well, here's the thing that is one of the basic spiritual teachings that's been around for like ten or twelve thousand years . . . and it is that if you just quit paying attention to bad trips, pull your juice out of them, that they'll run out of juice, and they'll run down and stop. And they do that, because the karma is a little slower when you're not stoned, but it's the same karma and it works the same way . . . it's just a little slower, but it's not a bit different than when you're ripped. And where you cast your head you get that kind of thing. As ye sow so shall ye reap. Well, that means that in an energy relationship if you feel that somebody's on a negative trip, first you have to be accepting and free enough to say that they can do that if they want to . . . cause they got free will. . . everybody's got free will. The next thing is that you also have a choice in the matter and that's whether you pay any attention to it or not. And if you pay attention . . . this is something I've found out so many times trying to take care of people who bring me a bad trip to sort out for them—you can straighten them and let go of them and they'll dive right back into it. . . cause they're looking for it, really. People who really want help, you just make a suggestion and they do it. . . and they get straight. I've seen that happen lots of times. If you put a lot of attention and energy into a down trip, then you're stepping on a down elevator. And the vibe may be exhilarating for awhile, but it gets pretty funky the farther down you go.

Comix

These ain't your run-of-the-mill comic books. At times they are gross, beautiful, or violent. Best of all, they can be very funny, and a good reminder not to take things (such as yourself) too seriously. Who sez comic books ain't relevant?

Keep on Truckin'..

TIME

Nail. Set. Hammer. Whap.
Set. Nail. Whap.
How's your blister, David?
Not too bad. It's not on my hammer hand.
We'll get some turpentine on it when we get done here.
Done.
Get done.
Two o'clock.
Two ten.
Nail. Set. Sweat, slick, hand, whap.
And then it was two eleven.

Times is hot session!

Everybody one ~~bestmic~~ fire or another just looks the living shit out of us.

Some stuff never smoked into the light of day before. You know? Out there after further get hot.

Under. Thunder. Boiling. **Everywhere!!** ...wow.

New wideawake fires with no respect for old shit

cooking us clean.

Thing is... what does a man do with a brand new rusty gob of gear slap in his lap?

Disposes of it, I guess, as efficiently as possible without getting too heavy about it.

And get on with the game.

But what **IS** the game?

Is it the GAME? Or The Game? Or THE game?

Dunno if I can say for certain. All I know is that **SOME** of the game is the question **above**.

...and some **HERE** is

(love)

Now! having decided to play our next question is:

What position?

Well, I'm glad you ask that question, neighbor, because I got not ONE NOT TWO BUT **ANSWERS!**

1. Perfection of flat-out **MED** Right?

2. Perfection of **OVER WORKERS!**... otherwise you got these miserable asses underfoot all the time disturbing your meditations

3. Perfection of GOD. You might assume the accomplishment of the first two steps would accomplish this. No. Indeed, that merely brings us up to the completion of fantasies ~~at~~ already outlined, while the third task is more interested in fooling **NEW** fantasies. Completion as opposed to creation, too separate tasks though our position in the action may and probably is **semulamic** or ~~however~~ its spelled.

Yeah, but **WORKING POSITION???**

I was getting to that, neighbor. Just keep your blue-eyes open for some fast footwork out plans stop execute plans **STOP WORK OUT AREA FOR WORKING OUT PLANS STOP WORK OUT HEAR WORK OUT TEACH WORK OUT GOD IN AREA STOP.**
OR: PROVIDE SITUATION CONDUCIVE TO HAPPENING???

He moved his ear to the animal's sleek bulk and could hear her guts working. He liked the sound. He liked the cow. He liked feeling her warmth and squeezing the rhythm of milk into the pail. It was a dumb-ass thing keeping a milk-cow these days when you could buy milk cheaper'n alfalfa, but dammit a cow's tit was a nice change from an ax-handle, and the soft working of a cow's gut was a relief after the old man's snortin' and fartin' and John's bullshitting and Orland's wife's screeching. Oh, well; they didn't really mean anything by it.

The milk rang into the pail, then muffled its ringing in folds of white froth, a measured bell sounding through thick, creamy warmth. This is Hank's bell.

On the river the motorboat gnashed at the leaf-dappled water as Joe Ben ferried the loads of people across. Cars started, spinning gravel to get back onto the highway. Henry's plaster cast thundered and rolled on the docks.

A dumb-ass thing, keeping a cow.

In the deepening sky where the spearpoint firs scratch the clouds, already a moon— like a cast-off paring from the setting sun. This is Hank's bell, too.

But god oh mighty ain't they warm to lean against?

On the docks the noisy woodpecker of a man parades up and down, shaking his plume of hair that is yellow and coarse as a bundle of broken toothpicks when seen close up; fifty yards away it is white as a thunderhead; fifty yards away at the wrong end of a telescope the drink-whipped cheeks of John glow with ruddy health, and Orland's wife steps into the waiting boat with a foot as demure and dainty as that of a thoroughbred colt. Joe Ben's poor hacked gridiron of a face shines out across the green water as pure as a cameo, and his potato-shaped wife is a swan in polka-dotted taffeta. Fifty yards away.

This is Hank's bell— secret between peaks of foam, muffled in warm white valleys— this is Hank's bell ringing

(I watched as Hank stood, strangely peaceful, and let the challenger deliver the first blow. It was almost his undoing. He was spun completely around and into the bar; his head struck the wood with a thick sound and he fell to his knees RUN FOOL! WATCH OUT! and the Bignewton was on him before he could rise. . .) You see, Lee? All every one dirty whining sniveling pricks vicious red-sweater cunts grubby faces far back I can remember blame me Me, Lee, do you see? (this time hitting him high on the cheekbone and rolling him face forward on the floor) asshole who couldn't pour piss outa a boot is my fault— Oh Christ, Lee, do you see? (and from this position he twisted his head toward me WATCH OUT! WATCH OUT! seemingly to make certain of my presence) all yelling stomp him stomp the hardosed motherfucker— Oh Christ, Lee! (He looked at me from the floor, his head twisting back, asking the question now with one green eye WATCH OUT RUN! the other blinded with blood. . .) all yelling kill him because I won't run the sonsabitches Lee, you bastard! (. . . and, before I could think— because of the noise, the beer I'd drunk, perhaps because I wanted him beaten further— WATCH OUT, HANK! I heard myself shouting encouragement right along with Joe Ben GET UP, HANK, GET UP GET UP GET UP!) sonsabitches you think I care please let me hate them Lee you see I care (and, as though he had been waiting for my signal, he rose GET UP trailing blood HANK HANK and an awesome war cry. . .) YOU you think I care hate I please them! owe them not run (. . . to prove himself HANK YES HANK HANK! every bit as primitive. . .) please hate! care do you? Them sonsabitches! (as the prehistoric biped) THEM NOW do you? CARE please KILL THEM! (and even more proficient YES HANK YES a puglist!) let me do you THEM kill NOW YES NOW. . .)

—SB

The bad time continued. It was expressed in a number of separate events, or processes, in this of that part of the world, whose common quality was horror — and a senseless horror. To listen, to read, to watch the news of any one of these events was to submit oneself to incredulity: this barbarism, this savagery, was simply not possible. And, everywhere in this country, in the world, people like oneself sat reading, looking, watching, in precisely the same condition: this is not possible; it can't be happening; it's all so monstrously silly that I can't believe it. . . . The war in Korea was at the height of its danger for the world, the propaganda on both sides had reached a point where no one sensible could believe a word of it, and for months it looked as if nothing could stop America using "the bomb" there. In America the hysteria had grown till that great nation looked from outside like a dog driven mad by an infestation of fleas, snapping and biting at its own flesh; and a man called Joe McCarthy, who had no qualities at all, save one, the capacity to terrorise other people, was able to do as he liked. Throughout Africa various countries fought in various ways against the white man, but in Kenya there was a full-scale war, both sides (as in Korea) fighting with a maximum of nastiness and lies.

This is Dali landscape. I'm plugged in to Dali mind. If I could draw, paint, then I'd paint this, Dali picture. Why does only Dali plug in to Dali country? No, Dali and me. Therefore Dali and — plenty of others. But nurse says, delusions. If ignorant, does not think is Dali country. Thinks: That's a silly picture. If educated, knows, thinks: I am a copycat. Or, that must be a Dali picture I haven't seen? (Perhaps it is.)

He couldn't have painted so many. Why not?

Plagiarism. (Think about this after when time.) Mark writes something. Then it's floating in the air. Someone can plug in. A City in the Desert is photostarted in the photosphere. (Oh, very funny. Ha. You only deserve half a laugh for that one.)

*One of them is rather weak,
And one of them is very meek,
And one of them is just a horse,
And one of them is rather coarse,
One of them would like to strangle,
Hurt and tear and bite and mangle,
And one of them is rather crude,
And one of them is just a prude,
And one of them . . .*

For God's sake stop, sobbed Martha, clutching her ears as this awful da-da-da-da-da- ground into her eardrums.

Lying face down, nose in a thick plush of carpet which smelled faintly of dust, the sea of sound came down, swallowed her.

Almost.

I'm so hot when I get through cooking a meal it's more than I can do to sit down to it and eat it:
How was it we were caught?

His mother sits in a hickory chair with her knees relaxed and her bare feet flat to the floor; her dress open and one broken breast exposed. Her head is turned a little slantwise and she gazes quietly downward past her son's head into the junctures of the earth, the floor, the wall, the sunlight, and the shade. One hand lies long and flat along her lap: it is elegantly made of bone and is two sizes too large for the keen wrist. With her other hand, and in the cradling of her arm and shoulder, she holds the child. His dress has fallen aside and he is naked. As he is held, the head huge in scale of his body, the small body ineffably relaxed, spilled in a deep curve from nape to buttocks, then the knees drawn up a little, the bottom small and sharp, and the legs and feet drifted as if under water, he suggests the shape of the word siphon. He is nursing. His hands are blundering at her breast blindly, as if themselves each were a new born creature, or as if they were sobbing, ecstatic with love; his mouth is intensely absorbed at her nipple as if in rapid kisses, with small and swift sounds of moisture; his eyes are squeezed shut; and now, for breath, he draws away, and lets out a sharp short whispered *ahh*, the hands and his eyelids relaxing, and immediately resumes; and in all this while, his face is beatific, the face of one at rest in paradise, and in all this while her gentle and sober, earnest face is not altered out of its deep slantwise gazing: his head is now sunken off and away, grand and soft as a cloud, his wet mouth flared, his body still more profoundly relinquished of itself, and I see how against her body he is so many things in one, the child in the melodies of the womb, the Madonna's son, human divinity sunken from the cross at rest against his mother, and more beside, for at the heart and leverage of that young body, gently, taken in all the pulse of his being, the penis is partly erected.

And Ellen where she rests, in the gigantic light: she, too, is completely at peace, this child, the arms squared back, and palms open loose against the floor, the floursack on her face; and her knees are flexed upward a little and fallen apart, the soles of the feet facing; her blown belly swimming its navel, white as flour; and blown full broad with slumbering blood into a circle: so white all the outward flesh, it glows of blue; so dark, the deep hole, a dark red shadow of life blood: this center and source, for which we have never contrived any worthy name, is as if it were breathing, flowering, soundlessly, a snoring silence of flame; it is as if flame were breathed forth from it and subtly played about it: and here in this breathing and play of flame, a thing so strong, so valiant, so unvanquishable, it is without effort, without emotion, I know it shall at length outshine the sun.

A Hall of Mirrors

Armageddon is ours. We can trudge along, getting by, matching facades, half-escaped, and be the very wheels of the juggernaut. Kill the fuckers, kill them. Them? In an Ice Age?

Hall of Mirrors

Marvin looked from face to face and stopped at Rheinhardt. "Man," he said, "that wasn't the California you know. No mufflers. No titty-tatty. No ogle bee. No gasoline-smell grease-trap taco stand plastic supermarket shit. No fat woman drive ins. No polite killer cops. No oregano salesmen. No Northbeach. No Southbeach. No Beach Beach. It wasn't like that, man—you think it was?"

"No," Rheinhardt said. "It couldn't have been."
"It couldn't have been," Marvin said soberly. "It could not have been. And it was not."
"It was a California of the mind," the girl said.

"My God," Bogdanovich said stepping forward in wide-eyed astonishment, "what a California that would be!" As they watched, he raised his hands to describe a box and held them palms facing down. "Look," he told them, "that's your mind, dig? And here it's all gray, it's all nowhere, it's just dry and barren and terrible trips. But here, dig—at the western end there's a curving beach and white surf rolling up on it. And there's blue and purple islands and high cold mountains and forests with a carpet of pine needles. And orange juice in the clear desert."

"There, there, baby. Don't feel so bad. I'll tell you a little story make you feel better. See, Lester knows how you all can't tell one black person from another because you couldn't live with yourselves and all like that. He enjoys that phenomenon very much, you dig it? Well, one time they sent him down a fool like you and he walked that cat over a whole floor of his wiggly little hotel interviewing different people. All sorts and kinds and shapes of humanity. Every one of them— man, woman and child— was the same cat. It was the greatest Big Store trip ever pulled and old Lester did it sheerly for the sport."

Berry removed his shades and wiped his eyes.

"Fella's name was Archie that was all the people. Archie had a lot of talent but the day was Lester's. It was too much. That white man left with a notebook full of details and a funny feelin' somewhere way down in his head. I don't think it ever really got to him."

He was weeping with mirth, waving his shades in Rainey's face.

Rainey began to laugh with him.

"The Big Store," Rainey said, twisting his rainhat, nearly doubling up.

"That's it, that's it," Berry said, gripping Rainey's shoulder. "Too much."

"Too much," Rainey said.

It seemed to Rheinhardt that he had elicited a respectful silence from the stands; thus encouraged, he went on.

"The American Way is innocence," Rheinhardt announced. "In all situations we must and shall display an innocence so vast and awesome that the entire world will be reduced by it. American innocence shall rise in mighty clouds of vapor to the scent of heaven and confound the nations!

"Our legions, patriots, are not like those of the other fellow. We are not perverts with rotten brains as the English is. We are not a sordid little turd like the French. We are not nuts like the Kraut. We are not strutting maniacs like the gibroney and the greaseball!

"On the contrary our eyes are the clearest eyes looking out on the world today. I tell you that before our wide, fixed blue-eyed stare the devious councils of the foreign horde are confounded as the brazen idolaters before enlightened Moses.

"No matter what they say, Americans, remember this— we're OK! Who else can say that? No one. No one else can say— we're OK. Only in America can a people say— we're OK. I want you all to say it with me.

"We're OK," Rheinhardt shouted raising his arm to invite accompaniment. Someone in the stands was heard to fire a pistol.

INATTENTION

But you could see it now. Taking shape. The short side was completed, and they were half way across the long front, nailing to the seventh post. An enclosure was being made. A wall, the horizontal one-by-sixes parallel, a perfect shape of empty space between them; the upright posts their roots into the ground. There was a texture now; the rough lumber like beard-stubble, splintery to the touch; there was shape and there was texture and marvelous patterned lines and angles at the posts. There was aesthetic going on, and cosmic law. It's measured space, enclosed, D.R. thought. It's a line upon the earth for the work of meat-production to go on behind. They were agents of the fence, its architects and builders; they were building fence, setting limits on the space. The space, enclosed, was inside time, it's two twenty now. . .

"Yeoww! Shit!" and D.R. dropped his hammer and grabbed his thumb and danced around in circles.

Leonard looked up and grinned as D.R. cursed.

"Be kinder to yourself," said Leonard. "Always pay attention to your work."

The Proper Study of Man

Jim Fadiman went to college and read all those books and readings in the social sciences and got acquainted with various pioneers and put together a book of all the good stuff. Now you don't have to go to college.

From *The Diary of Vaslav Nijinsky*

Everybody will say that Nijinsky has become insane. I do not care, I have already behaved like a madman at home. Everybody will think so, but I will not be put in an asylum, because I dance very well and give money to all those who ask me. People like an odd and peculiar man and they will leave me alone, calling me a "mad clown." I like insane people, I know how to talk to them. My brother was in the lunatic asylum.

I was fond of him and he understood me. His friends there liked me too, I was then eighteen years old. I know the life of lunatics and understood the psychology of an insane man. I never contradict them, therefore madmen like me. . .

Life is not sex— sex is not God, God is man, who fecundates only one woman, a man who gives children to one woman. I am twenty-nine years old. I love my wife spiritually, not for begetting children. I will have children if God wishes it. Kyra is an intelligent girl. I do not want her to be clever. I will prevent her from developing her intelligence. I like simple people but not stupidity, because I see no feeling in that. Intelligence stops people from developing. I feel God and God feels me.

The Five Ages of Man

Educational theory presumes that cognitive and intellectual and "social" development is about all that can or need be dealt with in the schools, and the schools act accordingly.

Gerald Heard (scarcely mentioning schools) investigates a deeper education, namely emotional human development both in history and in the individual. His effort is to recognize and honor the various stages of people's relation to their own energies, and recognize and honor the requirement of recurrent further growth, and recognize and assist the hard transitions from one stage to the next.

His notion spreads out like this:

Historical stages (5 crises)	Personal stages (5 ordeals)	Initiations (5 mysteries)
Coconscious man	Birth trauma	Rebirth (Earth)
Heroic, self-assertive man	Childhood (becoming paranoia)	Catharsis (Water)
Ascetic, self-accusing man	Adolescence (schizophrenia)	Inspiration (air)
Humanic, self-sufficient man	First maturity (manic depression)	Illumination (fire)
Leptoid, post-individual man	Second maturity (involuntary melancholy)	Transformation (electricity)

What emerges from all this is pretty radical education. Depending on where a person is hung up, you ritually bury him, or half drown him, or gas him, or burn him, or send electricity through him. Mr. Heard has done much of this to himself and speaks well of the effects. I believe it. Rites of passage are rare these days, and mostly fumbled when they occur. It would be nice to know what's going on and be able to get some help when spontaneous metamorphosis has you spinning.

Says Heard, if we tend properly to all the transitions, we will enable old people to be useful and growing, as seers. Gerald Heard is 80.

Briefly, then, this is the thesis of this book: man can train himself, and he has done so with increasing understanding. Although at first this training was implicit in a rite that worked without being consciously comprehended and, next, it was esoteric and a mystery understood only by psychophysical pioneers, today it can become explicitly exoteric, rendered in contemporary terms and applied with scientific exactitude and as a therapeutic education. Such an education can fully develop both an entire person and a complete society. It can produce a constituent able to accept and fulfill his whole personal process and also be the conscious, willing, and developmental unit of a civilization that is creatively run by a common consent and coterminous with a nonviolent mankind.

Skill

Ever since his "expulsion from paradise," man has been inclined to protest work as drudgery or as slavery, and to consider most fortunate those who seemingly can choose to work or not to work. The fact is that man *must* learn to work, as soon as his intelligence and his capacities are ready to be "put to work," so that his ego's powers may not atrophy.

The rudiments of *skill* add method to hope, will and purpose. Now, what "works" in the fabric of one's thought and in cooperative encounters: a self-verification of lasting importance. All human environments, therefore, meet this stage with the offer of instruction in *perfectable skills* leading to *practical uses and significant achievements*. All cultures have their logic and their "truth," which can be learned, by exercise, usage, and ritual. Where literacy is a common basis for all future specialization, the ruse of grammar and of algebra, of course, form a more abstract demonstration of the workings of reality. Thus *workmanship* and the *reasonableness* which comes from convincing experience prepare in the child a future sense of *competency* without which there can be no "strong ego." Without it man feels inferior in his equipment, and in the hope to match an ever increasing section of manageable reality with his growing capacities.

Erik Erikson, *The Roots of Virtue*

It is now clear that before historic record, but well illustrated by superb pictures, there was a culture that was preindividualistic and to some extent coconscious because it was under a comprehensive suggestion by imposed interpretation and rule. And even today there are fragmentary societies which (as in Australia and Papua) still seem to preserve much of the same cohesion and precritical amalgamation of psychological value and economic profit. Secondly, there is the Heroic Age, which helped to destroy the preindividual condition and which is itself only protoindividual; only crudely critical of the old order; childishly ignorant of its own weakness and faults; boastful, displayful, and un-self-conscious in any sense of objective awareness. It did not understand, it simply reacted. Thirdly, this second stage is succeeded by one of self-questioning and criticism that produces a desire for self-improvement, self-discipline, and finally self-reduction. Then, with struggle, this ascetic, midindividualistic condition passes into the fourth stage when individualism attains totality. At first, man's self-consciousness made him criticize only the tradition-bound group. Then it made him criticize himself. And now, in his complete self-confidence, he no longer sees any need either for boast and shame or for guilt and gratitude. He sees himself as neither condemning nor approving, as being the flawless mirror of the world that is as orderly (and so as repetitively aimless) as he is rational and inventively comprehending.

These four phases have therefore given rise to four distinctive types: (1) the nonpersonal group constituent, (2) the hero, (3) the ascetic and (4) the humanic. And that, until the beginning of this century, seemed to be the culminating end of the story.

For three reasons a specific treatment is required for the present dominant type, the totally self-conscious man, the person of first maturity. (1) Cut off from his own deep, intuitional mind, he must suffer increasingly from a subconscious anxiety. (2) Cut off from interior knowledge of his own body and function rhythms, he must be increasingly attacked by psychosomatic illness. (3) Cut off, psychologically, from the society whose granulation into separate cells he acutely expresses and coercively commands, he must create an international anarchy.

Manas

These guys, whoever they are, are all for making this a better place. They don't shout and they don't make funny. But they say a lot of good stuff for \$5/yr. What got me on to them was that I read somewhere that Manas was a kind of unofficial organ of the humanistic psychology bunch. I'm not sure this fully explains them, as they don't seem to follow any party line. They've got some heroes like Gandhi and Tolstoy, too; but they don't go on and on. They comment on whoever has grist for the mill (Plato, Paul Goodman, Peter S. Beagle, Christ knows who-all). They've turned me on to a whole hell of a lot of really great stuff.

If Buddhism were to contribute to the "Global Canon" its assumptions of "Mind Only," *karma*, and the Unity of Life, our ecological exertions within a chilling space-time continuum might gain some impetus from the emotion Einstein speaks of. But the *mahayana* has more to offer. Its last words affect man alone, as the recipient of self-consciousness, suggesting to him a peak definition of himself. For he is here sponsored as an advanced candidate for *prajna*, total Enlightenment through personal effort, in a world whose equilibriums, endlessly disturbed, are being as endlessly restored under a law of impartial justice.

But then comes the rider. Despite appearances, the effort boomerangs, the reward recedes, whenever *karuna*, compassion, is absent anywhere between the means and the end. Ruthless progress is, in fact, not progress at all.

The bigger logs, ablaze but not yet broken up by the fire, were arranged crosswise in the trench, above the bed of flame made by the pieces that had broken down into small brands and bright charcoal. So a kind of cattle-guard or corduroy walk was made, through which grate or grill the flames rose. The priest with the wands, who had sat before the fire while it was being lit and brought to full conflagration, had now moved and sat at one end of the trench with an assistant seated at the other. They stayed sitting like this for a few moments, after which all was ready for the therapy. The first to walk the length of the trench was one of the chief priests. By then a considerable portion of the lay congregation had been brought near and lined up. Old people, the middle-aged, and youngsters—between seventy-five and one hundred persons went along the trench. Dr. Campbell himself went in his turn. He reports, "I deliberately stepped on some nice fat flames, smelled the hair burning on my legs but found the flames were cool. When I put on my socks again I found that my right ankle, which had been swollen and sore from a strain acquired at Ankor Vat some weeks before, had gone down to normal and no longer hurt. The next day I walked some nine or ten miles and the ankle was still OK. The skin of my feet had not been damaged in the least—not even reddened by the flames. . . ."

A meteorologist friend of Jelinek's, caught in a thunderstorm on a Swiss peak, used the method. Having braced himself against the possibility of being struck, he was hit three times by lightning. But although his clothes were torn and his skin broken, because he was prepared he was neither stunned nor did he suffer anything but the surface abrasions.

The emergence of second maturity, the large class of healthy grandparent can be understood and be availed of only if we see that this fifth phase is inevitable; that it is the essential requirement for the manning of a fifth category of mankind, the fifth age of man as a race and as a person.

Now, with old age and at the upper end, Nature restores freedom of choice and permits, once again, that rightful irresponsibility to enquire and explore regardless of consequences. Being relieved of the armor of authority and the enforcement instruments of command, those in second maturity are once more at liberty to enquire rather than to order, and to question rather than reply.

Second maturity is a return to a regenerated outlook emotionally and intellectually, a resumption of generalized response. Hence, it can be the state in which it would be natural for the capacity of seership to be attained, to re-emerge. And, with that capacity, to regain a generalized affection, good will, and anxiety-free concern and vision into the nature of time that would explicate death by uniting the mind with eternal life.

The actual procedure of the water initiation would, then, involve first an immersion, naked and in a tank of circulating water kept at body temperature, and wherein the body would be irrigated exteriorly and interiorly. The eyes could see, through a glass visor, the water-suffused and wavering light that should probably also have rhythmic light patterns given it by the use of a stroboscope. The ear should be vibrated by sound rhythms of a comparable frequency sent through the water, which is a better sound-carrying medium than air. In this medium and state the postulant should first be floated. But after ten minutes the water in the tank would be made to begin a pulsing, vortex movement. And against this whirlpool he would have to struggle until exhausted. At this point he should achieve a further loss of self; he should emerge into an enlarged state of consciousness.

SIX SUB-SYSTEMS OF MAN'S EXTERNAL METABOLICS

Definitions

Materials Conversion— Sub-system whose function is to reduce complex or heterogeneous matter-energy into more simple or basic forms of matter.

Tool Making— Sub-system that takes pure or processed matter (from matter conversion) and makes it into more organized configurations that are to be utilized by all sub-systems (including tool making). Tool making outputs all tools and contact products (see definitions) but not services.

Power Conversion— Sub-system that transforms unutilizable matter-energy into energy utilizable by the entire technological system.

Transportation— Sub-system whose primary function is to deliver matter-energy forms and some types of information from sub-system outputs to desired inputs of the sub-systems. Transportation also performs storage functions for matter-energy and information temporarily not being utilized by the technological energy.

Media-People— Sub-system whose primary function is to accumulate, integrate, store and distribute information for all sub-systems. The effects of people occur primarily in this sub-system.

Everything Else— Those variables in universe over which man has no control (or over which man has relinquished control).

Education Automation

In this book Fuller is mainly concerned with educational access: designing ready access to comprehensive and replicable information and designing mobility as the basis of education.

—SB

Education Automation
R. Buckminster Fuller
1962; 88 pp.

Temporarily out of print, new edition by another publisher in the Fall.

I would say, then, that you are faced with a future in which education is going to be number one amongst the great world industries, within which will flourish an educational machine technology that will provide tools such as the individually selected and articulated two-way TV and an intercontinentally net-worked, documentaries call-up system, operative over any home two-way TV set.

We also find that generally speaking the geographically larger the physical task to be done, the duller the conceptual brain that is brought to bear upon the integration of the scientific discoveries and their technically realized applications. Finally, we get to international affairs, and you know what is happening today.

I would counsel you in your deliberation regarding getting campuses ready now to get general comprehensive environmental controls that are suitable to all-purposes like a circus. A circus is a transformable environment.

You don't need a detailed drawing; we do not make that kind of communication to a craftsman anymore; but all the schools go on teaching that we do. The data no longer goes to the craftsman; it goes to the tools. The idea of drafting measured details is going to become obsolete. We don't want any more measured detail drafting. What we want is the man who gets the fundamental concept, the information significance and can do some comprehensive thinking regarding that information. He will put the data into the information machines, and it will be processed by automation into physical realization of his effective thinking. We don't need many of the myriad of "things" we have had in schools.

Extinction

Of the innumerable topical board games that have come by lately, this is the first we've seen that is both an interesting game with some subject—fresh dynamics and pretty good education. Suppose you're a nocturnal species with a high litter size of 10 and mobility of 20; you're already over-populated and in hazard of famine or pestilence; you breed in swamps and marshes and you have water pollution resistance (water pollution just eliminated your competition in the marshes); you have defense against swift predators, but one of your opponents is crafty and you think the other one is strong since he changed genes last turn; you spin the spinner and get—watch out—migrate and reproduce; what do you do? [I would migrate out of marshes and swamps and up next to the predators before reproducing. Then spread the new individuals thin in 'unfavorable' environments, thus reducing my reproduction rate and keeping well buffered against environmental changes in my breeding grounds. Also I'd look for new genes.]

If the game could include considerations of nutrition, energy cycles, and specialization, I'd be happier with it, but the makers encourage you to add your own rules to make this flexible game closer to the Big Game.

Systems and Education

Author: John Pfeiffer
Title: *New Look at Education: Systems Analysis in our Schools and Colleges*
Publisher: The Odyssey Press, N.Y.
Cost: \$1.00—Paper
Total No. of Pages: 162

Books on systems are usually either loaded with statistical equations so complex that even advanced graduate students can't figure out what the author was saying, or they are specific to esoteric subject, like the hormone system of the species *Ratus Ratus*. Admittedly, such books are important to a very overspecialized scientific few, but for me (a layman) they take on the average of about one year to translate into everyday "living language" to be useful.

However, John Pfeiffer DID IT!!! He wrote a small book, with no excess verbage or professional rhetoric, which describes simultaneously the fascinating history, slow development, and almost karmatic application of systems analysis— all over the recent past thirty years. This in turn, is blended into a concise description of the basic elements of "the systems approach," with numerous "living" example for testimony to the naturalness of being and living with systems.

One last comment. There is fast approaching the long shadow of both individuals, and our entire society, beginning the mad scramble to discover and reset the most important priorities for personal and planetary survival. Which comes first? (Circle One!!!) Racism? Ecology? Cosmic Consciousness? Joy? Education? Poverty? Love? Population? Self-Awareness? Tools? God? Birds? Books? Man? Each group scrambles for identity and social awareness of its cause, and is eaten up by the mass media. And each person does two year stints at this or that, and not having "made it," put on another cause for another two years (with appropriate clothes.)

But what if there is no "first cause (or first sin)? What then? Where to begin!?!? "begin at the beginning, of course!" With everything. And then decide what to do and what to believe in. Pfeiffer helps man begin, by inviting him to take a look at systems, and then to make conscious decisions, with a renewed knowledge that whatever one does is interrelated IN SPECIFIC WAYS to EVERYTHING THAT IS.

Paul R. Poduska
Amherst, Mass.

ATTENTION

Attention drove the afternoon along outside of space and time. It drove the work along like floating free of gravity. It lifted the work above its own resistance and its friction, like running naked after wearing heavy boots and suits of clothes.

It set the posts and tamped them firm.

It drove the nails unerringly, and ran the one-by-sixes across the front and past the dog-leg by the stump, and pointed then along the final side to link up with the other corner of the barn.

It closed the fence. It held them to their task till they had cut a door in the barnwall for the pigs to come out through, and smell out their new universe.

Reluctant, then curious, the pigs came out, cautious, one at a time, then gathered in committee in the corner to inspect D.R.'s and Leonard's work.

They approved.

Grunting, muttering little squeals, they scattered across this unexpected ground, and one pished on it. D.R. and Leonard laughed at that, and D.R. listened carefully to their laugh. He watched closely as Leonard fed the hogs, and closed them back in their stall for the night.

On their way to the house for supper he paid attention when Leonard said: next winter when we have us some good sausage for breakfast we'll remember this day, David.

That thought thrilled D.R. and he paid attention to the thrill.

He paid attention to Roxie pouring turpentine in the wounds from his day's labor. He noticed how her hands felt on his, he paid attention to her presence, close, and to the food she had prepared.

Roast beef, boiled potatoes, beans, cole slaw heavy with mayonnaise, rhubarb, cornbread, cold milk, and then banana pudding for dessert. D.R. noticed every bite he took, he paid attention to his mouth chewing, he tasted every flavor that there was, and all their exotic mixtures in his mouth. He paid attention to the coffee, and when they had finished supper he experienced himself getting up and saying he guessed he better get on up the hill and get his animals fed — and watered — before it got dark.

He thanked Roxie for the supper, and Leonard thanked D.R. for the work. D.R. paid attention to Leonard's face and voice when he said it. Leonard offered to pay D.R. but D.R. said oh no. I owe you that much.

Leonard said, Well, when I get a little time I'll come up and give you a hand.

I'll be needing it, D.R. said.

Come down and go to church with us tomorrow if you want to, David, said Roxie.

D.R. said he didn't think he would, but he thanked her for inviting him.

We'll see you later then, said Leonard.

Yeah, said D.R. Good night, you all.

And he left then. He got home with just enough daylight left to do his chores.

Conscientious Guide to Drug Abuse

I'd call this **THE BOOK** to have around if you or anyone in your family is doing drugs. It has kind, quick, accurate advice.

BUM TRIPS

One of the prime factors inherent in acid is the possibility of incurring a bum trip. This possibility has kept many from tripping. Over the past several years in particular, it has been nearly impossible to obtain pure acid. Most stuff is mafia-originated and cut heavily with speed and/or strychnine (rat poison). Under clinical circumstances, bum trips rarely occur unless provoked. But when acid contains strychnine, speed or other impurities, the possibility of a bum increases tremendously.

The best advice to give straight or inexperienced people about dealing with bum trips is: Don't panic. Be gentle, kind, and smile a lot. If necessary to avert a traumatic chain of events, divert the person with pleasant music or a change of atmosphere (like turning off or on the lights). Most bum trips could have been prevented if the right information was only known by the person's friends ahead of time.

Clinically, Thorazine (a strong tranquilizer) has often been used to relieve the effects of a bum trip. Thorazine works by tranquilizing the system and relieving the built-up tension. Lately the use of Niacinamide has become popular in relieving bummers; this substance, buffered by Niacin or Vitamin B3, chemically changes LSD to another lysergic substance that has no effect on the body or mind.

It seems unlikely that the availability or legal status of LSD will be changed significantly in the next few years. Slowly, as the practical uses are realized, there may be a loosening of restrictions regarding research with the drug. At best, acid may soon be recognized as a legitimate, useful chemical to be given only under careful supervision...

SPEED KILLS. It's true. People have been taking speed ever since it was developed before World War II. How many people have you ever met who have been taking Speed for as much as 10 years? 6 years? A few 3 and 4 year veterans are around, but not in very good shape.

Even smack addicts have a longer life span.

Speed kills. The reason most kids don't notice it is because they have young, healthy bodies that can take a lot of stress and strain before they finally give in. Speed activates the entire body and forces it to race at high rates of speed for long periods of time. The larger the dose, the greater the strain. The smaller the dose, the smaller the strain. This is why Speed can be legitimately prescribed in minute doses (in diet pills, pep pills, etc.), for several months without apparent harm. A lot of speed puts a great strain on the entire circulatory system and often causes aneurism (ballooning) in the arteries or vessels.

Appetite is non-existent. Food is a big drag and it is almost impossible to eat solids. Sleep is also very difficult, if not impossible, during the run. Both lack of appetite and inability to sleep are side effects of speed; the body becomes very wasted when no nourishment or chance for sleep-rejuvenation takes place.

The liver and kidneys, which filter impurities from the system, are forced to over-work. This creates a situation which like operating a complex water pump and filter system without water. It just burns up.

Because of the massive stimulation of the nervous system by Amphetamines and because appetite and sleep patterns are disturbed, an eventual state of toxic psychosis often occurs. This is usually characterized by hallucinations, tremendous panic or fear reactions, with added waves of despondency and depression. During this period it is extremely tempting to avoid the hard comedown by shooting up again or dropping more speed. By the third or fourth day of continuous use the chemical starts taking over, everything seems unimportant.

Speed actually enables years of ageing and deterioration to be squeezed into a few weeks or months.

In addition, Speed freaks often suffer an acute state of paranoia. Friends who used to take Speed imagined that people were staring at them through windows and whenever they weren't looking. The natural uneasiness-nervousness that comes from Speed is intensified by fear of getting caught or busted.

Kids who are on Speed make a big mistake that is common to this and other hard drug users. The more Speed they take, the more their heads get messed up *anyway*, and take more speed to alleviate the anxiety caused by intense confusion. Of course, the end result is only increased confusion, anxiety, and decreased mental capacities. Another proven effect of Speed is eventual damage to brain functions; people who once had full control of the English language find themselves unable to remember proper words, and even have difficulty in speaking. Not all hard drugs will do this—but Speed will.

IN CASE OF SPEED OVERDOSE

Hospitalization is almost never necessary. The person will be very wired at first, eventually leveling off after several hours. Speed may be very dangerous for those with heart defects.

Besides long-term dangers of Speed itself, there are several dangers associated with using needles for the injection of the drug. The most common of these, *hepatitis*, will be discussed here:

HEPATITIS

The common form of hepatitis is "viral hepatitis", caused by an unclean needle or contamination of the drug being injected. There is nausea, loss of appetite, possible vomiting, and usually a feeling of being ill similar to the flu, but on a heavier scale. Following this, jaundice, yellowing of the skin and eyes, usually occurs. After a period of weeks to months, the patient feels fairly well. But the extensive cost and good care involved with such a rehabilitation are usually too much for the average speed freak to afford.

Research that is being done suggests that the average case of hepatitis among speed users is of a more chronic type. Weeks and even months after recovery from hepatitis, blood tests from the liver show high abnormality. It may be that a more chronic disease state is still occurring; cirrhosis of the liver has been suggested by one researcher. Cirrhosis also occurs in some alcoholics; normal liver tissue dies or is choked by other, non-functioning tissue...

ALCOHOL

Classification: Depressant.

Overdose potential: Possible, when taken in sufficient amounts or mixed with Barbiturates.

Physical addiction: Yes.

Common methods of consumption: Ingested, liquid form.

Notes:

Alcohol is a depressant; in chemistry and pharmacology, it resembles chloral hydrate and paraldehyde.

The pitfalls are many and varied. It is among the most dangerous drugs in existence, ranking in the category of Speed, Barbiturates and hard narcotics. An estimated 6 to 7 million Americans are chronic alcoholics, or one out of 30.

The American Pharmaceutical Association, in their pamphlet on "Drug Abuse Education," credits alcohol with causing "acute and chronic intoxication, habituation, physical dependence and addiction. Withdrawal symptoms (delirium tremens) result when alcohol is discontinued."

Because of the extent of the alcohol problem in the US and elsewhere, a great deal is known about treatment and cure of alcoholics. For more information or assistance, contact your local chapter of Alcoholics Anonymous.

Medical Uses: As mentioned earlier, alcohol and hashish were once used as an anesthetic during open surgery with reasonable success. Before either was widely available, alcohol was sometimes used medicinally. (Remember the Old West doctors in the movies?)

Alcohol is extremely dangerous when taken with most Barbiturates because it heightens action of the pills so much that it can create an overdose.

Magically Aborting Unwelcome Trips

About acid bummers &c.:

Assume that human beings are energy devices. Assume that your right hand is a positive pole, your left a negative (vice versa if you're left-handed). Assume that headaches, bummers & the like are symptoms of minor disturbances in energy flow. (These assumptions are not necessarily true. Just a useful metaphor, a convenient way to think, that works.)

To cure a headache, place your positive hand at the base of the sufferer's skull and your negative hand on his forehead. Imagine there is a current flowing through his head from your positive hand to your negative hand, and that this current causes the flow in the sufferer's head to straighten out & flow right, thus terminating his headache. This takes from 5 to 30 seconds.

This works, whether the operator believes it will or not, and regardless of what the sufferer believes. (Beautiful cries of "My God! It's GONE!" are commonplace.) The only requirement is the act of imagination. If you imagine it'll work, it works.

I've used the same process on about 50 acid bummers so far, with 100% success. Variations can be invented freely to suit various circumstances.

This is traditionally called "Magnetic Healing." I prefer to call it & related phenomena "Energy Transactions." Very useful in Magick & other western yogas.

Invent your own techniques. Please tell me what happens.

Relief is probably symptomatic, but saves on aspirin & similar crap.

Chester Anderson
Los Angeles, CA

First Aid

Chemically Aborting Unwelcome Trips

The following is excerpted from a pamphlet by Naturalism, Inc., Box 8318, Chicago, Illinois. L.S.D. Rescue in Chicago is doing a phenomenal service by researching dope at the same time they're cooling bummers. Nowhere else have I seen detailed reviews of the various drugs available in the street ("THUNDER. Grey and black speckled. The Dope is saturated on strychnine pellets. It's a bad trip. BLACK DOMES. Double-domed— dynamite— good tabs.")

—SB

ABORTIVE MEASURES:

Stimulants— Give Ascorbic Acid (vitamin C) 3-6 gr; this absorbs Amphetamine in the bloodstream. Also 7 tbs. Accent (meat tenderizer) or 5 gr. Glutamic acid to relax muscles. Sedatives (Barbituate) and tranquilizers may be used to control excess stimulants.

Depressants— (Barbituates, alcohol, Tranquilizers, and narcotics). Keep persons awake by physical shaking and/or hot & cold showers. Give Caffeine, or coffee, or amphetamine if available. Maintain vital signs, i.e., pulse, blood pressure, respiration. Opiates (Heroin) may be absorbed with Lorfan (3mg-2mg, I.V. or subcut.) or Nalline.

Cannabis (Marijuana, Hash, T.H.C.) Raise blood sugar by giving honey, sugar water, maple syrup. 4-10 oz. sugar water. This causes hyperglycemia which sedates the person. Mild tranquilizers may be used to relax persons in extreme situations. "Accent" is also effective.

Serotonin type drugs— (LSD, DMT, Psilocybin) Give Niacin (B3) 1 gr./50 lbs. body weight to stop hallucinations within 40 min. Prescription abortants include: Valium 5-25mg, Vistaril 25-200 mg., Librium 10-100 mg., Seconal 100-100 mg., Carbril 3/4-3 gr. Also "Accent" 7 tbs., is effective.

Adrenalin (Belladonna, scopolamine) Treat symptoms— give fluids to counteract dehydration. Take temperature often and bring down all fever over 104 degrees with alcohol rubs. Watch the person until the drug has worn off. In case of severe crisis (cholinergic) give physostigmine salicylate I.M. or orally 2-4mg.

Miscellaneous— (Glue) Restore consciousness if necessary. This usually occurs when fresh air is supplied to the person. Artificial respiration may be necessary. If person is conscious, have him inhale some alcohol to break down the glue.

Darvon— Treat symptoms; induce vomiting; if person convulses and respiration is depressed, give nalorphine and/or levallorphan. DO NOT GIVE AMPHETAMINE OR CAFFEINE as these will cause convulsions.

Peace Acid— Treat symptoms. Give 5g Glutamic acid to help person relax.

NOTES: Situations in which a person's life appears to be threatened are handled by a doctor or hospital. Emergency wards are much better equipped to maintain vital functions, i.e., heart, heat, and respiration, and have technical facilities more efficient than those found in the home stomach pumping and analysis of drug while most drug problems can be handled by empathetic and assuring trained friends or counselors, problems such as toxic drug overdose and poisoning may require professional medical care. Always when possible inform the victim when you feel that hospital attention is vital.

Psychedelic Guide to the Preparation of the Eucharist

This is a thoroughly unusual as well as an unusually thorough collection of details concerning the preparation of a number of hallucinogenic substances. There are an initial few pages that editorialize on the legal and ethical aspects of psychedelic drug usage (and some argument might be taken with the proposed dose schedules) but little fault can be found with the detailed recipes and techniques that constitute the bulk of the book. There is provided the do-it-yourself details for everything from organic gardening to organic synthesis.

On the botanical side of things, a number of comments are given concerning the growing of marijuana and its conversion to hashish or red oil. Far more unusual and interesting however are the procedures for the setting up of appropriate fungal culture media for the surface growth of *Psilocybe mycelia* (for the production of psilocybin) and *Claviceps* in submerged systems (for the production of the lysergic acid precursor to LSD). Also along the nature line, the isolation of mescaline and other alkaloids from Peyote is described in extreme detail.

Within the synthetic preparation of various substances, there is some unevenness. The preparation directions for tetrahydrocannabinol (THC) are sketchy; the details for the formation of precursors such as olivetol are clear, but the final steps are presented in outline only. It is doubtful that anyone without some chemical sophistication could successfully follow the procedures, and such a person would certainly have access to the original literature. The synthesis of mescaline, however, is described in adequate detail and several alternate processes are offered. The various indoles (psilocin, DMT and DET) are covered in good detail. Special note must be made of the section on LSD. The conversion of lysergic acid into LSD, and the final purification of the product, is given in exquisite detail. It is doubtful that such a thoroughly exacting account has ever previously been published.

A number of references are made to the scientific literature that will certainly help in filling out the missing fine points. Directions are at hand for the construction of a number of laboratory utensils, but these fall short of sufficient. The suggested modification of a refrigerator will probably not lead to a vacuum pump adequate for the described preparation of red oil from crude marijuana extract.

Finally there are warnings and admonitions advanced to the reader such as the naming of chemicals that are on the federal watched list. Of course, these chemicals to be avoided are to a large measure those that are required for the successful pursuit of the projects described in the book. This paradox is recognized by the editor, who states:

"It must be clearly pointed out that many things throughout this manual have recently become unlawful and no one should ever break the law. Therefore, anyone attempting to pursue the course outlined herein (in countries where prohibited) must be willing to shoulder the burden of persecution which may fall upon him. Since the religious user and chemist are unfortunately not immune to legal retribution, the editors sincerely hope that no one will be forced to martyr himself for his incorrect use of this guide-book"

All in all this is a charming book, pleasantly illustrated, that should serve at least as an engaging conversation piece in most households.

Preparation 2

Step I--Use Yellow Light

5.36 g of d-lysergic acid are suspended in 125 ml of acetonitrile and the suspension cooled to about -20 degrees C in a bath of acetone cooled with dry ice. To the suspension is added a cold (-20 degrees) solution of 8.82 g of trifluoroacetic anhydride in 75ml of acetonitrile. The mixture is allowed to stand at -20 degrees for about 1 1/2 hours during which time the suspended material dissolves, and the d-lysergic acid is converted to the mixed anhydride of lysergic and trifluoroacetic acids. The mixed anhydride can be separated in the form of an oil by evaporating the solvent in vacuo at a temperature below about 0 degrees. Everything must be kept anhydrous.

Step II--Use Red Light

The solution of mixed anhydrides in acetonitrile from Step I is added to 150ml of acetonitrile containing 7.6 g of diethylamine. The mixture is held in the dark at room temperature for about 2 hours. The acetonitrile is evaporated in vacuo, leaving a residue of LSD-25 plus other impurities. The residue is dissolved in 150ml of chloroform and 20ml of ice water. The chloroform layer is removed and the aqueous portions are combined and in turn, washed with four 50ml portions of ice-cold water. The chloroform solution is then dried over anhydrous Na₂SO₄ and evaporated in vacuo.

More dope on p. 210 and p. 62.

Psychedelic Review

The Psychedelic Review is back. It had stopped publication for over a year but — like its godfather Tim Leary — it is alive and well in a new location. Once again it arises to fill the gap between the bio-chemical abstracts and the yellow journalism treatments of psychedelic experience.

The review has been the place to look if you were seriously interested in drug usage, drug effects, drug theories, and drug-oriented art and poetry. The word psychedelic, once limited to drug-induced experience, now has expanded to include other altered states. The review has expanded as well. The latest issue has articles on the world of spirits, the use of pot in curbing alcoholism, LSD as preparation for death, and a multi-faceted view of Tim Leary's present position. Leary, Baba Ram Dass, and Leary's lawyer contribute ideas and reflections.

The Psychedelic Review is the only journal to treat the literary, the scientific, and the spiritual aspects of psychedelic experience equally well. Its return is good news.

By an extraordinary series of circumstances a confirmation appears to have been found for one of Emanuel Swedenborg's more unusual doctrines — that man's life depends on his relationship to a hierarchy of spirits. Out of my professional role as a clinical psychologist in a state mental hospital and my own personal interest, I set out to describe as faithfully as possible mental patients' experiences of hallucinations. A discovery four years ago helped me to get a relatively rich and consistent picture of the patients' experience. Though I noticed similarities with Swedenborg's description of the relationships of man to spirits it was only three years after all the major findings on hallucinations had been made that the striking similarity between what Twentieth-

Hemp

Hard work, but we must get there too. Also we must stop being such heads and learn the art of the follow-through. "Where were you? Why weren't you there? Why were you so late? Why didn't you finish it? Why don't you remember?" Hemp is a tool, not a separate universe.

—SB

When the British government was investigating the effects of marijuana on the Indian populace in the 1890's, they conducted a series of biological experiments with monkeys. One animal was trained to smoke a combination of marijuana and *Datura* and was allowed to continue this practice for a number of months. The monkey was then sacrificed and the autopsy revealed abnormally soft cerebral matter, while the other parts of the brain were in various stages of decomposition. None of these effects were seen in those monkeys trained to smoke only marijuana, and the doctors concluded that *Datura*, when used over a prolonged period of time, can directly cause organic brain damage.

It seems a sad commentary on the state of the present "psychedelic subculture" that the very practices of the establishment which are criticized as hypocritical (a lack of "truth in packaging" and the slick merchandizing techniques of Madison Avenue) are the same practices employed by the purveyors of our chemical sacraments. When television sells Middle America an electric toothbrush, it does not sell the toothbrush, but an entire way of living (of which the toothbrush is but one small component). In much the same manner the dealer who offers his clientele a plethora of "mind-altering goodies" (from 4-way "sunshines" to speckled psilocybin "pumpkin seeds") performs as much a disservice to the "counterculture." Unwary and inexperienced buyers are being led to believe that if they haven't been "stoned" with Dealer X's acid, then they've never been "stoned." A mind washed in one dealer's mescaline is purported to be "whiter than white" while the head of the unfortunate user of brand X seems to display the same old discouraging collar stains. "New" and "improved" preparations are being hawked with all the fervor of the quack who sells us Anacin on the tube.

Scores of underground chemists who have discovered that the *Life* magazine claim that anyone who received a B in high school chemistry can make good, pure LSD is a myth, have compensated by spiking their concoctions with everything from amphetamines to belladonna alkaloids. The powerful financial incentives associated with the manufacture and sale of illicit psychedelics have, unfortunately, attracted the same types of unscrupulous merchandisers who have grown rich convincing us to buy cars that are unsafe, diet drinks that cause cancer and a frightening variety of status symbols that are of no human use. As a result, many of the "freaks" who have gotten involved with the psychedelic scene in the past few years may have never had a real LSD experience. It is not difficult to comprehend the increasing cynicism of the "flower children" as they are manipulated and possibly even poisoned by people taking advantage of their implicit trust in others.

PSYCHEDELIC

Century patients describe and Swedenborg's Eighteenth-Century accounts became apparent to me. I then collected as many details as possible of his description. I found that Swedenborg's system not only is an almost perfect fit with patients' experiences, but even more impressively, accounts for otherwise quite puzzling aspects of hallucinations. I will first describe how I worked and my findings, and then relate this to Swedenborg's work.

It would appear that for selected alcoholics the substitution of smoked cannabis for alcohol may be of marked rehabilitative value. The drug effect of cannabis, as compared with alcohol, while having a sense of euphoria and detachment in common, lacks any other similarity except the intent for which it is taken. Excessive alcohol use produces a predictable weakening and dissolution of various superego and ego functions, whereas cannabis does not seem to have this attribute, providing, if anything, an increase in ego strength. Because cannabis does not facilitate ego alien behavior as seen with alcoholic excess, a great burden of guilt if removed, thus freeing the individual for more constructive pursuits.

The fact that cannabis did not produce symptoms of irritability upon withdrawal, nor effects on the gastrointestinal tract, as compared with alcohol, also assists in the rehabilitation of the individual. Since he is not physically sick any more, he is thus free to begin resocialization with the expansion of his consciousness to perceive the subtleties of the world beyond his needs for immediate gratification or succor. Certainly cannabis is not a panacea, but it warrants further clinical trial in selected cases of alcoholism.

DOSAGE BY WEIGHT

Drug	Light	High	Experienced User	Normal	First Psychedelic	Maximum safe dose
LSD	20-50 µg	100-200 µg	300 µg	400-800 µg	1000-3000 µg	20 mg
THC	1 mg	2.5 mg	5 mg	10 mg	20 mg	50 mg
STP	5 mg	10 mg	22 mg	35 mg	50 mg	100 mg
DMT	5-10 mg	20-30 mg	40 mg	50-60 mg	100 mg	150 mg
Psilocyn	5-10 mg	20-30 mg	35 mg	40-60 mg	100 mg	1000 mg
Mescaline	50-200 mg	300-500 mg	400 mg	600-800 mg		

The very light doses only give a feeling of well-being and seldom cause much hallucination. The experienced user can achieve the psychedelic effect with less of a dose, grading off to no drug at all. A person trying to experience the full psychedelic effect for the first time needs to be disconnected much more fully, therefore the larger dose. The largest doses cause a complete break with reality that few can handle pleasantly. The slight toxic side effects are not a major factor in considering the dosage because the hallucinogenic effects are so much more overwhelming at those high doses that other factors are minimized. The crude natural substances are not listed here because the amount of drug available does not follow any reliable weight percentage as the quality of these substances is not at all constant.

SUNDAY: THE MINE

Walking, body jolting, downhill. It's Sunday morning now and D.R. is on his way to explore the old abandoned coal mine he'd freaked out in his first day back at Trace Fork. It's been on his mind for several days to do it, to crawl back in with a light of some kind and get a real look at that place. He has passed the ruins of the tippie every time he has gone in or out of the hollow; but until this morning he has always been on some specific errand or other, and there has been no chance to stop and look around.

But it's Sunday now, his day of rest and leisure. D.R. slept till almost ten, fixed himself some eggs and fried a slice of green tomato for breakfast, and now at about the hour the other people of the community are gathering for Sunday worship at the church, D.R. has set out from the house with this very special destination in mind.

There were other things in D.R.'s mind too as he jolted down the hill, but they were bouncing around in such a chaos of broken images he wasn't paying them much attention. Pictures of the day before with Leonard, working, were vivid, and entirely pleasant to see: Leonard wiping sweat off his face, and grinning; the way the long one-by-sixes formed angles with the upright posts; and then an image of the finished pen itself, a space enclosed; all of those were pleasant scenes to see. But they flashed and flickered and jumped around so fast D.R. couldn't hold to any single one long enough to bring it into focus.

Shots from further in the past than yesterday were mixed in too. He caught a glimpse of himself walking out of Trace Fork years ago, a child among a group of people on their way to church on Sunday morning.

And then he saw Estelle lying on her back on that big rock where they'd made love that time, by the river.

He heard the sound that cars make when they pass real fast, that sudden whooshing of the wind, and he caught a glimpse of cactus by the roadside on some desert he had travelled in a car.

The Hallucinogens

You wouldn't nose out onto the freeway if you didn't know how to drive, and you damn well shouldn't go playing "eat me," and "drink me" unless you know what you're about. Here, in a book ostensibly for the medical profession, is the whole story to date. Hoffer and Osmond know more about this field than anyone else in the world, and their aim is to investigate it further. Osmond is one of the unsung sages of our times, working quietly in his own way to find out the nature of human nature. (He is a leading researcher into schizophrenia, the coiner of the word "psychedelic", the doctor who gave Huxley his mescaline, and is into a hundred other interesting things, including the reliability of the Jungian personality types. There are at least a few pages on every hallucinogen you've ever heard of, and on a lot you haven't; e.g.: the "dream fish" *kyphosus fuscus*, and the plants the ancient Norse used to induce the state of "berserk" (and why it became, among themselves, illegal.) Where previous experimenters have used themselves as guinea-pigs, their diaries are reprinted, e.g.: Wasson's trips with *psilocyba mushrooms*. In most cases, Osmond has tried the stuff himself; and he is a very patient, understanding and aware guinea-pig indeed. For people who remember their college chemistry, the molecular diagrams are here, for people who want to read more an exhaustive index shows you the way. This is a source book of knowledge, but by the by Osmond has two main observations of a philosophical nature: 1) man has been looking for hallucinogens from the beginning, and has been finding them, and 2) you don't get something for nothing. You can believe this man; he has smoked with the best of them, and popped things into his mouth that haven't been tried in a few centuries.

Warning: not reading this book may be injurious to your health.

Perhaps nutmeg pastry is popular because of the myristicin it contains. A feeling of well-being, following the ingestion of these cakes, might easily lead to a conditioned reaction to this pastry. In the same way it is likely that adrenoxyl is used by surgeons because of the feeling of well-being it induces in their patients, and not because it is a valuable hemostatic agent (Hoffer and Osmond, 1960). The euphoric or relaxant properties of nutmeg and of myristicin should be examined carefully. Too little attempt has been made by modern man to discover safe plant antitension and euphoric remedies.

There is a difference between LSD and other hallucinogenic compounds. LSD seems in small doses to act as a stimulant not unlike amphetamines, in larger doses it seems to possess a depressant effect. Other hallucinogenic compounds tend to have depressant effects at all the dose levels.

We had, as we later learned, merely hit upon a solution to alcoholism which the Native American Church of North America, or its antecedent groups, had used long before. According to Slotkin (1956) the Indians believed peyote took away the desire for strong drink and claimed that hundreds of drunkards had been "dragged from their downward way." The small band of Indians in Saskatchewan who allowed us to observe their ceremonies one night, explained that their religion based upon God and the use of peyote to reach Him included three important principles: (a) The member must be a good man, (b) he must educate himself, and (c) he must not drink. Thus we can only conclude that the peyote religion is the chief variable. Several Indians related to us how they had achieved sobriety only after this church.

Mr. Russell had the black drum passed to him. He sucked a little water from it, tautened the hide, and smoothed it with a caress. Frank Takes Gun explained the next part of the ceremony. "You have only seen three last night — the leader, the drummer, and the fireman. Now you will see the fourth. Thank God we have lived to see another day. We represent our lives: we don't imitate anything. The foundations of human life rest with our mothers who delivered us into this world." The Mother stepped into the tepee through the door flap, announced by the shrilling of the eagle's-bone whistle. She sat down by the white enamel waterpot. The tepee was dim, the fire was low, but some wisps of smoke rising from it seemed to surround her. She had a red blanket around her shoulders, a blue dress, smooth black hair, and her face seemed very broad. She was greeted by a song of welcome with voices, drum, and rattle. With the singing, she became superb mother earth, mother prairie, grass, cow buffalo, mare, and doe, the epitome of motherhood. The drum beating was not restful or sleep inducing. It was the fecund pulsing of sex, passion, generation, and death, sung without guilt and without self-consciousness. The mother was weary, patient, tender, but enduring. She stood behind all the men — drummer, fire tender, leader. In front of her were the waters of life and death.

Frank addressed her in the highest falsetto, a tearing, almost noiseless scream, the cry of the tiniest baby or of an old man breathing his last. It was unbearable. The mother could have been any age — maid, mother, or crone, from sixteen to a hundred sixteen.

"You have been good to us while we were here. You worked hard and made this possible. God knows we worship Him. God knows we respect the mothers of our children."

The happy, oceanic feeling so often experienced by normal subjects was also evident among preterminal patients. It could be noted up to twelve days following the administration of LSD . . . A certain change in philosophic and religious approach to dying took place that is not reflected in the numerical data presented here . . . Real terror experienced upon the contemplation of death in preterminal patients, as well as in normals, consists of fear of the loss of control of internal functions and environmental influences. It is self-evident that control can be achieved only to a very limited degree, but this small degree of control has enormous survival value. In conjunction with this actually very limited ability to influence internal and external events, goes a fantasy-feeling of power to shape one's fate and an adult elaboration of the infantile feeling of omnipotence and omnipresence. The realization of imminent death obviously deals a heavy blow to that fantasy.

During and after LSD administration, acceptance and surrender to the inevitable loss of control were noted; and this control is anxiously maintained and fought for in non-drugged patients. LSD administration apparently eases the blow that impending death deals to the fantasy of infant omnipotence, not necessarily by augmenting the infantile process, but by relieving the mental apparatus of the compelling need to maintain the infantile fantasy. Parallel to the general improvement in the patient's feelings, mood, and conflict situation, sleep patterns improved for approximately twelve to fourteen days . . .

The results of this study seem to indicate that LSD is not only capable of improving the lot of preterminal patients by making them more responsive to their environment and family, but it also enhances their ability to appreciate the subtle and aesthetic nuances of experience. This increased delicate sensitivity is as marked as that usually encountered in normal volunteers subjected to LSD. Here, however, this imagery not only gives aesthetic satisfaction, but creates a new will to live and a zest for experience that, against a background of dismal darkness and preoccupying fear, produces an exciting and promising outlook. Patients who had been listless and depressed were touched to tears by the discovery of a depth of feeling of which they had not thought themselves capable. Although short-lived and transient, this happy state of affairs was a welcome change in their monotonous and isolated lives, and recollection of this experience days later often created similar elation. Of course, these subtleties cannot be appraised in numerical terms. In human terms, however, the short but profound impact of LSD on the dying patient was impressive.

—Eric C. Kast

Acorus calamus is a plant known in Asia, Europe, and North America for its medicinal properties. It was also known as flag root, rat root, and sweet calomel. During the great depression of the 1930's it was chewed in England by people unable to buy tobacco.

Recently one of our informants well acquainted with the habits of the Indians of northern Canada, reported his personal experiences with rat root collected in northern Alberta by the Cree. He reported that nearly all the Indians over age 40 used rat root regularly but the younger Indians were unfamiliar with it and its use was discouraged by physicians who practiced there. Rat root users seemed to be healthier, and were not subject to alcoholism. The Indians used rat root (a) as an antitague medicine (they chewed about 1 inch of the dried root which had a diameter equal to a pencil); (b) as an analgesic for relieving toothache, headache, etc.; (c) for relief of asthma; (d) for oral hygiene, and (e) to relieve hangover.

Our informant had over the years tested these medicinal qualities and generally confirmed them. It was particularly effective for alleviating fatigue. On one occasion, he walked 12 miles in the northern woods to fight a forest fire. He was out of condition and was exhausted at the end of the march. He chewed and swallowed 2 inches of rat root. Within 10 minutes the fatigue vanished and on the return march he seemed to be walking 1 foot above the ground and felt wonderful. The effect was very unlike amphetamine. On his return home he was very exhausted but after a night's sleep was normal.

LSD was used not only in "Island," but in Chicago to relieve pain. It has powerful analgesic properties. Kast and Collins (1964) gave LSD to a group of patients many of whom knew they were dying of terminal cancer. In addition to their relief from pain some of the patients developed a peculiar disregard for the gravity of their situation. They spoke freely of their impending death with much less depression than they had had previously. The newer attitude to death lasted much longer than the analgesic action. It is likely those who have a visionary, psychedelic or transcendental reaction may equate this with life after death. This would account for the new more beneficial frame of mind for those patients who were dying.

One of our subjects recently told us that since his psychedelic experience several years ago, he no longer feared death.

The bark of the root of *Tabernaemontana iboga* contains about 12 alkaloids (Downing, 1962). Of these the best known is ibogaine, a tryptamine derivative. This plant, named in 1889 by Baillon, was used by the natives of West Africa and the Congo to increase resistance against fatigue and tiredness and as an aphrodisiac. Dybowski and Landrin (1901) extracted the psychologically active alkaloid which they named ibogaine. They reported that the natives considered the plant equivalent or similar to alcohol, that it was a stimulant which did not disturb the thought processes of the user.

The recent impassioned discussions of the possible effects of LSD on chromosomes is paralleled by similar discussions over masturbation. It was stated with the utmost confidence that not only would the secret vice result in the collapse and insanity of those who practiced it, but should they be unfortunate enough to survive to adulthood, their children would suffer for their sins. There was no evidence for this, but it did not prevent men of the highest integrity from stating that it was undoubtedly so.

While not everyone might choose to die with his mind stimulated by LSD, as did Aldous Huxley (Huxley, L.A., 1968), rather than dulled by morphine, such matters call for careful consideration, for each of us owes God a death.

If Victor Gioscia (1969) is correct, and there is an LSD subculture, the dangers, particularly to those under thirty, require very careful consideration. Leaving out chromosome damage, perhaps the most dramatic misfortune is the development of a schizophreniform illness. There is no doubt that this can happen, though it is not clear how often it does. Certain myths current among some young drug takers increase the danger. One of the most unfortunate is that the appropriate remedy for a bad trip is another one, frequently with a larger dose than that which produced the first one. This notion is on a par with the alcoholic slogan of having a hair, or even the tail, of "the dog that bit you." The sensible response to a bad trip is not to have another, but to seek competent advice and guidance without delay. Some people, who are clearly developing schizophrenia and have disturbances of perception (Hoffer and Osmond, 1966a) combined with usually depressed mood changes, with anxiety and sometimes thinking difficulties, take psychedelics because they have heard, or hope, that they will help. The most probable outcome is a severe and prolonged bad trip, or sometimes the precipitation of a more-severe and actual illness. If these dangers were more widely known and understood, many young people would avoid trying to treat themselves by these desperate means and avoid much unhappiness and distress.

The sociological, psychological, political, and other consequences of psychedelic experience, however induced, occurring in the majority or even a substantial minority of a postindustrial population, is likely to affect most of us far more than a few space jaunts for carefully selected heroes and heroines. The record is merciless: practical men of sound sense are nearly always wrong about the future, though never lacking in certainty. While the winds of change strum to gale force around us, they perform their ostrich acts and proclaim that they have everything under control. But the gale does not blow itself out because of their rhetoric, and to survive, we need to set a course that carries us into the future. Some years ago one of us wrote (Osmond, 1957a):

. . . these agents have a part to play in our survival as a species, for that survival depends as much on our opinion of our fellows and ourselves as on any other single thing. The psychedelics help us to explore and fathom our own nature.

We can perceive ourselves as the stampings of an automatic socio-economic process, as highly plastic and conditionable animals, as congeries of instinctive strivings ending in loss of sexual drive and death, as cybernetic gadgets, or even as semantic conundrums. All of these concepts have their supporters and they all have some degree of truth in them. We may also be something more, "a part of the main," a striving sliver of a creative process, a manifestation of Brahma in Atman, an aspect of an infinite God immanent and transcendent within and without us. These very different valuations of the self and of other people's selves have all been held sincerely by men and women. I expect that even what seem the most extreme notions are held by some contributors to these pages. Can one doubt that the views of the world derived from such differing concepts are likely to differ greatly, and that the courses of action determined by those views will differ . . . ?

. . . I believe that the psychedelics provide a chance, perhaps only a slender one, for homo faber, the cunning, ruthless, foolhardy, pleasure-greedy toolmaker, to merge into that other creature whose presence we have so rashly presumed, homo sapiens, the wise, the understanding, the compassionate, in whose fourfold vision art, politics, science, and religion are one. Surely we must seize that chance. . .

Psychedelics

A fine collection of the best papers by the man who coined the word *psychedelic*. Some good research got done before the Federal ban.

Once out of the water, I started climbing the mountain on a sacred pilgrimage. I stopped to examine small flowers and brightly colored rocks. I picked the flowers, putting them in my hair. The world shone with the joy of existence.

Again on level ground, I ran along, feeling Indian things. With virtually no plant growth in sight, I was hacking my way through jungles. I saw visions of snake gods, and received stories to take to my people. When I looked down to the oasis below, my friends, the others there, the wind caressing the water — all poignantly symbolized the human condition. Everybody should have a chance to see this vast panorama of man's existence on earth. To see the tides of nature, as I did then, seems an overwhelmingly marvelous thing in itself.

—Peter Stafford

Shortly after this my fellow observers left for what must have been twenty minutes or so, but it could have been as many centuries. I stayed behind with the Indians, and I became part of the worshippers. I entered their world, where for generation upon generation they had hunted the buffalo. They had lived with and on the buffalo. They were of one piece. They were the buffalo. Their lives were part of those shaggy lumbering herd beasts whose myriads roamed the great plains. On these wide prairies, where trees and hills are almost equally scarce, sound often conveyed as much as sight. So the Indians call up their past with song, with drum, and with rattle. For them, minute alterations of rhythm and pace evoke ever-changing images. Because we cannot hear as they do, the drumming and rattling seem endlessly repetitive to us. The drumming was the steady running of a man with his dog padding beside him. It was the pawing and thudding of buffalo hooves crescendoing in thunder. It was the gentle crumpling of dung falling or the soft plop of a calf dropping on turf, soundless, yet heard by the hunter. The gourd evoked the endlessly sifting wind, catching at scrub and grass as it passed. It was the hissing of an arrow as it leaves the bow or snakes by one's head in battle. It was the sizzling of buffalo meat grilling on the campfire and the creak of a hide tepee as the blizzard twists and whirls around it. The drumming was life and death, scarlet blood spurting from a stricken buffalo or from a fallen warrior. Yet it was also the first fluttering of a child inside its mother. As he sang, a young man wept, and Frank Takes Gun said, "Shed tears on mother earth that the Universal God may take pity on him."

When my friends returned, I felt that the Indians and I were one and that, for a little time, or more accurately, a different sort of time, I was of their world rather than that of my colleagues, their point conquerers. It was not simply that I realized they had a point of view I could respect, but that I felt in my bones as they felt in theirs. Looking back, I do not believe that this was an illusion, for I continued to be much more aware of their way of looking at things. But how could one prove such an opinion — without fine instruments for measuring a man's system of values.

—Humphrey Osmond

Altered States of Consciousness

If you're doing anything with meditation, dope, hypnosis, dreams, subjective exploration of any kind, this is a useful book. John Lilly borrowed our review copy and returned it with particular recommendation for these articles:

A Special Inquiry with Aldous Huxley into the Nature and Character of Various States of Consciousness	Milton H. Erickson
Toward the Experimental Control of Dreaming	Charles Tart
A Study of Dreams	Frederik van Eeden
The "High" Dream	Charles Tart
Mutual Hypnosis	Charles Tart
The Effects of Marijuana on Consciousness	Anonymous
Subjective Effects of Nitrous Oxide	William James
Attitude and Behavior Change Through Psychedelic Drug Use	Joseph Downing
Psychedelic Agents in Creative Problem Solving	Harman, McKim, Mogar, Fadiman, Stoleroff
Guide to the Literature on Psychedelic Drugs	Charles Tart
An Electroencephalographic Study on the Zen Meditation	Kasamatsu, Hiral
Operant Control of the EEG Alpha Rhythm and Some of Its Reported Effects on Consciousness	Joe Kamiya

Elsewhere in the CATALOG is a book called *Direct Use of the Sun's Energy*. Tart's book is moving toward *Direct Use of the Mind's Energy*.

1. The first three to five hours are usually individual, to try to relax and let go.
2. Spouses' problems; usually we like spouses separate for first group treatments. If both are present, it is better if you start in different areas, but if you both want to be together, okay.
3. Don't be surprised at anything you may see the therapist doing—he knows what he is doing.
4. A person who is having trouble breaking through needs something to resist against—the therapist may hand wrestle, or be on top and have three to six others on top as well. The person then can exert all his strength to break loose.
5. Anytime you are in trouble, don't hesitate to ask for help.
6. As people make break-through you'll hear laughing, crying, screaming. Don't worry about it, or get concerned.

7. Nothing is expected of you, don't expect anything of yourself—most people have a glorious trip.
8. Try to avoid impressing anybody—you'll have a better trip.
9. Around three to four hours after beginning, a stimulant will be brought around to keep your energy level up.
10. Anytime you want to stop the trip, take some niacin, 500 to 1000 mgm at a time. Niacin is good for bad re-entry, will make it easier.
11. During the experience, if you want to come together, touch the other person or ask him. He may shake his head 'no,' or else turn and touch you. Don't have hurt feelings, or guilt if they don't want to be with you, be freed to be yourselves.

The change that then came over Bill was dramatic. He began mumbling typical induction suggestions about relaxing, but over the course of a few minutes his voice became dramatic and forceful. He suggested that Anne see a diamond in her hand and concentrate on it and then almost immediately suggested that it would disappear and her mind would go blank. Then he very forcefully suggested physical relaxation as he counted her into hypnosis: when he reached 20 his whole manner changed and became relaxed and soothing. Anne reported a depth of 22.

Bill then began talking about a 'hallucinatory' journey that he and Anne were on together. His voice was confident, smooth, relaxed, and completely convincing that he was describing actual events that were happening rather than anything 'unreal.' They were standing on a mountain slope, in front of the entrance to a tunnel. They walked hand-in-hand down this tunnel, with the explicit suggestion by Bill that they would be going deeper into hypnosis as they walked deeper into the dark tunnel. It was quiet in the tunnel, all outside noises had vanished, and an ineffable feeling of pleasantness and significance pervaded the tunnel. Anne reported a depth of 35 after a few minutes of this, and Bill continued describing their walk down the tunnel.

The tunnel was absolutely real to Anne and Bill (and to Carol), as real as any experience in life. Although it was dark they could 'see' its walls in a strange way: Anne said it felt as if she had a 'light' coming out from under her eyebrows, and "...it wasn't illuminating anything I was seeing, yet it helped me to know that things were there without seeing them." Both Ss reported feeling the texture of the rock walls, which ranged from soft and slippery at places where it seemed moss-covered to quite hard where the bare rock was exposed.

Anne and Carol were intensely curious as to what lay at the end of the tunnel, the end that Bill would not let them reach. This resulted in an interesting aftermath. About a month after this session, Anne was a subject in a group hypnosis test. As she knew what the induction procedure was, she decided to 'go' back to the tunnel and explore it as soon as she was hypnotized but before the suggestibility test items were administered. She found herself running along the tunnel, hurrying to reach the end before the test items. At the end of the tunnel she found a cave, blazing with brilliant white light, and occupied by an old man of angelic appearance. The room was filled with music from an unseen source. Anne repeatedly asked him what this experience meant: he ignored her at first, and finally told her, very sternly, that he could not answer her question because Bill was not with her. Anne then found herself back at the group hypnosis testing.

I asked the Ss about their perceived bodies during the experience and found that they were curiously disembodied much of the time. They mentioned having heads or faces but no bodies at times, and Anne reported that they walked through each other sometimes. When Bill commanded Anne to give him her hand so he could lead her back, Anne reported that she had to "crawl back into my body, sort of. It was almost as if we were moving around with just heads. When Bill said give him my hand, I had to kind of conjure up a hand."

There is a better, faster way. Happily, there seems to be built-in directional senses if their use can be mastered. The "if" is the catch. As noted elsewhere, you "think" of the person at the end of your destination—never a place, but a person—and use the method prescribed. In a few moments, you are there. You can watch the landscape move under you if you wish, but it's a little disconcerting when you rush headlong toward a building or tree—and go right through it. In order to avoid such traumas, forget about seeing during the traveling process. You never quite get over the physical-body conditioning that such things are solid. At least I have not. I still have the tendency to move in the direction of the door to leave—only to realize again the situation when my Second body hand goes through the doorknob. Irritated with myself, I then dive through the wall rather than the door to reinforce my awareness of the Second state characteristics.

In conjunction with this convenient homing instinct that is uneffected by distance, you are given a further problem. The automatic navigational system is accurate, too accurate. And that is the problem. It works by what and of whom you think. Let one small stray thought emerge dominantly for just one microsecond, and your course is deviated.

This near area is not a pleasant place to be, albeit completely understandable from this viewpoint. It is a level or plane where you "belong" until you learn better. I don't know what happens to those who don't learn. Perhaps they stay there forever. The moment you disassociate from the physical via the Second body, you are upon the fringes of this close-by section of Locale II. It is here that one meets all sorts of disjointed personalities and animate beings, such as described in Chapter X. If there is some protecting mechanism for the neophyte, it was not apparent to me. Only by cautious and sometimes terrifying experimentation was I able to learn the art or trick of passing through the area. I still am not sure precisely of all this learning process, and so have presented only the obvious. Whatever it was, I happily have not been troubled in such passages for several years.

Anne and Bill read the transcripts over and were both shocked. They had been talking about their experiences to each other for some time, and found they had been discussing details of the experiences they had shared for which there were no verbal stimuli on the tapes, i.e. they felt they must have been communicating telepathically or that they had actually been 'in' the nonworldly locales they had experienced. This was frightening to both Ss, for what had seemed a lovely shared fantasy now threatened to be something real.

The most coherent and articulate sentence which came was this:
There are no differences but differences of degree between different degrees of difference and no difference.

Wonderingly, but with outward calm, I undertook to arouse Huxley from the trance state by accepting the partial clues given and by saying in essence, "Wherever you are, whatever you are doing, listen closely to what is being said, and slowly, gradually, comfortably begin to act upon it. Feel rested and comfortable, feel a need to establish an increasing contact with my voice, with me, with the situation I represent, a need of returning to matters in hand with me not so long ago, in the not so long ago belonging to me, and leave behind but AVAILABLE UPON REQUEST practically everything of importance, KNOWING BUT NOT KNOWING that it is AVAILABLE UPON REQUEST. And now, let us see, that's right, you are sitting there, wide awake, rested, comfortable, and ready for discussion of what little there is."

As he watched, he became annoyed with me since I was apparently trying to talk to him, and he experienced a wave of impatience and requested that I be silent. He turned back and noted that the infant was growing before his eyes, was creeping, sitting, standing, toddling, walking, playing, talking. In utter fascination he watched this growing child, sensed its subjective experiences of learning, of wanting, of feeling. He followed it in distorted time through a multitude of experiences as it passed from infancy to childhood to school days to early youth to teenage. He watched the child's physical development, sensed its physical and subjective mental experiences, sympathized with it, empathized with it, rejoiced with it, thought and wondered and learned with it. He felt as one with it, as if it were he himself, and he continued to watch it until finally he realized that he had watched that infant grow to the maturity of 23 years. He stepped closer to see what the young man was looking at, and suddenly realized that the young man was Aldous Huxley himself, and that this Aldous Huxley was looking at another Aldous Huxley, obviously in his early fifties, just across the vestibule in which they both were standing; and that he aged 52, was looking at himself, Aldous, aged 23. Then Aldous, aged 23 and Aldous aged 52, apparently realized simultaneously that they were looking at each other and the curious questions at once arose in the mind of each of them. For one the question was, "Is that my idea of what I'll be like when I am 52?" and, "Is that really the way I appeared when I was 23?" Each was aware of the question in the other's mind. Each found the question of "Extraordinarily fascinating interest" and each tried to determine which was the "actual reality" and which was the "mere subjective experience outwardly projected in hallucinatory form."

When I have been flying in my dreams for two or three nights, then I know that a lucid dream is at hand. And the lucid dream itself is often initiated and accompanied all the time by the sensation of flying. Sometimes I feel myself floating swiftly through wide spaces; once I flew backwards, and once, dreaming that I was inside a cathedral, I flew upwards, with the immense building and all in it, at great speed.

You are unaware of differences in sex, you yourself as a part of the Whole, are both male and female, positive and negative, electron and proton. Man-woman love moves to you and from you, parental-child-sibling-idol and idyl and ideal—all interplay in soft waves about you, in you and through you. You are in perfect balance because you are where you belong. You are Home.

Within all of this, yet not a part of it, you are aware of the Source of the entire span of your experience, of you, of the vastness beyond your ability to perceive and/or imagine. Here, you know and easily accept the existence of the Father. Your true Father, the Father, the Creator of all that is or was. You are one of His countless creations. How or why, you do not know. This is not important. You are happy simply because you are in your Right Place, where you truly belong.

Each of the three times I went There, I did not return voluntarily. I came back sadly, reluctantly. Someone helped me return. Each time after I returned, I suffered intense nostalgia and loneliness for days. I felt as an alien might, among strangers in a land where things were not "right," where everything and every one were so different and so "wrong" when compared with where you belonged. Acute loneliness, nostalgia, and something akin to homesickness. So great was it that I haven't tried to go There again.

The pictures and the images squirmed in D.R.'s mind like worms in a can. His mind was alive with their flickering dance, their scatter and their swirl, and it remained that way till he had left the world of sunlight and crawled into the darkness of the mine.

The mine.
That old coal mine hidden under the fallen tippie, there by the Trace Fork road.

It was an easy entrance this time. No digging, no scrabbling. The little furrow he had made the other time was still there, an indentation in the weeds, and then the dry, rotting wood and dusty earth leading to the center of the pile of fallen boards and beams. The old wood formed a lattice overhead, a network that allowed an ornate design of sunlight to filter through.

D.R. lay a moment, resting, looking up, peaceful in his body, the clatter in his mind already settling, slowing down.

Psychic Discoveries Behind the Iron Curtain

The Russians are coming, the Russians are coming! Without the historical set of disbeliefs that has kept ESP research in the country limited to card guessing and tall tales, the Russians have been developing a number of laboratories and qualified people to run them. This book is a relaxed, sometimes-flamboyant tour of the Russian work as well as samples of Bulgarian, Czech, and other iron curtain researchers.

The whole book blows my mind. The Russians are years ahead of us in using and understanding clairvoyance, telepathy, auras, and related areas. The Bulgarians appear to have made and implemented fundamental discoveries in learning (not teaching rates, but getting people learning five to ten times faster). The Czechs are ahead of us in pragmatic applications of astrology (birty control, fertility, sex determination of children). Most of the strange and wondrous powers we were all taught don't exist are being explored, trained, extended, and researched by well-known, well-qualified, and well-financed government researchers.

One result of this book is that our parapsychologists are trying to get over there to learn how to start catching up. Another result is that this publication may force the United States government to release its own secret work (which the Russians know about but which has never been reported here). Is there an ESP gap? Who will have the first telepath on the moon? From the looks of this tour through inner space you can be sure it won't be one of us.

Dr. S. N. Dobronravov of Sverdlovsk reported that up to 72 percent of children had skin sight potentials. "It is most noticeable in children from the ages of seven to twelve years." Scientists at this convention agreed that the "supersensational, carnival" atmosphere whirling around eyeless sight was harming the subjects and the investigation. Work would continue quietly with subjects anonymous to the public.

Dr. Novomeisky was quietly trying to get information to help the blind. He found that blind adults didn't take to skin sight as readily as did blind children. The adults probably didn't believe that hands could see. Secondly, their acquired sensitivity of touch, and the habit of trying to "read" textures, blocked feeling of the dermo-optic sensations. But when Novomeisky put colored paper in insulated trays, ten blind adults suddenly got all the eyeless sight sensations that seeing students experienced. "With the insulated tray," Novomeisky reported, "we didn't find a single blind person who did not have positive tendencies toward skin sight."

"Our support is from the highest levels of government," said Lozanov, "the highest. The government has given us excellent conditions for our work. We never have to worry about money here. We can go ahead on any project, in any area of paranormal. Vanga is the first clairvoyant in the world to be put on the state payroll and our government has created good conditions for researching pre-cognition." Lozanov said this with considerable pride—pride in Bulgaria and her remarkable people to whom Lozanov is extraordinarily dedicated.

In actuality this is a French lesson. Against the background of Brahms or Beethoven, the voice of the teacher seems sometimes businesslike, as if ordering work to be done, sometimes soft and calming, then unexpectedly hard, commanding. Her voice repeats in a special rhythm, on a special scale of intonation, French words, idioms, and their translations. But the students aren't really listening. They've been warned *not* to pay attention, not to think about whether they hear the teacher. "Relax. Don't think about anything." Their conscious minds are to be totally occupied with the music.

Psychological Exercises

Orage, who edited "New Age" in the 'thirties, knew everyone. His favorites, like Pound, Gurdjieff and Ouspensky, were certainly worth knowing. Those were the days when intellectuals thought they could change the world just by pointing out what was right and what was wrong. Hah! Anyway, Orage had a secret kick, too, and it was exercising the grey matter. For example: while reciting "Jack and Jill" write down "Mary Had a Little Lamb". For example: while you are talking to someone, or reading this, count from 100 to 0 backwards by three's. You'll find that with some practice you really can do these things, just like learning to pat your stomach while rubbing your head. And then where are you? Fun.

[Suggested and reviewed by Stephan Chodorov]

Journal of Transpersonal Psychology

This is a journal that is bringing old-fashioned "all-I-want-is-the-facts-ma'm" science one step closer toward areas of fundamental concern. It publishes articles on scientific subjects such as ecstasy, transcendent education, and deep hypnosis, as well as unusual articles such as Baba Ram Dass's lecture to the staff of the Menninger Clinic and a test to see if you can tell the difference between a mystic and a physicist. If you are willing and able to go beyond *Weird Tales and Fate Magazine*, to alpha feedback and experimental yoga this journal will make it easy to walk the distance without leaving your scientific or your telepathic friends behind.

[Reviewed by James Fadiman]

Each of these pictures shows a human fingertip magnified fifty times. Picture at top shows that of a healthy man, calm and even-tempered. Photo at bottom shows the finger of an overtired, emotionally tense individual. In a state of fatigue, more energy seems to leave the body.

The next day surprised students discover that even though they were sure they'd learned nothing, they remember and can easily read, write, and speak from 120 to 150 new words absorbed during the two-hour session. In the same way the toughest part of the language course, the grammar rules, painlessly take root in the minds of music-lulled students. Within a month students with no prior knowledge of a language have accepted two to three thousand vocabulary words and have a good grasp of the grammar. Tests a year later show they still know all the material learned in this incredibly effortless way.

How does it work? Lozanov based his method, which can help you learn five to fifty times faster, on the Yoga technique of relaxation—*Savasana*. Using suggestion and autosuggestion, muscle tension is relaxed and the brain relieved of the usual anxieties and stresses. In this relaxed "free state of consciousness," or meditative state, fatigue quickly vanishes. Freed from all distractions which hamper its functioning, the brain resembles a sponge able to absorb knowledge of all kinds. The secret of the technique is that material doesn't reach the memory in the ordinary way, because the student doesn't participate consciously in the process.

Statement of Purpose: The *Journal of Transpersonal Psychology* is concerned with the publication of theoretical and applied research, original contributions, empirical papers, articles and studies in meta-needs, ultimate values, unitive consciousness, peak experience, ecstasy, mystical experience, B values, essence, bliss, awe, wonder, self-actualization, ultimate meaning, transcendence of the self, spirit, sacralization of everyday life, oneness, cosmic play, individual and species-wide synergy, maximal interpersonal encounter, transcendental phenomena; maximal sensory awareness, responsiveness and expression; and related concepts, experiences and activities. As a statement of purpose, this formulation is to be understood as subject to optional individual or group interpretations, either wholly or in part, with regard to the acceptance of its content as essentially naturalistic, theistic, supernaturalistic, or any other designated classification.

... the reason why our sentient, percipient, and thinking ego is met nowhere in our world picture can easily be indicated in seven words: because it is ITSELF that world picture. It is identical with the whole and therefore cannot be contained in it as part of it.

... all phenomena and their development are simply manifestations of mind, all causes and effects, from great universes to the fine dust only seen in the sunlight, come into apparent existence only by means of the discriminating mind. Even open space is not nothingness.

... the stuff of the world is mind stuff.

Mantra gets so far out, that after I did it for two days and two nights solid in Nepal once, I stopped to go to sleep and of course it continued going. But instead of it continuing going just in my voice it continued going. . . what it sounded like was a cross between the Mormon Tabernacle Choir and the O Heavenly Day Chorus. It's that huge a thing except it was made up of all old voices and they stretched back in time and space in infinite direction. . . you know, distance. All I heard was *Om Mani Padme Hum* and the wind was *Om Mani Padme Hum* and the air conditioner was *Om Mani*. . . the whole thing. I had tuned in on that place where that was all I could hear. But it was no longer my voice. I went rushing to a yogi and I said, "What's happening? I'm going crazy." He said, "You've tuned in on the *Om*, that's that place. You've tuned in on that place. There it is. That's where they're all hanging out."

Now it turns out— and this is the one that many of you will find hard sledding, but it's the way I understand it now, having been through this particular trip I've been through— that Freud is an absolutely unequalled spokesman and master of second-chakra preoccupation, that is, of those beings who were primarily involved in second chakra. So he could say quite honestly, because it is true at the second chakra, that religion is sublimated sex. Now it is true that in his generalized libido theories and the idea that all the body is erogenous. . . there are a lot of ways in which he slips over the edge; but his system is primarily concerned with the second chakra. Adler is primarily concerned with third chakra. Jung is primarily concerned with fourth chakra. I would point out that there are still the fifth, sixth and seventh chakras. And these are in terms of other kinds of psychic spaces and ways of organizing the universe and understanding what's happening. So that to the extent that you have "uncooked seeds" of the second chakra and you have a Freudian analyst, he's going to help you cook those seeds. He's not going to do much about where you're stuck in the third chakra, particularly. And he hasn't much to say about the fourth chakra, which is what Jung pointed out to Freud.

Courses on Altered States of Consciousness are being offered at Sonoma State College, the University of California at Davis, and Stanford University. Within five to ten years, it will no doubt be offered as generally as present courses on Motivation or Abnormal personality.

Let some prepared incident be staged and played before a group of students, who shall afterwards report it correctly.

E.g., the lights are suddenly turned off. Student A. blows a police whistle. He scuffles with Student B. and some noisy conversation takes place between them. Student B. escapes, making some remark as he bangs the door behind him. The lights are now turned up; and the rest of the students are called upon to report fully, accurately and in proper sequence the events of the episode.

Arrange the following sentences in order of their intellectual content; and give reasons for your arrangement.

Where law ends, tyranny begins.
The road to Hell is paved with good intentions.
A desire in psychology has the same status as a force in physics.
Our antagonist is our helper.
The world is a comedy to those who think, a tragedy to those who feel.
Man's character is his destiny.
A stitch in time saves nine.

Lindberg Crosses the Great Water

If we can combine our knowledge of science with the wisdom of wildness, if we can nurture civilization through roots in the primitive, man's potentialities appear to be unbounded. Through his evolving awareness, and his awareness of that awareness, he can merge with the miraculous—to which we can attach what better name than "God"? And in this merging, as long sensed by intuition but still only vaguely perceived by rationality, experience may travel without need for accompanying life.

Will we then find life to be only a stage, though an essential one, in a cosmic evolution of which

our evolving awareness is beginning to become aware? Will we discover that only *without* spaceships can we reach the galaxies; that only *without* cyclotrons can we know the interior of atoms? To venture beyond the fantastic accomplishments of this physically fantastic age, sensory perception must combine with the extrasensory, and I suspect that the two will prove to be different faces of each other. I believe it is through sensing and thinking about such concepts that great adventures of the future will be found.

Read the whole marvelous piece in July 4, '69 *Life* Magazine (\$8.75/yr 540 North Michigan Ave., Chicago, Illinois 60611.)

1935, Lindberg in New Mexico with rocket inventor Robert Goddard.

1969, conservationist Lindberg.

Lucis Trust Library

Here's an unusual freebie: a mail library of magical books. The catalog lists 1600 titles from ABC of Jung's Psychology to Zoroastrianism: The Religion of the Good Life. You can borrow two books at a time for a month. Lucis is a nice service that subsists on contributions; it probably is fragile to exploitive use.

ONE MAN'S JOURNEY TO THE EAST

Baba Ram Dass
The former Richard Alpert tells the story of his own journey from professor at Harvard, through psychedelia, to the finding of his guru in the East and the continuing changes in his own life. Includes a discussion of yoga and meditation, reincarnation, and the problem of desire 4 hours □ 328-4

INTRODUCTORY LECTURE-DEMONSTRATION ON STRUCTURAL INTEGRATION

Ida Rolf
A discussion of Ida Rolf's methods of body alignment and balance through Structural Integration. A lecture and demonstration 1½ hours □ 450-1½

LEARNING FROM DOLPHINS

John Lilly
An attempt to communicate with another intelligent species is described, with comments on the dolphins' life styles and ethical codes 1½ hours □ 434 \$6

POLITICS AS EXPERIENCE

R.D. Laing
The initial family structure splits into social and political forms, creating complex obstacles to true self-knowledge 1 hour □ 118 \$6

ON BEING A "PSYCHIC"

Ann Armstrong
In this personal and informative account of a person with psychic abilities, Mrs. Armstrong describes her problems in learning to use her powers, how she first discovered them, and their changing character as they continue to emerge 1 hour □ 477-1

PSYCHOSYNTHESIS

Robert Gerard
Inner imagery as a technique to further psychological growth, illustrated with case history material 2 hours □ 206-2

LSD THERAPY

Stanislav Grof
Report on extensive LSD therapy from Czechoslovakia, with extraordinary findings 1 hour □ 111-1

WORLD MYTHOLOGY: SYNTHESIS

Joseph Campbell
The relation of myth to individual evolution, to the journey of one's own life 3 hours □ 339-3

or WHOLE EARTH CATALOG

Our concern is with those aspects of whatever is out there that constitute the individual reality (IR) of a specific individual. ("We must remember," wrote Werner Heisenberg in a famous statement, "that what we see is not Nature, but Nature exposed to our method of questioning.")

One is reminded here of the old Spanish proverb: "Take what you want," said God. "Take it, and pay for it."

He felt the cool air from the mine blow across his neck and face and arms.

And he smelled it, smelled the mine, the slate-taste-color flowing from the earth into his nostrils like some subtle gas that soothed and calmed his mind.

For a long time D.R. lay breathing and resting and looking at the lattice overhead.

Then he turned and eased himself into the narrow opening, underground.

And there he was, again.

Cool.

Dark.

Quiet, except for an occasional dripping, and except for the way the very silence was a kind of noise.

He was actually there, beneath the mountain, quiet in the bosom of the world. And conscious of it this time, there freely, there simply, without all that smoke and swirl. On his way down the hill to the mine his thought had been that he would go inside, maybe deep inside, and explore by the light of his candle. That impulse was gone now. Within thirty feet of the entrance D.R. found what he had come for. He hadn't known, really, just what he was going there for. But now he knew. It was just to sit a while, at rest in a cool, quiet place. That was all.

D.R. sat holding the candle in his hand, looking around him in the circle of light at the ragged posts on either side that held the roof in place.

The roof was slate, and the color of slate.

The walls were solid coal.

The floor was dusty near the walls, but in the center it was moist, with here and there a pool of water gathered from the dripping above.

D.R. sat a long time without moving. There was the roof above, the floor beneath him, and the walls on either side. And the candle, in the center of the circle of the light.

After a while, without deciding to, D.R. leaned forward and set his candle in the mud beside a little pool near his feet.

The reflection was a perfect reproduction of the real, and D.R. marvelled at it.

One above, one below, the two candles shone together in the vastness of the cavern, and D.R. sat crosstegged on the floor in total fascination.

Behind him in the dark was the entrance to the mine, and the world of day beyond.

Behind the candles was the deeper vastness of the mine.

Neither attracted him.

D.R. didn't want to go in motion either way.

He was where he was.

This was his place to be.

And that stayed true even after he blew the candle out.

Without deciding to, D.R. crawled forward and blew the candle out. And then, for longer than he knew, he sat there where he was, within and of the dark.

What I find missing from the pages of the Catalog are tools to help groups work better together. Too often, I think, we simply assume that like-minded people can get along with each other, find constructive work patterns by instinct, and so on. We toss around a lot of words like "openness" and "honesty," but the words and the practice are two different things. Then, six months after arriving on the homestead (or buying the big communal house in the city, or whatever), fights break out around the issue of who's to do the dishes. Some folks flare and smolder; they leave a few weeks later with a bucketfull of bad memories.

Premise: we really have not learned to listen effectively, give helpful feedback to others about their here-and-now behavior, plan together for a common task, be it building a barn or living collectively. We can't build community by good intentions alone, or by imploring our brothers and sisters to be "honest." In short, we need tools.

With that lengthy preface out of the way, I want to introduce sensitivity training. Before everyone starts to groan, let me make clear what I am not talking about. I don't advocate all the stereotypical stuff now coming out in movies and novels, the scenes where people are licensed to call each other no-good S.O.B.'s for a weekend. No free-wheeling ego destruction, no confessions about horrible misdeeds and terrifying anxieties. What I am talking about is the more conservative wing of the sensitivity training movement, as represented by the National Training Laboratories: training that focuses on the here-and-now aspects of group behavior, leadership, communications, and the like.

Since the sensitivity training movement has exploded into every imaginable direction, and since anybody can hang out a shingle and "run groups," folks interested in exploring this area should be wary and cautious. Even the legitimate trainers are expensive, to the tune of \$100 a day for the best of the bunch. Fortunately, there are some books around that qualify as tools; here are three of the best that I know about:

(1) *The Practice of Creativity*, George M. Prince, Harper and Row, 1970, \$8.50. This is about Synectics, but it's much better than the other Synectics book the Catalog used to list. Prince's book qualifies as a true tool; there are a variety of suggestions for improving the creative output of small groups. The entire Synectics problem-solving process is outlined in detail, and many of its techniques, if consciously applied, really help in all sorts of situations. One example: the Spectrum Policy, which says that you're not allowed to criticize an idea until you've said something positive about it. This sounds incredibly trite and artificial, I'm sure, but its use has drastically improved half a dozen work situations that I've been in. Even the best-intentioned people are often unwittingly destructive in group situations.

(2) *A Handbook of Structured Experiences for Human Relations Training* (two volumes), J. William Pfeiffer and John E. Jones, University Associates Press, Box 615, Iowa City, Iowa 52240, 1969, \$3.00 each volume. These are two small volumes of exercises in group processes. Some sample titles: "Hidden Agendas," "Status-Interaction Study," "Developing Group Commitment," "Process Intervention Practice". Not all of these will be helpful to every group, but some of the exercises have universal use. **IMPORTANT NOTE OF CAUTION:** These exercises are not toys; if they're to be used, they should be used only when every member of the group agrees to their use. Most of the exercises are designed for use by a trainer in a laboratory group. If, say, a commune uses some of these, the person acting as trainer should not be from that commune.

(3) *Basic Reader in Human Relations Training* (in eight mimeographed parts), Service to Dioceses, Episcopal Church Center, 815 Second Avenue, New York, N.Y. 10017, apparently free of charge. This series is what it says it is, a collection of written materials on all phases of group processes as shown in laboratory situations. The advantage is that the editors have collected many papers on the same topics, so the reader has a choice of frameworks on which to hang his understanding. The set includes a good bibliography and list of further sources.

For people interested in exploring further, the NTL Institute for Applied Behavioral Science runs labs all over the country in various aspects of group dynamics. Their address is 1201 16th Street, N.W., Washington, D.C. 20036.

Finally, a statement from George Prince, with which he closes his book: "The conscious practice of creativity as an everyday activity is particularly valuable because it permits you to rationalize, accept, and gradually expect miracles of yourself."

Go well,
Bob Fried
Berkeley, California

Love and Will

Here's a book to disabuse you, and you, and you of any notions you might have about there being anything very special in your sufferings; or anything terribly unique about your dilemmas and your fuck-ups. May describes our external and internal environments in their relationship to each other with a mind-boggling accuracy that evokes recognition—"Yes, that's me, all right, and that's just the way it is these days". Far from being brought down, one feels embraced by a warm intelligence, and relieved that there are minds like May's around. A sort of psychological ecologist, May points to the price we pay for every step of "social progress", and suggests that if perhaps we have unwittingly but consistently thrown out the baby with the bath water, then maybe it's time to find the hell some other way to get clean.

[Reviewed by Diana Shugart]

If we repress the daimonic, we shall find these powers returning to "sicken" us; whereas, if we let them stay, we shall have to struggle to a new level of consciousness in order to integrate them and not be overwhelmed by impersonal power. And (what a refreshingly honest motto to put up in a psychotherapist's office!) either way will hurt.

Psychology Today: An Introduction

My god, they've done it—and I'm stunned. After spending more years than I care to remember dealing with this sort of subject matter, I expected to skim through this book, and I tried—for hour after hour after hour. First off, it's the most fantastic visual presentation I've ever encountered in a textbook; every page is arresting and imaginative and many are clearly and simply beautiful. It's the first time I've ever seen such consistent remembering that the subject under study is that of me and you and our fellows. This would surely be the book to start with for anyone interested in finding out what psychology is all about. There are eight major sections, each representing a main branch of the field, and each being covered clearly and thoroughly. There are two companion volumes, the Instructor's Guide, and the student's workbook, *Involvement in Psychology Today*. The Instructor's Guide lists appropriate films and suggests demonstrations for each section. "Involvement" is designed to do just that—the suggested projects are unusual and look like fun. There are good bibliographies here too, for those interested in pursuing particular subjects further, including a lot of wonderful books that didn't used to be considered proper.

These things about the content especially impress me: The scientific study of behavior is treated cogently so that anyone can learn the basics of scientific methodology. And this without the usual accompanying tone that only what's measurable is worth studying, a tone that so pervades many textbooks that as an undergraduate I despaired of learning anything interesting or meaningful about human beings. This stuff really turned me on to human behavior and the study of it. The sections on drugs and craziness are also impressive in that the subjects are tackled head-on; there's no evasiveness and no apparent prejudice. There is lots of good information and, best of all, a powerful feeling conveyed of what it's all about.

The authors have clearly attempted to make this book super-relevant to today's world. They have succeeded.

[Reviewed by Diana Shugart]

Developmental Psychology Today

Again, a beautiful and stimulating book, all about growing up— and around, in and out, and sideways. All the ways we grow, how we get stuck and unstuck, what we need to get it together and what happens when we don't. These CRM books really make anything else on these subjects taste like dry oatmeal and read like an abridged, unillustrated Dick & Jane.

Normality

It is customary to start with definitions, but volumes have been written attempting to define the concept of normality— with very little success. Using any criteria, there is no such thing as a person who is totally normal in all respects and at all times, nor is anyone totally abnormal. Neither is there such an entity as an "emotionally disturbed child." Emotional disturbance is not a disease, like diabetes, that is either present or absent in a given individual. In current usage, "emotional disturbance" is an umbrella term that covers all degrees of behavioral problems in four major categories: antisocial aggressiveness, overwhelming fears, failures in learning, and infantile habits.

Figure 7.14

Aggression elicited by shocks may be displaced to a doll if another rat is not present.

May hypothesizes that when a culture is moving toward integration and unity, it has a system of symbols, myths, and values that give integration to the members of society, and people are then relatively free from psychological breakdown. But when a culture is in the process of disintegration, it loses first of all its myths and symbols, then its system of values that have been based on these myths. Subsequently, people in large numbers come to seek psychological help. May believes that therapy will remain a critical part of our cultural scene until society discovers new myths and symbols to replace those we are currently losing.

Put the personality of a child in the body of a man, furnish a need to be loved and a fierce desire to be independent, allow a need to be self-directing but leave out any idea of what direction to take, add an enormous amount of love but also the fear that it may not be accepted or returned, give physical and sexual powers without any knowledge or experience of how to use them— take these and place them in a society whose values and achievements are essentially incomprehensible and certainly unattainable and whose concerns are seemingly misplaced and insincere. Then you will have just begun to scratch the surface of adolescence.

If will remains protest, it stays dependent on that which it is protesting against. Protest is half-developed will. Dependent, like the child on parents, it borrows its impetus from its enemy. This gradually empties the will of content; you always are the shadow of your adversary, waiting for him to move so that you can move yourself. Sooner or later, you will become hollow, and may then be forced back to the next line of defense.

This next defense is projection of blame. We find an illustration in every war of this unwitting confession of failure to integrate the daimonic. In the Vietnam war, for example, Secretary Rusk and the Administration blamed the Viet Cong for the escalation, and the Viet Cong—and those in this country opposed to the war—blamed Rusk and our own Administration. The self-righteous security that is achieved by means of this blaming of the other gives one a temporary satisfaction. But beyond the gross oversimplification of our historical situation which this exhibits, we pay a more serious price for such security. We have tacitly given the power of decision over to our adversary.

Gestalt Therapy Verbatim In and Out the Garbage Pail

Fritz Perls is not nearly as deceased as he seems. These two books preserve his power for all to tap and use. They also, to my mind, revolutionize the book industry. Gestalt Therapy Verbatim is made of tapes from Fritz' seminars and workshops at Esalen—and seldom will you find conflict, funk, truth and accomplishment so thick in a book. In and Out the Garbage Pail is Fritz' application of his methods to himself, through the very writing. It's autobiography, theory, poetry, and Fritz' many voices hassling each other through impasse into growth. The illustrations by Russ Youngreen raise the book by at least a dimension.

But all of this is derivative from Fritz Perls' main accomplishment. His psychology and his therapy . . . work.

Helpers are con men, interfering. People have to grow by frustration—by skillful frustration. Otherwise they have no incentive to develop their own means and ways of coping with the world.

- F: Okeh. Withdraw into your body, to your anxiety.
- G: My—I can feel my heart pounding, and my pulse is—and my arms, and my legs, and my neck . . . Actually it's not a bad feeling.
- F: Enjoy it.
- G: It's a good strong heart . . . I feel the warmth of the fire on my back—that's nice, too.
- F: Now come back to us.
- G: I'm not so scared now—it works every time, Fritz.

Now let's take another step. You come up here and talk to me—just say anything. (as the person speaks, Fritz imitates his words, voice inflection, and facial expressions) Pair up and do this, and again try to really get the feel of being this other person. . . .

- Now I want each one of you to transform yourself into something a little bit more different. Say, transform yourself into a road. . . .
- Now transform yourself into a motorcar. . . .
- Now transform yourself into a six months-old baby . . .
- Now transform yourself into the mother of that baby . . .
- Now transform yourself into that same baby again . . .
- Now the same mother . . .
- Now the same baby . . .
- Now be two years of age . . .
- Now transform yourself into your present age, the age you are . . . Can everyone perform that miracle?

- Q: What is your opinion about meditation?
- F: Meditation is neither shit nor get off the pot.

Look at the difference between the words "I am tensing myself" and "There's a tenseness here." When you say "I feel tenseness," you're irresponsible, you are not responsible for this, you are impotent and you can't do anything about it. The world should do something—give you aspirin or whatever it is. But when you say "I am tensing" you take responsibility, and we can see the first bit of excitement of life coming out. So stay with this sentence.

As soon as you say, "I want to change"—make a program—a counterforce is created that prevents you from change. Changes are taking place by themselves. If you go deeper into what you are, if you accept what is there, then a change automatically occurs by itself.

You see how you can use *everything* in a dream. If you are pursued by an ogre in a dream, and you become the ogre, the nightmare disappears. You re-own the energy that is invested in the demon. Then the power of the ogre is no longer outside, alienated, but inside where you can use it.

You never overcome *anything* by resisting it. You only can overcome anything by going deeper into it. If you are spiteful, be *more* spiteful. If you are performing, increase the performance. Whatever it is, if you go deeply enough into it, then it will disappear; it will be assimilated. Any resistance is no good. You have to go full into it—swing with it. Swing with your pain, your restlessness, whatever is there. Use your spite. Use your environment. Use all that you fight and disown.

Gestalt Therapy Verbatim

One remark that I get makes me embarrassed and angry: "When will the book come out?"

"Will you please leave me alone and let me do my thing! I am glad that I am excited and eager to write. I am glad to do something that integrates your needs and mine. So, don't push the river; it flows by itself!"

But I am holding onto my credo: "I am responsible only for myself. You are responsible for yourselves. I resent your demands on me, as I resent any intrusion into my way of being."

I know I am holding on just a bit too tight.

Topdog: Stop, Fritz, what are you doing?
Underdog: What do you mean?

Cope and withdraw, contract and expand, implode and explode—like the heart imploding, contracting, and then exploding, opening to be filled. Permanent contracting leads to quick death, as does permanent extension.

In and Out of the Garbage Pail

The Primal Scream

. . . I read The Primal Scream. It is a long book written by a man who has stumbled upon a very valuable technique, and who still has not explored it to his total satisfaction, but who wants to communicate his whole experience and all he knows about it.

Dr. Janov says that neuroses and psychoses result from thwarted attempts made by the human organism in childhood to get what it wants. If an infant's Primal Needs (to be fed, kept warm and dry, to grow and develop at its own pace, to be held and caressed, to be stimulated) are not fulfilled, the infant must separate his needs from his consciousness, in order to avoid the pain of unfulfillment. The infant, and later the child, is forced to split into a real and an unreal self, to build a false persona which he uses in his struggle for gratification. Each time the struggle fails, each time the child is required to be other than he is in order to fulfill some aspect of his parents' needs, the resultant pain, unuttered and unrequited, is driven within, to add another drop to the Primal Pool, the reservoir of hurt.

As the assaults on the real system mount, they begin to crush the real person. One day an event will take place which, though not necessarily traumatic in itself—giving the child to a baby sitter for the hundredth time—will shift the balance between real and unreal and render the child neurotic. That event I call the major Primal Scene. It is a time in the young child's life when all the past humiliations, negations, and deprivations accumulate into an inchoate realization: "There is no hope of being loved for who I am." It is then that the child defends himself against that catastrophic realization by becoming split from his feelings, and slips quietly into neurosis. The realization is not a conscious one. Rather, the child begins acting around his parents, and then elsewhere, in the manner expected by them. He says their words and does their thing. He acts unreal, i.e., not in accord with the reality of his own needs and desires. In a short time the neurotic behavior becomes automatic."

Janov's cure for neurosis is simply to drain the Primal Pool, to enable his patients to feel their long-repressed pain and outrage, . . . to feel and recognize the split, and scream out the connection that will unify the person again." It is to this goal that Primal Therapy is directed.

For the first three weeks of Primal Therapy, the patient is the therapist's only patient. Twenty-four hours before the first session, the patient is isolated in a hotel room and asked not to leave it until he reports for therapy the following day. During that time, he is asked not to read, watch TV, telephone anyone, smoke, drink, or take drugs. When the patient arrives for therapy the next day, he is asked to talk about his childhood. The therapist observes him closely for signs of feeling. When the feelings manifest, the patient is urged to sink into them. When he begins to invent defense mechanisms, they are forbidden him. He is told to lie on his back, arms and legs spread-eagled, and breathe deeply through his mouth. When the unrequited needs of childhood begin to rise in him, he is told to give them utterance. "Tell Daddy you're afraid!" "Momma, don't go!" The patient will begin to thrash about, experience nausea, have difficulty breathing, try to say it, as the therapist urges him to let it out.

Finally, out it will come: a scream—"Daddy, be nice!" "Mommy help!"—or just the word "hate": "I hate you, I hate you!" This is the Primal Scream. It comes out in shuddering gasps, pushed out by the force of years of suppressions and denials of that feeling. Sometimes the scream is only "Mommy!" or "Daddy!" Just saying those words brings with it torrents of pain since many "mommies" would not even permit their children to call them anything but "Mother." Letting down and being that little child who needs a "mommy" helps release all the stored-up feeling."

This process continues for three weeks, after which the patient will enter a therapy group, where for several months he will continue to experience what Dr. Janov calls Primals, his openness having developed beyond the need for exclusive attention.

So that's what happens, and I was interested to read a while ago that it was happening to John Lennon, that he and Yoko were patients of Dr. Janov in his Southern California clinic. Then a friend brought me John's new record and said, "Hey, man, here's that Primal Therapy you were telling me about." And it is. . . .

MONDAY: THE SCHEME

On Monday morning, D.R. went to work expanding Emmitt's scheme.

He had tinkered with it and nursed it along, doing chores, in the time he had lived alone as Emmitt's successor at the homeplace. But it wasn't until this particular Monday morning that D.R. took up tools to enlarge and make his own mark on the work that Emmitt had begun the last year of his life.

(continued)

Man's Presumptuous Brain

Dr. Simeons spent 18 years in India (had brilliant successes with malaria there). Is that why he's written the most useful yoga book to originate in the West? It's not a yoga book, of course, it's an investigation of psychosomatic disease (which will probably kill you and is certainly killing Us). Simeons' contention is that our brains, cerebral cortex specifically, have evolved clear out of coordination with the rest of our nature, body especially. It is the arrogant cortex that permits us to burn holes in our stomachs and in each other.

The book would be worth reading just for its central theme, but a whole lot more than just that is going on in Simeons and in the book. Unique document. —SB

Psychosomatic ailments account for the bulk of urban man's ill-health and are the most frequent cause of his death. Man shares this kind of affliction with no other living creature.

The reptilian brain is so organized that it must respond to all incoming messages from the senses. On the ground these messages lead to purposeful actions, for instance burrowing for food or safety; but in the trees many of these actions became pointless. A reptile's behaviour is governed entirely by automatic reflexes. Its actions are not subject to reason. It does not have to make a choice between different ways of reacting. All its actions are due to sensory messages putting an ingrained reflex into operation, and over this process the reptile has no control.

A reptile, taking to the trees, carried with it all the ancient reflexes which it had acquired in millions of years on the ground. These reflexes which the change of habitat rendered useless must have been a terrible harassment to an already overworked reptilian brain. In the slow course of evolution these reflexes would have gradually changed into more suitable ones. But so desperate was the situation of the tree-living reptile that it would have become extinct long before normal evolutionary trends could have brought about a better adjustment to the new environment. Some sort of evolutionary shortcut was needed if the species was to survive.

The shortcut was biologically evolved out of just the right mutations occurring at this dramatic moment. It consisted of a mechanism which blocked useless messages from the nose and thus prevented them from reaching those centres of the brain which would have been obliged to react to them. In the olfactory lobes a few cells took over the function of a screening device, a sort of censorship or filter by which incoming olfactory messages were either suppressed or allowed to pass, according to their vital importance. This sorting or classifying of smells relieved the reptilian brain of the exhausting need to react to every message from the nose and thus, in the trees, proved to be an efficient labour-saving device.

The instinct-conflicts which produce an ulcer are usually concerned with sex or family relationships. The modern cortex refuses to admit such conflicts and to expose them to the processes of reasoning. Guilt of this type, therefore, continues to build up behind the censoring screen and forces the diencephalon into the drastic action which causes the ulcer.

This interpretation of the peptic ulcers suggests an obvious psychotherapeutic approach. Censorship at the level of consciousness must be so far relaxed that the conflicting instincts, and the emotion of guilt which they engender, can be ushered into conscious awareness. Thereafter the psychological situation becomes identical with that of a person who has a guilty conscience on account of something he knows he has done, a situation which never produces an ulcer. If such a psychotherapeutic manoeuvre is successfully accomplished, ulcers may heal with surprising rapidity, often in a matter of days, and do not recur unless an entirely new guilt-provoking situation arises.

One of the most remarkable things about the growth of the cortex was the incredible acceleration of this process. While the earlier phases took tens of millions of years to evolve, the later phases were covered in a few hundred thousand years. It seems to be a general law of evolution that once a trend towards a single successful specialization has become firmly established, the speed with which this specialization develops gets faster and faster and may even develop of its own accord beyond the limits of usefulness. Meanwhile, the rest of the body continues to evolve at a slow and steady pace, so that after a while a stage is reached in which all the other evolutionary trends are left far behind the outstanding specialization.

In modern man this development has already gone so far that there are signs of an evolutionary regression in the body in favour of a still more freakish growth of the brain. Modern man's body no longer reaches its full evolutionary maturity, as it did in Neanderthal Man. Though the modern brain develops further than that of Neanderthal Man, modern man's body remains behind in an earlier, embryonic stage. He carries certain embryonic features on into adult life. An example of this has already been mentioned in connection with the distribution of human hair, but there are many other instances. One that interests us here is the relationship between the brain and the rest of the body.

In the light-skinned human races the development of the body is sharply braked in the last stages of pre-natal life, while the growth of the cortex is accelerated. There is some evidence to suggest that the negro's body is better adjusted to his brain. He is physically more mature at birth, and under ideal environmental conditions he averages a larger body. From an evolutionary point of view this makes his brain-body ratio more balanced.

A tendency to self-destruction seems to be inherent in the over-developed human brain. It is a situation similar to that in which a parasite thrives so exuberantly that it destroys its host, thereby bringing about its own undoing. As the host can survive if the parasite's rapacity is kept within tolerable limits, so man will survive longer if he can release his body and his diencephalon from the cruel cortical grip to which civilization is increasingly subjecting him.

In psychosomatic disease urban man is already paying a heavy price for his civilization, but he now has the means substantially to reduce the price if he will but make full use of them and realize to what extent his cortical presumption, deluding him that he has full control over his animal nature, prevents him from doing so. Western man will eventually go about the solution of his most pressing biological problems through a better understanding of psychosomatic mechanism and will not adopt the only alternative, which is to give the cortex full rein; for if he did this, all his behaviour would become governed by rigidly conditioned reflexes. His mating and breeding, his drinking and feeding and all his many emotions would then have to conform to a fixed pattern applying to everybody; this would be entirely contrary to the way of life which he has so far followed.

The Mind of Man

A good broad intelligent introduction to current work in brain science. Well illustrated.

Everyone waited expectantly for the next half-hourly sample and its analysis. When it came, it showed an oxygen consumption of 2.2 litres. Ramanand Yogi had voluntarily knocked his requirement down to one quarter of the minimum supposed necessary for the maintenance of life. The *Bhagavad-Gita*, holy book of the yogis, remarks aptly:

As a blazing fire turns fuel to ashes,
so does the fire of knowledge turn all actions into ashes.

Changes in the size of the pupils of the eyes are an unconscious form of communication: large pupils denote interest and therefore make a woman seem more attractive. (Modified detail from Botticelli's *Primavera*)

The Savage Mind

Claude Levi-Strauss is the most famous — I mean, all the anthropologists recommend — He's so — I mean, so what if he's French — The most profound — Sartre couldn't — structural anthropology was what — Primitive doesn't mean — I mean, they knew what they were doing — So when — It looks crazy to us of course — They were just abstracting in a different — But you can analyze it once you — So you see, ritual is the — If you never — The Indians always — I mean, what makes you think you're so logical?

The real question is not whether the touch of a woodpecker's beak does in fact cure toothache. It is rather whether there is a point of view from which a woodpecker's beak and a man's tooth can be seen as "going together" (the use of this congruity for therapeutic purposes being only one of its possible uses), and whether some initial order can be introduced into the universe by means of these groupings. Classifying, as opposed to not classifying, has a value of its own, whatever form the classification may take.

A native thinker makes the penetrating comment that "All sacred things must have their place" (Fletcher 2, p. 34). It could even be said that being in their place is what makes them sacred for if they were taken out of their place, even in thought, the entire order of the universe would be destroyed. Sacred objects therefore contribute to the maintenance of order in the universe by occupying the places allocated to them. Examined superficially and from the outside, the refinements of ritual can appear pointless. They are explicable by a concern for what one might call "micro-adjustment" — the concern to assign every single creature, object or feature to a place within a class.

A housewife in her mid-thirties sits in a laboratory at the California Institute of Technology. In front of her is a screen and she has been asked to gaze at a spot marked in the middle of it. A strange picture appears briefly on the screen. It is a split face made up of two halves joined down the middle. On the right, as seen by the housewife, it is a young child; on the left a young woman wearing spectacles.

Next, the housewife is shown a choice of several faces, and she is asked to point with her right hand at the one she saw. She describes the old man and denies that there was anything odd about the picture.

Like the face on the screen, the housewife's brain has been split down the middle. She underwent an operation for severe epilepsy in which the surgeon cut the great bundle of nerve fibres which normally connect the two sides of the roof of the brain. The operation was successful and the woman is now able to lead a more normal life. To see her doing her housework, swimming, riding a bicycle, and so on, you would not for one moment suppose there was anything unusual about her. But the tests devised by Roger Sperry and his colleagues show that she possesses two independent minds under the one skull.

Several thousand Coahuila Indians never exhausted the natural resources of a desert region in South California, in which today only a handful of white families manage to subsist. They lived in a land of plenty, for in this apparently completely barren territory, they were familiar with no less than sixty kinds of edible plants and twenty-eight others of narcotic, stimulant or medicinal properties (Barrows). A single Seminole informant could identify two hundred and fifty species and varieties of plants (Sturtevant). Three hundred and fifty plants known to the Hopi Indians and more than five hundred to the Navaho have been recorded.

We have had to wait until the middle of this century for the crossing of long separated paths: that which arrives at the physical world by the detour of communication, and that which as we have recently come to know, arrives at the world of communication by the detour of the physical. The entire process of human knowledge thus assumes the character of a closed system. And we therefore remain faithful to the inspiration of the savage mind when we recognize that, by an encounter it alone could have foreseen, the scientific spirit in its most modern form will have contributed to legitimize the principles of savage thought and to re-establish it in its rightful place.

Centering

m. c. richards is an east/west potterpoet and philosopher. she makes ideas like tassajara porcupines make love, slowly, gently, carefully. i read her that way, opening up to an idea, reading until i'm asleep, munching around the edges, letting come together whatever falls together, centering. we are what is and what is—is what we are. the world is one. center us, center it. if it is centered, we are too. pull clay around the void, transform it, use it, turn it into a pot. m. c. richards may be just a touch too much of a poet.

Because I am a potter, I take my image, centering, from the potter's craft. A potter brings his clay into center on the potter's wheel, and then he gives it whatever shape he wishes. There are wide correspondences to this process. Such extensions of meaning I want to call attention to. For centering is my theme: how we may seek to bring universe into a personal wholeness, and into act the rich life which moves so mysteriously and decisively in our bodies, manifesting in speech and gesture, materializing as force in the world the unifying energy of our perceptions.

Our studies of Eastern philosophy teach us to let go, to drop it. To surrender our attachments, our mentation. To free ourselves from ignorance and suffering. Our studies of Western philosophy teach us to surrender our minds to perception. Pure thinking has its source at the center. Thus Idealism is our Western knowledge: to surrender reflections for the evolving forms toward which matter is continuously casting itself, a dynamic thinking which generates rather than mirrors. And Western empiricism, which brings us back always sharply to the edges of a particular moment. There is only the moment, and yet the moment is always giving way to the next, so that there is not even Now, there is Nothing. True, true. There is nothing, if that is the way to understanding how much there is.

Sense Relaxation

This is a book which is an experience while it teaches you how to have additional experiences. It is a combination of simple straightforward how-to-do-it prose broken by puns (to slow down your reading) plus sensual photographs of every exercise. Your first time through this book you will only glance at the words; the pictures are so compelling. The second and third times through you will read individual sections to find out what the pictures suggest. Finally you will begin to use this book to add touch, relaxation and pleasure to your life. This book gives very specific and easily followed exercises for individuals, couples, and groups to tune in to their own bodies and to all their senses. Gunther gives suggestions and techniques to energize, to tranquilize, and above all to increase awareness. It is a beautifully designed and executed book.

Most people are half breathers, keeping residual air in their lower lungs; they are unable to take a full deep breath even if they want to. To breathe deeper you must exhale more. Yelling gets out all the old air and some of those held-in feelings; let yourself be open-air.

Alpha

Alpha waves are produced by the brain when it's being nice and quiet. With a sensor you can learn to produce alpha, so it can be a sort of shortcut to meditative skill. But it's a fussy problematic business to deal with the sensors.

Alpha wave sensors are like water beds. A technological step in leisure activities they are being manufactured and marketed in profusion, largely on a cottage industry basis. Some are undoubtedly better than others, but we haven't sorted them out. Here's addresses and prices. Good luck.

—SB

It was a scheme to reclaim the soil of the homeplace that had been killed by the mining on the slopes above the farm. Until Emmitt started rebuilding the garden soil with rabbit shit behind the barn, the only living spot on the homeplace was the little triangle of green in front of the house, where some grass still grew and the poplar trees and the silver-leaf maple tree had leaves. It was only a matter of time before that little patch would be destroyed too, however, and the old family house along with it. For behind the house was a wall of dried mud and shale and blasted rock high as the roof in places. It had rolled down from the bench above, and then in two wet winters continued to slip until now it looked like a frozen ocean wave, waiting for another winter to melt it and send it flowing through the house and on across the yard toward the road and Trace Fork creek below.

But out near the barn, which stood a little uphill from the house and on a kind of roll in the slope, the overburden had stabilized. It had slipped as far as it was going to, and it was there that Emmitt had chosen to make his effort and invest his work the last few months of his life.

The barn had been pushed off its foundation by the wash of overburden, flowing down. A rock big as a car, set rolling by a bulldozer up above, had smashed into the upper end of the barn and ripped a big hole in the wall. But in spite of the damage the barn was still a fairly solid structure, and when the mud had dried and settled Emmitt had gone to work behind the barn, spreading all the manure and organic matter he could get, in an effort to create enough new topsoil to make a garden.

There'd been some old rotted manure in the stalls in the barn, left from the days when the Colliers kept cows and a work horse. Emmitt had shoveled it out and scattered some spoiled hay over it, and then worked that into the spot he intended to garden. Emmitt's health was starting to fail him even then. That shoveling was among the last heavy work he tried. It was then he got his idea to raise rabbits in hutches as a source of manure for the garden he intended to create below the barn.

A friend of Emmitt's on Upper Rockhouse Creek who raised rabbits for meat sold him the buck and the first two does. Emmitt built hutches for them out of weather boarding he ripped off the back of the old doomed house he lived in. In a year's time he built eleven hutches from lumber off the house, and his herd grew to nearly fifty rabbits. He fed them commercial rabbit feed that Leonard hauled up the creek in the sled by the hundred pound bag. It cost him, but the project was important to Emmitt and he was willing to pay. Emmitt received a disability pension from the government for his war wound, a hundred and forty-some dollars every month. His personal expenses were rarely more than half of that, so he could afford his herd of rabbits. Leonard said that Emmitt would eat a rabbit now and then, but what he kept them for was the first-class shit they produced. As it accumulated beneath the hutches he spread it on the sterile soil, and in a year's time he had redeemed a patch twenty feet by ten, and it was now growing short, single rows of lettuce, carrots, turnips, cucumbers, potatoes, beets, tomatoes and comfrey, and two longer rows of beans.

Pre-Trance Instructions

1. While in a comfortable place and with eyes fixed straight ahead:
1. Think of the time you wish to "wake up."
2. Formulate your suggestion.

Trance-Induction Procedure

3. Imagine "1000-1", the symbol for evoking tiredness of the eyelids.
4. Imagine "1000-2", the symbol for evoking eye-closure.
5. Imagine "1000-3", the symbol for relaxation.
6. Imagine "1000-4", the symbol for emotional tranquility.
7. Imagine "1000-5", the symbol denoting "hyper-suggestibility."
8. Imagine a circle enclosing an "X," then carefully erase the "X."

Deepening Procedure

9. Imagine, one by one, the letters of the alphabet, as if writing "a" in the circle, then erasing it, etc.

After she achieved a self-induced trance, I explained to her that she would see a movie that she had seen years ago, that it would be very clear and vivid and that she would see it upon a signal of snapping my fingers. I made a mistake, which had to do with the realization that I had neglected to give her certain instructions, and inadvertently snapped my fingers before explaining to her about the second signal. Imagine my surprise when she immediately woke up! I felt rather provoked with myself until I noticed her amazed expression, and she said, "Why, that's the most interesting thing that ever happened to me!"

"What happened?" I asked, not knowing quite what to expect.

"I just saw *Gone With the Wind*," she replied, laughing.

"How much of it did you see?"

"I saw the whole thing from beginning to end. It was even better than I remembered."

While I was still trying to figure out what had happened, she was telling me at great length about the picture. I found it hard to believe that she had really seen the whole picture, or even a small part of it, in such a short instant of time. But she convinced me by describing every detail of the opening scenes and dialogue, and continuing with vivid word-for-word reproduction as if she had just come from the theatre. Better, in fact, than if she had. It was clear that she had experienced imagery of the most vivid kind imaginable of a two-and-one-half hour picture in the time it took to snap my fingers—not between two signals; just during one snap!

Psycho-cybernetics

This strange and gaudy volume will probably turn you off if you associate wisdom with subdued writing or humble exposition. However, if you can overcome your initial resistance to the high-pressure, breezy style and the sometimes excessive claims, it will be worth the effort. Dr. Maltz has outlined perhaps the easiest program of personality development and modification in print. It is easy because it contains nothing but the suggested exercises and the understanding that the motivation to change is still the most powerful tool.

This is not a book to read. It is a kit of tools to use in gaining control of your nature for whatever ends you desire. The author has made it clear that there is no virtue in being obscure or even in being poetic if it detracts from getting the reader off his ass and doing something about himself.

There is an assumption of a higher self or a core to one's being which tends toward realization or whatever term you prefer but understanding of this inner nature is not vital to using the book.

What we need to understand is that these habits, unlike addictions, can be modified, changed, or reversed, simply by taking the trouble to make a **conscious decision**—and then by practicing or "acting out" the new response or behavior.

Simple? Yes. But each of the above habitual ways of acting, feeling, thinking does have beneficial and constructive influence on your self-image. Act them out for 21 days. "Experience" them and see if worry, guilt, hostility have not been diminished and if confidence has not been increased.

So, why not give yourself a face lift? Your do-it-yourself kit consists of relaxation of negative tensions to prevent scars, therapeutic forgiveness to remove old scars, providing yourself with a tough (not a hard) epidermis instead of a shell, creative living, a willingness to be a little vulnerable, and a nostalgia for the future instead of the past.

If the above puts you off then this is not the book for your use. If this totally western way of dealing with yourself interests you, this book is far better than most of the other pop-lightenment books around.

[Suggested and reviewed by James Fadiman]

Self Hypnotism

One of the things that intrigues me most about hypnotism is that no one knows how it works—which accounts for some of its disrepute. No common factors, for example, have been found to pre-distinguish susceptibles from non-susceptibles. Black box business

Lecron doesn't talk about any of this. He's concerned with how you can detect and suggest old imprinted hang-ups and suggest in new ones you like better. (One subject suggested herself larger breasts, and got them.

Possibly the most general use of this book is its clear delineation of a simple avenue in—a meditative technique without much dogma. There's a lot of hypnosis books; this is the best we've seen. —SB

Now that you are comfortable you will listen closely to my voice and will follow all the suggestions given. This will teach you how to enter hypnosis and how to produce it yourself. Your eyes are now closed. Take another deep breath, hold it a few seconds and let it out.

The more you can relax, the deeper you will be able to go into hypnosis. Let all your muscles go as loose and limp as possible. To do this start with your right leg. Tighten the muscles first, making the leg rigid. Then let it relax from your toes up to your hip. Then tighten the muscles of the left leg. Let that leg relax from the toes up to the hip.

Let the stomach and abdominal area relax; then your chest and breathing muscles. The muscles of your back can loosen—your shoulders and neck muscles relaxing. Often we have tension in this area. Let all these muscles loosen. Now your arms from the shoulders right down to your finger tips. Even your facial muscles will relax. Relaxation is so pleasant and comfortable. Let go completely and enjoy the relaxation. All tension seems to drain away and you soon find a listlessness creeping over you, with a sense of comfort and well-being.

As you relax more and more, you will slip deeper and deeper into hypnosis. Your arms and legs may develop a feeling of heaviness. Or instead you may find your whole body feeling very light, as though you are floating on a soft cloud.

Now imagine that you are standing at the top of an escalator such as those in some stores. See the steps moving down in front of you, and see the railings. I am going to count from ten to zero. As I start to count, imagine you are stepping on the escalator, standing there with your hands on the railing while the steps move down in front of you taking you with them. If you prefer, you can imagine a staircase or an elevator instead. If you have any difficulty visualizing the escalator or staircase or elevator, just the count itself will take you deeper and deeper.

Then you will think to yourself the phrase, "Now I am going into hypnosis." Then repeat to yourself the words, "Relax now" three times, saying them very slowly. As you do this you will slip off into hypnosis. You say nothing aloud, you merely think these words. When you have done this, take another deep breath to help you relax more and go through the relaxation just as you have done before. Tell your muscles to relax as I have done.

When you have finally relaxed your arms, imagine the escalator, elevator or staircase. Now you should count backward from ten to zero, including the zero. Count slowly. In your first four practice sessions repeat the count three times, as though going down different levels. With practice you need only count once.

Whenever you are ready to awaken, all you need to do is think to yourself, "Now I am going to wake up." Then count slowly to three and you will be wide awake. You will always awaken refreshed, relaxed and feeling fine.

While you are in hypnosis if something should happen so you should awaken, you will do so instantly and spontaneously—something such as the phone ringing or a real emergency like a fire. You will awaken instantly and be wide awake and fully alert. Actually this would happen without such a suggestion being necessary, for your subconscious mind always protects you.

Now I will count to three and you will be wide awake. (If convenient you should then go through this formula for self-hypnosis and put yourself back in. You will remember the formula and go through it exactly as given. Now, awaken as I count. ONE. Coming awake now. TWO—almost awake. THREE—now you are wide awake. Wide awake.

(Slowly) TEN—now you step on and start going down. NINE—EIGHT—SEVEN—SIX. Going deeper and deeper with each count. FIVE—FOUR—THREE Still deeper. TWO—ONE—and ZERO. Now you step off at the bottom and will continue to go deeper still with each breath you take. You are so relaxed and comfortable. Let go still more. Notice your breathing. Probably it is now slower and you are breathing more from the bottom of your lungs, abdominal breathing.

In a moment you will notice your hand and arm are beginning to lose any feeling of heaviness and are becoming light. If you are right-handed, it will be your right arm, if left-handed, it will be the left.

The arm is getting lighter and lighter. It will begin to lift. Perhaps just the fingers will move first, or the whole hand will start to float up. It will float toward your face, as though your face was a magnet pulling it up until the fingers touch your face someplace. Let's see where that will be. The arm begins to bend at the elbow. It is floating upward. If it has not started of its own accord, lift it voluntarily a few inches to give it a start. It will continue to go up of its own accord with no further effort. It floats on up toward your face, higher and higher. The higher your hand goes the deeper you will go. The deeper you go, the higher the hand will go. Lifting, lifting, floating up higher and higher. Going higher and higher. Now if it has touched your face let your hand go down to any comfortable position. If it has not touched yet, it can continue to float up until it does touch. You can forget about the arm while I tell you how you can put yourself into hypnosis whenever you may wish to do so.

You will use much the same method being used now. When you have made yourself comfortable, you will merely close your eyes and drift into hypnosis. But in your first three or four practice sessions it would help you if you first lit a candle and when you have made yourself comfortable would look at the flickering flame for two or three minutes. Then close your eyes.

Inner disturbance, or the opposite of tranquility, is nearly always caused by over-response, a too sensitive "alarm reaction." You create a built-in tranquilizer, or psychic screen between yourself and the disturbing stimulus, when you practice "not responding"—letting the telephone ring.

You cure old habits of over-response, you extinguish old conditioned reflexes, when you practice delaying the habitual, automatic, and unthinking response.

You may have never been formally hypnotized. But if you have accepted an idea—from yourself, your teachers, your parents, friends, advertisements—or from any other source, and further, if you are firmly convinced that idea is true, it has the same power over you as the hypnotist's words have over the hypnotized subject.

Your automatic mechanism, or what the Freudians call the "unconscious," is absolutely impersonal. It operates as a machine and has no "will" of its own. It always tries to react appropriately to your current beliefs and interpretations concerning environment. It always seeks to give you appropriate feelings, and to accomplish the goals which you consciously determine upon. It works only upon the data which you feed it in the form of ideas, beliefs, interpretations, opinions.

Meditation in Action

The Venerable Trungpa Rinpoche was some kind of a high abbot over a district of monasteries in Tibet, so you can expect a book of his talks to be some kind of esoteric and too profound for us surface-dwellers.

If it's esoteric, he's cleverly hidden that fact, and surface dwellers are being sucked in from all over the map. I've never seen so much good sense in so little space on the subject of meditation. As a book, it trends toward the very goal: singularity.

The point is that whatever one is trying to learn, it is necessary to have first hand experience, rather than learning from books or from teachers or by merely conforming to an already established pattern. That is what he found, and in that sense Buddha was a great revolutionary in his way of thinking. He even denied the existence of Brahma, or God, the Creator of the world. He determined to accept nothing which he had not first discovered for himself.

... He developed the creative side of revolution, which is not trying to get help from anyone else, but finding out for oneself. Buddhism is perhaps the only religion which is not based on the revelation of God nor on faith and devotion to God or gods of any kind. This does not mean that Buddha was an atheist or a heretic. He never argued theological or philosophical doctrines at all. He went straight to the heart of the matter, namely, how to see the Truth. He never wasted time in vain speculation.

If we are meditating at home and we happen to live in the middle of the High Street, we cannot stop the traffic just because we want peace and quiet. But we can stop ourselves, we can accept the noise. The noise also contains silence. We must put ourselves into it and expect nothing from outside, just as Buddha did. And we must accept whatever situation arises. As long as we never retreat from the situation, it will always present itself as a vehicle and we will be able to make use of it. As it is said in the Scriptures, "The Dharma is good at the beginning, the Dharma is good in the middle and the Dharma is good at the end." In other words the Dharma never becomes out-of-date, since fundamentally the situation is always the same.

The whole point is to cultivate the acceptance of everything, so one should not discriminate or become involved in any kind of struggle. That is the basic meditation technique, and it is quite simple and direct. There should be no deliberate effort, no attempt to control and no attempt to be peaceful. This is why breathing is used. It is easy to feel the breathing, and one has no need to be self-conscious or to try and do anything. The breathing is simply available and one should just feel that. That is the reason why technique is important to start with. This is the primary way of starting, but it generally continues and develops in its own way. One sometimes finds oneself doing it slightly differently from when one first started, quite spontaneously. This is not classified as an advanced technique or a beginner's technique. It simply grows and develops gradually.

Where there is an external person, a higher Being, or the concept of something which is separate from oneself, then we tend to think that because there is something outside there must be something here as well. The external phenomenon sometimes becomes such an overwhelming thing and seems to have all sorts of seductive or aggressive qualities, so we erect a kind of defence mechanism against it, failing to see that that is itself a continuity of the external thing. We try to segregate ourselves from the external, and this creates a kind of gigantic bubble in us which consists of nothing but air and water or, in this case, fear and the reflection of the external thing. So this huge bubble prevents any fresh air from coming in, and that is "I"—the Ego. So in that sense there is the existence of Ego, but it is in fact illusory.

Q. For meditation, would a student have to rid himself of Ego before he started, or would this come naturally as he is studying?

A. This comes naturally, because you can't start without Ego. And basically Ego isn't bad. Good and bad doesn't really exist anywhere, it is only a secondary thing. Ego is, in a sense, a false thing, but it isn't necessarily bad. You have to start with Ego, and use Ego, and from there it gradually wears out, like a pair of shoes. But you have to use it and wear it out thoroughly, so it is not preserved. Otherwise, if you try to push Ego aside and start perfect, you may become more and more perfect in a rather one-sided way, but the same amount of imperfection is building up on the other side, just as creating intense light creates intense darkness as well.

Thomas Merton entered the Cistercian Abbey of Our Lady of Gethsemani in Trappist, Kentucky, on December 10, 1941, to begin his life as a Trappist monk.

Twenty-seven years later, to the day, on December 10, 1968, a few hours after addressing a religious conference near Bangkok, Thailand he died alone in his room from the effects of an accidental electric shock received when he touched a fan.

His religious life formed a single arc. From the beginning he sought to lose himself in God in the silence of Trappist contemplative life. Through all the intrusions of his celebrity as a writer and prophetic figure, that initial religious passion remained paramount and growing. At the end of his life he was in search of deeper silence and solitude and more perfect contemplation.

On the Psychology of Meditation

If you're into meditation, but think Science has something to offer the world, you've probably tried to see what scientists have said about it. And been pretty disappointed. With few exceptions, they glibly call it "self-hypnosis," and, having said the magic word that exorcises the mysterious, forget about it. This book, still in press, is the first scientific treatment of meditation that is really good. If you're a meditator and want your world-view expanded this will help. If you're a scientist and want your world-view expanded, this will do it.

Claudio Naranjo looks at the multitude of ways of meditating and finds some basic dimensions running through them. Robert Ornstein looks at meditative practices and results from a psychologist's view and finds similarities to some well-known psychological processes that make it clearer just how meditation works, even though the ultimate question of where it takes you is beyond books.

Aside from the difficulty arising from the esoteric nature of some practices, a fact that makes writing on techniques almost irrelevant, in the sphere of meditation that we are discussing, is that the effectiveness of any practice seems to depend, more than in another case on an extra-technical factor of "personal contagion."

The infectious nature of possession by devils throughout history is well established, and it is impressive to read documents such as those of the epidemic of Loudun, showing how even apparently sane priests sent to perform exorcisms became affected by the prevalent state.

What is true in regard to unwanted devil possession is apparently as true with regard to states that are welcomed and cultivated. Among many peoples, trance is a collective phenomenon in which the state of the more experienced is believed to facilitate that of the novices. Among the Kung bushmen of the Kalahari desert, for instance, who understand the possessing entity not as a spirit but as an energy,—originally given to man by God— the energy, also called a "medicine", is now maintained by direct transmission from man to man. According to Dr. R. Lee, who has studied their trance dances, the practicing curers spend much of their time implanting medicine into the bodies of their trainees.

Recall the phenomenon of habituation. A slight change in the input is enough to "dishabituate" and to return the stimulus to awareness. Similarly, slightly altering our usual "automatic" behaviors, such as tying shoes, driving cars, should return them again into awareness.

In Yoga itself there is a similar tradition called Karma Yoga. The attempt is to treat everyday activities as a sacrament and to give them full attention. This exercise performs the same function as "right mindedness", or "self-remembering", and perhaps is a less extreme version of shikan-taza.

Most schools within these traditions combine the two major kinds of awareness, exercises or meditations, using a half hour or so twice a day of the "shutting down" meditation and as much as possible of the remainder of the day in a form of self-observation.

That concentrative meditation is a "turning off" of competing activity does seem quite clear. We recall in Anand's study of Yoga meditation that while in meditation the brains of the Yogins did not show any response to the external world. Also recall that the repetitive stimulation of the ganzfeld and by stabilized images leads to a state equivalent to that of no external stimulation at all. The repetitive form of meditation involves a trick to turn off the nervous system, to turn off awareness of the external environment, to enter a state of "darkness", or the "void", or, in our previous metaphor, that of turning out the light of the sun.

The rabbits were the central project in Emmitt's scheme, but he had other things going too that he had worked at as he had the time, and strength. He had a worm pit going by one of the walls inside the barn. He'd built it when he first got his rabbits, filled it with manure and stocked it with five thousand red worms he'd ordered through the mail. A year later there were so many worms in it he was scooping them out by the pitch-fork full and planting them in the garden rows to go to work on the mulch of shit and hay. But as the garden expanded and the rabbit population increased, Emmitt wanted still more worms, and the extension of the pit was one of the projects he left unfinished when he died.

D.R. intended to finish that pit, and perhaps build another one along the facing wall.

It would not be possible to breed too many worms for the work he had in mind.

Yoga is the method by which the restless mind is calmed and the energy directed into constructive channels. As a mighty river which when properly harnessed by dams and canals, creates a vast reservoir of water, prevents famine and provides abundant power for industry; so also the mind, when controlled provides a reservoir of peace and generates abundant energy for human uplift.

To make life healthy, happy and peaceful, it is essential to study regularly divine literature in a pure place. This study of the sacred books of the world will enable the sadhaka to concentrate upon and to solve the difficult problems of life when they arise. It will put an end to ignorance and bring knowledge. Ignorance has no beginning, but it has an end. There is a beginning but no end to knowledge.

Once the sadhaka has experienced the fulness of creation or of the Creator, his thirst (trṣṇa) for objects of sense vanishes and he looks at them ever after with dispassion (vairāgya). He experiences no disquiet in heat or cold, in pain or pleasure, in honour or dishonour and in virtue or vice. He treats the two imposters—triumph and disaster—with equanimity. He has emancipated himself from these pairs of opposites. He has passed beyond the pull of the gunas and has become a gunatita (one who has transcended the gunas). He is then free from birth and death, from pain and sorrow and becomes immortal. He has no self identity as he lives experiencing the fulness of the Universal Soul. Such a man, scorning nothing, leads all things to the path of perfection.

27. When one has mastered an asana, it comes with effortless ease and causes no discomfort. The bodily movements become graceful. While performing asanas, the student's body assumes numerous forms of life found in creation—from the lowliest insect to the most perfect sage—and he learns that in all these there breathes the same Universal Spirit—the Spirit of God. He looks within himself while practising and feels the presence of God in different asanas which he does with a sense of surrender unto the feet of the Lord.

Kundalini: The Evolutionary Energy in Man

dear jerry,
the universe from the inside out,
through the meditation efforts
of an Indian government worker,
a college failure.
a story of personal contact
with the cosmos,
and what happens to a man
when, unexpectedly,
he is set apart from his friend,
by a blinding flash
of pure white enlightenment.

During one such spell of intense concentration I suddenly felt a strange sensation below the base of the spine, at the place touching the seat, while I sat cross-legged on a folded blanket spread on the floor. The sensation was so extraordinary and so pleasing that my attention was forcibly drawn towards it. The moment my attention was thus unexpectedly withdrawn from the point on which it was focused, the sensation ceased. Thinking it to be a trick played by my imagination to relax the tension, I dismissed the matter from my mind and brought my attention back to the point from which it had wandered. Again I fixed it on the lotus, and as the image grew clear and distinct at the top of my head, again the sensation occurred. This time I tried to maintain the fixity of my attention and succeeded for a few seconds, but the sensation extending upwards grew so intense and was so extraordinary, as compared to anything I had experienced before, that in spite of myself my mind went towards it, and at that very moment it again disappeared. I was now convinced that something unusual had happened for which my daily practice of concentration was probably responsible. . . .

Entirely unprepared for such a development, I was completely taken by surprise; but regaining self-control instantaneously, I remained sitting in the same posture, keeping my mind on the point of concentration. The illumination grew brighter and brighter, the roaring louder, I experienced a rocking sensation and then felt myself slipping out of my body, entirely enveloped in a halo of light. It is impossible to describe the experience accurately. I felt the point of consciousness that was myself growing wider, I felt the point of consciousness that was myself growing wider surrounded by waves of light. It grew wider and wider, spreading outward while the body, normally the immediate object of its perception, appeared to have receded into the distance until I became entirely unconscious of it. I was now all consciousness, without any outline, without any idea of a corporeal appendage, without any feeling or sensation coming from the senses, immersed in a sea of light simultaneously conscious and aware of every point, spread out, as it were, in all directions without any barrier or material obstruction. I was no longer myself, or to be more accurate, no longer as I knew myself to be, a small point of awareness confined in a body, but instead was a vast circle of consciousness in which the body was but a point, bathed in light and in a state of exaltation and happiness impossible to describe.

After some time, the duration of which I could not judge, the circle began to narrow down; I felt myself contracting, becoming smaller and smaller, until I again became dimly conscious of the outline of my body, then more clearly; and as I slipped back to my old condition, I became suddenly aware of the noises in the

The Yoga System of Health and Relief from Tension

If you do yoga every day, you'll feel better. An uncluttered hour and Yogi Vithaldas' funky book will get you off . . . it has large print, adequate pictures, and makes you want to get out on the floor with it. A good book to begin with.

When concentrating on an object it is best to begin slowly and concentrate for thirty seconds intensely rather than three minutes in a half-controlled, disconnected fashion. Choose any object for the mind to fasten on, and make it a pleasant one—say a half-opened rose. Place it in front of you in a little vase on a level with your eyes, and think of nothing but its beauty, the soft imperceptible grading of the colours, the stalk, the thorns, and the leaf. Keep your mind on that rose until you could tell anyone every feature of the blossom, and eventually, even with your eyes closed, that rose will be so firmly imprinted on your mind that it will be as vivid for you as if you were still looking at it.

Regard the exercise as a kind of game, and have a shot at it at odd times of the day when you are waiting for a bus or for a meal. Do not waste that time by idle dreaming, but consciously direct your mind to some object, and, shortly, an admirable technique of mind-control will be established.

Place an acorn before you and gaze steadily at it, fixing it firmly in your mind. Know with certainty its attributes, as with the rose—its shape, colour, and any markings you can discern. Then imagine the acorn in the ground and a root shooting from its burst seed, and the first green leaf, and carry on the process to the complete tree. Leave nothing out, hurry nothing, let nothing interfere with you until in your mind the acorn has become a great tree.

Meditation has a positive and negative pole, or, in other words, two extremes in its practice which must be avoided. A person who erring on the positive side, avoids the great middle path, develops an assertive inner nature, and takes pride in a false superiority of power.

The student who sees no difference in receptivity and surrender of the will meditates in a negative manner, laying himself open to every passing force, desirable or not, instead of practising disciplined reception.

street, felt again my arms and legs and head, and once more became my narrow self in touch with body and surroundings. When I opened my eyes and looked about, I felt a little dazed and bewildered, as if coming back from a strange land completely foreign to me. The sun had risen and was shining full on my face, warm and soothing. I tried to lift my hands, which always rested in my lap, one upon the other, during meditation. My arms felt limp and lifeless. With an effort I raised them up and stretched them to enable the blood to flow freely. Then I tried to free my legs from the posture in which I was sitting and to place them in a more comfortable position but could not. They were heavy and stiff. With the help of my hands I freed them and stretched them out, then put my back against the wall, reclining in a position of ease and comfort.

Under the action of a stronger current than that for which it was designed, any man-made mechanism, even a hundredth part as sensitive and intricate as the human frame is, would be wrecked or damaged immediately, but because of certain inherent qualities, developed by the human organism as a means of evolution, the sudden release of the serpent power, provided the blood is healthy and the organs sound, is not attended by fatal results in favourable cases because of safety devices already provided by nature to meet a contingency of this kind in individuals ready for the experience. Even in such cases it is essential that the energy be benignly disposed and that the subject take the necessary precautions to maintain the strength of the body and the balance of the mind during the subsequent period of inexpressibly severe trial. How far I was endowed with a constitution suited for the great ordeal I cannot say, but being an utter stranger to the science, taken unawares without the requisite preliminary course of physical and mental discipline, and a prey to adversity, I was buffeted unceasingly for many years partly because of my ignorance and lack of sufficient strength and partly because of the extreme suddenness and rapidity of the extraordinary development.

I was destined to witness my own transformation, not comparable in any way to the great transfigurations in the past, nor similar in point of results to the marvelous achievements of genius; but though simple in nature and ordinary in effect, a transformation nevertheless, attended all along by great physical and mental suffering. But what I witnessed and still witness within myself is so contrary to many accepted notions of science, at variance with many time-honoured dogmas of faith, and so antagonistic to many of the universally followed dictums of civilization that when what I have experienced is proved empirically there must occur a far-reaching, revolutionary change in every sphere of human activity and conduct.

The Job

Burroughs' domain is the interface of individual mind and social mind—control. When social controls become demented, suicidal, the individual must break from them and find his own health. This book is a discussion of the control-busting techniques Burroughs has explored: Scientology's E-meter, word-subversion, violence, doing nothing, tape recorders, apomorphine, contradictory commands. All methods of seizing the social tools and turning them against themselves.

It's important research in a critical, invisible realm. My only carp would be Burroughs' assumption of crafty, subtle, efficient intellects behind society's controls... which describes Burroughs but hardly describes the tired men I've seen earnestly coping with the top jobs in the Pentagon and the Department of the Interior. Their main activity is trying not to fall over their own feet.

"Navigare necesse es. Vivare no es necesse."

"It is necessary to travel. It is not necessary to live." These words inspired early navigators when the vast frontier of unknown seas opened to their sails in the fifteenth century. Space is the new frontier. Is this frontier open to youth? I quote from the *London Express*, December 30, 1968: "If you are a fit young man under twenty-five with lightning reflexes who fears nothing in heaven or on the earth and has a keen appetite for adventure don't bother to apply for the job of astronaut." They want "cool dads" trailing wires to the "better half" from an aqualung. Doctor Paine of the Space Center in Houston says: "This flight was a triumph for the squares of this world who aren't hippies and work with slide rules and aren't ashamed to say a prayer now and then." Is this the great adventure of space? Are these men going to take the step into regions literally unthinkable in verbal terms? To travel in space you must leave the old verbal garbage behind: God talk, country talk, mother talk, love talk. You must learn to exist with no religion no country no allies. You must learn to live alone in silence. Anyone who prays in space is not there.

The last frontier is being closed to youth. However there are many roads to space. To achieve complete freedom from past conditioning is to be in space. Techniques exist for achieving such freedom. These techniques are being concealed and withheld. In *The Job* I consider techniques of discovery.

Why then does the subject when he is trying most desperately to make a good impression make the worst impression possible? Because he also has the goal to make a bad impression which operates on an involuntary automatic level. This self-destructive goal is such a threat to his being that he reacts against it. He may be conscious or partially conscious of the negative goal but he cannot confront it directly. The negative goal forces him to react. The Reactive Mind consists of goals so repulsive or frightening to the subject that he compulsively reacts against them and it is precisely this reaction that keeps these negative goals in operation.

We take karate and Aikido training in the schools scattered through large cities of the world, our Scientology training at Scientology centers. Other courses are provided by a network of institutes and foundations often short-lived. The training is often interrupted. Three months of karate then Scientology take up all my time and just before the advanced Scientology courses I am shifted to Cairo for an intensive course in Egyptian hieroglyphs. This center is closed down by the government. After that there is a weapons course financed by a rightist billionaire in East Texas where we learn to use every weapon from a crossbow to a laser gun, a seminar in black magic of Africa sponsored by an ethnology institute in London that is always short of funds, a volunteer experiment in prolonged sense

withdrawal set up the U.S. Navy which ended in a Congressional investigation of brainwashing, a free fall club in North Dakota, skin diving and just when I am getting used to the aqualung we are thrown out of Ceylon where the program is and I do a Yoga stint in Northern India.

The aim of academy training is precisely *decontrol* of opinion, the students being conditioned to look at the facts before formulating any verbal patterns. The initial training in non-chemical methods of expanding awareness would last at least two years. During this period the student would be requested to refrain from all drugs including alcohol since bodily health is essential to minimize mental disturbance. After basic training the student would be prepared for drug trips to reach areas difficult to explore by other means in the present state of our knowledge.

The program proposed is essentially a disintoxication from inner fear and inner control, a liberation of thought and energy to prepare a new generation for the adventure of space. With such possibilities open to them I doubt if many young people would want the destructive drugs. Remember junk keeps you right here in junky flesh on this earth where Boot's is open all night. You can't make space in an aqualung of junk.

the more people we can get working with tape recorders the more useful experiments and extensions will turn up why not give tape recorder parties every guest arrives with his recorder and tapes of what he intends to say at the party recording what other recorders say to him it is the height of rudeness not to record when addressed directly by another tape recorder and you can't say anything directly have to record it first the coolest old tape worms never talk direct

After the baptism of silence the student moves with ease in the soundless medium but words are at his disposition when he needs them to be used with absolute precision.

Society makes all these criminals quite deliberately, these great concentration camps, where they dump people known as criminals. Many of them are psychopaths, that is, they are refractory to control. As soon as they become criminals, they will be no more trouble from them at all. They're right in that game of cops and robbers for life, in a concentration camp. But now they've begun extending this concentration camp, extending it and extending it, by making more laws and making more people criminals, if all the laws were enforced, they'd have practically everyone in the concentration camp, and everyone else would be necessary to guard them. They have reached an impasse: they must either admit that the whole thing is a farce and that laws are not meant to be enforced, or change them, or enforce them.

Aikido and the Dynamic Sphere

Aikido is the most recent and most brilliantly conceived of the Japanese martial arts. A superb fighting technique, it is scarcely interested in fighting—it doesn't even have matches, just training. You train to put your mind and body in the same place for once—the one-point at your center of gravity. You train to acquire and direct Ki—energy (not strength, but coherent energy: when it's flowing you don't have to move). You train to blend with your opponent and use his energy to unhinge his attack. I find this book by two Americans to be far more useful for learning aikido than the numerous texts by Japanese students of the original master Morihei Uyeshiba. The illustrations here are profoundly better than the usual photographs. They depict the mental image—which is the heart of aikido technique. An editor can use aikido, a general, an actor, a craftsman, a politician, a designer. What the body learns and practices becomes useful in any realm.

American Aikido Federation
 142 West 18th St.
 New York, N.Y.

Your own Centre must become the center of your attacker's action as well. The Centre is not restricted in aikido, as we have indicated, to your personal dimension. If a man attacks you, he has lost his own point of independence and balance by the very irrationality of that act, and you must substitute your own Centre in an attempt to return the situation to normal. Thus he attacks, you evade; he plunges into a vacuum, you lead and guide him back around your own Centre and neutralize his attack.

A blow may be delivered to your head (attack no. 13, *shomen uchi*). You will pivot and kneel down, so that you are facing the same direction as your opponent. Your arm(s) will not "block" in the sense of stopping his motion, but will be extended so as to protect yourself. At the same time you will guide his motion (via his wrist or even sleeve) from the inside, lead him in full, circular extension forward and then down. This can be accomplished almost without touching him.

There is no pulling, no dragging; it is just a smooth, simple, circular lead, synchronized perfectly with your attacker's own movements. It is blended dynamically with them and, therefore, almost unnoticed until he is in flight. He falls, but yet does not know precisely how he came to fall.

T'ai-Chi

I've only watched two people doing t'ai-chi. one, an old man at sunrise, in front of a two-car garage, swooping and turning, the other, cathy dutton, sun on her eyelids, slowly working it out on the front lawn in menlo park. it is beautiful dance-with-the cosmos personal movement, meditational motion, and maybe it can be learned from a book.

How should a novice begin his training in T'ai-chi? He should relax completely. The aim is to throw every bone and muscle of the body wide open so that the *ch'i* may travel unobstructed. Once this is done, the chest must be further relaxed and the *ch'i* made to sink to the navel. After a time the *ch'i* will be felt accumulating for mass integration in the navel, from where it will begin to circulate throughout the body.

He also intended to go on dismantling the old house, to tear as much of it down for salvage as he possibly could before the coming winter's rains. Emmitt had only taken boards off as high as he could comfortably reach. He had stripped the weather boarding from the lower portions of the house on three sides. With a ladder D.R. would be able to get three times as much lumber as Emmitt had before he even touched the insides of the house. Emmitt had worked the lumber with a hammer and a wrecking bar, pulling out the nails and trimming up their edges with a saw. As he cleaned the boards he had stacked them neatly in a corner of the barn. He had scavenged more lumber than he needed for his hutches. It wasn't clear what he had intended to do with the extra, but D.R. knew exactly what his own intentions were: he was going to remodel two of the stalls into a weather-tight room, and live in it that winter. Two rooms, if he could get them done.

And three rooms, if Estelle would come to live there with him, and help him with the work.

If Estelle would come, they would convert one whole end of the barn into a house, and live there together by the rabbits and the worms and near the garden. They would get up early every morning and work to improve their place. If they wanted to, they could have a hundred hutches full of rabbits, and a million worms a year. They could have five hundred hutches full, and ten million worms at work in their manure, if they wanted to. If they wanted to, they could have a thousand hutches, one standing on every five square yards of that old ruined mountain, shitting pure worm food onto the ground, creating perfect lettuce beds and comfrey stands and alfalfa fields galore.

They could do that if Estelle would come to live there with him. They'd do all of that, and more. If she came.

Be Here Now

Baba Ram Dick Dass Alpert has put together for us a very tasty hot fudge Sunday school (you know how hot fudge sundaes came about? It seems this little princess once demanded of the King's cooks something absolutely new to tittle her jaded palette: "It must be both black and white and hot and cold," she pouted. Pow! They socked a sundae to her. . .) Be Here Now is western in flavor, Eastern in content and sprinkled generously with the kernels of wisdom gleaned from ten years of dedicated nutcracking. Rum Dum (as his father calls him) has over the past four or five years become a true disciple of Vedanta and Yoga, and in his box we get it all: a history, a cookbook, a bibliography and a collection of daily meditations hung together in beautiful layout. Though the book is clearly founded in Eastern Philosophy, Rum Dum's background is tennis shoes and bikes and cars and trying to get laid and gaining prestige, just like all of us, so his meditations are as familiar to us as our own bathwater. He makes the Message of the East comfortable for our coffee table studies with his references to drugs we have all taken, books we all have read and flashes we all have experienced. This warmth and dedication makes the Lama Foundation the most personal and reliable-seeming school of psychedelic thought that has so far surfaced in our hemisphere, and Baba Ram Dass shines forth from the box looking as though he may be our first true guru.

DO YOU THINK
THAT WHEN CHRIST IS LYING THERE
AND THEY'RE NAILING THE NAILS IN
HE'S SAYING "OH MAN DOES THAT HURT"? HE'S
PROBABLY LOOKING AT THE GUY WHO'S NAILING HIM
WITH

ABSOLUTE COMPASSION

HE DIGS WHY THE CAT'S DOING IT.
WHAT HE'S STUCK IN
HOW MUCH DUST COVERS HIS EYES
WHY HE'S GOT TO BE DOING IT
THAT'S THE WAY IT IS
HE SAID THE NIGHT BEFORE:
"WELL TOMORROW IS THE BIG TRIP.
YEAH-RIGHT- THESE ARE THE NAILS
WOW! LOOK AT THAT!"

AM I HE WHO IS BEING PAINED?

NO! THAT'S THE THING. ONCE YOU KNOW THAT
THEN: PLEASURE & PAIN
LOSS & GAIN
FAME & SHAME
ARE ALL THE SAME

The Hero With A Thousand Faces

myths and man's dreamworld have, for the past fifty years or so, been the objects of various alchemical attempts at synthesis. about the time i get convinced that screaming green weenies have some larger context than madison avenue, someone else denies the organic connection between them. the hero with a thousand faces is one of those syntheses. its about the monomyth. campbell traces his hero right out into the void.

426 Myth Learning

The Base Camp

The base camp includes all the living facilities with the exception of the hermitage rooms or buildings. Participants in the base camp follow a schedule as follows:

5:30	Rise
5:45-6:30	Group silent meditation.
6:30-7:00	Chanting, reading aloud, singing.
7:00-9:00	Dancing, asanas, pranayam, breakfast, getting the children to school, clean up, etc.
9:00-12:00	Karma yoga (work) period— assignments for an entire week are usually made once a week on Saturday morning.
12:00-2:00	Bringing food and supplies to hermit and preparing and having prasad (consecrated food), taken in silence. Then rest or relaxation and clean-up.
2:00-4:00	Karma yoga period.
4:00-5:30	Group study, and exercises in consciousness.
5:30-6:30	Pranayam, asanas, preparing evening food, etc.
6:30-8:00	Evening prasad (silently) plus clean-up and relaxation, reading, etc.
8:00-9:00	Group meditation and chanting and singing.

By assigning the karma yoga tasks over a period of a week you can use the karma yoga periods in a fluid fashion. One person's karma yoga, for example, might include milking goats, making cheese, weaving, picking the kids up at school, getting the car fixed, etc. Also a person may design his schedule to use a few of the morning karma yoga periods for personal study or meditation. The use of these periods is largely dependent upon the number of participants, and the amount of man-hours required for right livelihood and community maintenance. Time not spent in fulfilling assignments should be used on inner work (study, meditation, asanas, singing kirtan).

Most activities can be carried on in silence. Groups working together on a shared project such as gardening, building, etc. can either do these tasks in silence or do mantra during the work. Silence is an important part of the work. Formal discussions at the base camp of the hermitage experiences of the participants can be useful. Gossip, small talk, and hanging out. . . have a limited value in breaking through the illusion.

It is well to realize that the relationships in this community are not the dominant concern. Ideally, personality falls away in the common endeavor. If you want at all costs to hold onto your personality, don't join a spiritual community. . . because no one is going to be interested. Interpersonal matters are dealt with only to the extent that they are disruptive (i.e., capture the consciousness of the group or some participants.) Such matters can be dealt with at a group meeting if necessary. . . but the moment the group gets bogged down in heavy melodrama. . . it is well to call a meditation interlude until everyone can find a center again. Melodrama sucks us in again and again, but diminishes in power if actively thwarted.

THIS WHOLE TRIP I'M TALKING ABOUT IS PRAUGHT WITH

THE MOST EXQUISITE PARADOX
AS SOON AS YOU GIVE IT ALL UP
YOU CAN HAVE IT ALL

HOW ABOUT THAT ONE?
AS LONG AS YOU WANT POWER
YOU CAN'T HAVE IT.
THE MINUTE YOU DON'T WANT POWER
YOU'LL HAVE MORE THAN YOU EVER DREAMED
POSSIBLE

WHAT A WEIRD THING!

AS LONG AS YOU HAVE AN EGO
YOU'RE ON A LIMITED TRIP

YOU'RE ON A TRIMAL TRIP THAT'S GOING TO LAST
MAYBE WHAT? 60 — SAY 70 — MAYBE 80 YEARS
AND PULL WITH FEAR OF ITS END
TRYING TO MAKE ITS OWN ETERNITY.

WELL: IF I'AM NOT SPEAKING
IF I'AM NOT WHAT I THOUGHT I WAS
HOW DID I GET INTO THIS
WHO AM I?

FOR ONLY WHEN Y KNOW WHO Y AM WILL I KNOW WHAT IS

POSSIBLE

3715

"Did I ever tell you about the time that Tim and I . . ."
And he'd say, "Don't think about the past. Just be here now."
Silence.
And I'd say, "How long do you think we're going to be on this trip?"
And he'd say, "Don't think about the future. Just be here now."
I'd say, "You know, I really feel crummy, my hips are hurting. . ."
"Emotions are like waves. Watch them disappear in the distance on the vast calm ocean."
He had just sort of wiped out my whole game. That was it— that was my whole trip— emotions, and past experiences, and future plans. I was, after all, a great story teller.
So we were silent. There was nothing to say.

IN GOD WE TRUST

It is the business of mythology proper, and of the fairy tale, to reveal the specific dangers and techniques of the dark interior way from tragedy to comedy. Hence the incidents are fantastic and "unreal"; they represent psychological, not physical, triumphs. Even when the legend is of an actual historical personage, the deeds of victory are rendered, not in lifelike, but in dreamlike figurations; for the point is not that such-and-such could be done on earth, this other, more important, primary thing had to be brought to pass within the labyrinth that we all know and visit in our dreams. The passage of the mythological hero may be over-ground, incidentally; fundamentally it is inward—into depths where obscure resistances are overcome, and long lost, forgotten powers are revived, to be made available for the transfiguration of the world. This deed accomplished, life no longer suffers hopelessly under the terrible mutilations of ubiquitous disaster, battered by time, hideous throughout space; but with its horror visible still, its cries of anguish still tumultuous, it becomes penetrated by an all-suffusing, all-sustaining love, and a knowledge of its own unconquered power. Something of the light that blazes invisible within the abysses of its normally opaque materiality breaks forth, with an increasing uproar. The dreadful mutilations are then seen as shadows, only, of an immanent, imperishable eternity; time yields to glory; and the world sings with the prodigious, angelic, but perhaps finally monotonous, siren music of the spheres. Like happy families, the myths and the worlds redeemed are all alike.

The King and the Corpse

I know of no better myth-telling than this, and no better myths. You've got Abu Kasem's Slippers, and then Conn-eda and John Golden-Mouth, and four romances from King Arthur that take deeper turns than T. H. White, the King and the Corpse, and the prize: the ancient Hindu Romance of the Goddess, plumbing the involuntary creation. Collected by Heinrich Zimmer, edited by Joseph Campbell. There's few books with such a blend of extravagance and intelligence, and none that come so close to the heart of education. —SB

The course of the world runs awry, but therewith it goes directly to its goal. The catastrophe of the previously unforeseen is what breaks the world progression forward, and the moment the catastrophe has come to pass it appears to be what was intended all the while. For it is creative in a deeper way than the planning creative spirit supposes. It transforms the situation, forces an alteration on the creative spirit, and throws it into a play that carries it beyond itself carries it, that is to say, really and properly into play, and into a play that entrains the entirety of creation. The planner, the watcher, is compelled to become the endurer, the sufferer. Such a metamorphosis into the opposite, into the absolutely alien, is what throws the knots that reticulate the net of the living whole and mesh the individual alive into the fabric.

Shiva's visage became radiant with joy. In the presence of all the Holy Ones he lapsed, absorbed, into introverted vision. Then he permitted himself to sink to the floor, legs crossed, shut his eyes, and sank into his being to the depth of the Being Sublime. His body began to glow, so that the eyes of all the Holy Ones present became dazzled. And the moment he reached quietude in this immersion, Vishnu's Mâyā fell away from around him, and his entire body burst into such a radiance that even his own hosts were unable to bear the blast. Vishnu passed into him, poured into him as the pure Light of Heaven, and disclosed within Shiva's body, to the eye of his inner contemplation, the whole lotus-spectacle of creation and the procession of the world. Blissful and serene, beyond the senses and their universes of distinctions, alone and pure, beholding everything, the abstracted one experienced within his own being the Being Supreme, that Substratum of all Unfoldments. He beheld, riveted in contemplation, how the One Substance exfoliates into all the delictations of the world.

Shiva, bereaved, distracted, was conducted gently by his guru, Brahmā, out of the gates of the city of his life's loss and away into the Himalayan peaks of snow. There, walking together, the two came upon a little lake of solitude, clear, and delightful to the mind. Brahmā perceived it first.

And seated here and there about the quiet shores were saints and sages in absolute meditation; two or three stood bathing in the cool crystal waters, sending ripples out across its mirroring of the blue and immobile, high, mountain sky. Many migratory birds, shrilly crying, were coming from all directions to flutter down into its lotus-bordered waters—pairs of splendid ruddy geese beautifully spreading out their great wings in exultation, cormorants with their hooked bills, gray-winged geese, and Siberian cranes, stalking about the shores, floating on the surface of the lake, peering into the waters, themselves beautifully reflected—and, occasionally, with a sudden thunderous beating of hundreds of wings, all lifting out of the lake into the sky, to circle in many companies, and presently return to settle, flutter, and preen. And beneath them, in the crystalline depths, were swimming fish of innumerable brilliant hues, visible as they darted in and out among the lotus stems. Lotus buds, lotus chalice, blue lotuses and white were abundant there; and the vegetation about the shores was luxurious and of cool shade.

That night, in the bed, Sir Gawain could not at first bring himself to turn and face her unappetizing snout. After a little time, however, she said to him: "Ah, Sir Gawain, since I have ved you, show me your courtesy in bed. It may not be rightfully denied. If I were fair, you would not behave this way; you are taking no heed of wedlock. For Arthur's sake do kiss me at least; I pray you, do this at my request. Come, let us see how quick you can be!"

The knight and loyal nephew of the king collected every bit of his courage and kindness. "I will do more," he said in all gentleness, "I will do more than simply kiss, before God!" And he turned around to her. And he saw her to be the fairest creature that ever he had seen without measure.

She said: "What is your will?"

"Ah, Jesul!" he said, "what are ye?"

"Sir, I am your wife, securely; why are ye so unkind?"

"Ah, lady, I am to blame; I did not know. You are beautiful in my sight—whereas today you were the foulest wight my eye had ever seen! To have you thus, my lady, pleases me well." And he braced her in his arms and began kissing her, and they made great joy.

"Sir," she said, "my beauty will not hold. You may have me thus, but only for half the day. And so it is a question, and you must choose whether you would have me fair at night and foul by day before all men's eyes, or beautiful by day and foul at night."

"Alas," replied Gawain, "the choice is hard. To have you fair at night and no more, that would grieve my heart; but if I should decide to have you fair by day, then at night I should have a scabrous bed. Fain would I choose the best, yet know not what in this world I shall say. My dear lady, let it be as you would desire it; I rest the choice in your hand. My body and goods, my heart and all, is yours to buy and sell; that I avow before God."

"Ah, gramercy, courteous knight!" said the lady. "Mays't thou be blessed above all knights in the world, for now I am released from the enchantment and thou shalt have me fair and bright both night and day."

The involvement of the gods in the web of their own creation, so that they become, like Abu Kasem, the harried victims of their creatures, entangled in nets of not quite voluntary self-manifestation, and then mocked by the knowing laughter of their own externally reflected inner judge: this is the miracle of the universe. This is the tragicomic romance of the world. The gods, the fairy powers, are always in danger of self-enchantment. Like the youth Narcissus, they become fixed to their own reflected images—momentarily reluctant to pass with the passing of time, and critically in need of the shocking, shattering blow of the redemptive catastrophe. Man is the little world creator; God, the great. Each, surrounded by the figments of his own mirrored depths, knows and suffers the cosmic self-torment. And the fatal power that enchants them both is ever the great goddess, Mâyā, self-delusion, the supreme creatrix of all the worlds.

Brahmā, sinking still further into the limpid darkness of his own interior, struck a new depth: suddenly the most beautiful dark woman sprang from his vision, and stood naked before everyone's gaze.

She was Dawn, and she was radiant with vivid youth. Nothing like her had yet appeared among the gods; nor would her equal ever be seen, either among men, or in the depths of the waters in the jeweled palaces of the serpent queens and kings. The billows of her blue-black hair were glistening like the feathers of a peacock, and her clearly curving, dark brows formed a bow fit for the God of Love. Her eyes, like dark lotus calyxes, had the alert, questioning glance of the frightened gazelle; and her face, round as the moon, was like a purple lotus blossom. Her swelling breasts with their two dark points were enough to infatuate a saint. Trim as the shaft of a lance stood her body, and her smooth legs were like the stretched-out trunks of elephants. She was glowing with little delicate pearls of perspiration. And when she found herself in the midst of her startled audience, she stared about at them, in uncertainty, then broke into a softly rippling laugh.

The Masks of God

Want to grab history while reading mythology? Want to understand for the first time why those crazy Mayans and other South American civilizations used "Christian" symbols, attributed by European so-called Christians who came a-calling swords in hand, to works of the Devil? Want to see why Sumer and Egypt and Mexico are so similar? Want to really fumigate your fancy with the Mother Goddess and then enjoy Christmas all the more? Want to understand why the patriarchism of Judaism drives a woman nuts if she's neolithic at all, and why those paleolithic hunters may have had something important to say about self experience and a coming to an understanding? Want to hear who said the voice of the Universe is as gentle as a woman's? Want to sally forth into the world of the spirit, in other words, to really dig where Lewis Mumford says it's at: humanity's penchant for dreaming?

When you come right down to it, imagination really seems to be the point: we differ from our furred and feathered fellows because we dream of things that are not and of things that never were. We believe, and in our believing brings madness and the sublime into reality.

Get Joseph Campbell and blow your preconceptions. You'll never see yourself the same again.

Man with a dart, Castellón

Primitive Mythology

Gawain, on the other hand, was one who had spent his life not posing in a role unearned, conferred upon him by anointment, but in quest, sincerely, for his object of desire, and when he found her — after years, not days — he was transfixed, established in his own true center, and knew exactly where he stood. She was, again, the bereaved Orgeluse. But he was no toy king. There was no threat, no fear, either of man or of spirit, that could put him off his course or freeze him to a halt. His trials were proper to his own life and he was consequently their match: hence, at one with his Lady Soul; at peace with her; and in the fair castle of love, the master of his world.

It remained only to make peace as well with the world beyond the broad stream. . . .

Sitting chatting with his grandmother at the window, Gawain with a start of joy espied on the meadow on the other shore the first of Arthur's host arriving with banners, colors, spears, and immediately setting up pavilions. With love in his heart, tears in his eyes, he watched, then ordered all his own castle company — knights and ladies, squires and pages — to make ready with their own banners and tents to cross and welcome his uncle's court. Arthur and his queen were introduced to Arnie, the king's mother, Sangive, his sister, and the sisters of Gawain. All kissed and laughed, wept and laughed and kissed again. Moreover, many a knight who had been mourning Gawain's death came smiling into his tent. But the seneschal Keie only murmured, "God surely does work wonders! Where did Gawain get all these queens?"

Next day a third host, that of Gramoflanz, arrived, and Gawain then rode forth onto a broad plain, alone, for exercise, where he saw a lone knight galloping his way, wearing armor redder than rubies. . . .

Humor is the touchstone of the truly mythological as distinct from the more literal-minded and sentimental theological mood. The gods as icons are not ends in themselves. Their entertaining myths transport the mind and spirit, not up to, but past them, into the yonder void; from which perspective the more heavily freighted theological dogmas then appear to have been only pedagogical lures: their function, to cart the unadroit intellect away from its concrete clutter of facts and events to a comparatively rarefied zone, where, as a final boon, all existence — whether heavenly, earthly, or infernal — may at last be seen transmuted into the semblance of a lightly passing, recurrent, mere childhood dream of bliss and fright. "From one point of view all those divinities exist," a Tibetan lama recently replied to the question of an understanding Occidental visitor, "from another they are not real." This is the orthodox teaching of the ancient Tantras: "All of these visualized deities are but symbols representing the various things that occur on the Path";

as well as a doctrine of the contemporary psychoanalytical schools. And the same metatheological insight seems to be what is suggested in Dante's final verses, where the illuminated voyager at last is able to lift his courageous eyes beyond the beatific vision of Father, Son, and Holy Ghost, to the one Eternal Light.

"... in reality, Slayer and Dragon, sacrificer and victim, are of one mind behind the scenes, where there is no polarity of contraries, but mortal enemies on the stage, where the everlasting war of the Gods and the Titans is displayed. In any case, the Dragon-Father remains a Pleroma, no more diminished by what he exhales than he is increased by what he repossesses. He is the Death, on whom our life depends; and to the question 'Is Death one, or many?' the answer is made that 'He is one as he is there, but many as he is in his children here.'

Creative Mythology

TUESDAY: THE MAGIC RABBIT

Until the work was done, Tuesday was very much like Monday. D.R. spent the morning turning under the manure he had spread the day before. He planted the little new-ground with worms and humus from the pit, then worked a while tearing boards off the side of the house, dressing them and stacking them in the barn. Already the stack was waist-high and five boards across, enough to begin the work of converting the stalls to rooms. D.R. had an impulse to commence it then and there, but he knew he ought to talk to Leonard first. He could probably bang a room of some sort together by himself; but this was no crude project he had in mind. There are ways to go about certain kinds of work; there are rules in building and D.R. wanted to learn them. He wanted to do a good job, and know something truly useful when he was done. So he left the room alone till Leonard could come up to advise him on it, and worked some more in the afternoon on the new worm pit instead.

D.R. worked the whole day through, going from job to job. It tired his body in that satisfying way he'd come to relish the last few days, and after supper he was glad to sit in Emmitt's rocking chair on the front porch and rest himself a while. His body sank into the chair and without reluctance let go of the day in anticipation of the night.

But D.R.'s mind wasn't ready for that yet. His mind was still excited, eager for some action, some outlet for the words that had built up through the day and gone unsaid. And so he went in the house and got his tablet and his pen, came back to his chair and wrote another letter to the Flash.

Your life has a limit but knowledge has none. If you use what is limited to pursue what has no limit, you will be in danger. If you understand this and still strive for knowledge, you will be in danger for certain! If you do good, stay away from fame. If you do evil, stay away from punishments. Follow the middle; go by what is constant, and you can stay in one piece, keep yourself alive, look after your parents, and live out your years.

Cook Ting was cutting up an ox for Lord Wen-hui. At every touch of his hand, every heave of his shoulder, every move of his feet, every thrust of his knee—zip! zoop! He slithered the knife along with a zing, and all was in perfect rhythm, as though he were performing the dance of the Mulberry Grove or keeping time to the Ching-shou music.

"Ah, this is marvelous!" said Lord Wen-hui. "Imagine skill reaching such heights!"

Cook Ting laid down his knife and replied, "What I care about is the Way, which goes beyond skill. When I first began cutting up oxen, all I could see was the ox itself. After three years I no longer saw the whole ox. And now—now I go at it by spirit and don't look with my eyes. Perception and understanding have come to a stop and spirit moves where it wants. I go along with the natural makeup, strike in the big hollows, guide the knife through the big openings, and follow things as they are. So I never touch the smallest ligament or tendon, much less a main joint.

"A good cook changes his knife once a year—because he cuts. A mediocre cook changes his knife once a month—because he hacks. I've had this knife of mine for nineteen years and I've cut thousands of oxen with it, and yet the blade is as good as though it had just come from the grindstone. There are spaces between the joints, and the blade of the knife has really no thickness. If you insert what has no thickness into such spaces, then there's plenty of room—more than enough for the blade to play about in. That's why after nineteen years the blade of my knife is still as good as when it first came from the grindstone.

"However, whenever I come to a complicated place, I size up the difficulties, tell myself to watch out and be careful, keep my eyes on what I'm doing, work very slowly, and move the knife with the greatest subtlety, until—flop! the whole thing comes apart like a clod of earth crumbling to the ground. I stand there holding the knife and look all around me, completely satisfied and reluctant to move on, and then I wipe off the knife and put it away."

Chuang Tzu and Hui Tzu were strolling along the dam of the Hao River when Chuang Tzu said, "See how the minnows come out and dart around where they please! That's what fish really enjoy!"

Hui Tzu said, "You're not a fish—how do you know what fish enjoy?"

Chuang Tzu said, "You're not I, so how do you know I don't know what fish enjoy?"

Hui Tzu said, "I'm not you, so I certainly don't know what you know. On the other hand, you're certainly not a fish—so that still proves you don't know what fish enjoy!"

Chuang Tzu said, "Let's go back to your original question, please. You asked me *how* I know what fish enjoy—so you already knew I knew it when you asked the question. I know it by standing here beside the Hao."

The Secret of the Golden Flower

*the way it reads to me:
pass beyond the little old man
sitting on
that ledge of awareness
on which
you watch yourself making love,
become the little old man,
split him a few times,
and realize that,
because all this is possible,
the light from the golden flower
dissolves duality
into the one.*

Master Lu-Tsu said, When there is a gradual success in producing the circulation of the light, a man must not give up his ordinary occupation in doing it. The ancients said, When occupations come to us, we must accept them; when things come to us, we must understand them from the ground up. If the occupations are properly handled by correct thoughts, the light is not scattered by outside things, but circulates according to its own law. Even the still invisible circulation of the light gets started this way; how much more, then, is it the case with the true circulation of the light which has already manifested itself clearly.

足

One looks with both eyes at the tip of the nose, sits upright and in a comfortable position, and holds the heart to the centre in the midst of conditions. In Taoism it is called the yellow middle, in Buddhism the center of the midst of conditions. The two are the same. It does not necessarily mean the middle of the head. It is only a matter of fixing one's thinking on the point which lies exactly between the two eyes. Then all is well. The light is something extremely mobile. When one fixes the thought on the mid-point between the two eyes, the light streams in of its own accord. It is not necessary to direct the attention especially to the central castle. In these few words the most important thing is contained.

In the process of meditating introspectively upon the aphoristic teachings concerning the One Mind, the disciple will inevitably come face to face with the age-old problem of what man is. He will intuitively ask himself, Why am I? What am I? Am I a something, a self, a soul, eternally separate and different from each of the countless myriads of similarly constituted beings I see round about me in various states of existence? Is the glamorous world of appearances real? Are all these inanimate objects and all these living, breathing creatures, in the midst of which I find myself, real? Or are they, as the Buddhas declare, no more than the content of a karmic mirage, the stuff composing the dreams of life?

When the truth begins to come from within, very feebly at first, like the consciousness of a man awakening from the torpor of a drugged sleep, or like the first traces of dawn coming forth in an eastern sky, the disciple will realize gradually that only by transcending the realm of separateness and attaining super-consciousness of the immutable at-onement of all things, organic and inorganic, can the age-old problem be solved. The more the disciple meditates upon what the self has in common with other selves, the more he will discover the impersonal self common to all selves. Thence he will reach the conclusion that if one and the same factor is the core of each individual's selfhood, no individual in its true essence had individuality. There would be nothing like my self; there would only be the Self.

The One Mind being verily of the Voidness and without any foundation, one's mind is, likewise, as vacuous as the sky. To know whether this be so or not, look within thine own mind.

Being of the Voidness, and thus not to be conceived as having beginning or ending, Self-Born Wisdom has in reality been shining forever. Like the Sun's essentiality, itself unborn. To know whether this be so or not, look within thine own mind.

Being merely a flux of instability like the air of the firmament, objective appearances are without power to fascinate and fetter. To know whether this be so or not, look within thine own mind.

All appearances are verily one's own concepts, self-conceived in the mind, like reflections seen in a mirror. To know whether this be so or not, look within thine own mind.

Arising of themselves and being naturally free like the clouds in the sky, all external appearances verily fade away into their own respective places. To know whether this be so or not, look within thine own mind.

The Realization and the Great Liberation

Nothing save mind is conceivable. Mind, when uninhibited, conceives all that comes into existence. That which comes into existence is like the wave of an ocean. The state of mind transcendent over all dualities brings Liberation. It matters not what name may carelessly be applied to mind; truly mind is one, and apart from mind there is naught else. That Unique One Mind is foundationless and rootless. There is nothing else to be realized. The Non-Created is the Non-Visible.

By knowing the invisible Voidness and the Clear Light through not seeing them separately—there being no multiplicity in the Voidness—one's own clear mind may be known, yet the Thatness itself is not knowable.

Mind is beyond nature, but is experienced in bodily forms. The realization of the One Mind constitutes the All-Deliverance.

Without mastery of the mental processes there can be no realization.

Similarly, although sesame seed is the source of oil, and milk the source of butter, not until the seed be pressed and the milk churned do the oil and butter appear.

Although sentient beings are of the Buddha essence itself, not until they realize this can they attain Nirvana.

Even a cowherd [or an illiterate person] may by realization attain Liberation.

Zen Mind, Beginner's Mind

Suzuki Roshi says he prefers to work with American students because they are such total earnest beginners, and that is an advantage in the Zen business. Roshi is a remarkable person. During World War II in Japan he was a pacifist — unheard of. When the Americans came in the people in his town wanted to quickly tear down a war memorial statue they had; Roshi said don't do it, the Americans won't mind (they probably didn't even notice). Americans did notice during construction of the Tassajara Zen Center when the students found that their tiny Roshi could move as powerfully and gracefully with huge boulders as he could with obstacles to understanding. This book is a nicely edited transcription of words Suzuki Roshi spoke to a beginning Zen group in a Los Altos garage.

Informal talks on Zen meditation and practice
by SHUNRYU SUZUKI

Zen mind is one of those enigmatic phrases used by Zen teachers to make you notice yourself, to go beyond the words and wonder what your own mind and being are. This is the purpose of all Zen teaching — to make you wonder and to answer that wondering with the deepest expression of your own nature. The calligraphy on the front of the binding reads nyorai in Japanese or tathagata in Sanskrit. This is a name for Buddha which means "he who has followed the path, who has returned from suchness, or is suchness, thusness, is-ness, emptiness, the fully completed one." It is the ground principle which makes the appearance of a Buddha possible. It is Zen mind. At the time Suzuki-roshi wrote this calligraphy — using for a brush the frayed end of one of the large swordlike leaves of the yucca plants that grow in the mountains around Zen Mountain Center — he said: "This means that Tathagata is the body of the whole earth."

—Richard Baker

But perfect freedom is not found without some rules. People, especially young people, think that freedom is to do just what they want, that in Zen there is no need for rules. But it is absolutely necessary for us to have some rules. But this does not mean always to be under control. As long as you have rules, you have a chance for freedom. To try to obtain freedom without being aware of the rules means nothing. It is to acquire this perfect freedom that we practice zazen.

Galton's Walk

Associations, the mind's incessant ticking. You might get free of associations by investigating them, as this book relentlessly does.

I recall a jazz musician who kept seeing a little black dog walk by in front of him. "There he goes again," he would say. It never occurred to anybody that he was onto something.

In class one day, some undergraduates were told to tell a story, and observe the destruction of thought. One began, "There were three men on their way to Chatham . . . (pause) . . ." During the pause, the teacher said "Chatham," and the student boggled. He froze in amazed silence, having forgotten what he was going to say. Another student said, "I went downtown to the station and sat down at the lunch counter . . . (pause) . . ." During this pause, the teacher said, "I went," which also erased whatever was to follow — not just the speech, but the intention.

We are now well acquainted with the idea that consciousness has the features of a plenum; that it may be entirely full of its contents, whatever they are; and, therefore, that all movement in consciousness may be cyclic. On this basis the recurrence of thoughts and actions is just what we might expect. We are now acquainted with the idea that there is something called creative thinking and problem-solving about which nothing is so clear as that it is a chancy passive pursuit.

Finally, we are acquainted with some thrashings of the awakening beast, some rousing from the long sleep of thought, some attempts to jab it, poke it, mechanize it, shatter it, reform it, and shake it awake — so that we might find a way to do the same things we do passively, as in dreaming, while we are awake and with all our wits about us.

We have seen that memory is aided by an externalized simulacrum of the hidden plenum, and that a little intellectual progress can be made in taking words and separating them into a pile called content and a pile called form.

Not Even God Is Ripe Enough

Very far out African fables. Here's just the titles.

Kindness won't kill you, but it can give you a lot of worries	1
The mouth that commits an offence must talk itself out of punishment	5
He who shits on the road will meet flies on his return	8
When life is good for us, we become bad	11
You can fool others, but can you fool yourself?	14
A wise man solves his own problems	16
He who has patience has everything	21
Not even god is ripe enough to catch a woman in love	24
The unexpected amen	28

Every trickster will be fooled once	30
A young man can have fine cloth like an elder, but he can never have rags like an elder	33
Half a truth is no truth	35
The pot that boils over only dirties itself	38
When the man who knows no disasters hears weeping — he thinks it is song	42
Many words do not fill a basket	44
Every day is for the crook — but one day is for the deceived	46
Hatred is like rain in a desert — it is of no use to anybody	48
What an old man can see sitting down — a young man can't see standing up	51
A man's luck cannot be driven away — only delayed	54
Large eyes produce many tears	56

According to Christianity, every existence in nature is something which was created for or given to us by God. That is the perfect idea of giving. But if you think that God created man, and that you are somehow separate from God, you are liable to think you have the ability to create something separate, something not given by Him. For instance, we create airplanes and highways. And when we repeat, "I create, I create, I create," soon we forget who is actually the "I" which creates the various things; we soon forget about God. This is the danger of human culture. Actually, to create with the "big I" is to give; we cannot create and own what we create for ourselves since everything was created by God. This point should not be forgotten. But because we do forget who is doing the creating and the reason for the creation, we become attached to the material or exchange value. This has no value in comparison to the absolute value of something as God's creation. Even though something has no material or relative value to any "small I" it has absolute value in itself. Not to be attached to something is to be aware of its absolute value. Everything you do should be based on such an awareness, and not on material or self-centered ideas of value. Then whatever you do is true giving, is "dana prajna paramita."

I discovered that it is necessary, absolutely necessary, to believe in nothing. That is, we have to believe in something which has no form and no color — something which exists before all forms and colors appear. This is a very important point. No matter what god or doctrine you believe in, if you become attached to it, your belief will be based more or less on a self-centered idea. You strive for a perfect faith in order to save yourself. But it will take time to attain such a perfect faith. You will be involved in an idealistic practice. In constantly seeking to actualize your ideal, you will have no time for composure. But if you are always prepared for accepting everything we see as something appearing from nothing, knowing that there is some reason why a phenomenal existence of such and such form and color appears, then at that moment you will have perfect composure.

Egypt

For those who want to learn ancient Egyptian:
The standard work is Sir Alan Gardiner's *Egyptian Grammar*, 3rd edn, 1957, Oxford (\$12.50). It is the best grammar for beginners in any language and also the most authoritative reference grammar of Middle Egyptian. A magnificent piece of typesetting, it uses a special hieroglyphic font and a complete sign list and vocabulary. 4to, 646 pp + xxxvi

For the latest scholarly additions see H. J. Polotsky's "Egyptian Tenses" Jerusalem, 1965. 26 pp, 50¢.

The best and only dictionary in English is R. O. Faulkner's *A Concise Dictionary of Middle Egyptian*, Oxford, 1962. 327 pp 8 vo \$4.20.

For the history and culture of ancient Egypt:

John A. Wilson: *The Culture of Ancient Egypt*, Chicago, 1951. U of Chicago Press Phoenix Boox (paperback) \$2.45 best & most enlightened

Sir Alan Gardiner: *Egypt of the Pharaohs*, Oxford, 1961, paperback \$2.95

Adolf Erman: *The Ancient Egyptians*, a Sourcebook of their Writings, Harper Torchbacks, \$2.75

James B. Pritchard, ed.: *Ancient Near Eastern Texts*, Princeton. 2nd ed. \$30 ea.; \$50 set

W. C. Hayes: *The Scepter of Egypt*, Harvard, 1959. 2 vols. \$30

Prices quoted for books from England are those of Blackwell's, Oxford, England. They can be ordered there cheapest.

Enthusiasts should write for the catalogs from Blackwell's and also from Otto Harrassowitz, 6200 Wiesbaden, Postfach 349, Germany.

Note: I have listed only those works published in English. For works in other languages you can use the bibliographies in the above books as well as the book dealers catalogs.

Kenneth Konrad
Chicago, Illinois

Dear Flash,

Here's what's going on:
Saturday I helped Leonard build a new pen for his hogs.
Sunday I crawled back in an old coal mine and watched a candle burn. Then I sat a long time in the dark, just being quiet.

Yesterday I spread rabbit shit on some old dead ground, and today spaded it in and sprinkled two gallons of red worms on it.

I also ripped a lot of boards off this old house I'm living in, and cleaned them up to use building myself a pad in a corner of the barn.

This house I'm living in is dead.
There are people living who have memories of it, and things that happened here. I remember things, and my sister, and there are a few others scattered around with old home movies in their brains they filmed in years gone by.

But the house itself is dead, and within the year it will be buried by about a million tons of mud and crap piled up behind it.

The barn is where the life is now. The garden is behind it. The worms live inside it in a pit. There's a chicken lot on one side, and on two sides all the rabbits in their hutches that I told you about. They're in those hutches right this minute, Flash, wondering when I'm going to come and live there as their neighbor.

This afternoon I stuck my head in one of the hutches and breathed a while with the old momma and her litter. She's brown and white and solemn. The babies are about three weeks old, just starting to hop in and out of the nest box on their own, and sniff their mother's solid food. They're getting curious about the larger world. The old momma already knows. She's wise and proud and I think satisfied. We looked deeply into one another's eyes a time or two. I'm her bringer of food. That's my whole function in the world as far as she's concerned. As a matter of fact, it's my function in the world as far as I'm concerned too, except that what I know that she doesn't is that there's this whole larger scheme going on. What I know that she doesn't is that her produce — the manure; those thousands of little pellets that gather beneath her hutch — is food too, in this amazing scheme that my uncle started before he died, and that I'm now in the process of expanding.

(continued)

A Yaqui Way of Knowledge

This book records the experiences of an anthropology student who becomes the apprentice of Don Juan, a Yaqui indian "man of knowledge" who is also a "diablero", a black sorcerer. It is a profoundly disturbing book since it opens up areas and ideas we usually dismiss or deny. Don Juan, over a period of five years, teaches the author a little of his knowledge. He teaches through giving his apprentice various psycho-active plants: peyote, datura, and a mixture of psilocybin mushrooms, genista canariensis, and other plants. Each of these plants has its own way of teaching, its own demands and its own kind of power. For those of us who thought we understood psychedelic effects this book reveals the rudimentary state of our knowledge. For those of us who have dismissed magic as a combination of hypnotism and stage effects we are confronted with powerful and effective magic which seems irrefutable.

Don Juan himself appears as a powerful, indecipherable, wise man whose knowledge is both extensive and alien to our own. He offers to each of us the possibility of dealing with other realities, but he makes it clear that all these ways are dangerous, difficult and once entered, cannot be put aside as simply another experience.

The goal of his teaching is partially expressed as follows:

The particular thing to learn is how to get to the crack between the worlds and how to enter the other world. There is a crack between the two worlds, the world of the diablos and the world of living men. There is a place where these two worlds overlap. The crack is there. It opens and closes like a door in the wind. To get there a man must exercise his will. He must, I should say, develop an indomitable desire for it, a single-minded dedication. But he must do it without the help of any power or any man . . .

Not a book to be read for pleasure, a book which will affect you more than you may wish to be affected.

[Reviewed by Jim Fadiman]

(Why not read it for pleasure? It's frontier Boswell and Johnson. —SB)

He looked at me for a long time and laughed. He said that learning through conversation was not only a waste, but stupidity, because learning was the most difficult task a man could undertake. He asked me to remember the time I had tried to find my spot, and how I wanted to find it without doing any work because I had expected him to hand out all the information. If he had done so, he said, I would never have learned. But, knowing how difficult it was to find my spot and, above all, knowing that it existed, would give me a unique sense of confidence. He said that while I remained rooted to my "good spot" nothing could cause me bodily harm, because I had the assurance that at that particular spot I was at my very best. I had the power to shove off anything that might be harmful to me. If, however, he had told me where it was, I would never have had the confidence needed to claim it as true knowledge. Thus, knowledge was indeed power.

"Don't get me wrong, Don Juan," I protested. "I want to have an ally, but I also want to know everything I can. You yourself have said that knowledge is power."

"No!" he said emphatically. "Power rests on the kind of knowledge one holds. What is the sense of knowing things that are useless?"

Once a man has vanquished fear, he is free from it for the rest of his life because instead of fear, he has acquired clarity of mind which erases fear. By then a man knows his desires; he knows how to satisfy those desires. He can anticipate the new steps of learning, and a sharp clarity surrounds everything. The man feels that nothing is concealed.

And thus he has encountered his second enemy: Clarity! That clarity of mind, which is so hard to obtain, dispels fear, but also blinds.

"I say it is useless to waste your life on one path, especially if that path has no heart."

"But how do you know when a path has no heart, Don Juan?"
"Before you embark on it you ask the question Does this path have a heart? If the answer is no, you will know it, and then you must choose another path."

"But how will I know for sure whether a Path has a heart or not?"
"Anybody would know that. The trouble is nobody asks the question; and when a man finally realizes that he has taken a path without a heart the path is ready to kill him. At that point very few men can stop to deliberate, and leave the path."

"How should I proceed to ask the question properly, Don Juan?"
"Just ask it."

"I mean, is there a proper method, so I would not lie to myself and believe the answer is yes when it really is no?"

"Why would you lie?"
"Perhaps because at the moment the path is pleasant and enjoyable."
"That is nonsense. A path without a heart is never enjoyable. You have to work hard even to take it. On the other hand, a path with a heart is easy; it does not make you work at liking it."

You have the vanity to believe you live in two worlds, but that is only your vanity. There is but one single world for us. We are men, and must follow the world of men contentedly.

"But is this business of the dog and me pissing on each other true?"
"It was not a dog! How many times do I have to tell you that? This is the only way to understand it. It's the only way! It was 'he' who played with you."

"Let's put it another way, Don Juan. What I meant to say is that if I had tied myself to a rock with a heavy chain I would have flown just the same, because my body had nothing to do with my flying." Don looked at me incredulously. "If you tie yourself to a rock," he said, "I'm afraid you will have to fly holding the rock with its heavy chain."

He listened without interrupting me. I talked for a long time. Then he said:

"All this is very easy to understand. Fear is the first natural enemy a man must overcome on his path to knowledge. Besides, you are curious. That evens up the score. And you will learn in spite of yourself; that's the rule."

I protested for a while longer, trying to dissuade him. But he seemed to be convinced there was nothing else I could do but learn.

"You are not thinking in the proper order," he said. "Mescalito actually played with you. That's the point to think about. Why don't you dwell on that instead of your fear?"

"Was it so unusual?"

"You are the only person I have ever seen playing with him. You are not used to this kind of life; therefore the indications [omens] bypass you. Yet you are a serious person, but your seriousness is attached to what you do, not to what goes on outside you. You dwell upon yourself too much. That's the trouble. And that produces a terrible fatigue."

"What do you talk to yourself about?"

"I don't know; anything, I suppose."

"I'll tell you what we talk to ourselves about. We talk about our world. In fact we maintain our world with our internal talk."

"How do we do that?"

"Whenever we finish talking to ourselves the world is always as it should be. We renew it, we kindle it with life, we uphold it with our internal talk. Not only that, but we also choose our paths as we talk to ourselves. Thus we repeat the same choices over and over until the day we die, because we keep on repeating the same internal talk over and over until the day we die.

"A warrior is aware of this and strives to stop his talking. This is the last point you have to know if you want to live like a warrior."

"How can I stop talking to myself?"

"First of all you must use your ears to take some of the burden from your eyes. We have been using our eyes to judge the world since the time we were born. We talk to others and to ourselves mainly about what we see. A warrior is aware of that and listens to the world; he listens to the sounds of the world."

I put my notes away. Don Juan laughed and said that he did not mean I should force the issue, that listening to the sounds of the world had to be done harmoniously and with great patience.

"A warrior is aware that the world will change as soon as he stops talking to himself," he said, "and he must be prepared for that monumental jolt."

"What do you mean, Don Juan?"

"The world is such-and-such or so-and-so only because we tell ourselves that that is the way it is. If we stop telling ourselves that the world is so-and-so, the world will stop being so-and-so. At this moment I don't think you're ready for such a momentous blow, therefore you must start slowly to undo the world."

"The sole idea of being detached from everything I know gives me the chills," I said.

"You must be joking! The thing which should give you the chills is not to have anything to look forward to but a lifetime of doing that which you have always done. Think of the man who plants corn year after year until he's too old and tired to get up, so he lies around like an old dog. His thoughts and feelings, the best of him, ramble aimlessly to the only thing he has ever done, to plant corn. That, to me, is the most frightening waste there is.

"We are men and our lot is to learn and to be hurled into inconceivable new worlds."

"There aren't any new worlds for us!" I exclaimed.

"We have exhausted nothing, you fool," he said imperatively. "Seeing is for impeccable men. Temper your spirit now, become a warrior, learn to see and then make the statement that there are no longer new worlds for our vision."

A Separate Reality

The Teachings of Don Juan ended with Castaneda ceasing his apprenticeship, profoundly afraid to continue. In this book he is back at it, and in place of the fear prevalent in the first book now it is humor that pervades the teachings, along with some phenomenal events.

I don't have words for the importance I consider these books to carry.

"Please tell me, Don Juan, what exactly is controlled folly?"

Don Juan laughed loudly and made a smacking sound by slapping his thigh with the hollow of his hand.

"This is controlled folly!" he said, and laughed and slapped his thigh again.

"What do you mean . . . ?"

"I am happy that you finally asked me about my controlled folly after so many years, and yet it wouldn't have mattered to me in the least if you had never asked. Yet I have chosen to feel happy, as if I cared, that you asked, as if it would matter that I care. That is controlled folly!"

"Would I feel differently if I could see?" I asked.

"Once a man learns to see he finds himself alone in the world with nothing but folly," Don Juan said cryptically.

He paused for a moment and looked at me as if he wanted to judge the effect of his words.

"Your acts, as well as the acts of your fellow men in general, appear to be important to you because you have learned to think they are important."

He used the word "learned" with such a peculiar inflection that it forced me to ask what he meant by it.

He stopped handling his plants and looked at me.

"We learn to think about everything," he said, "and then we train our eyes to look as we think about the things we look at. We look at ourselves already thinking that we are important. And therefore we've got to feel important! But then when a man learns to see, he realizes that he can no longer think about the things he looks at, and if he cannot think about what he looks at everything becomes unimportant."

"Take your grandson Lucio," I said. "Would your acts be controlled folly at the time of his death?"

"Take my son Eulalio, that's a better example," Don Juan replied calmly. "He was crushed by rocks while working in the construction of the Pan-American Highway. My acts toward him at the moment of his death were controlled folly. When I came down to the blasting area he was almost dead, but his body was so strong that it kept on moving and kicking. I stood in front of him and told the boys in the road crew not to move him any more; they obeyed me and stood there surrounding my son, looking at his mangled body. I stood there too, but I did not look. I shifted my eyes so I would see his personal life disintegrating, expanding uncontrollably beyond its limits, like a fog of crystals, because that is the way life and death mix and expand. That is what I did at the time of my son's death. That's all one could ever do, and that is controlled folly. Had I looked at him I would have watched him becoming immobile and I would have felt a cry inside of me, because never again would I look at his fine figure pacing the earth. I saw his death instead, and there was no sadness, no feeling. His death was equal to everything else.

Don Juan was quiet for a moment. He seemed to be sad, but then he smiled and tapped my head.

"So you may say that when it comes to the death of a person I love, my controlled folly is to shift my eyes."

I thought about the people I love myself and a terribly oppressive wave of self-pity enveloped me.

"Lucky you, Don Juan," I said. "You can shift your eyes, while I can only look."

He found my statement funny and laughed.

"Lucky, bull!" he said. "It's hard work."

"You think and talk too much. You must stop talking to yourself."

"What do you mean?"

"You talk to yourself too much. You're not unique at that. Every one of us does that. We carry on an internal talk. Think about it. Whenever you are alone, what do you do?"

"I talk to myself."

Tantra Asana

All that have seen a copy of *Tantra Art* and its incandescent images have been tantalized by a year of rumors that a second *Tantra* book was coming. Here it is, more riches, tools, from what must be an inexhaustible source.

TANTRA ASANA

Rati is Kama's sakti representing kinetic energy. Kama is the god of love about whom it is said in the Vedas: "Desire first arose at the dawn of creation." In the Atharva-Veda, Kama is known as the creation. They remain in a union of oneness, enjoying that supreme bliss which is the highest non-duality.

"The woman you love, you must not possess"

Mysticism

The mystical event is to occupy ONE. Every time it happens it is a life enhancer and a history enhancer. Evelyn Underhill wrote this classic to gather and map the full range of Western mystical experience — Greek, Catholic, Protestant — and yours if you care to follow the steps. Each of those ONES is unique. Each is the same. That seems pat, but this book approximately proves it.

... Récejac has well said that "from the moment in which man is no longer content to devise things useful for his existence under the exclusive action of the will-to-live, the principle of (physical) evolution has been violated." Nothing can be more certain than that man is not so content. He has been called by utilitarian philosophers a tool-making animal — the highest praise they knew how to bestow. More surely he is a vision-making animal; a creature of perverse and unpractical ideals, dominated by dreams no less than by appetites — dreams which can only be justified upon the theory that he moves towards some other goal than that of physical perfection or intellectual supremacy, is controlled by some higher and more vital reality than that of the determinists. We are driven to the conclusion that if the theory of evolution is to include or explain the facts of artistic and spiritual experience — and it cannot be accepted by any serious thinker if these great tracts of consciousness remain outside its range — it must be rebuilt on a mental rather than a physical basis.

Pain, then, which plunges like a sword through creation, leaving on the one side cringing and degraded animals and on the other side heroes and saints, is one of those facts of universal experience which are peculiarly intractable from the point of view of a merely materialistic philosophy.

... Where the philosopher guesses and argues, the mystic lives and looks; and speaks, consequently, the disconcerting language of first-hand experience, not the neat dialectic of the schools. Hence whilst the Absolute of the metaphysicians remains a diagram — impersonal and unattainable — the Absolute of the mystics is lovable, attainable, alive.

... "All mystics," said Saint-Martin, "speak the same language, for they come from the same country." The deep undying life within us came from that country too: and it recognizes the accents of home, though it cannot always understand what they would say.

... there are two distinct sides to the full mystical experience. (A) The vision or consciousness of Absolute Perfection. (B) The inward transmutation to which that Vision compels the mystic, in order that he may be to some extent worthy of that which he has beheld: may take his place within the order of Reality. He has seen the Perfect; he wants to be perfect too. ...

... "Thou, my God, who art Love," says Nicolas of Cusa, "art Love that loveth, and Love that is loveable, and Love that is the bond between these twain." ...

... Here the common opinion that a pious effeminacy, a diluted and amiable spirituality, is the proper raw material of the mystic life, is emphatically contradicted. It is not by the education of the lamb, but by the hunting and taming of the wild intractable lion, instinct with vitality, full of ardour and courage, exhibiting heroic qualities on the sensual plane, that the Great Work is achieved. The lives of the saints enforce the same law.

... To go up alone into the mountain and come back as an ambassador to the world, has ever been the method of humanity's best friends. ...

... That law of the inner life, which sounds so fantastic and yet is so bitterly true — "No progress without pain" — asserts itself. It declares that birth pangs must be endured in the spiritual as well as in the material world: that adequate training must always hurt the athlete. Hence the mystics' quest of the Absolute drives them to an eager and heroic union with the reality of suffering, as well as with the reality of joy.

... In that remaking of his consciousness which follows upon the "mystical awakening," the deep and primal life which he shares with all creation has been roused from its sleep. Hence the barrier between human and non-human life, which makes man a stranger on earth as well as in heaven, is done away. Life now whispers to his life: all things are his intimates, and respond to his fraternal sympathy.

... "When the soul is plunged in the fire of divine love," he says, "like iron, it first loses its blackness, and then growing to white heat, it becomes like unto the fire itself. And lastly, it grows liquid, and losing its nature is transmuted into an utterly different quality of being." "As the difference between iron that is cold and iron that is hot," he says again, "so is the difference between soul and soul: between the tepid soul and the soul made incandescent by divine love." ...

It's a business, actually. I mean, just this very second I flashed that this enterprise of mine is actually a business. It's called **The Magic Rabbit**. The rabbits are my employees. They shit all week, around the clock, and I pay them with food. Out purpose is soil redemption. Salvation! Healing, by miracles, signs and wonders. The theme song of our commercials is **The Old Rugged Barn**.

On a hill far away,
Stood an old rugged barn,
The emblem of effort and pride.

Far out!
Come be my partner, Flash. Go find Estelle and bring her with you, and join the Magic Rabbit, Incorporated, and we'll get into soil salvation. First we'll save our own; we'll breed ten thousand rabbits and twenty million worms, and make this dead old hillside bloom. Then if other people feel like they've got a troubled soul, why let them call upon us, and we'll respond, with miracles, signs and wonders.
Faith, brother! Faith and rabbit shit, that's the themel

On a hill far away,
Stood an old rugged barn,
The emblem of effort and pride.
How I love that old barn,
So despised by the world,
For the weirdness that happens inside.

You've got forty-eight hours to reply to this business proposal, Flash. Refuse it at the peril of your soil.

Your associate,
D.R.

Plans and the Structure of Behavior

What I know is that this book and Act of Creation taught me most of what I know about using my head.

The result of a year-long conversation by the authors in California in 1958-59, the book discards Stimulus-Response psychology (which never helped my head, or probably anybody's) and wades into cybernetics instead. The book is cheerful, if academicky. From it the notion of being programmed, and self-programming, emerges as a convenience rather than a threat. That Plans (programs) operate hierarchically rather than single-file is clearly an enormous saving in trouble and trivia. The constant checking of feedback loops (called TOTE units) yields a nice connectedness to the environment. The consideration of contradictory or interrupted Plans gives insight into the uses and misuses of frustration. A handy book, this, of simple concepts for understanding the subtle realm.

As you brush your teeth you decide that you will answer that pile of letters you have been neglecting. That is enough. You do not need to list the names of the people or to draft an outline of the contents of the letters. You think simply that today there will be time for it after lunch. After lunch, if you remember, you turn to the letters. You take one and read it. You plan your answer. You may need to check on some information, you dictate or type or scribble a reply, you address an envelope, seal the folded letter, find a stamp, drop it in a mailbox. Each of these subactivities runs off as the situation arises—you did not need to enumerate them while you were planning the day. All you need is the name of the activity that you plan for that segment of the day, and from that name you then proceed to elaborate the detailed actions involved in carrying out the plan.

Plan. When we speak of a Plan in these pages, however, the term will refer to a hierarchy of instructions, and the capitalization will indicate that this special interpretation is intended. A Plan is any hierarchical process in the organism that can control the order in which a sequence of operations is to be performed.

A Plan is, for an organism, essentially the same as a program for a computer, especially if the program has the sort of hierarchical character described above. . . .

Execution. We shall say that a creature is executing a particular Plan when in fact that Plan is controlling the sequence of operations he is carrying out. When an organism executes a Plan he proceeds through it step by step, completing one part and then moving to the next. The execution of a Plan need not result in overt action—especially in man, it seems to be true that there are Plans for collecting or transforming information, as well as Plans for guiding actions. Although it is not actually necessary, we assume on intuitive grounds that only one Plan is executed at a time, although relatively rapid alternation between Plans may be possible. An organism may—probably does—store many Plans other than the ones it happens to be executing at the moment.

Image. The Image is all the accumulated, organized knowledge that the organism has about itself and its world. The Image consists of a great deal more than imagery, of course. What we have in mind when we use this term is essentially the same kind of private representation that other cognitive theorists have demanded. It includes everything the organism has learned—his values as well as his facts—organized by whatever concepts, images, or relations he has been able to master. . . .

The central problem of this book is to explore the relation between the Image and the Plan.

If this description of hammering is correct, we should expect the sequence of events to run off in this order: Test nail. (Head sticks up.) Test hammer. (Hammer is down.) Lift hammer. Test hammer. (Hammer is up.) Test hammer. (Hammer is up.) Strike nail. Test hammer. (Hammer is down.) Test nail. (Head sticks up.) Test hammer. And so on, until the test of the nail reveals that its head is flush with the surface of the work, at which point control can be transferred elsewhere. Thus the compound of TOTE [Test-Operate-Test-Exit] units unravels itself simply enough into a coordinated sequence of tests and actions, although the underlying structure that organizes and coordinates the behavior is itself hierarchical, not sequential.

—Planning can be thought of as constructing a list of tests to perform. When we have a clear Image of a desired outcome, we can use it to provide the conditions for which we must test, and those tests, when arranged in sequence, provide a crude strategy for a possible Plan. (Perhaps it would be more helpful to say that the conditions for which we must test are an Image of the desired outcome.)

We see, therefore, that a person who is caught between conflicting Plans is in a somewhat different situation from the person caught between conflicting motives. He is almost necessarily unaware that his Plans conflict, whereas he may be painfully conscious of his incompatible desires. There is almost certain to be a large penumbra of confusion surrounding the incompatible Plans: the person seems to be deliberately frustrating himself, but cannot discover why. He knows something is wrong, but cannot discover what it is. The two Plans may be isolated from one another in such a way that it never occurs to the person to contrast one with the other.

Human institutions exist primarily for the purpose of executing plans that their members, as individuals, would be unable or unwilling to execute. When the plans that form their *raison d'être* are taken away—finished, frustrated, outlawed, outgrown, completed, whatever—the group may disband. Sometimes they may hold reunions to swim in an ocean of emotion, but then they have become social groups with corresponding changes in the plans they execute. But many planless groups disappear and are never heard from again. In this respect groups are like computers, 90 percent plan and 10 percent image. Individuals, on the other hand are about 75 percent Image and 25 Percent Plan.

The means-ends analysis runs something like this: First, see if you know any way to transform the given into the desired solution. If no way is known, then try to reduce the difference between them; find some transformation that reduces the difference, and then apply it. Then try the first step again—see if you know any way to transform the new version of the given into the desired solution. If not, search again for a way to reduce the difference, etc. Each time the difference is reduced, the problem gets a little easier to solve.

A second very general system of heuristic used by Newell, Shaw, and Simon consists in omitting certain details of the problem. This usually simplifies the task and the simplified problem may be solved by some familiar plan. The plan used to solve the simple problem is then used as the strategy for solving the original, complicated problem.

The Act of Creation

Koestler takes his notion of bisociation to be the root of humor, discovery, and art. I take it to be one of the roots of learning, subject to applications of method (on yourself or whomever).

Koestler is a scientist of some reputation by now. He's made contributions beyond the work of others that he's generalized from. This is the book that gave him the reputation.

-SB

There are two ways of escaping our more or less automatized routines of thinking and behaving. The first, of course, is the plunge into dreaming or dream-like states, when the codes of rational thinking are suspended. The other way is also an escape—from boredom, stagnation, intellectual predicaments, and emotional frustration—but an escape in the opposite direction; it is signaled by the spontaneous flash of insight which shows a familiar situation or event in a new light, and elicits a new response to it. The bisociative act connects previously unconnected matrices of experience; it makes us 'understand what it is to be awake, to be living on several planes at once' (to quote T.S. Eliot, somewhat out of context).

The first way of escape is a regression to earlier, more primitive levels of ideation, exemplified in the language of the dream; the second an ascent to a new, more complex level of mental evolution. Though seemingly opposed, the two processes will turn out to be intimately related.

When two independent matrices of perception or reasoning interact with each other the result (as I hope to show) is either a collision ending in laughter, or their fusion in a new intellectual synthesis, or their confrontation in an aesthetic experience. The bisociative patterns found in any domain of creative activity are tri-valent: that is to say, the same pair of matrices can produce comic, tragic, or intellectually challenging effects.

The re-structuring of mental organization effected by the new discovery implies that the creative act has a revolutionary or destructive side. The path of history is strewn with its victims: the discarded isms of art, the epicycles and phlogistons of science.

Associative skills, on the other hand, even of the sophisticated kind which require a high degree of concentration, do not display the above features. Their biological equivalents are the activities of the organism while in a state of dynamic equilibrium with the environment—as distinct from the more spectacular manifestations of its regenerative potentials. The skills of reasoning rely on habit, governed by well-established rules of the game; the 'reasonable person'—used as a standard norm in English common law—is level-headed instead of multi-level-headed; adaptive and not destructive; an enlightened conservative, not a revolutionary; willing to learn under proper guidance, but unable to be guided by his dreams.

The main distinguishing features of associative and bisociative thought may now be summed up, somewhat brutally, as follows:

Habit	Originality
Association within the confines of a given matrix	Bisociation of independent matrices
Guidance by pre-conscious or extra-conscious processes	Guidance by sub-conscious processes normally under restraint
Dynamic equilibrium	Activation of regenerative potentials
Rigid to flexible variations on a theme	Super-flexibility (reculer pour mieux sauter)
Repetitiveness	Novelty
Conservative	Destructive-Constructive

I have coined the term 'bisociation' in order to make a distinction between the routine skills of thinking on a single 'plane', as it were, and the creative act, which, as I shall try to show, always operates on

more than one plane. The former may be called single-minded, the latter a double-minded, transitory state of unstable equilibrium where the balance of both emotion and thought is disturbed.

In the popular imagination men of science appear as sober ice-cold logicians, electronic brains mounted on dry sticks. But if one were shown an anthology of typical extracts from their letters and autobiographies with no names mentioned, and then asked to guess their profession, the likeliest answer would be: a bunch of poets or musicians of a rather romantically naive kind.

Modern man lives isolated in his artificial environment, not because the artificial is evil as such, but because of his lack of comprehension of the forces which make it work—of the principles which relate his gadgets to the forces of nature, to the universal order. It is not central heating which makes his existence "unnatural," but his refusal to take an interest in the principles behind it. By being entirely dependent on science, yet closing his mind to it, he leads the life of an urban barbarian.

I must mention one specific factor which is largely responsible for turning science into a bore, and providing the humanist with an excuse for turning his back on it. It is the academic cant, of relatively recent origin, that a self-respecting scientist must be a bore, that the more dehydrated the style of his writing, and the more technical the jargon he uses, the more respect he will command. I repeat, this is a recent fashion, less than a century old, but its effect is devastating. The pre-Socratics frequently wrote their treatises in verse; the ancient Peruvian language had a single word—*hamavec*—for both poet and inventor. Galileo's Dialogues and polemical writings were literary masterpieces which had a lasting influence on the development of Italian didactic prose; Kepler's *New Astronomy* is a baroque tale of suspense; Vesalius' *Anatomy* was illustrated by a pupil of Titian.

The I Ching

The I Ching, the Book of Changes, is a brilliant problem-solving device. A problem (or ignorance) generally consists of being caught in local cyclic thinking. To consult the oracle, the wisdom of chance (or synchronicity, no matter), is to step out of the cycle of no-change and address a specific story on the nature of change. You now have an alternative set of solutions that owe nothing but proximity to your problem. You make the associations, you find the way out. It's prayer.

I can't think of a more important and useful book than this one. It's famously ancient, poetic, deep, esoteric, simple, involving. It has been the most influential book on American art and artists in the last 15 years.

Most people know about it. We've included it here to point at the new smaller (unabridged) cheaper Princeton University Press version of the classic Wilhelm-Baynes Bollingen edition. The oracle method is still on page 721.

Leisure— The Basis of Culture

This is a searching, philosophical book, examining some important questions. It first appeared 20 years ago and surprisingly few people have read it.

But that isn't the item.

Here's the item: why would an economic consultant, specializing in recreation resources, turn to this kind of philosophical tract as a sourcebook (with an introduction by T.S. Eliot, yet!), when there are dozens of current, thickly documented studies available, prepared by first rate scholars, dealing with leisure, social change, consumer economics, and all the other relevant issues consultants are paid to investigate?

That is a question I am anxious to answer, especially for Whole Earth readers, who are inclined to be, I imagine, more than superficially interested in issues as basic to these times as leisure and our culture.

Whenever I read the current literature and listen to the experts on the subject of leisure, I realize that no one has contributed much new wisdom to the field beyond what Pieper, in fewer than 100 pages, has laid out. His major contribution, in my opinion, is to set down a fundamental, no horseshit, definition of leisure, which certainly has nothing to do with motor boat sales, average hours of work, and all that statistical trash that keep so many consultants and writers employed. In Pieper's words

Leisure, it must be clearly understood, is a mental and spiritual attitude— it is not simply the result of external factors, it is not the inevitable result of spare time, a holiday, a weekend or a vacation. It is, in the first place, an attitude of mind, a condition of the soul, and as such utterly contrary to the ideal of 'worker' in each and every one of the three aspects under which it was analysed: work as activity, as toil, as a social function.

Compared with the exclusive ideal of work as activity, leisure implies (in the first place) an attitude of non-activity, of inward calm, or silence; it means not being 'busy', but letting things happen.

Leisure is a form of silence, of that silence which is the pre-requisite of the apprehension of reality: only the silent hear and those who do not remain silent do not hear. Silence, as it is used in this context, does not mean 'dumbness' or 'noiseless'; it means more nearly that the soul's power to 'answer' to the reality of the world is left undisturbed. For leisure is a receptive attitude, and it is not only the occasion but also the capacity for stepping oneself in the whole of creation.

The adoption of this definition is like adopting a religion. Your life may be permanently altered.

Leisure is not the attitude of mind of those who actively intervene, but of those who are open to everything; not of those who grab and grab hold, but of those who leave the reins loose and who are free and easy themselves— almost like a man falling asleep, for one can only fall asleep by 'letting oneself go'. Sleeplessness and the incapacity for leisure are really related to one another in a special sense, and a man at leisure is not unlike a man asleep.

Compared with the exclusive ideal of work as toil, leisure appears (secondly) in its character as an attitude of contemplative 'celebration', a word that, properly understood, goes to the very heart of the meaning which I am concerned to put before you. . . God, we are told in the first chapter of Genesis, 'ended his work which he had made and beheld, it was very good'. In the same way man celebrates and gratefully accepts the reality of creation in leisure, and the inner vision that accompanies it. And just as Holy Scripture tells us that God rested on the seventh day and beheld that 'the work which he had made' was 'very good'— so too it is leisure which leads man to accept the reality of the creation and thus to celebrate it, resting on the inner vision that accompanies it.

40. Hsieh / Deliverance

above CH'EN THE AROUSING, THUNDER below K'AN THE ABYSSAL, WATER

Here the movement goes out of the sphere of danger. The obstacle has been removed, the difficulties are being resolved. Deliverance is not yet achieved; it is just in its beginning, and the hexagram represents its various stages.

THE JUDGMENT

DELIVERANCE. The southwest furthers.

If there is no longer anything where one has to go, Return brings good fortune.

If there is still something where one has to go, Hastening brings good fortune.

40. Hsieh / Deliverance

This refers to a time in which tensions and complications begin to be eased. At such times we ought to make our way back to ordinary conditions as soon as possible; this is the meaning of "the southwest." These periods of sudden change have great importance. Just as rain relieves atmospheric tension, making all the buds burst open, so a time of deliverance from burdensome pressure has a liberating and stimulating effect on life. One thing is important, however: in such times we must not overdo our triumph. The point is not to push on farther than is necessary. Returning to the regular order of life as soon as deliverance is achieved brings good fortune. If there are any residual matters that ought to be attended to, it should be done as quickly as possible, so that a clean sweep is made and no retardations occur.

THE IMAGE

Thunder and rain set in: The image of DELIVERANCE. Thus the superior man pardons mistakes And forgives misdeeds.

A thunderstorm has the effect of clearing the air; the superior man produces a similar effect when dealing with mistakes and sins of men that induce a condition of tension. Through clarity he brings deliverance. However, when failings come to light, he does not dwell on them; he simply passes over mistakes, the unintentional transgressions, just as thunder dies away. He forgives misdeeds, the intentional transgressions, just as water washes everything clean.

... In the same way, no one who looks to leisure simply to restore his working powers will ever discover the fruit of leisure; he will never know the quickening that follows, almost as though from some deep sleep. . . Aristotle says of leisure, 'A man will live thus, not to the extent that he is a man, but to the extent that a divine principle dwells within him.'

Leisure, it must be remembered, is not a Sunday afternoon idyll, but the preserve of freedom of education and culture, and of that undiminished humanity which views the world as a whole.

... once again, work stops for the sake of work, and the feast is subordinated to 'work'. There can of course be games, circenses, circuses— but who would think of describing that kind of mass entertainment as festal?

It simply cannot be otherwise: the world of 'work' and of the 'worker' is a poor, impoverished world, be it ever so rich in material goods; for on an exclusively utilitarian basis, on the basis, that is, of the world of 'work', genuine wealth, wealth which implies overflowing into superfluities, into unecessaries, is just not possible. Wherever the superfluous makes its appearance it is immediately subjected to the rationalist, utilitarian principle of the world of work. And, as the traditional Russian saying puts it: work does not make one rich, but round-shouldered.

WEDNESDAY: URGE'S BATH

When D.R. went off the hill late Wednesday to mail his letter to the Flash he was almost certain there'd be a letter waiting for him at the store. From the Flash, from Marcella, maybe even, by sudden cosmic arrangement, some word from Estelle. A postcard, a note, something, from somebody.

But there wasn't, and D.R. had to fight his disappointment down. He bought a Coke from Mrs. Godsey, and after he had drunk it he bought a few more groceries to see him through the remainder of the week. Mrs. Godsey asked D.R. how he was and he said fine, but it was clear to her that he wasn't fine, and Mrs. Godsey found herself worrying about D.R. a little. She tried to think of something to say that might make him feel better, but she didn't have any confidence in any of the words that occurred to her. She wrote his groceries up in the account book, and wished him a good day as he carried them out the door. But that wasn't enough, it wasn't enough at all and she felt bad about D.R. as the screen door slammed behind him.

Before he started back up the hill, D.R. went around in back of Godsey's store to look in Urge a minute. Urge had still not been given a thorough cleaning since he had been in Kentucky. A little at a time, D.R. had been taking stuff out of the bus and either throwing it away or carrying it with him up the hill. But the great bulk of their stuff still had not been touched, and in looking at it now D.R. felt suddenly inspired to pitch in then and there and clean it out once and for all.

As soon as he decided that's what he'd do, he felt instantly better, and better still when he started dumping junk out of the bus left and right. He spread their old stale sleeping bags on top of the bus to air. He dragged the mattress out and laid it on the grass in Leonard's yard. He collected the worst of the actual trash, the empty bottles, old apple cores, old smashed Kentucky Fried Chicken boxes, paper cups, old magazines, and grubby old paper napkins, and threw it all outside in a pile. Beside it he piled an old quilt that had had a chocolate milkshake spilled on it, and a towel too far gone to preserve. A pair of his own worn-out jeans wound up on the pile.

When he started coming to things he wasn't sure what he should do with, he began a separate pile. He found one of Estelle's blue sneakers, worn through at the little toe, laced with binder twine. He found a pair of her cut-off Levis, and three dirty socks. In a pillow-case he found two of her special outfits, the gingham frontier dress, and the tie-dyed jumpsuit she'd made out of a mechanic's coveralls. He found their kitchen stuff in a box lined with the green sports section of the San Francisco Chronicle. The pots and pans and skillet and plastic plates and bowls were piled in with the Mazola Corn Oil, a box of salt, some spices in little cans, brown sugar in a jar, some old rice. He found their mangled copy of the Whole Earth Catalog, the paperback of Stranger In A Strange Land that Estelle had made so many notes in. And then, way back under the bed, face down on the floor, opened at the hexagram called Youthful Folly, D.R. found their I Ching.

Far out.

The Ching.

It was like running into an old friend. D.R. picked it up and dusted it off, and sat for a while holding it in his hand. He had been wishing for the Ching. It was time for him to start consulting it again. And maybe he could find some shit to order from the Catalog, too. The found books pleased D.R. enormously, and lifted him past the little desire that had begun to build in him to stop working on the bus and go flake out somewhere. D.R. was suddenly filled with tenderness and affection for Urge, and he went the whole way with his cleaning job.

When he had emptied the bus completely, he went to Roxie's house and borrowed a broom, and swept everywhere in the bus the broom could touch. Roxie showed him where the outdoor faucet was, and Leonard's hose. D.R. took the sleeping bags off the top, spread them out beside the mattress, and moved Urge until the hose could reach. And then he washed him good, all over, inside and out, with soap and warm water from Roxie's kitchen, and then a cold rinse with the hose. It was the first bath Urge had had since the west coast, and you could tell by the sound of the motor how much the old bus dug it. When he went back in the store to get some cardboard boxes, Mrs. Godsey told him he could store anything he wanted to in her basement. D.R. spent the rest of the afternoon sorting through the stuff that he would keep, getting it into boxes, four of them, and then stacking the boxes on the floor of Mrs. Godsey's basement.

Leonard came home from another day with the Grand Jury in town as D.R. was finishing up and asked if he would like to stick around for supper. D.R. said no thanks. He had a whole new fund of energy now, and he wanted to get back up on the hill with it, and use it well. He gathered up his books and his groceries and set out whistling, back up Trace Fork again.

How To Do a Whole Earth Catalog

The masked man left behind a silver bullet. The people said, "We'd rather have a scribbled diagram," and they shot him with his silver bullet. Here's our scribbled diagram.

Take what you can use, and let the rest go by.
Ken Kesey 1969

Researching

For us this consisted of three big jobs. 1) Encouraging an incoming flow of information— spontaneous research by the readership. 2) Scanning "the literature" for promising stuff. 3) Sorting the good from the bad.

1) The incentives we laid out for spontaneous suggestions were: reward of money (\$10 for published review, later \$10 for any used suggestion); reward of recognition (we published the name of the reviewer and suggestor, spelled as correctly as possible); reward of honor-by-association (to the extent that we kept valid high standards, and honored the famous suggestor no more than the teenage one); reward of doing a good deed (to be a noble conduit we had to stay clean); reward of return (to the extent that we gave good, people returned it).

2) "The literature" for us consisted of *Publisher's Weekly*, *Forthcoming Books in Print* (both from R. R. Bowker, source of all the basic cataloging information on books in the U.S.— I consider R. R. Bowker a major pillar of Western Civilization; they labor endlessly, invaluable, without bias and of course unheralded). *Science* (who lists all the books sent to them for review), *Scientific American* (the first national publication to notice us, by the way), *Popular Science* (for tools), and later our cooperative competition such as *Mother Earth News*, *Big Rock Candy Mountain*, *Canadian Whole Earth Almanac*, *Natural Life* Styles.

Other major sources: catalogs from the publishers, bibliographies in good books (especially when annotated), big book stores, especially *Kepler's*, friends' bookshelves, the Stanford and Menlo Park libraries, and our own bookshelves revisited.

At the beginning of the CATALOG I ordered copies of promising titles from the publishers at 40% discount on ABA's Single Copy Order Plan. After about a year of this MIT said we didn't really have to pay for review copies from them. After that we requested free review copies from all the publishers and usually got them, at least on new books. It took some self-policing to keep from requesting "review copies" that we just wanted to have. There are some built-in conflicts-of-interest in the reviewing business.

3) Sorting. Fuller calls it "tuning out everything that's irrelevant", and considers it the core activity of thinking. It is utterly unglamorous; it is shovelling shit by the mountainload. I never spent my time reading the good stuff— whose quality was usually evident in 2-3 minutes. I spent the yellow-brown hours reading the lousy books, digging past their promising facades to the hollow within. Some of these wound up in the stove, where their publishers belonged.

Sorting requires criteria for yes and no, and sets to sort within. By ingenious good fortune I thought to spell out our criteria at the beginning on page one of the first CATALOG. The sets (the section headings, devised originally as a secondary definition of our contents) also held up surprisingly well. Both the criteria and the sets became well-worn handles on the otherwise wholly unmanageable mass of information that flooded in. They also helped preserve continuity during three years of gradually migrating values.

At the beginning of the CATALOG I imagined us becoming primarily a research organization, with nifty projects everywhere, earnest folk climbing around on new dome designs, solar generators, manure converters; comparing various sound systems, horse breeds, teaching methods... the only product-project we ever did was build a BD-4 airplane, and I felt guilty about that because of the big expense for low yield of information.

In fact we didn't do enough research. Not the studious kind. Of our staff of about 26, only 2 or 3 were ever engaged in active search for CATALOG material. It could have been much more and better, but it never got organized, probably because of prima donna failings on my part.

Reviewing

Usually I review a book before I read it. These are almost always shorter, pithier, more positive and useful reviews. You're approaching the book from the same perspective as the reader— unfamiliarity— and you're not apt to fall into imitation of the author's style or petty argument with his views, as critics do.

So, I review the book, enthusiastically, on what I know from its title, its subject, the author, my own experience, and a hasty glance at the pages. Then I look a little more deeply to see if the review is fulfilled. If not, I either rewrite the review or discard the book.

The quickest clues to the authority of a book are its illustrations and its back pages. Cheap shit editor's-idea books puff up their illustrations. If a book has a whole page devoted to a photograph of nothing, with a nothing caption and credit to some manufacturer for the photo, throw the book. Look for photographs that contain real information related to the text, and captions that multiply the use of the pictures; or diagrams that deliver complex understanding simply. In the back of the book look at the bibliography. If it's absent, or inflated endlessly, or unannotated, or oddly limited, be suspicious. The bibliography is an easy way to compare the author's judgment with your own.

The CATALOG format for reviews includes excerpts from the book (or magazine or catalog). The excerpts should expose the book— convey quickly what's in it, and deliver a few complete ideas independently useful to the reader. I always attempt to gut the book with the excerpts, extract its central value. Really good books like *On Growth and Form*, or *Stick and Rudder*, or *Natural Way to Draw* will not be gutted; practically any line or picture in them can be used.

An ideal review gives the reader: a quick idea of what the item is, what it's useful for, how it compares to others like it, and how competent the reviewer is to judge. (This last is why I stopped having unsigned reviews— the reader gradually grows familiar with the weaknesses and strengths of the various reviewers.)

The horrible temptation in reviews is to show off rather than simply introduce the item and the reader to each other and get out of the way.

Editing

The operational word on the cover of the CATALOG is access. Ultimately that means giving the reader access from where he is to where he wants to be. Which takes work, work takes tools, tools need finding, and that's where we come in.

A good catalog is a quick-scan array of tools, where you can find what you want easily, with detailed information where you're interested.

Our attempt to fulfill these requirements led to use-based section headings (*Shelter, Land Use, Communications*, etc.), an alphabetic index, and page-theme layout.

On each page we try to have one graphic which "keys the page", tells with a glance what's there. The hardest thing we had to learn was providing simple clear demarcation between items— an unadorned line.

We publish considerable detailed information— fine print. Sorting among that is aided by a consistent code of type-faces (reviews are always "univers italic", access is always "teeny", *Divine Right* is always "bold teeny", and so forth). The IBM Selectric Composer makes this an easy matter. Still we're not as consistent as we should be.

In descending order of importance, our layout guidelines are:

accuracy
clarity
quantity of information
appearance

Glamorous white space has no value in a catalog except as occasional eye rest. I figure the reader can close his eyes when he's tired.

I keep coming back to the reader/user because that's who the editor represents. I've had to feel that my obligations to *Portola Institute*, to staff, friends, relatives, and to myself are all secondary. So are obligations to authors, suppliers, publishers, other editors. Usually there's no conflict, but when there is the editor has to see that the reader wins.

The editor's main mechanical task is determining efficient use of production time and page space. It's like spreading hard butter on soft bread, best if you cut the task into workable hunks and distribute them evenly.

I use McBee cards, one for each item, for rough editing. I know from looking at previous CATALOGS and the new material approximately how many pages should be in the, say, *Nomadic Section*— 61 pp. So I take the stack of McBee cards punch-coded for that section and break them down into categories— mountain stuff, car-stuff, outdoor suppliers, survival books, etc. Then those sub-piles are put in some sensible sequence. Then on a big table the cards are separated further into 61 little page-stacks, by pairs (the reader sees 2 pages at a time, not one). The contents of those piles are written on my desk dummy. The cards are stacked in page sequence, and I've got a section rough-edited.

There are two main work governors tacked to the wall— a calendar showing days of production and a page-chart. If we have 8 weeks to do 448 pages, then we have to finish a signature of 64 pages every 6 working days, or about 11 pages a day. The signature-finished points are marked on the calendar so I know exactly how far behind we are and when we'll have to start working nights to get copy to the printer on time.

The page chart is big, a couple square inches for each page. On each page I write the basic information for the three layout people. As they finish a pair of pages they mark them off on the chart and look for the next ready pair. From the chart they get the number and name of the pages, the titles of the items (and whether they're new or to be cut out of old flats), plus the appropriate piece of *Divine Right*, and any headings.

In our production the editor, typist, cameraman, and three layout men work together. The editor tries to stay a couple days ahead of layout in fine-editing the pages, and the typist and cameraman a day ahead.

When a layout guy has the copy all gathered he calls me over to see what the space situation is and determine what to leave out and what to retype or reshoot so it will fit. After he's finished I'm called over again for any revisions and to try to catch the mistakes while they're easy to correct. Two other proofreaders also try (while they're indexing) before the page is flatted and sent to the printers.

Just before the signature goes to press I get page-proofs for a last chance at corrections before the karmic soup gels irretrievably.

Some publications make all their editorial decisions by continual discussion and consensus. I admire the ones who can make it work. I've gone the faster and possibly more limited route of strong central direction.

When we have a guest editor, every bit of the authority and most of the responsibility is his. Now that we're quitting, it's all yours.

Layout

We use a tabloid sized page, like the magazines in the Sunday papers. Steve Baer's *Dome Cookbook* was what convinced me it's a good format. You have enough space on each page and spread (facing pair of pages) to lay out a graphic array of information with multiple visual relationships and plenty of freedom for the reader to pick his own path. Also it's an economical size for printing on a web press. The two main disadvantages are that booksellers don't like the display space a tabloid book takes up, and some readers get tired holding the big page up.

Composition. IBM Selectric Composer, Evelyn Goslow. Some type fonts are visible at lower left.

IBM Selectric Composer

As far as I'm concerned this is the tool that made our operation possible. Instead of having to send material to a type-setter— a costly, standardized, and full-of-problems procedure— we can sit down with the layout people and editors and fit copy precisely to the page, with all the options of last-minute corrections. IBM offers about 140 different type fonts from 6-point to 12-point in size (you have to buy the fonts, \$30 apiece) which permits variety that would cost a fortune at a typesetter. We used 15 fonts for this CATALOG.

The Composer leases for \$150/month, a bargain if you're using it regularly or can rent it to careful people when you aren't. There is some special knowledge without which you will wreck the machine, but IBM can teach it to you in about an hour. The machine can, in two typings, make the right hand side of your copy straight, like in newspapers, but since this saves no space and is no easier to read, I think you're wasting your time to do it.

The Composer is a fine machine, flexible and durable (we dropped ours on the ground and ran wrong voltages through it in the desert; it kept typing). To see one, look up IBM in the yellow pages under *Typewriters*.

—SB

Larry Whiteside from IBM fixing the composer. Free and fast repair service is part of the lease contract. We needed to call a repairman usually 3-4 times during a production. IBM can furnish service damn near anywhere, which made travelling production a lot easier.

The I Ching: After supper, sitting on the porch in the final hour of light that day, D.R. threw the I Ching. He had always been ceremonious when he cast the Ching; but that evening the sense of ceremony and ritual came more naturally to D.R. than it ever had before. There were no trappings. No candles, or bells or incense, none of that. There was only D.R. on the front porch of the house, sitting on the floor with his feet two steps down, the book beside him on the floor, and the coins lying loosely in his hand. D.R. was sitting quietly, waiting for the spirit to move him, and the spirit was taking its time. It wanted D.R. to really settle now, to fit into his natural place within the flow and motion all around. The day was ending, the night was on its way. The air was fresh and thick with the settling evening dew. Over by the silver-leaf maple tree some lightning bugs were blinking. And above them in the sky the first stars of the evening were popping out. Day and night were trading times and places, easing into one another's spheres around the world. And D.R. sat very still and allowed a similar change to happen inside him.

Layout. Steamboat drawing dragons. George working on pp. 422-423.

Layout (continued)

At first we laid out our pages just the way a newspaper does (the Menlo-Atherton Recorder showed us how). We used flats (blank, line 2-page-sized pieces of paper provided by the printer) on light tables (made out of plywood, fluorescent lights, white plastic, and glass). The flats were placed line-side-down on the light tables, so the lines showed through and you could align items on them but they wouldn't show on the final layout. Also like the newspaper we used beeswax (also provided by the printer) to stick the items down with—it was kept liquid in an old electric frying pan. The advantage of wax is that it's fairly easy to lift an item and restick it. After everything was in place on a page we took a little wooden roller and ran it firmly over all the copy so it would stay attached to the flat.

We made the flats so that they could be used directly by the printer for making the negatives and the plates. Thus in the first CATALOG p. 1 and p. 64 were on the same flat, p. 2 and p. 63, p. 3 and p. 62, and so forth, with the even page always on the left. On this last production we found it more convenient to layout the flats for each signature when we were done (p. 65 and p. 128, p. 66 and p. 127, etc.).

We went along using light tables and wax until Gordon Ashby and Doyle Phillips revolutionized our procedure with the July 70 Supplement. They showed us that working on a portable drafting table, with a T-square and rubber cement for adhesive was really much easier and gave us better layout. We still had lines on the flats but they were on the top surface in light blue (invisible to the camera).

So now our tools are:

- Portable drafting table and engineers lamp
- T-square and triangle (for horizontal and vertical lines and alignment)
- Exacto knives and very good scissors (for cutting copy)
- Rapidograph pens (for clean ink lines)
- Rubber cement and dispenser (jar with brush), and solvent (in a squirt can dispenser, for lifting already glued copy), and warts (sticky squares for cleaning up stray rubber cement on the page).
- Drafting tape (for holding paper in place)
- Thin white tape (for holding down bits of copy where rubber cement won't do it and for covering up mistakes)
- Blue pencil (for marking on the page)
- Template (for ruling curved lines such as around Divine Right)
- Letraset (burnish-down characters for page numbers and headings) and wooden stylus (for burnishing)
- Tuffilm (to spray on finished copy for protection)

We still use the light tables for correcting copy. When the typist makes a mistake she simply types the line again correctly, makes a blue pencil mark, and goes on. Then on the light table it's easy to cut the copy, align the mistaken line under the previous line, stick the pieces together with white tape, and go on to the next mistake.

We used to custom-make each page with various column widths, which only led to extra trouble for us and the reader. Now we type to a basic 20-pica three-column page and everything's much simpler.

—SB

Polaroid MP-3 and Fred Richardson during January production in the desert. In the foreground are cans of Omit, pressurized air for cleaning glass surfaces.

436

Books

We get letters all the time asking how to start a Truck Store and Diana's quick hard summary tells you the basics. I'll try to tell you how to stock that store with books. There are a few how-to books on the subject of bookstores. The one I read is *How to Run a Paperback Bookstore* (R. R. Bowker 1962, \$5.00). It tells you enough to figure out hardbacks too and if you know nothing about bookstores, get it. Even if you do know something you might enjoy it and it can help answer some questions, like, how come we're not making any money. This book helps to explain the minimum initial investment of \$10,000 though they suggest \$15,000. That sum may sound staggering and I do know people who've done it on \$1,000 but they started 5 years ago and are still in the red. It's really not worth the headaches. Running a store that serves the community and turns people on to new ideas is a far out venture but don't forget that you've got to make a profit ("we're not in business for our health you know...").

Tools of the Trade

Join the American Booksellers Association and with your membership (\$25 the first year) you'll get their Book Buyers Handbook. This gives addresses for all the major publishers and their discount schedules returns policies and other good stuff. It's essential. When you join, tell them you want their MANUAL ON BOOKSELLING and other free stuff (you do have to remind them).

American Booksellers Association
175 Fifth Ave.
New York, N.Y. 10010

Bowker publishes the other essentials. *Books in Print* (\$25.50 yearly) is two volumes, authors index and titles index of current books in print with price and publisher. Their appendix of publishers' addresses is more complete than the ABA Handbook. *Paperback Books in Print* (\$29.95 yearly) has three cumulative issues in November, March and July which list current paperbacks by subject as well as alphabetically by title and author. There are also monthly editions to fill in between with reviews taken off the book's cover. *Publishers Weekly* is a great magazine and if you don't enjoy it you are probably in the wrong business. A subscription is \$18.50 and aside from giving you general news of the trade, its spring, summer and fall editions are devoted to notices by publishers of the books they plan to release that season. The weekly reviews of forthcoming books are honest and entertaining. The magazine keeps you ahead of your customers. *Forthcoming Books in Print* (\$19.95) supplements *Books in Print* following the same author and title format and is issued 6 times a year. *Subject Guide to Books in Print* (\$23.50 a year) is in two volumes and is an index by subject. For an additional \$8.95 you can get *Subject Guide to Forthcoming Books in Print* which is bi-monthly. *Publishers Trade List Manual* is a 6 volume collection of over 2,000 publishers trade lists which is pretty impressive but its main use is to check discount categories for making single copy orders and if you are not doing much of that or even if you are, you can still get by using some body's last year edition checking price changes in BIP. The cost is \$17.50 a year.

There are many more but these are the ones we have and I've listed them pretty much in the order of frequency of use. When deciding which to get, consider what services you want to provide to your customers.

Polaroid MP-3 Camera

The production photography that I do for W.E.C. includes all halftones up to 3 1/2" x 4 1/2" and line shots up to page size.

Our halftones are done with a screen that has 85 dots to the inch. Really fine printing on slick paper sometimes uses screens with more than 200 dots/inch. Consult with your printer to find out what he can handle with his camera/on what kind of paper/in your production.

We make all our 3 1/2" x 4 1/2" or smaller halftones and let the printer make the bigger ones. We do them as veloxes (positive prints on paper) and paste them down directly on the flats. On large photos that we want especially nice we have the printer do in negative and strip into the negative he does of the flat.

Why not have the printer do all of the halftones? You can. It won't cost anymore. In fact, it may cost less. We like to do our own, though, because it gives us control, reduces the problems of getting all the stuff to the printers in good shape, losing material, and getting the wrong picture in the right spot. We also get to see exactly what the page will look like.

The Polaroid MP-3 with lights, film back, halftone kit, and 5" lens costs about \$800. Film, depending on type, costs \$13.50 to \$15.50 per box of twenty sheets (60¢—75¢ per picture). After working with the MP-3 for 1 1/2 years, I average 2 1/2-3 shots per good halftone, 1 1/2 shots per good line shot. That is working with varied copy. If I have a series of originals to be done to the same size, I can arrange them by contrast and average maybe 1 1/2 shots per good halftone.

That assumes that I have good film. I had no trouble with the Polaroid film the first year I used it, but during the last six months, quality has been extremely variable.

Stat King

We bought a Visual Graphics Stat King camera for doing work up to 11" x 17". It is a fancy photostat machine that will enlarge/reduce 200%—50%. Cost \$4000. It can have prints out and dry in 5 minutes or so. We wanted to do halftones with a contact screen but it didn't work well enough (the camera lacks a vacuum back) so we use it only for line work. Fairly cheap to use, but we don't use it enough to be worth anywhere near \$4000.

—Fred Richardson

Kinds of Books

Books are not just books. There are obviously hardback (cloth) and paperbacks. There are also text, trade, and mass editions.

Text editions are not simply the books you read in school but rather are designated by publishers as texts and sold to bookstores on a very short discount, generally 20%. This small discount is the reason most stores don't carry text books. The Truck Store is an exception. Trade books are the largest category of books and they, like texts can be either hardbound or paper. Book stores get the most generous discount on these, generally 40% or better. Trade paperbacks are termed quality paperbacks. Mass books are weird and if you buy them from a distributor, which you are almost forced to do, you get only 30% discount. If you can buy direct from the publisher you get 40%, but more about this confusion later.

Where do Books Come From

You buy both direct from the publisher and from wholesalers (known also as jobbers or distributors). The best way to find out about wholesalers in your area is to ask around at friendly stores. You will find that most wholesalers deal mainly one kind of book, that is, trade hardbacks, trade paperbacks (call these guys quality jobbers) or mass paperbacks (the last are a special case and will be dealt with in their own section). You'll need accounts with all 3 kinds. At the Truck Store we do most of our business with publishers and use wholesalers only to fill in. There are advantages and disadvantages to this.

Wholesaler advantages: They are regional and thus can give faster service and shorter distance makes for less postage and freight costs. Since they are smaller operations they are easier to deal with and adjustments in billing or invoice errors are handled more quickly and returns are made with no hassle. Also there is less paper work as you are dealing with one firm rather than 20, so there's just one invoice and one bill. This saves an incredible amount of time.

Disadvantages: They either don't stock what you want or are out of it and won't back order (that is, record your order and send it when the books come in). Their maximum discount is anywhere from 36-40%. You must pay 30 days from date of invoice.

Publishers advantages: They do have the books you want and they will back order. They may say you must pay in 30 days but allow 60 to 90 without bitching. They will send you current price lists, order forms, catalogs, advance notices of new books, and a salesman once in a while. Salesmen lay raps on you about why you should buy 25 copies of everything in their line but also they help you stay on top of it, assist in getting returns permissions, and some times they'll give you free books or take you out to lunch. Publisher's most important advantage is their better discounts. They generally have a minimum order of 5 books to get a 40% discount but from there discounts go up. This schedule varies with every publisher and is fully detailed in the ABA handbook. WORKING WITH THESE DISCOUNTS IS WHERE YOU MAKE YOUR MONEY!!!

Publishers disadvantages: Unless you live in the East you have to wait at least 3 weeks for delivery and pay that long distance postage or freight, though a few publishers have regional centers. (If you are in a rush say so in red letters and ask for "special handling" book rate which is not too much more expensive and can speed delivery by as much as 10 days.) Their bills are often computerized and each account means more invoices and more bills to pay and it is a lot of paperwork. Getting returns permissions is a drag and the delay for credit on returns is slow but we feel that the better discounts we get from publishers offsets these. One other disadvantage is that there is the minimum order to earn their discount but a way to get around it is the single copy order plan (SCOP). Essentially you send in a check with your order on a special order form and the publisher gives you a better discount than he would otherwise (see the ABA Handbook for details.) We use this for the few super expensive books we stock rather than invest money in keeping them around the store collecting dust.

HILLSIDE, N.J. 07205

The Mass Book Racket

We have found that once you deal with a distributor of mass books the mass publishers are reluctant to sell to you. (I think it's some sort of conspiracy.) Mass distributors have some advantages in that they are everywhere there are magazines (that's the other side of their business) so there is probably one near you. This means that you can call in an order one day and can get it two days later. Delivery is cheap if not free and you can even go pick up the books yourself. Ask and maybe they will let you take a shopping cart around and pick the books off the shelves yourself (check out their nudie magazines while you're there.) Returns are also done with no hassle. None of these things do the Truck Store much good as we carry very few mass books but if you are doing a more general store you will find these things helpful. However they quite often don't stock the books you want as the bulk of their trade is traditionally with drug stores and magazine stands and they are not easily persuaded; if it doesn't sell at the corner grocery they won't stock it. **THEY ONLY ALLOW 30% DISCOUNT** and sometimes less which is hardly enough to get by on. If you do mail order you can lose money.

How To Get Around This (Maybe)

If you are just starting I suggest that you set up accounts with mass publishers from the beginning telling them you are a new store. If they try to direct you toward a local distributor tell them you're not interested (ours makes deliveries before we open and many boxes of books have been rained on). Then, when you are established, see what kind of service the local guy can give you. This way at least you have an option. If you've already been buying from the distributor and want to order direct, send in an order to the publisher. The minor mass houses will be more likely to ship direct because their local distribution isn't very good but with the major publishers this probably won't work. Another tactic would be to use the order form the publishers send out with promo material (tho you might have to write first telling them to put you on their mailing list. Getting yourself listed in Publishers Weekly as a new store accomplishes this, not a bad thing to do.) They might just fill your order automatically or they might send it back to your local distributor to fill. But if they do fill it they cannot legally refuse to ship future orders direct, though they might.

Another tactic is to get in touch with their salesmen (though being regional he may be far away) and get him to send in your order or a letter okaying your order. He'll be somewhat sympathetic as more orders mean more money for him and it will look like he's really doing his job. The problem here is that he probably isn't, and you may have some trouble finding him. The main office may tell you who he is or send him your way or you could ask other salesmen, bookstores, or maybe quality distributors. I wouldn't ask the mass distributor as he may catch on that you want to take your business elsewhere.

Some distributors:

- Ray Surguine (3640 Walnut, Boulder, Colorado 80302) is a western wholesaler that carries both quality and mass paperbacks. Their discounts are straight 30% on mass and 40% on quality with a minimum order of 25 books on each. They are a good firm to do business with when your local guy doesn't have what you want and you are doing battle with the mass publisher.
- Book People (2940 7th St., Berkeley, Ca. 94710) is a quality paperback wholesaler. They are unique in that they carry a lot of small presses. They have a free catalog.
- L & S Distributors (1161 Post St., S. F., Ca. 94109) carry a lot of the same publishers as Book People but fill orders faster and seem to have books in stock more regularly. They give good service and we use them alot.

Baker & Taylor Company has regional offices (Somerville, N.Y. 08876; Mornme, Ill. 60954; and Reno, Nevada 89502). They carry a very complete line of hardbacks, including text editions, and a limited selection of trade paperbacks.

The East Coast is full of wholesalers of all kinds of books. Check the telephone books for names of mass distributors, either under Books or under Magazines.

There are lots of things I didn't talk about, most of which are contained in HOW TO RUN A PAPERBACK BOOKSTORE. Things like stock control, checking invoices and paying bills, making returns, setting up credit and budgeting have to be learned and systemized as you go along, everyone has their own way of doing it.

One prime piece of advice to those of you who've never run a bookstore before would be to get yourself a job for a while to apprentice or if you can't do this try and hire someone who knows something about the business. If you have any specific questions you can write to us and we will try and answer them. Please don't send orders to us and expect us to fill them at a discount as we are a retailer just like you. Good luck.

—Laura Besserman

Sam Falk

The Quick Hard Summary

In the September 69 Supplement, Stewart boldly invited anyone who was thinking of opening a Whole Earth Store to write to Hal for a quick hard summary. We've since had many inquiries & various of our staff have written numerous more or less quick & more or less hard summaries. Here's a sort of composite of all that information. We've also told folks to write to the two going stores we now know of, & they've been very helpful:

Whole Earth Access Co.
2466 Shattuck
Berkeley, CA 94704
(415) 848-0510

Whole Earth Cooperative
845 East Johnson
Madison, Wisc 53703
(608) 256-8828

The Quick Hard Summary

First, get lots of money to start with. Ideally, enough to run on for at least six months, preferably longer, & assuming whatever you make during the first raunchy months will go for unforeseen expenses, which there always are. A very rough minimum estimate is \$10,000; it depends a lot on how much space you want to occupy & what you plan to do with it. Basic necessary expenses are: rent—often first & last months', plus cleaning deposit maybe—utilities—gas, electric, phone, water, garbage, some deposits required; insurance; equipment & supplies (possibly cash register, adding machine, typewriters), forms, paper, notebooks, files; use permit from your city—not much (\$10-\$50); furniture & redecorating: desks, tables, chairs, shelving, display areas, signs, etc. (A lot can be done with used stuff). If you don't have them you'll need tools—hammers, saws, etc. And paint. Salaries—possibly the largest single item, unless people work for free, which tends to breed poverty & discontent.

Now—assuming you have some bread, or think you can get some—find a place. Not too high-rent, but hopefully somewhere where people walk by a lot. Don't sign a lease until you have a friendly lawyer check it—most agencies use standard forms that are designed to screw the tenant, but you can change clauses you don't like if they want to rent the building. Next: apply to your town or city for a use permit, which often takes a while to get. Without one you can be shut down forthwith. Apply to your state for a resale permit, same reason. Invite your local building inspector & fire inspector to come inspect—before signing a lease, if possible. Because—if you're in an old building, you may be required by law to make changes in wiring, plumbing, fix leaks, etc. at your own expense. Again this is preventative—later harassment can come from these areas, & you have no recourse. Again, a good friendly lawyer can be a lot of help in knowing local ordinances, etc. Also, lots of towns are zoned so that you can only do business in certain areas. Find out about zoning before renting.

Hopefully when you start getting your building into shape & see how much space you have, you can start ordering stock. A good idea is to figure out how much it's going to cost you to keep the physical place & the people going for six months. Then see how much money you have left & order your stock accordingly. You'll probably have already opened a checking account. If you're going to stock books, join the American Booksellers Association—\$25 gets you a manual of publishers with info on almost all publishers—their discounts, access info, credit terms, policies, etc., free advice; & so forth. You can also file a statement of your credit with their affiliated group—the American Book Publishers Council; whenever you open a new account with a publisher you

just tell him your credit was established there, he looks you up, & things are speeded up considerably. Usually publishers & suppliers require payment in advance on your first, or first several orders—after a while you can order, be sent an invoice, & have 30 days to pay. The more you order at once, the better discount you get—it's a question of working up to where you're selling enough that you can afford to order in larger quantities. It takes an average of a month for orders to arrive. By the way, when opening accounts, please make it clear that you're not connected with us—we've had trouble already with publishers putting other people's accounts on our statements, because of similarity of names.

What to sell? Depends a lot on you. We do mostly books & that's what we know most about—also some merchandise (Ashley Stoves, Corona corn mill, Aladdin lamps, Snuggly baby carriers, etc.) & a few magazines. A lot of the people who've written to us are interested in health food; arts & crafts, & other trips. Selling food requires special permits; that's about all we know. You can often get local arts & crafts on consignment (you pay the artist when the item is sold), which can save you some basic stock expense. A rule of thumb in ordering books is that cheap paperbacks sell the most—you can be surer of selling more of them than of the more expensive hardbacks. The Catalog itself is our bestseller, could probably be yours too.

OK. If you get this far—plan a gala opening for publicity—invite Everyone & serve cheap (homade!) goodies. Word of mouth is best advertising we've found. But you can put up posters, flyers, whatever. Try to get your local newspaper to do a feature on you. Smile a lot.

We'd like to see a Whole Earth Store in every town. Yeah! But before you start, be sure you're ready to do business—you will have to hassle with publishers & suppliers, keep records, mess with forms, numbers, paperwork. You will need a lot of human energy—someone has to do: ordering stuff, keeping track of what comes in, selling stuff, bookkeeping, cleaning up around the joint, correspondence, typing, filing, building or buying equipment, furniture, painting, keeping track of what you have & what you need (inventory), business with landlord & miscellaneous officials, decision-making, paying bills & payroll, etc., etc. Our aim here is not to discourage anyone, but to encourage open-eyedness about the prospects.

—Diana Shugart

Sam Falk

AAA Adding Machine Company

I wish we'd known about this outfit when we started business. They carry used and reconditioned calculators, adding machines and cash registers at good prices.

MARCHANT \$99.00

Automatic carriage return • Carriage tabulation; preset decimal as well as multiplication • No repeat or non-repeat keys • Automatic elimination of 1 in division • Complete carriage carry-over • Exclusive keyboard check dial • Complete in line 3 figure foot.

Beginning in his mind, then flowing down along his spine and outward through his body, the change came slowly over him. D.R.'s hands waited for it to be complete. Then, on their own, unhurried, they began to toss the coins. Six times they shook and dropped the coins, and the reading materialized:

Ken/Keeping Still, Mountain

"The image of this hexagram is the mountain, the youngest of heaven and earth. The male principle is at the top, because it strives upward by nature; the female principle is below, since the direction of its movement is downward. Thus there is rest because the movement has come to its normal end.

"The hexagram signifies the end and the beginning of all movement. The back is named because in the back are located all the nerve fibers that mediate movement. If the movement of these spinal nerves is brought to a standstill, the ego, with its restlessness, disappears as it were. When a man has thus become calm, he may turn to the outside world. He no longer sees in it the struggle and tumult of individual beings, and therefore he has that true peace of mind which is needed for understanding the great laws of the universe and for acting in harmony with them. Whoever acts from these deep levels makes no mistakes."

Stranger in A Strange Land: D.R. tried to read that novel by lamplight after he went to bed, but he was too sleepy to pay attention.

Some other time, he said to himself. And he blew the lamp out and went to sleep.

One of the main things that drove me into business was ignorance. A liberally educated young man, I hadn't the faintest idea how the world worked. Bargaining, distribution, mark-up, profit, bankruptcy, lease, invoice, fiscal year, inventory— it was all mystery to me, and usually depicted as sordid.

I noticed that great lengths were gone to in order to prevent "consumers" from knowing that part of purchase price went to the retailer. It seemed exquisitely insane to me. You sell deception and buy mistrust, to no advantage. The retailer in fact earns his 25-40% by tiresome work, but the prevailing attitude makes him out a clever crook. Ignorance institutionalized. Would you mind leaving the room, we're talking about money.

So along with shit, fuck, cunt, and the rest, I wanted to say among my friends, money, not to swear but to honor function.

You may or may not think capitalism is nice, and I don't know if it's nice. But we should both know that the **WHOLE EARTH CATALOG** is made of it. Capital was invested by my parents and parents'-parents in such activities as iron-mining in Minnesota and Eastman Kodak. They paid nicely enough, and by family attentiveness-to-business and flat-out parental generosity, I wound up with a bundle of money without having done a lick of work for it. Stock had been bought in my name; my parents handled it but it was mine to work with; it's a good system, like giving your kid a tough horse to ride when he's young.

By the time I was 29 the stock came to over \$100,000. I had ignored it all through my twenties, living in \$20 apartments and not travelling much, occasionally wage-earning in photography, design, Army. I suspect I felt guilty about the money. I know I felt stupid about it. So it sat, and I sat, and alienation was a cozy room. Garrett Hardin has written that alienation and irresponsibility are parents of invention. James Watson says that boredom is a prime incentive to creativity. They're right.

The idea for the CATALOG hit me plenty hard, but I think I could never have raised the money for it. Certainly not by grant— I did know about foundations by then. I doubt if I had the brass to steal the money, or deal dope for it. Honest labor would have taken too long for my short attention span.

So I invested, comrade. I took the profits from old investments and put em into a new one, a brand new naive hopeful unlikely business with ditto in charge. Investing in yourself has hard truthful edges; I hope you get a crack at it, and can stay as sweet as you were as a dependent.

Why am I saying all this? Because many who applaud the CATALOG and wholeheartedly use it, have no applause for the uses of money, of ego, of structure (read uptightness), of competition, of business as usual. All the things, plus others, which make the CATALOG, and make the selective applauders into partial liars, and me one too if I aid the lie.

The CATALOG is advantage-seeking, all right. It gains advantage half as far as it gives it. 50% efficiency is about the best nature can do, says Odum (p. 8).

I am also saying all this by way of thanks to my parents. It's as Dick Alpert used to say: It's love money that underwrites this sort of venture every time. Which suggests that if foundations and governments want to do the job they say they do, they should retain the services of better lovers.

The figures. I thought it would cost \$10,000 for April-December of the first year, (I didn't even think about it until Dick Raymond mildly asked me). I would loan money to the CATALOG at 8% interest, to be paid back when and if we were money ahead. (This "self-dealing" is now illegal, reasonably. Assholes with tax-evasive non-profit corporations pour money back and forth within the corporation and collect personal tax-free interest. Borrowing now, I'd have to use a bank, and they'd get the interest.)

Well, that first nine months cost \$12,780, with no noticeable income. On that hopeful note we started the store (\$450/month rent) and started buying stock, too late for the Christmas rush—most book stores do 1/3 of their year's business in November-December. By February 1969 the CATALOG and Truck Store had gone through \$28,260, of which \$21,425 was loaned by me and Lois. We had 340 subscribers, had sold 800 copies of the Fall 68 CATALOG and were printing a second thousand of them. By May '69 we'd spent \$42,550, of which \$27,425 was loaned. We stopped loaning. Income kept growing, and by early Fall 1969 we went from red to black. We'd paid for the past.

At the time, in fact, finances were not particularly on my mind. How To Make Money was not the design problem. (I'd heard and bought Ken Kesey's advice that you don't make money by making money: you have that in mind early on, but then you forget it and concentrate entirely on good product; the money comes to pass.) The problem was How to Generate a Low-Maintenance High-Yield Self-Sustaining Critical Information Service.

Easy. You name what you know is good stuff and indicate exactly where to get it. You do this on newsprint, which costs 1/2 of the next higher page stock. Low overhead every step. Employ stone amateurs with energy and enthusiasm. Build furniture out of scrap doors, light tables out of scrap plywood, work in whatever space you have. Pay your pros \$5/hr (no raises) and the beginners \$2/hr with 25¢/hr raises every couple months. Employees fill out their own time sheets. If they get dishonest about that— or anything that hurts service, fire them. Spread responsibility as far as it will go, credit too.

If you're doing a clear public service you may get non-profit tax-exempt status. (We pay State taxes on store property, and State and Federal taxes on the store and mail order operation. The CATALOG is non-profit— this was helped by our lowering the price of the CATALOG twice, and by our plan to stop, which indicated we weren't kidding about being primarily an educational prototype. Even so the IRS is grumbling and may change our classification, which could endanger Portola Institute.)

To ensure in-house quality control, acquire low-cost maximum-flexibility tools. For us that was the IBM Selectric Composer for type-setting, the Polaroid MP-3 camera for line and half-tone graphics, and Pitney-Bowes mailing machine and scale for the mail order operation. Lease where you can. What must be bought can be owned by individuals who get depreciation tax advantage that the non-profit corporation can't get.

As Fuller advises: Always promise less than you deliver, and let customers, business associates, staff come to their own conclusions about you. Small business is based on earned trust. Send cash-with-order in your first dealings with another firm. Pay bills scrupulously on time. Keep exact, open books on all your accounting. Small businessmen respond faster to honesty than any other kind of person: most of them couldn't care less what you wear, smoke, or think if you're straight with them and don't care what they wear, smoke, or think.

What you're trying to do is nourish and design an organism which can learn and stay alive while it's learning. Once that process has its stride, don't tinker with it; work for it, let it work for you. Make interesting demands on each other.

Our stopping is primarily an economic experiment. Rather than do the usual succession things we prefer to just cease supply, let demand create its own new sources. Our hope is that those sources will be more diverse and better than we have been or could have been if we continued.

There's money in this business. We made some in spite of ourselves. To really clean up we could have:

Had a private sale of stock at the beginning like Rolling Stone and Zoweworks.

Sold expensive advertising space in the CATALOG.

Kept the cover price at \$4.

Gone for mass distribution.

Franchised Whole Earth Truck Stores around the world.

Developed a line of Whole Earth tools.

Sold the name and momentum of the CATALOG for a princely sum.

The expenses on this LAST CATALOG will take us back down to zero and probably past it. We're footing most of the \$200,000 printing bills and we won't get any income from Random House until November. It looks like we'll have to go into a second printing before then. Eventually we'll be money ahead again, and I'll be responsible for doing something interesting with it.

Here's a rough estimate of what happens to the \$5 you paid for this CATALOG. (It's true only at the instant that all 200,000 copies of the first printing have been sold and no further have been paid for.)

\$5		
\$2.00	bookseller	
.50	jobber	
.45	Random House	
1.00	printing and binding	
.15	production salaries, supplies, research	
.10	shipping and miscellaneous	
.064	Gurney Norman (8% of net)	
.0736	Don Gerrard (10% of what's left)	
.0662	Portola Institute (tithe) (10% of what's left)	
.5962	The Future (all slacks and surpluses taken up here)	

Here's the current state of our books:

Whole Earth Catalog Cash Flow 69-70

History

Some of what happened around here for the last three years.

The **WHOLE EARTH CATALOG** got started in a plane over Nebraska in March 1968. I was returning to California from my father's long dying and funeral that morning in Illinois. The sun had set ahead of the plane while I was reading *Spaceship Earth* by Barbara Ward. Between chapters I gazed out the window into dark nothing and slid into a reverie about my friends who were starting their own civilization hither and yon in the sticks and how could I help. The L. L. Bean Catalog of outdoor stuff came to mind and I pondered upon Mr. Bean's service to humanity over the years. So many of the problems I could identify came down to a matter of access. Where to buy a windmill. Where to get good information on bee-keeping. Where to lay hands on a computer without forfeiting freedom. . .

Shortly I was fantasizing access service. A Truck Store, maybe, traveling around with information and samples of what was worth getting and information where to get it. A Catalog too, continuously updated, in part by the users. A Catalog of goods that owed nothing to the suppliers and everything to the users. It would be something I could put some years into.

Amid the fever I was in by this time, I remembered Fuller's admonition that you have about 10 minutes to act on an idea before it recedes back into dreamland. I started writing on the end papers of Barbara Ward's book (never did finish reading it).

The next morning I approached Dick Raymond at Portola Institute with the idea. I'd been desultorily working for him for about a half a year, had helped instigate one costly failure (an "Education Fair" which aborted), and was partly into another doomed project I called E-I-E-I-O (Electronic Interconnect Educated Intellect Operation).

I told him this Access Catalog was what I wanted to do now. Dick listened gravely and asked a few questions I had no answers for (Who do you consider as the audience for this "catalog"? What kind of expenses do you think you'll have in the first year? What will be in the catalog? How often would you publish it? How many copies?). All I could tell him was that I felt serious enough about the project to put my own money into it, but not for a while yet. I wanted to move into the scheme gradually, using Portola's office, phone, stationery, and finances (which were Dick's personal savings, dwindling fast). He said okay.

For over a year Portola Institute had been nothing but Dick, a secretary he shared, his office, and a few expensive projects with big ideas and little to show. So he rented a nearby set of cubicles that some architects were moving out of, to give us more room to make mistakes in. I was working in my cubicle several weeks later when Dick leaned in the door and asked, "By the way, what do you think you'll call it?" My head filled with the last success I'd had, a 1966 photograph-of-the-whole-Earth campaign, which I felt was still incomplete. I told him, "I dunno, Whole Earth Catalog, or something."

My activities at this time were mostly visiting book stores and looking at books. One of Dick's friends at the Checkered Frog bookstore in Pacifica told me I could get single copies of books from publishers if I joined the American Booksellers Association, a commitment of \$25. Shortly after that I made the big step and (holding my breath) spent \$60 on note-o-gram stationery from Modern Business Forms. Dick helped me open a commercial account at a bank.

I was operating without pay but keeping track of my time, to pay myself back-wages of \$5/hr if we ever started to make money. In July 68 I printed up a mimeographed 6-page "partial preliminary booklist" of what I'd gathered so far (Tantra Art, Cybernetics, The Indian Tipi, Recreational Equipment, about 120 items). With samples of each in the back of our truck Lois and I set out to visit the market - familiar communes in New Mexico and Colorado. In about a month the Whole Earth Truck Store did a stunning \$200 of business. No profit, but it didn't cost too much and was good education.

On return in August I hired an employee, Sandra Tcherepnin, who came around part-time to type and buoy my conviction that something was going on. In September Lois and I moved into Ortega Park (formerly Rancho Diablo), 70 acres and house newly leased by Portola Institute as a teachers' laboratory. She was housekeeper and I was caretaker in an empty mansion. It was a plush time.

Dick Raymond had introduced me to Joe Bonner, a talented teenage artist looking for work. He preferred to do layout than janitor for Portola so I took him to Gordon Ashby's design studio in San Francisco for a 10-minute course in layout. In October 68 we started production on the first **WHOLE EARTH CATALOG** in the garage at Ortega. Sandy fell in love with the IBM composer while Joe nailed together light tables out of scrap plywood. We got some electric heaters and started work. Joe did layout, Sandy typed, and I researched, reviewed, edited, and photographed. Whenever the typewriter, heaters, camera lights, and fry-pan of wax were on simultaneously the electricity went out. We'd spend an hour on projects like making an exotic border with the composer. A leisurely production. A month or so for 64 white-spacey pages.

We had the contents printed at Nowels Publications, a newspaper press just down the street from Portola Institute, and the cover printed at East Wind in San Francisco (using the picture from a Whole Earth poster we'd already had them print), and the binding done at another place, with us doing the transporting between. It was a terrible arrangement. The 1000 copies we printed were a huge chore to cart around.

Our real luck was in finding Nowels Publications and Bob Parks. I've never met a man I'd rather do business with, and to find a printer who is fast, thorough, cooperative, creative, honest, and inexpensive is just unheard of. We had one **CATALOG** printed elsewhere and regretted it.

I only dimly recall what we did with that first **CATALOG**. We sent them to the 50 or so subscribers we'd got with mailers and personal contact. We carted some around to stores, who didn't want them, not even on consignment ("Too big. Too expensive. What is it?") We traded some with other publications like *This Magazine is About Schools*, *Explorers Trademark Log*, and *Green Revolution*.

Meanwhile we were starting a store. Dick Raymond had had his eye on the building at 558 Santa Cruz, just across the alley from the cubicles he'd rented. Formerly a USO, then a Salvation Army store, then a printer's, the place had apartments upstairs and 4000 sq. ft. of big rooms downstairs and a nice store front. The printer had failed and the building was going to be sold. Dick got the likeliest buyer and worked out a 5-year lease for the downstairs part at \$450/month. We felt like we were really into the soup now. Five years! That's 1973.

At Thanksgiving we'd met a girl from New York named Annie Helmut who had some familiarity with the publishing world, mostly on the publicity end. She was hired to take on publicity and help with research and typing since Sandy had left for woollier pastures. We soon found out that handling our own distribution was going to be impossible (bookstores wouldn't pay what they owed and hassled us with endless bizarre problems). Annie started looking around for other alternatives.

Arthur and Julia Brand

What I'm visualizing is an Access Table (accessory?) with ~~the~~ all manner of access materials & advice for sale cheap. Including performance of shell cases, dandy survival and camping equipment, catalogs, etc. a personal notebook, computer, etc. equipment (I don't know which equipment - some element of basket here). Prime item of access would be the catalog. Prime item the road show. Educational materials esp self-education. Books esp amateur education. Everything to small scale access. It all comes a large service is the product

research. I would prefer to offer at most 2 of any item: 1) The best; 2) The best/cheapest. Techniques and tools of access acceleration. Be the self-motivated. On items carried in the catalog, have a brief recommendation by credit. Encouraging others to do this. Would there be any reasons in shipping costs and/or direct to suppliers, so I don't get goods, but strictly a information? Suppose the traveling store were a courier and charged commission?

The Whole Earth appendix to *Spaceship Earth*

In December 68 we moved into 558 Santa Cruz. There wasn't much to move - a chair and some books. Joe set to work with free scrap wood making the store a funky pleasant wooden place. We sublet an office in the front to Dave Shapiro and a space in the back to lawyer Jim Wolman. That cut our rent to \$250/month. Joe made desks and tables out of doors and 2 x 4's. We never got around to changing the walls from institutional green.

From the beginning the pretty little Indian girl Lois, who still has to show her ID to bartenders, was the hard core of the business. She applied her math background to our bookkeeping, and her sharp tongue to our laziness and forgotten promises. She had the administrative qualities you look for in a good First Sergeant. In my experience every working organization has one overworked

underpaid woman in the middle of things carrying most of the load. None of the rest of us ever cleaned the bathrooms. Lois cleaned the bathrooms.

Annie was at the City Lights Bookstore in San Francisco one day talking to Shig the manager about where to look for a distributor. Shig suggested a new long-haired outfit in Berkeley called Book People. Annie went to them and was immediately taken with Don Gerrard and Don Burns. Pretty soon Book People was our distributor, and that was a big relief. We made no contracts or vows, but the **CATALOG** stayed with Book People as sole distributor until the March 71 Supplement (when the *Realist* took half the distribution).

In January we had a grand opening party at the store, though we'd been open for a couple weeks ("There's a customer in the store!" we'd whisper in the back room.) Annie and I invited all the newspapers and were surprised and hurt when none of them showed up. It was a nice party anyway. The readership was a small sort of cult then, most of whom seemed to know each other, or wanted to.

Also in January we produced our first "Difficult But Possible Supplement to the Whole Earth Catalog". It was a 32-page newsprint collection of friends' letters, old pamphlets like Abbie Hoffman's "Fuck the System," a solar heater, new **CATALOG** suggestions. We made it at the Store.

About this time Tom Duckworth joined the scene. He lived in a truck with Connie and their kids and soon had a place to park at Ortega. His dream was to really do a travelling truck store. In March we gave him a shake-down cruise to New Mexico when the Whole Store caravanned to ALLOY (p. 111). If I had to point at one thing that contains what the **CATALOG** is about, I'd have to say it was ALLOY. We put it in the March Supplement, along with how much the Supplement cost to make, which Steve Baer had suggested at ALLOY. A good practice. We've never regretted it.

When we started the **CATALOG** I imagined that it would be a month of work, then an easy month to travel around and get the news, then a month of work, then... but it wasn't working out like that. None of us knew how to run a store and we were learning the hard way. We couldn't seem to find a mailing house that would do an even half-decent job of serving the subscribers. We had to try three places, each at big expense.

Our hassle with the Post Office, which continues to this very day, was in its surreal beginnings. (We're a periodical, in every spiritual and legal sense. Periodicals are mailed Second Class, a faster, surer, and cheaper service than Third Class, which is Junk Mail. The classifications man in San Francisco said, "It says Catalog right here on the cover. Catalogs go Third Class." Dick Raymond cleared his throat, "The Rolling Stone," he said, "is not a stone." Through endless appeals the thing has ambled, letters to our Congressman Pete McCloskey, rulings, and re-rulings, to current result: We have to send this **LAST CATALOG** to you Third Class. When a mail truck gets stuck in the mud, Third Class is what they throw under the wheels.)

(continued) →

THURSDAY: PHONE CALL

By morning, though, D.R. was thoroughly animated again, restless and filled with an energy that just knew there'd be a letter for him in the mail that day. He felt it so strongly he couldn't get his mind on any work he tried around the place. At ten thirty he gave up trying and took off half-running down the hill to the store.

And sure enough, waiting at the post office was a letter from the Anaheim Flash.

- Divine Right,
1. Man, you have blown me out.
 2. The telephone is more civilized than letters.
 3. Letter-writing closes up my centers.
 4. Estelle has been at Angel's place the last couple of weeks.
 5. She may not be there now.
 6. But I sent your letter on to Angel's place anyhow.
 7. That's all I know.
 8. Here's 200 bucks.
 9. Don't spend it all in one place.
 10. And for Christ's sake, use the phone next time.

(signed) A. Flash, Esquire

Right on, said D.R. to himself.

(continued)

History (continued)

About this time Lois and I started living in the store. Joe and Annie and I, with editorial help from Lloyd Kahn, did the Spring 69 CATALOG production amid the busy din of the store, a bad mistake. The CATALOG was twice as big and a dollar cheaper. To clear my head after production I hitchhiked to New Mexico for what turned out to be the Great Bus Race (p 245). Joe and Annie also headed for the desert, pending rendezvous in Albuquerque for the July Supplement production.

You should know that all this time Portola Institute was going through continual interesting changes that someone else is going to have to write about. Dick Raymond did one especially nice thing for us: he protected us from the vicissitudes.

Store and mailorder business was gradually picking up, so we hired Hal Hershey, a friend of the Duckworths who had worked in bookstores. We also hired Diana Shugart, a close buddy of Lois' and mine. At the store we had a chart on the wall that showed our income and expenses for each month. The income was gradually catching up.

While we were having a good July production at Steve and Holly Baer's house in Albuquerque, Hal and Diana were starting to face a heavy current in Menlo Park ("52 subscriptions today!"). Philip Morrison had written kindly of us in the June 69 Scientific American. We were being mentioned in a lot of underground papers such as the East Village Other. And then Nicholas von Hoffman wrote a full piece on the CATALOG that got syndicated all over the U.S. We were caught. We were famous.

(One interesting note. Of all the press notices we eventually got, from Time and Vogue to Hotch!— in Germany— to the big article in Esquire, nothing had the business impact of one tiny mention in "Uncle Ben Sez" in the Detroit Free Press, where some reader asked, "How do we start a farm?" and Uncle Ben printed our address. We got hundreds and hundreds of subscriptions from that.)

Hal and Diana hired more people. Deposits at the bank were more frequent: the bank officers got more polite.

In September Joe and I returned to Ortega garage to work on the September Supplement. Annie had stayed on at Lama, so we hired a Kelly Girl to do the typing. As I was driving up the hill to work one day it suddenly hit me that I didn't want to. Instead of golden opportunity the publication was becoming a grim chore. I considered the alternatives of taking my medicine like a good boy or setting about passing on my job to somebody else. I'm sure I

Richard Raymond, President of Portola Institute

sighed unhappily. And then this other notion glimmered. Keep the job, finish the original assignment, and then stop. Stop a success and see what happens. Experiment going as well as coming. We printed in the September 69 Supplement that we would cease publication with a big CATALOG in Spring 71.

Meanwhile business was still growing. The morning mail was a daily heavy Santa Claus bag. We hired Tracy McCallum, Peter Ratner, Mary McCabe (a bit of uptown glamour amid the Hair), and a guy named Fred Richardson who had amazing talent for handling the world's hardware. Bernie Sproch and Megan Raymond came in periodically to handle our increasing load of filing and flyer-mailing and other chores. We were having group lunch at the store by now, Lois and Diana dishing it up.

I actually thought I could fit LIFERAFT EARTH (p. 35) in between the September Supplement and the fall CATALOG. Setting up the event was even harder than production. Then starving for a week was no way to recuperate. Dumb.

I went from the LIFERAFT straight into Fall CATALOG production. We were late, so we had to do it in two weeks. Fred was going to take over the camera. We had a hot new typist, Cappy McClure. We had a big new Stat-King that wasn't worth it. Joe brought in his brother Jay to double our layout speed. We worked 80 hours a week. We got to the printer on time.

Then Christmas was on us like a cat on a mouse. Everybody was overloaded at the store. In January we had another burst of hiring, practically whoever came in the door. Les Rosen the book-keeping ex-Marine, John Clark, Russell Bass, Jerry Fihn, Alan Burton, Leslie Acoia, the booklover Laura Besserman. Pam Smith was cooking lunch. When Tracy left to Canada, Pam's husband JD came in as manager. JD instituted a fine addition to the Storefront—a Free Box ("take or leave"). Everybody should have one; they really get used.

About this time I went over some edge. Minor tasks became insurmountable obstacles. The thought of another production filled me with hopeless dread. I couldn't walk right. It was a nervous breakdown, garden variety. I'd never had one before so I thought I was dying, which stirred up a snowflurry of phobias that took more than a year to disperse. I'm not happy to mention this, but it seems an important part of the bookkeeping we're doing here.

In retrospect what I particularly appreciate was Dick Raymond's help and comfort, which was none at all. He's an unusually merciful soul. He said out loud to Esquire, "You have to let people have their own nervous breakdowns." Correct.

256 Regal Row
Dallas, Texas 75221

Sound Criticism

What in the Hell is the Big Idea, anyway, threatening to cease publication of the Whole Earth Catalog?!! Why, you characters have hardly even started! What if all the telephone companies suddenly

Fidelity Executive

A good source of cheap, functional cardboard files and bins. Also other office equipment.

Fidelity Products Co.
705 Pennsylvania Ave. So.
Minneapolis, Minnesota 55426

-SB

decided to stop printing the yellow pages next year? What if Sweets suddenly decided they'd stop updating those huge catalogs each year or so? Where would we be? And don't put forth the argument that "Well, we'd probably be better off because somebody'd probably start a new Yellow Pages that would probably be better than the last ones..." because only You know how much Money, Time, Effort, Logistics, B.S., and Tears are required to compile and operate such an Information Processing Centre— and now that you've got the first touch of momentum in the Machine you're going to turn it off and like some child of itinerant interests create some new plaything to amuse yourselves and depress a lot of the rest of your followers because just as we get the hang of it and start Magnifying your Outer Ripples you'll Cop Out on us. If there was ever an Evil Plan, a commitment to Irresponsible Action, it's the decision to cease publication of the Catalog in 1971 which MR Brand had the audacity to suggest in a recent interview with TIME Magazine. What if Mother said after 3 months or so of Carrying The Weight: "Well, if Baby can't go it on his own from here I haven't been much use—!" But as I hope you have noticed, really responsible mothers hang on for at least 9 months if not 15 years and then, knowing when to shut up, they do it.

I don't know how much it's coming through to you guys yet or not but your not just titillating the Folks down on The Farm— you've pioneered a whole new concept in Information selection and distribution: "The Catalog With A Soul." And as you might gather from your sales increases over the last few issues there are a hell of a lot of other eyes gawping your rags. For example, there isn't a single school (particularly those tied up old design schools) that isn't absolutely fertile ground for you to pitch your Circus on...! The kind of Design Mentality which in your format and attitude you've begun to succeed in showing is possible and enviable on nearly everybody's scale— and the kind of Gospel of Self-Reliance en famille you've preached is so goddamned vital you just can't give up without realizing the Full Implications, the Total Possibilities of the Little Bomb you've set off.

If you had the nerve to call it The Whole Earth Catalog, why the hell isn't it going to BE a WHOLE EARTH CATALOG— a World Source with a World circulation, a World Exposure, a World of Contributors (have you considered the prospect of a WEC in every U.S. Embassy as a start)— A World Institution; Sears and Roebuck did it with a much smaller heart— and you don't even have to stock the merchandise! Here I am in Soggy Olde England and I've sold the Catalog to the First Five people I've shown it to except they query "Where can I get these goodies in England?"

1971 is not the year for you to fold up; 1971 is the year for you to start a New Growth Phase— to show that your concern is even more generous, even more thought-out than you'd have us believe at the moment. How about that: twice a year an Expanding Universe in my mail box! What New Forms can the Whole Earth Catalog take on? Maybe a separate edition for each major category of information, sources, and items as reviewers and contributors expand the range. Or how about a Telex station at WEC so that the backlog of old information from old issues and reviews which will surely pile up at an astounding rate could be tapped by a subscriber anywhere in the World when he needs source material and, as well, reviewers might click in a review when the P.O. eventually proves too slow. The Supplements: in addition to the sort of Interface they are now, could continue to be sort of Reporters-At-Large for us Lookers and Builders but on a much Broader Scale, reaching beyond the Western United States and extending our knowledge of Process/ Ideas by connecting up with other Farmers of the World. (You know that the first European Conference on The Environment was just held in Strassbourg?)

You see, of course, it is just as important that you publish the Catalog as what you put in it— you are a vital Priority Distillery: Catalog, Tools, and Appliances for Self-Reliance and you document that very process of distillation thereby endorsing Design as one entire side of the Evolutionary Coin. Now, as never before, because of Extraordinary Devices, one man's Special Sight can be shared by many more who see a little better because of his efforts; in our struggle to become ever less Blind, all the Vehicles which bring the Possibilities of these Special Sights to us are like much needed lenses or Aids: extra eyes and extra ears to help us make our Way in the Dark. As any designer knows— you cut off the Source, the Inspirator— and you cripple the Product, you trip up the Effort.

So, goddamnit, GROW UP. (or at least justify your suicide.)

Very Sincerely Yours,
Gregory Groth Jacobs
London

Every noon, volleyball at the store.

I jittered through the January 70 production and then asked Gurney Norman to handle March. He did, and with bells on. Guest editorship had come to Whole Earth. Joe Bonner left on the mystical road, and I was worried, but Hal Hershey more than filled his shoes on layout.

In January Fred built a volleyball court in back of the store. I was too fucked up to play on it for a while, which grieved me, because volleyball instantly became a valuable part of the store routine. We played two games after lunch every day. It improved our health, got us out in the weather, loosened our tensions, and — honest to God — built character.

Since we were playing on paid-for time, we naturally tried to stretch out the two games, so each day the players spontaneously arranged themselves into always different but equal teams. Lunch and volleyball kept us well acquainted. That, and the morning mail-opening scene. We had some newcomers — Mary Jo Morra, Soni Stoye the good cook, Austin Jenkins of good cheer.

On the Spring CATALOG we went up to 144 pages and lowered the price further to \$3. (Later a friend at Stanford Research Institute said he made the calculations one afternoon and figured out we would make the most money with a \$4 price tag. Or \$3.95, as they say.) A new face on Spring production was Steamboat, who seldom spoke but could draw volumes. (Tuesday's Child on p. 23 is his. So are the dragons.)

In July Lois and I left to see the world and Expo and the Bakers in Japan. My old (and favorite) employer Gordon Ashby took on the July Supplement and totally changed our layout ways.

JD, Nebraska's Marlon Brando, kept a strong crew busy at the Store and started gathering material for the Fall 70 CATALOG he was going to edit.

In September 70 Gurney came back from a summer in Kentucky with Wendell Berry and put out what came to be known as the Cracker issue of the Supplement. The BD-4 airplane kit we'd ordered started to arrive, and Fred and later Troll and Doug and Bob sawed and filed and puzzled and riveted it in the back room.

Don Gerrard had left Book People and among his other projects was trying to find a big distributor for the LAST CATALOG. We wanted a contract by Christmas. Nobody in New York seemed very interested.

There were strong family feelings in the Store by now and a desire to do something else together. A restiveness. When the teacher's lab at Ortega finally failed and quit, JD and I pressed to get it as a home for most of the Truck Store staff, a commune. Idealism

filled the air. It was never a very successful commune; it was a plenty educational one.

As Fall production went on up the hill in the garage there were new laborers in the store. Herald Hoyt, Dudley DeZonia, Francine Slate, Terry Gunesch, Diane Erickson. People's children were in the store more often now. Marilyn's kids, Francine's, Diane's, Pam's. I was buried in the back office starting the long haul toward the LAST CATALOG.

At Christmas there were memorable parties.

In January 71 some of us safaried to a remote unnamed desert hot springs for an adventurous Supplement production.

Don Gerrard had gotten good offers from Dutton and Random House for distribution of the LAST CATALOG. We decided to go with Random.

I asked Richard Brautigan, Ken Kesey, and Paul Krassner if any of them would like to edit the March Supplement. Brautigan said he was already involved in a quaint project, writing a novel. Kesey said he would edit if Krassner would, and new levels of offense and tooldom were leveled at our readers.

The LAST CATALOG you know about.

A lot of other stuff happened too, ask anybody who was there. Ask Bernie Sproch to show you his Whole Earth stamp collection. It's quite a collection.

Fame

I/we've been subject to some, and you're partially responsible, so I thought you ought to know a little about it. Everything bad you've heard about fame is quite true. It can throw a personality into positive feedback, where audience demands drive his character past caricature and off the deep end. Its over-rewards can jade a palate permanently. It wakes you up in the middle of the night with phone calls from whining strangers.

Worst of all is the classic bind of the successful do-gooder. If you do good well, your opportunities to do more increase, as your stamina to do any decreases. You should relax, yes you should, relax, with guilt yammering in your ear. FUCK EM ALL! is no answer either.

Some think they're strong, some think they're smart, Like butterflies they're pulled apart. America can break your heart. You don't know all, sir, you don't know all.

W. H. Auden

Krassner is right to note that celebrityhood is mainly a matter of convenience for people. There's no reason to take it personally.

I will say a couple of good words for fame. It accelerates access if you want access. You can hang around with famous people, which is fun sometimes. Your credit is good with strangers, it's never hard to meet people. It's usually easy to find work, make some money. If you've withstood fame there's some things you're strong at that you might not be otherwise.

The main problem with fame, or any kind of success, is the insulation it packs around you. You don't get all those little course-correcting signals from the universe. In part they're drowned out by all the people telling you what they think and what you ought to think. Also the signals just can't prick you; when a red danger light goes on, you can simply bribe the machine until the light goes off, and the danger grows unheeded.

The voices that you need to hear, whisper, slowly and infrequently. The only way to hear them is listen. Gaze at something until it's nothing. And then at nothing until it's something.

There's a difference between intention driving us on, and mystery pulling us on. Mystery will always educate and correct. Intention can go off the end of its own limb.

If it's all right with you, I'm going back to the tree. We get asked a lot, "What's in the future for you folks," as if we knew. Well, let's see. We'll clean up the garage and sell the production equipment, maybe to Kesey who wants to start a travelling magazine called Spit in the Ocean. Us out-of-work production people will draw our two weeks severance pay. We'll keep the Truck Store going in Menlo Park, and maybe try some new things with it in relation to Portola Institute. We'll have our DEMISE party that Scott Beach has set up at the Exploratorium. We'll do some travelling. We'll take a ride on Patchen's coda:

Pause.

And begin again.

—SB
May 31, 1971

Whole Earth Truck Store

The Whole Earth Truck Store is alive and quite well in Menlo Park. New ventures under way. Old CATALOGS and Supplements available. Come by.

And we still Mail Order.

Hours: Monday—Saturday, 10 am - 6 pm
558 Santa Cruz Avenue, Menlo Park, CA 94025
Phone: (415) 323-0313

PORTOLA INSTITUTE
INC.
1115 MERRILL ST.
MENLO PARK,
CALIFORNIA
323-5155

Portola Institute was established in 1966 as a non-profit corporation to encourage, organize, and conduct innovative educational projects. The Institute relies for support on private foundations and public agencies, to whom specific project proposals are submitted.

Because Portola Institute is a private organization with no need to produce profits or guarantee "success", it can experiment with new and unusual educational projects that would be difficult to administer within more structured organizations. For this reason the staff and facilities of the Institute are deliberately kept small and flexible.

Within its framework a wide variety of projects dealing with innovative education can be created as people with ideas are able to interest people with funds. New projects are always being considered, both within the existing divisions and programs, and within as yet unexplored realms of the learning experience.

Whole Earth Truck Store and Catalog is one division of Portola Institute. Other current activities include:

- Big Rock Candy Mountain
- Media Access Center
- Music Resources Program
- Kids Teaching Kids
- Learning in the World
- Wilderness Education

And he left the store and the people there and went around to Roxie's house to place a collect call to the Flash in California.

"Yal-low?"

"Flash, this is D.R."

"Stop right there," said the Flash. "Before you say another word, I want you to tell me a phone number where I can call you. I would of called you days ago..."

"Listen, man, have you heard from Estelle yet?"

"Tell me your phone number and I'll answer that question."

D.R. told the Flash Leonard's phone number. There was a little silence while he wrote it down.

"That's better," said the Flash. "People might as well be lost in outer space without a phone number. Estelle's in San Francisco."

"She's where?"

"She's with these friends of Angel's in the mountains, south of San Francisco. Down toward Santa Cruz."

"What the hell's she doing in San Francisco?"

"What are you doing in Kentucky?" asked the Flash. "What am I doing in Anaheim? It shifts, friend. It shifts and moves around. You should know."

"But San Francisco..."

"She's not in San Francisco," said the Flash. "She's south of there..."

"Did Angel tell you that?" D.R. asked. "When did you talk to Angel?"

"Yesterday, the day before yesterday, and about a week ago. I would of called you if I'd had your number. Always have a telephone number, D.R. It facilitates communication."

"So go on with it. What did Angel say?"

"She said Estelle had split. She said Estelle stayed with them two weeks, and day before yesterday took off, hitch-hiking south. Angel told her to stop off and stay a few days with these friends of hers who live in this dome in the mountains. Estelle said she'd probably do that, and if she did, then we can find her."

"What about my letter?"

"It got there the day Estelle left. Angel read it, and that's why she called me."

"I'm sorry she's hitch-hiking," said D.R.

"Angel said that was what she wanted to do. Besides that, she was broke."

"Oh shit. What else did she say? Did she say how she was, how she felt?"

"She's kind of down, I think. I'm not supposed to tell you that, so don't tell Angel I told you. She's already convinced you're a rat. I don't want her to think I'm one too."

"Jesus. Did she say what was wrong? Did she say..."

"No. But listen; don't sweat it. The Anaheim Flash is swinging into action. If my little scheme works out, you'll be talking to Estelle this afternoon."

"You going to call her? Can I call her?"

"I'm going to set it up. There's no phone in this dome she's supposed to be visiting. But I know a guy up there, in Menlo Park, and he'll fetch her to a phone if I ask him to. Then you guys can hate each other voice to voice, or groove on each other, or whatever weird thing it is you all are trying to get on. What the hell is going on, if I may ask?"

D.R. grinned into the telephone. "I've started a new corporation," he said.

"A what?"
 "A corporation."
 "You're crazy. What are you doing, dealing?"
 "I'm President of Magic Rabbit, Incorporated," D.R. said.
 "You're a vice president, and chief cohort."
 "The hell I am," said the Flash.
 "It's true. I've written you all about it. My truest and grandest
 scheme."
 "Well I'm hot to hear it," said the Flash. "But listen, mah: no
 more letters from me, okay? You got the money, I guess."
 "Got it. And many thanks for it, too."
 "The interest is six per cent," said the Flash.
 "Fair enough," said D.R. "But listen: if you get Estelle and me
 together on the telephone, I'll do better than that. I'll make you a
 full president of Magic Rabbit."
 "Can't beat that," said the Flash. "Hang around that phone,
 now, son. If you don't get a call by tonight some time, call me
 back, okay?"
 "Will do," said D.R.
 When he hung up he ran out of Roxie's house yelling "Yip-see!"

RIP-SNORTER

Okay folks, hold onto your hats. This is Gurney Norman the author speaking, bringing you the end of this folk tale, and it's a rip-snorter. The guy in California that the Anaheim Flash sent to fetch Estelle to the telephone was me. I live here in Menlo Park where the Whole Earth Truck Store is, where Stewart and the production crew are wild in the final stages of the *Last Catalog*, and I'm wild in the final stages of this here tale.

As a matter of fact, I'm so pushed for time I wasn't at all sure I was going to be able to get away from the desk long enough to go up to Troll's and Marilyn's dome on Skyline and find Estelle. But I did, and it all worked out okay.

As the Flash indicated, Estelle was a little down. She'd been pretty blue since she and D.R. split up in Cincinnati; her trip since then had been pretty much of a bummer. She was nervous and jumpy, and half-hostile when she asked me who the hell I was. I said I was a friend of the Anaheim Flash's, and that he'd called and asked me to get her to a telephone so she could call D.R., who was most desperate to hear from her.

Estelle seemed a little suspicious of the whole thing, but she went with me to Skylonda, where there was a phone booth. I loaned her a dime and she went in, and stayed a long time, talking to D.R. I didn't hear what they said, but apparently it was a pretty groovy conversation because she came out all smiles, and announced that she was going to Kentucky.

I asked her how.

She said the fastest way possible.

That means through the air, I said, and off we went to the San Francisco airport, where I bought her a one-way ticket to Cincinnati, and gave her twenty dollars for bus fare from there south into the hills, to Blaine, Kentucky. (All on the assumption, of course, that I'm to be reimbursed in full by our mutual friend and benefactor, the Anaheim Flash).

By the time the passengers were ready to board the plane, Estelle had mellowed toward me some. Just before she started down the loading ramp she gave me this incredible kiss right on the mouth, and I mean to tell you, it was fine. That D.R. is one lucky fellow, as I think he himself must realize by now.

(continued)

Opening the mail, reading aloud, disbursing. Mary, Cappy, John. Most of these photos are by Sam Falk.

Francine, Accounts Receivable

By the time Estelle's plane was east of the Sierras I was back at my desk again, where D.R. was still in raptures from the phone call. He was so stoned out by the whole thing he gave up all attempts at serious work, and spent the afternoon wandering around the homeplace in a daze. He forgot supper entirely. He tried to get into *Stranger In A Strange Land* again, but he couldn't focus on it, so he set it aside and picked up the *I Ching* again.

It was dark by now. D.R. was sitting at the kitchen table, casting the coins by lamplight.

He threw a broken line. A solid line. A broken line. A solid line. Another broken line, and then a final solid line.

Wei Chi/Before Completion

"This hexagram indicates a time when the transition from disorder to order is not yet complete. The change is indeed prepared for, since all the lines in the upper trigram are in relation to those in the lower. However, they are not yet in their places. While the preceding hexagram offers an analogy to autumn, which forms the transition from summer to winter, this hexagram presents a parallel to spring, which leads out of winter's stagnation into the fruitful time of summer. With this hopeful outlook the Book of Changes comes to its close."

And so does *Divine Right's Trip*. D.R. had only one more run to make, to Blaine, in Urge, bright and shining, freshly washed and cleaned-up Urge, to meet Estelle's bus, coming in from Lexington late that night.

THE WEDDING

There are no guarantees, of course. There are no guarantees. But if it could work, If it looks like it's worth the risk, The leap. If there's even a chance for the two of them there, then what D.R. and Estelle will do is have a most marvelous wedding.

One day late in the summer. Or early in the fall. All day long, From morning to night, a celebration. And people they love will come. The Flash will come. He will have to come because he's the presiding minister.

All the way from California, driving his silver Lotus. The Flash in his silver jumpsuit. The Flash with his silver hair. The Flash with his silver eyebrows, and little silver ring in the side of his nose. Silver boots, with pointy silver toes, and silver buttons down the sides. And buttons on his jumpsuit, silver. And silver scarf and silver gloves and sunglasses, on both sides, Silver.

The Flash had his silver helmet with him too, but as he parked the Lotus in front of Godsey's Store he thought: I probably shouldn't overdo this silver bit. So he left the helmet on the seat and clambered out, uncoiling his five foot, four inch frame as Barry Berry came rolling by in his wheelchair.

"My name's Barry Berry," Barry said. "I'm the Anaheim Flash," said the Flash, and he got behind Barry's chair and pushed him up the Trace Fork road behind a band of freaks and weirdos, strewing colored ribbons in the weeds.

"I'm Barry Berry," said Barry as they rolled by. "And this is the Anaheim Flash." "Morning," said J.D. "I'm J.D." And Pam said she was Pam.

Barry shook hands with them every one, Diane and Jerry and Amy and Barbara and Dudley and John and B. Anne and Peter and Laura and Soni and Doug and Terry and Francine and Bernie.

And Shera was filming it all. She'd moved down the road a ways from the party to catch the new arrivals, coming up.

She filmed the Flash and Barry Berry. And Dick Raymond escorting Mrs. Godsey up the road. She filmed them all passing, and then from low in the yard she filmed Angel's band of Oregonians, Ken and Fay and Babbs and Gretch and Hassler and Paula and Zodiac and Sky and some others, decorating the front porch steps as an altar where the bride and groom would stand.

She filmed Reverend Bagby and some men from the church, building a table across the yard.

Fifteen sawhorses, covered with boards, then women spreading sheets as tablecloths, and tacking on red and blue crepe.

She filmed Fred and George and Mike and Evelyn and Steamboat and Stewart, asleep in a people pile, with Lois and Steve and Holly and Lloyd and Sarah trying to wake them up to rap a while as The Captain, an utter freak in purple velvet and long mustache and conductor's hat too small for his shaggy head sneaked up with his tape recorder to catch what the people said.

"Deliverance. Release from tension," said George.

"No shit!" said Fred. "And Neptune and Jupiter are in conjunction in Sagittarius," said Mike.

"Be well," said Stewart. "Hey Mike, I just felt the baby kick," said Evelyn.

"Huh? Oh, the wedding!" said Steamboat. And The Captain recorded it all.

He recorded the Scott boys, Henry and Tommy from Second Creek, making bird sounds with their mouths.

The Captain tuned in on a conversation among some women carrying dishes to the table. One was Marilyn, of Troll and Marilyn, big and beautiful and pregnant, saying "It'll be a natural childbirth. I'm going to have it at home."

"I had all my younguns at home," said Mrs. Thornton. "Tended by a granny-woman. Old Aunt Dicey Pace from Turkey Creek. She's dead now, bless her soul."

And over by the Kool-Aid table Elmer the mailman was rapping with a leather and denim freak from San Diego, who hadn't said what his name was yet.

"I think ginseng is the answer to about half of mankind's problems," the freak said, and Elmer replied, "My daddy picked 'sang for a living, when I was a boy. It's as native to these hills as it is to over yonder in China."

The Captain recorded that.

And he recorded Maybeline Monday from the Organic Sunflower Commune in California, telling Mrs. Jennings of Jennings Branch that she was doing her own weaving now. And making quilts, and canning her own vegetables.

"We live in a commune, on the land, you see. We're opposed to the nuclear family."

"Lord, child," said Mrs. Jennings. "I've been weaving since I was nine years old. And ever quilt in our old house is hand-made. I had thirteen brothers and sisters, and then nine younguns of my own. We all live over yonder on Jennings Branch, you ought to come see us before you leave."

He recorded the musicians warming up.

He recorded the Scott boys, Henry and Tommy from Second Creek, making bird sounds with their mouths.

The Captain tuned in on a conversation among some women carrying dishes to the table. One was Marilyn, of Troll and Marilyn, big and beautiful and pregnant, saying "It'll be a natural childbirth. I'm going to have it at home."

"I had all my younguns at home," said Mrs. Thornton. "Tended by a granny-woman. Old Aunt Dicey Pace from Turkey Creek. She's dead now, bless her soul."

And over by the Kool-Aid table Elmer the mailman was rapping with a leather and denim freak from San Diego, who hadn't said what his name was yet.

Dorothy Thornton with her dulcimer, Cecil and Claudine Turner with guitar and mandolin, and Terry sitting in with his new sitar, leading now as they break into an old Mac Wiseman song called Rainbow In The Valley.

The Captain was getting it all.

Armed with a fresh cassette, he moved to the shady side of the house where Swami High-Time from Santa Cruz, carrying the Book of Tao, was into a heavy theatrical rap with Mrs. Godsey, who as usual held her Bible in her hand.

"A double-minded man is unstable in all his ways," she said. "That's scripture, brother. James one, eight."

The Swami smiled and nodded and turned to chapter twenty one in the Book of Tao.

At last, when all had settled, D.R. and Estelle came through the screen door, across the porch and down the steps to where they were supposed to stand.

D.R. had his leathers on, leather pants and leather shirt, and coonskin cap with tail.

Estelle had her ankle-length gingham on. There were no flowers.

Estelle's bouquet was simply D.R.'s hand in her own.

They stood there together, grinning at the people who grinned at them, waiting for the Flash to begin.

The Flash moves now to the third step up, so he can see over Leonard's head. He has a book with him, and a large brown bag filled with something, which he rests on the step by his foot. The book is the I Ching. He opens it to After Completion and clearing his throat, he reads:

"The transition from the old to the new time is already accomplished. In principle, everything stands systematized, and it is only in regard to details that success is still to be achieved. In respect to this, however, we must be careful to maintain the right attitude. Everything proceeds as if of its own accord, and this can all too easily tempt us to relax and let things take their course without troubling over details. Such indifference is the root of all evil. Symptoms of decay are bound to be the result. Here we have the rule indicating the usual course of history. But this rule is not an inescapable law. He who understands it is in position to avoid its effects by dint of unremitting perseverance and caution."

The Flash closes the book and places it on a step behind him.

Then he calls upon the Reverend Bagby to read the little passage from the Book of Tao.

"The surest test if a man be sane is if he accepts life whole, as it is," says Reverend Bagby.

And then the Flash calls upon Swami High-Time to read from the Book of James.

"A double-minded man is unstable in all his ways," says Swami High-Time.

As he and Reverend Bagby step back into the crowd, the Flash reaches into his pocket and takes out two rings. He hands one each to Leonard and Angel, who in turn hand them to D.R. and Estelle.

They face each other. They hold out their left hands, and simultaneously slip the rings on one another's fingers.

Then they come together in a long and fullsome kiss.

And the Flash says, "As a minister in good standing of the Universal Life Church, I pronounce you guys husband and wife. And I pronounce everybody here at this wedding hereby married to one another."

The Flash reaches into the bag at his feet then, and from it he begins to fling rice out over the gathered people.

"The surest test if a man be sane is if he accepts life whole, as it is," he read.

And just then the Flash appeared.

"Excuse me," he said. "But I happened to overhear that little exchange. And what I'm wondering is, would you folks mind reading those scriptures in the wedding ceremony after while?"

"Wow, man," said the Swami. "Far out!"

But Mrs. Godsey declined.

"Get Brother Bagby to read my part," she said. "I've got to go in the kitchen and help out."

The Captain recorded that, and then tuned into the band again. J.D. had joined it with his

autoharp, and Steamboat with his drums. Two other fellows that no one knew came in with a banjo and flute. Their exotic sound, which they had already dubbed Hillbilly Hindu Rock, lured Chloe and fourteen dancers in tie-dyed leotards out of the house and down the steps, a winding snake of movement through the crowd. They circled around the charcoal pit where Leonard and Doyle and Troll were baking potatoes and barbecuing fifty chickens. They wound around the long, white table where Roxie and Marcella and Mrs. Thornton and Peter and

And people watching began to clap and then to join in.

Shera had to move almost up to the barn to get the whole thing in her lens. Dudley and Barbara had their cameras going too, shooting stills of faces as they came by.

Then Barbara turned to shoot Leonard's face too, and Doyle's, sweating over the charcoal fire.

She shot the Captain as he came over to record Leonard yelling to the Anaheim Flash. "Ten more minutes, Flash! And the chickens'll all be done."

Ten more minutes.

The Flash nodded to Leonard, then nodded to the band, and the music and the dancers slowed down.

Down, down.

It all slowed down.

The people heard the Flash call out, "It's time for the wedding, folks. It's time to gather around."

Gather around.

Gather around the front porch steps where the alter has been arranged.

The best man, Leonard, walked through the crowd to stand at the side of Angel the maid of honor.

When the Flash came down the steps to join them, the scene became quiet and still.

Doug and Soni and Diane were

setting out bowls of beans and corn and pickled beets and kraut and casseroles and pies and cakes and puddings and plates of biscuits and cornbread with jams and jellies, fruit-jello and salads. The dancers writhed and turned as they moved through the crowd toward some square dancers Wheeler had formed. The rising tempo of the music whirled the dancers around and around and around and around, all in one big circle now.

Who is nothing Hear that!
Meaning:
The stars sing
Because it's always all right!
So far you've
Not been near except when
You didn't know. Night's day
Was everywhere. No one is
Ever separated from every other
For then the world would die.

And the world does not die!
O Glory, Glory of the Light!

We live one life. Message ends

Kenneth Patchen

We can't put it together.

It is together.
