

The Last Whole Earth Catalog

access to tools

\$5

*Evening.
Thanks again.*

*"The flow of energy
through a system
acts to organize
that system."*

FUNCTION

The WHOLE EARTH CATALOG functions as an evaluation and access device. With it, the user should know better what is worth getting and where and how to do the getting.

An item is listed in the CATALOG if it is deemed:

- 1) Useful as a tool,*
- 2) Relevant to independent education,*
- 3) High quality or low cost,*
- 4) Easily available by mail.*

CATALOG listings are continually revised according to the experience and suggestions of CATALOG users and staff.

PURPOSE

We are as gods and might as well get good at it. So far remotely done power and glory—as via government, big business, formal education, church—has succeeded to point where gross defects obscure actual gains. In response to this dilemma and to these gains a realm of intimate, personal power is developing—power of the individual to conduct his own education, find his own inspiration, shape his own environment, and share his adventure with whoever is interested. Tools that aid this process are sought and promoted by the WHOLE EARTH CATALOG.

Index on p. 442

FRONT COVER

Taken November 9, 1967, from NASA's Apollo 4 at a distance of 9850 nautical miles. This is probably the first American photograph of the "whole Earth." You're looking west over the Atlantic Ocean, with the Antarctic Continent just visible at the bottom of the crescent. The picture was released in 1967, but no one seemed to care about noticing it or publishing it. I think it was the shadow, which frightened people. There are no shadows on our maps.

INSIDE FRONT COVER

*The famous Apollo 8 picture of Earthrise over the Moon that established our planetary facthood and beauty and rareness (dry moon, barren space) and began to bend human consciousness. The quote is from *Energy Flow in Biology*, by Harold Morowitz, \$9.50 from Academic Press, 111 Fifth Avenue, New York, N.Y. 10003.*

INSIDE BACK COVER

*The photograph, courtesy Lick Observatory, shows the M-31 Andromeda Galaxy, which is considered similar to our own in structure and size. Where the thought-balloon originates is approximately the location of Earth in this galaxy. The quote is from p.464 of the extraordinary *Collected Poems of Kenneth Patchen*, 1967, 504 pp., \$3.95 from New Directions, J.B. Lippincott Co., East Washington Square, Philadelphia, PA. 19105.*

BACK COVER

This is the back cover that was on our first CATALOG, the Fall 1968 issue, which was 64 pages and cost \$5. As most of our color covers, it was designed with Peter Bailey. The photo, the first full-Earth picture, is from the noon part of a day-long high resolution color TV film shot from an ATS satellite in November 1967. To NASA our thanks.

CATALOG Procedure

The evaluations in this CATALOG were made in April-May 1971, after three years of sifting. They are not updated with subsequent printings.

Also, where there are excerpted items from catalogs we're reviewing, those items and prices are not updated from the 1971 originals.

Note. This really is the LAST CATALOG. Please don't send us your suggestions for new items and comments on old ones (except for revisions of access information). Let us R.I.P. Write to one of our kindred publications (see pp. 239-244). Or start your own catalog.

Format

We used to be two publications, the CATALOG, and the Supplement. The CATALOG was formal and responsible; the Supplement wasn't. In this LAST CATALOG they are mixed. Usually material from the Supplements has a Light heading, whereas formal CATALOG items have a Bold heading. Both are indexed in the back. About 1/3 of the material in this LAST CATALOG is new.

Each page number has a heading indicating the section it's in, such as Whole Systems, and a heading indicating the general contents of that page, such as Funky Future.

Blackwell's Books

Many books carried in the CATALOG are substantially cheaper in the British edition. You can order them from Blackwell's.

Blackwell's Bookstore in Oxford, England, is a service which the Catalog should list. Their collection is probably the world's most comprehensive and they run a global service, providing lengthy, free, separate catalogs on about 25 subject areas, including children's books, books in other languages, science, literature, philosophy, religion, mathematics, etc. Their prices are significantly lower and they will not send a book which can be obtained more cheaply in America unless you so request. They will open an account for you, accept your personal check, and bill you semi-annually. They also buy up old libraries (occasionally famous ones, recently John Masefield's) and issue catalogs on second-hand books and first editions. They have a cable code BOOKS OXFORD and a code system for some catalogs which enables you to place an order with a minimum of cost in a hurry. The books arrive slowly but the catalogs keep coming in all year long and are a great delight themselves.

[Suggested and Reviewed by Larry Schwartz]

Catalog free from:

BLACKWELL'S Broad Street, Oxford, England

METHODS OF PAYMENT

Orders and correspondence should, in every case, be sent direct to Oxford. The following addresses are for remittances only.

U.S.A. and American Account Area: by personal check in dollars (£1=\$2.40) sent to Blackwell's in Oxford; or to B.H. Blackwell, Ltd., P.O. Box 1452, Church Street Station, New York, New York 10008 (for their account with the Bankers Trust Co.).

Canada: by personal cheque in Canadian dollars (£=\$2.61) sent to Blackwell's, or to The Canadian Imperial Bank of Commerce, P.O. Box 6003, Montreal 3, P.Q., or by Bank Draft in sterling, or by Canadian Postal Money Order.

Prices given for Blackwell's in the Whole Earth Catalog do not include shipping.

The review is a bit out of date. Blackwell's now bills monthly, and they get upset if you don't pay them reasonably promptly; gone are the days where you could have their books for six months or so before even thinking about paying for them. One of the most useful Blackwell's catalogues isn't mentioned. This is New and Forthcoming Books in all subjects, and it comes twice a year. It's a good way to keep up with what's happening.

Another central point about Blackwell's is that they will order for you books published anywhere in the world. This includes printed music, and a substantial savings can be the result, since most of the European music dealers (as well, for that matter, as a good many book publishers) have sole American distributors; the European houses will not accept direct orders from Americans — but they will accept orders from Blackwell's. Recorder music which would cost \$10 at any music store in New York City costs about \$3 when ordered from England, if the stuff is foreign-published.

Divine Right's Trip

Our Story thus far

by Gurney Norman

This original folk-tale will be found proceeding episodically along the right-hand pages (lower-right corner) in this type face, making the CATALOG what it has longed to be, a work of drama. The Perils of D.R. Tune in next page.

Starts on p. 9.

Suggesting and Reviewing

We are a bunch of amateurs. Our reviewers — seldom experts, never critics — got \$10 and credit for their review. Suggestors got only credit until Fall 1970, then \$10.

Our policy with suppliers has been:

Suppliers (manufacturers, creators, etc.) may not buy their way into the CATALOG. Free samples, etc., are cheerfully accepted by CATALOG researchers; response not predictable. No payment for listing is asked or accepted. We owe accurate information exchange to suppliers, but not favors.

Our obligation is to CATALOG users and to ourselves to be good tools for one another.

The judgments in the reviews are wholly sincere. They are also only partially informed, often biased, very often wishful, occasionally a temporary enthusiasm. Many are simply hasty. I wouldn't rely on them too far. Try to see through them.

On Getting Stuff

As Dan Schiller suggested in *Popular Photography*, the CATALOG will bankrupt you if you can't distinguish between what you need and what you wish you needed.

Start extravagant, and you'll never finish. Get the cheap tool first, see if it feeds your life. If it does, then get a better one. Once you use it all the time, get the best. You can only grow into quality. You can't buy it.

Most of the stuff in the CATALOG can be borrowed free from a library.

This issue

of the CATALOG is the last. We encourage others to initiate similar services to fill the vacuum in the economy we stumbled into and are stepping out of. We don't see how using our name or copy can aid originality, so they're not available, for love or money. Ideas we've had and evaluations we've made are free for recycling.

Preparation of the CATALOG was done on an IBM Selectric Composer and Polaroid MP-3 Camera.

Printing and binding by:
Nowels Publications, Menlo Park, California
Deven Lithographers, Inc., Long Island City, New York
Craftsmen Press, Inc., Bladensburg, Maryland

6th Printing October 1971—160,000—Deven

Index on p. 442

Ordering from the CATALOG

- Address orders to the supplier given with the item. (Or shop locally.)
- If the price listed is not postpaid consult post office or express agency for cost of shipping from supplier's location to yours. Or have the item sent postage C.O.D.
- Add state sales tax if transaction is within your state. (California sales tax is 5%.) You don't have to do this for periodicals.
- Send check or money order.

If the item says or WHOLE EARTH CATALOG, you can get it by mail from us:

WHOLE EARTH CATALOG
558 Santa Cruz Ave.
Menlo Park, CA 94025

There is usually no price difference; the CATALOG gets the markup (10-40%) instead of the other guy, is all. Our service is fairly fast, especially for west coast. Generally, the closer a supplier is to you, the quicker and cheaper the shipping will be. If you're ordering from overseas, surface mail takes about two months, airmail just a couple days.

Sense and Patience

Be gentle. Sometimes we carry very small companies. They often have a hard time coping with the volume of inquiries they receive as a result of their unrequested listing in the CATALOG. Especially when most of the requests for literature seem to be just curiosity. That kind of thing can break a small company. So don't write just to keep your mail box full.

—Fred Richardson

Current Information

Bear in mind there's an inflation on. Prices are subject to rise without notice. Prices, addresses, suppliers — what we call access information — are as current as the most recent printing date (see bottom of this page).

Understanding Whole Systems

Buckminster Fuller

The insights of Buckminster Fuller initiated this catalog. Among his books listed here, *Utopia or Oblivion* is now probably the most direct introduction. It's a collection of his talks and papers from 1964 to 1967, at a bargain price. An *Operating Manual for Spaceship Earth* is his most recent, and succinct, statement. *Nine Chains to the Moon* is early, and openly metaphysical. The *Untitled Epic of Industrialization* is lyrical and strong. *Ideas and Integrities* is his most autobiographical, and perhaps the most self-contained of his books. No *More Secondhand God* is the most generalized, leading into the geometry of thought.

People who beef about Fuller mainly complain about his repetition—the same ideas again and again, it's embarrassing, also illuminating, because the same notions take on different contexts. Fuller's lectures have a raga quality of rich nonlinear endless improvisation full of convergent surprises.

Some are put off by his language, which makes demands on your head like suddenly discovering an extra engine in your car—if you don't let it drive you faster, it'll drag you. Fuller won't wait. He spent two years silent after illusory language got him in trouble, and he returned to human communication with a redesigned instrument.

| 1. Synergetics | 7. Communications |
| 2. General systems theory | 8. Meteorology |
| 3. Theory of games (Von Neumann) | 9. Geology |
| 4. Chemistry and physics | 10. Biology |
| 5. Topology, projective geometry | 11. Sciences of energy |
| 6. Cybernetics | 12. Political geography |
| | 13. Ergonomics |
| | 14. Production engineering |

Here on Southern Illinois' campus we are going to set up a great computer program. We are going to introduce the many variables now known to be operative in economics. We will store all the basic data in the machines memory bank; where and how much of each class of the physical resources; where are the people, what are the trends—all kinds of trendings of world man?

Next we are going to set up a computer feeding game, called "How Do We Make the World Work?" We will start playing relatively soon. We will bring people from all over the world to play it. There will be competitive teams from all around earth to test their theories on how to make the world work. If a team resorts to political pressures to accelerate their advantages and is not able to wait for the going gestation rates to validate their theory they are apt to be in trouble. When you get into politics you are very liable to get into war. War is the ultimate tool of politics. If war develops the side inducing it loses the game.

I was born cross-eyed. Not until I was four years old was it discovered that this was caused by my being abnormally farsighted. My vision was thereafter fully corrected with lenses. Until four I could see only large patterns, houses, trees, outlines of people with blurred coloring. While I saw two dark areas on human faces, I did not see a human eye or a teardrop or a human hair until I was four. Despite my new ability to apprehend details, my childhood's spontaneous dependence only upon big pattern clues has persisted. . . .

I am convinced that neither I nor any other human, past or present, was or is a genius. I am convinced that what I have every physically normal child also has at birth. We could, of course, hypothesize that all babies are born geniuses and get swiftly de-geniused. Unfavorable circumstances, shortsightedness, frayed nervous systems, and ignorantly articulated love and fear of elders tend to shut off many of the child's brain capability valves. I was lucky in avoiding too many disconnects.

There is luck in everything. My luck is that I was born cross-eyed, was ejected so frequently from the establishment that I was finally forced either to perish or to employ some of those faculties with which we are all endowed—the use of which circumstances had previously so frustrated as to have to put them in the deep freezer, whence only hellishly hot situations could provide enough heat to melt them back into usability.

or WHOLE EARTH CATALOG

To comprehend this total scheme we note that long ago a man went through the woods, as you may have done, and I certainly have, trying to find the shortest way through the woods in a given direction. He found trees fall across his path. He climbed over those crisscrossed trees and suddenly found himself poised on a tree that was slowly teetering. It happened to be lying across another great tree, and the other end of the tree on which he found himself teetering lay under a third great fallen tree. As he teetered he saw the third big tree lifting. It seemed impossible to him. He went over and tried using his own muscles to lift that great tree. He couldn't budge it. Then he climbed back atop the first smaller tree, purposefully teetering it, and surely enough it again elevated the larger tree. I'm certain that the first man who found such a tree thought that it was a magic tree, and may have dragged it home and erected it as man's first totem. It was probably a long time before he learned that any stout tree would do, and thus extracted the concept of the generalized principle of leverage out of all his earlier successive special-case experiences with such accidental discoveries.

To begin our position-fixing aboard our Spaceship Earth we must first acknowledge that the abundance of immediately consumable, obviously desirable or utterly essential resources have been sufficient until now to allow us to carry on despite our ignorance. Being eventually exhaustible and spoilsable, they have been adequate only up to this critical moment. This cushion-for-error of humanity's survival and growth up to now was apparently provided just as a bird inside of the egg is provided with liquid nutriment to develop it to a certain point. But then by design the nutriment is exhausted at just the time when the chick is large enough to be able to locomote on its own legs. And so as the chick pecks at the shell seeking more nutriment it inadvertently breaks open the shell.

A new, physically uncomprised, metaphysical initiative of unbiased integrity could unify the world. It could and probably will be provided by the utterly impersonal problem solutions of the computers.

Heisenberg's principle of 'indeterminism' which recognized the experimental discovery that the act of measuring always alters that which was being measured turns experience into a continuous and never-repeatable evolutionary scenario.

The gold supply is so negligible as to make it pure voodoo to attempt to valve the world's economic evolution traffic through the gold-sized needle's 'eye'.

Brain deals exclusively with the physical, and mind exclusively with the metaphysical. Wealth is the progressive mastery of matter by mind . . .

Stepping forth from its initial sanctuary, the young bird must now forage on its own legs and wings to discover the next phase of its regenerative sustenance.

Nine Chains to the Moon
Buckminster Fuller
1938, 1963; 375 pp.

Unavailable until 1972

Since Yogi is a personalized art, the art dies with the person. The abstract power involved remains as real and true, always, but it cannot be made utilizable in increasing continuity for the world in general. Christ and his counterparts realized this and were unique in their refusal to apply this power to self ends. It was this personal limitation of the Yogi art which led the prosaic philosophers to search further. They sought a means of limitless articulation.

This phantom captain has neither weight nor sensorial tangibility, as has often been scientifically proven by careful weighing operations at the moment of abandonment of the ship by the phantom captain, i.e., at the instant of "death". He may be likened to the variant of polarity dominance in our bipolar electric world which, when balanced and unit, vanishes as abstract unity 1 or 0. With the phantom captain's departure, the mechanism becomes inoperative and very quickly disintegrates into basic chemical elements.

An illuminating rationalization indicated that *captains*—being phantom, abstract, infinite, and bound to other captains by a bond of understanding as proven by their recognition of each other's signals and the meaning thereof by reference to a common direction (toward "perfect")—are not only all related, but are one and the same *captain*. Mathematically, since characteristics of unity exist, they cannot be non-identical.

'Still further—over the microphone STEPPED-UP electrically this music enters a super-or-sub-sensorial wave-length frequency that makes it broadcastable, apparently BACK INTO THE UNIVERSE AGAIN, the full LATENT broadcast of which men on ships at sea, an aviator in the air, or Julia Murphy in a city hovel, or the farmer's wife, can tune in upon, without any personal-equation dissonance by unwanted diverting human beings in their presence, and so hear the music of the universe that Bach heard years ago.

'Here is IMMORTALITY!'

'Darling,'—that radiant flash of infinite understanding had flashed between Jonesie and the X-ian—"I can understand those houses all right.'

However, man unconcernedly sorting mail on an express train, with unuttered faith that the engineer is competent, that the switchmen are not asleep, that the track walkers are doing their job, that the technologists who designed the train and the rails knew their stuff, that the thousands of others whom he may never know by face or name are collecting tariffs, paying for repairs, and so handling assets that he will be paid a week from today and again the week after that, and that all the time his family is safe and in well being without his personal protection constitutes a whole new era of evolution—the first really "new" since the beginning of the spoken word. In fact, out of the *understanding* innate in the spoken word was Industrialization wrought after milleniums of seemingly whitherless spade work.

Standing by the lake on a jump-or-think basis, the very first spontaneous question coming to mind was, "If you put aside everything you've ever been asked to believe and have recourse only to your own experiences do you have any conviction arising from those experiences which either discards or must assume an *a priori* greater intellect than the intellect of man?" The answer was swift and positive. Experience had clearly demonstrated an *a priori* anticipatory and only intellectually apprehendable orderliness of interactive principles operating in the universe into which we are born. These principles are discovered but are never invented by man. I said to myself, "I have faith in the integrity of the anticipatory intellectual wisdom which we may call 'God.'" My next question was, "Do I know best or does God know best whether I may be of any value to the integrity of universe?" The answer was, "You don't know and no man knows, but the faith you have just established out of experience imposes recognition of the *a priori* wisdom of the fact of your being." Apparently addressing myself, I said, "You do not have the right to eliminate yourself, you do not belong to you. You belong to the universe. The significance of you will forever remain obscure to you, but you may assume that you are fulfilling your significance if you apply yourself to converting all your experience to highest advantage of others. You and all men are here for the sake of other men."

I define "synergy" as follows: Synergy is the unique behavior of whole systems, unpredicted by behavior of their respective sub-systems' events.

Buckminster Fuller on Hippy Hill, San Francisco, 1968.

Thinking is a putting-aside, rather than a putting-in discipline, e.g., putting aside the tall grasses in order to isolate the trail into informative viewability. Thinking is FM—frequency modulation—for its results in tuning-out of irrelevancies as a result of definitive resolution of the exclusively tuned-in or accepted feed-back messages' pattern differentiability.

I see God in the instruments and the mechanisms that work reliably, more reliably than the limited sensory departments of the human mechanism.

And God says observe the paradox of man's creative potentials and his destructive tactics He could have his new world through sufficient love for "all's fair" in love as well as in war which means you can junk as much rubbish, skip as many stupid agreements by love, spontaneous unselfishness radiant.

The revolution has come— set on fire from the top. Let it burn swiftly. Neither the branches, trunk, nor roots will be endangered. Only last year's leaves and the parasite-bearded moss and orchids will not be there when the next spring brings fresh growth and free standing flowers.

Here is God's purpose— for God, to me, it seems, is a verb, not a noun, proper or improper; is the articulation not the art, objective or subjective; is loving, not the abstraction "love" commanded or entreated; is knowledge dynamic, not legislative code, not proclamation law, not academic dogma, not ecclesiastic canon.

Yes, God is a verb, the most active, connoting the vast harmonic reordering of the universe from unleashed chaos of energy.

And there is born unheralded a great natural peace, not out of exclusive pseudo-static security but out of including, refining, dynamic balancing. Naught is lost. Only the false and nonexistent are dispelled.

And I've thought through to tomorrow which is also today. The telephone rings and you say to me Hello Bucking this is Christopher; or Daddy it's Allegra; or Mr. Fuller this is the Telephone Company Business Office; and I say you are inaccurate. Because I knew you were going to call and furthermore I recognize that it is God who is "speaking."

And you say aren't you being fantastic? And knowing you I say no.

All organized religions of the past were inherently developed as beliefs and credits in "second hand" information.

Therefore it will be an entirely new era when man finds himself confronted with direct experience with an obviously a priori intellectually anticipatory competence that has interordered all that he is discovering.

World Resources Inventory
P.O. Box 909
Carbondale, Illinois 62901

In the 1920's with but little open country highway mileage in operation, automobile accidents were concentrated and frequently occurred within our urban and suburban presence. Witnessing a number of accidents, I observed that warning signs later grew up along the roads leading to danger points and that more traffic and motorcycle police were put on duty. The authorities tried to cure the malady by reforming the motorists. A relatively few special individual drivers with much experience, steady temperament, good coordination and natural tendency to anticipate and understand the psychology of others emerged as "good" and approximately accident-free drivers. Many others were accident prone.

In lieu of the after-the-fact curative reform, trending to highly specialized individual offender case histories, my philosophy urged the anticipatory avoidance of the accident potentials through invention of generalized highway dividers, grade separators, clover leafing and adequately banked curves and automatic traffic control stop-lighting systems. I saw no reason why the problem shouldn't be solved by preventative design rather than attempted reforms. My resolve: Reshape environment; don't try to reshape man.

[WSDS Document 1]

Tension and Compression are complementary functions of structure. Therefore as functions they only co-exist. When pulling a tensional rope its girth contracts in compression. When we load a column in compression its girth tends to expand in tension. When we investigate tension and compression, we find that compression members, as you all know as architects, have very limited lengths in relation to their cross sections. They get too long and too slender and will readily break. Tension members, when you pull them, tend to pull, approximately, (almost but never entirely), straight instead of trying to curve more and more as do too thin compressionally loaded columns. The contraction of the tension members in their girth, when tensionally loaded, brings its atoms closer together which makes it even stronger. There is no limit ratio of cross section to length in tensional members of structural systems. There is a fundamental limit ratio in compression. Therefore when nature has very large tasks to do, such as cohering the solar system or the universe she arranges her structural systems both in the microcosm and macrocosm in the following manner. Nature has compression operating in little remotely positioned islands, as high energy concentrations, such as the earth and other planets, in the macrocosm; or as islanded electrons, or protons or other atomic nuclear components in the microcosm while cohering the whole universal system, both macro and micro, of mutually remote, compressional, and oft non-simultaneous, islands by comprehensive tension; —compression islands in a non-simultaneous universe of tension. The Universe is a tensegrity.

RELATIONSHIP OF MAN TO ELECTROMAGNETIC SPECTRUM

To start off with it is demonstrated in the array of events which we have touched on that we don't have to "earn a living" anymore. The "living" has all been earned for us forever. Industrialization's wealth is cumulative in contradistinction to the inherently terminal, discontinuous, temporary wealth of the craft eras of civilization such as the Bronze Age or Stone Age. If we only understood how that cumulative industrial wealth has come about, we could stop playing obsolete games, but that is a task that cannot be accomplished by political and social reforms. Man is so deeply conditioned in his reflexes by his milleniums of slave functioning that he has too many inferiority complexes to yield to political reformation. The obsolete games will be abandoned only when realistic, happier and more interesting games come along to displace the obsolete games.

[WSDS Document 3]

World society has throughout its millions of years on earth made its judgements upon visible, tangible, sensorially demonstrable criteria. We may safely say that the world is keeping its eye on the unimportant visible 1 percent of the historical transformation while missing the significance of the 99 percent of overall, unseen changes. Forms are inherently visible and forms no longer can "follow functions" because the significant functions are invisible. . . .

[WSDS Document 4]

beware of whole systemitis.
 its the loneliness awareness.
 imagine you are a near sighted, bucktoothed, kid, doing
 sunflower seeds,
 and somebody comes along and puts eyeglasses on you,
 holds up a mirror,
 then takes you out on a hilltop at night,
 points up at the little winks out there,
 and tells you they aren't really little winks at all,
 but great big flashes,
 a long way away,
 then asks you if you want some more sunflower seeds.
 you want to throw away the eyeglasses, but it is too late,
 you are stuck,
 you've seen it,
 you are little,
 alone,
 puny,
 except
 except for a few soft flannel thoughts,
 and a belief that there are others like you,
 brothers like you,
 and that a sunflower seed
 is a whole system too.

The Hubble Atlas of Galaxies

This book is a series of superb photographs which is the definition of Edwin Hubble's classification of galaxies. Galaxies come in a variety of shapes from round blurry ones through the familiar spiral in Andromeda to fantastic blazing pinwheels like M101.

Hubble has lined them up in a sequence according to shape. The meaning of this sequence has not yet been determined. It may indicate a series of stages in the life of one galaxy which progresses from blurred youngsters to majestic spiral or vice versa. More likely vice versa, since the spirals contain hot young blue stars which we know will burn out in a few million years or so, while the blurry ones contain many ancient red giants. It is also possible that the sequence is not an age sequence at all, but merely reflects conditions at that place in the universe when that galaxy was formed.

But besides being a tool for scientists, this book is like a guided tour through our own miraculous universe. When this planet gets you down, leaf through the Atlas and feast your spirit on galaxy after galaxy, as beautiful and varied as snow flakes. Some galaxies are so far away that the graininess of the photograph shows in the blow up. Some photographs show small blurred objects in the background which one suddenly realizes are more galaxies.

Star Maker

A man's consciousness unwillingly departs his body and his planet. Once in space he accomplishes willed travel in search of Star Maker. His journey takes him into the minds of other planetary beings; a company of these travel together and witness countless civilizations; eventually they participate in a combined consciousness of worlds that in time embraces the stars as well; this leads to galactic and cosmic consciousness and the culminating encounter with Star Maker.

Jordan Belson, who I trust in these matters, asserts that it is a true vision, that Stapledon's whole life pointed at attaining it, and that the book will be used and discussed for centuries.

This Dover edition includes an earlier Stapledon story, "Last and First Men".

-SB

The sheer beauty of our planet surprised me. It was a huge pearl, set in spangled ebony. It was nacrous, it was an opal. No, it was far more lovely than any jewel. Its patterned colouring was more subtle, more ethereal. It displayed the delicacy and brilliance, the intricacy and harmony of a live thing. Strange that in my remoteness I seemed to feel, as never before, the vital presence of Earth as of a creature alive but tranced and obscurely yearning to wake.

The sport of disembodied flight among the stars must surely be the most exhilarating of all athletic exercises. It was not without danger; but its danger, as we soon discovered, was psychological, not physical. In our bodiless state, collision with celestial objects mattered little. Sometimes, in the early stages of our adventure, we plunged by accident headlong into a star. Its interior would, of course, be inconceivably hot, but we experienced merely brilliance.

The psychological dangers of the sport were grave. We soon discovered that disheartenment, mental fatigue, fear, all tended to reduce our powers of movement. More than once we found ourselves immobile in space, like a derelict ship on the ocean; and such was the fear roused by this plight that there was no possibility of moving till, having experienced the whole gamut of despair, we passed through indifference and on into philosophic calm.

Though the pronoun "I" now applied to us all collectively, the pronoun "we" also applied to us. In one respect, namely unity of consciousness, we were indeed a single experiencing individual; yet at the same time we were in a very important and delightful manner distinct from one another.

With unreasoning passion we strove constantly to peer behind each minute particular event in the cosmos to see the very features of that infinity which, for lack of a truer name, we had called the Star Maker. But, peer as we might, we found nothing. Though in the whole and in each particular thing the dread presence indubitably confronted us, its very infinity prevented us from assigning to it any features whatever.

"When the cosmos wakes, if ever she does, she will find herself not the single beloved of her maker, but merely a little bubble adrift on the boundless and bottomless ocean of being."

Almost certainly, the star's whole physical behaviour is normally experienced as a blissful, an ecstatic, an ever successful pursuit of formal beauty. This the minded worlds were able to discover through their own most formalistic aesthetic experience. In fact it was through this experience that they first made contact with stellar mind.

We, or rather I, now experienced the slow drift of the galaxies much as a man feels the swing of his own limbs. From my score of viewpoints I observed the great snowstorm of many million galaxies, streaming and circling, and ever withdrawing farther apart from one another with the relentless "expansion" of space. But though the vastness of space was increasing in relation to the size of galaxies and stars and worlds, to me, with my composite, scattered body, space seemed no bigger than a great vaulted hall.

From all the coincident and punctual centres of power, light leapt and blazed. The cosmos exploded, actualizing its potentiality of space and time. The centres of power, like fragments of a bursting bomb, were hurled apart. But each one retained in itself, as a memory and a longing, the single spirit of the whole; and each mirrored in itself aspects of all others throughout all the cosmical space and time.

I said, "It is enough, and far more than enough, to be the creature of so dread and lovely a spirit, whose potency is infinite, whose nature passes the comprehension even of a minded cosmos. It is enough to have been created, to have embodied for a moment the infinite and tumultuously creative spirit. It is infinitely more than enough to have been used, to have been the rough sketch for some perfected creation."

Below is a contour map of the centimetric emission of the Sun.

The Lagoon Nebula, M8 Sagittarii, is a typical emission nebula, 4850 light-years away. The "lagoon" is produced by the foreground dust-clouds. It is thought that the star producing the H-II region is of type O, and is so deeply embedded in the nebula that it cannot be observed. Globules have been detected, indicating that star formation is in process. The Lagoon is a dense nebula; there are 10^3 to 10^4 atoms per cubic centimeter in the central region—even though this density still corresponds to what we would normally term a laboratory vacuum.

Landing of Apollo 12 (above)

The lunar module Intrepid is seen descending toward the Oceanus Procellarum (19 November 1969). This photograph was taken from the command module. After Intrepid had returned to orbit, and had been abandoned, it was deliberately crashed on to the Moon setting up crustal vibrations which lasted for almost one hour.

The Galaxy below

The Galaxy, seen edge-on. The Sun is 30,000 light-years from the center of the system. The direction of the center is toward the rich star-clouds in the constellation of Sagittarius, but it cannot be seen through the obscuring intervening matter.

The Unexpected Universe

Loren Eiseley celebrates our grandest ignorances, the places in human experience where if you stare into them, the void stares back. City dumps; the open end of evolution; the unexplored continent in your mind; stars; a Pharaoh's dead gesture; edges of oceans. Strong useful prose from an old guy who knows something clear and bleak about regeneration.

In the end the sea rejects its offspring. They cannot fight their way home through the surf which casts them repeatedly back upon the shore. The tiny breathing pores of starfish are stuffed with sand. The rising sun shrivels the mucilaginous bodies of the unprotected. The seabeach and its endless war are soundless. Nothing screams but the gulls. . . .

. . . The sun behind me was pressing upward at the horizon's rim—an ominous red glare amidst the tumbling blackness of the clouds. Ahead of me, over the projecting point, a gigantic rainbow of incredible perfection had sprung shimmering into existence. Somewhere toward its foot I discerned a human figure standing, as it seemed to me, within the rainbow, though unconscious of his position. He was gazing fixedly at something in the sand.

Eventually he stooped and flung the object beyond the breaking surf. I labored toward him over a half mile of uncertain footing. By the time I reached him the rainbow had receded ahead of us, but something of its color still ran hastily in many changing lights across his features. He was starting to kneel again.

In a pool of sand and silt a starfish had thrust its arms up stiffly and was holding its body away from the stifling mud.

"It's still alive," I ventured.

"Yes," he said, and with a quick yet gentle movement he picked up the star and spun it over my head and far out into the sea. It sank in a burst of spume, and the waters roared once more.

"It may live," he said, "if the offshore pull is strong enough." He spoke gently, and across his bronzed worn face the light still came and went in subtly altering colors.

"There are not many come this far," I said, groping in a sudden embarrassment for words. "Do you collect?"

"Only like this," he said softly, gesturing amidst the wreckage of the shore. "And only for the living." He stooped again, oblivious of my curiosity, and skipped another star neatly across the water.

"The stars," he said, "throw well. One can help them"

. . . It is as if at our backs, masked and demonic, moved the trickster as I have seen his role performed among the remnant of a savage people long ago. It was that of the jokester present at the most devout of ceremonies. This creature never laughed; he never made a sound. Painted in black, he followed silently behind the officiating priest, mimicking, with the added flourish of a little whip, the gestures of the devout one. His timed and stylized posturings conveyed a derision infinitely more formidable than actual laughter. . . .

We had been safe in the enchanted forest only because of our weakness. When the powers of that gloomy region were given to us, immediately, as in a witch's house, things began to fly about unbidden. The tools, if not science itself, were linked intangibly to the subconscious poltergeist aspect of man's nature. The closer man and the natural world drew together, the more erratic became the behavior of each. Huge shadows leaped triumphantly after every blinding illumination. It was a magnified but clearly recognizable version of the black trickster's antics behind the solemn backs of the priesthood. Here, there was one difference. The shadows had passed out of all human semblance; no societal ritual safely contained their posturings, as in the warning dance of the trickster. Instead, unseen by many because it was so giganically real, the multiplied darkness threatened to submerge the carriers of the light.

. . . Out of the depths of a seemingly empty universe had grown an eye, like the eye in my room, but an eye on a vastly larger scale. It looked out upon what I can only call itself. It searched the skies and it searched the depths of being. In the shape of man it had ascended like a vaporous emanation from the depths of night. The nothing had miraculously gazed upon the nothing and was not content. It was an intrusion into, or a projection out of, nature for which no precedent existed. The act was, in short, an assertion of value arisen from the domain of absolute zero. A little whirlwind of commingling molecules had succeeded in confronting its own universe.

Here, at last, was the rift that lay beyond Darwin's tangled bank. . . .

I picked up a star whose tube feet ventured timidly among my fingers while, like a true star, it cried soundlessly for life. I saw it with an unaccustomed clarity and cast far out. With it, I flung myself as forfeit, for the first time, into some unknown dimension of existence.

Around me in the gloom dark shapes worked ceaselessly at the dampened fires. My eyes were growing accustomed to their light.

"We get it all," the dump philosopher repeated. "Just give it time to travel, we get it all."

Men, unknowingly, and whether for good or ill, appear to be making their last decisions about human destiny. To pursue the biological analogy, it is as though, instead of many adaptive organisms, a single gigantic animal embodied the only organic future of the world.

Every time we walk along a beach some ancient urge disturbs us so that we find ourselves shedding shoes and garments, or scavenging among seaweed and whitened timbers like the homesick refugees of a long war.

It was the failures who had always won, but by the time they won they had come to be called successes. This is the final paradox, which men call evolution.

The Character of Physical Law

If you look larger or smaller than the skinny realm of life, all you see is physics. It is our substratum and superstratum. These famous Feynman lectures introduce the subject as no other book has.

Water pulled partly away from Earth by moon

Earth pulled partly away from waters by moon

Actual situation

The water at y is closer to the moon and the water at x is farther from the moon than the rigid earth. The water is pulled more towards the moon at y, and at x is less towards the moon than the earth, so there is a combination of those two pictures that makes a double tide.

We do not realize what we have on Earth until we leave it.—JAMES M. LOVELL

Figure 16 An infrared photo of the Gulf coast showing two plumes of smoke from forest fires December 7, 1965

from *Ecological Survey From Space*

From an astronaut's vantage point, one can gaze down into the tremendously deep chasms of the Hindu Kush range in the Himalayas. The sky above the white crowns of snow on the peaks was clear when this photo was taken, but clouds filled the valleys. Temperatures as well as altitudes vary widely in this part of the world. When the morning Sun warms the highlands, fierce cold winds rush down the mountain sides to increase the rigors that men must endure to climb them.

NASA Earth Photo Books

You're too close. Back off and survey the big picture and old mysteries will clear up for you, and other mysteries will arrive (what is that enormous gyre in the Salton Sea?).

The earliest of the NASA color photo books, *Earth Photographs from Gemini III, IV, and V*, and *Earth Photographs from Gemini VI through XII*, are the purest, least edited and evaluated. Hundreds of full page color photos of North Africa, the Himalayas, New Mexico, ocean cold fronts. If they were Sierra Club books, and they could be, they would cost \$25 each. They cost \$7 and \$8.

Exploring Space With a Camera takes you up through *Apollo 7*, with good putting-it-all together text. *Ecological Surveys From Space*, still plenty beautiful, gets into big picture grit of how and where our systems affect each other. Invaluable information, which we're still learning how to interpret. *This Island Earth*. The most recent NASA book photographically places Earth in the Solar System.

Among the discoveries in these books is that this lovely place is scarcely inhabited, and scarcely inhabitable.

In November 1967 an ATS satellite whose funds phenomenally had not been cut made a home movie. It was a time lapse film of the Earth rotating, shot from 23,000 miles above South America. (This is synchronous distance. The satellite orbits at the same speed the Earth turns, so it remains apparently stationary over one point of the equator.) Color photographs of the Earth were transmitted by TV every 1/2 hour to make up a 24 hour sequence. The shots were lap dissolved together to make the movie. You see darkness, then a crescent of dawn, then advancing daylight and immense weather patterns whorling and creeping on the spherical surface, then the full round mandala Earth of noon, then gibbous afternoon, crescent twilight, and darkness again.

A 16mm 400-foot silent color print of the film includes several forms of the 24-hour cycle and close-up cropping of specific sectors as their weather develops through the day.

Space Law

An international "Treaty for Outer Space" was prepared at Geneva in 1966 with the following principles written in. The treaty is in the process of ratification by various nations. In April 1967 the U.S. Senate approved it 88 to 0.

- No nation can claim sovereignty to outer space, to the Moon or to other celestial bodies.
- All nations have the right to conduct space activities.
- No one may use outer space or celestial bodies to begin a war.
- The rules of the United Nations charter apply to space activities.
- No country may station in space or orbit around the Earth nuclear or other weapons of mass destruction.
- No country may install such weapons on a celestial body.
- No nation may establish military bases, installations, or fortifications on a celestial body. Nor may any weapon be tested or military maneuvers be conducted there. The right to visit another country's installations and space vehicles on a celestial body is guaranteed.
- Astronauts are envoys of mankind. If an astronaut lands on another country's soil he must be returned safely, promptly and unconditionally.
- Space activities and their results are to be reported for the benefit of all.

Evolution fitted the new species together in ways that not only conserved energy and the mineral nutrients utilized in life processes but also conserved the nutrients by recycling them, releasing more oxygen and making possible the fixation of more energy and the support of still more life. Gradually each landscape developed a flora and fauna particularly adapted to that place. These new arrays of plants and animals used solar energy, mineral nutrients, water and the resources of other living things to stabilize the environment, building the biosphere we know today.

The available evidence suggests that, in spite of the much larger area of the oceans, by far the greater amount of energy is fixed on land. The oceans, even if their productivity can be preserved, do not represent a vast unexploited source of energy for support of larger human populations. They are currently being exploited at close to the maximum sustainable rate, and their continued use as a dump for wastes of all kinds makes it questionable whether that rate will be sustained.

Malnutrition, particularly protein deficiency, exacts an enormous toll from the physical and mental development of the young in the poorer countries. This was dramatically illustrated when India held tryouts in 1968 to select a team to represent it in the Olympic games that year. Not a single Indian athlete, male or female, met the minimum standards for qualifying to compete in any of the 36 track and field events in Mexico City. No doubt this was partly due to the lack of support for athletics in India, but poor nutrition was certainly also a large factor. The young people of Japan today are visible examples of what a change can be brought about by improvement in nutrition. Well-nourished from infancy, Japanese teen-agers are on the average some two inches taller than their elders.

This year the U.S. will consume some 685,000 million million B.T.U. of energy, most of it derived from fossil fuels. (One short ton of coal has a thermal value of 25.8 million B.T.U. The thermal value of one barrel of oil is 5.8 million B.T.U.) Industry takes more than 35 percent of the total energy consumption. About a third of industry's share is in the form of electricity, which, as of 1960, was generated roughly 50 percent from coal, 20 percent from water power, 20 percent from natural gas and 10 percent from oil.

The earth's thin film of living matter is sustained by grand-scale cycles of energy and chemical elements. All of these cycles are presently affected by the activities of man

CARNIVORE 2

CARNIVORE 1

HERBIVORE

INTACT NATURAL ECOSYSTEM is exemplified by a mature oak-hickory forest that supports several stages of consumers in the grazing food chain, with from 10 to 20 percent of the energy in each trophic level being passed along to the next level. The symbols represent different herbivore and carnivore species. Complexity of structure regulates population sizes, maintaining the same pattern of energy distribution in the system from year to year.

The nation's homes use almost as much energy as industry does. A major consumer is space heating, which for the average home requires as much energy as the average family car: about 70 million B.T.U. per year, or the equivalent of 900 gallons of oil. The other domestic uses are for cooking, heating water, lighting and air conditioning.

All together, in order to support one individual in our society, something like 25 tons of materials of all kinds must be extracted from the earth and processed each year. This quantity seems certain to increase considerably in the years ahead.

DEGRADED ECOSYSTEM has a truncated grazing chain. The annual production of the sparse grasses, herbs and shrubs fluctuates (shaded area). So do populations of herbivores and carnivores, which are characterized by large numbers of individuals but few different species. Under extreme conditions most of the net production may be consumed, leading to the starvation of herbivores and accentuating the characteristic fluctuation in populations.

With the turning of the earth, the sun comes up on fields, forests, and fjords of the biosphere, and everywhere within the light there is a great breath as tons upon tons of oxygen are released from the living photochemical surfaces of green plants which are becoming charged with food storages by the onrush of solar photons.

The system of man has consumption in excess of production. The products of respiration—carbon dioxide, metabolic water, and mineralized inorganic wastes—are discharged in rates in excess of their incorporation into organic matter by photosynthesis. If the industrialized urban system were enclosed in a chamber with only the air above it at the time, it would quickly exhaust its oxygen, be stifled with waste, and destroy itself since it does not have the recycling pattern of the agrarian system. The problems with life support in 1970 on the space flight of Apollo 13 dramatized this principle to the world.

The biosphere with industrial man suddenly added is like a balanced aquarium into which large animals are introduced. Consumption temporarily exceeds production, the balance is upset, the products of respiration accumulate, and the fuels for consumption become scarcer and scarcer until production is sufficiently accelerated and respiration is balanced. In some experimental systems balance is achieved only after the large consumers which originally started the imbalance are dead.

DARWIN-LOTKA ENERGY LAW

Thus, whenever it is necessary to transform and restore the greatest amount of energy at the fastest possible rate, 50 percent of it must go into the drain. Nature and man both have energy storages as part of their operations and when power storage is important, it is maximized by adjusting loads. . . . In the last century Darwin popularized the concept of *natural selection*, and early in this century Lotka indicated that the maximization of power for useful purposes was the criterion for natural selection. Darwin's evolutionary law thus developed into a general energy law.

Money flows in the opposite direction to the flow of energy and the concept of price which operates among human bargains adjusts one flow to be in proportion to the other. Thus a man purchasing groceries at a store receives groceries in one direction while paying money in the opposite direction. The heat losses of these transactions are small since the work involved is small.

LOOP SELECTION PRINCIPLE

In ecological studies there is the positive feedback loop through which a downstream recipient of potential energy rewards its source by passing necessary materials back to it. For example, the animals in a balanced system feed back to the plants in reward loops the phosphates, nitrates, and other compounds required for their growth. A plant that has a food chain which regenerates nutrients in the form it needs is therefore reinforced, and both plant and animal continue to survive. Species whose work efforts are not reinforced are shortly eliminated, for they run out of either raw materials or energy. They must be connected to input and output flows to survive.

Stability allows complex diversity and uniqueness of individuals. As in Augustinian Rome, there may be golden eras—if men can be satisfied with small causes, for energies big enough for new causes would have to be diverted from older endeavors. This in turn requires a willingness to discard activities.

Environment, Power, and Society

Beautiful work. Energy language is the simplifier we've lacked to see our systems whole. When the cosmic yum comes by, you get the ONE! all right, but that may not particularly help you work with connectedness. The terms and understandings in this book can.

Odum's point is that the macro-view of our energy systems must be clear to all of us—accurate grand images, adapted mores and laws, and responsive religions responsible to biospherical ethics—or however right in detail we shall be wrong big.

ENVIRONMENT,
POWER,
AND SOCIETY

HOWARD T. ODUM

How many persons know that the prosperity of some modern cultures stems from the great flux of oil fuel energies pouring through machinery and not from some necessary and virtuous properties of human dedication and political designs?

Bit by bit the machinery of the microscope is evolving in various sciences and in the philosophic attitudes of students. The daily maps of worldwide weather, the information received from the high-flying satellites, the macroeconomic statistical summaries of nations and the world, the combined efforts of international geophysical collaborations, and the radioactive studies of cycling chemicals in the great oceans all stimulate the new view. Whereas men used to search among the parts to find mechanistic explanations, the macroscopic view is the reverse. Men, already having a clear view of the parts in their fantastically complex detail, must somehow get away, rise above, step back, group parts, simplify concepts, interpose frosted glass, and thus somehow see the big patterns.

Man's Domain

I scarcely believe it. An inexpensive, paperback, lightweight but complete World Atlas that skips all the political planetary persiflage and goes straight to the guts: climate, minerals, agriculture, population, languages, land forms, ocean forms.—all the remorseless factors that have been invisible to most of humanity until recently. Nice work, McGraw-Hill, you whipped Rand-McNally and Hammond at their own game. —SB

Divine Right's Trip

Our story thus far

by Gurney Norman

PART ONE

DIVINE RIGHT'S BUS, URGE

I was a fairly straight '63 VW microbus till Divine Right got me, a good clean red and white seven passenger job with five new re-capped tires and near perfect upholstery. The only bad thing that ever happened to me was the Muncy's youngest kid use to puke on my seats all the time. The Muncys bought me new in Germany when the old man was stationed over there in the army. He was a Master Sergeant in an infantry outfit, a little old for that kind of work maybe, but he liked it well enough to volunteer for Vietnam when that war heated up. They brought me to the States when the sergeant went to Vietnam, and after he got blown up by a land mine, his wife Marie traded me in on a Falcon.

Two days on a car lot is a long time when you're not used to it. It was hot and damn boring, so even though this guy Divine Right looked pretty weird, I was so eager to get on the road again I felt grateful to him for buying me, although it did piss me off when the dealer let me go for only five hundred and fifty dollars. Divine Right paid the man with cash he'd got from a big grass score that morning, and if I could whistle I'd have whistled when we drove away together.

Which goes to show you how much I knew about freaks in those days. I hadn't gone five hundred miles with that son of a bitch before I'd of given my fuel pump to be back on that parking lot. That bastard drove me from Boston to Chicago to St. Louis to Cincinnati without once checking my oil. I found out later he didn't even know where my damn oilstick was. Drove non-stop too, all day, all night, the only time I got even a little rest was when he'd slow down long enough to refuel or buy a rat-burger. If his brother-in-law in Cincinnati hadn't noticed I was a quart and a half low I'd probably have thrown a rod as soon as we hit the next freeway.

D.R. doesn't seem to like them much, but his sister and brother-in-law are nice people. Doyle understands about cars. He's a mechanic, he knows how to take care of machines. He tried to tell D.R. about preventive maintenance, but D.R. was too stoned to pay attention. He was on speed that trip, out of his skull on ritilin and benzedrine. He told Doyle he had to split in order to make the Ultimate Rendezvous. Doyle said what's an Ultimate Rendezvous? But D.R. just grinned and started my motor and drove away.

So you get some idea of where D.R.'s head was at. He was the kind of guy who never had the faintest idea how he affected things. He could fuck over a nice '63 VW microbus he'd just paid five hundred and fifty dollars for and never blink an eye. I don't know what was the most humiliating, having my working parts ignored, or all that stupid paint sprayed all over my body. Inside and outside, I suffered both places. It's one thing to go around feeling bad because you're low on oil; but when you have to look like a made-up whore it gets to be a bit much. Housepaint, Day-Glo, fingernail polish, you name it and I got smeared with it. Sometimes he'd pull off into the emergency lane of some big interstate and start painting on the spot. Said God was sending him directions how to do it. Sometimes he'd pick up hitch-hikers and tell them to lean out the window and paint while he drove. By the time him and his weird friends got through I looked like a watercolor that got rained on. It was awful.

But I survived. I don't know how but I did. Well, yes I do know too. It was Estelle. There's no doubt about it, that little lady saved my ass from the junkyard. She was one nice person, that Estelle. There was something kind of sad about her, it seemed like she cried a lot. But she sure knew how to be nice to an old broken-down bus. She'd wash me, and empty my ash trays. Sometimes D.R. would be too stoned to drive and Estelle would take over, and it would just be so fine, just me and her cruising quietly across the country through the night. That was the thing about Estelle. She understood cruising, she understood roads, and traffic, she knew how to flow with things in motion. I never did understand what she saw in D.R., but I guess it's not my place to have opinions about people. My job was to carry them around from place to place while they acted out their story, and although I resented it most of the time I did my best. It was painful, but I do have to say that it was interesting, and instructive. On some level I'm sure I'm a better bus for it. I kind of wish I could have a voice in this narrative to tell my side of the story, but Gurney says there's too many points of view already to clutter it up even more with a talking car. So this is the only chance I'll have to speak my mind. It ain't much, but, when you've been down as long as I have, you get grateful for small favors. So goodbye. If you're ever rambling around down in the Kentucky mountains, come by and see me sometime.

Bless you all.
Urge

The Times Atlas of the World

'A world remade must be a world remapped.' That intelligent dictum was issued at the end of World War I by Lord Northcliffe, then proprietor of The Times of London. He didn't wait for someone else to do the job; The Times Survey Atlas of the World, with cartography by John Bartholomew of Edinburgh, was issued in 1921, and was recognized immediately as one of the finest atlases ever printed. The tradition has been continued, and the latest Times Atlas—the Comprehensive Edition—is the best place for an English-reading person to find where in the world something is located. The book also has a unique ability to convey the feel of the world. It measures 18" x 12 1/2" x 2", weighs 11 pounds, and contains 468 pages, of which 240 are double-page maps of superb accuracy and beauty. The index-gazetteer includes more than 200,000 entries, incomparably more than any other atlas of the world, and the entries are keyed not only by individual map coordinates, but by latitude and longitude as well (a feature offered by no other atlas). Despite the huge number of place names the maps are extraordinarily legible, and they are mercifully free of the pink-purple-yellow political emphasis offered by lesser cartographers. Some of the place names may look strange to American readers, because the atlas follows the rules of the Permanent Committee of Geographical Names. This supra-political body sensibly believes that places should be called what their occupants call them. In cases where the generic name is unfamiliar, the traditional anglicized name is also given, in parentheses.

The Comprehensive Edition of The Times Atlas of the World is published in the United States by Houghton Mifflin Company, Boston, Massachusetts. It is dedicated, by gracious permission, to Her Majesty Queen Elizabeth II, and bound in appropriately regal bright red linen, gold-stamped. It costs \$57.50, and it will make anything else on your coffee table seem puny, as the whole world should.

Human Use of the Earth

To get a handle on your future you've got to get outside yourself, because only from outside can you see your space-time environment whole. One way is to identify out into another culture, Indian or whatever (this is Jim Nixon's idea). Another way is to take Philip Wagner's trip into fascinated objectivity about Earthly doings. In this book he merges some of the best of geographical and anthropological perspective into a detailed treatise on the Earth as tool, how it is used and how to understand it better to use it better. —SB

As we shall see, one of the strategies by which supplies of goods and services become available for actual use is the movement of the would-be consumers themselves to the sources of goods or services. There are even objects that act as containers of man himself, which move over land, across water or through the air, delivering the individual to the places at which he can obtain goods he desires, or where he will be served as he wishes.

The modern inhabitant of a commercial country does not make his world; he buys it. The material circumstances of his life are not the outcome of his individual encounter with the natural order, but arise out of his relations with the social order.

Those same features of the most complex human communities which indicate their ecological advantages also suggest an unusual degree of inherent ecological risk. Such communities are complex and delicately balanced, and depend utterly upon their artificiality. They and the individuals in them are threatened by the same biological penalties that attend any highly specialized system or species. Their very technical perfection may destroy them in time as other high specializations have destroyed many former species of animals and plants.

The individual organism must, on the one hand, be specialized enough in function to exploit some particular conditions in the habitat, so as to occupy a niche that no other organism can contest with it; and it must, on the other hand, possess enough versatility to adapt to any conditions of environment that may impinge upon its life activities. These two requirements may be thought of as polar extremes of a continuous scale, and every species may be placed somewhere along the scale between specialization and versatility. Some of the disadvantages of commitment to either specialization or versatility are overcome by aggregation of organisms into larger groups within the community.

Geology Illustrated

An artist of aerial photography, Shelton uses some 400 of his finest photos to illuminate a discussion of the whole-earth system. Not a traditional textbook, but a fascinating exploration of the problems posed by asking "How did that come about?" Worth buying for the photos and book design alone, but you'll probably find yourself becoming interested in geology regardless of your original intentions.

[Reviewed by Larry McCombs]

Surface Anatomy

This book is included as a companion piece to the Earth picture books. The whole lovely system of the human creature, seen from without, surface by surface, is here. One of its main revelations is how cliché ridden our usual views of ourselves are—we are still not good with mirrors (satellites were up 10 years before we got a full view of the Earth). Posing friends and neighbors, with a simple light set-up and a 35mm camera, Joseph Royce has shot the most beautiful human album I know.

It also teaches anatomy.

As a means of communicating geological concepts, the pictures are fully as important as the words that accompany them. On most pages the photographs represent the facts, the words supply the interpretation. Many of the illustrations will, therefore, repay a little of the kind of attention that would be accorded the real feature in the field. In keeping with this, almost no identifying marks

have been placed on the photographs and very few on the drawings. The text (which almost invariably concerns an illustration on the same or a facing page) serves as an expanded legend for the picture; if, while reading it, it is necessary to look more than once to identify some feature with certainty, this is no more than Nature asks of those who contemplate her unlabelled cliffs and hills.

The World from Above

Close-up glamor shots of the Earth. Mystery shots (What is that? What's our altitude above it, 10 feet or 10,000?) (Fold out captions tell all.) Good traffic flow pattern shots: surface anatomy of civilization. Not a bad compendium; it'll do until they reprint E. A. Gutkind's Our World From the Air.

ST. GEORGE AND THE DRAGON

Here comes D.R. Davenport, Divine Right he calls himself after that incredible stoned-out afternoon when the words Divine Right formed in the clouds above the meadow where he was lying in the grass looking up and breathing deeply in awe of how really simple everything is when you come right down to it; Divine Right he calls himself, D.R. for short, driving along the highway now through a dark and rainy night in his VW microbus, Urge.

When all of a sudden Urge's headlights pick up a hitch-hiking freak on the road ahead.

I sure don't want to pick that guy up, D.R. told himself. I wish I didn't have to. He was into a radio talk show out of Los Angeles. This strange woman had called in to comment on dress styles and wound up on the Turner thesis and the American westward movement. D.R. was listening to her rap, even talking back from time to time, shaking his finger, agreeing and disagreeing, (but not too loudly; Estelle was asleep in the back of the bus somewhere and he didn't want to disturb her). Estelle was another reason not to pick the freak up but, out there the poor fucker was, sitting on his backpack holding out his thumb, with a little black dog huddled against his feet. So, D.R. dimmed the headlights and turned the radio down and pulled off the road just past where the guy was sitting.

"Get in," said Divine Right. "We're just, you know, rolling along, digging it, the windshield wipers, rain on the roof, this weird westward movement lady's on the radio, how far you going, how long you been sitting out there?"

The hitch-hiker hassled his gear in and stuffed it on the floor. He was a little old feller, just barely strong enough to lift his pack inside. But finally he managed it, and his dog Salvadore leaped in behind him. Salvadore didn't even bother to sniff out his new scene. He just curled up on the floor next to the emergency brake and lay completely still.

D.R. said, "Davenport's my name, Divine Right Davenport. Like, this radio guy says KCBR, sort of sings it you know, says KCBR, Wayne Dixon here may I have your name please? And I say Divine Right is my name and weirdness is my game, what's yours?"

Meaning, of course, his passenger, who was pissing D.R. off just sitting there. D.R. was a word man, you see, he liked to talk and to be talked to, and thirty seconds into their ride together his passenger hadn't said a thing. All he did was nod and grin and look at the wet highway stretching out in the long beams of light up ahead. After a mile or two D.R. was wishing he'd minded his own business and left the silent bastard sitting by the roadside, rain or no rain.

He turned the radio back up.

"... all I mean is that genocide against the Indians was the official policy of every American President after Andrew Jackson."

The announcer was aghast. "Are you saying our government had a policy..."

"Absolutely. It's a well known, I mean you're in radio, it's common knowledge among informed people."

"It's common rumor, maybe..."

"Rumor, hell," D.R. said. "The lady's right. Every word she says is true." He turned the radio down then and leaned across to stare at his passenger. "And I'll bet if you'd say something, it'd turn out to be true too, I know it would."

When the hitch-hiker didn't answer, D.R. started slowing down. "What I want to know, fuckhead, is how you're gonna keep dry when I dump your ass out in the rain about half a mile from now."

And when there was still no reply, D.R. brought Urge to a full stop, and leaned across again to look his passenger full in the face. He was surprised to see how young the freak was. Fifteen, sixteen at the most. D.R. was only twenty one himself, but the kid made him feel like an old man. He had a goatee of scraggly whiskers, twenty three long blonde hairs sticking out of various little blotches on his skin. His eyes were pale blue, streaked with red.

"Far out," said Divine Right. "Did you know you had red, white and blue eyes?"

No longer smiling, the kid opened the door and got out in the rain. He left his pup on the floor while he got his pack on, and settled his floppy, widebrim hat back on his head. Finally he was ready. As he reached in to get his dog he looked up at D.R. and said, "Did you ever read about St. George and the Dragon?"

D.R. said he hadn't.

"It's far out shit," said the kid. And he closed the door and started walking down the highway toward where ever they'd just come from.

Laws of Form

The laws of form have finally been written! With a "Spencer Brown" transistorized power razor (a Twentieth Century model of Occam's razor). G. Spencer Brown cuts smoothly through two millennia of growth of the most prolific and persistent of semantic weeds, presenting us with his superbly written Laws of Form. This Herculean task which now, in retrospect, is of profound simplicity rests on his discovery of the form of laws. Laws are not descriptions, they are commands, injunctions: "Do!" Thus, the first constructive proposition in this book (page 3) is the injunction: "Draw a distinction!" an exhortation to perform the primordial creative act.

After this, practically everything else follows smoothly: a rigorous foundation of arithmetic, of algebra, of logic, of a calculus of indications, intentions and desires; a rigorous development of laws of form, may they be of logical relations, of descriptions of the universe by physicists and cosmologists, or of functions of the nervous system which generates descriptions of the universe of which it is itself a part.

The ancient and primary mystery which still puzzled Ludwig Wittgenstein (Tractatus Logico-Philosophicus, A. J. Ayer (ed), Humanities Press, New York, 1961, 166 pp.), namely that the world we know is constructed in such a way as to be able to see itself, G. Spencer Brown resolves by a most surprising turn of perception. He shows, once and for all, that the appearance of this mystery is unavoidable. But what is unavoidable is, in one sense, no mystery. The fate of all descriptions is "... what is revealed will be concealed, but what is concealed will again be revealed."

At this point, even the most faithful reader may turn suspicious: how can the conception of such a simple injunction as "Draw a distinction!" produce this wealth of insights? It is indeed amazing—but, in fact, it does.

The clue to all this is Spencer Brown's ingenious choice for the notation of an operator \lrcorner which does several things at one time. This mark is a token for drawing a distinction, say, by drawing a circle on a sheet of paper which creates a distinction between points inside and outside of this circle; by its asymmetry (the concave side being its inside) it provides the possibility of indication; finally, it stands for an instruction to cross the boundary of the first distinction by crossing from the state indicated on the inside of the token to the state indicated by the token (A space with no token indicates the unmarked state). Moreover, these operations may operate on each other, generating a primary arithmetic, an opportunity which is denied us by a faulty notation in conventional arithmetic as pointed out by Karl Menger in "Gulliver in the Land without One, Two, Three" (The Mathematical Gazette, 53, 24-250; 1959).

These operations are defined in the two axioms (no other ones are needed) given on pages 1 and 2. They are:

Axiom 1. The law of calling

The value of a call made again is the value of the call.

That is to say, if a name is called and then is called again, the value indicated by the two calls taken together is the value indicated by one of them.

That is to say, for any name, to recall is to call.

(In notation:  the "form of condensation".)

Axiom 2. The law of crossing

The value of a crossing made again is not the value of the crossing.

That is to say, if it is intended to cross a boundary and then it is intended to cross it again, the value indicated by the two intentions taken together is the value indicated by none of them.

That is to say, for any boundary, to recross is not to cross.

(In notation:  the "form of cancellation".)

For instance, take a complex expression

$E =$ 

Then, by the two axioms

$E =$

In the beginning this calculus is developed for finite expressions only (involving a finite number of \lrcorner), simply because otherwise any demonstration would take an infinite number of steps, hence would never be accomplished. However, in Chapter 11, Spencer Brown tackles the problem of infinite expressions by allowing an expression to re-enter its own space. This calls for trouble, and one anticipates now the emergence of antinomies. Not so! In his notation the classical clash between a simultaneous Nay and Yea never occurs, the system becomes "bi-stable", flipping from one to the other of the two values as a consequence of previous values, and thus generates time! Amongst the many gems in this book, this may turn out to be the shiniest.

Sometimes the reading gets rough because of Spencer Brown's remarkable gift for parsimony of expression. But the 30 pages of "Notes" following the 12 Chapters of presentation come to the reader's rescue precisely at that moment when he lost his orientation in the lattice of a complex crystal. Consequently, it is advisable to read them almost in parallel with the text, if one can suppress the urge to keep on reading Notes.

In an introductory note Spencer Brown justifies the mathematical approach he has taken in this book: "Unlike more superficial forms of expertise, mathematics is a way of saying less and less about more and more." If this strategy is pushed to its limit, we shall be able to say nothing about all. This is, of course, the state of ultimate wisdom and provides a nucleus for a calculus of love, where distinctions are suspended and all is one. Spencer Brown has made a major step in this direction, and his book should be in the hands of all young people—no lower age limit required.

CONSTRUCTION

Draw a distinction.

CONTENT

Call it the first distinction.
Call the space in which it is drawn the space severed or cloven by the distinction.
Call the parts of the space shaped by the severance or cleft the sides of the distinction or, alternatively, the spaces, states, or contents distinguished by the distinction.

INTENT

Let any mark, token, or sign be taken in any way with or with regard to the distinction as a signal.
Call the use of any signal its intent.

In all mathematics it becomes apparent, at some stage, that we have for some time been following a rule without being consciously aware of the fact. This might be described as the use of a covert convention. A recognizable aspect of the advancement of mathematics consists in the advancement of the consciousness of what we are doing, whereby the covert becomes overt. Mathematics is in this respect psychedelic.

One of the most beautiful facts emerging from mathematical studies is this very potent relationship between the mathematical process and ordinary language. There seems to be no mathematical idea of any importance or profundity that is not mirrored, with an almost uncanny accuracy, in the common use of words, and this appears especially true when we consider words in their original, and sometimes long forgotten, senses.

The main difficulty in translating from the written to the verbal form comes from the fact that in mathematical writing we are free to mark the two dimensions of the plane, whereas in speech we can mark only the one dimension of time.

Much that is unnecessary and obstructive in mathematics today appears to be vestigial of this limitation of the spoken word.

Any evenly subverted equation of the second degree might be called, alternatively, evenly informed. We can see it over a subversion (turning under) of the surface upon which it is written, or alternatively, as an in-formation (formation within) of what it expresses.

Such an expression is thus informed in the sense of having its own form within it, and at the same time informed in the sense of remembering what has happened to it in the past.

We need not suppose that this is exactly how memory happens in an animal, but there are certainly memories, so-called, constructed this way in electronic computers, and engineers have constructed such in-formed memories with magnetic relays for the greater part of the present century.

We may perhaps look upon such memory, in this simplified information, as a precursor of the more complicated and varied forms of memory and information in man and the higher animals. We can also regard other manifestations of the classical forms of physical or biological science in the same spirit.

There is a tendency, especially today, to regard existence as the source of reality, and thus as a central concept. But as soon as it is formally examined (cf Appendix 2), existence ($ex = out, stare = stand$. Thus to exist may be considered as to stand outside, to be exiled.) is seen to be highly peripheral and, as such, especially corrupt (in the formal sense) and vulnerable. The concept of truth is more central, although still recognizably peripheral. If the weakness of present-day science is that it centres round existence, the weakness of present-day logic is that it centres round truth.

Throughout the essay, we find no need for the concept of truth, apart from two avoidable appearances ($true = open to proof$) in the descriptive context. At no point, to say the least, is it a necessary inhabitant of the calculating forms. These forms are thus not only precursors of existence, they are also precursors of truth.

It is, I am afraid, the intellectual block which most of us come up against at the points where, to experience the world clearly, we must abandon existence to truth, truth to indication, indication to form, and form to void, that has so held up the development of logic and its mathematics.

Tao Teh King

Reviewing the Tao is like reviewing the Bible. As soon as you presume, it just giggles and rains on you. Nevermind.

The Tao Teh King is a very old book (500 B.C. is one date) written by a legend named Lao Tzu. It describes how the universe is and makes an excellent case for harmony as the only survival technique that works. This translation by Archie Bahm is straightforward.

or WHOLE EARTH CATALOG

Everyone says: "Nature is great, yet Nature is simple."

It is great because it is simple.

If it were not simple, long ago it would have come to little.

Nature sustains itself through three precious principles, which one does well to embrace and follow.

These are gentleness, frugality and humility.

When one is gentle, he has no fear of retaliation.

When one is frugal, he can afford to be generous.

When one is humble, no one challenges his leadership.

But when rudeness replaces gentleness,

And extravagance replaces frugality,

And pride replaces humility,

Then one is doomed.

Since a gentle attack arouses little antagonism,

And a gentle defense provokes little anger,

Nature predisposes to gentleness those most suited for survival.

Intelligent control appears as uncontrol or freedom.

And for that reason it is genuinely intelligent control.

Unintelligent control appears as external domination.

And for that reason it is really unintelligent control.

Intelligent control exerts influence without appearing to do so.

Unintelligent control tries to influence by making a show of force.

It is because we single out something and treat it as distinct from other things that we get the idea of its opposite. Beauty, for example, once distinguished, suggests its opposite, ugliness.

And Goodness, when we think of it, is naturally opposed to badness.

In fact, all distinctions naturally appear as opposites. And opposites get their meaning from each other and find their completion only through each other. The meanings of "is" and "is not" arise from our distinguishing between them.

Likewise, "difficult and easy," "long and short," "high and low," "loud and soft," "before and after"—all derive their meanings from each other.

Therefore the intelligent man accepts what is as it is. In seeking to grasp what is, he does not devote himself to the making of distinctions which are then mistaken to be separate existences.

In teaching, he teaches, not by describing and pointing out differences, but by example.

Whatever is exists, and he sees that nothing is gained by representing what fully exists by a description—another lesser, diluted kind of existence.

If something exists which cannot be wholly revealed to him with his viewpoint, he does not demand of it that it be nothing but what it seems to him.

If some one else interprets him, he does not trust that interpretation as being equal to his existence.

If some part of him stands out as if a superior representative of his nature, he will not surrender the rest of his nature to it.

And in not surrendering the whole of his nature to any part of it, he keeps himself intact.

This is how the intelligent man preserves his nature.

We cannot escape the fact that the world we know is constructed in order (and thus in such a way as to be able) to see itself.

This is indeed amazing.

Not so much in view of what it sees, although this may appear fantastic enough, but in respect of the fact that it can see at all.

But in order to do so, evidently it must first cut itself up into at least one state which sees, and at least one other state which is seen. In this severed and mutilated condition, whatever it sees is only partially itself. We may take it that the world undoubtedly is itself (i.e. is indistinct from itself), but, in any attempt to see itself as an object, it must, equally undoubtedly, act so as to make itself distinct from, and therefore false to, itself. In this condition it will always partially elude itself.

To explain, literally to lay out in a plane where particulars can be readily seen. Thus to place or plan in flat land, sacrificing other dimensions for the sake of appearance. Thus to expound or put out at the cost of ignoring the reality or richness of what is so put out. Thus to take a view away from its prime reality or royalty, or to gain knowledge and lose the kingdom.

Part Two: Reward

From the outset I was determined to avoid relating to the garden abstractly, in terms of "poetry," or "ideas." My usual tendency is to reduce my experience to metaphors, then render the metaphors in words, and I wanted to beat that rap this time. Food, chewed and swallowed, was what the garden was all about, and nothing less than that was going to satisfy. I wanted the experience to come alive outside my head, in the concrete world, and achieving that of course was the prime reward.

But the thing I'm pleased to discover, now that the garden is a fact, is that I'm not as nervous as I was about abstractions. Abstractions built out of other abstractions can lead to actual sickness, I believe. But abstraction derived from the concrete is like the other side of the coin, yin and yang. It feels good to talk about gardening, now that the work is done. Feels the best in a long time, in fact. Like dessert, after a good meal. It's amazing what a little honest, sweat-producing work can do for a nervous head.

So stuff has been occurring to me: talk, for instance. The difference in the quality of talk that grows out of true experience, against talk that grows only out of other talk. Talk among people who never do anything but talk, vs. words between people who have other things to do with themselves. Drawing room conversation dependent on other drawing rooms, against conversation among people who've just come in from the world. Political opinions based on other people's political opinions, against a politics growing from the life you've personally lived. It's all like the difference between a wax apple, and one just dropped off a tree.

And this: rules. How we've all gone around crazy the past few years in revolution against rules because they are rules; discovering some rules that are bad, deciding all rules must be bad, so what the world needs is anarchy. Head filled with such cheap crap, then coming up against something like a garden, entering into the work of it as if: this is my scene; I decide the processes of this garden because I'm a free man and I'm going to do my thing. So you thing is to spray water around. "Express" yourself in water. It's so... esthetic. The curve of the spray is so... poetic. It's a veritable art form, no less, the avant-garde of agriculture. Jackson Pollock with a green thumb. Spray here, spray there, spray all over God's whole creation cause I'm going to do my thing.

Well, do tell. Because what's happening, the reason all those beans and tomatoes and carrots are, like drooping a little is that you've damned near drowned the things. And so you learn: the gardener doesn't make up the terms of his relationship to the garden. He doesn't invent them out of his precious head, change them around according to his petty whim. The terms exist before he gets there and they'll still exist long after he has gone. It's like the plants are saying: "Give us none of your hip esoteric shit; we want water, and we want it in precise amounts, according to the varying root systems of each plant. We want fertilizer, and if you don't know how much, find out. Find out about nitrogen, about phosphorus, about potash. For if you expect anything from this garden, you must know what the garden expects of you. There's a reality among these rows, stuff is going on bigger than all of us, so dig it. You are only a part of what is happening here. Fit yourself into the scheme. Abide by the law, and maybe you'll be pleased that you did."

Then this: pick up a radical newspaper, see a picture of the entrance to an Army post. Fort Dix, probably. And above the gate and the M.P.'s helmets is a sign that reads: "Obedience to the law is freedom." It's one of the philosophical highlights of the gardening season to read those words in political terms, and shudder; then read them again in terms of the natural world and think: how true, how true.

From The Free You Volume 3 September 1969

Sand County Almanac

"Classic" it's called now, because it was published in 1949 and still has bite. Wherever the ecologist looks the world weaves a wild story. This one looked at Sand County, among other places, and was led to propose a Land Ethic.

American conservation is, I fear, still concerned for the most part with show pieces.

Perhaps the most serious obstacle impeding the evolution of a land ethic is the fact that our educational and economic system is headed away from, rather than toward, an intense consciousness of land. Your true modern is separated from the land by many middlemen, and by innumerable physical gadgets.

A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise.

In the beginning there was only the unity of the Ice Sheet. Then followed the unity of the March thaw, and the northward hegira of the international geese. Every March since the Pleistocene, the geese have honked unity from China Sea to Siberian Steppe, from Euphrates to Volga, from Nine to Murmansk, from Lincolnshire to Spitsbergen. Every March since the Pleistocene, the geese have honked unity from Currituck to Labrador, Matamuskeet to Ungava, Horseshoe Lake to Hudson's Bay, Avery Island to Baffin Land, Panhandle to Mackenzie, Sacramento to Yukon.

By this international commerce of geese, the waste corn of Illinois is carried through the clouds of the Arctic tundras, there to combine with the waste sunlight of a nightless June to grow goslings for all the lands between. And in this annual barter of food for light, and winter warmth for summer solitude, the whole continent receives as net profit a wild poem dropped from the murky skies upon the muds of March.

I was young then, and full of trigger-itch; I thought that because fewer wolves meant more deer, that no wolves would mean hunters' paradise.

We all strive for safety, prosperity, comfort, long life, and dullness.

So in his article on sanctity and adaption, Rappaport cites two essential tautologies: that every living being is connected to every other living being, and that the environment is so complex that we cannot predict the total consequences of any action. So the supernatural world, in which all beings, visible and invisible, are connected by the great spiritual thread, in which the consequences are never seen yet always critical, is not just similar but identical to the natural world. It is science which operates with an imaginary environment, an environment it imagines it can control, in which it believes its own predictions, setting limits on just how far it will trace a poison or follow a river. Who cares if insecticide in Iowa pollutes the Great Lakes, who cares if the poisonous wastes from the potato factory in Maine pour into New Brunswick, as long as the crud passes political boundaries? Who cares if the microorganisms are poisoned, the algae and snails choked, these are not men's delicacies? Who cares about the supernatural, the world we cannot see? Who cares what happens to the skeletons of the fish after the fish are eaten, when every house has a garbage disposal; except during a garbage strike in New York the people forget that there is waste and the waste goes somewhere, motorboats killing off everything in a lake during successive Memorial Days and July 4's and Labor Days? And every living organism shares in the consequences, and the consequences are collective, only civil wars says the astronaut looking down at Earth, only civil wars even as the hunter downs the bear, the fish are caught in the Bella Coola trap. And everyone is simultaneously the benefactor and the victim; we are all victimized by what we are made out of, by, in fact, that we are made out of anything. The consequences never cease but pass and rebound, and this is the story of light in the universe, a sun whose powers flood on beyond Earth, beyond planets, an Earth which receives the decay of other stars.

NOTE ON SPELLING: *Oecology* is the etymological spelling of *Ecology*. The *logos* of *oikos* is the law of the house in the deepest sense: meaning the speech by which the house is known to itself, meaning that the house is subject to the proportions of its rule. It's house rules I'm talking about, just and unjust, or finally JUST. I want to recall to you the house, of which planet is one aspect, language is another, body is another—house in the sense that economy is the management of the house and Oikumene is the known, inhabited, LIVED IN world.

LOOKING FOR DOPE

Urge's wipers wiped and wiped and wiped and wiped and wiped and wiped and wiped, and still D.R. could barely see through the windshield. It hadn't bothered him the first few hours, but as the rain kept falling and the night wore on and his eyes got sore and tired, the world outside the windshield gradually turned into such a visual mush D.R. had trouble keeping Urge on the road. What Urge needed was a new set of windshield wipers, and what D.R. needed was some food and a good night's sleep. But short of that the next best thing of course was a good hit of grass to kind of bring things into focus.

Sorry old bus, he said to Urge as he felt his shirt pocket for a J.

And he meant that too. One of Divine Right's convictions was that it was possible to turn a vehicle onto dope if only the right means could be found. One time just before crossing the Canadian border he'd stashed an ounce of prime Afghan hash in Urge's crank case and Urge had obviously loved it. Within a mile Urge's headlights had started flashing on and off, his horn spontaneously bleated tones of joy. At least it had seemed that way. D.R. was pretty stoned himself at the time and it may have been that those were only things he wanted Urge to do. At any rate, the bus began to cough and choke and gasp for breath after a while, and he'd had to take the hash back out. But that's okay, Urge old buddy, D.R. said, feeling his shirt for a J. That's all right. I'm working on it. One of these days I'll come up with a formula to stone you with so fine, so right you'll think: divine.

The joint D.R. had put in his shirt pocket was gone. All he found was a tattered book of matches. He looked in the glove compartment and felt in his leather-belt-pouch, but it was the same. So at a wide place at the end of a bridge D.R. pulled off the road and started to rummage around the bus in search of dope.

"What is it?"

"Shhh. Go back to sleep."

"What is it?" Estelle sat up and rubbed her eyes. She was in a sleeping bag, lying cross-ways on the mattress near the back of the bus. The bus wasn't wide enough for her to stretch out fully, but there was so much junk scattered around there wasn't any other place to lie. In spite of having to twist herself into an S to lie down, she'd slept so deeply for seven straight hours that now she was having trouble getting her eyes to stay open.

"Go back to sleep."

"No, I'm awake. Where are we?"

"Fuck, I don't know. Somewhere out west."

The engineer, who had been busy designing a new and powerful crane, saw in a moment that the arrangement of the bony trabeculae was nothing more nor less than a diagram of the lines of stress, or directions of tension and compression, in the loaded structure; in short, that Nature was strengthening the bone in precisely the manner and direction in which strength was required; and he is said to have cried out, "That's my crane!"

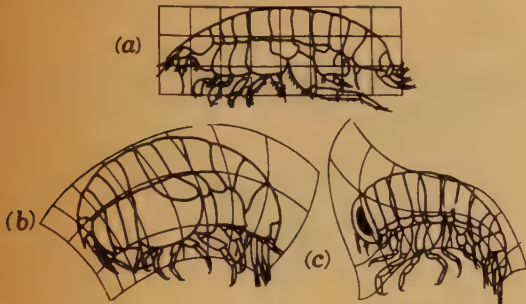

Fig. 143. (a) Harpinia plumosa Kr.; (b) Stegocephalus inflatus Kr.; (c) Hyperia galba.

When Plateau made the wire framework of a regular tetrahedron and dipped it in soap-solution, he obtained in an instant a beautifully symmetrical system of six films, meeting three by three in four edges and these four edges running from the corners of the figure to its centre of symmetry. Here they meet, two by two, at the Maraldi angle; and the films meet three by three, to form the re-entrant solid angle which we have called a "Maraldi pyramid" in our account of the architecture of the honeycomb. The very same configuration is easily recognized in the minute siliceous skeleton of *Callimitra*. There are two discrepancies, neither of which need raise any difficulty. The figure is not rectilinear but a spherical tetrahedron, such as might be formed by the boundary edges of a tetrahedral cluster of four co-equal bubbles; and just as Plateau extended his experiment by blowing a small bubble in the centre of his tetrahedral system, so we have a central bubble also here.

This bubble may be of any size; but its situation (if it be present at all) is always the same, and its shape is always such as to give the Maraldi angles at its own four corners. The tension of its own walls, and those of the films by which it is supported or slung, all balance one another. Hence the bubble appears in plane projection as a curvilinear equilateral triangle; and we have only got to convert this plane diagram into the corresponding solid to obtain the spherical tetrahedron we have been seeking to explain.

The geometry of the little inner tetrahedron is not less simple and elegant. Its six edges and four faces are all equal. The films attaching it to the outer skeleton are all planes. Its faces are spherical,

Fig. 63. Diagrammatic construction of *Callimitra*. (a) A bubble suspended within a tetrahedral cage; (b) another bubble within a skeleton of the former bubble.

and each has its centre in the opposite corner. The edges are circular arcs, with cosine $\frac{1}{3}$; each is in a plane perpendicular to the chord of the arc opposite, and each has its centre in the middle of that chord. Along each edge the two intersecting spheres meet each other at an angle of 120° .

We have not yet built into our educational system any recognition of the points where precision is essential, and yet we are living in a society where one mistake can dislocate the lives of thousands of people, wreck distribution systems, and distort life-history data, and subsequent career lines.

There is no basic reason why one cannot design a control memory with a different technology, a technology which would allow the computer itself to alter the information stored in the control memory. Thus we would have a computer that could alter its own character as required. To my knowledge very little conceptual work has been done in thinking through the implications of this extremely powerful possibility. The possibilities are so staggering and deep. The poor harried souls responsible for trying to understand the classical computer as we now know it wish this idea would go away.

The act of choosing a representation for a problem involves the specification of a space where the search for solution can take place. Such a specification involves the choice of a language—and its use—for expressing problem conditions, properties of solutions, and knowledge of regularities in the search space.

If we detach the concern of survival from computers, as is generally the case, they can learn abilities more useful to man than the struggle for existence.

A friend of mine once gave what I regard as a nice shorthand formula. When in a dilemma, introduce novelty.

Exaggerated politeness is a powerful source of misunderstanding.

Regularity seeking activities that seem to be generally useful include the detection of symmetries, the identification of 'critical points' (key points through which the search must go to get a solution), and the recognition of redundant information in problem descriptions.

Aspects of Form

This is a well-used collection of insights by venerable initiates of form study.

Fig. 2 Copperhead Snake—illustrating the effectiveness of disruptive contrast in relation to background configuration

A man may learn by experience to associate two series of events between which any connection seemed at first wildly improbable. For such associations to be possible, provision must be made for every signal entering the nervous system to be relayed to every part, not merely to the specialised receiving zone. Thus from the knot of an event is generated a web of speculation; when two series of events are perceived together they form the warp and woof of a shimmering fabric into which is woven the pattern of the probability that the two events are significantly related.

An 'image' in this biological sense, then, is not an imitation of an object's external form but an imitation of certain privileged or relevant aspects. It is here that a wide field of investigation would seem to open.

We know that there are certain privileged motifs in our world to which we respond almost too easily. The human face may be outstanding among them. Whether by instinct or by very early training, we certainly are ever disposed to single out the expressive features of a face from the chaos of sensations that surrounds it and to respond to its slightest variations with fear or joy.

Synthesis of Form

Christopher Alexander is a design person that other design people refer to a lot. This book deals with the nature of current design problems that are expanding clear beyond any individual's ability to know and correlate all the factors. The methodology presented here is one of analysis of a problem for misfits and synthesis of form (via computer-translatable nets and hierarchies) for minimum misfits.

—SB

2. Goodness of Fit 15
3. The Source of Good Fit 28
4. The Unselfconscious Process 46
5. The Selfconscious Process 55

But if we think of the requirements from a negative point of view, as potential misfits, there is a simple way of picking a finite set. This is because it is through misfit that the problem originally brings itself to our attention. We take just those relations between form and context which obtrude most strongly, which demand attention most clearly, which seem most likely to go wrong. We cannot do better than this. If there were some intrinsic way of reducing the list of requirements to a few, this would mean in essence that we were in possession of a field description of the context: if this were so, the problem of creating fit would become trivial, and no longer a problem of design. We cannot have a unitary or field description of a context and still have a design problem worth attention.

Indeed, not only is the man who lives in the form the one who made it, but there is a special closeness of contact between man and form which leads to constant rearrangement of unsatisfactory detail, constant improvement. The man, already responsible for the original shaping of the form, is also alive to its demands while he inhabits it. And anything which needs to be changed is changed at once.

A subsystem, roughly speaking, is one of the obvious components of the system, like the parts shown with a circle round them. If we try to adjust a set of variables which does not constitute a subsystem, the repercussions of the adjustment affect others outside the set, because the set is not sufficiently independent. The procedure of the unselfconscious system is so

organized that adjustment can take place in each one of these subsystems independently. This is the reason for its success.

In the selfconscious situation, on the other hand, the designer is faced with all the variables simultaneously.

The greatest clue to the inner structure of any dynamic process lies in its reaction to change.

The Mousgouh cannot afford, as we do, to regard maintenance as a nuisance which is best forgotten until it is time to call the local plumber. It is in the same hands as the building operation itself, and its exigencies are as likely to shape the form as those of the initial construction.

The selfconscious individual's grasp of problems is constantly misled. His concepts and categories, besides being arbitrary and unsuitable, are self-perpetuating. Under the influence of concepts, he not only does things from a biased point of view, but sees them biased as well. The concepts control his perception of fit and misfit—until in the end he sees nothing but deviations from his conceptual dogmas, and loses not only the urge but even the mental opportunity to frame his problems more appropriately.

The solution of a design problem is really only another effort to find a unified description. The search for realization through constructive diagrams is an effort to understand the required form so fully that there is no longer a rift between its functional specification and the shape it takes.

Two misfits are seen to interact only because, in some sense at least, they deal with the same kind of physical consideration. . . . It is such a physical center of implication, if I may call it that, which the designer finds it easy to grasp. Because it refers to a distinguishable physical property or entity, it can be expressed diagrammatically, and provides a possible non-verbal point of entry into the problem.

The Sciences of the Artificial

Simon says: we have generalized methods of obtaining elegant information from nature. We don't have generalized methods of making elegant things to add to nature; we lack a science of design. He's right and he doesn't waste much time being right, but proceeds to make useful suggestions—lots of them probably wrong and useful anyway. His notion of sub-system stability in evolution is beautiful.

The Evolution of Complex Systems

Let me introduce the topic of evolution with a parable. There once were two watchmakers, named Hora and Tempus, who manufactured very fine watches. Both of them were highly regarded, and the phones in their workshops rang frequently—new customers were constantly calling them. However, Hora prospered, while Tempus became poorer and poorer and finally lost his shop. What was the reason?

The watches the men made consisted of about 1,000 parts each. Tempus had so constructed his that if he had one partly assembled and had to put it down—to answer the phone, say—it immediately fell to pieces and had to be reassembled from the elements. The better the customers liked his watches, the more they phoned him and the more difficult it became for him to find enough uninterrupted time to finish a watch.

The watches that Hora made were no less complex than those of Tempus. But he had designed them so that he could put together subassemblies of about ten elements each. Ten of these subassemblies, again, could be put together into a larger subassembly, and a system of ten of the latter subassemblies constituted the whole watch. Hence, when Hora had to put down a partly assembled watch in order to answer the phone, he lost only a small part of his work, and he assembled his watches in only a fraction of the man-hours it took Tempus.

Most of the complex structures found in the world are enormously redundant, and we can use this redundancy to simplify their description. But to use it, to achieve the simplification, we must find the right representation.

If a complex structure is completely unredundant—if no aspect of its structure can be inferred from any other—then it is its own simplest description.

The Artifact as 'Interface'

We can view the matter quite symmetrically. An artifact can be thought of as a meeting point—an 'interface' in today's terms—between an 'inner' environment, the substance and organization of the artifact itself, and an 'outer' environment, the surroundings in which it operates. If the inner environment is appropriate to the outer environment, or vice versa, the artifact will serve its intended purpose. Thus, if the clock is immune to buffeting, it will serve as a ship's chronometer. (And conversely, if it isn't, we may salvage it by mounting it on the mantel at home.)

I should like to point to evidence that there are only a few 'intrinsic' characteristics of the inner environment of thinking man that limit the adaptation of his thought to the shape of the problem environment. All else in his thinking and problem-solving behavior is artificial—is learned and is subject to improvement through the invention of improved designs.

D.R. was on his knees next to Estelle, digging in a duffle bag. A light would have helped but Urge's overhead light was out, and D.R. didn't know where the flashlight was.

"Here, honey, light this candle," said Estelle, and she handed him a candle.

But somehow climbing through the general debris to get to the back, D.R. had lost the matches. He yelled goddamn it! as loud as he could yell.

"Shhh, honey, it's all right. What are you looking for?" "I'm looking for the goddamn dope that I had in my goddamn hand not six goddamn hours ago. That's what I'm looking for." And he lifted the duffle bag by its bottom and dumped its contents on top of the other stuff already scattered over the mattress.

Estelle found a match and lit it. The whole wild interior of the bus came alive for a moment, but quickly began to fade.

"Give me the candle," said Estelle.

"Where is it?"

"I handed it to you."

D.R. felt around his knees and legs, and in the pile of stuff he'd just dumped out. But all he could find was a broken screw driver. He held it up, looked at it, then threw it as hard as he could toward the front. "Fuck it!" he yelled, and strangled himself on the yell. It was as if something had seized his throat and choked him. Falling onto his side D.R. grabbed the handle of the side doors and threw them open, then tumbled in a heap outside into the rain. Estelle was out of her sleeping bag by the time he hit the ground.

"Honey, what's wrong?"

"I can't breathe!" he gasped. "That space in that bus . . ."

"Honey, it's fine in here. Come on back in, you're getting wet."

D.R. got to his feet and tried to wipe the mud off his knees. But that only smeared it more. "What a goddamn mess."

"Get in, baby, lie down. I'll drive awhile, and you can get some sleep."

D.R. did not seem persuaded, but he obeyed. Estelle closed the door behind him, then guided him toward the far end of the mattress.

"Where's my sleeping bag?" D.R. asked.

"Get in mine. Come on, now."

"I want mine," he whined. "Where is it?"

"It's on the floor half full of pork and beans, that's where. Now come on back here."

D.R. was too confused to argue. Estelle pulled off his sandals and got his feet pointed into the sleeping bag. He wiggled on down inside, feeling the dark warmth of Estelle's body become his own deep in the interior of the bag.

General Systems Yearbook

Good thinking, rotten publishing. The usual graphic output in this yearbook is three pallid diagrams. And you know that the mothers who wrote the articles are forever whacking away at their blackboards, but because typewriters don't draw, all that vivid stuff gets left in the author's private experience. Man, there's something suspect about General Systems Theory if the practitioners are this far out of intelligent communication. Here's part of the contents of a recent volume, which may help to vindicate matters.

by P. E. Chase

Uncoupling Spatial Systems
by Roslyn Lindheim

Understanding whole systems is knowing how to fly. You can rise above local circumstances, travel with blurring speed, and set down in a place wholly distant, strange, and wonderful. Or maybe not so wonderful, in which case you best know how to take off in a tight situation, and remember where home is.

The price you pay for the understanding is the grim knowledge of trade-offs in design. That you can have an airplane that goes fast or one that lands in 200 ft. but not both. That to save these people you may have to starve those people.

By and by you dwell in a wilderness of conflicting considerations. If you survive your wishful solutions—and there's usually margin—you may become a wily and sky-hooked metaphysician. The solutions are always meta. The means always funky field expedient.

—SB

Dynamo and Virgin Reconsidered

Here in one sharp little book are noted many of the large-scale turns of history and culture that we are visibly and invisibly making in one evolutionary blink of time. Unlike most overviews, White does not concern himself with so much pace of change as he does with origins and directions. His 1967 essay "The Historical Roots of Our Ecologic Crisis" (chapter 5 in this book) is already a much-reprinted classic. I suspect that Chapter 11, "The Necessity of Witches" will become one.

From the kaleidoscopic and iridescent record of mankind, we can learn chiefly this: the possible range of human thought, emotion, organization, and action is almost infinite. In facing today's problems, we must therefore liberate ourselves from presuppositions as to what may or may not be possible. Knowledge of history frees us to be contemporary.

The Human Use of Human Beings

A proper sequel to his *Cybernetics*, this book is social, untechnical, ultimate in most of its considerations. Its domain is the whole earth of the mind.

Norbert Wiener is one of the founders of an n-dimensional inhabited world whose nature we've yet to learn.

—SB

It is the thesis of this book that society can only be understood through a study of the messages and the communication facilities which belong to it; and that in the future development of these messages and communication facilities, messages between man and machine and between machine and machine, are destined to play an ever-increasing part.

Messages are themselves a form of pattern and organization. Indeed, it is possible to treat sets of messages as having an entropy like sets of states of the external world. Just as entropy is a measure of disorganization, the information carried by a set of messages is a measure of organization. In fact, it is possible to interpret the information carried by a message as essentially the negative of its entropy, and the negative logarithm of its probability. That is, the more probable the message, the less information it gives. Clichés, for example, are less illuminating than great poems.

I believe that Ashby's brilliant idea of the unpurposeful random mechanism which seeks for its own purpose through a process of learning is not only one of the great philosophical contributions of the present day, but will lead to highly useful technical developments in the task of automatization. Not only can we build purpose into machines, but in an overwhelming majority of cases a machine designed to avoid certain pitfalls of breakdown will look for purposes which it can fulfill.

We are not stuff that abides, but patterns that perpetuate themselves. A pattern is a message, and may be transmitted as a message.

One reason why some fields are overstudied these days is our present system of government grants.

Enrico Fermi once said that a scientist should change fields every 10 years; that, in the first place, his ideas were exhausted by then, and he owed it to the younger men in the field to let them advance; and that, in the second place, his ideas might still be of great value in bringing a fresh viewpoint to a different field.

Why should someone not make us a single suit that would shed rain and that we could ruffle up for comfort in any weather, as a bird ruffles its feathers? A bird needs no suitcase.

Many who have made the jump to the subjective have ended by treating the objective as small and unimportant. Solipsist tyrants, believing that their will, like their eyeballs, could move mountains, have come to believe that it should trample over these small annoying figures in their visual field.

Prophecy is rash, but it may well be that the publication of D.T. Suzuki's first *Essays in Zen Buddhism* in 1927 will seem in future generations as great an intellectual event as William of Moerbeke's Latin translations of Aristotle in the thirteenth century or Marsiglio Ficino's of Plato in the fifteenth. But in Suzuki's case, the shell of the Occident has been broken through. More than we dream, we are now governed by the new canon of the globe.

Francis tried to depose man from his monarchy over creation and set up a democracy of all God's creatures. With him the ant is no longer simply a homily for the lazy, flames a sign of the thrust of the soul toward union with God; now they are Brother Ant and Sister Fire, praising the Creator in their own ways as Brother Man does in his. . . I propose Francis as a patron saint for ecologists.

It is the great public which is demanding the utmost of secrecy for modern science in all things which may touch its military uses. This demand for secrecy is scarcely more than the wish of a sick civilization not to learn the progress of its own disease.

It is illuminating to know that the sort of phenomenon which is recorded subjectively as emotion may not be merely a useless epiphenomenon of nervous action, but may control some essential stage in learning, and in other similar processes.

Good living is with a tribe. At the Marine Biological Laboratories at Woods Hole, Massachusetts, where I have spent several summers, the boundaries between the generations seem to disappear, as well as the boundaries between work and play and between indoors and outdoors and between man and environment. Children and students and teachers walk barefoot in and out of the laboratories, arguing science and studying the odd creatures brought up from the sea. All night they watch the fish embryos developing in the dishes, and they go out before dawn together to catch the big striped bass. The 4-year-olds solemnly examine frogs, the 10-year-olds sell their catch of dogfish to the labs, the 15-year-olds listen to the DNA arguments on the beach or play savage tennis with the senior scientists.

As perception theory now suggests, each of us stands at the creative, choosing focus of a moving web of past antecedents and future consequences that branch out from our present choices and actions, propagating and amplifying themselves indefinitely. We interpenetrate the universe; it responds to our every breath.

It seems to me that the new rights for which a demand is arising in our time, I think in an irresistible way, revolve primarily around the right not to be treated as an object. We are co-subjects in our society.

It is said that after the ceremonies dedicating the great telescope on Mount Palomar, someone remarked to an astronomer, "Modern astronomy certainly makes man look insignificant, doesn't it?" To which the astronomer replied, "But man is the astronomer!"

There was a period in our own society when we needed witches and had them in enormous numbers. It began about the year 1300, ended somewhat after 1650, and is usually called the Renaissance. This was a time of torrential flux, of fearful doubt, marking the transition from the relative certainties of the Middle Ages to the new certainties which dominated the eighteenth and nineteenth centuries.

The Next Development in Man

Books. Lancelot Law Whyte, *The Next Development in Man*, Mentor paperback, 60¢ (may be more now). Written in 1948 but still relevant. Whyte wants to change the processes of thinking from static concepts to fluid developments. In order to do this he first has to redefine the whole language to replace our usual noun-name centered ideas with verb-action-process emphasis. Most of the book is a long, head-wrenching reinterpretation of Western history, seen as the working out of what Whyte calls the universal formative principle. But where we are now represents a blocked, one-sided aspect of this principle, hence the requirement of the development of process thinking and unitary man. The failure we are living with now Whyte recognized in 1948, the value of the book is its display of a vast and essentially complete metaphysical system that is in fact a philosophic program for the future.

Cary James
Mill Valley, Calif.

"Form is the recognizable continuity of any process." p. 15

"Anything which facilitates the development of characteristic organic form is called proper to the organism." p. 23

"The poverty of language in process concepts compels unitary thought to use 'process' as both noun and adjective. Formation, growth, development, destruction, decay, are process concepts; god, idea, number, matter, energy, are static concepts lacking the asymmetry of the time sequence and implying permanence." p. 27

"...the one God was a jealous God. With the ideal of universality appeared intolerance." p. 76

"More comprehensive processes than those of the conscious mind control human destiny." p. 118

"The final elimination of the dualism can only come about through the realization that the need to formulate ideals, and in so doing split man asunder, is itself an expression of the very human but futile desire to escape the uncertainty of process and find spiritual security in the aim at least of a permanent harmony. Unitary man can achieve this realization, and see himself as a whole, because he is ready to accept his personal life for what it is, a transient development through changes which cannot be foreseen." p. 210-11.

Man's Role in Changing the Face of the Earth

This book of almost 1200 pages is the result of a major conference held in 1955, sponsored by the Wenner Gren Foundation for Anthropological Research. More than 50 scholars submitted papers, covering almost every imaginable point of view related to man's capacity to transform his physical environment. Though first presented nearly 15 years ago, the facts and insights are richly rewarding today. In my opinion in fact, it is an unsurpassed achievement in assembling pertinent, insightful information of interest not only to serious students of the planet Earth, but to non-trained readers as well.

The three sections of the book are: I. "Retrospect", an historical background; II. "Process", methods and agencies involved in man's interactions with the land; and III. "Prospect", the effects and future implications of man's habitation of the Earth. Some typical subjects covered within these sections include: fire as the great force employed by man; origins and decline of woodlands; man and grass (sic); ecology of peasant life; harvests of the seas; ports channels and coastlines; and sewerage (don't belittle sewerage—society is structured around it).

This book rewards a reader like me because of its minimum of moralizing and its abundant substance. Edgar Anderson, director of the Missouri Botanical Garden in St. Louis and without whom such a book as this would be certainly incomplete, pointed out that the average thoughtful person has little inkling of how man has reclothed the world. Even professional biologists have been tardy in recognizing that a significant portion of the plants and animals surrounding us are of our own making. For example, neither Kentucky bluegrass nor Canada bluegrass is native to those places, but came from Europe. The corn belt is a very obviously man-dominated landscape, but the casual observer might never realize that even the grass covered and oak-dotted stretches of what looks like indigenous California vegetation came uninvited from the Old World along with the Spaniards.

[Reviewed by Richard Raymond]

Generally speaking, the plants which follow man around the world might be said to do so, not because they relish what man has done to the environment, but because they can stand it and most other plants cannot.

FIG. 123.—A demonstration of man's unconscious role in creating new plants. (From Riley, 1938.) At the far right one of the minor bayous of the lower Mississippi Delta. At right angles to it and running nearly across the figure is the abandoned channel of a former stream, now drained by a ditch. The natural levees of the stream are slightly higher than the surrounding country. Their sharp inner edges are indicated on the map by hatchures. The road has been run along the lower levee, and houses have been built along the opposite one. The property lines (as in many old French settlements) produce a series of long narrow farms, which for our purposes serve as so many experimental plots. Each farm has its house on a low ridge with a long entrance drive connecting it across a swale to the public road on the opposite ridge. The farms (including a score of others which are out of sight to the left of the figure) were originally essentially similar. At the point where the ditch joins the bayou is a large population of *Iris hexagona giganteo-caerulea*. Behind the levee on which the houses were built, *I. fulva* grows on the lower ground as well as farther upstream along the ditch. The key fact to be noted is that the hybrids are on only one farm, that they are abundant there, and that they go up to the very borders of the property on either side. Nature is evidently capable of spawning such hybrids throughout this area, but not until one farmer unconsciously created the new and more or less open habitat in which they could survive did any appear in this part of the delta. (See Anderson, 1940, pp. 1-11, 94-98, for a more complete discussion.)

FIG. 147.—Changes in wooded area of Cedar Township, Green County, Wisconsin (43°54' W, 47°30' N), during the period of European settlement. The township is its ratio to a side and is drained by the Pecatonica River. The shaded areas represent the land remaining in, or reverting to, forest in 1855, 1900, and 1950.

Almost every change in environmental conditions which man can make results in some change in the water economy or water budget at the earth's surface. The pressure for beef supply from the grasslands is very rapidly depleting the potential for protein. Where the plow went ahead of the cow, we have been able to measure the reduction in soil capabilities. The protein content of the wheat now grown on the eastern edge of the grassland area has been dropping decidedly. Where once it ranged from 19 to 11 per cent, it is now 14-9 per cent.

These are all very good ideas, but I've got something else that is very much more important. Every time you get where there is one of these populations of plants, find a large, flat rock, in the shade if necessary; sit down upon it for at least fifteen minutes by your wrist watch; and do not try to think about your clematises. Just think what a nice day it is, how pretty the flowers are, and the blue sky. Think how lucky you are to be doing this kind of work when the rest of the world is doing all the awful things they do not want to do. Just let your mind alone. Now, I am not joking. Please do this, by the clock if necessary.

FIG. 147.—Changes in wooded area of Cedar Township, Green County, Wisconsin (43°54' W, 47°30' N), during the period of European settlement. The township is its ratio to a side and is drained by the Pecatonica River. The shaded areas represent the land remaining in, or reverting to, forest in 1855, 1900, and 1950.

As the year 2000 approaches, an epidemic of sinister predictions is spreading all over the world, as happened among Christians during the period preceding the year 1000.

We behave often as if we were the last generation to inhabit the earth.

If the rebellious young succeed in discovering a formula of life as attractive as that of the troubadours, we may witness in the twenty-first century a new departure in civilization as occurred in Europe after it recovered from the fears of the tenth century. To be humanly successful, the new ages will have to overcome the present intoxication with the use of power for the conquest of the cosmos, and to rise above the simple-minded and degrading concept of man as a machine. The first move toward a richer and more human philosophy of life should be to rediscover man's partnership with nature.

Considered broadly, evolution always involves learning from experience. The learning may take place by storage of genetic information in the chromosomes, by accumulation of knowledge and skills in the individual organism, or by transmission of practices and wisdom in institutions or in society as a whole.

History shows that cultures of a sort can emerge from the most improbable ways of life, provided these last long enough to become integrated into an organic whole. The emergence of a new culture is rarely if ever the result of a conscious choice with a definite goal in mind.

So Human an Animal

Dubos has a combined medical and evolutionary perspective that prepares him perfectly to diagnose and prescribe for the new ills of mankind, the macro-maladies of cities and pollution and panic. Unlike other General System Practitioners, he supports his thoughts with a wealth of fascinating facts and anecdotes presented with a good cheer that makes health look quite attractive.

The task and potential greatness of mortals lie in their ability to produce things—works and deeds and words—which would deserve to be and, at least to a degree, are at home in everlastingness, so that through them mortals could find their place in a cosmos where everything is immortal except themselves.

It is true that one-man, monarchical rule, which the ancients stated to be the organizational device of the household, is transformed in society—as we know it today, when the peak of the social order is no longer formed by the royal household of an absolute ruler—into a kind of no-man rule. But this nobody, the assumed one interest of society as a whole in economics as well as the assumed one opinion of polite society in the salon, does not cease to rule for having lost its personality. As we know from the most social form of government, that is, from bureaucracy (the last stage of government in the nation-state just as one-man rule in benevolent despotism and absolutism was its first), the rule by nobody is not necessarily no-rule; it may indeed, under certain circumstances, even turn out to be one of its cruelest and tyrannical versions.

Love, in distinction from friendship, is killed, or rather extinguished, the moment it is displayed in public. ("Never seek to tell thy love/Love that never told can be.") Because of its inherent wordlessness, love can only become false and perverted when it is used for political purposes such as the change or salvation of the world.

Without actually standing where Archimedes wished to stand (*dos moi pou sto!*), still bound to the earth through the human condition, we have found a way to act on the earth and within terrestrial nature as though we dispose of it from outside, from the Archimedean point. And even at the risk of endangering the natural life process we expose the earth to universal, cosmic forces alien to nature's household.

The Cartesian removal of the Archimedean point into the mind of man, while it enabled man to carry it, as it were, within himself wherever he went and thus freed him from given reality altogether—that is, from the human condition of being an inhabitant of the earth—has perhaps never been as convincing as the universal doubt from which it sprang and which it was supposed to dispel. Today, at any rate, we find in the perplexities confronting natural scientists in the midst of their greatest triumphs the same nightmares which have haunted the philosophers from the beginning of the modern age.

QUESTIONS

Did he dream about dragons? Did he dream about deer? Did he whisper the names of friends who were near? What songs did they play, and how far away? Why did he whisper, why did she scream? What does the sound of a screen door mean? Who walks in the pasture? Who talks on the hill? Who goes to the collar, can you feel the chill? Where does the river, when will the wind? How far are the mountains? Where do they end? Why would the church? Did the service begin? Tell me who died, and tell me who cried. Help me to hide in the skin of a deer, my zippered-up bag in the mouth of a stag so swiftly I go through rows of does, it flows, it flows, it flows, it flows all over the hill where the green grass grows.

The Human Condition

At the end of a peyote meeting, in the morning, food and water are brought in by a woman designated to be Peyote Woman. Indian women are not supposed to speak up much on general subjects, and during a meeting the women are silent participants. But at dawn Peyote Woman has the floor and the power. She speaks of fundamental things like water and birth and nourishment with all the authority of the Earth and with awesome perception.

Hannah Arendt does the same in this book. Her subject is the elements of the human condition. Her perspective, the threshold of travel away from the Earth.

Man and His Symbols

Carl Jung did a nice thing just before he died. He helped with a British effort to bring all of his work together in one richly illustrated introduction to the breadth of his realm. This book covers his concepts of the unconscious, myths, individuation, the visual arts, dreams, and analysis. Why aren't all psychology books illustrated?

A car is another kind of possession that is usually feminized—i.e., that can become the focus of many men's anima projections. Like ships, cars are called "she," and their owners caress and pamper them like favorite mistresses.

A still more subtle manifestation of a negative anima appears in some fairy tales in the form of a princess who asks her suitors to answer a series of riddles or, perhaps, to hide themselves under her nose. If they cannot give the answers, or if she can find them, they must die—and she invariably wins. The anima in this guise involves men in a destructive intellectual game. We can notice the effect of this anima trick in all those neurotic pseudo-intellectual dialogues that inhibit a man from getting into direct touch with life and its real decisions. He reflects about life so much that he cannot live it and loses all his spontaneity and outgoing feeling.

Oh, come, lonely hunter in the stillness of dusk.
Come, come! I miss you, I miss you!
Now I will embrace you, embrace you!

Come, come! My nest is near, my nest is near.
Come, come, lonely hunter, now in the stillness of dusk.

He throws off his clothes and swims across the river, but suddenly she flies away in the form of an owl, laughing mockingly at him. When he tries to swim back to find his clothes, he drowns in the cold river.

The sign is always less than the concept it represents, while a symbol always stands for something more than its obvious and immediate meaning.

Abstract mandalas also appear in European Christian art. Some of the most splendid examples are the rose windows of the cathedrals. These are representations of the Self of man transposed onto the cosmic plane. (A cosmic mandala in the shape of a shining white rose was revealed to Dante in a vision.) We may regard as mandalas the haloes of Christ and the Christian saints in religious paintings.

The archetypal sacred marriage (the union of opposites, of the male and female principles) represented here by a 19th-century Indian sculpture of the deities Siva and Parvati.

Psychological Reflections

The selection and editing of paragraphs from Jung's writings by Jacobi is done with an informed sense of continuity, so that the book is readable in sequence or by bits.

No one develops his personality because someone told him it would be useful or advisable for him to do so. Nature has never yet allowed herself to be imposed upon by well-meaning advice. Only coercion working through casual connections moves nature, and human nature also. Nothing changes itself without need, and human personality least of all. It is immensely conservative, not to say inert. Only the sharpest need is able to rouse it. The development of personality obeys no wish, no command, and no insight, but only need; it wants the motivating coercion of inner or outer necessities. Any other development would be individualism. This is why the accusation of individualism is a cheap insult when it is raised against the natural development of personality.

The man who would learn the human mind will gain almost nothing from experimental psychology. Far better for him to put away his academic gown, to say good-bye to the study, and to wander with human heart through the world. There, in the horrors of the prison, the asylum, and the hospital, in the drinking-shops, brothels, and gambling hells, in the salons of the elegant, in the exchanges, socialist meetings, churches, religious revivals, and sectarian ecstasies, through love and hate, through the experience of passion in every form in his own body, he would reap richer store of knowledge than text-books a foot thick could give him. Then would he know to doctor the sick with real knowledge of the human soul.

A neurosis has really come to an end when it has overcome the wrongly oriented ego. The neurosis itself is not healed; it heals us. The man is ill, but the illness is an attempt of nature to heal him. We can therefore learn a great deal for the good of our health from the illness itself, and that which appears to the neurotic person as absolutely to be rejected is just the part which contains the true gold which we should otherwise never have found.

The secret of the earth is not a joke and not a paradox. We need only see how in America the skull and hip-measurements of all European races become Indianized in the second generation. That is the secret of the American soil. And every soil has its secret, of which we carry an unconscious image in our souls: a relationship of spirit to body and of body to earth.

The greater the contrast, the greater is the potential. Great energy only comes from a correspondingly great tension between opposites.

A revised and retranslated edition of *Psychological Reflections* is available in hardcover for \$8.50 from Princeton University Press, Princeton, N.J. 08540.

It is naturally a fundamental error to believe that if we see an anti-value in a value, or an untruth in a truth, the value or the truth is then invalid. They have only become relative. Every thing human is relative, because every thing depends upon an inner polarity, for everything is a phenomenon of energy. And energy itself necessarily depends on a previous polarity without which there can be no energy. There must always be high and low, hot and cold, etc., so that the process of adjustment which is energy, can occur. The tendency to deny all previous values in favour of their opposites is therefore just as exaggerated as the former one-sidedness. Where generally accepted and undoubted values are suddenly thrown away, there is a fatal loss. Whoever acts in this way ends by throwing himself overboard with the discarded values.

The gigantic catastrophes that threaten us are not elemental happenings of a physical or biological kind, but are psychic events. We are threatened in a fearful way by wars and revolutions that are nothing else than psychic epidemics. At any moment a few million people may be seized by a madness, and then we have another world war or devastating revolution. Instead of being exposed to wild beasts, tumbling rocks, and inundating waters, man is exposed today to the elemental forces of his own psyche. Psychic life is a world-power that exceeds by many times all the powers of the earth. The Enlightenment, which stripped nature and human institutions of gods, overlooked the one god of fear who dwells in the psyche. Fear of God is in place, if anywhere, before the domination power of psychic life.

No doubt it is a great nuisance that mankind is not uniform but compounded of individuals whose psychic structure spreads them over a span of at least ten thousand years. Hence there is absolutely no truth that does not spell salvation to one person and damnation to another. All universalisms get stuck in this terrible dilemma.

Anthropology Today

If revising human affairs is your concern, or adapting to harsh social/environmental changes, the anthropological perspective can be enormously useful. Much of the value of Gary Snyder, Kurt Vonnegut, Carlos Castaneda is attributed by them to their study of anthropology. When understanding spans remote cultures, it's powerful understanding, seldom chauvinistic.

This book from the Psychology Today folks will do for introduction.

And then there was that strange element in the evolution of so many towns: the drive to the west which so often leaves the eastern part of the town in poverty and dereliction. It may be merely the expression of that cosmic rhythm which has possessed mankind from the earliest times and springs from the unconscious realization that to move with the sun is positive, and to move against it negative; the one stands for order, the other for disorder.

The ensemble of a people's customs has always its particular style; they form into systems. I am convinced that the number of these systems is not unlimited and that human societies, like individual human beings (at play, in their dreams, or in moments of delirium), never create *absolutely*: all they can do is to choose certain combinations from a repertory of ideas which it should be possible to reconstitute.

What we call 'natural' sentiments were held in great disfavour in their society: for instance, the idea of procreation filled them with disgust. Abortion and infanticide were so common as to be almost normal—to the extent, in fact, that it was by adoption, rather than by procreation, that the group ensured its continuance. One of the main objects of the warriors' expeditions was to bring back children. At the beginning of the nineteenth century it was estimated that not more than one in ten of Guaicuru group were Guaicuru by birth.

No society is perfect. Each has within itself, by nature, an impurity incompatible with the norms to which it lays claim: this impurity finds outlet in elements of injustice, cruelty, and insensitivity. How are we to evaluate those elements? Anthropological enquiry can provide the answer. For while the comparison of a small number of societies will make them seem very different from one another, these differences will seem smaller and smaller as the field of investigation is enlarged. It will eventually become plain that no human society is fundamentally good: but neither is any of them fundamentally bad; all offer their members certain advantages, though we must bear in mind a residue of iniquity, apparently more or less constant in its importance, which may correspond to a specific inertia which offers resistance, on the level of social life, to all attempts at organization.

When we make an effort to understand, we destroy the object of our attachment, substituting another whose nature is quite different. That other object requires of us another effort, which in its turn destroys the second object and substitutes a third—and so on until we reach the only enduring Presence, which is that in which all distinction between meaning and the absence of meaning disappears: and it is from that Presence that we started in the first place. It is now two thousand five hundred years since men discovered and formulated these truths. Since then we have discovered nothing new—unless it be that whenever we investigated what seemed to be a way out, we met with a further proof of the conclusions from which we had tried to escape.

The Bible of the World

A collection of the essential writings of the eight major religions—Hindu, Buddhist, Confucianist, Taoist, Zoroastrian, Judeo-Christian, and Mohammedan. Super for dipping into as literature & poetry; more than adequate at conveying the essential sameness, rather than the differences between religious philosophies. Softly mind-expanding.

(Death concludes his discourse)

There is that ancient tree, whose roots grow upward and whose branches grow downward—that indeed is called the Bright, that is called Brahman, that alone is called the Immortal. All worlds are contained in it, and no one goes beyond.

Whatever there is, the whole world, when gone forth from the Brahman, trembles in its breath. That Brahman is a great terror, like a drawn sword. Those who know it become immortal. From terror of Brahman fire burns, from terror the sun burns, from terror Indra and Vayu, and Death, as the fifth, run away.

If a man could not understand it before the falling asunder of his body, then he has to take body again in the worlds of creation.

As in a mirror, so Brahman may be seen clearly here in this body; as in a dream, in the world of the fathers; as in the water, he is seen about in the world of the Gandharvas; as in light and shade, in the world of Brahma.

Having understood that the senses are distinct from the Atman, and that their rising and setting, their waking and sleeping, belong to them in their distinct existence and not to the Atman, a wise man grieves no more.

The Upanishads

In hewing the wood for an axe-handle, how do you proceed?
Without another axe it cannot be done.

Confucianist Scriptures

We sacrifice unto the undying, shining, swift-horsed Sun.

When the light of the sun waxes warmer, when the brightness of the sun waxes warmer, then up stand the heavenly Yazatas, by hundreds and thousands: they gather together its glory, they make its glory pass down, they pour its glory upon the earth made by Ahura, for the increase of the world of holiness, for the increase of the creatures of holiness, for the increase of the undying, shining, swift-horsed Sun.

And when the sun rises up, then the earth, made by Ahura, becomes clean; the running waters become clean, the waters of the wells become clean, the waters of the sea become clean, the standing waters become clean; all the holy creatures, the creatures of the Good Spirit, become clean.

Zoroastrian Scriptures

Then the Lord answered Job out of the whirlwind, and said, Who is this that darkeneth counsel by words without knowledge?

Grid up now thy loins like a man; for I will demand of thee, and answer thou me.

Where wast thou when I laid the foundations of the earth? declare, if thou hast understanding. Who hath laid the measures thereof, if thou knowest? or who hath stretched the line upon it? Whereupon are the foundations thereof fastened? or who laid the cornerstone thereof: when the morning stars sang together, and all the sons of God shouted for joy?

Job

EAGLE ROCK

Sometime between first light and actual sunrise Estelle turned onto a dirt road and followed it three miles to Eagle Rock State Park, where the sign said there was a campground. They really didn't have time to stop and camp. They were almost out of money and the only chance they had of getting any time soon was in St. Louis if they could get there by Tuesday. D.R.'s buddy Eddie owed him sixty dollars. Eddie had promised to pay D.R., but Tuesday night he was splitting St. Louis for Mexico to score a big bunch of grass. If they were going to get to St. Louis by Tuesday they certainly couldn't afford to lose a whole day camping, but, as Estelle figured it, they couldn't afford not to stop either. D.R. was getting freakier by the mile and Estelle thought she felt a cold coming on. They were both wiped out and Urge was an impossible mess. Maybe if they stopped and rested for a day, straightened up their gear and got some sun they'd both feel strong enough to make St. Louis in one more non-stop push.

There was a chain across the drive-way at the park entrance but it was easy enough to drive around it. If the ranger didn't come around later in the day to collect the camping fee, Estelle had just saved two whole dollars. It was a good omen. Stopping was the thing to do all right. As she cruised the graveled drive-way looking among the assorted tents and trailers for a place to park, she began to feel really happy. The campground was incredibly crowded, but at last she found an empty space in the corner farthest from the river, a narrow slot between a GMC pickup with a great hulking camper rig on top, and a green Porsche parked in front of a red pup tent. There were beer cans all over the place, and someone had left an enormous turd lying cross ways on the metal grill above the fireplace. But Estelle was so glad to be someplace in particular she didn't let it bother her. She picked the shit up on a piece of cardboard and buried it under some leaves. In fifteen minutes she had most of the trash picked up, which included a plastic bag with some old apples in it good enough to wash and eat. I could even cook 'em, she told herself. Cooked apples. Goddamn. Her taste buds went to work on an image of apples steaming in a pot as she walked off in search of a restroom.

Parable of the Beast

if you are into molecular memory, chemical communication, slime mold colonies, time pulse perception, third eyes, acid, serotonin, intramural aggression, and other types of meta-mysticism, then bleibtreu probably has something for you, too.

he's trying to put instincts back into science and take a little of the speculation out of the name "Homo sapiens", through an introduction to the study of ethology.

readable, maybe reliable.

No man enters a relationship except on purpose. The question is always, "How do I best stay alive and happy?"

The answer is eternally the same. "No matter how hard you work to better yourself, you can't possibly be happy while the people around you are down. It's plain common sense then to start out with making others happy." Now you can relax.

HOW TO TELL UP FROM DOWN

There are 3 characteristic signs which appear when you're headed in the right direction:

1. There's an immediately noticeable improvement in the style of your daily existence.
2. You gradually assume conscious control over what happens to you.
3. It feels good.

THE HUMAN FIGURE IN MOTION, Eadweard Muybridge. "Unparalleled dictionary of action for artists" (American Artist) contains more than 4500 stopped-action photographs, in series, showing undraped men, women, children jumping, lying down, running, sitting down, throwing, wrestling, carrying objects, and similar actions. Taken by the great 19th-century photographer, Muybridge, these are among the finest action shots ever taken. 4789 photographs. xvii + 390pp. 7 7/8 x 10 3/4. 20204-6 Clothbd. \$12.50

THE UPANISHADS, translated by Max Müller. Twelve classical upanishads: Chandogya, Kena, Aitareya, Kaushitaki, Isa, Katha, Mundaka, Taithiriya, Brhadaranyaka, Svetasvatara, Prasna, Maitriyana. 160-page introduction, analysis by Prof. Müller. Total of 826pp. 20992-X, 20993-8 Two volumes, Paperbd. \$6.00

THE INDIANS' BOOK, recorded and edited by Natalie Curtis. Lore, music, narratives, dozens of drawings by Indians themselves from an authoritative and important survey of native culture among Plains, Southwestern, Lake and Pueblo Indians. Standard work in popular ethnomusicology. 149 songs in full notation. 23 drawings, 23 photos. xxxi + 584pp. 6 7/8 x 9 3/4. 21939-9 Paperbd. \$4.00

THE PHOENIX AND THE CARPET. The Bastables find an egg in an oriental carpet and hatch a phoenix. 48 illustrations. 325pp. (USO) 21501-6 Clothbd. \$3.00

VISUAL ILLUSIONS: THEIR CAUSES, CHARACTERISTICS, AND APPLICATIONS, Matthew Luckiesh. Thorough introduction for psychologists, artists, laymen to geometric and perspective illusions; size and shape distortions; illusions of color, of motion; natural illusions; psychology involved. Also uses of illusions in arts, magic, science. Introduction by William H. Ittleson. 100 illustrations. xxi + 252pp. 21530-X Paperbd. \$1.75

THE BEAR THAT WASN'T, Frank Tashlin. Delightfully humorous, yet with serious implications; a fable for our time and an utterly charming children's story. In sum, a book that defies classification. Profusely illustrated. v + 51pp. 20939-3 Paperbd. \$1.00

THE SYMPHONIES OF MOZART, G. de Saint-Foix. The author of the standard multi-volume work on Mozart writes with his usual profundity and clarity on all 41 symphonies, the Maurerische Trauermusik, overtures, minor pieces, etc. Translated by Leslie Orrey. 121 musical quotes. xiii + 222 pp. (USO) 21247-5 Paperbd. \$2.00

SNOW CRYSTALS, W. A. Bentley and W. J. Humphreys. Over 2,000 beautiful, clear snowflakes (and occasional ice formations) enlarged from photomicrographs. Brief text on methodology of research. Can be used for decoration in many contexts. 202 plates. 226pp. 8 x 10 1/4. 20287-9 Paperbd. \$4.00

FROM MAGIC TO SCIENCE: ESSAYS ON THE SCIENTIFIC TWILIGHT, Dr. Charles Singer. Foremost medical historian on topics in history of medicine, related areas. Medicine in the Roman Empire, the Dark Ages, School of Salerno, early English magic and medicine, herbals, St. Hildegard and migraine visions, etc. 122 illustrations. xxxi + 253pp. 20390-5 Paperbd. \$2.75

ABSOLUTELY MAD INVENTIONS, A. E. Brown and H. A. Jeffcott, Jr. Inventions—zany, absurd, hilarious, useless or merely fanciful—all of which have been granted patents by the United States Patent Office. An edible tie pin, a balloon propelled by eagles and vultures, and a locket to hold used chewing gum, are but three of the proposed devices, all illustrated with the inventors' drawings and descriptions. 57 full-page illustrations. Formerly Beware of Imitations. 125pp. 22596-8 Paperbd. \$1.50

PRIMITIVE ART, Franz Boas. America's foremost anthropologist surveys textiles, ceramics, woodcarving, basketry, metalwork, etc. Patterns, technology, creation of symbols, style origins. All areas of world, but very full on Northwest Coast Indians. More than 350 illustrations of baskets, boxes, totem-poles, weapons, etc. 378pp. 20025-6 Paperbd. \$2.50

MECHANICS, J. P. Den Hartog. A classic introductory text or refresher. Hundreds of actual applications and design problems are used to illuminate fundamentals of trusses, jacks, hoists, loaded beams and cables, gyroscopes, etc. Over 550 diagrams and drawings. 334 answered problems. x + 462pp. 60754-2 Paperbd. \$3.00

AN INVESTIGATION OF THE LAWS OF THOUGHT, George Boole. Classic in symbolic logic, still most useful as an introduction showing use of algebraic methods, calculus of probabilities, and similar material. Reprint of 1854 edition. xi + 424pp. 60028-9 Paperbd. \$2.75

Ecology and Revolutionary Thought

To sum up the critical message of ecology:

If we diminish variety in the natural world, we debase its unity and wholeness. We destroy the forces making for natural harmony and stability, for a lasting equilibrium, and what is even more significant, we introduce an absolute retrogression in the development of the natural world, eventually rendering the environment unfit for advanced forms of life. To sum up the reconstructive message of ecology: If we wish to advance the unity and stability of the natural world, if we wish to harmonize it on ever higher levels of development, we must conserve and promote variety. To be sure, mere variety for its own sake is a vacuous goal. In nature, variety emerges spontaneously. The capacities of a new species are tested by the rigours of climate, by its ability to deal with predators, by its capacity to establish and enlarge its niche. Yet the species that succeeds in enlarging its niche in the environment also enlarges the ecological situation as a whole. To borrow E. A. Gutkind's phrase, it "expands the environment", both for itself and for the species with which it enters into a balanced relationship.

In the New World, the so-called "classic" period of the Amerindian civilizations continued in full bloom for several centuries after 600 A.D. In Guatemala and adjacent parts of Mexico, classic Mayan cult centers increased in number and complexity. Then, about the middle of the ninth century, Mayan temples began to be abandoned, one by one, and jungle grew back over the vast courtyards, roadways, and steps pyramids. Yet there is no reason to suppose that the Mayan populations abandoned the region. Perhaps raids from the north destroyed the corps of ritual experts, thus preventing the continuance of the old elaborate cults, even if the common people still retained full faith in them. But, in view of the absence of any signs of violence at the deserted sites, it is more probably that the priestly specialists simply failed to prevent the spread of a simpler, popular religion that allowed individual farmers to assure the fertility of their maize fields by appropriate private ceremonies, thus rendering the priests' costly ritual services otiose. In the sixteenth century, European intruders found just such a private cult among the Mayan peoples, which (whenever it was introduced) obviously made the elaborate temple centers of an earlier age permanently unnecessary.

The fact that even the best laid plans for directing human affairs still often fail may turn out to be humanity's saving grace.

Once their intellectual curiosity had been aroused, Westerners discovered that the Moslems possessed a sophistication of mind and richness of learning far surpassing that available in Latin. Regular schools of translators therefore set eagerly to work to bring the treasures of Arabic learning to the Latin world. Toledo became the principal seat of this activity; but parallel work was done also in Sicily and, on a smaller scale, at Salerno, Salamanca, and Venice. The translators sought useful knowledge and were little concerned with belles-lettres. Hence they concentrated on works of medicine, mathematics, astronomy, optics, philosophy, and encyclopedic collections of information about the natural and supernatural world.

Men some centuries from now will surely look back upon our time as a golden age of unparalleled technical, intellectual, institutional, and perhaps even of artistic creativity. Life in Demosthenes' Athens, in Confucius' China, and in Mohammed's Arabia was violent, risky, and uncertain; hopes struggled with fears, greatness teetered perilously on the brink of disaster. We belong in this high company and should count ourselves fortunate to live in one of the great ages of the world.

A Year From Monday

John Cage is bright, original, and cheerful. Reading him makes me feel the same. His subject these days is "How to Improve the World (You Will Only Make Matters Worse)". Practical hints, slipped past like a puck behind the goalie's back.

Most men of fifty or so are more intimate with another revolution, with the peculiar timebound apocalypse (for so we now see it) of the Thirties. There was almost pathetic testimony to this at a conference on The Future held at Rutgers University in 1965, where the discussion, dominated by well-known writers from New York, got stuck in the Thirties, as if the only true basis for prediction was in that period. I was never myself subjected to any experience comparable to the cauldron of New York left politics, but I could understand the fixation; my late teens were dominated by the Depression and the Spanish Civil War and the Moscow Trials and the Ribbentrop Pact. It is difficult, and probably useless, to go into this with the young. The Marxism of the time was cruder, the economic predictions on which we founded our certainties of disaster and renovation were wrong, and we all made, without thinking, certain reservations about our own roles in a transformed society which now seem naive or even dishonest. But there are, for all that, resemblances between then and now. It seemed quite certain that after the crisis there would be a wholly new state of affairs, not a modification of the old one.

ESTELLE'S SHOWER

It was at the Eagle Rock State Park campground that Estelle took the most delicious hot shower she'd ever had in her entire life. It was like a dream. The water pounded her neck and shoulders and folded her up in great hot clouds of steam. I'm a taco, she thought, a hot tamale cooking in a pan. The water sprayed into her mouth, the steam filled her ears and nose and seeped in at the corners of her eyes. After a night of cold rain on the open road, here she was in hot rain in a room, a steam room that at five fifteen in the morning belonged to her alone. She ran out of the shower for a minute to turn on all the other showers. In the corner stall she found a brand new bar of Dial soap, and as the bathroom filled with steam, Estelle washed herself all over, then shampooed her hair. She stayed under the water till her fingers began to wrinkle. Finally she managed to draw away from the shower stall into the cloud outside, where she used her shirt for a towel. When she was dry she went to the door and looked out, holding her clothes in her hand. The camp was sound asleep. Not even the birds were stirring yet. Laughing out loud, Estelle skipped naked down the gravel street to dear old Unga, stopping off along the way to steal some firewood from a shed that was selling it on the honor system for seventy five cents a bundle.

The Year 2000

Is Herman Kahn the bad guy (as liberal opinion would have it) or a good guy (as in some informed opinion)? Kahn will hang you on that question and while you're hanging jam information and scalding notions into your ambivalence. He does this best with a live audience, but this book is a fine collection of the information he uses.

Here is most of the now-basic methodology of future study—multi-fold trends, surprise-free projections, scenarios, etc. And here are their results. It's the best future-book of the several that are out.

In my opinion, it is not particularly an accurate picture of the future but the most thorough picture we have of the present—the present statistics, present fantasies, present expectations that we're planning with. We are what we think our future is.

TABLE IX

The Postindustrial (or Post-Mass Consumption) Society

1. Per capita income about fifty times the preindustrial
2. Most "economic" activities are tertiary and quaternary (service-oriented), rather than primary or secondary (production-oriented)
3. Business firms no longer the major source of innovation
4. There may be more "conservatives" (vs. "marketives")
5. Effective floor on income and welfare
6. Efficiency no longer primary
7. Market plays diminished role compared to public sector and "social accounts"
8. Widespread "cybernation"
9. "Small world"
10. Typical "doubling time" between three and thirty years
11. Learning society
12. Rapid improvement in educational institutions and techniques.
13. Erosion (in middle class) of work-oriented, achievement-oriented, advancement-oriented values
14. Erosion of "national interest" values
15. Sensate, secular, humanist, perhaps self-indulgent criteria become central

The Futurist

In part because the Future is a new field of methodic study this is a lively newsletter. It reports bi-monthly on new books and programs having anything to do with social forecasting. Future study is like education: everybody thinks they're good at it. The newsletter has some of that diluted flavor, but it doesn't matter. Useful pointing at useful activities done here.

Maslow's Hierarchy of Needs

Abraham Maslow, a Brandeis University psychologist, has postulated that all men share certain basic needs which can be arranged in a hierarchy of five levels, from the most fundamental physiological needs to the needs of intellectual and spiritual fulfillment. The five levels are:

1. **Physiological needs:** To survive, man needs food, clothing, shelter, rest. As the imperative requirements for staying alive, these represent the most elemental needs.
2. **Safety or security needs:** When physiological needs are satisfied, man wants to keep and protect what he has. He starts to try to stabilize his environment for the future.
3. **Social needs:** As his environment becomes more stable, he seeks to be part of something larger than himself. He has social needs for belonging, for sharing and association, for giving and receiving friendship and love.
4. **Ego needs:** These are the needs that relate to one's self-esteem (needs for self-confidence, independence, achievement, competence, knowledge) and one's reputation (needs for status, recognition, appreciation, deserved respect of one's peers).
5. **Self-fulfillment needs:** Finally comes the need for growth, self-development, self-actualization. As the capstone of all his other needs, man wants to realize the full range of his individual potential as a human being.

At each level, needs determine values and patterns of behavior. At the survival level, for instance, man values food, clothing and shelter most highly. It is important to note that a satisfied need is not a motivator of behavior. (Once hunger has been satisfied, it no longer has much motivating force.) Furthermore, higher level needs operate only when lower level needs continue to be met.

A Generation Looking for "Munich" May Be Followed by a Generation Looking for "Vietnam"

There was, once upon a time, a generation whose consciousness was formed by Munich, and that generation has been walking around looking for Munich ever since. Among them are the guys who got us into this crazy disaster in Vietnam, because they were looking for Munich and they thought they had found another one.

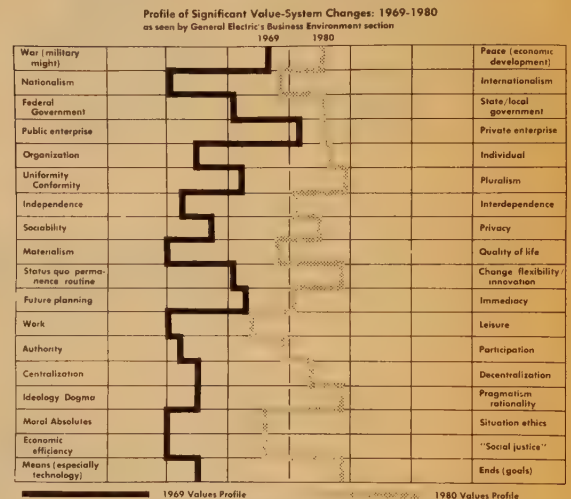

Try to think what it is going to mean to have millions of Americans looking for Vietnam the rest of their lives. That is: the first thing they say about an American President is: "He is probably lying to us." Not the last thing. Not the thing you come to through great suffering. But the first thing you say is: "That son-of-a-bitch is probably lying, because every American President I can ever remember has been lying to us."

That is going to cut very deep, because if you are living in a society in which a big chunk just doesn't believe the government is legitimate, or thinks it probably isn't, and you've got to prove to them with great labor that it is, that is a very strange event in American history.

—Arthur I. Waskow

Changes in value systems will be the major determinant of social, political and economic developments on the domestic scene.

It may well be that identifying value changes will become the single most important element of environmental forecasting. For, if these changes can be identified and analyzed, then it will be that much more feasible to predict the course of the major currents in our society.

One way of anticipating probable changes in values, attitudes and behavior is to view them as the consequences of a progression, on a national scale, up Maslow's hierarchy of needs. Since man is a creature of seemingly endless needs, we can predict that, when one has been satisfied, another will appear in its place. Furthermore, when one level of needs has been satisfied, he will proceed to the next level. The levels are progressively less essential in terms of sheer survival, and more important in terms of living at one's fullest human potential (which seems to be the ultimate level of aspiration).

Mankind 2000

Politicians seldom invent things. They respond to pressures by reaching into the current social invention bag and finding whatever looks like the most promising program for this day our daily conflict.

So who makes the inventions? A motley crew is who. Political aids, academes, business entrepreneurs, artists, liberal scientists, and occasionally a grass root and friends. Some of their thoughts get published; some purely happen.

Whether you're an inventor or a piece of the pressure, you may want to know what's in the bag so far for the rest of this century. This book has a good range of the published ideas and expectable pressures, some lovely, some harrowing, all impinging on your very own personal world to come.

—SB

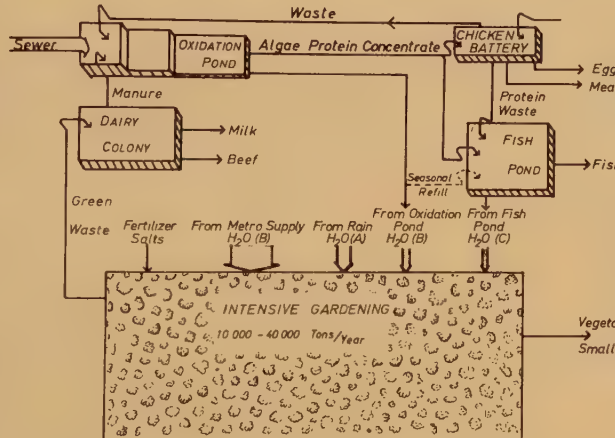

Fig. 3. Production of perishable foods in urban village (Population up to 35,000 persons)

The neatest case is the sit-ins, where the civil rights movement said, "Our desirable-achievable future is that we want to be able to eat in integrated restaurants. We will not petition legislatures to require integration, we will not petition the owners of the restaurants to integrate, we will simply create the future. This is, we will integrate the restaurants, and it will rest upon those who have the power of law and the power of ownership in their hands, to decide how to respond to that creation. So we will build now what it is we want to exist in the future, and society will have to react to that. It will have to let us build it, or it will have to punish us for building it. If it punishes us for building it, we believe we can build support around that vision of the future, and can, therefore, mobilize people into action to achieve that future."

Arthur I. Waskow

We might be able to create "future gaming" centers which could offer experience in "living" alternative futures to people who are fed up with the present but have no feel for a workable or desirable society.

Arthur I. Waskow

Sewage-produced algae would be fed to chickens and fish (cattle do not need the protein) according to minor modifications of existing art in these forms of husbandry (Fig. 3).

Altogether, about two thirds or more of the weight and at least a quarter of the caloric intake of the urban diet can very likely be produced economically inside the city itself using present knowledge.

Richard L. Meier

Even in advanced countries, futurology is not necessarily identical and, moreover, can be roughly divided into three groups:

- European type
- US-Soviet type
- Japanese type

All through the riots of '72 we watched, itching to leave the city but somehow still attached. I mean, we knew. We knew as early as '67, but it was so science-fictiony that we just kind of dreamed happily over it, making incredibly detailed lists, playing with the Ouija Board, studying astrology and making predictions in an off-handedly superior way. We got disillusioned in '68, and went on a lot of sidetrips, falling in love, losing it, moving, practicing all kinds of odd crafts, having babies. We knew what was happening by '69. We had our Whole Earth catalogs, and our stash of Acapulco and Panamanian pot seeds, and we were desperately raking bread, working, trying to get it together.

It was a communal trip at first, and gradually it got thinner, down to the family, and the family seemed to be a lot smaller than we'd thought. Government pamphlets, nightsoil, organic gardening, Diesel engines, music, meditation and chauvinism mounted. We decided to leave in secret.

All the mediums, most of the astrologers, some of the psychics, and even some political economists agreed that we were eating the earth into Armageddon. So we still waited, planning, collecting. In '73 we got into our bus and split for Oregon. We drove all night and the better part of the day, slept just in time to hear on the car radio that Red China had started bombing somebody, but not us yet, thank God. We woke and drove again, through the night, and finally we got there, and fell out, exhausted. In the morning the baby started to cry.

We got up. Outside the curtained windows of our bus, through the trees and the virgin country, we saw seven tepees, three Volkswagen busses, two school busses, one Renault Dauphine with a pup tent on top of it, a half-hewn cabin, two chemical toilets, several dogs, more cats, a fire somewhere off in the distance, and standing around us were ninety-seven people. They looked hungry. They all had long hair. Nobody was smiling.

We ate the ones over thirty first.

Later, the soldiers came.

What's wrong with this story?

from *Tuesday's Child*—Vol. 1, No. 2

1616 North Argyle Ave.
Hollywood, CA 90028
\$6/yr.

It is as impossible to appeal to a neutral principle to determine the rationality of competing systems, as it is to invoke a neutral vocabulary to characterize a language. It is in the name of one kind of logic that one rejects the logic of another. Arnold Nash illustrated this "irrational prejudice" of reason very well in the story of a doctoral examination. The candidate, who submitted a study on Mormon history, was asked whether he, being a Mormon, regarded himself sufficiently unprejudiced to write a thesis on Mormon history. The student replied, "Yes, if you, not a Mormon, consider yourself unprejudiced enough to examine it."

An important difference exists between "having-no" knowledge and having "no-knowledge." The former is merely a state of ignorance; the latter is one of ultimate enlightenment and universal sensibilities. To the confirmed rationalist, no-knowledge may appear to be the hugger-muggery of the mystagogue. Nevertheless, it is precisely its ineffability that lends force to its reality. The mysteries of nature appear to be mysteries only to those who refuse to participate in them. . . .

With rational knowledge, the scientist is a spectator of nature. With no-knowledge, he becomes a participant in nature. There is a communion of understandings. He no longer shares that tragic suffering of many individuals, who "fear of finding oneself alone," as André Gide describes it, "and so they don't find themselves at all."

The Emerging Japanese Superstate

After some uncomfortable years with the old cliché—California Is The Future—I welcome the new cliché—Japan Is The Future. After a visit there last year, I do believe that all futurists should do some time in industrial Japan. Not just awesome statistics, as Kahn cogently points out, but a whole national psyche is cooking there. A sense of Manifest Destiny that dwarfs Israel's. Generational conflict like and oddly unlike our own. Ecological practice far worse and far better than anyone else's. The damndest loyalties. Insatiable resource hunger. Desire for nuclear weapons. Planetary impact, and maybe leadership.

It'll be nice to have California merely quaint again.

. . . This all-embracing applicability of no-knowledge makes it a valuable tool for the executive. It provides him with a common ground of all situations. It is his means of transcendence over specific experience of which he has not yet tasted. Versed in no-knowledge, he is at home under otherwise strange conditions; he always finds familiar strains in his management of assorted enterprises.

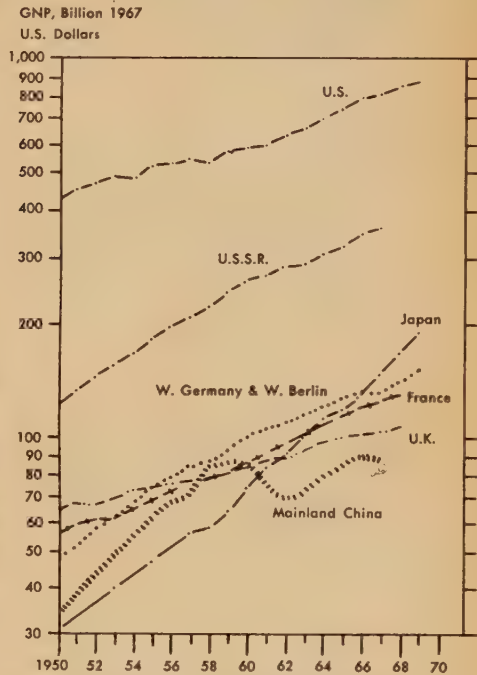

The scientific West adopts the positive method and the Taoist East the negative. In the positive method the item under question is intentionally pointed out and described. In the negative method, it is specifically not discussed. By not dissecting the ineffable x in question but merely restricting discourse to objects that it is not, the features of the x are revealed in our dim consciousness.

Communal. In nearly all activities and issues the Japanese traditionally think of themselves as members of a group, and their satisfactions are largely expected to come through group fulfillment of group objectives. In traditional Japanese culture, and to an amazing degree today (despite a nominal emphasis on democratic individuality and other erosions of traditional patterns and ties), one of the worst of all sins is to display an egoistic disregard of, disinterest in, or resistance to group mores, attitudes, taboos, totems, traditions, or objectives—or often just to display any individualism at all.

Traditionally every Japanese is part of a hierarchical structure. There are people who rank above every individual, except the Emperor and the shogun, and except for the youngest daughter of a member of the outcast Burakus, there are people beneath. To say in Japan that certain people are equal generally implies they are in equal distance from some common superior—i.e., they are equal in the way two privates or two generals are equal. Both have common rank in a pyramidal hierarchical structure.

It should also be noted that in probably no place in the world but Japan are such songs sung voluntarily and for fun. Certainly not in China, where there is a grim compulsion about singing them and where pleasure and voluntarism are the last two words one would use to describe the situation. It was interesting to me that at one time in Vietnam, when the Viet Cong took over a village they often made the people sing such songs for an hour or two. And when the Saigon government took over a village they too made the villagers sing songs for a half hour or so. However, when the villagers were queried, "What do you want?" the answer was almost invariably, among other things, "We want to quit singing."

The point I wish to make is the contrast between the high morale of present-day Japanese culture—in at least this matter of production—and the very low morale in the West on almost all issues.

Note: Purchasing power exchange rates are used.

THE LONE OUTDOORSMAN

About eight o'clock a man in a red hunting cap came out of the camper parked next to Urge and began dismounting the yellow trailbike from the front end of his GMC. He was short and overweight but you could tell by the way he wore his cap and held his pipe between his teeth that he took himself pretty seriously. His face was absurdly handsome. His face could have been in a TV ad for pipe tobacco, or a men's cologne. Probably in some previous incarnation the Lone Outdoorsman had been the best five foot, five inch high school halfback in the conference. He had on a black and green wool shirt, army boots and fatigue pants faded to a pale green. Dangling from the army web belt around his waist were a canteen, a compass, a long sheath-knife, a first aid kit, survival kit, snake bite kit, sewing kit, and a kit to repair flat tires with. He banged and rattled like a mobile hardware store, and yet he smoked his pipe and worked on his bike like any neighborhood family man out waxing his car on a Sunday afternoon.

From time to time the Outdoorsman would glance over his shoulder and peek at Divine Right and Estelle through the overhanging trees. They were sitting on the ground in front of the fireplace, eating hot apples and talking quietly. He didn't mean to pry. He was just, you know, checking things out, looking to see if there was any crime going on over there among the hippies. He noticed they were both eating out of the same dish, out of a stewpot, as a matter of fact. That was irregular, to be sure, but not quite an infraction, nothing to call the Lone Outdoorsman into action yet. He glanced at the two young people every few minutes until he got the bike dismounted. Then he got on, started 'er up, and rode off to the bathroom a hundred yards away.

Think Little

by Wendell Berry

these crises have been more private, and that we have each suffered more from them and been more responsible for them, than has been readily apparent, but the connections have been difficult to see. Racism and militarism have been institutionalized among us for too long for our personal involvement in those evils to be easily apparent to us. Think, for example, of all the Northerners who assumed—until black people attempted to move into *their* neighborhoods—that racism was a Southern phenomenon. And think how quickly—one might almost say how naturally—among some of its members the peace movement has spawned policies of deliberate provocation and violence.

But the environmental crisis rises closer to home. Every time we draw a breath, every time we drink a glass of water, every time we eat a bite of food we are suffering from it. And more important, every time we indulge in, or depend on, the wastefulness of our economy—and our economy's first principle is waste—we are *causing* the crisis. Nearly every one of us, nearly every day of his life, is contributing *directly* to the ruin of this planet. A protest meeting on the issue of environmental abuse is not a convocation of accusers, it is a convocation of the guilty. That realization ought to clear the smog of self-righteousness that has almost conventionally hovered over these occasions, and let us see the work that is to be done.

In this crisis it is certain that every one of us has a public responsibility. We must not cease to bother the government and the other institutions, to see that they never become comfortable with easy promises. For myself, I want to say that I hope never again to go to Frankfort to present a petition to the governor on an issue so vital as that of strip mining, only to be dealt with by some ignorant functionary—as several of us were not so long ago, the governor himself being “too busy” to receive us. Next time I will go prepared to wait as long as necessary to see that the petitioners' complaints and their arguments are heard *fully*—and by the governor. And then I will hope to find ways to keep those complaints and arguments from being forgotten until something is done to relieve them. The time is past when it was enough merely to elect our officials. We will have to elect them and then go and *watch* them and keep our hands on them, the way the coal companies do. We have made a tradition in Kentucky of putting self-servers, and worse, in charge of our vital interests. I am sick of it. And I think that one way to change it is to make Frankfort a less comfortable place. I believe in American political principles, and I will not sit idly by and see those principles destroyed by sorry practice. I am ashamed and deeply distressed that American government should have become the chief cause of disillusionment with American principles.

And so when the government in Frankfort again proves too stupid or too blind or too corrupt to see the plain truth and to act with simple decency, I intend to be there, and I trust that I won't be alone. I hope, moreover, to be there, and with a sign or a slogan or a button, but with the facts and the arguments. A crowd whose discontent has risen no higher than the level of slogans is *only* a crowd. But a crowd that understands the reasons for its discontent and knows the remedies is a vital community, and it will have to be reckoned with. I would rather go before the government with two men who have a competent understanding of an issue, and who therefore deserve a hearing, than to go with two thousand who are vaguely dissatisfied.

But even the most articulate public protest is not enough. We don't live in the government or in institutions or in our public utterances and acts, and the environmental crisis has its roots in our *lives*. By the same token, environmental health will also be rooted in our lives. That is, I take it, simply a fact, and in the light of it we can see how superficial and foolish we would be to think that we could correct what is wrong merely by tinkering with the institutional machinery. The changes that are required are fundamental changes in the way we are living.

What we are up against in this country, in any attempt to involve private responsibility, is that we have nearly destroyed private life. Our people have given up their independence in return mostly for the cheap seductions and the shoddy merchandise of so-called “affluence.” We have delegated all our vital functions and responsibilities to salesmen and agents and bureaus and experts of all sorts. We cannot feed or clothe ourselves, or entertain ourselves, or communicate with each other, or be charitable or neighborly or loving, or even respect ourselves, without recourse to a merchant or a corporation or a public service organization or an agency of the government or a style-setter or an expert. Most of us cannot think of dissenting from the opinions or the actions of one organization without first forming a new organization. Individualism is going around these days in uniform, handing out the party line on individualism. Dissenters want to publish their personal opinions over a thousand signatures.

The Confucian Great Digest says that the “chief way for the production of wealth” (and he is talking about real goods, not money) is “that the producers be many and that the mere consumers be few. . . .” But even in the much publicized rebellion of the young against the materialism of the affluent society, the consumer mentality is too often still intact: the standards of behavior are still those of kind and quantity, the security sought is still the security of numbers, and the chief motive is still the consumer's anxiety that one is missing out on what is “in.” In this state of total consumerism—which is to say a state of helpless dependence

on things and services and ideas and motives that we have forgotten how to provide ourselves—all meaningful contact between ourselves and the earth is broken. We do not understand the earth either in terms of what it offers us or what it requires of us, and I think it is the rule that people inevitably destroy what they do not understand. Most of us are not directly responsible for strip mining and extractive agriculture and other forms of environmental abuse. But we are guilty nevertheless, for we connive in them by our ignorance. We are ignorantly dependent on them. We do not know enough about them; we do not have a particular enough sense of their damage. Most of us, for example, not only do not know how to produce the best food in the best way—we don't know how to produce any kind in any way. And for this condition we have elaborate rationalizations, instructing us that dependence for everything on somebody else is efficient and economical and a scientific miracle. I say, instead, that it is madness, mass produced. A man who understands the weather only in terms of golf is participating in a chronic public insanity that either he or his descendants will be bound to realize as suffering. I believe that the death of the world is breeding in such minds much more certainly and much faster than in any political capital or atomic arsenal.

For an index of our loss of contact with the earth we need only to look at the condition of the American farmer—who must in our society, as in every society, enact man's dependence on the land, and his responsibility to it. In an age of unparalleled affluence and leisure, the American farmer is harder pressed and harder worked than ever before; his margin of profit is small, his hours long; his outlays for land and equipment and the expenses of maintenance and operation are growing rapidly greater; he cannot compete with industry for labor; he is being forced more and more to depend on the use of destructive chemicals and on the wasteful methods of haste and anxiety. As a class, farmers are one of the despised minorities. So far as I can see farming is considered marginal or incidental to the economy of the country, and farmers, when they are thought of at all, are thought of as hicks and yokels, whose lives do not fit into the modern scene. The average American farmer is now an old man, whose sons have moved away to the cities. His knowledge, and his intimate connection with the land are about to be lost. The small independent farmer is going the way of the small independent craftsmen and storekeepers. He is being forced off the land into the cities, his place taken by absentee owners, corporations, and machines. Some would justify all this in the name of efficiency. As I see it, it is an enormous social and economic and cultural blunder. For the small farmers who lived on their farms *cared* about their land. And given their established connection to their land—which was often hereditary and traditional as well as economic—they could have been encouraged to care for it more competently than they have so far. The corporations and machines that replace them will never be bound to the land by the sense of birthright and continuity, or by the love which enforces care. They will be bound by the rule of efficiency which takes thought only of the volume of the year's produce, and takes no thought of the slow increment of the live of the land, not measurable in pounds or dollars, which will assure the livelihood and the health of the coming generations.

If we are to hope to correct our abuses of each other and of other races and of our land, and if our effort to correct these abuses is to be more than a political fad that will in the long run be only another form of abuse, then we are going to have to go far beyond public protest and political action. We are going to have to rebuild the substance and the integrity of private life in this country. We are going to have to gather up the fragments of knowledge and responsibility that we have parceled out to the bureaus and the corporations and the specialists, and we are going to have to put those fragments back together again in our own minds and in our families and households and neighborhoods. We need better government, no doubt about it. But we also need better minds, better friendships, better marriages, better communities. We need persons and households that do not need to wait upon organizations but who can make

necessary changes in themselves, on their own.

For most of the history of this country our motto, implied or spoken, has been Think Big. I have come to believe that a better motto, and an essential one now, is Think Little. That implies the necessary change of thinking and feeling, and suggests the necessary work. Thinking Big has led us to the two biggest and cheapest political dodges of our time: plan-making and law-making. The lotus-eaters of this era are in Washington D.C., Thinking Big. Somebody comes up with a problem, and somebody in the government comes up with a plan or a law. The result, mostly, has been the persistence of the problem, and the enlargement and enrichment of the government.

But the discipline of thought is not generalization; it is detail, and it is personal behavior. While the government is "studying" and funding and organizing its Big Thought, nothing is being done. But the citizen who is willing to think little, and, accepting the discipline of that, to go ahead on his own, is already solving the problem. A man who is trying to live as a neighbor to his neighbors will have a lively and practical understanding of the work of peace and brotherhood, and let there be no mistake about it—he is *doing* that work. A couple who make a good marriage, and raise healthy, morally-competent children are serving the world's future more directly and surely than any political leader, though they never utter a public word. A good farmer who is dealing with the problem of soil erosion on an acre of ground has a sounder grasp of that problem, and *cares* more about it, and is probably doing more to solve it than any bureaucrat who is talking about it in general. A man who is willing to undertake the discipline and the difficulty of mending his own ways is worth more to the conservation movement than a hundred who are insisting merely that the government and the industries mend *their* ways.

If you are concerned about the proliferation of trash, then by all means start an organization in your community to do something about it. But before—and while—you organize, pick up some cans and bottles yourself. That way, at least, you will assure yourself and others that you mean what you say. If you are concerned about air pollution, help push for government controls, but drive your car less, use less fuel in your home. If you are worried about the damming of wilderness rivers, join the Sierra Club, write to the government, but turn off the lights you're not using, don't install an air conditioner, don't be a sucker for electrical gadgets, don't waste water. In other words, if you are fearful of the destruction of the environment, then learn to quit being an environmental parasite. We all are, in one way or another, and the remedies are not always obvious, though they certainly will always be difficult. They require a new kind of life—harder, more laborious, poorer in luxuries and gadgets, but also, I am certain, richer in meaning and more abundant in real pleasure. To have a healthy environment we will all have to give up things we like; we may even have to give up things we have come to think of as necessities. But to be fearful of the disease and yet unwilling to pay for the cure is not just to be hypocritical; it is to be doomed. If you talk a good line without being changed by what you say, then you are not just hypocritical and doomed; you have become an agent of the disease. Consider, for an example, the President, who advertises his grave concern about the destruction of the environment, and who turns up the air conditioner to make it cool enough to build a fire.

Odd as I am sure it will appear to some, I can think of no better form of personal involvement in the cure of the environment than that of gardening. A person who is growing a garden, if he is growing it organically, is improving a piece of the world. He is producing something to eat, which makes him somewhat independent of the grocery business, but he is also enlarging, for himself, the meaning of food and the pleasure of eating. The food he grows will be fresher, more nutritious, less contaminated by poisons and preservatives and dyes, than what he can buy at a store. He is reducing the trash problem; a garden is not a disposable container, and it will digest and re-use its own wastes. If he enjoys working in his garden, then he is less dependent on an automobile or a merchant for his pleasure. He is involving himself directly in the work of feeding people.

If you think I'm wandering off the subject, let me remind you that most of the vegetables necessary for a family of four can be grown on a plot of forty by sixty feet. I think we might see in this an economic potential of considerable importance, since we now appear to be facing the possibility of widespread famine. How much food could be grown in the dooryards of cities and suburbs? How much could be grown along the extravagant rights-of-way of the Interstate system? Or how much could be grown, by the intensive practices and economics of the small farm, on so-called marginal lands? Louis Bromfield liked to point out that the people of France survived crisis after crisis because they were a nation of gardeners, who in times of want turned with great skill to their own small plots of ground. And F. H. King, an agriculture professor who traveled extensively in the Orient in 1907, talked to a Chinese farmer who supported a family of twelve, "one donkey, one cow, . . . and two pigs on 2.5 acres of cultivated land"—and who did this, moreover, by agricultural methods that were sound enough organically to have maintained his land in prime fertility through several thousand years of such use. These are possibilities that are very readily apparent and attractive to minds that are prepared

to think little. To Big Thinkers—the bureaucrats and businessmen of agriculture—they are quite simply invisible. But intensive, organic agriculture kept the farms of the Orient thriving for thousands of years, whereas extensive—which is to say, exploitive or extractive—agriculture has critically reduced the fertility of American farmlands in a few centuries or even a few decades.

A person who undertakes to grow a garden at home, by practices that will preserve rather than exploit the economy of the soil, has set his mind decisively against what is wrong with us. He is helping himself in a way that dignifies him, and that is rich in meaning and pleasure. But he is doing something else that is more important: he is making vital contact with the soil and the weather on which his life depends. He will no longer look upon rain as an impediment of traffic, or upon the sun as a holiday decoration. And his sense of man's dependence on the world will have grown precise enough, one would hope, to be politically clarifying and useful.

What I am saying is that if we apply our minds directly and competently to the needs of the earth, then we will have begun to make fundamental and very necessary changes in our minds. We will begin to understand and to mistrust *and to change* our wasteful economy, which markets not just the produce of the earth, but also the earth's ability to produce. We will see that beauty and utility are alike dependent upon the health of the world. But we will also see through the fads and the fashions of protest. We will see that war and oppression and pollution are not separate issues, but are aspects of the same issue. Amid the outcries for the liberation of this group or that, we will know that no person is free except in the freedom of other persons, and that man's only real freedom is to know and faithfully occupy his place—a much humbler place than we have been taught to hink—in the order of creation. And we will know that of all issues in education the issue of relevance is the phoniest. If life were as predictable and small as the talkers of politics would have it, then relevance would be a consideration. But life is large and surprising and mysterious, and we don't know what we need to know. When I was a student I refused certain subjects because I thought they were irrelevant to the duties of a writer, and I have had to take them up, clumsily and late, to understand my duties as a man. What we need in education is not relevance, but abundance, variety, adventurousness, thoroughness. A student should suppose that he needs to learn everything he can, and he should suppose that he will need to know much more than he can learn.

But the change of mind I am talking about involves not just a change of knowledge, but also a change of attitude toward our essential ignorance, a change in our bearing in the face of mystery. The principle of ecology, if we will take it to heart, should keep us aware that our lives depend upon other lives and upon processes and energies in an interlocking system which, though we can destroy it completely, we can neither fully understand nor fully control. And our great dangerousness is that, locked in our selfish and myopic economics, we have been willing to change or destroy far beyond our power to understand. We are not humble enough or reverent enough.

Some time ago I heard a representative of a paper company refer to conservation as a "no-return investment." This man's thinking was exclusively oriented to the annual profit of his industry. Circumscribed by the demand that the profit be great, he simply could not be answerable to any other demand—not even to the obvious needs of his own children.

Consider, in contrast, the profound ecological intelligence of Black Elk, "a holy man of the Oglala Sioux," who in telling his story said that it was not his own life that was important to him, but what he had shared with all life: "It is the story of all life that is holy and it is good to tell, and of us two-leggeds sharing in it with the four-leggeds and the wings of the air and all green things. . . ." And of the great vision that came to him when he was a child he

said: "I saw that the sacred hoop of my people was one of many hoops that made one circle, wide as daylight and as starlight, and in the center grew one mighty flowering tree to shelter all the children of one mother and father. And I saw that it was holy."

MANIFESTO: THE MAD FARMER LIBERATION FRONT

For Jack and Mary Jo

- Love the quick profit, the annual raise,
- vacation with pay. Want more
- of everything ready made. Be afraid
- to know your neighbors and to die.
- And you will have a window in your head.
- Not even your future will be a mystery
- any more. Your mind will be punched in a card
- and shut away in a little drawer.
- When they want you to buy something
- they will call you. When they want you
- to die for profit they will let you know.
- So, friends, every day do something
- that won't compute. Love the Lord.
- Love the world. Work for nothing.
- Take all that you have and be poor.
- Love someone who does not deserve it.
- Denounce the government and embrace the flag.
- Hope to live in that free
- republic for which it stands.
- Give your approval to all you cannot
- understand. Praise ignorance, for what man
- has not encountered he has not destroyed.
- Ask the questions that have no answers.
- Invest in the millennium. Plant sequoias.
- Say that your main crop is the forest
- that you did not plant
- and that you will not live to harvest.
- Say that the leaves are harvested
- when they have rotted into the mold.
- Call that profit. Prophecy such returns.
- Put your faith in the two inches of humus
- that will build under the trees every thousand years.
- Listen to carrion—put your ear
- close, and hear the faint chattering
- of the songs that are to come.
- Expect the end of the world. Laugh.
- Laughter is immeasurable. Be joyful
- though you have considered all the facts.
- So long as women do not possess
- great power, please women more than men.
- Ask yourself: Will this satisfy
- a woman satisfied to bear a child?
- Will this disturb the sleep
- of a woman near to giving birth?
- Go with your love to the fields.
- Lie easy in the shade. Rest your head
- in her lap. Swear allegiance
- to what is highest your thoughts.
- As soon as the generals and the politicians
- can predict the motions of your mind,
- lose it. Leave it as a sign
- to mark the false trail, the way
- you didn't go. Be like the fox
- who makes more tracks than necessary,
- some in the wrong direction.
- Practice resurrection.

—Wendell Berry

Biological and the Future of Man

Where we are today technologically (and thus politically) is largely the product of several specific scientific revolutions that gathered steam early in the century—most notably mass medicine, nuclear physics, and investigation of materials. Since World War II the Information Sciences (computers, cybernetics, organization theory) have wrought considerable havoc and promise. Now we're in for biology, says everybody, probably right. Molecular biology, already mature, has only begun to hit the fan. Ecology, though in great demand, has short supply so far. The glamour light, long in molecular biology, may now be migrating into brain science, the very heart of darkness. Still waiting for systematic study is the big version of brain science. The participation of consciousness in evolution.

This book probably supports few of my assertions above. It is an authoritative up-to-the-year report on the state of biology by the leading biologists, with emphasis on unanswered questions and promising leads and possible impact of all this on society in the near future. It's a heavy book, implying no lightsome future. Technology marches on, over you or through you, take your choice.

Figure 20-2. World Population Growth (Projected with assumption of constant fertility levels and declining mortality).

... any desired number of genetic twins could be produced. It would require the collection of unfertilized eggs from the oviducts of many women, removal of the egg nuclei, and replacement by the nuclei of body cells of the chosen man or woman. This would be followed by return of the eggs to the uteri of women who then would undergo normal pregnancies. In this way one could produce multiple identical copies of any person judged admirable.

At the present moment of extremely dangerous population growth, social pressures are best directed to lower reproduction, in general, without qualitative considerations. But one day, when populations are stable, world peace is the norm, and man's social and political institutions are sufficiently mature to assure that biological understanding will not be utilized to perpetuate injustice or strengthen dictatorship but, rather, to expand human potential, man will be free to guide his own evolutionary destiny. . . . Man's view of himself has undergone many changes. From a unique position in the universe, the Copernican revolution reduced him to an inhabitant of one of many planets. From a unique position among the millions of other species which evolved from one another. Yet, *Homo sapiens* has overcome the limitations of his origin. He controls the vast energies of the atomic nucleus, moves across his planet at speeds barely below escape velocity, and can escape when he so wills. He communicates with his fellows at the speed of light, extends the powers of his brain with those of the digital computer, and influences the numbers and genetic constitution of virtually all other living species. Now he can guide his own evolution. In him, Nature has reached beyond the hard regularities of physical phenomena. *Homo sapiens*, the creation of Nature, has transcended her. From a product of circumstances, he has risen to responsibility. At last, he is Man. May he behave so!

The Second Genesis

What I like about the threat of total human control in the near future is that it obliges us to figure out fast what we are about. We got the power; here comes the responsibility. Whether you prefer to embrace it, or flee it (some should, for safeguard), or stay trembling where you are, you might as well have some detailed idea of what's looming.

This book, by the Science Editor at LIFE, does good journalism on three spooky areas: Refabrication of the Individual; Exploration of Prenativity; Control of the Brain and Behavior.

Hypothesis: changes this radical outdistance the laws but not the economy. Control diminishes for governments and increases for consumers. The outlaw area of rapid change. Witness dope.

—SB

Coming: The control of life. All of life, including human life. With man himself at the controls.

Also coming: a new Genesis—The Second Genesis. The creator this time around—man. The creation—again, man. But a new man. In a new image. A whole series of new images. What will the new images be?

They will have to be quite different from the images we have known—the images that have led us to Vietnam, to turbulent racial conflict, to nuclear confrontation, to the threat of a polluted and overpopulated planet.

But all these things have come about—have they not?—with man at the controls, more or less. If he is acquiring awesome new powers—and he is—with immeasurably greater controls, does this not accelerate us all, at uncountable G's, toward the inevitable Dead End—a hundred bangs, followed by three billion whimpers?

If we believe so, yes.

But man's new images may offer us surprising alternatives. Their creation will require the energetic projection of the best minds of the race to the farthest reaches of their imaginations.

Futile effort?

Anything but. What we believe about man, what we want for man, will profoundly influence what actually happens to man.

What would you like: Education by injection? A catalog of spare body parts? A larger, more efficient brain? A cure for old age? Immortality through freezing? Parentless children? Custom-ordered body size and skin color? The ability to convert sunlight directly into energy, just as plants do, without utilizing food as an intermediary? Name it, and somebody is seriously proposing it.

In sober scientific circles today, there is hardly a subject more commonly discussed than man's control of his own heredity and evolution. And the discussions seldom leave much doubt that man will acquire this control. It is a matter of when, not if.

The late Dr. J. B. S. Haldane, always intrigued by the bizarre, wrote in 1949: "If King Charles I's or King Louis XVI's head had been stuck within a minute or so [after their executions] on a pump which supplied oxygenated blood to it, it would almost certainly have come around, after half an hour or so, enough to open its eyes and move its lips, and would probably have recovered consciousness. I hope that if I have an inoperable cancer this experiment will be tried on me."

Could anyone ever replace a dead-but-frozen ruler? As billions of people were frozen in every generation, the dead might ultimately own all the property and hold all the important offices. Barring the return of some sort of ancestor worship or a cult of the dead, would the unfrozen population put up with it? With life so overabundant and so easy to produce anew, why should anyone want to go to all the trouble and expense of reviving all that competition? Those piled-up frozen corpses might in fact be fiercely resented. If the planet became desperately overpopulated, with prevailing undernourishment and contempt for life, their very presence might even encourage a drift toward cannibalism.

"There is no doubt," says Richard R. Landers in *Man's Place in the Dybosphere*, "that machines as a group will dominate man as a group, and eventually, individual machines will dominate individual men."

"By dominate I mean control, regulate, restrain, influence, pervade, direct, guide, prescribe, etc., by virtue of superiority in all aspects of tasks demanding a leader."

Jarfalla: City of the Future

STOCKHOLM—The first city of the future will be built in Sweden. It will be called Jarfalla, have about 100,000 residents, and be accessible by subway or highway from Stockholm, just 12 miles away. No gasoline-powered vehicle will be allowed. Noiseless electric minibuses moving at a soothing 20 miles per hour will pass within 150 yards of everyone's house, carrying passengers and baggage free. Rolling platforms something like horizontal escalators will carry downtown shoppers on their rounds, underground heating will melt snow as it falls to the sidewalks, garbage will be collected by vacuums installed in each residence and transported through tunnels by compressed air to incinerators 30 miles away. Heat and hot water will be supplied by a single thermonuclear plant, the temperatures regulated by individual thermostats. The air will be pure, the smog-free light dazzling, the water delicious and wholesome, the streets impeccable, the only sounds those of music and children at play. It will cost an enormous amount of money.

Alas, we cannot be all Swedes, nor can all Swedes live in Jarfalla. By the time there are 7 billion of us milling around the planet, 30 years from now—or 9 billion, 20 or 30 years from now—our lives are likely to be arranged quite differently. Futurologists hold out a considerable range of repellent prospects.

Among the most cheerful is Nigel Calder, former editor of *New Science* in England, whose ideas go something like this:

Those of us still living on land may be enclosed in anything from towns of 50,000 completely under glass to supercities of 50 million commanding nearly a million square miles—the size of Western Europe. But the majority of the human race will be settled on the sea, in floating towns reaching deep under water so that disturbance due to surface winds and waves—seasickness, that is—will be negligible. More likely than not, these towns will take the form of iceships, ice being unsinkable, easily landscapable, and relatively cheap to make and preserve (one doesn't like to think of a possible power failure, but Mr. Calder assures us we needn't worry). The icetowns would be protected against wind by geodetic domes, perfumed and decorated by thoughtfully contrived sights and sounds, air-conditioned to a year-round spring-like temperature, and supplied with food by ocean gardens grown either on imported soil or in enclosed and cultivated tanks of sea water.

Limited as such nourishment may be to the palate, we might go down on our knees in gratitude for it, considering the possible alternatives. About 4 or 5 billion people would be facing starvation, few of us could permit ourselves the luxury of real fruit and vegetables (a cucumber, say, or a watermelon). Scientists having discovered that yeast can be grown on petroleum, vast quantities of this cheap protein source can be grown to feed animals destined in turn to feed us. Three main production lines for animal protein would then operate side by side.

In one, cattle, pigs and poultry would be raised on plant material for meat and eggs. In another, milk would be formed continuously by a culture of milk-producing glands, intended for drinking and making butter and cheese. In a third, beef muscle would grow continuously in long tubes, extruding itself for chopping into steaklike portions. A complex of smaller works would turn out a selection of prepared foods—soups, sausage, bread, beer and so on—for national or regional distribution. Vitamins and flavors from national suppliers would be added as required. Orange and lemon juice could be produced from cultures, with chemical processing of fibrous materials to add "bite." The very rich could buy natural fruit and vegetables from millionaire market-gardeners; the very poor could sustain life with combinations of plant and yeast material reinforced with vitamins—comparable, perhaps, to having all of one's meals supplied by a domestic airline, with vitamins added.

Mr. Calder does not go very deeply into the psychological side-effect of all this.

If the effects on human beings may not be altogether foreseeable, we are already getting some idea of what may happen to the animals we'll be counting on, nutritionally speaking. The latest method of pig-raising, for instance, already makes use of the production line, the pigs arrayed in rows before conveyor belts moving at a carefully calculated pace with carefully dosed food rations designed for optimum fattening at minimum cost. The one hitch is an inclination on the pig's part to go crazy; thus, the otherwise automated system requires a highly paid attendant whose only function is to watch for early symptoms of insanity and snatch the unfortunate patient from his place at the conveyor belt, replacing him with another identical in appearance, within five minutes at most, before all the rest go wild.

—Times/Post News Service

Moving On

One early evening in my senior year at Holy Cross College, Worcester, Mass., just before stepping onto the crossover into Loyola Hall, I stopped stoned. Like lightning, I "wanted a want"—a big one, sharp, and jagged. I wanted to swallow the whole wide world in one gulp. To get to the last alley in the world and meet the last person walking down it. Ah so!

Frankly, I haven't pulled it off. But I've tried.

At least, the long looking has made me lean, lean as a needle with a hole in it. My eyes have gone gimlet, legs gone skinny. Add New England bones, 4 years in the Iraqi Deserts, a dozen years in the Great Tramp Territory west of Denver to the Pacific. No matter how you mix it, it comes out a slim stew.

You say—"like you really cared"—"What in the world have you been looking for?"

"Don't laugh. I'll tell you. A horse. A horse named Freedom. 'Freedom,' says Matthew Arnold, 'is a horse but a horse is meant to go somewhere.' He sure is, has."

When I stood years ago in front of Loyola Hall with my mouth open, the horse was at an easy trot. Long since he'd finished his pioneer walk from Plymouth Rock to the Pacific, dragging that covered wagon behind him. As a reward for that Grand Tour, the people built him a big red barn. Time since has proved him right in not settling so cheap. That kind of pioneer paradise can now be produced by a pushbutton.

From the 'solid', 'thingy' walk, Freedom shifted into a 'thinking' trot. Not only by the sweat of our brow but by the cleverness thereof, would we eat bread. Much bread. The great American dream became Things & Think, Inc.—everything under control and a few beautiful people at the controls. As a trotting reward, the Corporation has built a beautifully decorated baroque stable. BUT THE HORSE HAS SPLIT OUT! Once again, off and running down the cold cement. The only thing now left behind is the empty stable, the 'soiled' straw, and the bad smell.

Now, 1969, no other when, the horse named Freedom is about to break into a full gallop, third gear. Up until now, in the walk, the trot (1st and 2nd gear), the harness, the bit and bridle have been in control. The control has been from without. Horse and rider, freedom and people, just puppets pulled on a string.

In the full gallop, both horse and rider are running free in the wind, glued into one shared spirit. You and I, not the horse, then drop the blinds from our eyes. Things, thoughts, stones, tree, dogs, that man in the last alley whatever his color—the whole world racing by—is caught up in the shape and mass of a single Big Man. The control is from within.

Freedom at full gallop is Celebration. The Big Man's general dance. Red barns full of oats won't hold him. Nor corrals built by cleverness. The entire range of America from Atlantic to Pacific would still cramp his style. Oppenheimer, the physicist, says "the universe has become a wild windy place." Only the swift spiral of Celebration is big enough to swallow the world at a single gulp.

We're all waiting for the shift into third: Czechoslovakia, Vietnam, the black man, students, ghettos, Wall Street, Roman Curia, hippies and housewives. The little ones, the beautiful people, are coming out of the highways and the hedges. The whole world has become one big waiting room, a Greyhound Bus Terminal at 3 A.M. The stranded sitting by pitiful little piles of luggage in the fluorescent emptiness.

The clutch is in. Who has not somehow felt it grabbing at his entrails? The shift can hardly be smooth and easy. The world is not a Volkswagen. The only way to get into third gear may be a violent grinding slam.

In all the doubt, despair, violence and madness, we have somehow to take our eyes from the clutch on the floor and fix them instead on the Celebration ahead. Even the worst kind of madness has a ring of reason to it. The best reason I know for this one of 1969 is:

The Big Man is in a hell of a hurry to get to his wedding on time! And you know what? This wild, silly, mixed-up bitch of a world is his bride. How about that!

What will be left of the plant world if we allow the basically village culture, founded on a close symbiotic partnership between man and plants, to disappear? For some twelve thousand years, all the higher achievements of civilization have rested on this culture, one devoted to the constructive improvement of the habitat and the loving care of plants—their selection, their nurture, their breeding, their enjoyment. That culture, as Edgar Anderson suggested, originally made some of its best discoveries in breeding by being equally concerned with the color, the odor, the taste, the flower and leaf patterns, the sexual functions, and the nutritive qualities of plants, valuing them not only for food and medicine, but for esthetic delight. There are plenty of people working in scientific laboratories today who, though they may still call themselves biologists, have no knowledge of this culture, except by vague hearsay, and no respect for its achievements. They dream of a world composed mainly of synthetics and plastics, in which no creatures above the rank of algae or yeasts would be encouraged to grow.

Teg's 1994

We're generally down on Utopian thinking around here, holding to a more evolutionary fiasco-by-fiasco approach to perfection. Thus Walden Two, Island, Stranger in a Strange Land, and Rimmer's stuff have not been listed. They're well known enough anyway. One publication—relatively unknown—with a more structural brand of speculation is Theobald & Scott et al's Teg's 1994. The "book" is an on-going process that invites your participation. —SB

During her year of travel as an Orwell Fellow, Teg learns that her contemporaries' concept of the "communication society" is increasingly flawed by interaction failures between diverging communities. A full expression of each community's sub-culture, or myth, has been achieved only at the cost of increasing mutual incomprehension, and even a re-emergence of an aggressive community ethnocentricism.

Some of the longer-term residents have begun to question this community myth of sea-use, and are proposing a change to a myth of sea-existence. They wish to convert to a vegetarian sea-diet and prevent the eating of fish. Given the fact that pisciculture is presently essential to protein adequacy throughout the scarcity-regions the other residents think this is unrealistic. There are also a few residents who want to change over completely to a myth of sea-adaptation. They propose surgical conversion of the human-being for water-breathing.

THE RED TENT

D.R. and Estelle had finished breakfast and were into cleaning out the bus when a woman from the red tent and the Porsche next door came over to borrow some sugar. She looked to be in her thirties somewhere, a very tanned athletic woman wearing a leather vest and a pair of chic brown riding pants. She was European. Her accent was so thick Estelle at first didn't understand what she wanted. But finally she heard "shu-ger" and after they'd gone through the routine of scooping some brown sugar out of the coffee can Estelle kept it in, the woman began to come in a little more clearly.

"You arrive very late," she said.
"No, no," said Estelle. "Very early. We got here just at dawn."
"You must come far."
"Very far," said D.R. "Very, very far. And we've still got a long way to go."
"We have come far too. From Amsterdam to New York, from New York to here."
D.R. asked the woman where she got her red tent.
"You like it?"

"I've never seen a tent like that before."
"Would you like to see inside? It is very lovely."
Estelle was knee-deep in the shit they'd unloaded from Urge and she wanted to get on with the work. But D.R. was fascinated by the red tent, and so he followed the woman past the Porsche over to her camping place. Another woman about the same age as the first, but who turned out to speak no English at all, was just coming out the front flap as they walked up.
"These nice people loaned me sugar," said the first woman, speaking European. "He admires our tent."

Her companion smiled and nodded and held the flap open for D.R. as he entered.

D.R.'s first hit was off the fantastic quality of the light inside. It was mid-morning by now. The sun was above the tree-line, shining directly into all the little clearings on the western side of the campground. It filled the red tent with the most completely restful light he'd ever seen before. A whole tension that had screwed his face tight all morning went away as his eyes gulped the quiet rose of the tent's interior. It wasn't large at all. There was only one place a person could half stand up, and two sleeping bags side by side would cover most of the floor. Yet somehow it struck D.R. as the most spacious, elegant room he'd ever been in. It was immaculate. In the corners of the tent near the entrance were two rolled sleeping bags. On top of each bag were small blue and white flight bags, both neatly zippered, the carrying straps arranged just so. Except for a strip of grass down the middle, the ground was covered by two straw mats. On each mat was a rubber air mattress, deflated and folded into a perfect square and stashed in the far corner of the tent. In the middle of the far end stood a short, three-legged table with a candle on it, and a single wildflower of some kind, in a glass of water. D.R. was amazed. He hadn't smoked any dope in over twelve hours now, and yet he felt completely stoned on the perfect arrangement of the small red world around him. He glanced over his shoulder to see if the two women were watching. When he saw them through the tent flap doing something over at the picnic table, he stretched himself out on one of the mats and stared up at the slanting red roof above him.

The View from the Barrio

What a refreshment this book was after reading a handful of "future" books—scholarly radical technological inflated prophetic advice gas—which left me with a depressed feeling that the future is just words.

The real future will be made of much that is reported in this book (and approximately unknown to the scholars). Namely rural Third World people in newly rich economies and new planned cities, subverting the planners and transforming their own lives.

La Laja is a barrio in the planned Venezuelan city of Ciudad Guayana. Dr. Peattie was there for 2½ years with her family, taking part in barrio life and paying structured attention to what was going on. Social life around her was loose, fluid to a swiftly changing environment and economy. People were self-organizing only around critical community issues such as water or sewers. From the barrio it was a huge impassable distance to the planners, so when something came down that was intolerable they would beef futilely for a while and then plant dynamite under it. Nothing romantic. Just making do, getting by.

It dynamited my depression.

—SB

Under that wide sky's bowl of light the new roads and new concrete buildings—rows of developer houses, apartment buildings, commercial structures—seem to erupt from the dusty-dry earth which bulldozers have scraped clear of vegetation. Elsewhere, the improvised housing of the poor, of sheet aluminum or pressed-board, looks as if it had been thrown together by a hurricane. It is a city of bulldozers, of engineers who wear boots and dungarees and carry shiny briefcases, of noisy bars and holes in the streets, and of new traffic interchanges; it is a city of building and of disorderly entrepreneurship; it is a city which lives in the future.

Another part of La Laja's natural environment consists of the strip of unimproved land just beyond the Iron Mines fence. This land, covered with brush and cactus, is often used for toileting, especially by children; debris may be dumped there, and children collect certain wild fruits in the brush. Some medicinal plants (from an extensive folk pharmacopoeia of herbal remedies) are collected there by adults. Some men of the barrio shoot birds in this piece of monte. Boys hunt birds and sometimes rats with stones, either thrown or projected with a sling shot; their accuracy is astonishing by American standards.

The general development planning and urban design functions of the CVG were being carried out far away from the people of La Laja, on the thirteenth floor of the Shell Building, 350 miles away in Caracas. Some individuals in San Félix—the priests, certain political and economic leaders—from time to time made visits to these offices, but to my knowledge no resident of La Laja had ever been there, and certainly the overwhelming majority had no conception of that far-off world in which La Laja appeared on maps as an area encircled by the planners' "Magic Marker" or zipatone symbols.

Large-scale biological systems are dynamic phenomena of great complexity, embracing lag effects, cumulative effects, thresholds, interactions between variables, large number of variables, and nonlinear causal relations. Because of this complexity, we must concede at the outset that even mathematical models based on oversimplified and hence unrealistic assumptions would be insoluble using traditional paper-and-pencil methods. Therefore the emphasis is shifted from ingenuity of mathematical manipulation to realism of description, with computer simulation being substituted for paper-and-pencil solution. This does not lead to less complication in the mathematics. Rather it leads to complexity of a new type. The requirement now is for depth of insight into the character of the processes dealt with, in order that computer simulation studies can in fact mimic nature.

Considerably more ambitious and information-hungry are models that attempt to describe population processes in some detail, while still assuming a constant extrinsic environment. Such models consider not only the numbers of animals present at each age, but also their growth rate. The most elaborate, widely applied, and discussed model of this type was proposed by Beverton and Holt, (1956, 1957) for use in the understanding and management of commercially exploited stocks of oceanic fisheries. This model was developed as follows.

Consider the rate of change of biomass yield, Y_w , with respect to time t . The average weight of fish of age t is given by w_t , and F denotes the instantaneous fishing (or harvesting) mortality coefficient, where N_t is the number of t -aged fish still alive in the typical year class, then

$$\frac{dY_w}{dt} = FN_t w_t$$

gives the rate of change of biomass yield for the typical year class with respect to its age. The problem is to evaluate N_t and w_t .

That the fossil fuels be conserved for uses which cannot be met by other sources. The fossil fuels (petroleum, natural gas, coal) are needed for petrochemicals, synthetic polymers, and essential liquid fuels, for which suitable substitutes are as yet unknown. They might also play a part in synthetic or bacterial food production (although such a use is also limited). They should not be spent in the generation of electricity, for heating, and for industrial purposes where substitutes can qualify. The Department of the Interior should be authorized and directed to develop and institute a practicable and effective hydrocarbon conservation program.

World Game Note

There's something funny going on round here.

Right in the middle of the March one dollar issue is Gene Youngblood's article on Fuller's World Game. It's exciting, inspiring even. Here are all these guys with all the best intentions about to wire up the globe so that by the year 2000 (if not sooner) everybody will have enough of everything. He really makes you feel like it's within reach, once we get off the merry-go-round of local politics. Though NASA has promised \$12 million, how much more will Fuller get when the feds discover that he really intends to put them out of business?

Anyway, once the world is all wired up, everybody will live at least as well as we do now. All the people, that is.

Right at the end of Youngblood's piece you slip into the Ecology section. The first thing to hit my eye was the quote from Lynn White, "The victory of Christianity over paganism was the greatest psychic revolution in the history of our culture... Christianity... not only established a dualism of man and nature but also insisted that it is God's will that man exploit nature for his proper ends..."

But what do you call wiring up the earth? Far out. Maybe Fuller is the first of the really big Christians.

Are we to be total Whole Earth technocrats, insuring only our own survival? (If you read closely you will note that Youngblood — like Fuller — talks about minerals and such, and makes no mention of organic things except what people can eat.)

Or are we to be Ecology Action pagans, trying to scramble back to a sense of union with the planet that created us?

The ecology people say we gotta change our whole culture, or we won't survive. The Fuller people say we've only got to make our culture really efficient not only to survive but to get a whole lot better.

You know, the problem goes a lot deeper than just, will we survive, and how? No doubt we can with Fuller mold and shape and wire the earth toward the complete human habitation. We will change and even destroy a lot of things, but Fuller believes we have the thrust of evolution on our side, and that people are really a lot more important than the brown pelican (to use an unfair example).

But it's not just a matter of "Christian American saying can't. I need the money." Money really isn't important, especially in America. How much did we spend just to have a couple of guys walk on the moon, for "the spirit of exploration", for "national prestige"? How much do we pump daily into Vietnam, for "the defense of democracy" even as we search for "an honorable peace"? We struggle and fight for abstract ideas, and the money really doesn't matter.

Now Fuller obviously has the best technique for survival, given the human desire to avoid changing basic ideas. Fuller is a catalogue of 1700 years of Christian ideas. Up against this, the ecology freaks really have no chance, because all they are talking about is survival, too.

But ecology really demands another psychic revolution. Like you say, a holy war. We need to believe we are one with the whole earth. And not just to survive, but because we really are. And that means, at least in the beginning, a new religion, a new faith.

Only through belief do you really change people's heads. And right now we believe in rationalism, in the technical method, in the validity of abstract numbers. Even the piece about the sacred earthworm is full of the scientific things earthworms are and do, like 30 tons of this, 1800 species of that, 15 years of something else.

Somewhere I read an old Chinese parable about a farmer who refused to take the technologic step of making a waterwheel to water his crops, even though he knew how. The rhythms and cycles of his life were the important things. He would not, he said, subject his body to a machine merely for the gain of efficiency. In medieval China this was the highest wisdom.

The distance between that view of life and our own is almost unbridgeable, but it is that step ecology asks us to make. Can we make it? In thirty years?

So you have an answer? I don't. I'm afraid we had better light our candles to St. Buckminster.

Cary James
Mill Valley, CA

I figure our best chance lies in ecological pagans, and the world game, and critical letters, and the rest of it. So long as stuff is getting tried, and there's lots of different stuff, and the stuff knows about each other, once it's in the world, evolution can sort it out.

—SB

FIGURE 8.23 Complete cycles of world crude-oil production for two values of Q_0 .

The hunter is camped on a great plain with a small fire providing a flickering light and intermittent warmth. Tiny wisps of smoke ascend into a vast, clear night sky. Tomorrow the hunter will move, leaving behind ashes, food scraps, and his own excreta. After ten steps these are lost from sight and smell, probably forever. With them he leaves too his brief speculation about sky and earth, brought on by the loneliness of night, and he peers toward the horizon in search of prey.

The Administrator of the World Environment Control Authority sits at his desk. Along one wall of the huge room are real-time displays, processed by computer from satellite data, of developing atmospheric and ocean patterns, as well as the flow and quality conditions of the world's great river systems. In an instant, the Administrator can shift from real-time mode to simulation to test the larger effects of changes in emissions of material residuals and heat to water and atmosphere at control points—generally corresponding to the locations of the world's great cities and the transport movements among them. In a few seconds the computer displays information in color code for various time periods—hourly, daily, or yearly phases at the Administrator's option. It automatically does this for current steady state and simulated future conditions of emissions, water flow regulation, and atmospheric conditions. Observing a dangerous reddish glow in the eastern Mediterranean, the Administrator dials sub-control station Athens and orders a step-up of removal by the liquid residuals handling plants there. Over northern Europe, the brown smudge of a projected air quality standards violation appears and sub-control point Essen is ordered to take the Ruhr area of sludge incineration for 24 hours but is advised that temporary storage followed by accelerated incineration—*but with muffling*—after 24 hours will be admissible. The CO₂ simulator now warns the Administrator that another upweller must be brought on line in the Murray Fracture Zone within two years if the internationally agreed balance of CO₂ and oxygen is to be maintained in the atmosphere.

The Pentagon of Power

It's easy to O.D. on Fuller, Kahn, and other technological prophets. Mumford is a fine, careful antidote. He examines the unexamined premises that lead to excess.

Western man not merely blighted in some degree every culture that he touched, whether 'primitive' or advanced, but he also robbed his own descendants of countless gifts of art and craftsmanship, as well as precious knowledge passed on only by word of mouth that disappeared with the dying languages of dying peoples. With this extirpation of earlier cultures went a vast loss of botanical and medical lore, representing many thousands of extraordinary discoveries—such as the American Indian's use of snakeroot (reserpine) as a tranquilizer in mental illness—modern medicine has now, all too belatedly, begun to appreciate.

Scientific truth achieved the status of an absolute, and the incessant pursuit and expansion of knowledge became the only recognized categorical imperative.

Now, if the history of the human race teaches any plain lessons, this is one of them: *Man cannot be trusted with absolutes.*

Unfortunately, if "meaning means association," as Gray Walters observes, then dissociation and non-intercourse must result in a decrease of shared meanings. Thus in time, specialized knowledge, "knowing more and more about less and less," finally turns into secret knowledge—accessible only to an inner priesthood, whose sense of power is in turn inflated by their privileged command of 'trade' or official secrets.

The salutary truth of the old proverb 'Haste Makes Waste' was over-ridden by the new principle: 'Haste and Waste Make Money.'

Most of the important inventions and discoveries that served as the nucleus for further mechanical development, did not arise, as Spengler would have it, out of some mystical inner drive of the Faustian soul: they were wind-blown seeds from other cultures. After the tenth century in Western Europe the ground was, as I have shown, well plowed and harrowed and dragged, ready to receive these seeds; and while the plants themselves were growing, the cultivators of art and science were busy keeping the soil friable. Taking root in medieval culture, in a different climate and soil, these seeds of the machine sported and took on new forms: perhaps, precisely because they had not originated in Western Europe and had no natural enemies there, they grew as rapidly and gigantically as the Canada thistle when it made its way onto the South American pampas. But at no point—and this is the important thing to remember—did the machine represent a complete break. So far from being unprepared for in human history, the modern machine age cannot be understood except in terms of a very long and diverse preparation. The notion that a handful of British inventors suddenly made the wheels hum in the eighteenth century is too crude even to dish up as a fairy tale to children.

Technics and Civilization

I first read this book in 1957 then again in 1963 and then part of it in 1969.

Here is the first paragraph of the book.

During the last thousand years the material basis and the cultural forms of Western Civilization have been profoundly modified by the development of the machine. How did this come about? Where did it take place? What were the chief motives that encouraged this radical transformation of the environment and the routine of life: what were the ends in view: what were the means and methods: what unexpected values have arisen in the process? These are some of the questions that the present study seeks to answer.

2: The printing press was a powerful agent for producing uniformity in language and so, by degrees, in thought. Standardization, mass-production, and capitalist enterprise came in with the printing press; and not without irony, the oldest known representation of the press, shown here, appeared in a Dance of Death printed at Lyons in 1499.

Lewis Mumford is an unusual man. He is not an engineer or a scientist, he isn't an historian or sociologist, you can't identify him as a business man or a literary man or an academic. He seems beyond all those roles. This made him especially attractive to me when I was 19 because his style smelled of the place I wanted to go. He is profound, poetic knowledgeable. He takes care of the large and small things in his books.

How I have used him: all through my twenties I used him as my guide.

[Suggested and reviewed by Steve Baer]

The Ghost in the Machine

Koestler's latest book seems to be sharing the fate of Norman O. Brown's Love's Body: the book after the big influential one (Act of Creation, Life Against Death) is considered too far out, fragmented, excessive . . . and sells half-heartedly.

Nevermind. Koestler here is doing useful dirty work: salvaging rat psychology, exploring broader implications of biological systems research, and foreseeing our imminent demise unless we organize our brain-use better. Which brings him to drugs. He proposes research to find a chemical which will voluntarily disengage old-brain from new-brain—the interior emotional kill-heavy unprogrammable stuff from exterior rational flexible stuff. Our paranoia is accidentally designed in, he suggests, and may be designed out.

Get to it, outlaws. No nation is going to support this research.

DRAW BACK TO LEAP

It seems that this retracing of steps to escape the dead ends of the maze was repeated at each decisive evolutionary turning point. I have mentioned the evolution of the vertebrates from a larval form of some primitive echinoderm. Insects have in all likelihood emerged from a millipede-like ancestor—not, however, from adult millipedes, whose structure is too specialized, but from its larval forms. The conquest of the dry land was initiated by amphibians whose ancestry goes back to the most primitive type of lung-breathing fish; whereas the apparently more successful later lines of highly specialized gill-breathing fishes all came to a dead end. The same story was repeated at the next major step, the reptiles, who derived from early, primitive amphibians—not from any of the later forms that we know.

And lastly, we come to the most striking case of paedomorphosis, the evolution of our own species. It is now generally recognized that the human adult resembles more the embryo of an ape rather than an adult ape.

A tent, he thought. A room of space. It starts here by my left arm, goes up then down and ends over there on the far side of the other mat. That is what this room is, and that is all it is, no more and no less. This is its total size and shape and full dimension: a room of space marked off and set aside by these walls of red canvas that weren't here yesterday probably and probably won't be here tomorrow, but they are here today and I am here too inside the particular space they enclose. This space has always been here. But it has not always been a room, at least not this room, because it has never been enclosed by this particular tent before. The space is here. The time is now. And they are intersecting in a way that no other tent has ever caused before. This very space where I am lying has been tented over before, closed up in other canvas rooms. And so the question seems to be: would another tent around this same space re-create this room, or does this room disappear forever once this red tent has been removed and taken somewhere else? And what about when this tent is pitched in another place? If you pitch it in the Blue Ridge Mountains, take it down and put it up again in the Rockies, has the same room been in both places? Or is it another brand new room every time you pitch the tent again?

"Comfortable, eh?"
The woman's voice startled D.R. and caused him to sit upright. But her smile was so friendly and there was such charm in her strange voice, D.R. relaxed again and invited the woman to come in. The idea struck her as very funny. Giggling, she called to her companion. Soon both women were in the tent with Divine Right, sitting cross-legged on the other mat, drinking tea and smiling back and forth at one another, and at D.R.
"I mean," D.R. was saying, "I mean, like, if you take this tent down, you know, take the poles down, fold the whole thing up, and move it fifteen yards . . . I mean, I'm just saying, if you move it, if you take it down and set it up again, where does the room . . . I mean, like, we're in a room, right? The room is these walls. And these walls are here. They're here, and they're here now. And so the question seems to be . . . the question seems to be, where does the room go when you take these walls down and fold them up and put them in your car?"
The lady who didn't speak English had begun to look a little troubled, perhaps even a little afraid. But when her friend interpreted she began to nod. Both women nodded and said, "Yes. Yes."
"Do you really know what I'm talking about?"
"Of course," said the woman who had borrowed the sugar. "You're talking about space and time."
"Far out!" D.R. exclaimed. "Far out!" Suddenly he had to get out of the red tent, and go and tell Estelle. Hastily he mumbled his thanks and his goodbyes, and crawled to the opening. Outside, he was so excited he tripped over a tent stake and fell on his ass.

Nature and Man's Fate

THE introduction to theoretical and applied evolution. Hardin is further than anyone in blending the insights of evolution and cybernetics into what may be an embryonic science of general development. Still it's a completely earthy book. The specific history of Darwin and his idea. The specific application of evolutionary understanding to human survival now. —SB

So we see that the concept of progress, for all its historical importance in sheltering the idea of evolution, is not easily applicable to facts of biology.

All men are, by nature, unequal—this is the censored truth of our century. We are as afraid of the consequences of admitting this truth as the Victorians were of the consequences of admitting that men are animals. Yet surely history will ultimately show that, in both instances, the consequences are good and compatible with human decency.

As early as 1920, the philosopher, Bertrand Russell, spelled out the nightmare qualities of the Russian dream in terms that he never needed to revise in the light of later facts. For his pains and his honesty Russell was quietly ousted from his position as the philosophic spokesman of the liberal elements. (Since he was patently unfit to speak for the conservatives either, he was henceforth a philosophic man without a party. This position may not be the most comfortable of all positions, but for a living philosopher it has its advantages.)

As a species becomes increasingly "successful," its struggle for existence ceases to be one of struggle with the physical environment or with other species and comes to be almost exclusively competition with its own kind. We call that species most successful that has made its own kind its worst enemy. Man enjoys this kind of success.

It is one of the few rules of evolution that extreme specialization results in eventual extinction. Environmental changes are inevitable, and the specialist-species is too strongly committed to one way of life to be able rapidly enough to "back up" genetically and take off in another "direction." All the evidence of comparative morphology and paleontology, fragmentary though it is, indicates that each great new group of organisms arises from very unspecialized species of the group "below" it, not from the conspicuously specialized ones.

Fig. 7. The effects of mutation and selection on a Gaussian ("normal") distribution curve.

The Step to Man

I'll be damned. I thought this was another yessir-things-are-changing technological social treatise thing. No such. It's a manual of strategies for changing the world, if you have a mind to do that. Not heavy stuff about what is terrible or what should happen, but how to remake life and stay alive in the process. Strategies like multiple working hypotheses so you don't get infatuated with your first idea. Like seed operations where one phone call makes the whole thing happen. Like self-stabilizing provisions so a process is safe from its own too-quick successes. —SB

It is not easy to define "play" precisely, but whatever it is, it is something that is in some sense non-competitive, non-rational, non-economic. It is also productive of novelty in viewpoints, opening a path to new ways of doing things that would often never be discovered if only direct, completely rational, wholly efficient approaches were employed. Play, for many men, is by no means confined to childhood; it extends into the adult state, only changing its form. Freud has said, "The child has toys; the mature man has art and science." Out of the play called science—which is possible only to a society rich enough to suspend partially the laws of competition—out of the economically non-competitive intellectual play called science there comes, in fact, a competitive weapon of the most powerful sort, technology. Competition has its own dialectic.

In order to make a perfect and beautiful machine, it is not requisite to know how to make it. Quite so.

... To Darwinians, Design emerges from blind Waste. "To be an Error and to be cast out is a part of God's Design," said William Blake.

Fig. 12. Evolution, as it has probably occurred in a group of plants, showing how "nature is too disorderly" for those who seek to find clean-cut "phylogenetic trees" and unidirectional evolution everywhere. (From Clausen, *Stages in the Evolution of Plant Species*, Cornell University Press, Ithaca, N. Y.; 1951. By permission.)

The Competitive Exclusion Principle. No two organisms that compete in every activity can coexist indefinitely in the same environment. To coexist in time, organisms that are potentially completely competitive must be geographically isolated from each other. Otherwise, the one that is the less efficient yields to the more efficient, no matter how slight the difference. When two competing organisms coexist in the same geographical region, close examination always shows that they are not complete competitors, that one of them draws on a resource of the environment that is not available to the other. The corollary of the principle is that where there is no geographical isolation of genetically and reproductively isolated populations, there must be as many ecological niches as there are populations. The necessary condition for geographical coexistence is ecological specialization.

And concepts themselves occur in various grades of generality, forming a hierarchal complex that has not yet been explicitly described. Language is a wondrously subtle and complicated tool; by far the greater part of it is to be found only in mathematics. That which most men call "language" is only a small part of man's concept-handling machinery, scarcely the ABC's of it.

For more details on organic evolution, see Ernst Mayr's recent classic *Animal Species and Evolution* (1963; 797 pp. \$11.95 postpaid from Harvard University Press, 79 Garden Street, Cambridge, Mass. 02138). The promising, if heretical, hypothesis that evolution may be directly affected by changes within the cells is presented in Lancelot Law Whyte's *Internal Factors in Evolution* (1965; 120 pp. \$4.00 postpaid from George Braziller, Inc., 215 Park Avenue South, New York, N. Y. 10003). For a non-too-satisfactory but still tantalizing look into cultural evolution, see Sahlin and Service, *Evolution and Culture* (1960; 131 pp. \$3.95 postpaid from The University of Michigan Press, 615 East University, Ann Arbor, Michigan 48106).

Among the impotence principles of socio-biology is surely this: *competition is inescapable.* That species which has succeeded in eliminating all other species as competitors, ends by becoming its own competitor. The world, in spite of comic-strip science, is a limited one. Man, freed of the population-controlling factors of predators and disease organisms, must—willy-nilly, like it or not—control his own numbers by competition with his own kind. By taking thought he can elect the kind of competition he employs; but he cannot escape all kinds. This is not to imply that the election is a trivial matter.

To the biologist it is clear that the best chances for man's long-time survival depend on the fragmentation of the species into well-separated populations. But it would be foolhardy to say what form the separation should take. It might be a matter of nations, as we know them; or some sort of caste system, that would permit genetic isolation with geographic unity; or—far more likely—some new kind of communities that are neither nation nor caste nor anything that has yet been conceived of.

The crowd-diseases—smallpox, cholera, typhoid, plague, etc.—are, by the ecologist, labeled "density-dependent factors," whose effectiveness in reducing population is a power function of the density of the population. No growth of population could get out of hand as long as the crowd-diseases were unconquered, which means that man did not have to sit in judgment on man, to decide who should have a cover at Nature's feast and who should not. With the development of bacteriological medicine, all this has been changed. Now, the feedback control is man himself.

Darwin's life is symbolic. His *Autobiography* clearly and unconsciously reveals two elements that are needed to produce any creative genius: irresponsibility and alienation. . . .

He who is to see what other men have not seen must, in a real sense, become alienated from the crowd. The manner in which this alienation occurs is subject to an infinity of permutations. . . .

The wealthy eccentric is a nearly extinct dodo. The man of wealth is now an other-directed man. He may become a lawyer or a doctor. But not a scientist. He is too much a part of the world to achieve the alienation required to be creative. (What millionaire today would have the nerve to do what Darwin did—retire to a "non-productive" life in the country to think?)

... We can hardly expect a committee to acquiesce in the dethronement of tradition. Only an individual can do that, an individual who is not responsible to the mob. Now that the truly independent man of wealth has disappeared, now that the independence of the academic man is fast disappearing, where are we to find the conditions of partial alienation and irresponsibility needed for the highest creativity?

Fig. 25. A large population, which is very sensitive to selection pressure, is narrowly confined to an adaptive peak (Mount Tory). A species broken up into many separate small breeding populations is much less responsive to selection pressures; its populations will wander widely from their adaptive peak (Mount Risky)—some to perish, some, perhaps, to find the way to new adaptive peaks like Mount Opportunity. As before, the water represents the threatening natural selection.

In order to carry out any great project, the future good of the group must be anticipated and turned into present and individual good, into a reward for every step that is taken in the right direction.

I am beginning to believe that in any social endeavor, it is the analysis of chain-reacting social processes that will enable us to choose the best course and will indicate the most effective ways for our intelligence to multiply its feeble energies. The future is waiting to respond to a touch, if it is the right touch. It is ingenuity we need, not lamentations. The world's future becomes almost plastic in the light of these possibilities.

We begin to realize that our brains are the most complex and self-determining things in the known universe. After all the measurements of atoms and galaxies are folded into laws in some corner of our networks, there will still be universes of interrelationships in the rest of our networks to be discovered. If this property of complexity could somehow be transformed into visible brightness so that it would stand forth more clearly to our senses, the biological world would become a walking field of light compared to the physical world. The sun with its great eruptions would fade to a pale simplicity compared to a rosebush. An earthworm would be a beacon, a dog would be a city of light, and human beings would stand out like blazing suns of complexity, flashing bursts of meaning to each other through the dull night of the physical world between. We would hurt each other's eyes. Look at the haloed heads of your rare and complex companions. Is it not so?

Man Adapting

The focus of this book is the human individual, what he has to deal with in this life, and what means he has to do the dealing with. Dubos is a superdoctor, so you get a damned well-informed medical perspective on questions of environment, population, health, nutrition, adaptation, etc. that subverts many a popular opinion.

-SB

The concept of perfect and positive health is a utopian creation of the human mind. It cannot become reality because man will never be so perfectly adapted to his environment that his life will not involve struggles, failures, and sufferings. Nevertheless, the utopia of positive health constitutes a creative force because, like other ideals, it sets goals and helps medical science to chart its course toward them. The hope that disease can be completely eradicated becomes a dangerous mirage only when its unattainable character is forgotten. It can then be compared to a will-o'-the-wisp luring its followers into the swamps of unreality. In particular, it encourages the illusion that man can control his responses to stimuli and can make adjustments to new ways of life without having to pay for these adaptive changes. The less pleasant reality is that in an ever-changing world each period and each type of civilization will continue to have its burden of diseases created by the unavoidable failures of adaptation to the new environment.

The paradoxical truth is that the phenomenal increase in world population during the past 50 years has coincided with great epidemics, two world wars, several minor ones, and deep disruptions of social and economic life everywhere. Furthermore, as is well known, the most destitute and disease-ridden populations of the world are precisely the ones that are increasing the fastest.

"In most cases, man's responses are determined less by the direct effects of the stimulus on his body fabric than by the symbolic interpretation he attaches to the stimulus. Human beings may suffer and even die under circumstances which seem highly favorable to physiological performance, whereas paradoxically others will prosper even though conditions appear almost incompatible with the maintenance of life."

"The negative aspects of biological interrelationships are not the most common in nature, nor are they the most important in the long run. Under natural conditions, a state of equilibrium is commonly reached between various living forms when they have long been associated in a given area. This equilibrium is achieved through biological and social mechanisms that permit the survival and perpetuation of all species involved."

The truth is, that improvements in the general nutritional state began when prosperity and greater facilities for the transportation of food made it possible for many people to afford at least one square meal a day; likewise, the mortality of many infections began to recede in a dramatic fashion in Western Europe and North America long before the introduction of specific methods of therapy, indeed before the demonstration of the germ theory of disease.

The Age of Discontinuity

How come Peter Drucker has so much good sense and perspective, and still remains so cheerful? Traditionally considerations such as his—economics, organizations, the future—turn a prophet's soul terrible and dark or at least partially wiggly. The only other intact floater on this ocean I know of is Marshall McLuhan. You sense that both of them have a backyard in their mind that resides somewhere else, some time else. (It would be worth pursuing this. How To Think Big and Stay Sane.)

The Age of Discontinuity takes notice of the remarkable continuity of the last 50 years in building on the technological breakthroughs of the Victorian era. Now, says Drucker, we are in for some hard changes, particularly around new technologies (of information, materials, oceans, megalopolis), global economics, and redistribution of responsibility in large organizations.

Since the computer first appeared in the late 1940's the information industry has been a certainty. But we do not have it yet. We still do not have the effective means to build an "information system." This is where the work is going on, however. The tools to create information systems may already exist: the communications satellite and other means of transmitting information, microfilm and the TV tube to display and store it, rapid printers to reduce it to permanent record, and so on. There is no technical reason why someone like Sears Roebuck should not come out tomorrow with an appliance selling for less than a TV set, capable of being plugged in wherever there is electricity, and giving immediate access to all the information needed for schoolwork from first grade through college.

Yet though IBM is now shipping computers at a rate of a thousand a month, we do not have the equivalent of Edison's light bulb. What we are lacking is not a piece of hardware like the light bulb. What we still have to create is the conceptual understanding of information. As long as we have to translate laboriously every set of data into a separate "program," we do not understand information. We have to be capable of classifying information according to its characteristics. We have to have a "notation," comparable to the one St. Ambrose invented 1,600 years ago to record music, that can express words and thoughts in symbols appropriate to electronic pulses rather than in the clumsy computer language of today. Then each person could, with very little training, store his own data within a general system, that is, in what the computer engineers call a "routine." Then we shall have true "information systems."

The Phenomenon of Man

Reading The Phenomenon of Man is a bit unnerving: Teilhard de Chardin manages to say most of the things many of us are trying to say. He said them in 1938. Was no-one listening?

The Phenomenon of Man deals with evolution—the ascent to consciousness. The plan of the book is

Pre-life: Life: Thought—three events sketching in the past and determining for the future (survival) a single and continuing trajectory, the curve of the phenomenon of man.

His aim is to try to see (and to help us to see)

to try to develop a homogeneous and coherent perspective of our general extended experience of man. A whole which unfolds.

Teilhard de Chardin's vision and expression of that vision are beautiful—of man evolving a super-abundance of mind; in the noosphere where the All and the Person are one. The only way to put all this together without feeling bullshitted is to read The Phenomenon of Man.

Only one reality seems to survive and be capable of succeeding and spanning the infinitesimal and the immense: energy—that floating, universal entity from which all emerges and into which all falls back as into an ocean; energy, the new spirit, the new God.

hominisation...noogenesis...cosmogensis...when Teilhard de Chardin uses a simple word like homogeneous something magical happens to it.

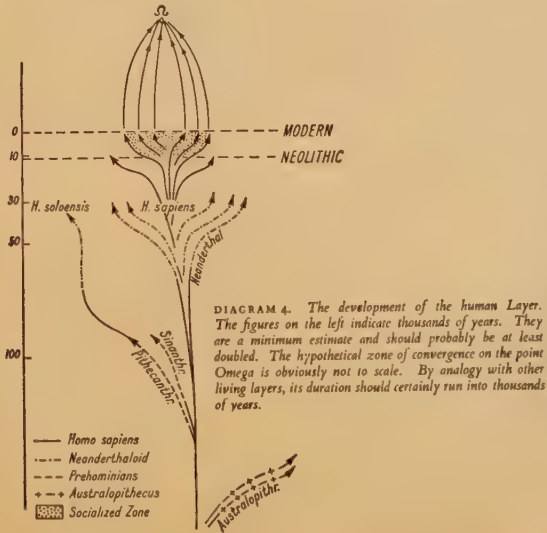

The Omega point is where man is God and God is man, where all layers of the noosphere become involuted, fusing and consuming the All and the Person integrally in itself.

Underlying the beautiful presentation of man's ascent towards consciousness is a hard core of science:

Man, in nature, is a genuine fact, falling...within the scope of the requirements and methods of science.

[Reviewed by Dave Evans.
Suggested by Julia Brand.]

The mind is essentially the power of synthesis and organisation.

A PLACE FOR EVERYTHING AND EVERYTHING IN ITS PLACE

Estelle everything's by god I really believe it is. You can tell it, you can feel it, the signs are all around. This is here and we are now and the intersection of time and space is just special as hell, and I'm going to find out some things we need to know. I believe there's going to be better relations between east and west. I believe if we get organized, a place for everything and everything in its place, books in a book box, clothes in a clothes box honey you've done a wonderful, you have now, and I love you for it and take heart and determine to be better than I've been in a long time. Those women understood every word I said. When we get to St. Louis. Are these crackers any good? Where's the tape recorder? Where'd I put the cassettes? When we get to St. Louis I'm going to get some car polish and wax old Urge all over. Is this to throw away? Ain't this box any good? We need all the boxes in St. Louis I'm going to get ten cardboard boxes of identical size and label them with what they're supposed to hold. Books in one, look at this shit on my Whole Earth Catalog. Fuck, I was going to order some stuff out of there. Books in one box, tape shit in another, every goddamn thing we got's going to have its proper place. You've done a wonderful thing here honey, you really have. You ought to see their tent. From now on. When we get to St. Louis. Here, let me lift that for you. Wait! Don't throw that glass away. Here, I'll wash it out after while, I want to put a wildflower in it. I got into this rap about space, you know? I was afraid. But they knew exactly and I believe the world's getting to be a better place. I receive that from somewhere in my mind. I think love and gentleness and neighborliness and human harmony are going to prevail. I think the stars are moving into very particular cosmic arrangements. And we've got to do our part. I believe it all depends on everybody doing his part. Look at this bus, goddamn I bet old Urge is proud.

The Subversive Science

"So God created man in his own image, in the image of God he created him; male and female he created them. And God blessed them, and God said to them, 'Be fruitful and multiply, and fill the earth and subdue it, and have dominion over the fish of the sea and over the birds of the air and over every living thing that moves upon the earth.'" Genesis 1, 27-28.

And we have been fruitful, and we have filled the earth and subdued it, and we have dominion over every living thing. And what is subversive about ecology is that we know now we must turn aside from that ancient narrow edict, and live with, and not upon, the earth.

The Subversive Science is thirty-seven essays on the shape of life. By its very breadth it creates a depth of truth no single point of view could ever make. There is a new world view within this book, a new sense of ourselves and our position on and within this earth. It is rigorous and scientific and yet in its vibrant complexity almost mystic.

[Reviewed by Cary James]

Igloos, tepees, prairie sod-huts, hogans, pueblos—have ecology in their roof-lines.

These shelters for families, like such individual protectors as sunbonnets, sombreros, serapis, are oriented to a landscape, to weather, and to local materials.

Ecology

There are two major components to ecological study: quantitative and cybernetic. The cybernetic—control relationships—is most interesting, but the only reliable research avenue to that understanding is through grueling quantitative investigation. This book is a concise and reliable introduction to the science.

Variable
Characteristic

We who were close to the Indians watched the disappearance of boys from public view. Even their father saw them no more. After sometimes a year, sometimes eighteen months, the boys returned—from the underground kivas, from the pathless areas of the Sangre de Cristo range, from the hidden crag where perhaps burns the mystical everlasting fire. Radiant of face, full-rounded and powerful of body, modest, detached: they were men now, keepers of the secrets, houses of the Spirit, reincarnations of the countless generations of their race; with "reconditional reflexes," with emotions organized toward their community, with a connection formed until death between their individual beings and that mythopoeic universe—that cosmic illusion—that real world—as the case may be, which both makes man through its dreams and is made by man's dreams.

The desire to maintain absolute constancy in any system must be recognized as deeply pathological. Engineering theory indicates that excessive restraints can produce instability. In psychiatry also, the desire for complete certainty is recognized as a most destructive compulsion. And in the history of nations, attempts to control rigidly all economic variables have uniformly led to chaos. The psychologically healthy human recognizes that fluctuations are unavoidable, that waste is normal, and that one should institute only such explicit controls as are required to keep each system on its homeostatic plateau. We must devise and use such controls as are needed to keep the social system on the homeostatic plateau. On this plateau—but not beyond it—freedom produces stability.

"This is the dog that bit the cat that killed the rat that ate the malt that came from the grain that the ox ate." (Reproduced by permission of Punch.)

Perhaps the most serious obstacle impeding the evolution of a land ethic is the fact that our educational and economic system is headed away from, rather than toward, an intense consciousness of land. Your true modern is separated from the land by many middlemen, and by innumerable physical gadgets. He has no vital relation to it; to him it is the space between cities on which crops grow.

When we think in terms of systems, we see that a fundamental misconception is embedded in the popular term "side-effects" (as has been pointed out to me by James W. Wiggins). This phrase means roughly "effects which I hadn't foreseen, or don't want to think about." As concerns the basic mechanism, side-effects no more deserve the adjective "side" than does the "principal" effect. It is hard to think in terms of systems, and we eagerly warp our language to protect ourselves from the necessity of doing so.

Whether you will or not
You are a King, Tristram, for you are one
Of the time-tested few that leave the world,
When they are gone, not the same place it was.
Mark what you leave.

Concepts of Ecology

There is a crusade called Ecology. And also a science called Ecology. And they're not as distinct as they think they are.

This book is about the science, unhindered by rhetoric. Its subject is energy flow, cycles, populations, ecological communities, and man's place in the system. The emphasis is on theory and observation rather than math. Areas that are still poorly understood get due attention. I wish this book had been around when I studied ecology.

Although the original coining of the term is an uncertainty, there is consensus that the German biologist Ernst Haeckel first gave substance to it in the following statement:

By ecology we mean the body of knowledge concerning the economy of nature—the investigation of the total relations of the animal both to its inorganic and to its organic environment; including above all, its friendly and inimical relation with those animals and plants with which it comes directly or indirectly into contact—in a word, ecology is the study of all the complex interrelations referred to by Darwin as the conditions of the struggle for existence.

The climax community results when no other combination of species is successful in outcompeting or replacing the climax community. In part, this is to be explained by the tolerance limits and optimum requirements inherent in each species. But stability of the climax is certainly not so simply explained. The answer lies in an as yet not fully understood property—diversity.

Redrawn, from B. O. Hughes and D. Dunning. 1949. Pine Forests of California. U. S. Department of Agriculture Yearbook.

Fig. 5-2. Profile of central Sierra Nevada showing altitudinal distribution of principal forest types.

Environment and Man

This is a pretty complete introductory text, well-illustrated, on all the ecological issues. There's quite a few of them, and to respond right we do need to know about all of them, or a solution to one problem may accelerate six others.

When species diversity is reduced in natural ecosystems, either willfully or inadvertently, the same kinds of problems seen in monoculture begin to arise. But a natural ecosystem cannot be treated like a cornfield and routinely sprayed to control some beetle or caterpillar. For a biocide that might be tolerated in a cornfield could so scramble the food web in a woodland that the original problem would be lost in the ensuing chaos. Moreover, while we can afford the energy input to maintain a field of corn because of the value of its yield, we cannot possibly afford the economic burden of maintaining natural ecosystems that have maintained themselves until disturbed by man. Consequently, until we know exactly the role of every organism in an ecosystem, how it controls or is controlled by others, we cannot abandon any species as superfluous, not even that pitiful flock of seventy whooping cranes. If we do we run the risk of having to cope with future population explosions of fungi, insects, rodents, or whatever, that might well dwarf any problems seen to date.

Figure 4.7 The areas in black are over five miles from the nearest road, railroad, or navigable waterway. This is America's remaining wilderness. (From C. Tunnard and B. Pushkarev, *Man-Made America*, Yale University Press, 1963.)

Science and Survival

Scientific and technological critics are significantly rare and much needed. Barry Commoner is a good one—prestigious scientist, active administrator, capable writer, committed critic.

Reading his anthology of technological blunders, I am led to wonder if the success of death-fear-driven science merely changes the size of the package that death comes in. There's less of piecemeal local, "natural" dying, and more of massive "caused" dying. I think I prefer the old way. Is anybody working on establishing friendlier relations with Death? Maybe he's a good guy who's had bad press.

The trouble began with the failure of a relay which controlled the flow of electricity from the Sir Adam Beck No. 2 power plant in Queenston, Ontario, into one of its feeder lines. The remaining lines, unable to carry the extra load, shut down their own safety switches. With these normal exits blocked the plant's full power flowed back along the lines that tied the Queenston generators into the U. S. - Canadian grid. This sudden surge of power, traveling across New England, quickly tripped safety switches in a series of local power plants, shutting them down. As a result the New England region, which until then had been feeding excess electricity into the Consolidated Edison system in New York, drained power away from that city; under this strain the New York generators were quickly overloaded and their safety switches shut off. The blackout was then complete. The system had been betrayed by the very links that were intended to save local power plants from failure.

The new hazards are neither local nor brief. Air pollution covers vast areas. Fallout is worldwide. Synthetic chemicals may remain in the soil for years. Radioactive pollutants now on the earth's surface will be found there for generations, and, in the case of carbon-14, for thousands of years. Excess carbon dioxide from fuel combustion eventually might cause floods that could cover much of the earth's present land surface for centuries. At the same time the permissible margin for error has become very much reduced. In the development of steam engines a certain number of boiler explosions were tolerated as the art was improved. If a single comparable disaster were to occur in a nuclear power plant or in a reactor-driven ship near a large city, thousands of people might die and a whole region be rendered uninhabitable—a price that the public might be unwilling to pay for nuclear power. The risk is one that private insurance companies have refused to underwrite. Modern science and technology are simply too powerful to permit a trial-and-error approach.

Sometimes, in moments of impending crisis, we are aware only that the main outcome of science is that the planet has become a kind of colossal lightly triggered time bomb. Then all we can do is to issue an anguished cry of warning. In calmer times we try to grapple with the seemingly endless problems of unraveling the tangle of nuclear physics, seismology, electronics, radiation biology, ecology, sociology, normal and pathological psychology, which, added to the crosscurrents of local, national, and international politics, has become the frightful chaos that goes under the disarming euphemism "public affairs."

RETURN OF THE LONE OUTDOORSMAN

The birds in the treetops hushed their singing as the Lone Outdoorsman came into Divine Right's camp. But D.R. was too deep into his monologue to catch the warning. He was too deep into it even to realize that Estelle had left the camp and gone for a walk. Before he could prepare himself in any way, there the Outdoorsman was, standing above him with his hands on his hips, staring at D.R. like a teacher or a cop. As he became aware of the Lone Outdoorsman's presence, D.R. went silent as the birds. The music that had filled his head changed from harps to kettle drums, and he wondered where Estelle had gone, and why.

"Afternoon," said the Outdoorsman.
"Good afternoon," said Divine Right.
"How're you?" asked the Lone Outdoorsman.
"Okay, I guess," said D.R.
"Yeah, Well, I noticed you over there in the tent with them foreign ladies, and I just wondered if anything might be wrong."
"No," said D.R. "Nothing wrong, as far as I know."
"Yeah. Well, just checking. I noticed you over there in the tent with 'em. You never know. Cleaning out your bus, looks like."

D.R. nodded. He had been kneeling among the stuff from the bus when the Outdoorsman first came over. Now he was on his feet, and following the Outdoorsman as he walked around the bus, looking at the paint job.
"You paint all this stuff on your bus?" asked the Outdoorsman.

"Some of it," said D.R.
"How come you do it?" said the Outdoorsman. "Messed up a good paint job. What's that there?"

The Outdoorsman was pointing at a large yellow moon on U-ge's side, with a crab walking across it, leaving tracks.
"That's a moon with a crab on it," said D.R.

The Outdoorsman looked D.R. in the eye. "You say it is, huhh?"

D.R. nodded
"How many horsepower this thing have?"
"I don't know. Fifty, maybe."

"Fifty, huh. Yeah. Well, my GMC over there's got four hundred and fifty. Of course, the rig weighs it down some, and my boat. But it'll still outrun a bus like yours any day of the week, you better believe that."

D.R. asked the Outdoorsman why he was telling him that. The Outdoorsman said you never know. Then he told D.R. to let him know if anything came up.

"What do you mean?"
"Well. You know. Trouble."

D.R. nodded. His heart was pounding. He watched the Outdoorsman light his pipe, then carefully crush the match against his knife handle.

"You remember what I told you, now," he said, and he turned and jingled off through the trees to his own camp.

Not So Rich As You Think

Once upon a time, men lived in trees high above the forest floor. It was a gay, carefree life—your food grew right in your house and when you had eaten your fill you tossed the garbage down through the leaves. The same with your shit, and even your body when you died. The forest scavengers and processes of decay speedily disposed of all refuse.

Man came down from the trees long, long ago and created for himself a less carefree way of life. But he remains the filthiest animal around, treating his environment as if it were still magically gobbling up everything he discards. This book documents the folly with the gross disheartening facts. From human excrement to nuclear fallout, with smog, DDT and the junkyard on the way.

The Population Bomb

There's a shit storm coming. Not a nice clean earthquake or satisfying revolution but pain in new dimensions: world pain, sub-continents that starve and sub-continents that eat unable to avoid each other. The consequences will dominate our lives. In the heart of the problem are the solutions, and the sooner we're clear about what's happening the sooner the solutions can work their way out. This book is the best first hard look that's around. The author is a well-regarded young population biologist and ecologist who freaked out of his lab and into the media with the bad news. Besides freaking well he reports well.

It is, of course, socially very acceptable to reduce the death rate. Billions of years of evolution have given us all a powerful will to live. Intervening in the birth rate goes against our evolutionary values. During all those centuries of our evolutionary past, the individuals who had the most children passed on their genetic endowment in greater quantities than those who reproduced less. Their genes dominate our heredity today.

The reproductive function of sex must be shown as just one of its functions, and one that must be carefully regulated in relation to the needs of the individual and society. Much emphasis must be placed on sex as an interpersonal relationship, as an important and extremely pleasurable aspect of being human, as mankind's major and most enduring recreation, as a fountainhead of his humor, as a phenomenon that affects every aspect of his being

The battle to feed all of humanity is over. In the 1970's the world will undergo famines—hundreds of millions of people are going to starve to death in spite of any crash programs embarked upon now. At this late date nothing can prevent a substantial increase in the world death rate, although many lives could be saved through dramatic programs to 'stretch' the carrying capacity of the earth by increasing food production. But these programs will only provide a stay of execution unless they are accompanied by determined and successful efforts at population control. Population control is the conscious regulation of the numbers of human beings to meet the needs, not just of individual families, but of society as a whole.

Nothing could be more misleading to our children than our present affluent society. They will inherit a totally different world, a world in which the standards, politics, and economics of the 1960's are dead. As the most powerful nation in the world today, and its largest consumer, the United States cannot stand isolated. We are today involved in the events leading to famine; tomorrow we may be destroyed by its consequences.

Remember also that in virtually all underdeveloped countries, people have gotten the word about the better life it is possible to have. They have seen colored pictures in magazines of the miracles of Western technology. They have seen automobiles and airplanes. They have seen American and European movies. Many have seen refrigerators, tractors, and even TV sets. Almost all have heard transistor radios. They know that a better life is possible. They have what we like to call 'rising expectations.' If twice as many people are to be happy, the miracle of doubling what they now have will not be enough. It will only maintain today's standard of living. There will have to be a tripling or better. Needless to say, they are not going to be happy.

A ship has hit the rocks and is sinking. The passengers scream for help. Some jump overboard and are devoured by the circling sharks. A group of distinguished scientists is on board. One of their number suggests that they can help man the pumps. 'Oh, no!' shout the others. 'That might hurt the captain's feelings. Besides, pumping is not our business. It's outside our field of competence.' You can guess what they do. They appoint a committee to study the problem, with subcommittees on marine engineering and navigation. They announce to the passengers that in two or three years the committee will produce a wonderful report which will be acceptable to the passengers, the captain, and the steamship line. Not so passive are the politicians. Some jump up to say that the passengers don't understand the political realities of the situation. Other more progressive politicians grab thimbles and start bailing, stopping every few seconds to accept praise for their valiant efforts.

Careless overuse of DDT has promoted to 'pest' category many species of mites, little insectlike relatives of spiders. The insects which ate the mites were killed by the DDT, and the mites were resistant to DDT. There you have it—instant pests, and more profits for the agricultural chemical industry in fighting these Frankensteins of their own creation. What's more, some of the more potent miticides the chemists have developed with which to do battle seem to be powerful carcinogens—cancer-producing substances.

The old idea that industry could create the mess and then the taxpayers must clean it up has to go. The garbage produced by an industry is the responsibility of that industry.

Population, Resources, Environment

In *Population Bomb* Ehrlich spared us the customary statistics and graphs, and he was accused of being no scientist. So here are the statistics and graphs and much besides—a 400-page textbook on the population-ecology crisis. Don't bother taking a course. The lab is the world.

The global polluting and exploiting activities of the DCs are even more serious than their internal problems. Spaceship Earth is now filled to capacity or beyond and is running out of food. And yet the people traveling first class are, without thinking, demolishing the ship's already overstrained life-support systems. The food-producing mechanism is being sabotaged. The devices that maintain the atmosphere are being turned off. The temperature-control system is being altered at random. Thermonuclear bombs, poison gases, and super-germs have been manufactured and stockpiled by people in the few first-class compartments for possible future use against other first-class passengers in their competitive struggles for dwindling resources—or perhaps even against the expectant but weaker masses of humanity in steerage. But, unaware that there is no one at the controls of their ship, many of the passengers ignore the chaos or view it with cheerful optimism, convinced that everything will turn out all right.

1877-1878 *North China*. "Appalling famine raging throughout four provinces [of] North China. Nine million people reported destitute, children daily sold in markets for [raising means to procure] food. . . . Total population of districts affected, 70 millions. . . ." The people's faces are black with hunger; they are dying by thousands upon thousands. Women and girls and boys are openly offered for sale to any chance wayfarer. When I left the country, a respectable married woman could be easily bought for six dollars, and a little girl for two. In cases, however, where it was found impossible to dispose of their children, parents have been known to kill them sooner than witness their prolonged suffering, in many instances throwing themselves afterwards down wells, or committing suicide by arsenic.

All flesh is grass. This simple phrase summarizes a basic principle of biology that is essential to an understanding of the world food problem. The basic source of food for all animal population is green plants—"grass." Human beings and all other animals with which we share this planet obtain the energy and nutrients for growth, development, and sustenance by eating plants directly, by eating other animals that have eaten plants, or by eating animals that have eaten animals that have eaten plants, and so forth.

Because, as indicated in the acknowledgments, the various drafts of our manuscript were thoroughly reviewed by a large number of critics who are competent in the various areas covered, we believe that the factual basis of the book is sound throughout. We do not believe that such minor errors as may be revealed in any of our figures, estimates, or interpretations will change the thrust of our major conclusions. In many areas, of course, it is impossible to determine exactly what has happened, or to know what the significance of certain trends may be. Data are often unreliable or unavailable, and our understanding of the complexities of ecological systems and human behavior is still fragmentary. But in dealing with the population-resource-environment crisis, it is important to recognize that people are going to have to learn to make decisions in the face of such uncertainty. Possible benefits will have to be weighed against possible risks, and a great deal of thought given to possible future events which may seem unlikely but which will be catastrophic if they do occur. It would be a major step forward for mankind if all people could know the general state of the world and could be informed as to just what chances are being taken with their lives and the lives of future generations.

From the almost limitless number of subjects which might have been included in this book, choices of those that were to be treated in detail had to be made. We have tried to emphasize those which seemed to us to be of the most general importance, and we make no apology either for our selection of subjects or for the personal style and approach we have used throughout. We have not attempted to give equal weight to both sides of all controversial issues; where we think one side is correct we have so indicated. We also make no claim to having tried to detail all exceptions to general rules. We hope that this book will provide concerned readers with enough background to enable them to make informed political decisions about environmental issues and to combat what C. P. Snow has referred to as the "excessive unsimplicity" which, in his words, "crops up whenever anyone makes a proposal which opens up a prospect, however distant, of new action. It involves a skill which all conservative functionaries are masters of, as they ingeniously protect the status quo: it is called the 'technique of the intricate defensive.'"

Population, Evolution, and Birth Control

Once you've woken up to the population squeeze and the blindness of most of your fellow men, it's worth looking around. Garrett Hardin has assembled a strong selection of eyes to look around with. Here are the ingredients for understanding. Now, how do we get the mule's attention?

—SB

The closed earth of the future requires economic principles which are somewhat different from those of the open earth of the past. For the sake of picturesqueness, I am tempted to call the open economy the 'cowboy economy,' the cowboy being symbolic of the illimitable plains and also associated with reckless, exploitative, romantic, and violent behavior, which is characteristic of open societies. The closed economy of the future might similarly be called the 'spaceman' economy, in which, therefore, man must find his place in a cyclical ecological system which is capable of continuous reproduction of material form even though it cannot escape having inputs of energy.

If the food supply is falling short, or a new disease threatens us, inventions to relieve it must be made before famine and pestilence have done their work. Now, we are far nearer to famine and pestilence than we like to think. Let there be an interruption of the water supply of New York for six hours, and it will show in the death rate. Let the usual trains bringing supplies into the city be interrupted for forty-eight hours, and some people will die of hunger. Every engineer who has to deal with the administration of the public facilities of a great city has been struck with terror at the risks which people are willing to undergo and must undergo every day, and at the complacent ignorance of these risks on the part of his charges. . . .

Norbert Wiener

The rest of the night I lay there sleepless, trapped between the quivering human cry in the night and the cold fact that forced me to know I could not save him or the thousands of others whose cries I could not hear. The next morning they came and told us that the beggar was dead.

Gerald Winfield

We are talking about how to be able to change the games that Peoples play.

The strategy of game change is: you don't change a game by winning it or losing it or refereeing it or observing it. You change it by leaving it and going somewhere else and starting a new game from scratch. If it has appeal it will gather its own energy. (Fighting a system, however, merely strengthens the system, which accounts for a lot of bitter revolutionaries, including victorious ones.)

Whatever plays the game, the game is played on the field of the physical. Mind points don't count unless something happens physically. Pain penalties are of no consequence unless something adapts physically. Move the molecules, or admit you're a spectator.

As mind grows mightier, and physicality stays what it is, the world may manifest a subtler and subtler play of elements, wielded with enormous finesse by intellection largely invisible, but ever held to this world by the mundane leash. I like the rule. (Margaret Fuller said, "I accept the universe." Thomas Carlyle said, "She'd better.")

There are lots of ways to organize social behavior. The advantage of working with games is that they are regenerative, if they work. The fun of playing sustains the game from within, from the pleasure of the players. Instigators need not be leaders; the game generates its own leadership and succession.

Liferaft Earth

The event we did recently called Liferaft Earth was designed as a game. Its intent was to make very personal the matter of population control. The stadium was the news media, so a certain amount of theater (i.e. plot) was designed in.

The few rules, announced far in advance of the event, were: a lot of people stay publicly together for a week without eating. Anybody may leave anytime but may not return; their departure is considered a death.

The bait for the media, besides the noble cause, was suspense. Who would come to the event? How many would last the week? Who would they be? What kind of stuff would go on with hungry people penned up together?

An additional unexpected question was, Will the sponsors find a place to hold the event? We went into our press conference to announce Liferaft Earth still without a site for it. [Nobody wanted the unknown in their yard, not the University of California, Stanford, Berkeley, San Francisco, Tilden Park, San Mateo County. Everybody loved the idea, somewhere else.] So the press conference consisted partly of us asking for a place to hold our noble event. And it went pretty well—Jerry Mander had not given much information in the press releases, so press had to come to get the news. We had some attractive names helping with the announcement: Stephanie Mills, Dr. Eugene Schoenfeld, Don Aitken of Friends of the Earth, Dr. Sheldon Margen with nutritionist credentials at Cal, and Wavy Gravy (in his last days as Hugh Romney) dressed as a hamburger. Further visual interest—useful for TV and wirephotos—was provided by Earth posters, the door for the event with its sign "Are You Ready To Die", and a splendid model of the inflated 10,000 sq. ft. polyethylene pillow that we planned to hold the event in. Even though the reporters distrusted us for not having a site, the item was carried on local TV and newspapers, and the wire services. Thank the popularity of environmental issues for that.

The following five pages chronicles a week-long event sponsored and organized by the CATALOG in October 1969.

Richard Brautigan saw the end of it. The beginning of it was three days I spent alone on a train with excellent hash and Paul Ehrlich's Population Bomb. Ehrlich had been a teacher of mine, back in his butterfly and my tarantula days, so I knew to believe him.

LIFERAFT EARTH

This is the inflatable pillow, 100 ft x 100 ft of 4 mil polyethylene, that the Fire Marshall wouldn't let us use for Liferaft Earth. It was designed by Charlie Tilford. A month later the Fire Marshall okayed the structure for public use because a physicist told them it was "self-extinguishing", which it is.

Site-finding was getting truly desperate when a phone call from Hayward in the East Bay came through. A guy named Bill Goetz, head of a poverty program office in Hayward, said he had seen us on Channel 2 and did we want to hold the event in his parking lot. I went and looked, and it was all wrong, too small, all at a weird angle on a hillside, out of anybody's mainstream, into a different population than us—old folks and Spanish and social workers. . . . It was perfect. So was Goetz and his staff. So, it turned out, was Hayward.

Hayward's city manager was an old acquaintance of the head of Portola Institute. That meant that from the top there was trust. We got nothing but friendly cooperation from the city fire department, police department, health inspectors, and press. After what we'd been through, Bill Goetz and Hayward had our vote as All-American City of the Year.

Who were the cast by now? Most active was Wavy Gravy, who had signified for the Hog Farm's participation way back during the summer. Now he was inviting people left and right, buying toys like jacks and plastic fruit, hustling around. Frantic work was going on by the Southeast Inflationenvironment group (initially Charlie Tilford, by now mostly Andy Schapiro and Joe Hall)—they were building a net to hold down the vast pillow and getting kicked off test sites. Slack polyethylene burns like napalm; inflated poly doesn't: try telling that to a Fire Marshal. Dick Raymond of Portola Institute was placating our insurance company and all the others who needed hourly placation. Stephanie Mills was on her Planned Parenthood phone inviting and reassuring. Jim Burleigh of People's Architecture in Berkeley was still hoping to find a way to do it in Berkeley. Dan Rosenberg of Sierra Club, out of the blue sky had volunteered to help find a site (Dan is the model of something every business should have, a company good guy, who's paid to go out and find good that needs doing, and do it). Back East Charlie Tilford was camped in the Union Carbide offices trying to get us a pillow of non-inflammable vinyl. Bill Goetz was busily soothing the concerned environs of his parking lot.

Since confirmation of the site came only 2 days before the event, we distributed map press-releases to the media, and made them available to participants through offices in Berkeley, San Francisco and Menlo Park. The last words of instruction were:

To make the event as easy as possible on the community we're asking that participants who plan to starve-in not park in the immediate vicinity of the site. Have someone drop you off, or park a long distance away. If you are a temporary visitor, please do what you can to reduce traffic near the event. There are many people living and working in the neighborhood of the site who did not ask for a public show on their street. They deserve every courtesy.

The Hunger Show begins on Saturday, Oct 11, with the door closing on the pillow at 6 pm. Whoever's inside at that time is in the show. No one else comes in. Anyone can leave anytime (no return). Participants should have their own sleeping gear and clothing to accommodate warm days and chilly nights. No food in the pillow. There is water. Persons with kidney troubles or other ailments that might be made worse by malnutrition should skip this token famine and wait for the real thing in 1977. There will be an MD on hand for emergencies throughout the event. No children fasting please; not yet. Participants will be asked to sign a terrifying release form which signifies that you're on your own in terms of liability and that you don't mind being filmed. Regarding legal/illegal, bear in mind that you are very visible in the pillow, and visible lawbreaking is punishable by endless inconvenience. Changing that requires some other kind of event. The subject of this one is: you are what you eat.

Believing him, I began to wonder what belief was made of. Clearly, some form of personal experience, such as knowing an author, or knowing hunger and overcrowding. How many of us arrogant world-shapers knew hunger? Could we learn it and teach it at the same time? The Hunger Show took shape.

Publicly it was a failure. We lost the focus of the plastic pillow and we lost the focus of staying in one place. But internally among the starvers, we connected with our bodies, with each other, with the Depression generation, with the Third World, and with the future in ways and depths that we're still sorting out.

—SB

Liferaft Earth

Robert Frank's 37-minute 16mm color sound film of the Hunger Show staged last October by Portola Institute may be rented for \$30 from WHOLE EARTH CATALOG. "I'm sorry, Leon," said Bonnie Jean, "I'm hungry and I'm crazy."

LIFERAFT EARTH PHOTOS BY BONNIE-JEAN ROMNEY

Under the Press Conference gun.

Before saying how this Hunger Show went, I want to suggest what could be. Muster a travelling troupe of skilled improvisational actors and divide it into two or three sub-troupes. Set up a tour through college campuses with pre-publicity and all that. Starting on a Monday at each campus a hunger show begins in the theater, with the participants—one sub-troupe of actors and however many voluntary students from the college—confined behind chicken-wire on the stage. Let 'em starve all week, building publicity, to a paid-audience performance on Saturday night. Now the troupe cuts loose, laying in every kind of stress and issue, trying to burn or pray their way to the center of the population madness. Let whoever was the "leader" have a cowardly death and departure. Serve food to the audience. And so on. For the last day, Sunday morning, let audience in admission-free for what I can assure you is holy communion—the first food for the starvers.

There were as many Hunger Shows as there were participants (170, counting those starving on the Hog Farm buses travelling from New Mexico during the event). So rather than try to solo a description I'd rather ride tandem with Rick Field's account and Tari Reim's mid-week report for the *Berkeley Tribe*.

From *Berkeley Tribe*, Oct. 17-23, 1969

The highly public place turned out to be a parking lot for a motel turned poverty center in Hayward, California. The Southwest Electric Campfire nomad architects circled the concrete with a polyethylene air-filled wall about four feet high. It had been planned to hold the show inside a giant space-egg of the same semi-transparent membranous material. But the fire chief declared it a fire hazard, so the wall was a last-minute innovation. Not until it was fully inflated did we realize it looked exactly like the bulging sides of a rubber raft.

Inside we had ourselves, a sound system, television, water, chemical toilets and whatever anybody brought. We flew world flags, the ones showing earth as seen from a satellite. About one-hundred twenty weighed in before the supposed one-way door closed at 6 P.M. Saturday.

People kept arriving as late as Wednesday. It was decided to let each new-comer ask everyone on board for permission to join. They spoke to us from outside the wall, using a microphone. The crew then voted yes or no, usually by voice.

No one was denied. Though a sizable minority wanted to stick to the dead-line.

The first division appeared here: some took the Liferaft as a vow, and wanted to play the game close. Others didn't like the role of insider refusing outsider; they pushed for the opening up of the Liferaft game. A familiar commune problem, population pressure, how not to close off and yet not be swamped. We, however, had enough room—at least we did as long as we stayed in Hayward. And we had no problems feeding everyone. There was enough plain water, ice, and even an occasional treat of hot water, "tealess tea." We had none of the kitchen problems of large groups. No hassles about diet, cooking, cleaning. (Though we did have our share of talk about food, especially diet.) But neither did we have the unifying ceremony of a common table.

When you don't eat you have nothing but time. One corner of the raft was given over to the technology of communication and time-filling. Running this Liferaft brain-center was our jester of ceremonies, Wavy Gravy, Hugh Romney of the Hog Farm Family.

The first days records were played whenever no one was speaking over the sound system. Imaginary, usually elaborate, meals were read for breakfast, lunch and dinner. Games were played with prizes of plastic fruit. Newscasts kept us informed of events inside and outside

← The inflated surround was a wonder. Ideal minimal barrier. A product of desperation, it couldn't have been invented better. It was pure vulnerability—you could fall over it or cut through it easy as pie. We were contained by will and barely anything else.

Signing in Saturday afternoon was a ceremony. You weighed yourself on this funky scale and signed your weight and name with a pen embedded in a plastic asparagus into a big impressive Hog Farm book. Bonnie Jean conned and supervised. This ceremony and the many others were the product of Wavy Gravy's insistence on dramatic forms, hard edges to the game. "Play hard and play fair" is a place where he lives. It can unfuzz your mind.

A hundred or so people. It wasn't enough. We weren't crowded. (Goodbye, expectations, you never had a chance.) And we weren't reflected on ourselves; open sky inhaled everything from us. All we had in common was plastic fence, the mike and sound system, and only gradually hunger. Without the open mike the event would have been nothing. The sound system was our mutual consciousness, however cluttered.

Who was there? An odd lot. A scoutmaster and his wife. Calvino, 52. High school girls. A guy, never identified, who looked like the vice-president of an electronics firm, and made it through to the end. Ecological politicians (no offense): Keith Lampe, Stephanie Mills, Gene Schoenfeld, me I guess, others. Hog Farmers, hard core and fringe—the substance of our population (Bukovitch, Tom Law, Reno, Ruffin, Sunshine, Danny, Gloria, &.). A blind girl. The filmmakers Robert Frank and Danny Lyon. Student pres. from SF State. One of the staff from the poverty offices. Dick Raymond from Portola Institute. No narcs.

Liferaft Earth
Whole Systems

the raft. Six medical students had started fasting in Salt Lake City. The Hog Farm convoy of seven buses was on route to join. Sixty of them had begun to fast on Saturday.

We also watched a UN starvation movie on a sheet hung from the poverty center balcony, and listened to a tape of Kafka's "Hunger Artist."

The light-heartedness and activity were helpful, but beneath it all there was the growing awareness that the sound was never off. Since the raft was wall-less there was no escaping. Noise pollution of our own environment by our own entertainment. The amplification was using us more than we were using it.

Some Liferafters left because of this. But those who left without first trying to bring up the problem via the open microphone—it was there for anyone to use—did not grasp that we Liferafters could change anything we wanted to change.

Had the model of Liferaft as Earth been more deeply felt, there would have been more active caring. We create our environment. We cannot pretend the world is not our environment—an object outside—for we cannot leave it. It follows us even as we destroy it.

Thus leaving the Liferaft because of not liking its environment was like leaving the earth—an impossibility. Yet many left, giving up the game and the vow.

Quite simply, the Liferaft depended on the people in it. Some saw this. Others treated the event more passively. They came out of curiosity and stayed as long as things were "interesting." Not seeing that the "interestingness" of Liferaft depended on the people in it. Stewart Brand, the inventor of the Liferaft idea, was conspicuous by his silence. More interested in what would/could happen than in making it happen.

On Sunday ABC-TV arrived. They were filming a special on ecology activists. They were on our side. Could they film us from within?

Another division: some Liferafters were dead against mass media; they were the enemy. Others felt we could use them. Still others felt we could convert them, by being open and friendly.

The decision was to let them come in if they fasted with us. ABC pleaded. They had important work to do, useful work. They couldn't spare the time. So they filmed us over the wall. Anyhow, we had our own media inside, Robert Frank with an empty stomach filmed ABC filming us.

Since the door was closed at 6 pm Saturday, the music, the color TV, the four microphones, have been blaring away.

Saturday night, Reno-the-jacks-coach held the World Series of Jacks. After exhausting preliminary matches, Susy B, upset the much-lauded Gloria, much to the delight of Hayward fans watching from the perimeter.

← Rick, I was wasted. As much cogency as I could muster was sliding out over the telephone lines to the reporters who kept calling. Stephanie and I were the names they knew to ask for, and whatever we said on that fucking phone is what appeared in the newspapers—it shouldn't be that way, but that's how it was, and it drained us.

It was far better with the TV people, because they had to come to the scene and would interview more people. More important, they saw us, and saw us diminish, and began to identify. That never happened with the newspapers and radio interviews.

If news is as important to social consciousness as everybody says, how come there's so much sloppy reporting? Associated Press (via phone) conjured the news that Dr. Schoenfeld was denying people aspirin for their headaches, and that fiction was printed throughout the United States. Some of the underground coverage was better, some much worse. You pay your money and you take your chances when you read a newspaper.

LIFERAFT EARTH

With the arrival of the TV crew we felt how exposed we were. Flat parking lot concrete. Hot sun. Cameras. The good citizens of Hayward peering at us over the wall, as if they had never seen fasting long-hairs before. Some of us got uptight, tried to find a spot as far away from the eyes as possible, but finally there seemed nothing to do but become transparent, get used to it and continue living.

A question about getting high. Some people smoked grass, as discreetly as possible. For others, the paranoia level was too much—all those people watching. Others preferred meditation, yoga. The first three days we did group breathing exercises. (Meditation and yoga seemed good survival skills; it was easier to survive the noise, tension, nothing to do time; it gave moments of solitude in a week of constant social living.)

Truly, The Eyes of Hayward were upon us. But it was all right. Most spectators had never had the chance to observe tribal ways so closely.

The transparency phase didn't last long. Kids invented the game of punching holes in the raft. A Hole Patrol was armed with tape. It became clear that most spectators didn't know what we were doing. Some Liferafters wanted to go outside the wall and talk to people. Some wanted to let spectators wander around inside. Most of us felt exposed enough. Again, the open/closed division. Gandalf said, If you can't get through to people over the wall, you can't get through to them outside it. The end result was that more of us spent more time in communication yoga, rapping with spectators over the wall.

It was twenty-four hour parking-lot theatre; the main action was not eating. Suspense was supplied by how long we would last. It was hard for many spectators to see the connection between our "game" of not eating and getting along with each other and our "message". It was hard for some of us to see the connection also. Anyone who didn't was welcome. And some came just to fast, as self-purification, as a joyous, positive act. To some the link of fasting to starvation ecology politics was a bring-down.

The political/spiritual dichotomy was always present. Yet for many of us it was not real. Some learned what it was like to fast; some learned what it was like to be hungry; most of us learned both.

Fasting to get high, to purify, to understand the root fear of infant helplessness when the breast did not come on time; did not cancel out fasting to know hunger, to call human attention to present and future starvation of food and space and silence.

"Political" and "spiritual" were not only not mutually exclusive. They were mutually interilluminating, as interdependent as the life-support system. The Liferaft experience was a continuum, a sliding wave-length between the two conceptual extremes.

In case there's some question what Liferaft Earth was about, it was about this

Tom Law and Reno led the yoga breathing exercises. It meant a lot to do something with the body that was growth, not further shrinkage. We were doing something in unison, and that meant a lot.

On Sunday, the crew built a swimming pool and we spend the day lounging in the sun at our microcosmic Country Club.

The following day remained cold and cloudy and the crew kept warm with football, frisbee, flying kites, darts, and yoga.

We also tried a Hog Farm specialty, the Gong-Bong. A group of people get in a circle, hold hands tightly, then squatting, breathe deeply 14 times. Slowly stand up, raise your arms, holding the last breath. Then let out any sound that your lungs make. It's a very strange high. I fell to my knees dizzy, the dude next to me passed out.

Then, gong-bonged, we stayed in the circle and the microphone was passed around for each person to say who he was and why he was on the Liferaft. Wavy's right: this should happen at every event where people are staying together. What people said was strong clear stuff. By the time the mike came around I had to talk through a considerable lump in my throat.

By the second night crew members were asking other crew members for permission to leave the raft, keep the fast on the outside, and then return. By this time we had evolved a method of decision making: we would make no decision about future policy. Leave if you want and ask for permission to re-enter when you get back. In practice, people left and came back without much trouble. Maybe five, give or take a few. But there was a growing group feeling that people should not leave and then return because it was becoming clear that the difficulty was not only fasting but staying in this often insane place with the same people. (Most of us had not known each other before. We ranged from age 16 to 52, from scoutmaster to beyond description.) What it came down to was, if you felt people shouldn't leave, you didn't leave.

We were not in a beautiful spot. We sat, walked and slept on concrete. Longing for trees. Calvino talked about organic gardening. Maybe we could bring some earth into the raft. At least the sky was there, if you lay back.

Hayward was the kind of place you get marooned in while hitchhiking. Cars slow down just to look at you, never to stop. But as far as the ecological consciousness of Liferaft—it was perfect. A hungry crowded concrete future. And the people could step right up and see it, for free. It was also good for us, to be out there in the middle of parking lot shopping center america, talking to people far from hip ghettos. It was intensified by that empty spaced-out lighter than air feeling of hunger. And it was funny, how many of them were impressed by our not eating. We were Fools but we were doing something that was beyond them. Some heads got opened. Not making a big serious deal of fasting was our best Fool's way. We gave the microphone to somebody munching a hamburger. Spectators—a few—wanted to know what they could give us. Since food was out there wasn't much. Some of us struggled through Ehrlich's "Population Bomb", to know what we were talking about. (It was hard to read after the second day; eyes kept slipping off the page.)

Rain clouds on Tuesday. We inflated our common shelter—a smaller version of the original space-egg. A warm drowsy secure nest. But it was called a fire hazard, even though it was raining. Soon we had a shanty town of scrounged plastic and wood lean-tos. Private property. The common one-sky-one-roof feeling disappeared. Small groups invisible behind their plastic. No longer could you spend time just drifting around the parking lot, bumping into people, picking up on what was happening.

[photo: Oxfam]

Tuesday, getting bleak.

The rain that night was just too heavy. We found shelter in the poverty center office. People and sleeping bags soaked through. Started the morning with chanting. Rain continued. People left. Report that Liferaft was sinking because holes could not be patched because of wet plastic. Report that a stop sign had been thrown into Liferaft during the night. Decision to abandon Liferaft—we couldn't stay in Center office—and continue Liferaft in back room of Whole Earth Truck Store. (No place else to go.)

Many of us left during the move. Everytime condition/place changed we lost people. Keeping open to moving and change was harder than fasting for many. We were wet, tired, funky. The room was warm and dry and much much too small. We covered the floor with dry sleeping bags and the walls with wet clothing. Again, the model of a crowded hungry future, too many people living in insect closeness. Of course for a while it was nice and cozy, close comfortable groups laying around, taking it easy. But. The TV in the corner reached every ear. Cries of Turn it down. Cigarette smoke duplicated L.A. air. Many, able to stop eating, were unable to stop smoking. If you took a step, you had to stop over somebody. After a few hours of this more and more people died.

A general goofy punch-drunkness. Some avidly read cookbooks, especially savoring the big glossy illustrations. A TV crew arrived. Wavy Gravy passed out all the toys he had left. During an interview with Brand some crew member blew bubbles in front of the television camera.

We took stock. The three days in Hayward were over. We had plenty of publicity—on the news every night, talked to too many reporters. Now when TV or radio men came most people hardly stirred. Nor was there much interest in watching ourselves on TV. The Log was hopelessly out of date since people were leaving without bothering to weigh-out.

Roy Sebern, artist.

With the sky gray and threatening, like a scene from the Old Testament, with the fourth day of hunger producing weird and mellow hallucinations, the entire Liferaft Earth seems more surrealistic and more absurd.

But sitting here, looking out across the "Hunger Show", sitting here in Liferaft Earth looking across the desolation of this Asphalt-Parking-Lot In-Hayward-Wasteland, I can still remember that this macabre and absurd scene does not surpass the outside world I came from.

Tuesday night. The rain kept coming down that sloping asphalt. ("No rain this week" the weather bureau had said.) People were 3-days weak and now were soaked. ("Two more days of rain" the weather bureau said now.) The Pneumonia Show. I started waking people up and sending them into the plastic tube—it wasn't dry enough, and the Fire Department would chase them out. We'd have to leave the enclosure. I stood by the door "ARE YOU READY TO DIE" for two breaths, and pushed on out. The key I had to the big building didn't work; I called Goetz and he came down to open his office. Warm dry office, gradually filling wetly with people. Wavy comes in. His wife Bonnie Jean comes an hour later nearly hysterical; she's been searching for him all this time in every pile of junk in the enclosure. I go back out to get the final refugees. Rain and wind. What I hear, walking through the debris, is "This is the way the world ends . . . sooner than expected", only not that dramatic. Just a caption.

It was impressive, that people as weak and fucked-up as we were could clean up the parking lot and move out so efficiently. We kept discovering that, how as you get weaker you still can do what you have to, only you do it better. You get kind of simple-minded, I think. It makes for good press interviews: you're too weak to tell anything but the middle of the truth.

Robert Frank stopped by to tell us he'd died driving over from Hayward. He felt the movie he'd been trying to make had been in the parking lot. If we'd stayed there, stuck it out . . . He obviously didn't feel too good. We'd watched his last movie, "Me and My Brother," starring Julius Orlovsky, in Hayward, projected on a sheet; it was depressing to lose him.

The seven Hog Farm buses arrived that night. Painted with "Liferaft Earth Hunger Show", driving from New Mexico through breakdowns and hamburger highways. It was now Thursday. Sixty or so had managed to stay alive, driving, feeding kids. Others hadn't started the fast or had died along the way.

Back in the Hayward parking-lot—hearing that they were now in Reno, that they had to fix a clutch in Las Vegas—we had talked of the energy we would receive when they joined us. How beautiful it would be. The vision of sixty more Liferaft people coming as our numbers dropped.

But we did not run out into the rain and embrace them. Instead we stuck stubbornly to our remaining structure—probably because it had in fact fallen apart and we were doing our best to keep going. But we went through the whole trip of our game: Stop at the door, are you alive or dead, weigh-in, and so on. One by one. Since many Hog Farm people were dead, having eaten, and needed to get out of the rain, see friends, dry off, stretch, use the bathroom—the game at this point was just in the way. Living and dead from the Farm all

had the same living problems. The pure Liferaft of only fasters was, by necessity, a thing of the past. But we held on tight to our conception of what we were doing; or our conception held on tight to us.

Understandably, many brothers and sisters from the Farm were unhappy. Thoughtlessness and our weary apathy were received as negative vibrations. Farm people felt a come-down from their cross-country bus-life Liferaft. Not that it was all bad. A lot of what happened was just fine, embraces, smiles, sharing. But there were just too many people in the room. Kids and dogs running around. More people kept coming in to the room from the buses. Before our eyes our population exploded. Out of overcrowding, misunderstanding. Arguments over the microphone. Some trouble within the Farm. Somebody wanted to discuss the wording of the original Hunger Show leaflet. Finally twenty-five of the newly arrived Farmers walked out and died across the street in a Chinese restaurant. Wavy Gravy, torn between communes, said he was leaving because so many of his family were leaving. He looked miserable. Somebody said, But you can't go, weren't you one of the organizers. Somebody answered, That's the trouble, there aren't any organizers, it's what all of us do.

Wednesday, the full catastrophe.

At this shock-point one Hog Farmer took the microphone, and said, Listen, I have this book, you ask it questions, and there was suddenly instant agreement. Bring in the Book of Changes, to help us through our changes.

A call for silence. People meditating, going into themselves, quieting down. We passed the bundle of yarrow stalks around. Over ninety people touched them, held them, heavy with potential. We all placed our hearts in the straight-crooked stalks, falling apart, coming together. Intense highly charged stale late night air.

"The Arousing: Thunder repeated: the image of shock. Thus in fear and trembling the superior man sets his life in order and examines himself." Changing to The Receptive: "Since there is something to be accomplished we need friends and helpers in this hour of toil and effort . . . to find friends means to find guidance." The words flashed away our weary collective stupidity. There was no discussion afterwards. The whole room began breathing normally. Wavy Gravy took to heart the section dealing with the leader, that ". . . this is also a time of planning and for this we need solitude . . . In this sacred hour he must do without companions, so that the purity of the moment may not be spoiled by factional hates and favoritism." Wavy Gravy returned to his air mattress and announced that he would not speak until the same time tomorrow. Thus he signed off.

The police in Menlo Park also thought the Truck Store was overcrowded. Our third and final move was to a house in the mountains. It seemed a reward for going through all the rest. Walking through the forest, under clouds, pine-needle ground, hunger-sharpened taste buds feasting on fresh air, remembering I haven't been alone since the fast began. Please, People; let there be trees and space enough for space.

The scene Wednesday at the Truck Store was harrowing. This was my most protected research haven. With wall to wall people in it I was flat freaked. Now we were reflected on ourselves. "This is it", said Wavy, "This is the 21st Century." With the arrival of the Hog Farm buses that night (still raining), it began to get really interesting—jammed with people now, and tempers rising and procedures fraying: everything from this point on is news because nobody knows what happens next. We never found out. A long slow reading of the I Ching put everybody to sleep. The next morning Menlo police came and said to leave.

That was a strange scene. I was in the parking lot of my own store raving at a cop, wondering if I was going to slug him. He was no polite cop and I was no polite citizen. I didn't hit him, but was going to do it in the press, when Dick Raymond (who'd left and eaten, because of a death in the family) came up with an original thought. Let the cops be. Hippies against cops is a boring and useless story. Go to Portola's place in the mountains, Ortega Park, and don't tell the media where we're going. Keep the fast, but get some rest. And that's what we did. A reporter from Channel 7 said as we departed, "Is there anything else I can do for you, besides leave you alone for a few days?"

All of us are here. The Hog Farm, fasters as well as non-fasters, visitors who can find us. Robert Frank returns, asks to rejoin, resumes not eating, and brings out his camera. All Structure has disappeared. No games, no news reports, no hard and fast line between living and dead. Energy comes for clear headed moments, then evaporates, then returns. Non-fasters cook elaborate meals constantly. More people die due to proximity of food but most of them don't leave. Someone proclaims, "There is no difference between the living and the dead." A comfortable wandering chaos. One radio station reports we've given up, another, closer to the truth, says we're in hiding. We wait and take showers. Wavy Gravy, in all day silence, covered with balloons, ceremoniously presents a glass of water to everyone as they arrive from the Truck Store.

Thursday, Friday at Ortega. People who had "died" were cooking constantly in the kitchen, eating four or five meals a day in front of close friends who were starving. They weren't doing it meanly, more as if with so much hunger around, someone had to do a lot of eating. I have a feeling that this is happening in the world—under-eating in one place matched by over-eating in another to compensate.

The return of Robert Frank and Danny Lyon. "I woke up this morning," said Robert, "and I felt terrible. I had to come back." Danny commented, "I'm glad Robert had some food. He couldn't carry the camera any more." During the week Tom Albright had an article in the San Francisco Chronicle about Robert's involvement in the Hunger Show, titled "One Man's End to Cynicism."

Friday, final meeting on the final issues.

We meet and try to discover an end to what had a beginning. Survivors decide to all sleep upstairs, then break the fast together. Press is invited. People give up their fantasy dinners and agree to break fast on stewed tomatoes with a little salad later, as suggested in a book.

Frank takes movie and tape snapshots of all survivors; some speak; some just look into the camera.

Sentient beings are numberless, starving and driven mad by over-crowding; vow to save them all.

A vow is making a choice not to choose at each changing moment whether to stay or not.

Survivors took the experiment as a vow.

Here Liferaft opens out, game into world. Because there is no denying the vow of birth, of living with this world; it follows us where-ever we go, what-ever we do; there is no other choice for living because there is no other place to live.

The TV newsman said, "Well, now that you've made it through this week and I see you're having some food, how do you feel?" The same guy who answered with a simple heartfelt murmur, "This is Christmas," was the guy who had nightmares for a week that the Hunger Show was continuing, and shat pale and painful. That was me. That was my end of it.

The one Richard Brautigan saw happened back on Wednesday, around noon, after everybody had taken their sopping gear and split to Menlo Park. Brautigan surveyed the empty parking lot with its smelly outhouses and outline of deflated plastic. He poked around in our tidy pile of trash, noted the abundance of children's toys. He stood by the still-standing doorframe and listened to the sound of the rain on the plastic. While every so often the are-you-ready-to-die door swung slowly open and blam shut in the wind.

Fasting at Ortega was simple: endurance. Bonnie Jean was now unable to walk, and Wavy carried her from room to room. Tom Law and Reno were hustling around organizing their Symposium. "The yogis," said Bonnie Jean, "are man-mountains."

Friday afternoon was a big last meeting, partly on Hog Farm business, partly Hunger Show. Wavy was making his farewell address to the Hog, signifying a new period for him of "fast yoga", on one quick bus, next destination the Chicago 8. For the Hunger Show, it was finding a way to bring a loose show back together and end it formally Saturday morning, on schedule.

Saturday morning, the first bite of food—a squeeze of lemon, some avocado, stewed tomato—went off like fireworks in the body. Everybody's smiling, everybody's chewing. We had a kind of diploma printed up for those who made it through, and people are signing each others diplomas like high school yearbooks. "Best of luck in '69. Patty-cake."

Who are the survivors? Gandalf is manning the logbook and the scales and has the total: 52 survivors. Quite a crew. The hairiest and quietest of the starters. Lot of girls. Roy, Calvino, Rick, Amy, Wavy, Bonnie Jean, Ruffin, Tom, Reno, Steven, Marsha, Peter, Jim, Bob Redhat, Dick Duncan, Tim, Buffalo Bob, Gil, Eban, Jerry Lamb, . . . roll-call of the living.

Liferaft Earth Cost Pie

total cost \$2357.61
no income paid for by customers and subscribers of Whole Earth Catalog

Saturday, Pigasus, Wavy Gravy (scrawny gravy—down 20 lbs.)

My mother is right, at last at last
So Eat! Eat!, so fast & fast
In India, China & Peru
The last meal has got to be you.
DDT & a BM
The teeth of reason grind again
Fuck no more for heavens sake!
Save the world from the old fuck quake.
\$1.10 and I'll make you sterile
Get your rocks off the moon
(balls of beryl)
Kids are made by fools like me
But only the pill can make you free.

Man is a mucker (Cain mucked Abel)
Don't throw your beer cans under the table!
God's in his penthouse—all's right with the world
He's got a Dispozall for all things soiled.
Make room for God! (Heah come de judge!)
In a crown of garbage, with a scepter of sludge
Man the mucker at his right hand side
And Dr. Filth his sinister bride.

Envoi:
Breathe while you can & fuck while you may
Species pass another day
Yez dont take yer choice so yez pays yer fee:
The earth a desert & death home free.

Time release

A year ago, when you did Liferaft, I felt a little surprised that you were putting energy into a paranoid trip. I was also a little curious, a little envious, as I watched people leave here to go and participate. I had never fasted. Six days ago I began a fast, my first; and as I began I knew it would last at least seven days, because Liferaft had been seven days.

I sat today for a long while under a green tree looking up at the sky through the leaves. There were many different shades of green and as the sun moved the patterns of the leaves changed; it was very beautiful.

For some reason I found myself remembering a sentence from a science book I'd been reading: "Probably 300 million children in the world today are so undernourished that they are suffering permanent brain damage."

Since I came to live in the country I have been keeping useless information out of my head. I don't want to listen to horror stories when I could be chopping wood or canning blackberries or telling a story to the kids. I refuse to worry about something that I can't do anything about. But this sentence didn't feel like that. There I was, under a tree, surrounded only by good things, and yet I knew that on this planet children were hungry real children, children that I could easily reach in a days time (given enough money and a passport). They were inside my head, and it was right that they were inside my head.

I don't know where to go on from here. It feels like I am climbing aboard the Liferaft, a year late.

Elaine
Cave Junction, Oregon

AT HOME WITH THE LONE OUTDOORSMAN

So far that day the Lone Outdoorsman had motorcycled to the toilet and back, and hiked around Section B of the Eagle Rock State Park campground. His plan had been to stop off at his camper for a beer and a bar of pemmican, and then go hunting over in the park amphitheater with his new AR-15 semiautomatic double-barrel over-and-under. But after he'd noticed the hippie queer bothering the two foreign ladies in the red tent, he decided he'd better hang around the campsite just in case.

He wanted a beer really badly by now, but as an act of discipline he kept his cooler closed, and satisfied his thirst with the warm water in his canteen. He considered foregoing a beer as an act of sacrifice for the ladies. As women, alone in the wilderness, they had a right to expect that much of him. He owed it to them, to the cause of westward settlement and civilization in general, to keep alert and ready until the threatening element among them had been dealt with in some sure and final way. Maybe it had already been dealt with. Maybe that little show of force right there in the hippie queer's own campground would be sufficient to keep him from running amuck. The Lone Outdoorsman hoped it would. He sincerely hoped it would.

For he was a peaceable man. He'd fought the war to make the peace. It was his most fervent hope that peace would in fact endure, so that women and children could be safe in their homes, to grow and learn and become good citizens, so that people like these two foreign ladies could come to America and witness the magnificence of this great land from sea to shining sea in freedom and safety. Let the foreign people come to America, he thought. Let them experience our great mountains, our flowing rivers, our abundant wildlife, our historic monuments, our magnificent parks, both state and federal and our majestic canyons, deserts, plains and lakes, both fresh water and salt. Let peace reign, he thought. Let the people come, and enjoy, and be free. And let the freaks and queers and Jews and motorcycle gangs be goddamn careful when they fuck with the Lone Outdoorsman.

The Lone Outdoorsman took another pull from his canteen. As he holstered it again he peered through his curtains and saw a suspicious thing: the threatening element next door was trying to sneak away, to rendezvous with a band of confederates over by the river. The Outdoorsman reached for his AR-15 semiautomatic double-barrel over-and-under and prepared to fire. But then he lowered the weapon and through clenched teeth muttered, "I think I'll follow that son of a bitch." He hung the rifle on the wall and got his .357 magnum pistol out of a drawer and hitched it to his web belt.

As Divine Right disappeared into the trees in the rear of Section C, the Lone Outdoorsman stealthily trailed behind him.

The User's Guide to the Protection of the Environment

The consumer has more power for good or ill than the voter. All of us ecologically-concerned citizens have frets of creeping hypocrisy when we enter the supermarket all unknowing or half-knowing about the effect of our purchases and refusals to purchase.

This book is a fret-reducer. It defines daily virtuous behaviour toward ecological Good. —SB

WATER CONSERVATION IN THE HOME

Minimize the amount of water you use and the waste burden you impose on the sewer system.

Fix leaky faucets and toilets. The steady flow uses up a considerable considerable volume.

Food waste disposal units are about as ecologically unsound as an appliance can get. A disposal unit will increase the load you impose on the sewage system by 25%.....

Plant lawn covers and shrubs that will be able to get along with a minimal amount of sprinkling.

Don't move where the water is scarce.

Don't use your sink as a dump. Refrain from washing garbage, detergents, and chemicals (e.g. Drano) into the sewers as much as you can.

Never use pesticides in such a way that they could contaminate either ground or surface water.

Don't use salts in the winter to free walkways of ice. This practice is ruining a growing number of wells in New England.

"... If the options are traveling in an old jalopy with two passengers and a driver, taking a half-full bus, a half-full plane, or a half-full train, the options would rank: train (12 gm/100 passenger miles), bus (27), jet (160), and auto (2666) in terms of CO emissions. . ."

The press release is, in effect, a news article. It must be clear, interesting, readable and to the point. In its first sentence (the lead), five questions should be answered—who, what, when, where, and why. Reporters will essentially be rewriting a press release for their articles if there are no other facts at hand, and everything they need should be included. If the lead is clear and informative, local radio stations may also use it in their hourly reports.

To be effective, the press release must also be timely. One of the media's strictest rules is the deadline, and this must always be taken into account. For morning papers, the deadline is around 7:00 P.M.; for evening papers, around noon; and for evening television news, about 4:00 P.M. Reporters should receive releases substantially ahead of the deadline, preferably by several days if the information is available. Releases should be marked "press release" and should include a release date, or a time when they are to be announced. Groups must also include on every release the name and telephone number of a person who can be contacted for further information or any questions. For best results, the envelope should be addressed to the attention of a sympathetic newsmen.

The Voter's Guide to Environmental Politics

Read this book if you intend to recycle wastes, write letters to politicians and business leaders, testify in court actions, design posters, raise and donate money, use public transportation, walk precincts, limit the size of your family, and vote intelligently.

The Friends of the Earth chart on how your congressmen vote on critical environmental issues, reprinted in this book, is available as a wall chart at 50¢ from Friends of the Earth, 917 15th Street N.W., Washington, D.C. 20005. Evaluations of congressmen are done by many other organizations and you would do well to get the ones from any organization which you feel represents your interests. All of these voting record analyses must be used with discretion because of the problems, discussed in the chapters on Congress in this book, that many key votes are not recorded and congressmen often change their vote when they know it will be recorded as a roll call vote. Hopefully, the bill now in progress to require all votes to be recorded as roll call votes will pass before the end of this Congress so you can know your congressman's position more fully.

Several complicated measuring and monitoring devices exist to detect the presence of lead, boron hydrides, arsine, hydrogen fluoride, combustible gases, and other potentially harmful substances. Some other companies which should be contacted for information are:

Foxboro Company
367 Neponset Avenue
Foxboro, Mass. 02035

Mast Development Company
2212 East 12th Street
Davenport, Iowa 52803

Micronesian "out-islander" in particular—that is, those who live across a hundred miles or more of sea from any neighboring islands, and whose contact with the rest of the world is limited to the few souls who arrive on the eighty foot government boat every six months—simply don't think about infinity, or to put it more accurately, the idea that everything is possible.

In order to survive out there by themselves, they've had to gain a pretty good feeling for pacing the breadfruit production and the coconut eating. In some of those places the highest crime is cutting down a coconut tree without communal permission.

Jerry Mander

By conventional book-keeping methods, for example, the coal companies strip-mining away the hillsides of Kentucky and West Virginia show a handsome profit. Their ledgers, however, show only a fraction of the true cost of their operations. They take no account of fractioned land which can never bear another crop; of rivers poisoned by mud and seeping acid from the spoil banks; of floods which sweep over farms and towns downstream, because the ravaged slopes can no longer hold the rainfall.

John Fischer.

The Environmental Handbook

The Environmental Handbook as "the bible" of New Conservation. Paul Ehrlich, the others, as prophets predicting the literal end of the world. Ecology Action, the others, as young disciples working zealously to save it. The Survival Walk from Sacramento to L.A. as a modern version of the crusades. The public outcry against pollution as an evangelical call to cast out evil. San Jose State students actually burying a devil alive, in the form of a new Maverick.

While Lynn White Jr. says: "Human ecology is deeply conditioned by beliefs about our nature and destiny—that is, by religion. . . . The victory of Christianity over paganism was the greatest psychic revolution in the history of our culture. . . . We continue today to live, as we have lived for about 1700 years, very largely in a context of Christian axioms. . . . Christianity, in absolute contrast to ancient paganism and Asia's religions. . . not only established a dualism of man and nature but also insisted that it is God's will that man exploit nature for his proper ends. . . . [Christians] are superior to nature, contemptuous of it, willing to use it for our slightest whim."

Conservation asking Christian America to quit being Christian America, America saying can't, I need the money.

Psychic revolution. Beginnings of religious war. Christ a space-age anti-Christ. Battle in the cockpit. Veer left, veer right 66,000 miles an hour. Off course! Quick! Somebody grab the wheel!

or WHOLE EARTH CATALOG

The phrase, "health of the environment" is not a literary convention. It has a real biological meaning, because the surface of the earth is truly a living organism. Without the countless and immensely varied forms of life that the earth harbors, our planet would be just another fragment of the universe with a surface as drab as that of the moon and an atmosphere inhospitable to man. We human beings exist and enjoy life only by virtue of the conditions created and maintained on the surface of the earth by the microbes, plants and animals that have converted its inanimate matter into a highly integrated living structure. Any profound disturbance in the ecological equilibrium is a threat to the maintenance of human life as we know it now.

Rene DuBos

Ecotactics

The Sierra Club's paperback Ecotactics was published two months after Friends of the Earth brought out The Environmental Handbook. The difference shows, but not enough to hurt. If The Handbook hadn't got there first, Ecotactics would be a hot item indeed. It's not quite as punchy as The Handbook but it's got a lot of good stuff in it, most of it by ecology writers I hadn't heard of before, which I consider a virtue. I mean, I've heard Paul Ehrlich and Rene Dubos and other big guns who appear prominently in The Handbook. I know what they have to say. It's encouraging to see just how many good young writers the whole ecology thing is producing. Since both books cost only 95 cents, the serious ecology revolutionary by all means ought to have copies of each. They complement each other, sort of fill in each other's holes. For example, The Handbook contains Gary Snyder's now famous environmental manifesto, "Four Changes", while Ecotactics presents a short article about Snyder himself, as a man, poet and a naturalist. Both statements deserve wide audiences. So do both the books as wholes.

Youth must develop an investigative approach to the problems of pollution. It is one of the most basic prerequisites. Not only must there be a close analysis of corporate statements, and periodicals, annual reports, patents, correspondence, court records, regulations, technical papers, Congressional hearings and agency reports and transcripts, but there must be a search for the dissenting company engineer, the conscience-stricken house lawyer, the concerned retiree or ex-employee, the knowledgeable worker and the fact-laden supplier of the industry or company under study. They are there somewhere. They must be located.

Ralph Nader

Atrocity

Last week I saw some copies of The Environmental Handbook (Ballantine) being carted out of a bookstore to be burned. Their front covers had been torn off and returned to the distributor for refund. The books had been on the shelves too long without being sold, so they had to be disposed of to keep the stock moving. It was too expensive to ship them back to the publisher; the distributor had no room to store them; so they were being burned—not recycled—BURNED! The bookstore manager said that in about 6 months when demand had built up, he would order more copies of the book, which of course would be new, meaning that more trees had been cut down for paper, etc. I sure hope WEC doesn't operate this way.

Pat Patterson
Austin, Texas

We don't. It's the difference between "mass distribution" and "quality distribution". All newstand periodicals and most paperbacks are mass distributed, and are destroyed rather than returned. With Book People and with Random House we have had quality distribution. All returns and over-runs we try to give to prisons, schools, and libraries.

—SB

P.S. Our printer Bob Parks says that paper suppliers are very quick to tell you you're buying recycled paper. If you want to be sure you had better personally check their process. I haven't checked ours.

The Tassajara Ecological Thoroughness Prize

is awarded to the students at Tassajara Zen Center, who drink their dish water. When you finish eating, a lady student pours hot water into your biggest dish. You take your elegant little cleaning stick and scour the inside of the bowl, then pour the water into your smaller dish and dry the first dish. You repeat the process into your third and smallest dish, scour it, and then drink the water, which is a sort of garbage tea, tasty and nutritious.

Can this be sewage? Winter irrigation with the treated sewage effluent in this forested area produced a fairyland of ice. Because effluent is produced year round, some special distribution techniques had to be developed for operating the system during sub-freezing temperatures. Several methods were tried including open trenches, perforated pipes, and revolving sprinklers. But the best performance was obtained using a stationary deflecting sprinkler-head developed specially for the project. Although the new sprinklers operated continuously under all conditions, the distribution pattern was not completely satisfactory, and research is continuing to try to improve them.

Now that NTA is gone, the detergent industry appears to be moving in two directions. The large manufacturers, such as Procter and Gamble, Lever Brothers and Colgate-Palmolive, are returning to phosphate detergents. A growing number of smaller companies, on the other hand, are putting out "unique" new detergents which they claim do not have phosphates or NTA.

Mr. W. J. Wjtancig, a chemist with Consumers Union, believes that nobody really knows what effects these new products will have on the environment. "Most of these products contain large quantities of washing soda or salt," Mr. Wjtancig explained, "but they are coming out so fast that we don't have the staff or facilities to analyze them. There is no government mechanism designed to examine these products before they enter the environment." . . . Until government or consumer pressure forces detergent manufacturers to conduct all their business in the best interests of the natural environment, rather than their own enrichment, washday miracles should be performed only by good old-fashioned soap.

eco-tage (ē'-ko -tazh or ē -ko -tazh), n. [MnE. *ecology* and *sabotage*, from Gr. *oikos*, a house, and *logy*, to study; and *saboter*, to damage machinery with wooden shoes], the branch of tactical biology that deals with the relationship between living organisms and their technology. It usually refers to tactics which can be executed without injury to life systems.

BY THE RIVER

The rock Estelle was on was one of several boulders near the river, all of them gray and half as big as houses. It was already dark on the ground around the rocks, and cold enough to make you want a sweater. But the sun was still shining in the trees overhead, and as D.R. climbed he thought: climbing for Estelle is climbing for the sun. It warmed him to think that. And he was warmed all over again when he saw Estelle lying on her bright Mexican serape on the broad, flat surface of the rock.

Estelle had her shirt off, rolled under her head for a pillow. Her skin was naturally dark, a sort of pale olive that was always consistent in its tone no matter how much or how little sun she got. Estelle's hips and her thighs were too thick for anyone ever to call her figure "beautiful" in that plastic sense that Miss America is considered "beautiful". And her face was too much the face of the average girl in a crowd for, say, a TV camera man to ever zoom in on and freeze as something special. And yet Estelle was a truly beautiful girl. She had dark hair and very large, dark brown eyes. Her breasts weren't especially big, or little, or round, or pointy or any of those magazine-writer tit-fetish cliches. They were just nice boobs on a nice woman, absolutely real like everything else about her. Goddamn, D.R. thought. Tears came into his eyes. He could hardly believe the loveliness of the moment his painful walk across the campground had led him to. The sun was just going down behind the cliffs across the river, shining orange through the trees and across Estelle's naked skin. Shielding her eyes with her hand, she looked up and smiled at D.R., then patted the rock beside her with her hand. D.R. lay down and snuggled his face in her hair.

"I've been having the loveliest visions," said Estelle. "I've been seeing wonderful feathered horses, flying through the sky. And wheat fields that would turn to wings and fly away."

D.R. asked Estelle what she thought the visions meant. "Nothing," said Estelle. "At least I hope they don't mean anything. I like them just exactly as they were."

They lay quietly for awhile. The sky was full of light and still a brilliant blue. But the rock and the river valley and the cliffs on the other side were all in shadow now, and it was getting cool. Estelle turned on her side and moved closer to D.R., laying her arm across him. Her breast tumbled precisely into D.R.'s hand, and for a time the reality between them was simply hand on breast, hand folded in the flesh of breast, pressing and rubbing and smoothing like patting down a pillow. Then their mouths came together in a long and dreamy kiss.

Food from Waste

An inkling of the broad vision and planning needed comes from a sleepy little Mississippi town called Bay St. Louis. There, a National Aeronautics and Space Administration facility was scheduled to be phased out. But government officials and Louisiana State University [Baton Rouge 70803] representatives worked out a plan to use the buildings, scientists, and a fraction of the usual budget for a fantastic new idea of food production. Using a bacteria strain discovered in a sugar cane field by an LSU associate professor of microbiology, the scientists attempted to convert cellulose waste products—corn cobs, grass, leaves, sugar cane residue, and even logs—into high protein food.

They succeeded. In contrast to a 1,100-lb grazing cow, which produces about 1 lb of protein a day, 1,100 lb (much more than they now have working) of their busy microbes could turn waste products into 12,000 lb of protein each day—and do it without adding to the environment's burden of pesticides and nitrogenous fertilizers.

"The stuff doesn't taste bad at all—something like egg yolk with a little salt in it," says Dr. Clayton D. Callihan, LSU associate professor of chemical engineering and director of the project. It analyzes down to 50% protein, and the rest cellulose, carbohydrates, and fat."

Dr. Callihan is jubilant: "I know we already have some good cattle feed. If we ever get FDA approval, we could have human food. And we've found we can convert old books, rags, newspapers, and magazines, too."

Ecology Access

Ecology Forum, Inc.
Suite 303 East, 200 Park Avenue
New York, N.Y. 10017

ACCESS is an indexing, abstracting and information retrieval service that covers published and non-print information on environmental pollution, conservation and related fields. ACCESS provides subscribers with an overview of the environmental reporting of more than 400 scholarly, scientific, industrial, technical and general periodicals and major newspapers; important environmental radio and television programming, films and filmstrips, books, corporate publications and major conference publications.

ACCESS is made available to subscribers in four steps:

1. *Indexing and abstracting services, published bi-weekly (26 times per year) ensure timely coverage of important information; abstracts summarize contents, and describe type of information provided.*
2. *Information Retrieval Services allow subscribers to order copies of needed items, in hard copy or microfiche.*
3. *Semi-annual cumulative indexes, provide cross-referenced coverage of past ACCESS information.*
4. *On-call research services assist subscribers in locating special items, assembling data or bibliographies, obtaining literature surveys, summaries or other research.*

ACCESS can be used to monitor:

- general developments affecting the environment.
- horizontal environmental categories such as water pollution chemical and biological contamination, solid waste disposal, or water pollution.
- specific aspects of horizontal categories such as eutrophication, compaction, or metal poisoning.
- coverage of timely environmental issues such as mercury pollution, SST, DDT, Project Rulison, Trans-Alaska pipeline, or Trans-Florida barge canal.
- vertical industrial categories such as Agricultural chemicals, paper industry, utilities.

ACCESS can be used as starting point for literature searches and as a reference tool for articles, congressional hearings, position papers, research reports, speeches, state of the art papers or theses; as a tool to keep abreast with professional reading; to alert superiors, peers or subordinates to important environmental information or developments; or to obtain advance notice about environmental books, radio and TV programs and films. Certain items can be ordered directly through ACCESS.

How to be a Survivor

Lest the population issue become the property of the Establishment, who would probably blow it, this book by Ehrlich and Harriman establishes the radically-based theory and practice it must take to evade the ultimate population crunch.

No matter how you slice it, the resources of the planet are finite, and many of them are non-renewable. Each giant molecule of petroleum is lost forever when we tear it asunder by burning to release the energy of sunlight stored in it millions of years ago. Concentrations of mineral wealth are being dispersed beyond recall, senselessly scattered far and wide to where we cannot afford the energy to reconcentrate them. Precious stores of fresh ground water, accumulated over millennia, are being drained much more rapidly than natural processes can replenish them.

A less discriminatory and therefore potentially more effective program might be simply to cut the income tax in half for each woman for each year she did not reproduce, with a similar tax break going to guardians of girls who do not pay taxes. Since most of the poor have little or no income tax liability, the system would discriminate against the prime villains: the middle class. The effect on the rich, however, would probably be negligible, since the present tax structure is largely a swindle perpetrated by the rich at the expense of the middle class and poor. Replacement of our regressive income tax system with a truly progressive one would help in this area as well as in many others.

Europeans live a pleasant, reasonably affluent life on somewhat less than one-half the per capita electric power consumption of Americans, and with careful planning their level of consumption could also be greatly reduced. Amazingly, though, the American power industry wants to increase our per capita consumption at a rate that will double our national use of power every decade.

Defending the Environment

Even more direct than boycotting the bastards is suing the bastards or toughening the laws they must abide by or just enforcing the laws they're presently ignoring. Citizen action. Sax shows why and how.

or **WHOLE EARTH CATALOG**

This book deals principally with preventive injunctions, designed to stop environmentally dangerous projects before they get underway.

Lawsuits seeking money damages for the public, by and large, are of secondary importance in environmental controversies. Most of the interests sought to be protected could not be easily compensated in damages in any event. Clean air and water for public use, scenic vistas, and the maintenance of fisheries and recreation areas, even where demonstrably harmed, rarely matter in significant dollar amounts to any particular identifiable citizen. The effects of environmental conditions are diffuse both in space and time, and rarely will a damage suit achieve the results sought. This is not to assert that such suits should be banned—only that they are not appropriately at the cutting edge of the movement for environmental quality. The prospect of damage suits may have some deterrent effect, but they tend to drag on interminably, with little result.

There is no good reason why we should hesitate to adopt a theory of public rights to environmental quality, enforceable at law, nor is there any reason to think we cannot adjudicate the reasonable accommodations needed to protect against unnecessary threats to the environment.

The Environmental Defense Fund, a group of scientists and lawyers attacking a broad range of environmental problems by incorporating science into new law and pushing for the enforcement of ecologically sound but politically unattractive existing legislation. I think a lot of Catalogue readers would like EDF. Its life style is not as funky as some ecology action groups, but it has been extremely effective in its short lifetime. EDF also has a newsletter which unspins legal and bureaucratic webs as exotic as nature herself. In that sense, affiliation with EDF is a dynamic encounter with some of the most pervasive and influential forms of our civilization.

John Woodcock
Bloomington, Indiana

Environmental lawyers might be interested in the Environmental Law Reporter, \$50/yr (monthly), from: The Environmental Law Institute, Dupont Circle Bldg., Suite 620, 1346 Connecticut Ave N.W., Washington, D.C. 20036. Know Your Local Polluters

and boycott the bastards. "The garbage produced by an industry is the responsibility of that industry." (Ehrlich). Individual buyers have far more control over economic behavior than voters. Regardless of how you feel about the profit motive (I like it fine), most of the polluters are bound by it, except government ones. If you hurt their sales because they hurt your air or water, then they or their competitors will do anything to get your business back. High-mindedness doesn't have to enter into it, just choice for value.

However, beware of false labeling. Ecology is fashionable, and there's a lot of pretense going on, especially in the ads. This is where the ecology organizations can be invaluable. They are best equipped to determine who the real polluters are (and who are making real efforts to clean up their cycles), and they can shout it from the rooftops.

A compendious list of ecology (etc.) organizations has been compiled by *Ecology Center and Planned Parenthood*: —SB

Richard Harriman

FALLING

Estelle and D.R. hadn't had many times like this one lately. They'd fucked a time or two coming down through California, but it seemed like there just wasn't enough leisure on this trip for any real love-making. Exhaustion was the theme so far. Exhaustion had been catching up to them for a long time now. In a way their whole experience together since Altamont had been a steady descent into exhaustion; a drop that gained momentum as they went along, like falling. When D.R. felt particularly tired, and dirty, and locked up in his mind, it was like he was the one who was falling, with Estelle being dragged along behind. That wasn't accurate, of course. That was just stuff in D.R.'s head, a product of the same weary fever that produced the sense of falling in the first place. There was a way in which Estelle had already fallen further than D.R. had, already knew stuff that he had yet to learn. In a way, she was coming up as he went down, and reaching out a hand to save him from what she already knew. The thing that overwhelmed D.R. when he thought about it that way was how utterly generous that was of her, and how dangerous for her. Danger was everywhere, it seemed, and in more guises than he could account for. Sometimes D.R. felt like he had some kind of disease that Estelle was sure to catch if she stayed with him long enough. As a matter of fact, he'd given her the clap the very first week they were together. As a man who dealt heavily in signs and omens, he had seen that as a forewarning, a metaphor of all that and worse things yet to come. It hadn't bothered him all that much at the time. In the beginning, Estelle had been just another cunt by the roadside as likely to give the clap to him as the other way around. But that was a couple of months ago, or three, or four, he wasn't sure any more just how long ago it had been. His sense of time was all internal now. The only things he measured were miles and micrograms, and even then he had little use for precision. But however long ago it had been since he'd first found Estelle, it was long enough for him to come to depend on her so much it threatened him. He hated depending on someone as much as that, and the fact that she depended just as much, or more, on him only made it that much worse.

But it wasn't a thing that he could choose by now. It was like there was a power over his life that wasn't his to wield, a power so large and mysterious all D.R. could do was yield.
Yield to yield, now there's a nice play on words for you.
I'll have to work on that. Yield and yield. Shield and dealed.
"I've just written a poem," said D.R.
"Tell it to me," said Estelle.
"Yield and yield and shield and dealed."
Estelle laughed and rolled onto her back so she could take her pants off. "That's a good poem."
D.R. started undressing too. When they were naked Estelle pulled D.R. on top of her, and for almost an hour they made love.

CHANGES 4 CHANGES CHANGES

Drawing of Evolution Valley by Judy Daniel for '4 Changes' poster by Noel Young.

CHŌFŪ

I. POPULATION

THE CONDITION

Position: Man is but a part of the fabric of life—dependent on the whole fabric for his very existence. As the most highly developed tool-using animal, he must recognize that the unknown evolutionary destinies of other life forms are to be respected, and act as gentle steward of the earth's community of being.

Situation: There are now too many human beings, and the problem is growing rapidly worse. It is potentially disastrous not only for the human race but for most other life forms.

Goal: The goal would be half of the present world population, or less.

ACTION

Social/political: First, a massive effort to convince the governments and leaders of the world that the problem is severe. And that all talk about raising food-production—well intentioned as it is—simply puts off the only real solution: reduce population. Demand immediate participation by all countries in programs to legalize abortion, encourage vasectomy and sterilization (provided by free clinics)—free insertion of intrauterine loops—try to correct traditional cultural attitudes that tend to force women into child-bearing—remove income tax deductions for more than two children above a specified income level, and scale it so that lower income families are forced to be careful too—or pay families to limit their number. Take vigorous stand against the policy of the right-wing in the Catholic hierarchy and any other institutions that exercise an irresponsible social force in regard to this question; oppose and correct simple-minded boosterism that equates population growth with continuing prosperity. Work ceaselessly to have all political questions be seen in the light of this prime problem.

The community: Explore other social structures and marriage forms, such as group marriage and polyandrous marriage, which provide family life but may produce less children. Share the pleasures of raising children widely, so that all need not directly reproduce to enter into this basic human experience. We must hope that no woman would give birth to more than one child, during this period of crisis. Adopt children. Let reverence for life and reverence for the feminine mean also a reverence for other species, and future human lives, most of which are threatened.

Our own heads: "I am a child of all life, and all living beings are my brothers and sisters, my children and grandchildren. And there is a child within me waiting to be brought to birth, the baby of a new and wiser self." Love, lovemaking, a man and woman together, seen as the vehicle of mutual realization, where the creation of new

elves and a new world of being is as important as reproducing our kind.

II. POLLUTION

THE CONDITION

Position: Pollution is of two types. One sort results from an excess of some fairly ordinary substance—smoke, or solid waste—which cannot be absorbed or transmitted rapidly enough to offset its introduction into the environment, thus causing changes the great cycle is not prepared for. (All organisms have wastes and by-products, and these are indeed part of the total biosphere: energy is passed along the line and refracted in various ways, "the rainbow body." This is cycling, not pollution.) The other sort is powerful modern chemicals and poisons, products of recent technology, which the biosphere is totally unprepared for. Such is DDT and similar chlorinated hydrocarbons—nuclear testing fall out and nuclear waste—poison gas, germ and virus storage and leakage by the military; and chemicals which are put into food, whose long-range effects on human beings have not been properly tested.

Situation: The human race in the last century has allowed its production and scattering of wastes, by-products, and various chemicals to become excessive. Pollution is directly harming life on the planet: which is to say, ruining the environment for humanity itself. We are fouling our air and water, and living in noise and filth that no "animal" would tolerate, while advertising and politicians try and tell us we've never had it so good. The dependence of the modern governments on this kind of untruth leads to shameful mind-pollution: mass media and most school education.

Goal: Clean air, clean clear-running rivers, the presence of Pelican and Osprey and Gray Whale in our lives; salmon and trout in our streams; un-muddled language and good dreams.

ACTION

Social/political: Effective international legislation banning DDT and related poisons—with no fooling around. The collusion of certain scientists with the pesticide industry and agri-business in trying to block this legislation must be brought out in the open. Strong penalties for water and air pollution by industries—"Pollution is somebody's profit." Phase out the internal combustion engine and fossil fuel use in general—more research into non-polluting energy sources; solar energy; the tides. No more kidding the public about atomic waste disposal: it's impossible to do it safely, and nuclear-power generated electricity cannot be seriously planned for as it stands now. Stop all germ and chemical warfare research and experimentation; work toward a hopefully safe disposal of the present staggering and stupid stockpiles of H-Bombs, cobalt gunk, germ and poison tanks and cans. Laws and sanctions against wasteful use of paper etc. which adds to the solid waste of cities—develop methods of re-cycling solid urban wastes.

Re-cycling should be the basic principle behind all waste-disposal thinking. Thus, all bottles should be re-usable; old cans should make more cans; old newspapers back into newsprint again. Stronger controls and research on chemicals in foods. A shift toward a more varied and sensitive type of agriculture (more small-scale and subsistence farming) would eliminate much of the call for blanket use of pesticides.

The community: DDT and such: don't use them. Air pollution: use less cars. Cars pollute the air, and one or two people riding lonely in a huge car is an insult to intelligence and the Earth. Share rides, legalize hitch-hiking, and build hitch-hiker waiting stations along the highways. Also—a step toward the new world—walk more; look for the best routes through beautiful countryside for long-distance walking trips: San Francisco to Los Angeles down the Coast Range, for example. Learn how to use your own manure as fertilizer if you're in the country—as the Far East has done for centuries. There's a way, and it's safe. Solid waste: boycott bulky wasteful Sunday papers which use up trees. It's all just advertising anyway, which is artificially inducing more industry consumption. Refuse paper bags at the store. Organize Park and Street clean-up festivals. Don't work in any way for or with an industry which pollutes, and don't be drafted into the military. Don't waste. (A monk and an old master were once walking in the mountains. They noticed a little hut upstream. The monk said, "A wise hermit must live there"—the master said, "That's no wise hermit, you see that lettuce leaf floating down the stream, he's a Waster." Just then an old man came running down the hill with his beard flying and caught the floating lettuce leaf.) Carry your own jug to the winery and have it filled from the barrel.

Our own heads: Part of the trouble with talking about DDT is that the use of it is not just a practical device, it's almost an establishment religion. There is something in Western culture that wants to totally wipe out creepy-crawlies, and feels repugnance for toadstools and snakes. This is fear of one's own deepest natural inner-self wilderness areas, and the answer is, relax. Relax around bugs, snakes, and your own hairy dreams. Again, farmers can and should share their crops with a certain percentage of buglife as "paying their dues." Thoreau says: "How then can the harvest fail? Shall I not rejoice also at the abundance of the weeds whose seeds are the granary of the birds? It matters little comparatively whether the fields fill the farmer's barns. The true husbandman will cease from anxiety, as the squirrels manifest no concern whether the woods will bear chestnuts this year or not, and finish his labor with every day, relinquish all claim to the produce of his fields, and sacrificing in his mind not only his first but his last fruits also." In the realm of thought, inner experience, consciousness, as in the outward realm of interconnection, there is a difference between balanced cycle, and the excess which cannot be handled. When the balance is right, the mind

recycles from highest illuminations to the stillness of dreamless sleep; the alchemical "transmutation."

III. CONSUMPTION

THE CONDITION

Position: Everything that lives eats food, and is food in turn. This complicated animal, man, rests on a vast and delicate pyramid of energy-transformations. To grossly use more than you need, to destroy, is biologically unsound. Most of the production and consumption of modern societies is not necessary or conducive to spiritual and cultural growth, let alone survival; and is behind much greed and envy, age-old causes of social and international discord.

Situation: Man's careless use of "resources" and his total dependence on certain substances such as fossil fuels (which are being exhausted, slowly but certainly) are having harmful effects on all the other members of the life-network. The complexity of modern technology renders whole populations vulnerable to the deadly consequences of the loss of any one key resource. Instead of independence we have over-dependence on life-giving substances such as water, which we squander. Many species of animals and birds have become extinct in the service of fashion fads—or fertilizer—or industrial oil—the soil is being used up; in fact mankind has become a locust-like blight on the planet that will leave a bare cupboard for its own children—all the while in a kind of Addict's Dream of affluence, comfort, eternal progress—using the great achievements of science to produce software and swill.

Goal: Balance, harmony, humility, growth which is a mutual growth with Redwood and Quail (would you want your child to grow up without ever hearing a wild bird?)—to be a good member of the great community of living creatures. True affluence is not *needing* anything.

ACTION

Social/political: It must be demonstrated ceaselessly that a continually "growing economy" is no longer healthy, but a Cancer. And that the criminal waste which is allowed in the name of competition—especially that ultimate in wasteful needless competition, hot wars and cold wars with "communism" (or "capitalism")—must be halted totally with ferocious energy and decision. Economics must be seen as a small sub-branch of Ecology, and production/distribution/consumption handled by companies or unions with the same elegance and sparseness one sees in nature. Soil banks; open space; phase out logging in most areas. "Lightweight dome and honeycomb structures in line with the architectural principles of nature." "We shouldn't use wood for housing because trees are too important." Protection for all predators and varmints: "Support your right to arm bears." Damn the International Whaling Commission which is selling out the last of our precious, wise whales! Absolutely no further development of roads and concessions in National Parks and Wilderness Areas; build auto campgrounds in the least desirable areas. Plan consumer boycotts in response to dishonest and unnecessary products. Radical Co-ops. Politically, blast both "Communist" and "Capitalist" myths of progress, and all crude notions of conquering or controlling nature.

The community: Sharing and creating. The inherent aptness of communal life—where large tools are owned jointly and used efficiently. The power of renunciation: If enough Americans refused to buy a new car for one given year it would permanently alter the American economy. Recycling clothes and equipment. Support handicrafts, gardening, home skills, midwifery, herbs—all the things that can make us independent, beautiful and

whole. Learn to break the habit of unnecessary possessions—a monkey on everybody's back—but avoid a self-abnegating anti-joyous self-righteousness. Simplicity is light, carefree, neat and loving—not a self-punishing ascetic trip. (The great Chinese poet Tu Fu said "The ideas of a poet should be noble and simple.") Don't shoot a deer if you don't know how to use all the meat and preserve that which you can't eat, to tan the hide and use the leather—to use it all, with gratitude, right down to the sinew and hooves. Simplicity and mindfulness in diet is a starting point for many people.

Our own heads: It is hard to even begin to gauge how much a complication of possessions, the notions of "my and mine," stand between us and a true, clear, liberated way of seeing the world. To live lightly on the earth, to be aware and alive, to be free of egotism, to be in contact with plants and animals, starts with simple concrete acts. The inner principle is the insight that we are inter-dependent energy-fields of great potential wisdom and compassion—expressed in each person as a superb mind, a handsome and complex body, and the almost magical capacity of language. To these potentials and capacities, "owning things" can add nothing of authenticity. "Clad in the sky, with the earth for a pillow."

IV. TRANSFORMATION

THE CONDITION

Position: Everyone is the result of four forces: the conditions of this known-universe (matter/energy forms and ceaseless change); the biology of his species; his individual genetic heritage and the culture he's born into. Within this web of forces there are certain spaces and loops which allow total freedom and illumination. The gradual exploration of some of these spaces is "evolution" and, for human cultures, what "history" could be. We have it within our deepest powers not only to change our "selves" but to change our culture. If man is to remain on earth he must transform the five-millenia-long urbanizing civilization tradition into a new ecologically-sensitive harmony-oriented wild-minded scientific/spiritual culture. "Wildness is the state of complete awareness. That's why we need it."

Situation: Civilization, which has made us so successful a species, has overshot itself and now threatens us with its inertia. There is some evidence that civilized life isn't good for the human gene pool. To achieve the Changes we must change the very foundations of our society and our minds.

Goal: Nothing short of total transformation will do much good. What we envision is a planet on which the human population lives harmoniously and dynamically by employing a sophisticated and unobtrusive technology in a world environment which is "left natural." Specific points in this vision:

- * A healthy and spare population of all races, much less in number than today.
- * Cultural and individual pluralism, unified by a type of world tribal council. Division by natural and cultural boundaries rather than arbitrary political boundaries.
- * A technology of communication, education, and quiet transportation, land-use being sensitive to the properties of each region. Allowing, thus, the Bison to return to much of the high plains. Careful but intensive agriculture in the great alluvial valleys; deserts left wild for those who would trot in them. Computer technicians who run the plant part of the year and walk along with the Elk in their migrations during the rest.
- * A basic cultural outlook and social organization that inhibits power and property-seeking while encouraging exploration and challenge in things like music, meditation, mathematics, mountaineering, magic, and all other ways of authentic being-in-the-world. Women

totally free and equal. A new kind of family—responsible, but more festive and relaxed—is implicit.

ACTION

Social/political: It seems evident that there are throughout the world certain social and religious forces which have worked through history toward an ecologically and culturally enlightened state of affairs. Let these be encouraged: Gnostics, hip Marxists, Teilhard de Chardin Catholics, Druids, Taoists, Biologists, Witches, Yogins, Bhikkus, Quakers, Sufis, Tibetans, Zens, Shamans, Bushmen, American Indians, Polynesians, Anarchists, Alchemists. . . the list is long. All primitive cultures, all communal and ashram movements. Since it doesn't seem practical or even desirable to think that direct bloody force will achieve much, it would be best to consider this a continuing "revolution of consciousness" which will be won not by guns but by seizing the key images, myths, arche-types, eschatologies, and ecstasies so that life won't seem worth living unless one's on the transforming energy's side. By taking over "science and technology" and releasing its real possibilities and powers in the service of this planet— which, after all, produced us and it.

The community: New schools, new classes, walking in the woods and cleaning up the streets. Find psychological techniques for creating an awareness of "self" which includes the social and natural environment. "Consideration of what specific language forms—symbolic systems—and social institutions constitute obstacles to ecological awareness." Without falling into a facile interpretation of McLuhan, we can hope to use the media. Let no one be ignorant of the facts of biology and related disciplines; bring up our children as part of the wild-life. Some communities can establish themselves in back-water rural areas and flourish—others maintain themselves in urban centers, and the two types work together—a two-way flow of experience, people, money and home-grown vegetables. Ultimately cities will exist only as joyous tribal gatherings and fairs, to dissolve after a few weeks. Investigating new life-styles is our work, as is the exploration of Ways to explore our inner realms—with the known dangers of crashing that go with such. We would work with political-minded people where it helps, hoping to enlarge their vision, and with people of all varieties of politics or thought at whatever point they become aware of environment urgencies. Master the archaic and the primitive as models of basic nature-related cultures—as well as the most imaginative extensions of science—and build a community where these two vectors cross.

Our own heads: Is where it starts. Knowing that we are the first human beings in history to have all of man's culture and previous experience available to our study, and being free enough of the weight of traditional cultures to seek out a larger identity.—The first members of a civilized society since the early Neolithic to wish to look clearly into the eyes of the wild and see our self-hood, our family, there. We have these advantages to set off the obvious disadvantages of being as screwed up as we are—which gives us a fair chance to penetrate some of the riddles of ourselves and the universe, and to go beyond the idea of "man's survival" or "the survival of the biosphere" and to draw our strength from the realization that at the heart of things is some kind of serene and ecstatic process which is actually beyond qualities and certainly beyond birth-and-death. "No need to survive!" "In the fires that destroy the universe at the end of the kalpa, what survives?"—"The iron tree blooms in the void!"

Knowing that nothing need be done, is where we begin to move from.

THE HUMANITY OF THE LONE OUTDOORSMAN

There were at least three things the Lone Outdoorsman could have done in response to the filthy crime he saw happen on the big rock by the river. He could have shot big holes in the young couple's arms and legs and heads and backs with his .357 magnum pistol. Or he could have gone to his camper, got his rubber life raft out of his fourteen foot aluminum motorboat, launched it a mile upstream and staged an amphibious assault upon the little beach near the rocks and captured them before they knew what was happening. Or—and admittedly this is a big or; it's big because, as it turns out, the Lone Outdoorsman is far from your ordinary, everyday one-dimensional heavy; the thing that redeems the Lone Outdoorsman is a refreshing mental complexity of a kind you don't ordinarily run into in folktales. All mixed in with his gory mental images of bullet-riddled bodies and heroic assaults upon beachheads was a commendable impulse to be nice to these kids, to befriend them and hopefully influence them in some constructive way. In short, the Lone Outdoorsman could either shoot these kids, assault them from the river and take them captive, or else be a good neighbor and invite Divine Right and Estelle over to his place for supper.

And so when D.R. and Estelle had finished balling, had dressed and folded the serape and walked back through the darkening campground to their own scene, they found the Lone Outdoorsman leaning against Urge's front, waiting for them.

THE INVITATION

"Well," he said, "how are you young folks this evening. Feeling all right? What I thought was the two of you all might like to come over and eat supper with me, I mean it looks like you all have been traveling pretty hard, and maybe not eating too well, and since I've got these steaks, yes sir, four of the juiciest steaks you ever sunk your fangs in, buddy, that ain't no lie. And I'd be mighty pleased to have your company, you know I've got a niece and a nephew about your age, my brother's kids, the wife and me, we had a kid but he died, but my brother's kids, now, I tell you, they're all right. They come out from Little Rock about once a year, and we appreciate seeing 'em, I declare we do. You know, a lot of the older folks now, they ain't got much patience with young people these days, they object to the way they behave. And I guess in some things I do too. But my granddaddy was a big influence on me, and what he believed in was giving people a second chance. I take after Granddaddy in that respect. I guess when it comes to being with people and judging 'em, I'm what you'd call a liberal. For I find a lot of good in young people nowadays, I declare I do. Why shit, all the young people need is to get out in the hills

and romp around some. I grew up on the land and I know how good it is for you. Why when I was a kid I could hunt and track, why I'd go out by myself for days at a time when I was ten and twelve years old. I loved it, there just wasn't anything greater than getting off to myself in the hills with my gun. I've always said I was born a hundred years too late. I ought to be a pioneer. The wife, she don't like to get out much, so two or three times a year I just cut loose by myself and go live out in nature a few days. As my granddaddy would say, nature's good for what ails you. Ain't that what you all say?"

Estelle mumbled that that was what she said too. Divine Right said something and the Lone Outdoorsman said something else. But five minutes later they didn't have the faintest idea how the conversation had ended. The vision of steak crowded everything else out of their head except the smoke from the horrendous joint D.R. rolled, in celebration of the party. Giggling, tumbling around in the bus trying to get dressed and smoke dope and hug and kiss all at the same time, D.R. and Estelle were ecstatic. Every kink in them had been ironed out by their wonderful hour on the rock. And now here they were, getting all dressed up and stoned, about to go eat free steak with their neighbor. Steak! Goddamn. It would be their first real meal since they'd left the Anaheim Flash's house in California. When they had their outfits on, Estelle in her ankle-length gingham dress and D.R. in his pioneer outfit of leather pants and shirt and coonskin cap with tail, they paused long enough to hold each other tightly for a moment. Then D.R. took the last drag on the joint, ate the roach as the first hors d'oeuvre of the evening, then set out with his lady to call on the Lone Outdoorsman.

Land Use

An Agricultural Testament

The first "organic gardener" I ever ran into was a man who ended all his sentences "thus saith the Lord." The Lord, it turned out, had been in the habit of speaking in a very conversational manner to this fellow, and had given him all manner of helpful hints on gardening—among other things, a recipe for fertilizer. I noticed that the Lord's side of the conversation tended to be most flattering to my new acquaintance, and most decidedly threatening to all the neighbors—a gang of villains, who were going to die of cancer because of such sins as listening to the wrong prophets, and cooking with aluminum pots.

Now I would be the last to deny the possibility that a man might receive the word from on high and speak beyond the usual powers of his head. But I am exceedingly mistrustful of a man who depends on divine revelation to show him what is obvious about the ground under his feet. This man deservedly belongs in "the lunatic fringe" of a discipline that demands respect and attention not because it is far out or esoteric or mystical, but because it makes good sense.

The principles of organic agriculture are not derived from mystical insight or revelation, but are based upon observation. They have been established in our part of the world in our time by men who were excellent observers, and who were moreover accomplished and respectable scientists. The scientific respectability of organic methods has been obscured for us both by those who have insisted upon making a cult of the obvious and by the affluence and glamor of the technological agriculture—the agriculture of chemicals and corporations.

The pioneer book of organic agriculture in modern times is King's *Farmers of Forty Centuries*, which proposed no innovation, but only provided new access to the ancient tradition of organic practice in the Orient. King was no cultist or food faddist. He was a professor of agriculture, an eminently practical and observant man, well enough trained that he fully understood what he saw, in terms of the history and culture of Asia, and in terms of its potential usefulness to the West. King's is one of the most important books I have ever read. If it is allowed to remain out of print I believe that will be a tragedy and a great loss, for it can provide indispensable insights into the causes and the possible remedies of our environmental crisis.

King's most famous reader and follower was probably Sir Albert Howard, who in thirty years of research and experimentation established scientifically the soundness of the ancient methods. Howard's *An Agricultural Testament* is another extremely important book. Howard's work is based upon the premise that good agricultural practice is based upon the observation and the use of natural processes. King's book, Howard thought, demonstrated that an agriculture based upon natural processes could thrive for an unlimited time, whereas an agriculture that contradicts or ignores natural processes can only exhaust the land, and in its failure assure the failure of the society.

Howard's thinking proceeds from one cardinal fact: "The forest manures itself." He later elaborates this observation in an agricultural metaphor:

The main characteristic of Nature's farming can therefore be summed up in a few words. Mother earth never attempts to farm without live stock; she always raises mixed crops; great pains are taken to preserve the soil and to prevent erosion; the mixed vegetable and animal wastes are converted into humus; there is no waste; the processes of growth and the processes of decay balance one another; ample provision is made to maintain large reserves of fertility; the greatest care is taken to store the rainfall; both plants and animals are left to protect themselves against disease.

And so the task Howard set himself was first to understand those processes and interrelationships by which the natural world sustains and renews itself, and then to work out methods by which people could use the land in cooperation with nature. He realized—and I think it would be hard to overestimate the importance of this—that the specialized analytical approach of "scientific" agriculture was creating more problems than it solved:

Instead of breaking up the subject into fragments and studying agriculture in piecemeal fashion by the analytical methods of science, appropriate only to the discovery of new facts, we must adopt a synthetic approach and look at the wheel of life as one great subject and not as if it were a patchwork of unrelated things.

He insisted that quality was a more important evaluative standard than quantity. He saw that the soil was more a process than a substance, that its life was more important than its analyzable contents, that its health was not a matter of inert proportions but a balance of live forces, and that therefore "the correct relation between the processes of growth and the processes of decay is the first principle of successful farming."

Howard's discoveries and methods and their implications are given in detail in *An Agricultural Testament*. They are of enormous usefulness to gardeners and farmers, and to anyone who may be interested in the history and the problems of land use. But aside from its practical worth, Howard's book is valuable for his ability to place his facts and insights within the perspectives of history. This book is a critique of civilizations, judging them not by their artifacts and victories but by their response to "the sacred duty of handing over unimpaired to the next generation the heritage of a fertile soil."

A matter of considerable interest to me is that, written within the context of more knowledge and from the perspective of a more urgent time, *An Agricultural Testament* can be read as a confirmation and elaboration of Jefferson's belief in the supreme importance of the small farmer—the man devoted in final terms to his own piece of his homeland, who makes of the life of the land a human way of life.

Farmers of Forty Centuries

I have come more and more strongly to believe that the ultimate moral goal, even the moral necessity, of the American people must be to become the aborigines of the American land. An aborigine, my dictionary says, is "an indigenous inhabitant... as contrasted with an invading or colonizing people." An indigenous people is one "living naturally in a particular region or environment." In general, aborigines are preservers of their land, whereas invaders or colonizers are the exploiters and destroyers of theirs. White Americans have for the most part remained the invaders and colonizers of the American continent; their relationship to the land has remained economic, exploitive, superficial, destructive. American history is to a fearful extent the history of a group of mercenary nomads, exhausting the land as they have moved over it.

A great mistake has been to assume that people could become American in any sense that would be meaningful and ennobling by means of the souped-up emotions of public patriotism, nationalism. The fact is that meaningful native Americanism would have to involve a complexly reverent and knowing and preserving attitude toward the land; it would manifest itself not only in public fervor but in private behavior; and it would be based on methods of land use. No matter how "sophisticated" and urban our society becomes, our basic relation to the land will continue to be agricultural. And if we are ever to have a decent relation to our land, we will probably have to begin by converting from agricultural methods that are exploitive and wasteful to methods that are preserving. For this we will need more than the scientific expertise that we have relied on so far; we will need models.

A great deal in the way of models and examples is to be learned from the American Indians, for their relation to this part of the earth seems to me to have been exemplary. Our assumption that we could learn to live here, ignoring their example, is a cultural disaster as well as an ecological one. But we have a great deal to learn from all truly indigenous peoples. The agricultural practices of primitives and peasants ought to be particularly instructive to us, for these people have farmed the land with a sense of profound unity with it; their ways, formed slowly over generations out of an intricate knowledge of the land and its needs, have tended to preserve it.

One of the richest sources of information about peasant agriculture is a book called *Farmers of Forty Centuries* by an American professor of agriculture, F. H. King. In 1907 King traveled in Japan, Korea and China, looking closely at the local practices of agriculture and land management everywhere he went. He talked with experts and with peasants. He was full of interest in the knowledge and the life of farming. His book is loaded with details of the life of the people, observed sharply, and put down with delight and sympathy.

The question that King bore in mind throughout his travels was how these people had preserved their land, which after thousands of years of intensive use was as fertile as ever. The answer involved a complexity of methods and practices and traditions, but what it amounted to was that the taking of produce from the land was always balanced by a return of organic matter. The sewage of towns and cities, instead of being flushed out to pollute the waterways as with us, was brought back to the fields; the mud dredged from the canals was carried to the fields; no organic waste of any kind was ever thrown away, but always worked back into the soil.

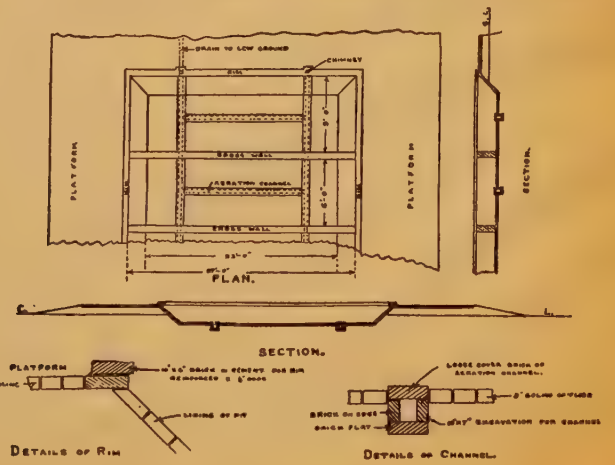

King has a lot to say about the methods of composting, intertillage, crop rotation, irrigation, green manuring, and so on. He has a scientist's respect for statistics and he supplies plenty of them. But he also gives the sort of lively information that he could only have got by talking, by "passing the time of day," with the people he met in the fields. He writes of practices, tools, materials, dimensions. His book is the best sort of manual; it is one of the pioneer books on organic farming. And for the same reasons it is the best sort of travel book; he talks occasionally about how the plants are cared for around some temple or shrine, but for the most part avoids "tourist attractions," the life of the ordinary people, its sources and ways, was what fascinated him. There are more than two hundred photographs, not the work of a gifted photographer, certainly, but informative and useful.

This is a book that can suggest things for you to do, if you have a piece of ground to do them on. Whether or not you have a piece of ground, it is a book that can change your mind.

Plan and working details of composting pits at Tollygunge, Calcutta.

Living the Good Life

Some decades ago Scott Nearing gave up as an academic and retreated to the Vermont woods, where he promptly began to rediscover for himself how to stay alive in the North Temperate Zone. His advice is in this book. He invented a method for building stone houses very cheaply, he perfected a way of living into the winter on crops taken in the summer from ingeniously constructed gardens, and he relied—perhaps more than anyone today will care to rely—on a division of his labors between the hands and the head. He was a one-man community. He never wasted anything (it will drive you mad to hear his peans of praise for used motor oil), he tried to ignore machines wherever possible, he tried to live on a cash-less basis (and largely succeeded), and he annoyed his old-timey Vermont neighbors by living in a more down-to-earth life than they ever could and showing them how to maple-sugar and farm. He beat them at their own game, and for thirty years it lasted—until the ski crowds began to turn utopia into suburbia. Nearing fled to Maine where, presumably, he's started all over again. Lots of sawy advice in here, and a good picture of how it works in practice to turn your back on advantages that you know are right out there waiting for you. Nutrition freaks will find the Nearing diet a new challenge. Nearing is no spring chicken, and so if nothing else this book will shame you into getting up and getting moving.

We chose stone for several reasons. Stone buildings seem a natural out-cropping of the earth. They blend into the landscape and are a part of it. We like the varied color and character of the stones, which are lying around unused on most New England farms. Stone houses are poised, dignified and solid—sturdy in appearance and in fact, standing as they do for generations. They are cheaper to maintain, needing no paint, little or no upkeep or repair. They will not burn. They are cooler in summer and warmer in winter. If, combined with all these advantages, we could build them economically, we were convinced that stone was the right material for our needs.

... we soon discovered that after the building was finished, the different rate of expansion for concrete and wood pulled the two apart at times, leaving a small crack between the frame and the concrete wall. We remedied this in later construction by cutting a square groove all around the outside of the frame and inserting a small strip of wood which projected 1/4 inch or a little more beyond the center of the frame into the concrete. Later we improved this method still more and cut a groove half an inch deep with a bench-saw and set a piece of galvanized metal 1/4 inch wide into the groove. This took less time than inserting the wood strip and served the same purpose of bridging the crack between frame and concrete.

We would attempt to carry on this self-subsistent economy by the following steps: (1) Raising as much of our own food as local soil and climatic conditions would permit. (2) Bartering our products for those which we could not or did not produce. (3) Using wood for fuel and cutting it ourselves. (4) Putting up our own buildings with stone and wood from the place, doing the work ourselves. (5) Making such implements as sleds, drays, stone-boats, gravel screens, ladders. (6) Holding down to the barest minimum the number of implements, tools, gadgets and machines which we might buy from the assembly lines of big business. (7) If we had to have such machines for a few hours or days in a year (plough, tractor, rototiller, bull-dozer, chainsaw), we would rent or trade them from local people instead of buying and owning them.

Walden

This edition is the one, I believe, that Thoreau would have bought. It costs sixty cents. The prime document of America's 3rd revolution, now in progress.

Most of the luxuries, and many of the so-called comforts of life, are not only not indispensable, but positive hindrances to the elevation of mankind. With respect to luxuries and comforts, the wisest have ever lived a more simple and meagre life than the poor.

The customs of some savage nations might, perchance, be profitably imitated by us, for they at least go through the semblance of casting their slough annually; they have the idea of the thing, whether they have the reality or not. Would it not be well if we were to celebrate such a "busk," or "feast of first fruits," as Bartram describes to have been the custom of the Mucclasse Indians? "When a town celebrates the busk," says he, "having previously provided themselves with new clothes, new pots, pans, and other household utensils and furniture, they collect all their worn out clothes and other despicable things, sweep and cleanse their houses, squares, and the whole town, of their filth, which with all the remaining grain and other old provisions they cast together into one common heap, and consume it with fire. After having taken medicine, and fasted for three days, all the fire in the town is extinguished. During this fast they abstain from the gratification of every appetite and passion whatever. A general amnesty is proclaimed; all malefactors may return to their town.

"On the fourth morning, the high priest, by rubbing dry wood together, produces new fire in the public square, from whence every habitation in the town is supplied with the new and pure flame."

I learned this, at least, by my experiment: that if one advances confidently in the direction of his dreams, and endeavors to live the life which he has imagined, he will meet with a success unexpected in common hours. He will put some things behind him, will pass an invisible boundary; new, universal, and more liberal laws will begin to establish themselves around and within him; or the old laws be expanded, and interpreted in his favor in a more liberal sense, and he will live with the license of a higher order of beings. In proportion as he simplifies his life, the laws of the universe will appear less complex, and solitude will not be solitude, nor poverty poverty, nor weakness weakness. If you have built castles in the air, your work need not be lost; that is where they should be. Now put the foundations under them.

Malabar Farm

Bromfield was a Pulitzer Prize-winning author who at the start of Hitler's war returned to his boyhood home in north central Ohio, bought several worn-out farms, established something which would probably be called a commune if it were done today (it wasn't called that then, as Bromfield and the people associated with him were ultra-respectable), and proceeded to use good conservation practices and numerous innovations to restore his land to fertility and health.

All our contour plowing, cover crops, and strip cropping have paid us great dividends. Throughout the drought when farms all over Ohio were hauling water, our springs kept up their flow, because the methods we took to stop erosion and the run-off of surface water had stored up great quantities of water underground. When we came here about 80 percent of the water in a heavy rainstorm ran off the place; today we keep on the place 80 to 90 percent of the rain that falls, trapped by sod, contours, and strips. It sinks deep into the earth to replenish the reservoirs in the great crevasses in the underlying sandstone rock.

The proper use of the land plus a simple program of game food and cover has certainly paid big dividends in fish, birds, and game. Everywhere at Malabar, since we established the farm as a game propagation area, the population of wild life has doubled and redoubled, again and again. Once the area becomes saturated, the excess population moves off into the neighboring territory where it provides sport for hunters. We do not shoot on the farm and allow no shooting but the sportsmen benefit enormously by the closed season on this large area. Big fox-squirrel, fox, raccoon and rabbits are especially abundant. Of course there is always plenty of quail (on which in Ohio there is no season) and some grouse and pheasant although the foxes kill off the latter pretty rapidly.

The whole theory of the ability of healthy plants grown in organically balanced and complete, mineralized soils to resist disease and even to some extent attacks by insects is not altogether new, either in the field of research among highly skilled market gardeners or among intelligent amateurs, but it is largely unknown in general agriculture. The theory of putting into the soil the means of resistance rather than applying it externally by dusts and sprays is much more revolutionary and comparatively little research has been done along these lines.

THE LESSON OF THE DEER

Divine Right and Estelle were sitting in folding chairs drinking beer and eating cashew nuts while the Lone Outdoorsman grilled steaks over a charcoal fire. Like Estelle and Divine Right, he had dressed for the occasion too. He had on a cowboy hat and cowboy boots, a pair of levis, a flannel shirt with a vest and, while he cooked, a knee-length apron that was white everywhere it didn't have blood stains on it. Now and then a breeze would swirl the smoke up in a cloud around his head, momentarily decapitating him so that it appeared that there was only his wide, round body in cowboy clothes tending the slabs of meat on the charcoal fire. It was a surreal scene all right, but D.R. and Estelle were both so stoned it struck them as the most ordinary of domestic occasions. It was dark by now and so far there wasn't any moon. The trees around the camp framed the entire universe, as far as they were witness. What they saw was all there was anywhere in all creation, and for heads as awash with dope smoke as D.R.'s and Estelle's, that was quite enough.

"I'm a cancer," D.R. suddenly called out to the Lone Outdoorsman. "My sign is the crab. I get where I'm going by walking sideways."

The Lone Outdoorsman nodded as he turned the steaks. "Yeah. I'm in the Fin, Fur and Feather Club myself, great buncha guys."

"Got him?" Estelle exclaimed, swatting a fat mosquito on her arm.

"Yeah," said the Outdoorsman. "They're pretty bad tonight. We'll go in soon as these steaks are done. Time for Westward, Westward anyhow."

"You got TV?" Estelle asked.

"Sure. It's a little one, but you can see it all right."

"Far out! Can we watch it too?"

The question pained the Outdoorsman. He turned to look at his guests. "Of course you can. You're my guests, ain't you?"

"Fantastic!" Estelle and D.R. were so excited by the prospect of TV they leaned their chairs together and gave each other little hugs.

"We haven't seen TV since we left Oregon."

"How long ago was that?" asked the Outdoorsman.

"I don't know," said D.R. "When did we leave Oregon?"

"Three weeks ago tomorrow."

"Three weeks ago tomorrow," D.R. said to the Outdoorsman.

"Shucks. I drove here from Phoenix in a day and a half."

"Yeah, well, you see," said D.R. and he got out of his chair and walked closer to his host. "You see, I'm a Cancer, my sign is the crab, I get where I'm going by walking sideways."

"I plan to take a different route back to Phoenix myself," said the Outdoorsman. "See some new country. That's the great thing about America, there's always some new country to see."

(continued)

Long-Legged House

Wendell Berry is the Sergeant York charging unnatural odds across our no-man's-land of ecology. Conveying the same limber innocence of young Gary Cooper, Wendell advances on the current crop of Krauts armed with naught but his pen and his mythic riderunner righteousness. One after the other he picks them off, from the flying bridges of their pleasure boats as they roar through his native Kentucky rivers, from beneath the hard hats in the Hazard County strip mines, from the swivel chairs in the Pentagon where they weigh the various ways to wage war on all forms of enemy life beyond the end of their own friendly chin. He's a crackshot essayist, and, for those given to capture, a genial and captivating poet. He boasts a formidable arsenal of novels, speeches, articles, stories, and poems from his outpost in one of the world's most ravaged battlefields where he writes the good fight and tends his family and his honeybees. Consider him an ally. Here are some samples from *The Long-Legged House*.

For do not all our rights have as their ultimate expression and meaning the right of a man to be secure in his own home? When this right is no longer defended by a power greater than himself, his days begin to come to him by accident, in default of whatever caprice of power may next require his life.

Man cannot be independent of nature. In one way or another he must live in relation to it, and there are only two alternatives: the way of the frontiersman, whose response to nature was to dominate it, to assert his presence in it by destroying it; or the way of Thoreau, who went to the natural places to become quiet in them, to learn from them, to be restored by them.

The years I spent between childhood and manhood seem as strange to me now as they did then. Clumsy in body and mind, I knew no place I could go to and feel certain I ought to be there. I had no very good understanding of what I was rebelling against: I was going mostly by my feelings, and so I was rarely calm. And I didn't know with enough certainty what I wanted to be purposeful about getting it. The Camp offered no escape from these troubles, but it did allow them the dignity of solitude. And there were days there, 's in no other place, when as if by accident, beyond any reason I might have had, I was deeply at peace, and happy. And those days that gave me peace suggested to me the possibility of a greater, more substantial peace—a decent, open, generous relation between a man's life and the world—that I have never achieved; but it must have begun to be then, and it has come more and more consciously to be, the hope and the ruling idea of my life.

In a blundering, half-aware fashion I was becoming a writer. And, as I think of it now, school itself was a distraction. Although I have become, among other things, a teacher, I am skeptical of education. It seems to me a most doubtful process, and I think the good of it is taken too much for granted. It is a matter that is overtheorized and overvalued and always approached with too much confidence. It is, as we skeptics are always discovering to our delight, no substitute for experience or life or virtue or devotion. As it is handed out by the schools, it is only theoretically useful, like a randomly mixed handful of seeds carried in one's pocket. When one carries them back to one's own place in the world and plants them, some will prove unfit for the climate or the ground, some are sterile, some are not seeds at all but little clods and bits of gravel. Surprisingly few of them come to anything. There is an incredible waste and clumsiness in most efforts to prepare the young. For me, as a student and as a teacher, there has always been a pressing anxiety between the classroom and the world: how can you get from one to the other except by a blind jump? School is not so pleasant or valuable an experience as it is made out to be in the theorizing and reminiscing of elders. In a sense, it is not an experience at all, but a hiatus in experience.

What has interested me in telling the history of the Camp is the possibility of showing how a place and a person can come to belong to each other—or, rather, how a person can come to belong to a place, for places really belong to nobody. There is a startling reversal of our ordinary sense of things in the recognition that we are the belongings of the world, not its owners.

Farmer's Almanac

The almanac for weather forecasting (a year in advance), astronomical information, holidays, planting and cultivating, hunting and fishing, cooking, nautical information, livestock and poultry farming, and various other necessities of rural living. It includes astrology, entertainments (essays, poems, puzzles), practical information, old superstitions, and New England "pleasantries." It's main emphases, however, are on weather forecasts, farming data, and astronomy. Try to get one without ads.

When I was a boy, Dad and I often took a Sunday walk over his land, about 200 acres of oak and pine, a spring brook, swamp and pastures. A single big path went directly through it. One Sunday Dad said, "We need another path. Go ahead and make it." I knew well enough how to use my axe, the big brush cutters, and the pruning saw, though I'd never cut a path. But the next day, all excited, I went down past the big pine and along the orchard wall to where the cows had their own path through the berry bushes. I went in and tramped back and forth blazing to the special places I wanted my path to see—the spring, down the brook to the white birches, the porcupine rock and the dens, and along the pine knoll where you found the lady slippers and the May flowers and the hobble bush in springtime. Dad hadn't said anything about the path wandering, but it was going to sure enough, a little wandering path the sun looked into and the trees arched over. When I was cutting, by mistake I had cut beyond two of my special places. So I made two little extra paths to them. "Sight seeing paths," Dad called them. But he liked it all, and I was proud as punch. I remember this now, for my grandsons, who live over the hill from us, are cutting their own path to our house.

Countryside

This is a new publication (started in 1970 I think) and a mild one. It gently lays out tips and speculations and ruminations about country living that aren't a bit sensational, but are a bit useful.

Marshall, Wisconsin 53559

Here's a good example of how availability increases consumption (and waste). When water has to be carried from a well, average usage is 8 gallons per day. When a pump is put at the kitchen sink, consumption increases to 10 gallons per person per day. Put in a faucet and that figure goes up to 12 gallons. Introduce hot water in the kitchen and you'll use 18 gallons a day.

Cities Aren't Places Any More.

Practically everybody I know in California is talking about "the land thing." The visions I hear, almost daily, range from buying the northeast third of New Mexico, to getting a three-acre spread in Maine. People with access to half a million dollars of the old man's loot are in the same dream with people saving three dollars a week in a glass jar. Land. Rural land. Land in the direction of east. Western drive has brought us here. Eastern serenity, or the desire for it, is nudging us back again.

Probably everybody into "the land thing" would explain his motives in different, or at least personal, language. But I think the theme running through any variety of language would be the same. I think the thing we're talking about is no more or less hard to understand than the simple desire to have a home. A home, and a sense of home that can only grow out of a sense of place. Cities aren't places any more. They're scenes, projected on screens, then bulldozed away, neighborhood by neighborhood, like cancelled TV shows. People who are tired of scenes are leaving, or wanting to anyway, longing for a place, torn between the joy of getting out of town, and a vague despair that maybe there aint no such thing as place after all, that maybe all there is to do is ride around in outfitted buses, floating along the bloodless traffic arteries of the world.

I guess the essential thing that sustains me as I try to live in the California suburbs is the sense I carry around in my mind that, in fact, there are some places left in the world that are very nice, places left over from how the world used to be, continuing in a kind of time-warp that surrounds them like a shield. I'm sure there are similar places in every state. But the ones that I know about are in Kentucky, certain towns, certain counties that go on, and on. There's a social fabric in those places intact from their very beginnings as towns and counties, and what I wish is that that fabric could somehow be declared a national treasure, and given protection, like the mountain lion, or the California condor. That won't happen, of course. The fabric is already badly torn by new freeways and the coal industry, with strip-mining as its cutting edge. So I guess the best that one can hope for is that the surviving old places be studied as models for the new places about to create themselves.

Gurney Norman

Few Americans realize how completely our American meadow plants came along with us from the Old World. In our June meadows, timothy, redbud, and bluegrass, Old World grasses all three, are starred with Old World daisies, yarrow, buttercup and hawkweeds. The clovers too, alsike and red and Dutch, all came from the Old World. Only the black-eyed Susans are indigenous. An informed botanist viewing such a June meadow may sometimes find it hard to point out a single species of plant which grew here in pre-Columbian times.

Ever since I first saw acres of wild sunflowers blossoming in gold and green confusion all down the back slopes of Dago Hill in Saint Louis, I have been intoxicated with sunflowers. They happen to be of key significance in the story of plants and man; if they were not I should be tempted to tell you about them anyway. I wish it were possible fully to communicate my enthusiasm for these lusty brilliant flowers, these coarse and resinous weeds which have been so closely tied up with man during his varied history on this continent. Crop plant, garden flower, roadside weed, growing unasked but seldom unwanted on vacant lots and rights of way. I wish one could in a few sentences paint the full pageant of them in any one year. The colonies of them in railroad yards in our larger eastern cities, the thousands upon thousands of acres in the Great Plains, long golden rows of them bordering roadsides and drainage ditches throughout the West, regular lines of them planted as windbreaks in some of the irrigated valleys, little bunches of them in neat Hopi gardens below the mesa tops, acre after acre grown for oil in western Canada. Or the fields of them in Peru and in Europe, single rows of them in allotment gardens at the fringes of cities, masses of them in Hungary and the Ukraine where they are grown for cooking oil. But with all my enthusiasm for them, with all my understanding of their high yield, I do not advise you to try growing them on an American farm year after year in efficient mass production.

The Oxford Book of Food Plants

A beautiful book, for looking and for reference. Color plates as illustration of every plant, emphasizing the part which supplies food. Arranged in a practical way—plants are grouped according to the kind of food they produce: fruits, herbs, leaf vegetables, oil crops, sugar-crops, root vegetables, etc. Common and botanical name included, and an index which lists both, plus a glossary of descriptive botanical words. Descriptions of each plant tells its use, history, countries of origin and regions where it grows, along with a physical description accompanied by a drawing, food value, and economic value.

(These Handbooks are separate editions of special feature issues of PLANTS & GARDENS)
- | | | |
|--|--|---|
| 10. Rock Gardens \$1.00
125 pictures of the best; ideas on design, construction, and care; appropriate plants | 30. Handbook on Breeding Ornamental Plants \$1.00
how to cross-pollinate many kinds of garden flowers and ornamentals; select good parents, raise new plants from seed. Basic genetics | 43. Succulents \$1.00
where to obtain and how to grow American cacti, South African flowering stones and others. Illustrated dictionary of succulents |
| 13. Dwarfed Potted Trees—The Bonsai of Japan \$1.25
answers important questions on selection, training, pruning, care; over 100 pictures | 31. Bulbs \$1.00
when and how to plant all kinds of bulbs; best uses in the garden; indoor forcing; over 60 kinds illustrated | 44. Flowering Shrubs \$1.00
landscape uses, succession of bloom and care of 200 kinds, with selections by geographical region and topographic situation |
| 14. Vines \$1.00
how and where to use; cultivation and care, extensive blooming schedules | 33. Gardens of Western Europe \$1.00
a copiously illustrated guide-book for garden-minded travelers | 45. Garden Construction \$1.00
walks and paths, fences, walls, paved terraces, steps, garden pools, benches |
| 19. Flower Arrangement \$1.00
how to use basic rules of color and design, making attractive containers, dried flower pictures, Christmas and other decorations | 34. Biological Control of Plant Pests \$1.00
parasites, predators, and other natural means | 46. Dye Plants and Dyeing \$1.25
a handbook on dyes derived from plants; how to use them for dyeing yarns and textiles; many recipes; four pages in color |
| 20. Soils \$1.00
kinds of soils; how to build up and maintain good soils for different ornamentals | 35. Fruits in the Home Garden \$1.00
the best varieties of fruits and nuts for utility and beauty, how to grow and spray | 47. Dwarf Clovers \$1.00
culture and uses of dwarf evergreens; 800 varieties described, 60 illustrated |
| 21. Lawns \$1.00
how to establish and maintain lawns, best kinds of grass to use | 36. Trained and Sculptured Plants \$1.00
essentially a beautifully illustrated guide book on specialized training and pruning | 48. Roses \$1.00
a mine of information on landscaping, planting, pruning, hybridizing, exhibiting roses |
| 22. Broad-leaved Evergreens \$1.25
culture and use of hollies, rhododendrons, magnolias, and other broad-leaved evergreens | 37. Japanese Gardens and Miniature Landscapes \$1.00
traditional and contemporary gardens and their application to Western culture; also tray landscapes and garden accessories | 49. Creative Ideas in Garden Design \$1.00
83 fine photographs of well-designed gardens for outdoor living and for viewing |
| 23. Mulches \$1.00
best kinds to use in various regions, when and how to apply, new materials available | 38. Gardening with Native Plants \$1.00
how to know them and grow them. Informative articles from all parts of the U. S. A. Same, cloth bound, hard cover \$2.50 | 50. Garden Pests \$1.25
how to control plant diseases and pests |
| 24. Propagation \$1.00
seeds, hardwood and softwood cuttings, layering, grafting, use of plastics, plant hormones, propagating with mist | 39. The Environment: A Handbook of Ideas on Conservation for Every Man \$1.00
how to embark on anti-pollution and many other projects in communities, in short, constructive solutions for ecological problems that face man today | 51. Bonsai: Special Techniques \$1.25 |
| 25. 100 Finest Trees and Shrubs \$1.00
descriptions and pictures of 100 of the world's best trees and shrubs for temperate climates; culture, hardiness, landscaping | 40. House Plants \$1.00
150 pictures of outstanding kinds, their culture and ideas for using | 52. Handbook on Weed Control \$1.25 |
| 26. Gardening in Containers \$1.00
using containers for gardening on roofs and terraces, in city gardens, in difficult localities; hanging baskets, window boxes and moss-walls; new kinds of containers | 41. Flowering Trees \$1.00
crab apples, dogwoods, magnolias, cherries, others; how to select and grow them | 53. African-Violets and Relations \$1.25 |
| 27. Handbook on Herbs \$1.00
featuring an illustrated dictionary of 88 different herbs; propagation; mints, geraniums, thymes; growing herbs indoors | 42. Greenhouse Handbook for the Amateur \$1.00
greenhouses of all types; plants to grow in them, how and at what temperatures | 54. Handbook on Orchids \$1.25 |
| 28. Pruning Handbook \$1.00
methods and effects of pruning woody ornamentals, fruits, and many tender plants | | 55. Origins of American Horticulture \$1.25 |
| 29. Handbook on Gardening \$1.00
everything for beginning gardeners, experienced gardeners, too; how to select and care for plants; scores of "how-to" pictures | | 56. Summer Flowers for Continuing Bloom \$1.25 |

1000 Washington Avenue, Brooklyn, New York 11225

Estelle asked the Lone Outdoorsman if he lived in Phoenix. She'd come over to the fire and was holding a plate while he piled the steaks on. Hungry as she was, she was already plotting in her mind to stash part of their supper in her bag so they'd have something to eat the next day. She'd already scored a can of beer and a handful of cashew nuts. What she wanted now was half a steak and at least one baked potato. She would have scooped a potato off the platter then and there if the Outdoorsman had given her a chance. But he said, "I'll help you with that," took the platter and led his guests around the truck and through the narrow door of his camper.

"Yeah, I'm from Phoenix," the Outdoorsman said. "My grandfather helped settle that place in the 70's. Came out with the United States Cavalry, chasing after Proud Person, the Apache renegade."

"Did he catch him?" D.R. inquired.
"Well sir," said the Outdoorsman. "As a matter of fact, he did."

"Far out. What did he do with him?"
"Took him to jail. Made him promise to quit bothering people, then let him go."

"Did Proud Person keep his promise?" asked Estelle.
"He did. Proud Person was a good Indian from then on. My grandfather was proud of that. He used to talk about it a lot. He got out of the Army and settled there in Phoenix as a grocer. Proud Person used to come in from the Hills about once a year and trade with him. They became life-long friends. My grandfather was a tough old codger, but that's one thing you can say for him, he was always a believer in giving folks a second chance."

The Outdoorsman was quiet then as he chewed a bite of steak. When he'd swallowed he set his plate aside and got up to turn the TV on.

The television set was a little portable with a four inch screen. It sat on top of the refrigerator toward the rear of the camper. Estelle and the Outdoorsman were seated on bunks on either side of the little room, with Divine Right between them sitting on a stool at the end of a table that folded out of the wall. Behind and above D.R. was a sleeping space that ran crossways of the cabin. On either side of the entrance to that space were the mounted heads of two small deer, both of them does. D.R. noticed them as soon as he came in. He didn't want to sit under them but he didn't want Estelle to have to either. Somehow the two does reminded him of Estelle, and he didn't like the thought. If he hadn't been on the crest of a good mood at the time, the two sad-eyed deer would have depressed him terribly. But Divine Right was about two steps back from his ordinary responses now, and the two mounted deer were no more than a minor weight upon his consciousness. He was even able to laugh when he asked the Lone Outdoorsman where he'd bagged the deer and the Outdoorsman said he'd run over them with his truck.

"Both of 'em at once?"
"No. But within a week of one another. It was the strangest thing. Soon as I got my truck fixed from hitting the first one, I was out in the hills again, and I'll be damned if another one didn't crash right into my fender."

D.R. laughed. "Sounds to me like those deer were trying to tell you something."

"Could be," said the Outdoorsman. "Cost me four hundred dollars to get my front end fixed."

The Organic Gardening Books

When I first started gardening three seasons ago, I considered *How to Grow Vegetables and Fruits by the Organic Method* as the first and last word on raising your own food. And I still believe that if you intend to own only one gardening book, that's the one to have. In addition to all the facts you need about soil, compost, mulch, and most domestic fruits and vegetables grown in North America, the book contains beautiful statements by individual gardeners, and by the editors themselves, that add up to an eloquent testimony in behalf of the organic idea. It is these statements, these images of gardeners as people trying to make their very lives organic, that gives the book its strength and true distinction. It's a book to turn a person on to the organic idea in the first place, and then go on to show him in precise detail ways to put that idea into practice. The book is an indispensable guide for the beginning organic gardener.

The thing I have discovered through further reading and continued gardening, however, is that, as good as it is, *How to Grow Vegetables and Fruits* is neither the first or the last word on the subject. There's a new book out now called *Grow Your Own*, by Jeanie Darlington, that to my mind comes closer to being the first word. And two other sources, *The Encyclopedia of Organic Gardening* and all of Ruth Stout's work in general, strike me as being closer to final statements.

All I mean by "first" and "last" is that *Grow Your Own* is for gardeners who are absolutely just beginning, and not only beginning, but beginning in a city at that, right up there on the very front lines where conditions come closest to impossible; while the other sources I mentioned are for people who have had gardening experience and are out to improve upon, rather than discover, their individual methods.

Grow Your Own is by a young Berkeley, California woman who did the whole organic trip in a plot ten feet by ten feet outside her home, paid close attention to what was going on, did careful homework, and then turned it all into a lovely little paperback book. It's an extremely personal book, sort of like a letter to close friends, charming and informational. (Of ladybugs, Jeanie says: "Imagine Volkswagens humping. That's what ladybugs look like when they mate"). The first audience for *Grow Your Own* is other beginning gardeners in the San Francisco Bay region, because much of the information on soil, weather and sources of organic supplies are of a local nature. But it is by no means a purely "local" book. It's a community book, but the community Jeanie is speaking to, and for, is scattered everywhere, and geography will not greatly diminish the book's practical usefulness. As the book serves the community with facts, it also helps create it in spirit. It establishes Jeanie as a kind of hero, in that by effort she has gained the experience of a professional without sacrificing the joyous spirit of the amateur. She's a freak, but she's a competent freak, and competent freaks just may be the most important people in the entire culture at this nervous point in its development. *Grow Your Own* is a solid achievement that everybody in the community can not only benefit from, but feel proud of.

A lot of experienced gardeners find the *Encyclopedia of Organic Gardening* more useful than *How to Grow Vegetables and Fruits*, and this is understandable. Once you're deep into gardening, past the point of needing to be convinced and wanting only to get on with the work at hand, the *Encyclopedia* does stand as a handier, more efficient tool. There's no table of contents. The subjects are not laid out in categories. It's all there in alphabetical order, crabapple followed by crabgrass; tobacco followed by tomato; lima beans, lime,

lime tree, limonium, linaria and linden. Virtually any question you'd like to ask a master gardener is anticipated and answered here, and beyond that, a lot of questions that wouldn't have occurred to you are asked on your behalf and then answered. You wind up with a lot of accidental knowledge, browsing in this volume, and that's always fun and frequently immediately useful. I can best sum up my feelings about the *Encyclopedia* by simply saying that after three seasons as a gardener, I'm about to buy a copy, instead of borrowing any more, out of an impulse to acquire literature on gardening to match my own level of competence and curiosity.

If you were to chart a course from *Grow Your Own*, through *How to Grow Vegetables and Fruits*, on into the *Encyclopedia*, you'd wind up, of course, in Ruth Stout's garden watching her ignore practically everything you just learned from all those books as she grows stuff twice as good and ten times as easily as you do. Well, not really ignoring it. Just seeming to, in the same way that your grandmother ignores the printed recipe as she sort of unconsciously mixes a lot of stuff together and throws it in a coal stove oven to make the best Sunday dinner you ever sat down to. Ruth Stout is a master gardener who's been refining her procedures for decades now. She's sort of like an elderly Zen priest, an old roshi who after years of work and study has distilled a large burden of "knowledge" into a single gem of wisdom which he renders in a single haiku. Just at the point that I felt like I was really catching on to making compost and feeling kind of proud, I found out that Mrs. Stout doesn't fool with compost anymore. Too much trouble. Doesn't fool with tools much either. Doesn't fool with anything much, actually, except mulch. Just spreads a lot of hay around, plants by poking a hole in the ground with her finger, and when it is time, goes out and picks the produce and eats it. I'm confident that if I were to do everything in my garden that she does in hers, mine would still fail while hers would flourish, simply because I'm too young and foolish to get along without some rules. It's the difference between wisdom and knowledge, between having correct information and knowing the truth. I'll be needing "the facts" for a long time to come, but Mrs. Stout assimilated all of that long ago. She just... does it, and her accounts of doing it are among the very best statements on organic gardening that you're likely to come across.

The thing to remember about organic gardening is that it's a movement, a national energy that since its beginnings early in the 1940's has grown into a force so potent by now that it contains serious political implications. The books I have mentioned are landmark documents. But more central to organic gardening as a movement is a monthly magazine published by the same Rodales who brought out the *Encyclopedia* and *How to Grow Vegetables and Fruits*, called *Organic Gardening and Farming*. It has occurred to me that if I were a dictator determined to control the national press, *Organic Gardening* would be the first publication I'd squash, because it is the most subversive. The whole organic movement is exquisitely subversive. I believe that organic gardeners are in the forefront of a serious effort to save the world by changing man's orientation to it, to move away from the collective, centrist, super-industrial state, toward a simpler, realer one-to-one relationship with the earth itself. Most of the current talk about "ecology" in America is simply the noise that accompanies all fads. It's obviously doomed to go the way of hula-hoops and the fifty-mile hike. The thing I like to remember is that even when all the froth has blown away, and the rhetoric of pop-ecology has drifted off to join the other forms of pollution in the sky, the gardeners are going to still be gardening. They're going to quietly go on composting and tilling and planting, and then reaping all the good things they have sown.

1. Perennial crops such as asparagus, strawberries, and rhubarb should be located at one side of the garden.
2. Tall-growing crops, such as corn, must be kept away from small crops like beets and carrots to avoid shading.
3. Provide for succession crops—a fall garden, small fruits, and overwintered crops to mature early in the spring. In this way, space for spring crops which will be harvested early, may be used again for later crops. Examples: tomatoes after radishes; cucumbers after spinach.
4. Early planted, fast-growing, quick-maturing crops should be grouped together. Examples: radishes, lettuce, early cabbage, scallions, etc.
5. Provide plenty of vegetables for canning, freezing, and storing.
6. Do not overplant new varieties, vegetables which the family does not like, or too much of any one vegetable at one time.
7. Rows should follow across the slope (on the contour) in hilly areas.
8. Make sure the plan provides the best spacing between rows for the method of cultivation that you intend to use (hand, tractor, horse).
9. Run rows north and south if possible to prevent plants from shading one another.
10. Long rows save time in care and cultivation. Several crops may be planted in the same row if the distance between rows is the same.

Chemical fertilizers-put your soil on a speed trip. The normal component balance of the soil is disturbed by the availability of more plant food than can be accepted. For a short time, everything that is living in the soil gets pushed way beyond its normal rhythm of life and of course the humus stores are depleted. A chemically treated soil is almost devoid of soil bacteria and earthworms. The structural strength of the soil is lost, and hardpans form that make it hard for water to penetrate deeply. This causes dust storm and erosion problems.

A forest is an ideal example of good soil structure. The leaves, twigs, and everything else that falls to the ground, act as a mulch and gradually decay, leaving a spongy rich layer of humus just below the surface. It is well balanced in all the nutrients necessary to the soil below and to all the living things in it. All the reserves are there mainly in an insoluble form, and they are gradually released by the action of the weather, the bacteria, the earthworms, and all the other micro-organisms in the soil.

Birds are good friends to the organic gardener. If you feed them seed this winter, they'll stick around and eat their share of bug kingdom baddies next summer.

Sweet Peas. The climbing variety, 5-7 feet, is great for hiding a wall or making a screen. Use trellis netting.

Nasturtiums. Great for hot, dry, poor soil areas. The leaves, which are peppery and high in Vitamin C, taste great in salads or cream cheese sandwiches. The flowers are good to eat too, and the green seed pods can be pickled in vinegar with a touch of mace, allspice, 1 clove and salt. They resemble capers.

The first step in pest control is to have healthy plants growing in fertile soil that is rich in organic matter. Then they are more resistant to virus and to insect invasion. Step Two: Restore the balance of nature. The reason there are so many aphids in relation to other bugs, is that DDT has wiped out all their predators. So encourage and import predators into your garden. Ladybugs, praying mantids, ichneumon flies, lacewing flies, toads, lizards and birds all like to eat a wide variety of insects.

Step three: Outwit the insects. Here's where your ingenuity comes into a action. Companionate planting is the first thing to consider. The idea is that certain smelly flowers and herbs repel insects when planted next to susceptible plants. The flowers: marigold, calendula, nasturtium, geranium and chrysanthemum. The herbs: tansy, wormwood, chives, onions, garlic, sage, savory, coriander and hemp.

MULCH GARDENING

How to Have a Green Thumb Without an Aching Back

*"The best book ever written on mulch gardening."
—Bernadine Kirby, Ladies Home Journal*

*"It isn't often that we get this excited about a new book."
—Organic Gardening and Farming*

by Ruth Stout

I stopped short as a thought struck me like a blow. One never plows asparagus and it gets along fine. Except for new sod, why plow anything, ever?

Why plow? Why turn the soil upside down? *Why plow?*
I AM NOT GOING TO. I AM GOING TO PLANT!

I don't suppose I actually shouted the words aloud, but they were making a deafening uproar in my head and even in my heart. The things in me which had, at one time and another, been subjects of comment for those who bothered to notice—my extremism, radicalism of various kinds, ignorance of and indifference to convention, to the status quo, to the written word, to the "established" fact—all of these unfashionable qualities rushed in now and took over. I would ask no one's advice or opinion, I would tell no one until I had done it, but just as sure as God made rebels and nonconformists I was going to ignore custom and tradition and I was going to plant right now.

The dirt made by building a compost pile is a very desirable thing to have, but the man who goes through all the antics necessary to make this pile is to be pitied unless he has a great deal of time and energy he wouldn't know what to do with otherwise. He is like a man, let us say, who is suffering from a physical ailment and knows of a plant, growing on a far mountain, which will cure him. He makes the long, hard journey, finds the plant and is cured.

He is well satisfied until he returns home and finds that this plant also grows in his back yard. He had no way of knowing that until he saw the plant on the mountain and compared the two.

And so it is with those who build compost piles; they don't know any better way to make rich dirt. Now you are hearing of an easier, better way; you need no longer climb a mountain for your compost. It is yours for a small fraction of that labor.

METHODS OF TRAINING BLACKBERRY PLANTS

The Amazon, however, has disappointed settlers in the past, and is likely to continue to cause immense problems, despite the technological tricks of advanced scientists.... The potential Amazon farmer looks at "a veritable wall of brown-green vines and emerald-colored trees reaching 250 feet into the blue sky." Seldom is such abundant production of plant matter seen anywhere else in the world. The new farmer clears the jungle (at considerable expense) and finds that the land produces good crops for a few years. But then comes...a "shocking discovery." The Amazon land, after a few seasons of direct exposure to the relentless tropical rains, *hardens up like a brick*. Without the protective jungle cover as an umbrella, the basic life elements in the soil are leached out. Potassium, iron, calcium, magnesium, and aluminum are washed away.

The stone wall that neighbors helped build is to the right behind the iris in the rock garden. Six years after the project started, the author writes that she is "still hauling stones... but it's worth it!"

A Tier-Shelf Bed for Mushrooms

A BARREL ROOT CELLAR can store all or most garden produce in a fresh state over the winter. A strong, well-made barrel should be used and cleaned carefully before being set in trench.

Uses Manure Both as Fertilizer and Medicine

To keep my flower garden looking good, I use another natural resource, manure, both as a fertilizer and a medicine for every plant in our yard. I prefer horse manure for its light texture, and it makes a very nice mulch when dry. If a plant looks sick, it gets a dose of manure tea, and a new mulch of manure. I have found this a sure cure in our yard for rot in iris rhizomes, thrips in glads, and scale in lilacs. I haven't lost a birch tree since I started to mulch them with manure.

The use of composting to convert organic solid waste into a fertilizer, soil conditioner or nutrient source, is a topic of discussion and controversy. Actually the real value of this process is disposal of solid waste with the production of a usable aesthetically non-objectionable and hygienically safe residue. In this process, carbon in a high energy form and nutrient elements are returned for reuse in the ecological cycle rather than destroyed as done by incineration. Various modifications of the basic process are used throughout the world for the disposal of night soil, sewage sludge and refuse. In the United States, the interest in composting has been rather limited. It has been stated that the lack of enthusiasm for composting in this country follows from the American tradition of putting wastes "out of mind" which in effect obstructs any interest in reclaiming organic solids. Recently, some cities have recognized its potential as a method of refuse disposal as other methods of treating solid waste become uneconomical.

Past attempts to produce and market compost have met with limited success. Failure is often due to the inability to market the compost competitively with chemical fertilizers. The high paper content of a typical urban solid waste makes the material resistant to degradation by composting microorganisms. Consequently, with the limited technology available, existing compost plants operate inefficiently and cannot stabilize the organic material rapidly or completely.

Swedish Composter

Looks like it could be made as a do-it-yourself kind of kit — the inventor is looking for someone in U.S. to manufacture — any suggestions?

(Suggested by Ernest Rimerman)

CLIVUS IS NOT TO BE CONNECTED TO WATER OR SEWER SYSTEMS

The waste decomposes added by the supply of air and the inherent moisture (urine, wet garbage, etc.). Water vapour and carbon dioxide rise through the exhaust duct after leaving the waste mass which decreases considerably in volume and moves slowly towards the lowest chamber where the final products (soil, humus, nutritive salts) occur. late. They can be utilized as fertilizer — normally first after about 2 years and with intervals e.g. of 1-2 years.

Clivus is designed to meet the need for convenience and a hygienic and natural means of diminishing household waste and converting remains to soil restorer on the site.

A household with Clivus needs drainage for bath, dish and laundry water only (purification separately by method suited to local conditions — information concerning valid regulations can be obtained from the health authorities). Since Clivus takes kitchen waste normally poured down the drain, the sewer is relieved of such matter.

Through purification on site: transportation (vehicles, sewers, etc.) of refuse can be reduced or eliminated; outflow and spreading of contaminated matter in ground and water is prevented; the quantity of pure water used solely for the transport of excrement and refuse in the sewage network can be put to better use.

Methane Gas Production—Harold Bate

CHICKEN MANURE FUEL: "Put a chicken in your tank" may never match the zap of Esso's "Put a tiger in your tank" slogan. But British inventor Harold Bate will tell you that chicken power will run your car faster, cleaner and better than gasoline.

Bate has found a way of converting chicken droppings into gas—and runs his automobile on it.

By processing methane gas from rotted chicken manure and feeding it to the engine through a special device he invented, Bate says he has managed to drive his 1953 Hillman at speeds up to 75 m.p.h. without the use of gasoline.

At his farmhouse in Devon, Bate, 62, told an ENQUIRER reporter:

"This is the thing of the future. . . all you need is a couple of buckets of manure, a tin drum and my carburetor conversion device, and you're in business."

Bate's "chicken coupe" has been investigated and upheld by the British Ministry of Transport.

"We've looked into it," Frank Standing, information officer for the ministry told the ENQUIRER, "and the device works perfectly."

"However, as to mass use, that seems doubtful. There is simply not enough of a supply of chicken manure to provide fuel for autos on a mass basis."

Bate says he has been running his car and five-ton truck on the methane gas—as well as heating his home with it—for years.

"The method is really very simple," Bate said. "You just put about three buckets of manure into a sealed oil drum. Put a small oil heater under the drum to keep the manure at a steady 80 degrees."

"There are two microbes in the manure which, when heated, eat each other—this produces the gas."

"You can collect the gas in bottles or in plastic balloons for storage. Then all you do is feed the methane through an adapter into your carburetor—and you've got chicken power."

"I keep replenishing my manure supply. I run my car for about six months before I clean out the tank and start with fresh dung."

Bate said the conversion from gasoline to methane power can be made in two hours and requires no special tools. The only engine alteration required is the installation of Bate's patented device which feeds the methane from the bottle to the carburetor.

The gas, sucked into the engine by the cylinders, is ignited in the usual manner by the spark plugs to produce power.

Methane is not only cheap and efficient, said the inventor, but it is better for your car—no carbon deposit on your cylinders and no engine wear and no poisonous carbon monoxide fumes.

(Taken from NATIONAL ENQUIRER June 1970)

The Device is ready for connecting to the engine and is complete with Instructions and Drawings—also Instructions and Drawings for Methane Gas Production from Chicken-Pig-Cow-Sheep-Horse and Human manure—also the construction of Methane Gas Digesters of all sizes and costing from £ 5 upwards. The price is \$27 which included the Device and the two sets of Instructions and Drawings—also the Postage by Air Mail to any part of the world.

Thanking you;
I Am Yours Sincerely;
Harold Bate.

Bate from Earth Move

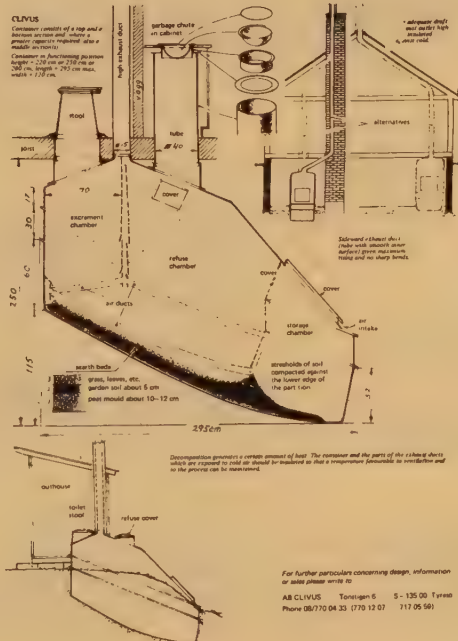

The Harold Bate conversion kit for automobiles and vehicle engines in general, is available from EARTH MOVE for \$33. This price includes delivery to any address of a full kit exactly as distributed by the inventor. This comprises: The conversion device itself which comes ready-to-use and suits all makes and types of engines. Full instructions and drawings for the device. Full instructions and drawings for 'backyard' Methane Gas production.

The device allows a vehicle to run on any gas including Propane and Natural Gas (which is Methane as is gas produced from chicken manure). An emergency or permanent switch-back to gasoline power can be made at any time; even while in motion.

You may be interested to know that over 100,000 automobiles have made the switch to Methane recently—in Italy, including about one third of the taxis in Milan. Gasoline stations there are now selling 'Metano' (Methane gas). Converted vehicles carry heavy tanks in which commercially produced Methane is stored under pressure. Pressurized storage or supply to the vehicle's engine is not necessary with the Bate conversion unit, although there is no reason why commercially produced (pressurized) Methane Gas should not be used in addition to the home made variety. All of this, and more, is apparent from the detailed information which is supplied with the kit itself.

No special tools, equipment or knowledge are required to make the conversion.

Composter in the Sky

My wife & I recently moved to Ben Lomond from Atlanta & are unaccustomed to trash & garbage disposal problems, although we had some difficulties in Atlanta. We've been very interested in a composter, & my wife, Sandi, believes she's found the best. It's maintenance free, accepts any food scraps—except coffee grounds, which go to the ivy, is absolutely odor-free, rather handsome & extremely convenient. It's the California Blue Jay. It's only drawback is the noise factor. My wife has tried lubricating with meat grease but that had no apparent effect.

Really, Sandi says the blue jays eat anything—she puts all the garbage on an old redwood stump on the hill in back of our cabin & the jays have it cleaned up in a few minutes. If anyone knows how to make them run silently, please let us know.

Dave & Sandi
Ben Lomond

Biodynamic Gardening

"They plant by the moon."

"Some European mystic is behind it."

"A lot of weird theories. Nothing proven."

"They surely know their plants."

I have yet to see a 'respectable' formal evaluation of the 'biodynamic gardening' inspired by Rudolf Steiner. All I know is, the most sensational gardens I've seen all claim they owe something to biodynamic notions of soil nutrition, companion plants, and the year cycle.

The Philbrick's *Gardening For Health and Nutrition* looks to be the most practical entry into biodynamic gardening. Next level in: *Companion Plants* or *The Pfeiffer Garden Book*. Then Steiner's own *Agriculture*, with the farthest-out illustrations (in color) ever seen in a garden book.

—SB

Transplanting cabbage seedlings in Chadwick's incredible biodynamic garden at UC Santa Cruz, the main reason a lot of longhairs are attending the school. This photo from *Cry California*, Winter '71.

DANDELION (*Taraxacum officinale*) This is an important biodynamic plant, used to make one of the six Compost Preparations. The growing plant produces a fine neutral humus, encourages earthworms, and is a good influence among the vegetables, so do not weed them all out. Do you know how good its young leaves are in early spring salads; that its roots may be brought indoors in late fall like endive, the leaves cut off to the crown and new ones grown for winter greens? Or the roots may be dried, chopped and used like coffee. Many people enjoy dandelion wine made from the blossoms. The cultivated variety of dandelion known in Europe is used in all these ways, but that seems difficult to start here. Wild dandelions grown in a biodynamic garden are fully as satisfactory. Their deep roots bring up calcium and other minerals from the soil.

or WHOLE EARTH CATALOG

Plants grown in the hotbed or greenhouse without being shifted from the seedbed to provide more room and those shipped from the South usually have very little soil adhering to the roots when they are set in the garden. Such plants may require special care if transplanting conditions are not ideal; otherwise, they will die or at least suffer a severe shock that will greatly retard their development. The roots of these plants should be kept covered and not allowed to dry out. Puddling the roots, that is, dipping them in a thin mixture of fresh cattle manure and clay, or even clay alone, helps greatly in bridging the critical transplanting period. Planting when the soil is moist also helps. Pouring a half pint to a pint of water, or less for small plants, into the hole around the plant before it is completely filled is usually necessary. A starter solution made by mixing ½ pound of a 4-12-4 or 5-10-5 commercial fertilizer in 4 gallons of water may be used instead of plain water. It is usually beneficial. Finally, the freshly set plants should be shaded for a day or two. Small branches a foot or two long from trees with heavy foliage, stuck into the soil on the south side of the plant row, serve the purpose.

WHERE IT IS STILL PLEASANT TO LIVE IN THE USA

This booklet recommends seeking a place outside of the 224 Standard Metropolitan Statistical Areas, as defined by the Bureau of the Census. These are cities of 50,000 or more with their economically attached suburban communities. The SMSA's occupy only 10% of the land area of the United States. It discusses in detail a checklist of factors to be considered in selecting an area and gives the method of finding the answers to each of the questions. \$1.00, paperback.

THE BUG BOOK: HARMLESS INSECT CONTROLS

by John and Helen Philbrick

A useful compilation of imaginative methods used by practicing biodynamic gardeners to combat insect and animal pests. The bugs are arranged alphabetically with accompanying sketches and descriptions for easy identification. Remedies are suggested, and in the back is a listing of effective brews and potions. An invasion of blister beetles can be checked, say the authors, by calling in the neighbors and tromping through the garden beating the bushes and waving sticks and scaring them off. 143 pp., \$3.50, paperback.

WESTWARD, WESTWARD

On the TV screen the world's tiniest wagon train began inching its way across what was surely the world's smallest prairie, and Divine Right and Estelle cracked up immediately.

But the Lone Outdoorsman didn't see anything funny about it.

"What do you mean?" he argued. "Look at it, why it's two miles long or more. Count the wagons. I see fifty right there." "No! No! No!" D.R. cried. "The screen itself's only four inches wide."

"But this is a movie," the Outdoorsman protested. "I know it's a movie," said D.R. "That's the point!"

To settle the argument, Estelle got up and held her finger against the TV screen. "I officially pronounce this wagon train we see before us worming its way across the west as being precisely one and three-fourths inches long, no more and hopefully no less otherwise it will disappear altogether."

D.R. was in hysterics. He laughed so hard he fell over backwards off his stool. And even the Lone Outdoorsman was amused now. He didn't know why, exactly. He was a little put out by the irreverence of his guests, but their mirth was contagious. He grinned. And then he laughed as hard as D.R. did when the first line of dialogue on *Westward, Westward* turned out to be the wagon master saying "Shut up and sit down," to a lady wagon driver.

"Stuff it up your ass," Estelle replied. When the wagon master started to answer, Estelle turned his volume down so low nobody could hear what he said.

"Turn it up, turn it up!" D.R. and the Lone Outdoorsman yelled. Estelle turned it back up and sat down to eat her steak as the lady wagon driver said to the wagon master, "Have you no feelings? Don't you care about anything except your stupid westward movement? I hate the westward movement. I wish I'd never left St. Louis."

And the lady wagon driver began to cry.

Aside from birds, there is another, more prosaic but effective insect eater—the toad.

True friend of the gardener, nearly 90 percent of the toad's food consists of insects and other small creatures, most of which are harmful. In 3 months a toad will eat up to 10,000 insects, 16 percent of which are cutworms. Mr. Toad delights on slugs and mole crickets. And golf course operators are aware of this fact. One Southern club pays for a children's Saturday movie matinee every spring. Price of admission? A toad.

The toad relishes other pests too. Yellow jackets, wasps, rose beetles, spiders, ants, moths, caterpillars, flies and squash bugs are all on its menu. In parts of Europe, toads are collected and brought to market, where they are bought by horticulturists. And before the advent of insecticides, tidy housewives kept a few toads in the house to eat cockroaches and other insect pests.

Toads, like people, feel there is no place like home, and possess a certain amount of homing instinct. So if you import yours from a distance, keep them penned up for a while so they can adjust to their new environment. After a spring rain, small toads can be found and collected in swampy, marshy lands and around shallow ponds.

Friendly insects may help the gardener in his fight against the cabbageworm-butterfly. Trichogramma, commercially obtainable parasites, attack many worms of the Lepidoptera order, which includes the cabbageworm. The trichogramma lays her eggs inside the eggs of the harmful insect by the use of her pointed egg-laying apparatus. When the trichogramma egg hatches, the young parasite proceeds to eat out the contents of the egg in which it lives, causing the egg to become black and preventing it from producing a harmful insect.

Yellow jacket hornets have been found to thrive on cabbage worms, and their presence should not be discouraged. The Braconid wasps, *Macrocentrus ancylivorus* and *Agathis diversa*, are extremely helpful control agents. The gardener can encourage *M. ancylivorus* by planting strawberries, as it feeds also on the strawberry leafroller. *A. diversa*'s alternate host has not yet been discovered. Avoid using poison sprays which will kill these and most helpful insects.

Until this natural help arrives, the gardener can control the cabbageworm by the use of many homemade, non-toxic sprays. Dorothy Schroeder of Lyons, Colorado, has made her cabbages distasteful to the cabbageworm and the cabbage butterfly by spooning a little sour milk into the center of each cabbage

The ladybug is a veritable nemesis to aphids and also helpful in controlling scales and other troublesome insects.

In another example of how natural controls can offer effective protection, an attacking grasshopper is destroyed by the sting of the tiny red ant.

Beware of preparations containing the following. They are the compounds most likely to accumulate and cause damage to the environment and people. Know your enemy.

Aldrin	Endrin	Methoxychlor
BHC	Heptachlor	Perthane
Chlordane	Heptachlor epoxide	Strobane
DDD (TDE)	Hexachlorobenzene	Telodrin
DDE	Kelthane	Toxaphene
DDT	Kepone	
Dieldrin	Lindane	

Commercial insecticidal preparations which may accumulate and eventually cause environmental damage.

Good & Bad Insecticides

Commercial insecticidal preparations which are relatively safe for the environment:

Harnessing the Earthworm

Harnessing the Earthworm, by Thomas J. Barrett, Wedgewood Press, Boston, Mass, 1959. A small (166 page) book about how everyone can help save the Earth a little bit by raising earthworms to make all the good new top soil that everyone knows all about (hopefully). You can raise them from egg cases in culture beds that Mr. Barrett shows you how to build & everything. Book is in two sections: "The Earthworm & Its Environment" and "The Earthworm Under Control" and you have this man speaking in terms of hundreds of thousands—millions!—of worms per acre, each processing his own weight in dirt daily resulting in the super-rich organic material that can "turn a barren desert hillside into a luxuriant paradise", like the book jacket says. It's all there, and he's done it. I'm sorry I can't give you anymore information on price & address, but I found it in the library and you know the way they insist on cutting off the price.
Eric Wurzbacher

54 Pests
Land Use

BENEFICIAL INSECTS FOR BIOLOGICAL CONTROL

Raising insects, or even gathering them, for biological control use is difficult. As a result, there is a great deal of specialization. Most firms try to work with more than one control insect but are often short in supply of the second group. Some of the basic suppliers are:

Bio-Control Co.
Rt. 2, Box 2397
Auburn, California 95603

Ladybug beetles gathered in the Sierras from winter colonies; two species; sometimes mantis cases.

Ecological Insect Services
15075 W. California Avenue
Kerman, California 93630

Consultation and control for both farms and gardens; sells retail.

Dead Drunk Slugs

In the February 9, 1970 issue of *Time* on page 46 is a short article on "Dead Drunk Slugs". Entomologist Floyd F. Smith found that beer, fresh or otherwise, attracted and killed 300 slugs compared with 28 slugs for a metaldehyde/arsenic mixture. The small amounts of alcohol used in such traps as "poison" would not harm small children or pets who sometimes find and eat poison bait. This new "poison" is easy to get and safe to handle. Of course, some bird might get drunk by eating an insect killed in a trap of this type but I think that is much better than dying slowly from DDT. This new "poison" can be used for almost anything. I can remember my Grandfather telling of how he got rid of unwanted pigeons by feeding them rum soaked cracked corn and dropping the drunk birds off on the other side of town.

Yours Truly,
David Smith

Bug Heartburn

If you have a garden you probably hate things like cutworms and aphids but are also afraid of giving yourself that last dose of chlorinated hydrocarbon that will do it. Solution: plant things like garlic, onion and chili pepper along the border of your garden and through the middle if it's wide. Bugs don't like these plants and will avoid them. Consequently they will also avoid your garden. If they don't then crush a chili carefully into about a quart of water, add a crushed clove of garlic and sprinkle or spray the stuff on your plants. This will give all the bugs heartburn and they will vow never to patronize your garden again. Good bugs to have in your garden are lady bugs, ants, wasps, bees, and spiders. Even safe insecticides will kill them, so beware. Cutworms and other caterpillars aren't numerous and should be picked off by hand.
Piece and under:ning,
RD and JL Hamilton

Troy-Bilt Roto Tiller

\$459-\$489 (Direct factory orders get discount from 10% in the spring to 22% July thru September) You'll save enough on beer in ten hot days to pay the difference between this machine and some suburbanite deluxe.

Your 14-year-old daughter may never take the Troy-Bilt over and plow under the neighbor's cornstalks with it (though it has happened) but you can still work 10 acres easier & better with this tiller than with any garden tractor in sight. Gear-driven, powered wheels—you can guide it with one hand and not come trampling along thru the seed bed. It also cultivates, furrows, plows snow and chops in virtually anything but trees for direct composting. Front-blade tillers break your back and shake your skin loose—it would be easier to keep mules. Troy-Bilt has blades behind the wheels, so in rough going (asphalt, maybe? I've never run into any "rough going") you could lean on the handles instead of lifting the wheels off the ground. Engineering miracle, no? They are also just plain nice people to deal with.

This review is not intended to replace the one of the Gravelly tractor. Gravelly is a fine machine, will last almost forever, and will do just about anything (with extra cost attachments.) But it costs twice what the Troy-Bilt does and I don't think it will do twice as much. Maybe on a larger acreage... but at least in the Midwest almost any implement lot or farm sale will produce an old tractor, disc, harrow, buzz saw for wood cutting and brush clearing, snow blade, etc. for less than the price of a complete Gravelly outfit. None of it is the latest but with some mechanical sense and a little judicious rapping at the implement dealers, you learn what to watch for and you won't get junk either. And remember, you can't ask questions if you don't know a plow from a pump jack. Get the basics from a book—or a friendly farmer (who will probably try to sell you every piece of scrap iron on his place)—or go to a garden tractor shop and pretend you're suburbanites.

As marginal farmers follow Good Life consumption hype off the land it's only right we should take up this smaller machinery even as we use those small scraps of land that don't fit into corporate food factories. Going at it this way, \$1200 will buy the same machines your uncle used to farm a half section—or two Troy-Bilt tillers, a chain saw, pump, and snow shovel—or the Gravelly tractor outfit—and any of them will turn your 20 acres into Eden with no strain at all. But for a simple tilling/composting machine, the Troy-Bilt roto tiller is the best thing around.

Transatlantic Arts, Inc.
North Village Green
Levittown, N.Y. 11756

or WHOLE EARTH CATALOG

probably cheaper from Blackwell's (p. 2).

A crop of mushrooms may be produced in boxes beneath the kitchen sink, in a cellar or in a garden shed. They may be grown in a cupboard beneath the stairs, or in an attic room, where perhaps no more than two or three boxes may be planted with spawn; these would take the minimum amount of time to care for, just a few minutes each day. When the crop came into bearing and, provided the temperature did not fall below 45°F (7°C) there would be a few mushrooms each week for possibly three months or more. Artificial heat is not necessary for mushrooms, but the beds (or boxes) will not bear if the temperature falls below 40°F (4°C). Though the beds may become completely frozen, no harm will be done, and the crop will begin again as soon as the air temperature rises. This is another advantage in growing mushrooms in comparison with plants which may be damaged by hard frosts. Indeed, the best quality mushrooms will be obtained where the temperature does not rise above 55°F (13°C), and a cool place is better than one which is too warm, when pest and disease will be at a minimum.

Gravelly Tractor

I own an old one—and my 5 acres is more like 35. We mow, plow, cultivate, cut brush, saw wood, pump water, plow and blow deep snow, clear ice, haul, etc., with it. No belts and plenty of power. (Don't try to help it—it's stronger than you are.) Rotary plow turns organic debris under and leaves a ready-to-plant seed bed in one operation.

How did you miss it so long? Not cheap, first cost, but it will outlast them all and does a better job easier.

[Reviewed by George D. James, Jr.]

Brochure from:
Gravelly Corporation
Gravelly Lane
Clemons, N. C. 27012

2 wheel tractors \$500-910.
Rotary plow \$136.00

Sudbury Laboratory, Inc.
Sudbury, Mass. 01776

It is important that the compost attains a temperature of at least 160°F (71°C) in the heap so that the spores of vert-degris disease and brown plaster mould are killed. A high temperature will also drive any mushroom mites to the surface, where they may be killed by one of the mushroom fly sprays. It should be said that, where animal manures are excluded, relying entirely upon the activator and possible a little poultry manure for composting, the incidence of introducing disease spores will be minimised.

The wagon master was moved. Behind the stern set of his huge jaw his face showed real emotion. He stood above the weeping woman, trying to figure out what to do. Finally he thought of something. He took off his hat. But the woman cried on as before, and the wagon master showed more and more real emotion. At last he sat down beside her and picked up a stick and began drawing in the dirt.

"Aw shucks, mam," he began. "I didn't mean tuh make yuh cry. It's just that, well, out here on the trail, it seems like there just ain't no time much for payin' attention tuh people's feelings. Life's hard out here, mam. And it makes a man hard. Whatever good comes out of this westward movement's going to have to be carved right out of the dust, and it ain't a gonna be easy. People get hurt, and people get bitter, and some people get killed. But I believe a great thing will come out of it all someday, mam, and a brand new world where folks'll stand tall and be free and independent. Every day more people are headin' west, mam. And once you set out, there ain't no turnin' back. They've got a vision, mam. They're a very special kind of people, almost a new kind of people, you might say. People that want something more outa life than just comfort and security and money. This wagon train's made up of people like that, mam, people willin' to work and sacrifice and give up the old things so they can learn how to do what the new world requires 'em to do. That's the kind of person you are, mam. And I mean that. It's people like you who're gonna make this new world into what it's going to be. And I'm proud to help out some. I know I make a lot of mistakes, mam, mistakes that a woman like you is bound to notice and get upset by. So I apologize, mam, for upsettin' yuh. I'll try to keep it from happenin' again. If we don't run into any redskins, we'll be in Fort Leary in a couple of days. Everything'll be all right then."

The lady wagon driver dabbed her eyes with a hankie. Then she looked up and managed a smile through her tears. "I don't know why I'm telling you this," she sniffed, reaching to take his hand in hers. "But after what you just said, I feel compelled to. Tom, I've admired you greatly, ever since we left St. Louis. I know I haven't shown it. I know that I've been silly, and a nuisance. I've been confused, but now I think I understand, and I must speak my heart to you. All these weeks on the trail together, long days of dust and thirst and the ever-present danger of Indians, and these cold nights when the wolves howl and the moon lights up the emptiness of the lonely prairie, all the long, hard weeks since we left St. Louis, Tom, I've believed that I was in love with you. And the thing I realize now is that I'm not. I admire you too greatly for that. To love you would only be to tie you down. You've got a great work in front of you, Tom Ginsberg, a great role to fill on behalf of all the people who are to follow you west to help build the new world of freedom and opportunity you spoke of. It's not people like me who keep alive the promise of the westward movement, Tom, it's people like you. You've got dragons to slay, great heroic deeds to perform. I know that now. And knowing it somehow fills me with the deepest peace I've ever known."

The wagon master didn't know what to say. He just sat there scratching in the dirt with his stick. Finally he reached over and shook hands with the lady wagon driver. Then he went over to the chuckwagon and told the cook to fix her a buffalo steak.

WELCOME TO WESTERN COUNTRY

"Welcome to Western Country," said a fag in a cowboy suit as he held up a package of cigarettes. "Welcome to the clean, fresh taste of the great outdoors." As the fag took a Western out of the package and lit it, the camera pulled away to show a bunch of guys branding calves and generally horsing around the corral. Then the camera closed in on the fag again as he took a deep drag on his Western. He filled his lungs, and then without exhaling he seemed to fill his lungs again. Two, five, ten seconds and more went by and still he didn't exhale. As his face turned red and his eyes began to bulge he looked straight at Divine Right and grinned. D.R. laughed and gave him the V-sign. At last the fag blew the smoke out and holding up the cigarettes one more time he said, "Won't you have a Western?"

"Thanks," said D.R. "But I just had one."

Laughing, Estelle said "Them Westerns is all right cigarettes." The cigarette commercial was followed by one about Stud pickup trucks. The picture showed a new Stud pickup rolling across the prairie chased by a herd of wild Mustangs. A closeup showed how the independent front suspension absorbed the shock of the rocks and holes while the passengers rode in total comfort.

[Suggestions and evaluations by Lloyd Kahn, Craig Harris, R. Ruiz, Pierce Jones, Fred Gaines, Marc Lerner, Carnegie Schensted]

Seeds are exquisitely designed instruction capsules for an orderly rearrangement of the elements. The gardener plays only a small role in the process—the seed tells the soil nutrients, air and water to organize into exactly what is described on the seed packet. Automation—and an example of what we've been given to work with on our planet.

—Lloyd Kahn

a seed is a little plant in a box with its lunch. write to these addresses for free catalogs and brochures.

This is The Year To FIGHT INFLATION AND THE HIGH COST OF LIVING GROW YOUR OWN GROCERIES WITH A GURNEY GARDEN

Gurney

Shumway

492 Oak Leaf

40 days. Improved strain of an old favorite loose leaf variety. Forms a tight bunch of medium green leaves which are deeply lobed. Very tender, long standing and of excellent quality. Pkt., 40 cts.; oz., \$1.25; 1/4 lb., \$3.00, postpaid.

Shumway

Vegetables for Survival

Clyde Robins now offers a "Survival Garden" — especially long lived seeds vacuum-sealed in a can for use in emergencies, etc. The catalog description:

After special treatment to prolong their life and their power to germinate with vigor, these superior seeds were immediately deposited in this sanitary container. Here their added vigor remains and their life span is greatly increased as they lie unmolested, figuratively, "Out of This World," ready to produce abundantly when the can is opened.

Seeds sealed by our method have been found very good after more than ten years. Our experience with them only goes this far.

- Sealed in this container are:
- 4 oz. Beans
 - 1-1/4 oz. Beets
 - 1/2 oz. Spinach
 - 1/2 oz. Cabbage
 - 1/2 oz. Carrot
 - 1/8 oz. Squash
 - 4 oz. Corn
 - 1/2 oz. Onion
 - 1/8 oz. Eastern Tomato
 - 1/8 oz. Western Tomato

Complete instructions for planting are included.

Enough seed to feed a small colony the essential vegetables for survival are contained in this can. . . . Shipped anywhere in the United States . . . \$3.25

Clyde Robin

Wildflower & Wild Tree Seeds. Gardeners and food growers—and maybe hunters and gatherers too—should check out Clyde Robin's seed catalog. It offers not only wildflowers, which grow easily without too much attention, but also many weird and unusual seeds of flowers, trees, shrubs, herbs, and vegetables, plus occasional information on their culture, appearance, uses, etc.

The Special Roadside Mixture grows in places where you thought only weeds would, and makes a really gaudy show in early Summer. After it has bloomed you cut it all down to the ground and the California poppies grow back and flower again. Grow catnip and turn your cats on—it grows easily from seed but you have to start the seedlings inside a small protective wire cage (which the plants will grow up through and out of) otherwise those dope-crazed cats rub out the young plants entirely.

TUB GARDEN

Lilies and Lotus

The Van Ness Water Gardens carries a wonderful selection of Water Lilies—both hardy and tropical and also the sacred Lotus—they will send you a 75¢ catalog on request and therein you will find beautiful pictures and descriptions of the lilies and lotus they offer.

Also in this catalog you will find complete instructions on growing lilies, their requirements and information also on building lily ponds—curing them—planting and natural balance of a pond. They also sell many beautiful goldfish—water plants and snails. There is a list of helpful books in there also!

In my limited dealing with them they have been very nice to me and very pleasant to deal with. You can visit the Gardens on Thurs., Fri., Sat. only between 8:00AM—5:00PM—the other days are closed because of packing and shipping because they ship all over the world. Address of Water Gardens—

Van Ness Water Gardens
2460 N. Euclid Avenue
Upland, California 91786

They also are familiar with the organic growing method and practice it also.

Having a frog pond gives such joy and serenity! Visiting the Zen Temples in Kyoto gave such an indescribable feeling especially the peaceful ponds! I hope this information opens new experiences for people.

Paul & Toni Goldenberg
La Habra Heights, CA

"The Stud," said an unseen baritone. "Everybody wants one."

The Lone Outdoorsman asked Divine Right if his VW had independent front-end suspension. D.R. said he didn't know.

"It's a good thing to have if you're going to do any cross-country driving."

"I guess it is," said D.R.

"We're driving cross-country," said Estelle.

The Outdoorsman turned and looked at her. He was on his feet now, looking for some ketchup in a cabinet near the TV set.

"No kidding? You all drive around in the boonies?"

"No," said Estelle. "We stay on the highway. But we're driving across the country."

"I've driven across the country fourteen times in the last two years," said D.R.

"Oh," said the Outdoorsman. "That's not what I mean. I mean out in the boonies, where you'd take a trail-bike, or something. You know. Cross-country."

Divine Right asked the Outdoorsman if he'd ever driven across the country.

"Well now," said the Outdoorsman. "Do you mean cross-country, or across the country?"

"I mean across America," said D.R.

"The nation, in other words," said the Outdoorsman.

"But the nation is the country," said Estelle.

Pine, Cypress, Fir, Redwoods, Eucalyptus

Davis Headquarters Forest Nursery, Rte. 1, Box 1410, Davis, California 95616. The state of California's distribution center for trees for reforestation, erosion, windbreaks. A long form of course, but they mail pines, cypress, fir, redwoods, eucalyptus in quantities of 100-1,000 or more. One year old bare-root trees (4-10" height) are as little as \$10 per 500.

Growing Wildflowers

I might point out that the growing of desirable wildflowers involves a great deal more than turning them loose. If you live in suburbia the idiot who built the place dug the topsoil out to form your basement and then thoughtfully graded the subsoil over top of the existing topsoil. You can remedy this as I did by "digging the soil up two feet down", and throwing it out. Replace this with leaf-mold soil from the nearest woods, add a ton of peat moss, the contents of your compost pile, and some well-manured soil from your vegetable patch and you're all set to go, provided you have adequate shade and moisture. Also since chlorine and flouride are fatal to native orchids, obtain water from a non-polluted source. Do this and you will be growing ladyslippers, trailing arbutus, trilliums, what have you, even as I am.

I do not recommend growing wildflowers from seed to the beginner, unless the species is otherwise unobtainable, is a biennial or annual, or is grown rather easily. It is a lot easier to collect a few specimens from your locality, and obtain desirable plants which do not grow in your area from dealers. A plant which will not survive transplant when in bloom will move with utmost ease when dormant. So place little flags on the plants you want and come back later. New plants will soon replace what you have collected if you fill in and cover the soil. If you take no more than a couple plants, the station is safe till the bulldozer arrives, and a collection of wildflowers in cultivation can restock the wild following depredation. I wonder if anyone would care to engage in a plant exchange, agricultural regulations notwithstanding.

The very best wildflower dealer I know of is Mr. Paul Leslie, 30 Summer Street, Methuen, Mass. He has obtained his entire stock by growing it from seed, without removing one specimen from the wild, which is more than I can say for myself. He also digs his plants from the ground the day he sends them to you, whereas some others use cold storage facilities. He is also more knowledgeable and takes more professional pride in his work than some others. Catalog 25¢. Also good (and less expensive) sources of plants are C. Robbins' Gardens of the Blue Ridge, Ashford, N.C. and The Three Laurels, Marshall, N.C. Although many of their plants are nursery-grown, both of these dealers sell plants collected directly from the wild. Catalogs free.

There are three firms which might be of interest to you because they offer plants which are simply not obtainable in the U.S.A. I recommend Sutton & Sons, Limited, Reading, England for vegetable seeds, Thompson and Morgan, Ipswich, Ltd., Ipswich, England for flower seeds, and C. J. van Tubergen, n.d., Zwanenburg Nurseries, Box 116, Koninginneweg 86, Haarlem, Holland, for bulbs. The last-mentioned are wholesalers, and charge 50% extra on orders under \$100. Also don't let them aimail something which doesn't need it, and place your order well in advance. You will obtain superior bulbs by ordering from them, however. I wish some people in New Mexico would get together and grow their Onco-cyclus and Regelia series of Iris species; they are of unique beauty but require a hot, dry summer I cannot provide.

All three offer free catalogs.

Donald Hackenberry
Reedsville, Pa.

The Outdoorsman wrinkled his brow and thought about that as he spread ketchup on the remnants of his steak. "The nation is America," he said. "What the country is is all the land, and the rivers and things."

D.R. had stopped eating altogether. Leaning toward the Outdoorsman, and emphasizing with his fork, he said, "Do you mean you don't think America and the country are the same thing?"

"Of course not," said the Outdoorsman. "Ain't you ever read any history?"

"I've read history," said Estelle.

The Lone Outdoorsman swallowed some more steak and went on as if Estelle hadn't said anything. "Now you take these people on the wagon train. They're traveling across the country, right?"

"Right," said D.R.

"Okay. They're traveling across the country, but they're not traveling across America. Because the country where they're traveling hasn't been taken into the nation yet, if you see what I mean. There's no statehood there on the plains yet, therefore that country they're in isn't part of America. Now if where they are was a state, say Kansas, or South Dakota, then you could say they're traveling across America. But since they're not, why then they're traveling cross-country."

"So you mean the people on Westward, Westward are not traveling in America, but just traveling in the country, because America and the country are two different things."

"Something like that. America, you see, is yet to come on Westward, Westward. Of course by now it has come. Westward, Westward's just a story, don't you see. It's about something that's been over a long time. I mean, the westward movement is something my grandfather helped do. Him and the others took the country, and turned it into America, if you see what I mean."

"Well, I don't, actually," said Divine Right.

The Lone Outdoorsman asked the last of his steak, and sopped up the gravy with a piece of bread. "Well," he said. "You're young yet. You will one of these days."

TOM GINSBERG'S I CHING

By the time the Outdoorsman and his guests had finished their steaks and cleaned the table off for dessert, the wagon train had been surrounded by about a thousand Indians, and Tom Ginsberg had been wounded twice. He could still shoot a pistol but the lady wagon driver had to load for him. She loaded while he shot and he shot while she loaded, and the bodies made a little border around the circled wagons. Now and then the camera panned around the circle and showed other people firing at the Indians. But it was clear that the outcome of the battle really depended on how well Tom and his lady friend did with their guns. And in spite of the stack of bodies beyond the wagons, you could tell by the desperate expressions on their faces that they didn't think they were doing very well.

"Poor old Tom looks sort of undecided, don't he?" said the Outdoorsman.

Estelle laughed. "Maybe he ought to throw the I Ching," she said.

D.R. leaped to his feet. "Perfect!" he yelled. "Perfect!"

The Outdoorsman asked what was perfect but D.R. was moving too fast to answer. He bolted past Estelle, stumbled out of the camper and ran through the dark to his own campsite where Urge was patiently waiting. Half a minute later he was back in the Outdoorsman's camper, carrying his battered, leather-covered copy of the I Ching.

"What are you doing?" asked the Outdoorsman.

"We're throwing Tom Ginsberg's I Ching," said D.R.

"What's an I Ching?"

"Never mind," said D.R. "Just toss these coins."

Quickly they tossed the coins, two times each, and Estelle drew the hexagram.

Chien.

Obstruction.

Trouble.

"Uh oh," said D.R. "It looks heavy."

Indeed it did. Nearly everybody in the wagon train was dead now except Tom and the lady. Indians had penetrated the inner circle and were systematically scalping the slain white folks while still other Indians battled the remaining survivors.

D.R. began to read Tom's Ching aloud: "The hexagram pictures a dangerous abyss lying before us and a steep, inaccessible mountain rising behind us. We are surrounded by obstacles."

As D.R. said that, an arrow pierced the lady wagon driver's heart.

"Difficulties and obstructions throw a man back upon himself," D.R. went on. "While the inferior man seeks to put the blame on other persons, bewailing his fate, the superior man seeks the error within himself, and through this introspection the external obstacle becomes for him an occasion for inner enrichment and education."

The screen was filled with the face of a hideous savage, advancing on Tom with tomahawk upraised. Tom shot him with his pistol but instantly two more savages appeared, armed with knives and tomahawks.

"When threatened with danger," D.R. read, "one should not strive blindly to go ahead, for this only leads to complications. The correct thing is, on the contrary, to retreat for the time being, not in order to give up the struggle but to await the right moment for action."

"Retreat, hell!" shouted the Outdoorsman. "Stand your ground, Tom. Die with your goddamn boots on!"

The camera closed in on Tom's tense face. In spite of the blood oozing from the gash in his forehead his eyes blazed with courage and determination. Gritting his teeth, Tom struggled to get to his feet. Leaning against the wagon wheel, his left arm dangling useless at his side, Tom raised his right arm and pointed his pistol at the advancing Indians. Then he disappeared and was replaced on the screen by fifteen Dalmatian pups gorging themselves on Fido Dog Food.

Herbs

I would like to turn people on to herbs. You can grow herbs in the corner of your vegetable garden, in a patio box, in a window, in a window, in a flowerpot. You can be an agriculturalist with only a few square feet of ground and prepare yourself for that land you ultimately hope to gain part or all your livelihood from. You can use your herbs for flavoring cooking, for salads, for making things smell nice, for dyeing cloth, for curing yourself of all sorts of illnesses, for making magic and casting spells, for alchemy. And herbs are beautiful, simple plants, most of which grow and flourish even in the poorest soil. You can even grow your own I Ching yarrow stalks.

I haven't investigated many herb books as yet; maybe some of the other readers can recommend some good ones; anyway, better to start with the herbs and get to the books later. One interesting one I've seen is NATURE'S MEDICINES—The Folklore, Romance, and Value of Herbal Remedies really lays down a lot of lore. Another good one is HANDBOOK ON HERBS published by the Brooklyn Botanical Gardens, Brooklyn, N.Y., which is enough to get you hooked on herbs all by itself. The Brooklyn Botanical Garden, by the way, publishes a wonderful bunch of books on all phases of gardening, all of which sell for either \$1.00 or \$1.50 (the herb one is \$1.00) Free list available from them.

As an example of herb lore, someone told me that when he gets a bad case of poison oak, he uses a leaf of comfrey to scratch with, rubbing it freely over the itchy spot, and wipes out the poison oak in a few days. However, he says, if you use a comfrey poultice on an infection or wound, don't bind the leaf directly to the skin, as it's so effective in promoting the growth of epithelial cells that it may actually grow to the skin. The Nature's Medicines book has a lot more rap on comfrey.

A problem with growing herbs is that there are seldom more than a few of the most common types in the local nursery. So I talked to someone who is really into herbs, spices, gardening, essential oils, gourds, and all that useful vegetable stuff, and asked her where to get herbs, etc. She sent me a list of addresses, I sent for their catalogs, and the following is all about that.

Nature's Herb Co., 281 Ellis St., San Francisco, Calif. They sell dried herbs and spices by the pound, ingredients for potpourris and sachets, prepared herbal remedies, and essential oils. Also various herbal tea mixtures for both enjoyment and medicine.

Herb Products Co., 11012 Magnolia Blvd., North Hollywood, Calif. 91601. Much the same as the above, with the addition of some far-out cosmetics. They are very much into ginseng, and can tell you something about that. Their prices tend to be a little higher than Nature's Herb Co., but each has things that the other doesn't

Indiana Botanic Gardens, Inc., Hammond, Indiana 46325. They will tell you a very far-out catalog and an herbalists almanac, which will tell you the best days to plant, what the weather will be like for all of 1969, and other useful tidbits. They sell teas and medicines, herbs and spices, seeds, beans, nuts, gums, resins, oils, vitamins, cosmetics, perfumes, formulas to cure liquor addiction, tobacco habit, and tobacco chewing, and tell you what grateful users write about rectal ointment no. 103.

Tradewinds Candle Shop, 1224A Fillmore Street, San Francisco, Calif. I throw this in just for the hell of it. They sell candles, but their scene is magic. I was last there several years ago, and it appeared to be an old established business, run by an elderly white-haired man who looked like a Suth'n Cuhn'l, and his wife, who looked like a Haitian voodoo lady. They sell the usual oils, powders, etc., but I think they may also handle other things they don't list in their catalog. They will also give intelligent advice on how to change your luck, make money, make your love love you, etc. They make no outrageous claims, but will answer questions. I tried them once, and their advice worked, but I don't think I'd do it again. Handle at your own risk.

None of the above deal in things for gardening.

Meadowbrook Herb Garden, Wyoming, Rhode Island 02898. Their catalog is a beautiful piece of printing and calligraphy. They don't ship live plants, but will deliver if you live within forty miles. They sell herb teas and tea herbs, spices, seeds, toiletries, books, supplies, and miscellany. They seem to be into Anthroposophy and something called Bio-Dynamics.

Carl Odom, Pinola, Mississippi 39149. He will send you a very down-home two-sheet catalog on newsprint, telling you all the groovy things you can do with gourds. I won't say anything about it and ruin it for you. He also sells vegetable and flower seeds.

Nichols Garden Nursery, 1190 North Pacific Hwy., Albany, Oregon 97321. They will send you an incredible 44-page catalog that will require every ounce of your willpower to keep you from making a hundred dollar order on the spot. Seeds for vegetables and herbs, growing plants, dried herbs and spices, mushroom spores, wild-flower seeds, house plants, gourd seeds, books, supplies, brewing and winemaking stuff, and all sorts of other oddments. They specialize in the unusual, like very large, very tasty, or very different vegetables. Their catalog is mimeographed because, they say, "modern, high speed presses could probably do the job better, but we believe that people are more important than machines, and for that reason will continue to resist automation." I bought some live plants from them, they arrived in good condition and are now growing well.

Woodland Acres Nursery, Crivitz, Wisconsin 54114. They specialize in wildflowers and ferns, many of which have herbal uses, and sell mostly live plants.

Greene Herb Garden, Greene, Rhode Island. Getting their catalog is like hearing from your nice aunt that lives in the country. Full of news about their family, spring in New England, and gentle conversation about herbs. They sell only herb seeds and bulbs.

Vita Green Farms, P.O. Box 878, Vista, California 92083. They sell vegetable and herb seeds, vegetables, fruits, and preserves. If you want organic produce and are not near a good health food store, their vegetables might be worth investigating. Expensive, but I'm sure they're excellent. All vegetables are organically grown, seeds are "un-treated, natural, old-fashioned, un-hybridized, un-crossed." Their tone is a little stern, but anyone who raises organic produce for a living is bound to be a fanatic and a crusader. I sent for some of their seeds, and they came virtually before I put the letter in the mailbox. They are also pure water maniacs, and sell various types of home filtering units.

Walnut Acres, Penns Creek, Pennsylvania 17862. They sell nothing for gardening, but have the most complete selection of organic foods and related products I've ever seen, including every conceivable organic grain. Prices are high, but they have all sorts of stuff I've never seen before. They also seem like very beautiful people who love and are concerned about the world around them.

That's all for now. I'll keep in touch. Keep up the good work.

Love,

Roland

A Modern Herbal

This is far and away the most complete (and expensive) information on herbs.

"The medicinal, culinary, cosmetic and economic properties, cultivation and folk-lore of herbs, grasses, fungi, shrubs and trees with all their modern scientific uses . . ."

Over 160 useful plants are listed—the history, description, constituents, medicinal uses, preparation, dosages, and even recipes of each.

It is a two-volume set, with a meticulously complete index of the common names of the plants, followed by a service index of Latin binomials.

[Reviewed by Alan Schmidt]

Comfrey leaves are of much value as an external remedy, both in the form of fomentations, for sprains, swellings and bruises, and as a poultice, to severe cuts, to promote suppuration of boils and abscesses, and gangrenous and ill-conditioned ulcers.

The whole plant, beaten to a cataplasm and applied hot as a poultice, has always been deemed excellent for soothing pain in any tender, inflamed or suppurating part. It was formerly applied to raw, indolent ulcers as a glutinous astringent. It is useful in any kind of inflammatory swelling.

... The reputation of Comfrey as a vulnerary has been considered due partly to the fact of its reducing the swollen parts in the immediate neighbourhood of fractures, causing union to take place with greater facility.

GINSENG

Nichols Herb & Rare Seeds

Nichols and his wife who seem to have just popped out of the Black Forest. The whole place is one room of cardboard boxes and pigeon holed walls and odd notes tacked up all over the place. He is basically a mail order business and sells wine making supplies, beer making supplies (and ingredients) and rare seeds and herbs and plants and all sorts of weird stuff. He also printed his own recipe book which is fantastic for sourdough stuff, wine & beer making, and baking with malt syrup and hops also lots of recipes for yeast.

They are really beautiful old souls who send you home with extra goodies that you are to try and accept as gifts.

Needless to say—they're organic. They have a fairly complete catalog that they will send and their seeds really are superior.

Nettle.

It is a strange fact that the juice of the Nettle proves an antidote for its own sting, and being applied will afford instant relief.

From a culinary point of view the Nettle has an old reputation. It is one of the few wild plants still gathered each spring by country-folk as a pot-herb. It makes a healthy vegetable, easy of digestion.

The young tops should be gathered when 6 to 8 inches high. Gloves should be worn to protect the hands when picking them. They should be washed in running water with a stick and then put into a saucepan, dripping, without any added water, and cooked with the lid on for about 20 minutes . . . they thus form a refreshing dish of spring greens, which is slightly laxative. In autumn, however, Nettles are hurtful, the leaves being gritty from the abundance of crystals they contain.

An efficient hair tonic can be prepared from the Nettle: simmer a handful of young Nettles in a quart of water for 2 hours, strain and bottle when cold. Well saturate the scalp with the lotion every other night. This prevents the hair falling and renders it soft and glossy.

INTERIOR DURING 1st PLANTING

Inflated Plastic Greenhouses

Inflated plastic greenhouses have been built, costing only about 15 cents per square foot, near the fishing community of Puerto Penasco on the Gulf of California. This location provides bright and plentiful sunlight almost every day of the year, but this is coupled with almost a complete absence of fresh water. The enclosed plants are grown in an atmosphere of approximately 100 per cent relative humidity and 1,000 ppm. of carbon dioxide (the normal outdoor figure is 300), thereby reducing the water requirements to 1 to 5 per cent of normal. The unlimited sea water is used for cooling in the summer and heating in the winter. (The direction in which such schemes may go in the future is described in another article in this issue by Edward A. Mason.)

Indoor Greenery

For those who are still in the city but are attempting an indoor green revolution to freshen air, eyes and soul, may I suggest the following sources of info., plants and materials:

The really best book on "how to" is Ernesta Drinker Ballard's *A Garden in Your House*, Harper & Row. An excellent & unusual feature of this book is that it contains lists of plants especially suited to specific indoor environments.

Indoor plants by mail:

Loge's Greenhouses, Danielson, Conn.
Catalog \$50. 39 p of Begonias, 9 of geraniums, lots of herbs.

Merry Gardens, Camden Maine 04843
Handbook & price list \$5.00. Gives cultural requirements for each plant or plant type. Offers a wide variety of plants—and especially wide variety of fuschia, begonias, scented geraniums and herbs. They also sell herb seeds.

Julius Roehrs Co., Rutherford, N.J. 07070
Exotic Plant Collectors list \$25
These are really groovy & unusual plants from one of the largest greenhouse complexes in the US. It's worth a visit if you're anywhere near NYC—NJ side of Lincoln Tunnel on Patterson Ave. This is the only source of "specimen size" plants by mail I know of. Most deal in plants in 2"-3" pots which are easiest to ship—and relatively inexpensive to acquire.

Materials & supplies—particularly for growing things under lights
House Plant Corner
PO Box 810
Oxford, Maryland 21654
Catalog \$20 the 1st time.

Algae

I notice in your September 1970 \$1 WEC, p. 17, you refer to some algae production experiments. Ideas of this sort have been around for quite a while. Most of them date back to Vannevar Bush, who proposed in the mid-1940's that the U.S. should "grow algae and feed the world." In 1953, the Carnegie Institution of Washington, D.C. issued their Publication No. 600, "Algal Culture from Laboratory to Pilot Plant." This book has been reprinted several times, most recently in 1964. Price is about \$5.00. The Japanese microbiologists have also been very active in this field. There is a French company researching the area, but they regard both their organism and their process as proprietary, and refuse to release any detailed information (a violation of scientific etiquette). However, the real pro's in this business at present are the Czechs. In the Annual Reports of the Laboratory of Algology of the Institute of Microbiology of the Czechoslovak Academy of Science for 1966, 67, and 68 (issued at Trebon, Czechoslovakia), they describe a method of producing large quantities of algae, outdoors, using natural illumination plus artificial nutrients and pumping facilities. One clever adaptation, not previously used so far as I know, is that they let the algal suspension flow down over large inclined sheets of glass, with interspersed barriers to increase flow turbulence and promote mixing. Thus the algae are exposed to sunlight. In the winter, when it gets cold they shut down the algae operation and use the sheets of glass as the top of a greenhouse, and grow ordinary plants inside the space used in summer for pumping and storage. These Annual Reports were free at last notice, but their budget is minimal; and people shouldn't request them unless they can really use them. Much of the information is detailed and highly technical, not to be skimmed over in a weekend.

Hydroponics

growing things without soil . . .
remember the avocado pit suspended on four toothpicks over the glass of water on the top of the refrigerator?
or half a potato scumming away in some dark corner?
that all has a name. here's a complete set of short booklets on hydroponics.

—jd

Hydroponics is the opposite of Land Use. Ever since Skinner's Walden Two it's been with us in the pop culture as some kind of solution to things. And if you're living in a Soleri city, or floating Fullertown, or mountaintop, or moon, it might well be.

DEPARTURE

If D.R. had done what he wanted to do right then he would have leaned across the table and turned the television off.

If he had done that, and the Outdoorsman had then done what he wanted to do, he would have leaned across and turned the TV on again, which very likely would have resulted in an argument between him and D.R. about the difference between stupidity and heroism.

If there's to be a fight, D.R. reasoned, the courageous thing is to retreat before it begins, as the I Ching so wisely advises. And so D.R. stood up, held out his hand to the Lone Outdoorsman and announced that he and Estelle were leaving.

The Lone Outdoorsman took D.R.'s hand. Then, realizing what D.R. had actually said, let it go again and began pleading with them to stay for dessert and the rest of Westward, Westward.

No, said D.R. We must continue our journey to the east. We have to be in St. Louis by Tuesday in order to meet Eddie. We have a long, hard trip ahead. But we sure thank you for the food and the hospitality.

Estelle told the Outdoorsman thanks, and goodbye, and stepped out the door, with D.R. close behind.

From the ground D.R. turned to shake hands with the Outdoorsman again, and again to tell him thanks for the food and the very pleasant evening.

The Outdoorsman said that they certainly were welcome, and urged them again to stay on for dessert and the rest of Westward, Westward.

But D.R. said no, they had to be on their way, that it was going to be hard to make St. Louis by Tuesday as it was.

The Outdoorsman said he understood, and walked with them to their bus.

As D.R. and Estelle drove away the Lone Outdoorsman stood in the empty campsite waving, until Urge's red taillights were swallowed by the night.

Then he went back to his camper and wrote this letter to his wife, while drinking a beer:

Dear Lucille,

How are you? Fine I hope. I'm having a good time in the big woods. Ha. There are not as many people at Eagle Rock this year as last year but at Pine Point there were more people this year than last year. Rig doing fine. Tell Charley he was wrong in all his predictions of mechanical failure and he owes me five bucks. Ha. Food good tho not like you can cook it. Ha. Met a young traveling couple here at Eagle Rock, nice kids. Lucille you take care of yourself call Wanda any time necessary, you be sure to call her if you have to. I'll be home a week from Monday.

Sincerely yours,

William F. Dixon

Nasco Farm and Ranch Catalog

part of the trouble with going back to the farm, just like going into a new job or hobby, is that the technology of gadgets must be looked into, so the new farmer will be able to tell whether he really needs a master artificial vagina, liquid semen refrigerator, and trans-jector electronic ejaculator, or whether he is going to believe in a little more organic process.

the nasco catalog sits smack in the middle of farmy equipment consciousness, and carries all of the above mentioned goodies. but, nasco also carries the more staple farm tools, like crank forges, seed sowers, cant hooks, load binders, pulaskis, lopping shears, and post hole diggers.

if you are a windowshopping farmer, or farmy windowshopper, write for the catalog. prices look reasonable.

9. GOLDIE HALTER
A most beautiful halter . . . one that really sets the pace and rightfully belongs on the Champion.

Brilliant white polypropylene with gold threads woven into it and all gold hardware. Wool nose band. Nothing else like it on the market, and you'll want to be the first to have it.

Like all other Johnson halters, top quality and design have gone into this outstanding and unusual horse halter. Sh. wt. 1½ lbs.
C2443N-21-12 For 1100 lb. to 1500 lb. horse \$5.95
C2444N-22-12 For 800 lb. to 1100 lb. horse 5.95

FARM POND HARVEST

This unique publication is exactly what pond owners and farmers interested in a pond have been looking for . . . a magazine dedicated to farm pond planning and construction — pond management — fishing and harvesting. Here are some typical articles from past issues: Build a Better Fish Pond; Stocking Private Ponds; Is Your Pond Clear or Muddy?; Trout in Farm and Ranch Ponds; How to Control Weeds in Your Fish Pond; The Mute Swan and Your Pond; The Raising of Channel Catfish in Cages.

Each and every pond requires management, and to be managed properly, the owner must be aware of the principles involved. Farm Pond Harvest will help you to achieve a well managed and productive body of water . . . and keep you up to date on all of the latest news pertaining to farm ponds. If you own a farm pond, plan to build one in the future, or contemplate entering the fish-farming market, you won't want to be without Farm Pond Harvest.

1. STAINLESS STEEL UTILITY OR DAIRY PAILS With Tilting Handle

Tapered design for easier pouring. Made of extra heavy, high polished, stainless steel with thick, flat sanitary rim. Smooth and seamless. — no crevices to catch dirt. Handy tilting handle. Extra thick bottom.

16 QT. CAPACITY. 12¼" top dia., 7¼" base dia., 12¼" deep. Sh. wt. 5¼ lbs.
B291N-5816-1 \$17.85

1. PORTABLE WATER COOLERS — With Recessed Spigot

Now deluxe Arctic Boy portable water coolers feature two exclusives!

Hot-dipped inset is galvanized after forming to eliminate chips and cracks in zinc coating. Galvanizing after forming fills lap joint completely, eliminates possible leaks, corrosion points and dirt catchers! Smooth, gleaming interior can be cleaned in seconds! No rough edges, no exposed metal, bottom rounded for free cleaning access!

Impregnite 90 — plastic on steel interior. Permanent sanitary bond. No odor — no taste. They're made of quality materials throughout to take rugged abuse in the field . . . everywhere men work. Ideal for hunters and fishermen, too.

M1013N 2 gal. size. Sh. wt. 6¼ lbs. \$10.70
M1014N 5 gal. size. Sh. wt. 14 lbs. 5 oz. 13.20

2. TUNED IN HARMONY — SWISS SHEEP AND COW BELLS

Very best Swiss bell metal. The kind of pleasure they give is what makes farm life really worthwhile. You can afford their small luxury. Set of three cow bells size 4", 5" and 6¼". Sheep bells are 2¼", 3" and 3-5/16". Complete with handsome leather straps. Sh. wt. 8 lbs and 4 lbs.

C132N-A Cow Bells. Set of 3 \$44.00
C167N-D Sheep Bells. Set of 3 16.50

Agricultural Extension Services

Each of the 50 states provides agricultural advice and services through county or area offices of their Agricultural Extension Service. These services are twofold:

1. Farm Advisors, extension agents, or county agents—depending on which state you live in, staff personnel under one of the above names are available for consultation or house calls in any area or agriculture or related fields such as turf care, home gardening, livestock, pest or rodent control and soil & water conservation to name a few. Most staffs usually also have a home economist.

2. Publications—a wide range of publications are also available through the AES or the U.S. Dept. of Agriculture. Some are for sale, but most are free. They are non-scientific & are written for the lay person. These publications cover a wide range of subjects of interest in commercial agriculture, home gardening or homemaking. Most states will have a catalog of their publications, such as the two from the University of California. You may either order publications by mail or pick them up directly at the county office. If you have specific questions, it is often best to pick up brochures at the county office so that you may consult the farm adviser at the same time. Agricultural Extension Offices are normally listed in the phone book under the county listings.

Soil Conservation Service—USDA

Most rural areas of the US are incorporated into Agricultural Conservation Districts. This situation offers two services you should be aware of.

1. Soil conservationist & engineers—

The services of these people are available to you through your local district office. If you need a livestock pond or watering sites for wild game, they'll do the engineering for you. They can also help out if your basement floods, your soil is blowing away or the creek is eating away the bank under your pad.

2. Agricultural Credit & Production—

ACP, as this program is referred to, is a cost sharing program for land owners or users sponsored by the US Dept. of Agriculture. If you are located within a conservation district, you may be eligible for government money to help you develop springs, seed pasture, build fences or stabilize stream banks.

E233N-448 Each \$2.84; 12 or more, each \$2.56

The Farmer and Wildlife

A farm that encourages wildlife is much more of a self-balancing low-maintenance system than one without. Also it's less boring. Encouraging wildlife mostly consists of not discouraging it so much, like leaving your brushpiles instead of burning them, damming the gully instead of letting it erode, leaving a bit of woodlot instead of stripping the land.

Washington, D.C. 20005

The small owls are almost universally beneficial. The farmer will do well to protect them.

A grazed woodlot is neither a good woodlot nor a good pasture. The farmer will profit by making it one or the other.

Formerly it was assumed that brushy fence lines might harbor crop pests. More recently we have learned that they are much more likely to serve as cover for birds, predaceous and parasitic insects, and insect-eating small mammals. An Ohio biologist whose work was mentioned before showed that there were 32 times as many songbirds in brushy fencerows as in open croplands. Such field borders also contained 60 times as many aphid-destroying lady beetles as sodded fence lines.

In addition to songbirds, a strip of brush between fields is attractive to skunks, weasels, and birds of prey which feed upon the meadow mice in hay and grain fields. The small animals that live in shrubby fencerows are for the most part either beneficial, like the shrews, or of kinds like the woodmouse which do not commonly destroy crops. Sodded field borders are likely to harbor heavy populations of destructive meadow mice, which spread into croplands. These animals do not live in thick brush.

The Negev

If you're into *really* dry farming, you can talk to Hopis or to Israelis. The Hopis haven't done a book yet. These Israelis have, and it's fascinating business, involving detailed desert study, reconstruction of ancient agricultural techniques—terraces, cisterns, measuring weirs, plant adaptation—the careful life with minimum water.

The native wild oats (*Avena sterilis*), once established, was shown to have extremely high yields under water spreading in fertilized seed beds—yields equaling those of seeded hay crops in a humid region. After satisfactory inoculation by symbiotic bacteria had been reached, several medick and vetch species developed and yielded well under conditions of runoff agriculture; their yields approached or surpassed that of the control oats and thus were as high as or higher than those of commonly used unirrigated forage crops in more humid areas.

It often happens that not the whole plant but only some of its branches die. Other branches retain just as much green photosynthesizing matter as can be supplied with the available water and this suffices to keep a few branches alive. Sometimes in extremely dry localities in years of great drought only a single branch out of many survives in this way. During the following years the plants may slowly regenerate themselves from dormant renewal buds. This is a fascinating phenomenon which shows that, paradoxically, when death is partial it becomes a means of survival.

A New Technology for Dry Land Farming

India's efforts against recurrent famine have led them into sophisticated new farming techniques for marginal land. They're the only farmers I've ever heard talk about synergy.

Ak Sharma
Indian Agricultural Research Institute
New Delhi 12
India

To cite two examples, deep ploughing has been recommended for dry areas. This practice, however, is important only in areas where the subsoil has a highly compacted zone, thereby preventing the infiltration and movement of water and penetration of roots. Hence, before a particular tillage practice is advocated, a detailed study of soil structure would be essential. Also, it is obvious that if deep ploughing using suitable iron ploughs is to be adopted, the bullocks in that area must be better-fed and made to gain the needed strength. Thus, if in 1971 it is proposed to introduce the practice of deep ploughing in a village, high-protein *bajra* fodder and other high-quality fodder crops should be introduced in 1970. Ignoring such interactions has often been in the past the cause of condemning some of the implements designed by our agricultural engineers.

Retention of rainfall as soil moisture mainly depends on the infiltration characteristics of the soil, time available to the surface water to infiltrate, and the moisture storage capacity of the soil. Studies at the I.A.R.I. have shown that infiltration rates could be significantly increased by improving the structure of the surface soil and by adopting suitable cultural practices. Cultural practices such as wheat-maize or wheat-*Sorghum* rotations, deep ploughing and incorporation of naoh, stubbles and green stalks of cereal crops into the soil were found to be most beneficial in improving the structure of the top soil. Inclusion of a legume crop in the rotation would also considerably improve the structure of the surface layers.

Pruning Handbook

This booklet starts with a basic description of the way plants grow, lists pruning tools and their uses, and describes pruning systems for ornamental and fruit trees, berries and grapes, roses and vines.

One way to learn the fundamentals of pruning is to study the mistakes that other gardeners make.

General objectives of pruning have to do with modifying the growth of the plants to adjust it to the conditions of the garden.

Pruning Handbook

or WHOLE EARTH CATALOG

Heavy pruning of the apricot is essential to insure regular fruit production. One-year old shoots produce a portion of the crop, but short-lived spurs carry the major portion. As these spurs are usually good for only three years, they must constantly be renewed. The tree, in suitable areas, is a very lush grower and a heavy bearer. Unless kept in severe check, it will rapidly become too large and will bear its fruit high in the tree where it cannot be thinned or picked easily. The lower spurs will be shaded out by the lush foliage and new ones will not form. In short, you would have a fine shade tree but a very unsatisfactory fruit tree. The necessary pruning for good fruit production does not always develop a graceful garden tree.

[Suggested by Fred Richardson]

PART TWO

THE FISHER OF MEN

About two o'clock in the morning Divine Right and Estelle passed through a little town that was absolutely unlit except for a light shining on the front of a funeral home, and a neon sign in front of a church across the street that said, "Dope is the Only Answer. Surrender Now." Actually the sign said that Christ was the only answer, but somebody had crossed out "Christ" and with a crayon written the word "Dope" just above. It was crude lettering but the message was clear enough for D.R. to dig it, and he took three hundred micrograms of acid on the spot.

Half an hour later, the first messages from God began to float up through his soul. Feel good, God said. Feel what your eyes can see as smooth and soft and rounded. Let all the world around you sigh, let go and start to breathe. Let the steering wheel melt to bread dough and bake a donut in your hands. Guide Urge around the curves by leaning with your body, go with Urge as a sighing sleigh, riding high and far away, beyond the desert, behind the moon, you won't be coming back anytime soon.

An image of his grandfather chopping kindling flashed on the movie screen of his mind as Urge's headlights caught the gleam of animal eyes on the road ahead. D.R. blew the horn so hard and long it turned into a roar, then whooshed on out of hearing like a jet plane passing by. The plane became a bug that flew into his ear, but when he probed his finger punched on through and scratched his brain instead, causing sparks to fly out of his eyes and turn to dragonflies. The flies swarmed, flew apart all over the inside of the bus, then came together in a cloud of smoke above a burning world in front of D.R.'s eyes. Fire was everywhere. Urge's headlights were darts of flame, the center-strip down the highway was a stream of molten red. In every grate in every room of some old house he'd lived in fires hissed and licked and brooded like inflamed sick eyes of some old ancient man. Water, D.R. yelled, someone bring some water! He leaned and guided Urge from room to crowded room, swaying with his body steering Urge past people singing hymns on Sunday mornings as they warmed before the fire in grates in all the separate rooms. He rode into a kitchen where someone was making donuts in a coal stove. He wanted one, and took it, but his mother jerked it from him saying, "Honey, no, come on now, you'll have to let me drive."

D.R. tried to say no, but his tongue ignored his mind and babbled stupidly on its own like a baby's. He was crying like a baby now. Crying was the only words he had and D.R. had oh so much to say. He wanted to say the kitchen, and his grandfather's building fires. He wanted to say the river he had been baptized in, and swimming in that river with other people who had not lived. He was on a riverbank now, casting far out in the stream. The sun was shining on him, he was naked in it, but a shadow lay upon the water from a bank of tall sycamores on the other side. D.R. reeled in and stuck another dragonfly on his hook, and cast again, upstream this time near an old snag of a tree where the water seemed to spin a little as it flowed. The hook sailed through the sunlight and plopped into the water a few feet from the snag. Instantly a giant catfish took hold and pulled so hard D.R. fell on the muddy riverbank and slid into the water, where an unseen current sucked him far into the river and dragged him down below. Air! he tried to call, Breath, give me breath! But his lungs were full of water now and he could make no sound. Deeper and deeper he sank in the dark and murky river. Nothing he could do would help him rise again. Nothing he could think would give him air. The chill of death entered at his fingertips and toes and slowly flowed up through his body to his throat to gather in a pool. D.R. was drowning in the pool that filled his throat and choked him. He felt his life go out, and turn into a fish with gills and scales and fins and tail, tempted by a powerful light that dangled from his brain. The light scared him but he nosed around it, lured and terrified. Against his will he nibbled at its edges. As soon as his lips touched the light a three-pronged hook snagged his throat and yanked him up. Blood filled his throat and ran out of his gills and eyes and asshole and spilled upon the sand. He struggled to ease the pressure of the hook against his flesh, but the fisherman only laughed and dangled him up and down. At last when he could stand no more the fisherman gave the line a jerk and ripped D.R.'s tongue out by the roots and dropped him bleeding to the sand. Words rose up inside him to protest but they could get no farther than his throat. Words that started deep inside him lifted through his system to collide and fall apart in heaps of jumbled a b c's. Words he'd said in childhood came charging into words he'd heard old preachers say in sermons long ago, words of preachers, words of teachers, words mysterious kin folks uttered over Sunday chicken dinners into words he'd muttered to himself in saying who he was and might become all crashed against the roadblock and piled up in a grave of words as dry and hard as bones. D.R. picked up a bone shaped like the letter W. He smelled it, licked his tongue across it, and held it to his ear. He tried an O, and R, and a broken D, but they were all the same. Dead. Dead. All the words were dead, not one had lived to tell what happened, none survived that knew the tale. Tell it! said the fisherman, but all he could do was cry. Tell it! said the fisherman, but all he could do was cry. The fisherman cursed and roughly kicked D.R. back into the river. The water scalded his wound as it mixed with blood and made a soup for bones of broken letters D.R. clutched at for support to keep from drowning.

Many writers have picked up on a piece of misinformation which holds male plants to be useless for drug purposes. It is substantially true that males have a much lower potency than females, but that is not the reason that they are pulled up and destroyed by professional growers. They are pulled primarily because if the male is allowed to go to maturity and pollenate the female, she will lose considerable potency because much of her energy will then be turned to nourishing the fertilized seed. What might be gained, then, in terms of overall bulk at harvest time by keeping the male plants will be lost in per-unit potency of female plants. So it becomes a trade-off situation where you have the option of lots of leaves (both male and female plants harvested) with lowered potency per unit of yield, or less yield (destroy the males and keep only females) with a higher per-unit potency. It is up to the individual cultivator to make the decision.

Another common source of death and destruction among indoor Cannabis plants is tobacco smoke. It is with a heavy heart, my fellow Americans, that I announce tonight that the smoking lamp is not lighted during grass cultivation. If smokers are using the same air supply which the plants must breathe, you must try to filter the air somehow or take great risks with the plants' survival up until the third week, and with their health beyond that.

General Viticulture

This book includes everything needed to know by anyone really interested in grapes. It is mainly concerned with vineyard production but it contains valuable information for small arbors and home gardening as well. Winkler deals with soils, propagation, pruning, irrigation, diseases, pests, raisins, wine grapes, table grapes and even includes a detailed appendix of costs involved. This book is the only complete work on grape production, it is a U.C. text, make your own raisins.

For best development the *vinifera* grape requires long, warm-to-hot, dry summers and cool winters. It is not suited to humid summers, owing to its susceptibility to certain fungus diseases and insect pests that flourish under humid conditions. Neither will it withstand intense winter cold. A long growing season is required to mature the fruit, and, since the green parts of growing vines are likely to be frozen at temperatures below 30°F., areas subject to late spring and early fall frosts must be avoided. Rain is desirable during the winter, but deficiencies in rainfall can be made up by irrigation. Rains early in the growing season make disease and pest control difficult, but are otherwise not detrimental to the growth of the vine. Rains or cloudy weather during the blooming period may result in a poor set of the berries, especially in some varieties, and rains during ripening and harvest permit much damage through fruit rot. Where raisins are to be produced by sun-drying between the vine-rows, as in California, a month of clear, warm, rainless weather is essential after the grapes are mature. Higher humidity can be tolerated in cool regions than in warm regions.

If the seedlings are to be transplanted at any point, it will be helpful to germinate them in containers making transfer to the planting soil easy and non-traumatic. Germinating the seeds in ice-cube trays or similar devices allows easy transfer of the seedlings in their original soil. The ball of soil can either be popped out at transplant time; or each depression in the tray can be lined with foil or plastic before the germinating soil is added, making transplantation a matter of lifting out the ball of soil intact and placing it in the receiving soil equally undisturbed. The foil or plastic film can be removed easily prior to placing the seedling in its new home.

Wild Rice

Lord god, imagine having enough wild rice.

I always thought that Indians had some kind of legal monopoly on this expensive staple-delicacy. Maybe not. Maybe you can grow the expensive staple-delicacy in your own fresh-water shallows.

or WHOLE EARTH CATALOG

All the wild-rice sold today comes from untended stands that grow in streams and other waterways. There have been attempts to control the supply and level of the water, or to create new impoundments in localities where this is possible, but cultivation in a paddy has been done only on an experimental scale. Most of the grain is still harvested by hand from canoes. The operation of harvesting, however, is conducted in a much larger scale than formerly, and, in some regions, it follows a well-organized plan.

Wild-rice forms thick productive beds in some small rivers in southern Ontario in the spring. In midsummer, stands occupy all the shallow water, leaving only a narrow mid-river channel. A patch of perennial plants, including cattails and pickerelweeds, is at the right of this picture, taken near Dalrymple, Victoria County, Ont. (Photo by W. J. Cody)

Softwood in the sugar brush cuts off sunlight. Sunlight is vitally essential to sap flow, especially in the early days of a sap season. First-class sap runs, early in the season, often occur entirely on the south side of the trees.

If syrup is of proper consistency it will keep from one season to another without deterioration, except that fresh-made syrup possesses a delicate tang and bouquet that old syrup invariably lacks.

Here is a typical case in our neighborhood. The household is made up of a man, his wife, and five children, the oldest a boy of fifteen. Sugartime comes in late February or early March. The snow is so deep in the woods that logging and wood cutting (the usual winter occupations) are difficult or impossible. In the homestead there is little to do beside the regular chores. The family has a sugar bush, a sugarhouse, 1,500 buckets, covers, and spouts, an evaporator, a gathering tank, a team of horses standing idle in the barn, a supply of sugar wood. Not a single cash outlay is involved in the entire sugar operation. School allows the children a three-week "sugaring vacation." The man and his family tap out. All gather. He boils and she puts up the syrup. In the course of five or six weeks, if weather is favorable, the household can produce 350 to 400 gallons of maple syrup. If the syrup is put into steel drums, provided by one of the companies that buy syrup, there is not a nickel of necessary cash outlay, unless there are replacement parts for worn-out equipment.

ABC and XYZ of Bee Culture

The first edition of this authoritative book was written in 1877 by Mr. A. I. Root. The current edition, the 33rd, is edited by Mr. E. R. Root, with the help of H. H. Root and J. A. Root. You get the picture.

We've been told by several people that bee-keeping is one of the easiest ways to make extra money with little effort and a certain amount of down-home adventure. If you are waiht you eat, food from flowers is hard to beat.

From whatever standpoint—commercial, nostalgic, or amateur scientific—this is a fascinating and useful book. The Roots also have a catalog of bee supplies, a beginner's book (Starting Right With Bees), and a magazine (Gleanings in Bee Culture)—monthly, \$3.00 per year.

FIG. 1 ROUND BEE

MARKETING HONEY.—The bee-keeper with four or five colonies of bees will have no difficulty in selling honey to his neighbors. It soon becomes known that he has a few hives of bees and the people in the vicinity, feeling that they can buy "real honey," will go to the neighbor and pay good prices furnishing their own utensils. If the honey is of first quality there is no trouble about selling the entire crop from the doorway.

How to Adopt a Colony of Bees

This magical method may be used for removing bees and their honey from an attic without the use of pesticides or other violence, or for adopting a colony from a bee-tree. All the entrances, into the colony must first be carefully stopped up with plaster, calking compound or other goop. A single 3/4" diameter hole is left, over which a bee escape (one-way exit) is placed. Following this, a bee hive is strategically located with its entrance as close as possible, preferably within a few inches, of the bee escape. The hive may then be enticingly smeared with honey or sugar syrup on its landing strip and entrance. The bees will come out of their old home and will form a large swarm within a few days. At this point, a queen bee, in her cage, with courtiers, is suspended within the new hive. When the other bees learn of her presence, they will all go into the new hive, eat out the plug of sugar which seals the entrance to her royal residence, and liberate her. One then has a going colony of bees in the new hive. After a few weeks, the original colony will be quite depleted or almost entirely absent. At this point, the entrances to the attic or tree may be completely opened and the bees from the new hive will then go back, take all the honey out, and bring it into the new hive, which may then be moved to any convenient location.

I tried this method on a colony of bees in my attic with partial success. Unfortunately the bees found a new way to get back into the attic under the shingles which I had not adequately blocked, and I was left with two competing colonies. However, I think the colony in my hive is now getting stronger, and I will eventually have all the bees in it. It would seem desirable to do this in the spring when flowers are blooming, since in the autumn I have found the bees are less energetic and have to be fed with sugar syrup. A reliable source of bee supplies is the Sears Roebuck Suburban and Farm Catalog. In order to get a catalog, one must first place an order at a Sears Catalog Order Desk, and if they think you look like a good potential customer, they will give you a free catalog to take home. Supplies arrive by mail or parcel post in less than a week, but queen bees are sent only from April 15 to Oct. 1, and take about a week and one-half to two weeks to arrive.

P.S. If it is necessary to move the beehive less than two miles, it must be done in two steps: first the hive is moved more than two miles away and the bees are allowed to get settled in that location, and then it is moved back to where you really wanted it in the first place, which can be closer than two miles to their original location as long as it is more than two miles from the intermediate place.

Giant Wild Rice is easy to grow when fully-ripe, sure-growing seed is used. Many areas throughout the U.S. and Canada where Wild Rice does not grow, provide conditions suitable for it, and such places could and should be planted with Giant Wild Rice. Briefly stated the conditions required for its successful growth are fresh water streams, lakes, ponds or sloughs having a change of water (such as an inlet or outlet), soft mud bottom being best, but will thrive on sand, and in water from 6 inches to 3 feet deep. Sunny sheltered bays or covers where planting will not get the full current or direct wash of waves are ideal for it.

Near the seacoast it will grow along the streams 25 to 50 miles above where they enter the sea, where the water is not salty to taste and the tide not over four feet. Spots where fresh water brooks or springs enter the stream are more fresh and better suited for it. Wild Rice thrives best north of San Francisco, Memphis and Savannah; however under ideal conditions we have grown seed in the "Deep South."

Because goats are dairy animals, they must have dairy characteristics. Check to see that the doe has a feminine head, thin neck, sharp withers, well-defined spine or backbone and hips, thin thighs, and rather fine bones. The skin should be thin and fine over the ribs. Look for a wide spring of rib and roomy barrel. This will help you to know how much feed she can eat. The constitution, or physical nature, is an important item shown by the depth and width of the chest. It's important to look at the udder, too. It should be large when full of milk and very much smaller when empty. A large udder does not always mean a high milk yield.

The goatherd who knows his flock and range can lead on the first stage or two of their wanderings and as soon as they are all busy at a popular stop he can quietly slip away. The flock queen will call him when she is ready to move on, but if he has disappeared she will take the lead herself. This tactic works well in broken wooded country; but in open country the delinquent leader is caught in the act of escape and the whole flock comes scampering after him.

Under such conditions the goatherd must use plain language to tell his flock when he has ceased to be their king billy. Mere

rudeness won't suffice; king billy's manners are not of the best; a push and a grunt and a show of displeasure convey his warning to the flock to obey and follow him more closely. But king billy doesn't throw sticks or stones; the performance of such an act is a special characteristic of man and monkey which is peculiarly repulsive to all other species. So long as it is carried out calmly and ceremonially, so as not to be mistaken for mere rudeness, the flock will turn their backs on the goatherd, will go their way and leave him to go to his. The popular use of effeminate males has produced flocks of half-witted goats which may be incapable of finding amongst themselves a flock queen of sufficient independence of character to accept even so broad a hint as the thrown stick. If such a flock refuses to be content without a king billy to lead them, the only cure is to give them a real one.

Dairy Goats

This book bridges the gap between the 4-H pamphlet and the \$15 goat book. It covers everything you should know before and when you get into goats. You can skip the analysis/amplification (if you want) of how a goat's stomach works, the manufacture of proteins, etc. and just discover that one half pound of good dairy mix grain for each pound of milk produced is what you want.

Perhaps the person who already knows a bit about goats will find that the most interesting and valuable part of the book is the last two pages which lists breed clubs, goat journals, books, and other literature.

Addendum: My friend and fellow goat husbandman, Don Symanski tells me that the one he went to the book for wasn't there—a goat's normal temp. I'll tell you, it's 101 to 102 degrees F.

Feeding the Kids

Giving kids a proper nutritional start without expensive goat milk is a good practice; particularly if you can sell the goat milk for a higher price than necessary to buy cow's milk for the kid. Goat's milk is ideal for growing out a kid, but you lose your income during this time. If you intend to rear the kid without mother's milk, never let him nurse. Milk the colostrum or first milk from the mother and feed it at body temperature to the kid from a nipple bottle. Continue this for three to four days. The colostrum is laxative, high in carotene, protein, and other nutrients, as well as antibodies which are so necessary to the newborn kid's digestive system and developing tissues. The nipple bottle is usually preferred over pan feeding of milk as it is more natural for the kid and less air is gulped which can cause digestive upsets.

The small fat globules and the soft curd of goat's milk contribute to its ease of digestibility. Some persons who are allergic to cow's milk can consume goat's milk readily, due largely perhaps to its easier digestibility. In a great many cases goat's milk has proved especially valuable for infants and invalids.

P. O. BOX 62-G WARWICK, NEW YORK 10990

Lesson one about dairy goats—don't expect them to "mow" your grass for you.

Goats don't care much for grass.

But they are crazy about trees and bushes—especially fruit trees, shade trees, rosebushes, raspberry bushes, any other large woody plants you or your neighbors treasure.

A goat will strip a young fruit tree to a bare stub faster than you can run from house to orchard to stop her.

Several goats will chew enough bark off a good-sized shade tree to kill it in a single season.

If trees hang over their pens, the goats will dance about on their hind legs and trim the leaves evenly 4 to 6 feet above the ground. Makes the place look like a park.

Even innocent-looking baby kids will strip the bottom branches of an ornamental evergreen—before they have really learned to eat hay!

Moral of this is—before you get goats, get some good goat fencing. Four foot high seems necessary. They will climb on the fence to reach trees on the other side, so make it sturdy. Take care with gate latches. Bored goats scratch their heads on things which stick out—like gate latches. They have a habit of opening gates. Then they head for the fruit trees.

A length of chain and a snap hook makes a nice auxiliary latch on your gates.

About that Grass—

Most goat raisers find it necessary to mow pastures and barn lots from time to time—to keep the grass short and neat-looking.

Goats can make good use of pastures—especially if you have planted legumes such as alfalfa and clover. Good farmers mow pastures just to keep the plants young and growing for more protein.

But goats are not by nature good grass eaters. If your interest in goats is a well-mowed lawn, we suggest sheep instead.

Goat Buying

Goat owners are a lot like horse traders. Be careful. Seek out experienced advice. If possible, have someone whose opinion you trust along with you when buying a goat. If you are paying fifty dollars or more, as is sometimes necessary, for your goat, invest in a vet's inspection and opinion if at all possible.

My preference is unquestionably Toggenburg. A three year old doe whose milking and kidding record is available is most desirable. Toggenburg crosses cut the price in half and by selecting bucks you can breed back to almost pure strain in a few years. (Toggenburg on the doe's side as that's who determines milk production.) A last word: if you are in the market for goats you probably already like them. They are almost all beautiful animals. When I first got into goats I bought a nice three year old Alpine doe just drying up. She looked like an antelope. Beautiful. She did dry up shortly. I bred her, fed her for five months. She had trouble kidding and her milk production was poor. Nothing I could do in the way of feeding and milk schedules helped. I still had a beautiful pet goat but awfully expensive. Somehow I like the good milkers more.

or **WHOLE EARTH CATALOG**

A ton of raw garbage formerly produced 50 to 80 pounds of pork. With the changes that have come about in kitchen and restaurant management, a ton of garbage today may produce only from 20 to 30 pounds of pork. Unless considerable grains are fed with the garbage, a poor carcass will be produced.

Garbage-fed hogs were responsible for the rapid spread of vesicular exanthema during the past few years, and cases of trichinosis have been prevalent in some communities where raw garbage was fed to hogs. In feeding garbage, extreme care should be taken to maintain sanitary quarters. Concrete feeding floors are recommended, and the yards should be thoroughly cleaned and disinfected regularly. Thorough cooking of pork products is necessary to kill any disease organisms which may be prevalent in the meat.

POLLED HEREFORDS. In 1900, Warren Gammon of Iowa wrote to nearly every breeder of Herefords in the United States asking if they had any cattle which did not develop horns. He succeeded in securing 13 head of purebred Herefords that were polled. From this small beginning the polled Hereford breed was established.

The breed has become very popular among breeders who desire the Hereford form but dislike the horns. Polled Herefords originating from registered Hereford stock may be registered in both breed associations.

In form and characteristics, the polled Herefords closely resemble their ancestors, the Herefords. The distinguishing difference is the absence of horns.

PASTURES. The natural feed for dairy cattle is pasture. The pasture season should be made as long as possible. Fall-seeded rye provides early spring pasture, in areas where it is adapted, and may be followed by native grasses, or a legume and grass mixture. Sudan grass, or a sudan grass and soybean combination, makes an excellent summer and early fall pasture. In general, a legume and grass combination provides more grazing per acre of highly nutritious forage than any other common pasture crop. Pastures recommended for beef cattle are suitable for dairy cattle.

HERE'S THE WAY MANY SURGEONS TIE A KNOT

Right: This is a good way to tie a knot, especially when suture material is short or slippery. Instead of using forceps, as shown, the operator can use a pair of long-nose pliers.

Left: The suture is wound around the forceps, taking care not to disturb the stitch.

Right: The end of the suture is pulled through the loop.

Left: After tightening the first part of the knot, make the second loop by winding the suture around the forceps in the opposite direction. Then complete the knot by winding the third loop like the first, as shown on page 249.

FEVER AS A SYMPTOM

The temperature of an animal's body, rises above normal when more heat is produced than is given off. This happens naturally under a number of conditions, such as during exercise, after eating, in very hot weather and among cows in the later stages of pregnancy.

When the temperature of an animal rises without apparent reason, it is generally caused by illness or injury. That is why the presence of fever is of great importance in the diagnosis of disease, especially those that affect the internal organs.

An increase in temperature is not the only symptom of fever. Sometimes when the temperature goes up rapidly, chills may occur, and these in turn are accompanied by trembling muscles, cold skin, erect hair coat and arched back.

A strange thing about fever is that the legs, ears, nose and base of the horns in cattle and sheep become alternately hot and cold even though the internal temperature of the animals remains uniform.

One ear may be hot while the other is cold. Later these conditions may be reversed, or both ears may be hot or both cold. The same thing holds true of legs and other extremities.

Other signs of fever are dry muzzles and snouts, loss of appetite, indigestion, constipation, increased thirst, decreased urination and mental depression.

Chills do not occur with all fevers but with disease where microbes or toxins are in the blood stream. Among them are anthrax, shipping fever and maladies accompanied by pus formation. Once the body becomes used to a higher temperature, chills cease. But they will come back if the animal is taken to a colder place.

Rabbits

Here are some good books on rabbit raising. If you raise rabbits you can eat them and tan the hides for clothes to keep you warm.

[Suggested and Reviewed by Martin K. Rorapaugh]

The Purina Rabbit Book, available from your feed store or probably from Ralston Purina Company, Checkerboard Square, St. Louis Mo. 63199. This one is free (they might appreciate postage if you send for it I don't know) and gives all the information you need if you just want to eat the rabbits. It gives cage dimensions, good breeding practices (for the rabbits), and feeding suggestions. The best part of this little book is that it gives a calendar system so that you can keep track of when to do what. It's a good easy thing to follow. The same people also offer pamphlets on rabbit diseases, and cage plans.

Raising Rabbits Farmers Bulletin No. 2131, U.S. Dept of Agriculture. Available from Superintendent of Documents, U.S. Govt. Printing Office, Washington, D.C. 20402 cost 15 cents. Covers basics but doesn't cover diseases or tanning hides. Its cheap but not much better than the free one above.

Commercial Rabbit Raising Agricultural Handbook No. 309, U.S. Dept. of Agriculture. Available from Superintendent of Documents for 30 cents. This is a good cheap book. It covers all the basics like how to select a breed, feed and manage the herd etc. It also tells how to use the manure (as if you didn't know) and cure rabbit skins. This is a goodie for the price.

Domestic Rabbit Production by George S. Templeton (He's a real genuine expert). If you want the best and don't mind paying money this is it. It is complete. Covers everything the others cover plus rabbit diseases (thorough and easy to follow), tanning the hides, rabbit recipes, and get this, quantity recipes adjusted for 25, 50 or 100 souls. Its published by the Interstate Printers & Publishers, Inc, Danville, Illinois.

Common Diseases of Domestic Rabbits, USDA Bulletin No. 45-3

Litters range from 6 to 18 young, depending upon the breed, age of the doe, and the season. The ideal number to leave for the mother to wean is seven. If you have two or more does kindling at the same time, litters can be balanced by taking youngsters from one mother and giving them to another on the first or second day after they are born. When the young are no more than 2 days old, neither doe will mind the transfer.

Sheep

I would like to spread the word about the joys of raising sheep. They require almost no work and very little money to care for. In return you get enough wool for yourself, your friends, as well as some extra to sell; excellent manure for your garden (second only to chicken manure in nitrogen content), and, if you're into it, a cheap source of mutton or lamb which, like all home grown foods, is far superior to anything in the store.

In the winter, you'll need some hay, corn, and a shelter for them to sleep in. In the summer, you'll need nothing but a grassy field (they're great to trim the grass around your house). Also, since they can't reach very high and are unable to climb at all, they don't wreak destruction to all your small bushes and trees as goats do.

If you're interested in raising a small flock, may I recommend the Horned Dorset. They are a good breed for producing wool or meat and are by far the most beautiful of domestic breeds. The main practical advantage of the Horned Dorset is the high frequency of twins produced during lambing. They are able to lamb twice a year, so you can usually count on three or four lambs a year from each ewe.

Rambling Rabbit Rap

I spent most of this past summer with a farmer friend of mine who raises rabbits as a main source of table meat for his family. Six does and a buck kept in hutches at the edge of the garden provide regular meat for his family of four. Other than the heavy work of removing the manure as it accumulates, the rabbits are in the care of my friend's twelve-year old daughter, who feeds and waters them as part of her daily chores. Her father does the slaughtering as the young rabbits mature. The meat is kept in the freezer, and eaten at the rate of about one, sometimes two, a week.

I'd tasted wild rabbit before, but I didn't remember much about it, except that the occasion was loaded with an atmosphere of muted guilt, or at least an uncomfortable degree of self-consciousness. I was a kid at the time and I don't remember who the adults were, cooking and serving the meat. But I do remember the almost compulsive talk that went on among them about how wild rabbits were sometimes dangerous to eat, about how we probably ought not to be eating this one, but let's just take a bit of him anyway, and see. I took my bite, but what I tasted was the general misgivings about the whole thing. And those misgivings stayed in my head for 25 years, until this very summer when we were eating rabbit as a regular staple.

And it was great! It was at least as good as fried chicken, and maybe even a little better, depending on whose chicken you've been eating. My friend said that as far as the work of meat-production is concerned, rabbits are far less trouble to keep than chickens. He keeps chickens, but mainly for the eggs. (He raises beef and pork too, as well as a fantastic organic garden, all on twelve rather hilly acres. Working together, he and his wife and their two children come as close as anyone I know to total organic self-sufficiency).

We talked some about the question of animal slaughter, of killing other creatures to feed on them. He said that in the beginning he had some trouble killing his rabbits, but that he finally overcame it when he quit thinking of them as "bunnies" and looked upon them as simply a source of protein. That attitude will no doubt trouble the more committed vegetarians; but not many farmers putting in 10 and 12 hours work a day are vegetarians. If a rabbit is a fellow being, so is a corn stalk. Creatures eat creatures. Some day worms will eat us all, and whatever debt we may owe the carbon-nitrogen cycle will no doubt then be paid in full.

So went our dialogue. Or one chapter of it, anyway. One of the great things about the summer on the farm was the kind of running conversation we had, picking up, hours and even days later where the talk left off before. Farmers certainly work a good deal more than they talk, but when they do talk, it's grand to listen in. The language of men working together in a field is a rare and special thing. Men who work together, summer after summer, for years, have a common body of lore, a mutual frame of reference that underlies everything they say. When its best is when the words begin from a concrete subject, rise into a grand abstraction, convolute a time or two then return to earth again. Our talk about rabbits was like that. We talked about them as "bunnies," against rabbits as food to eat. That got us into talk about the esoteric loveliness of a wagon wheel as a thing you paint and display in your front yard, against the loveliness of a wheel on an actual wagon that's helping you do the work necessary to your livelihood. Then we got into the difference between vocation and avocation, of the unhappiness that comes when a person's play is too far removed from his work. Raising rabbits is play, it's fun, a hobby. But it can also be work, good, productive work of the kind that contributes to health and vigor by getting good home-grown food on the table.

And so we got into the organic life as an ideal, a life in which opposites like "work" and "play" are reconciled. When your life is one of daily, personal "creation," of work that satisfies like play does, you're less in need of purchased, artificial re-creation. The average industrial worker does a job he hates in order to buy the things he loves, like food, and entertainment. His vocation is one thing, his avocation another, and never the twain shall meet. This split ultimately leads to the deadly division between city and country. And in the same way the modern vocation, or industrial job, is deadly to the individual worker's creative spirit, the city has become the deadly enemy of the countryside. To satisfy the appetites of the city, the countryside is pillaged by industrial, mechanized farms for food and strip mines for fuel for electric power. How neurotic, how divided our culture against itself!

And thus we came to the question, can the lowly rabbit possibly come to the rescue? We decided it could. Rabbits can be raised in any back yard, as food, primarily; but they can also be raised as a metaphor of a new and simultaneously old possibility, the possibility of cottage economy. They can be raised as a metaphor of opposites reconciled, of cultural schizophrenia overcome. They can stand as an image of country stuff happening in town, of town style stretched to embrace country substance, of work become play and play become work, which, after all, is not far from Adam and Eve's set-up in the Original Garden. I don't plan to hold my breath till the Golden Age arrives. But I do plan to raise some rabbits in my suburban backyard this year, and to eat the little morsels one by one when they are grown.

—Gurney Norman

I think a small flock of horned Dorsets would be an invaluable addition to any agricultural community. For free information on raising sheep and brochure for Horned Dorsets write: William Gratwick, Pavilion, N.Y. 14525.

Yours truly,
Ned Nisson

Genuine CANADIAN HONKERS

THE PRIDE AND JOY OF SPORTSMEN

You and your friends will be thrilled to see a pair or more of these dignified Canadian honkers about your country place. They are also a challenge to the devoted and dedicated waterfowl raiser. Mating is by pairs only—their choice of mates is a very serious matter with them. While they mate for life, should one die there is a chance they will take another mate. Still, on the other hand, they may never take another mate—especially older stock. This stock has exceptional long life, and have been known to reproduce up to 65 years of age, with some attaining an age of 85 years. Though listed in the American Standard of Perfection to encourage exhibiting, they are not a domestic but a truly wild fowl. A Federal Permit is required to ship.

STANDARD WEIGHTS

Adult Gander 12 lbs.	Young Goose 8 lbs.
Young Gander 10 lbs.	Adult Goose 10 lbs.

HOW TO OBTAIN A FEDERAL PERMIT

There is no charge for the Federal Permit to raise Migratory Fowl such as the Canadian Honkers, Blue and Snow Geese. In the event you do not have this permit, write for your application to: U. S. Department of Interior, Fish and Wild Life Service, Bureau of Fisheries and Wildlife, 1006 West Lake Street, Minneapolis 8, Minnesota, or the same Department in Washington, D.C.

Royal Palm Tom

OASIS

Estelle had been driving since about two in the morning and by ten she was exhausted. She might have been able to go another hour or two if she hadn't drunk the beer she'd swiped from the Lone Outdoorsman the night before. But she did, and it wiped her out completely. Divine Right had been in a trance for over an hour now, but she couldn't spare the energy to worry about him yet. She felt it was a major achievement just to get Urge off the freeway into the little town of Lone Oak before she passed out at the wheel. Her neck and back were killing her, and she could barely keep her eyes open to look for a Chevron station. She had to find a Chevron station because they were traveling on the Anaheim Flash's credit card, and they only had three dollars and a quarter left out of the twenty dollars they'd set out with. Lone Oak was just a one-street spot on a two-lane road, but if it had a Chevron station it would be an oasis indeed. Estelle held her breath as she slowly cruised the street. At last she saw the blessed red white and blue sign, and gratefully pulled up under the canopy.

"Good morning miss, how are you today?"
The service station man was an older fellow who walked with a limp, but he gave off the nicest vibe Estelle had found at a station in more stops than she could remember. As soon as he got the gas pump going he went right to work scraping bugs off the windshield and checking Urge's tires. Estelle was so used to taking crap from service station people the old fellow's manner made her want to just stop the trip and hang around the station all day. Or even just live here, she thought. God, would I ever like to have a nice, clean service station to call my home for ever, ever more. Her sense of welcome, and relief, was so complete she decided to celebrate and blow fifteen cents on a Coke.

"Don't drink that stuff," a man's voice behind her said.
"Try some of this."
Estelle turned around to face two freaks, a man in a Greek athlete costume and a girl in a drab outfit of dirty jeans and work shirt with the tail hanging out. Her expression was very spacy. She looked a little older than Estelle, but her eyes were so weird it was hard to read anything very definite in her face. After she'd looked Estelle up and down, she turned and sat on the curb in the lotus posture and stared off into the east. The Greek, however, stayed right there with Estelle, looking into her eyes very intensely, smiling broadly as he held out a small brown bottle of stuff for her to drink. Estelle glanced at the bottle, then up and down at the guy's costume. He had on a white toga, a leather thong for a belt, leather sandals that laced up to his knees, and a leather band around his upper arm. Estelle disliked him immediately, although she wasn't exactly sure why.

"What is it?" she asked.
"This, my dear, is acidophilus," said the Greek taking the lid off his bottle.
Estelle asked what acidophilus was.
"It's the source of everything good for your tummy. People have been drinking it since before recorded history. You really ought to try some."
Estelle asked if it got you stoned.
"Absolutely," said the Greek. "It stones you on health, vigor and enthusiasm for the pure-food way of life."
Estelle nodded and said no thanks and turned around to buy her Coke. The Greek pleaded with her not to buy the Coke, and when she went ahead and bought it anyway he lectured her on its evil properties as she drank it. To hush him, Estelle asked if they were traveling.

"Oh yes," said the Greek. "By all means, we are traveling. We are traveling along the Middle Way enroute to a land where nothing has a name. And we'd also like to get to Oklahoma City, if you happen to be going that way."
"Can you drive?"
"Drive like a champion," said the Greek. "I have many talents for the many circumstances, situations and occasions one encounters as he journeys along The Way. I've also got some good food in my bag here, in case you happen to be hungry."
Estelle positively disliked the Greek by now, but she knew she was going to give the people a ride and so she tried to come on to him as neutrally as she could. If he would drive and let her rest it would probably be okay. Ideally Estelle would have liked to simply pass out and wake up in St. Louis some time during the night, but she knew that was too much to hope for. An hour or two of sleep while they made a few more miles was the realistic prospect, but it was enough. She told the people to go over to the bus, that she'd be there as soon as she went to the bathroom.

"Who's that in back there?" asked the Greek when Estelle got back to the bus.
"My old man. He's a little strung out right now, but he'll be all right. You ready to drive?"
"Who painted this thing?" asked the Greek's girlfriend. Her name was Frieda. It was the first time she had spoken. There was something beligerent in her tone, and for a second it pissed Estelle off. But when she looked at Frieda again her anger went away and turned to something close to pity. Something about her eyes, what was it? She looked so lost, so far away in her mind. As gently as she could, Estelle replied, "Different people."
"Different people, huh."
"Yeah. You know. Friends."
"Friends, huh."
Estelle nodded and said yeah, and turned to pay the man for the gas and oil.

"Goodbye," Estelle said to the Chevron man. "I really enjoyed your station."
"Stop in again," said the man. "All of you, come back and see us, you hear?"
The Greek started Urge's motor. Estelle crawled in back and stretched out next to Divine Right. By the time they were on the freeway again, she was sound asleep.

Farm Horses

The best way to learn about farm horses is to work with someone who uses them. If you're still curious, try this British handbook.

In many stables it is the custom during the winter to give the horses a bran mash, in place of the usual bait, once a week. This is usually done on Saturday evening before the Sunday rest. The purpose of this is to clear the horses' bowels (for a bran mash is laxative) and to lighten the diet at the weekend when there is less work for the horses to do. For if horses are hard at work and are being highly fed on oats, maize, beans or similar concentrates, they may become very ill indeed if their work suddenly stops and their rich feeding continues. The concentrates must be reduced and gran given as a mash instead. Horses have died as a result of the waggoner neglecting to reduce their feed in this way.

Veterinary Notes for Horse Owners

an old standard, semi-technical, exhaustive, reference guide. i can't see much application for the book if you don't own a horse, but if you do, it could save you a few hundred dollars in vet bills.

Working mares are more apt to conceive than the fat and idle, while a working stallion will often succeed in impregnating mares which have proved barren to several successive sires; this is one of the reasons why farmers use an indifferent sire in their own neighbourhood, instead of a high-priced animal who leaves no foals behind him. The method of trying a mare over a gate, and the conclusions arrived at, are not always reliable, as in the case of a mare the writer had, and for whom a suitable sire could not be found, till chancing to meet a friend's cob, he took the mare out of harness and got her covered in a neighbour's barn, much against her will, with the result that she brought a splendid foal, and 7 days afterwards conceived to another horse. The 9th day after foaling is very generally agreed to be the most successful time for impregnation, and the case mentioned is to show how great this is a departure from the received traditions of breeders is yet consistent with impregnation. This little mare never at any time showed the ordinary signs of being in use, on both occasions resented the visit of the sire, was at no other time stunted, yet proved a most jealous mother and brought up both foals. The mere fact of a stallion coming through the village was the sole reason of her being served on the 7th day.

Horseshoeing

where i grew up they didn't shoe horses, ground was so sandy that they didn't need to. horseshoes were used for pitching at stakes after the picnic. this book tells how to shoe horses.

HORSESHOEING

The object of shoeing is,—

1. To protect the hoof from excessive wear, and thus render the horse continuously serviceable upon our hard roads.
2. To prevent slipping and falling during the winter season.
3. To so far remove the disadvantages of faulty positions of the limbs that horses may render good service, and, in some cases,
4. To cure or improve diseased or defective hoofs or feet.

Horseshoeing, though apparently simple, involves many difficulties, owing to the fact that the hoof is not an unchanging body, but varies much with respect to form, growth, quality, and elasticity. Furthermore, there are such great differences in the character of ground-surfaces and in the nature of horses' work that shoeing which is not performed with great ability and care induces disease and makes horses lame.

FIG. 69. Examination of the hocks from each shoulder. The near (left) hock is 'spavined'.

Bit for Drilling Rock

The bit described here has been used to drill through layers of sedimentary stone up to 11 meters (36') thick.

Tools and Materials

Mild steel bar: about 7 cm (2-3/4") in diameter and about 1.5 meters (5') long, weighing about 80kg (175 pounds)

Stellite (a very hard type of tool steel) insert for cutting edge

Anvil and hammers, for shaping

Steel rod: 2.5cm x 2cm x 50cm (1" x 3/4" x 19-3/4") for bail

Welding equipment. . .

Drilling Mechanically

A method for raising and dropping the bit mechanically, not used on the project but used successfully elsewhere, is:

1. Jack up the rear wheel of a car and replace the wheel with a small drum.
2. Take the rope which is attached to the bit and come from the tripod on the pulley and wrap it loosely around the drum.
3. Pull the unattached end of the rope taut and set the drum in motion. The rope will move with the drum and raise the bit.
4. Let the end of the rope go slack quickly to drop the bit.

It will probably be necessary to polish and/or grease the drum.

VITA's International Division offers technical assistance specifically to those in developing countries overseas. We solve problems by mail for foreign nationals sometimes directly with the nationals, sometimes through Peace Corps, AID, CARE, United Nations and other groups. Our services are free.

VITA's USA Division offers technical assistance to poverty programs within the United States. In addition to by-mail assistance, VITA-USA offers a great deal of on-site consultation. There is no charge to a requester for such assistance. VITA-USA determines the eligibility of a requester by considering whether or not the project is a self-help project and the inability of a requester to purchase the assistance needed.

We distribute VITA publications to people in the United States on an at-cost-plus-postage basis. We constantly receive nickels and dimes for publications that cost more than the ad states and we would appreciate those who are interested to write us for a publications list. The *Solar Cooker Construction Manual* is out of print and no longer available.

Terry Ladd
 Publications Specialist

The evaporative food cooler is cooled by the evaporation of water from its cloth cover. The cloth is moistened as capillary action moves water from the pans through it.

If the climate is dry and the cooler is kept in a breezy spot in the shade, it will cool food considerably below the prevailing temperature. To be safe, the cooler must be kept clean. The cooler's cloth cover keeps flying insects out. The water-filled lower pan discourages roaches and other crawling insects.

Solar Stills

Solar stills purify seawater, hard or brackish water using heat from the sun. Sunwater Co. has done extensive work in Baja California, in one case providing drinking water for a home 200 miles from the nearest source of fresh water.

The Solarstil is a small unit, primarily designed as a boat water purifier.

New Sources of Energy

Well, they aren't new sources; they're the oldest: sun, wind, earth heat (geothermal). But OK, to us they're new, and indeed they're exciting. The prospect of truly self-contained habitable energy systems is romantic country. There you are with your friends on your hill putting sun and wind through useful changes that are not only apparent to you but an integral part of your living.

Michael Rosenthal first hipped us to this remarkable set of U. N. documents which arose from a conference in Rome in 1961. If you're deeply into solar or wind energy there's lots of stuff here unfindable elsewhere. Japanese solar pillows - simple elegant water heaters up on the roofs, thoroughly described in volume five. Traditional Dutch drainage windmills with suggested adaptations for other early-technology applications in volume seven. And so on. A trove.

Solar Water Heaters in Japan

Solar House

Page 38 of the Fall 1970 Whole Earth Catalog shows the interesting and useful books United Nations Conference on New Sources of Energy. I felt that figure 1 on the same page labeled "a cross section of a solar heated house" was an unfortunate choice of diagrams. I saw the diagram and thought, "Wow, a solar heated house!" Went to the library, found the books and eventually found the article from which the diagram was taken. It was not a real solar heated house but was a model of one used by a group of Canadians for studying various problems involved in group heating. All this is rather petty but what I'm trying to say is that there is, from a different article, a diagram (have enclosed a copy) that would arouse more interest because it is a cross section of a real and practical solar heated house. This solar heated home in Washington, D.C., built by Harry E. Thomason in 1959, (he has since built others) required only \$11.05 worth of auxiliary fuel for the years 1959-60.

Jack McKee

The working surfaces of the stones required careful preparation, and skilled stone dressers were craftsmen in their own right. When dealing with a new stone it was necessary first of all to produce a perfectly smooth surface. A laminated wooden straight edge was used with 'raddle', a composition of red oxide, to detect the high spots, and these were rubbed down with a fragment of burr stone. An extraordinary degree of accuracy was required, and achieved, in this operation. The dresser tested the edge of his wooden staff from time to time against a proof staff of cast iron, which was kept carefully protected from damage in a wooden case. The final aim was to achieve a surface very slightly dished, or hollowed, towards the central eye, ready to receive the system of 'furrows' which performed the actual operation of grinding. These were set out in patterns established through years of trial and error to suit the particular use to which the stone was to be put. In common dressing, the surface was marked out into ten equal 'harps' or sectors, divided not by true radii, but by lines drawn at a tangent to the eye of the stone. This basic method of division, to be seen on Roman millstones, was to remain in use until the end of the traditional corn mill. Each 'harp' was subdivided into alternate 'lands' and 'furrows', the latter cut to a depth which varied between one half and three quarters of an inch, and finished with a sharp aris on one side, an even slope up to the 'land' on the other. Finally a system of fine parallel grooves, the 'stitching' or 'cracking', was added to the surface of each land, a process calling for both skill and precision, experienced men being able to cut as many as 16 'cracks' to the inch. The dressing was so arranged that when the stones were in their working position, face to face, the 'furrows' crossed at each revolution, cutting the grain with the action of scissor blades. As the stones became dulled with wear they ceased to grind efficiently, and frequent re-dressing was required. This involved the deepening of 'furrows' and the renewal of 'stitching', and with a pair of French burrs, might become necessary every two or three weeks.

Wind and Batteries

I would like to comment on a comment on p 39 January (I think) p 7 March Re: small power plants for electricity generation.

The plants (wind) I've seen in operation all used banks of storage batteries. These batteries of the common lead acid type used in cars will last several years more than usual if taken care of (feed rain water and keep charged up). Direct current is of course produced and some sort of inverter would have to be used to get AC out of the system. I recall a rancher saying the company who sold him his system guaranteed the batteries 10 years; lots of technical data is available on batteries since telephone exchanges use them for emergency power.

The use of batteries with either water wheel or wind generation systems allows large surge power output; with only a few watts charging on the average thousands of watts can be drawn intermittently.

Car alternators can be used for either water wheel or wind installations; I recall seeing that VITA was working on such. They also had a design for a wind type which had a propeller made by cutting a 55 gallon drum along its axis and then offsetting the halves so that it became a two cup anemometer like rotor (I don't know how successful this was but suspect they may have had starting up problems when the wind died down all the way). When you use a car alternator you can use the regulator to keep the battery charged correctly too. The maximum output of a car alternator is in the 300-600 watt range.

On large wind plants flywheels have been used to store energy between gusts; to make the whole thing efficient several transmissions must be used and it's pretty complicated.

I think the aesthetics and ecology make gasoline fired power plants unattractive. Rural electric lines not only cost every month but often there is a line building charge on the order of a dollar or more per foot. A single auto battery will store enough to run a 40 watt fluorescent lamp 10 hours; or a small radio transmitter etc. Don't expect wind fired plants to run the electric heaters and other garbage. Washing machines are made with gasoline engines; refrigerators are made that run on kerosene. Solar electric cells are still expensive (unless you happen to run into a heap NASA threw out!). We should all learn to live with less power use. Even if it is superficially cheap.

By the way on propane engine conversions I found a dandy technical book a few months ago; a little dated but lots of good info for the initiate:

"Butane Propane Power Manual" Principles of LP Gas Carburetion, by Carl Abell, William Clark, ed; Chilton Publishing Co., 401 Walnut St., Philadelphia, Pa. 19106 1962, \$5.00, 300 pp.

This book covers planning of engine conversions and specific available equipment in considerable detail for those who dig mechanics.

I'd be happy to try help with small generator problems but I don't know anything much about propane conversions! Less power to ya.

John K. Green
Boulder, Colorado

P.S. Windmills still used a lot for water pumping.

THE GREEK'S FIRST RAP

As soon as the bus began to roll the Greek launched into his first monologue of the day. It was actually his tenth one, but the first that Divine Right had heard, and it blew into the middle of his acid high like a rock band showing up at your house for supper. Estelle was so sleepy the words merely pricked her awareness, like flies flitting about on her skin, but the words were like sudden good music to D.R.'s mind. They energized and charged him up at the same time they smoothed out his waking, day-long dream. D.R. had never heard a voice like the Greek's before. He'd never heard anyone speak that confidently that rapidly. The rap was two or three minutes old before D.R. even realized that a strange man and woman had taken over the bus and was driving them away. If it had been a silent fellow mysteriously behind the wheel, acid-paranoia would have overwhelmed and terrified D.R. But this was a talker, a speaker, and D.R. trusted him implicitly. For a long time he lay there next to Estelle, taking in the Greek's words as he would a song. But he felt like moving about, and although he was weak and shaky he made his way to the front of the bus and situated himself on a box of stuff just behind the front seats.

"What I envision," the Greek was saying, "is a world entirely free from mucus. I'm convinced that if mucus can be overcome then everything else will fall into place. War. Poverty. Racism. All second-level stuff in the gross dimension, and absolutely avoidable if people would only give up their attachment to mucus-making foods.

"Now I know a lot of people are on a dairy-protein trip. You hear a lot about yogurt, cheese, eggs, and brown rice these days. And it's true that protein is essential. But what's got to happen is that people must quit accepting mucus as the price of protein in their bodies. As anyone who has studied the sex and dietary habits of the ancient Sumerians can tell you, there's lots of protein available in non-mucus-making foods. But the thing about people in the west is nobody's interested in what he eats, now, let alone people in ancient cultures. Since the industrial revolution, people have become mere spectators of their own lives, eating what's sold to them, thinking what's told to them, never giving a thought to life after the arbitrary cut-off point the mucus propagandists have established as natural. That's why eighty is considered extremely old in places like the United States. It's due to nothing other than the American mucus conspiracy, business men, capitalists, money-mongers of the lowest order, out to make money peddling food that causes mucus that causes people to die when they're about seventy-five or eighty.

Sanitation and Health

The World Health Organization publishes three excellent books on water supply and waste systems.

Excreta Disposal for Rural Areas and Small Communities is 189 pages of privies, latrines, and septic tanks. It's a book for health officials, and gives good information on outhouse-type waste disposal, as well as water-carried methods (5 gallons each flush).

The most complete information we've seen on building a methane generator is in the book **Composting**, which devotes a whole chapter to the subject. Manure and shit are placed in a sealed tank, and the anaerobic decomposition produces methane gas, which can be used for heating, cooking, lighting, and to power small engines.

The book deals with the reclamation and recycling of wastes, explains the decomposition of organic matter, and stresses the importance of sanitation in the process.

[Suggested by Craig Schensted]

A few years ago, I spent some time looking for a good book on water systems and couldn't find one. **Water Supply for Rural Areas and Small Communities** was just what I was looking for. Excellent information on wells, pumps, distribution systems, developed springs, and treatment.

The World Health Organization publishes this book and apparently directs it toward underdeveloped areas. Some of their reasons for not recommending certain methods and equipment for outlying areas seem to me to be applicable to developed areas. For instance, treatment is recommended only as a last resort because of the necessity for trained operators and often expensive equipment. They have found many cases of impure water in communities where treatment was supposedly taking place, but for one reason or another, wasn't happening. Often, no one worries about water pollution if the water is being treated.

Many of the methods and equipment described are not much used in the U. S. There is very good information on low cost wells. Hand dug, drive point, and jetted. Also information on hand pumps.

[Reviewed by Fred Richardson]

SKETCH OF MANURE GAS PLANT WITH LATRINES

The use of anaerobic digestion of organic waste materials, such as farm manure, litter, garbage, and night-soil, accompanied by the recovery of methane fuel, has been an important development in rural sanitation during the past 10 to 15 years. This development is basically an extension of the anaerobic process for sludge digestion used in municipal sewage treatment to small digestion-tank installations on farms. These farm plants comprise one or more small digesters and a gas-holder. Manure and other wastes are placed in a tank which is sealed from atmospheric oxygen, and are permitted to digest anaerobically. The methane gas, which is produced during the anaerobic decomposition of the carbonaceous materials, is collected in the gas-holder for use as fuel for cooking, lighting, refrigeration, and heating, and for other domestic or agricultural purposes, such as providing power for small engines.

CROSS-SECTION OF INDIVIDUAL DIGESTER UNIT

Attention: Communes, extended families, groups, tribes, families, loners

PEOPLE

Subject: Health & Sanitation or Sanitation & Health

It is rapidly becoming clear that if we do not pay attention to some basic facts about health & its relation to sanitation we are going to have some problems. These problems will not/cannot & won't go away. Neither can we. There is no where to go. People thru out time/space have all ways had to deal with these problems.

SO

People eat food which maintains body which rejects what it can't use as waste.

What to do with it OR How to get rid of it

The easiest way is to leave it where you laid it. Problem: someone else has to cope. Don't pass your load on. We are all one. What's yours is mine. An other easy is to put it in the river/stream/ditch. You're still passing on your load. Remember water equals life. Who wants to drink water with yr. load in it. There is a good solution: put it in the ground. Give it back to mother nature; she can use it (Nitrogen, etc.).

or WHOLE EARTH CATALOG

A reasonably safe way for a villager to prepare excreta for use as fertilizer is for him to compost it in a privy pit. After the required period of composting, the pit can be emptied, thus eliminating the handling of the raw excreta. . . .

1. Dig a pit of required size, the bottom of which should always be above ground-water level.
2. Before the slab is placed, cover the bottom 50 cm (20 in.) of the pit with grass cuttings, fine leaves, garbage, paper, etc.; but allow no rubbish such as metal cans, glass bottles, or similar materials to be deposited therein.
3. Place slab, and complete superstructure, keeping in mind that they will both be moved periodically to another site.
4. In addition to depositing human excrement, throw the daily garbage into the pit, along with cow, horse, sheep, chicken, and pig manure, as well as urine-soaked earth or straw. The latter materials are important, as urine is rich in nitrogen, an essential plant nutrient.
5. About once a week throw a few kilograms of grass clippings and fine-texture leaves into the pit. After some experimentation, one can arrive at a pit mixture which will provide a good fertilizer.
6. When the pit's contents reach a level of 50 cm (20 in.) below ground, a new pit is dug 1.50-2 m (5-6.5 ft) away (more if desired), and the superstructure and slab are moved over it. The first pit is leveled, finally, with 15 cm (6 in.) of grass clippings and leaves, and the top 35 cm (14 in.) with well-tamped earth.
7. When the second pit is filled as indicated above, the first pit is uncovered and the compost removed. It should be stable, and will provide a good fertilizer which can be applied immediately to the fields or stored. . . .

Before applying or recommending this method in a rural area where it is not familiar, it is desirable to try it first on a pilot scale under adequate control in order to determine the proper operating schedule and materials suitable and available in the area under consideration. The collaboration of agricultural officials and of local leaders among the farmers of the area is necessary.

Excreta Disposal

Fig. 33. PROPERLY PROTECTED SPRING (I)

- A Protective drainage ditch to keep drainage water a safe distance from spring
- B Original slope and ground line
- C Screened outlet pipe: can discharge freely or be piped to village or residence

Springs can offer an economical and safe source of water. A thorough search should be made for signs of ground-water outcropping. Springs that can be piped to the user by gravity offer an excellent solution. Rainfall variation may influence the yield, so dry-weather flow should be checked.

Hand-dug wells naturally have certain limitations. While successful wells have been sunk in special circumstances to depths of over 120 m (400 ft), half that distance is usually considered the limit of practical sinking.

The first consideration, then, in designing a well is its diameter; neglecting for the moment large-diameter wells built for special purposes, the size of a completed well represents a compromise between economic and practical considerations. It has been found that the cost of a lined well varies almost exactly with its diameter, taking into account the increased thickness of lining necessary in a larger well. The minimum diameter is limited by the room available for a man or men to work; experiments show that a diameter of about 1 m (3 1/4 ft) is necessary for one man and about 1.3 m (4 1/4 ft) for two men. It has been found that the efficiency of two sinkers working together is more than twice that of a single man, and consequently a 1.3-m (4 1/4-ft) diameter is a convenient standard size. Other considerations affecting this decision are the greater natural ventilation of the larger hole, the more efficient size of the kibbles (hoisting buckets) and other equipment which can be used in it, the additional room for concreting operations and insertion of caisson rings, and the possibility of using orange-peel grabs if desired. On the other hand, an increase in diameter beyond 1.3 m (4 1/4 ft) does not appear to give any great constructional advantages.

The quantity of water from a spring can very often be substantially increased by digging out the area around the spring down to an impervious layer to remove silt, decomposed rock, and other rock fragments and mineral matter (usually calcium carbonate) sometimes deposited by the emerging ground water. In doing this, particular care should be taken, especially in fissured limestone areas, to avoid disturbing underground formations to the extent that the spring is deflected in another direction or into other fissures.

Energy which Nature has provided, such as the wind, should be taken advantage of whenever possible. In many Northern European and Western Hemisphere countries, wind energy is used for pumping water for farms, homes, and small communities. This method is excellent for obtaining a steady flow of water from a well at a very low cost.

For proper operation, the following conditions must be met:

- (1) winds of more than 8 km per hour during at least 60% of the time;
- (2) available windmill equipment;
- (3) wells that can be pumped for many hours' duration each day;
- (4) storage capacity of three days' supply (or more) to take advantage of long pumping periods and to provide for calm periods when there is no wind;
- (5) clear sweep of wind to the windmill. This can be obtained by the use of a tower to raise the windmill 4.5-6 m (15-20 ft) or more above the surrounding obstacles.

Water Supply

The Canadian Department of National Health and Welfare puts out a free simple book on sanitation, intended for remote northern areas. It has good clear diagrams of septic tanks, privies, and chemical toilets. There is also information on heating, lighting, water supply, and sanitation. Funky.

Well Drilling Operations

The Army has done it. A good cheap book on wells. The most useful parts are on auger-bored, driven, and jetted wells. Covers percussion and rotary drilling with military equipment. Useful section on well development and redevelopment of old wells, testing for yield and recognition of strata.

Even a section on "Arctic Methods of Well Construction" (jet with steam!).

The WHO Book on water supply (p.72) has much better information on dug wells and spring development. [Reviewed by Fred Richardson]

Another simple method of testing is to pour water into the well. If the well point is in dry sand, all of the water added will drain into the sand. If the well point is in water-bearing sand, the added water also will seep out but only to the static level or the water table elevation. When the well point is in water-bearing sand, the quantity of water that can be poured into the well continuously is a rough measure of the rate at which the well can be pumped, since the saturated sand yields water about as freely as it absorbs it. Sometimes raising or lowering the well point a foot or more brings a greater length of the screen into contact with the water-bearing sand and a greater yield results.

Figure 28. Expedient support for driven well.

b. In constructing bored wells, small rocks or boulders may be encountered that will prevent further penetration. When this occurs, lift the auger from the hole, remove the cutting bit, and replace it with a spiral or ram's horn auger. This tool is then lowered into the hole and turned in a clockwise direction. The spiral will usually twist around the rock so that it can be lifted to the surface. The regular bit is then replaced and boring continued. If an extremely large boulder is encountered and it cannot be removed with the spiral auger, the hole will have to be abandoned and another one started elsewhere.

Leffel Hydraulic Turbines

if you have a good head of water nearby, a creek, river, reservoir, dam, then you can build a electrical system powered by the water. There are homemade methods, and used turbines, but it helps if you understand what it takes to change the creek into a lightbulb. Leffel has been doing this industrially for a hundred or so years, but they also have single family systems. Ask for Pamphlet A and Bulletin H-49.

The HYDRA-DRILL is designed to drill water wells approx. 3/4" diameter and up to 200' deep. Because it is economical, portable and easy to use, many contractors and prospectors use it for coring and other test drilling.

The HYDRA-DRILL is powered by the latest model TECUMSEH 3-H.P. engine featuring needle bearings thru out. A thumb-bar throttle control affords total operator control. The rugged 36:1 gear reducer converts the 3,600 engine rpm to 100 rpm for the hi-torque required for hard drilling.

"Now I realize that not very many people can dig on this. But it's actually an established fact that our national leaders are dedicated to the pro-mucus ethic. They consciously and maliciously intend people to get hooked on mucus-causing food as a means of keeping them in bondage and servitude, so they'll buy anything that promises to keep the specter of age eighty at a safe distance. You take the Food and Drug Administration. Big time outfit, right? Big federal scene up there in Washington. They're into mucus like the State Department's into hydrogen bombs. It's like the President's got these two big heavy numbers he's laying on people, hydrogen bombs and youth-cult mucus promotion as a means of subjecting the world-not just this country, mind you, that's old nineteenth century hat-but the whole entire world to a mucus-loving servitude. That's what's behind the eighteen year old vote shuck. And the Peace Corps. Big youth-cult mucus oriented shuck.

"It's like these friends of mine. I had these friends used to be in the Peace Corps, over in Africa, trying to turn the spades onto mucus. Stayed over there two years pretending to help the people, and all the time he was trying to get 'em hooked on mucus. And the poor people in Appalachia, down there in Kentucky, and West Virginia, and in the slums, giving away all those food stamps won't buy anything except a lot of pasty mucus-making food. And the Middle East. What do you think all that friction over in the Middle East is really about, if not mucus? A whole big goddamn mucus plot run right there in Washington, D.C. by the Food and Drug Administration. Trying to stop drugs that might help enlighten the people about the evils of mucus-making food, and promote mucus-spreading foods all because our national leaders are determined to stamp out health and spirituality, and because they're against people getting old naturally and gracefully.

"Look at the state of old people in America. Look at what America reduces old people to. People in the western world are absolutely terrified of getting old. That's because instinctively they understand, although intellectually they reject it, that man's true sexual possibilities don't even begin till around the age of ninety. It's a fear of sex, and for sex read natural health and vigor, disguised as a fear of death. Shit. Do you know what the average life span was among the ancient Sumerians? A hundred and sixty-two years. The average, mind you. Their elders lived well over two hundred years, and death at a mere hundred was considered tragically premature. Those people knew, man. They knew about everything. Western people can't even conceive the kind of sex trip those dudes were into. Western people are fuck-gluttons, just like they're food-gluttons. Got to have it, got to have it, got to have it, and it's all just one big energy-wasting, mucus-oriented scam, shaped and defined and made into policy, as I say, by the American federal government, with the Food and Drug Administration as the principal architects. The Western idea is to get people to ball two or three times a week, and eat a lot of mucus-producing food so their minds won't ever wonder how it would be without all that mucus. The Sumerians knew better. All they ate were walnuts, and they only fucked once a year.

(continued)

Water in the Service of Man

"Water, that's our life," a Navaho told me once. This book details how the man-water relationship is played—ancient techniques, theory, flow in pipes and channels, waves, pumps, turbines, wells hydrology. A neat package.

—SB [Suggested by Steve Baer]

FIGURE 65. Air lift pump

Waves in deep water generally travel in groups or trains, separated by patches of comparatively calm water, rather than in a continuous series. A peculiar feature of the travelling groups is the successive disappearance of the leading waves and the corresponding appearance of fresh waves at the rear of the train. This results in the group advancing with a velocity that is only half the velocity of the individual waves. The newly created rear wave gradually works its way through the group to the front and then disappears. Perhaps there is some human analogy in this birth of a wave, its advancement through the group, and its ultimate death.

Heller-Aller

windmills, towers, pumps, and so forth

—jd

Information

free

from: The Heller-Aller Company
Corner Perry and Oakwood
Napoleon, Ohio 43545

The company was organized by John Aller and Frederick Baker. Sam Heller, a dry goods merchant, joined the company in 1904. The company's mills still bear the trademarked name "Baker" on their fan blades.

The development of gasoline and electric water pumps shrank the market and the competition after the 1920's, Mr. Selhorst said. Where there were once almost 20 concerns making windmills, now there are only two others competing with his, the Braden Aeromotor Corporation of Broken Arrow, Oklahoma, and the Dempster Mill Manufacturing Company of Beatrice, Nebraska. Before the decline the Heller-Aller Company was selling 4,000 windmills a year.

Despite the efficiency and speed of new water pumps, windmills still serve a useful function, particularly on large ranches where distances prohibit the continual service and refueling that gasoline and electric pumps need.

All a windmill needs, Mr. Selhorst said, is wind and about a half-gallon of lubricating oil a year. The mills, which last 20 to 40 years, cost from \$200 to \$400, plus \$200 to \$1,000 for a tower, and require no money for operation.

Swimming Pools as Reservoirs

Water being a basic necessity for life, especially in the country where it doesn't just run out of faucets, we'd like to pass along an idea for water storage, that we have been using for over a year. A swimming pool—the kind you assemble yourself with aluminum frame and plastic liner—makes a totally adequate storage tank.

When we were planning our water system, we investigated the various ways of storing water, ranging from homemade cement tanks (tricky to build so they don't crack) to expensive redwood tanks (approximately \$600 for 5000 gallons and you have to keep them full or the wood gets screwed up & leaks). Finally, and luckily, we hit upon the idea of a swimming pool. We got ours (15 ft. diameter, 5500 gallons) during a Monkey Wards Spring Catalog Sale for about \$160—a real buy, but even at regular prices (up to \$200) this beats the redwood tanks by quite a bit, and it's easier to install than a cement tank. Sears and Western Auto also carry similar models.

We installed ours on a hillside above our house (after leveling and shoring up a 15 ft. area), and we siphon the water to our house and garden using good old gravity (the tank is high enough above us so we have adequate pressure). The plastic liner (very good heavy duty) imports no taste to the water, and can be replaced for about \$40. The plastic cover you can buy to go with the pool (about \$12) is worthless, so we bought heavy black plastic, draped it over a cone-shaped frame we built of 2x4's (to keep the plastic from hanging down in the water—it's heavy!), and secured it around the circumference with the nylon rope that came with the original cover.

If you're going to use a siphon, curve the pipe (we used a length of copper pipe connected to our regular plastic pipe) up off the bottom of the tank 6-10" and cover the opening with screen to keep out the silt (which settles to the bottom), bugs, & frogs.

If you install this tank on a hillside, try to find a spot that has a couple of big trees or a large stump on the downhill side (our tank butts up against an old burned-out redwood), so that if the earth shifts the whole pool won't slide downhill—an unlikely occurrence, but you'll sleep better!

Upkeep is minimal. We emptied ours completely after a year to clean the liner, and found that it really wasn't necessary (the plastic looks grungy, but isn't really dirty). We "fill" ours about once a month (more often in the summer)—we don't let it get completely empty or the siphon wouldn't work. It costs us less than \$2 per month in electricity to pump water uphill from our spring (if you're smart you'll put your spring above your tank—but we didn't have a choice).

Hope this suggestion will solve someone's water-storage problem as well as it solved ours. Will be glad to answer any questions we can.

TYPES OF WELLS

Wells may be classified with respect to construction methods as dug, bored, driven, drilled, and jetted.

Drilled wells may be drilled by either the rotary or percussion method.

Each type of well has distinguishing physical characteristics and is best adapted to meet particular water-development requirements.

The following factors should be considered when choosing the type of well to be constructed in a given situation.

1. Characteristics of the subsurface strata to be penetrated and their influence upon the methods of construction.
2. Hydrology of the specific situation and hydraulic properties of the aquifer; seasonal fluctuations of water levels.
3. Degree of sanitary protection desired, particularly as this is affected by well depth.
4. Cost of construction work and materials.

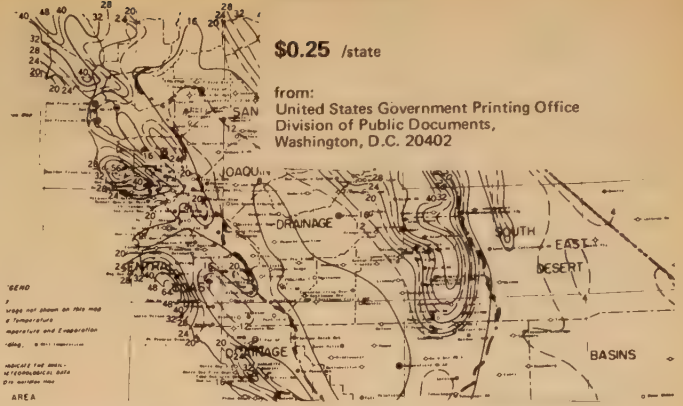

Climates of the States

Normal Annual Total Precipitation (Inches) -- California

Prospecting and Operating Small Gold Placers

When I was panning gold one summer up along the Feather River a few years ago, there were still a couple of old left-overs from the Depression living meagerly off of placer gold, but Jesus that's thin hard work. Nobody pushes you around though. And just down the river from my claim a couple of college kids cleared several thousand \$ out of an unlikely sandbar. This book gives you the working rudiments.

Rocking creek gravels in California.

The placer miner who is obliged to rely solely on the pan for treating the gravel must realize that it will be only the exceptionally rich gravel that will yield him day's wages, and he must therefore try to find pay-dirt that is far above the average. Just a few colors to the pan, however consistent, will not pay out, because it is not physically possible for him to put through unaided enough yardage by panning alone, though the gravel might pay handsomely by some more ambitious plan of working.

All they ate were walnuts, and they only fucked once a year. Once a year, that was all, but it was enough, you see.

Because what they had were these fantastic folk rituals where everybody over ninety got together in the temple at the summer solstice and balled, seventy-two hours non-stop. It was far out. Of course the younger people did it a little more often than that. But even they knew, at incredibly young ages, like nine and ten and twelve, that there were laws in life, and that if you learned them and obeyed them, learned how to orchestrate your impulses properly within the limits set by Sumerian law and folk custom, you became capable of genuine spiritual enlightenment.

Yes sir. The Sumerian line of nut-eaters remained unbroken right on up till almost modern times. That's a little known fact, but it's true. There's a good book about Sumerian nut culture by a guy named Agolt you ought to read. Dr. F. Wong Agolt. Fantastic book. It really changed my life.

Handyman Jack

Basically the Handyman Jack is a super heavy duty bumper jack but it bears no resemblance to the inadequate things that Detroit supplies with their inadequate automobiles. It weighs 28 pounds, has a capacity of 3 tons, is four feet tall, and has a lift of three feet. The jack is guaranteed for 18 months, and complete repair parts are available should they ever be required.

I've used mine for lifting my truck, stretching shrunken plastic water pipe, and a number of odd lifting and spreading jobs, and wouldn't part with it for anything.

WARNING: Beware of handle, or EAT TEETH.

Tractor Supply Company

OK, so you've got this new community in Niobrara County, Wyoming, half way between Dull Center and Bright. You've got 20 people, 5 assorted dogs, a hen (but no rooster), and 12 cats, several of which are pregnant. You've also got: 1 glacier tent, 1 yurt, a Red VW Microbus camper with a noisy rear end, a 15 speed racing bike, and a 1947 John Deere "A" tractor.

There being no roads within 40 km., the Poppin' Johnny is the only transportation in or out. (I told you to get a horse.) Except "It" just broke a rear axle (I told you not to try those 20 ft. jumps) and it's a long, long, way to your Friendly Local John Deere Dealer. Who probably doesn't have the parts in stock anyway. And 1) won't come get your tractor; 2) doesn't want to sell you a repair manual.

There is only one general mail order house that I know of that deals in tractor parts: TRACTOR SUPPLY COMPANY.

Moving the Earth Modern Techniques of Excavation

The beauty of this tome, and its abridged edition, is that it does not stop after postulating optimum conditions like a "long enough lever and a firm place to stand." After suggesting ways to clear land, remove tree stumps, or lay out an access road using rented machinery like dozers and dump trucks, it goes on to explain many other ways to get it done when the "proper" equipment is not available. Most conceivable snafus are dealt with. Not just how to use a dozer so it doesn't turn over, and rig a winch so it doesn't snarl; but how to get your dozer back on its treads without calling the AAA, and how to unsnarl your winch. All is explained in text and again in eminently understandable drawings.

Brunton Pocket Transit

Great for rough topographical mapping necessary for planning and laying out water systems, roads, you name it.

Basically a high quality sighting compass with 10 graduations, it has an integral clinometer for vertical angles 10° to 90° with a vernier reading to 10 minutes. Very rugged.

Hand-held, it is hard to make use of its full capabilities, so there is a ball and socket head available for use with a tripod or Jacobs staff. The Brunton is available graduated in either quadrants or degrees and with or without induction damping.

HUSH, LITTLE BABY

Estelle resisted the irritation of the Greek's rap for perhaps a hundred miles. But gradually she moved into a thinner sleep dimension which his voice pierced like claws. When she absolutely couldn't stand any more she leaned up on her elbow and yelling asked the Greek please to hush a while.

"Hush, you say," said the Greek, also yelling so Estelle could hear him above the VW's whirring engine. "Hush. Now there is one of the more peculiar words in all the English language. Hush. Notice how simple that word is, yet how loaded with implication, and strange music. Hushhhhh. Hear that whisper? Hear that sigh? It's like wind through Sycamore trees. It's the aural equivalent to wheat swaying in a Van Gogh painting. Hushhhhhhh, little baby. There's only one vowel in hush, but notice how the whole word hangs on it, sort of pivots on the U, how it seems to clutch at either side of the U and just hang there in perfect balance. Notice, too, how the word is at once imperative, hush your mouth, hush that noise, but also a noun. A hush settled over the audience as the maestro walked onto the stage. Hush. Hush, now. A marvelous word, hush."

When the Greek had finished, Divine Right broke into applause. He tried to say "Bravo!" but he was so stoned, his tongue was so uncontrollable, the word came out as a kind of growl, like some moron's, or an ape's. The slurpy nonsense of D.R.'s "Bravo!" caused him and the Greek both to break into hysterical laughter.

"Stop the car," said Estelle. She had scooted forward to sit next to D.R., just behind the Greek and Frieda.

"What?" said the Greek.

"What?" D.R. tried to say, but it was such a goofy sound he and the Greek roared with laughter again.

"Excuse me, honey," said Estelle to Frieda as she elbowed past D.R. and crowded into the little space between the two front seats. When she was situated she told the Greek once more to stop the car.

"Stop," said the Greek. "Now there is truly one of the interesting words in our language. When you analyze the word stop . . ."

Estelle grabbed the steering wheel and jerked Urge violently to the right. Gasping in mid-sentence, the Greek yelled "Are you crazy?" and fought to keep the bus from going off the road. Estelle said nothing. She waited till the Greek had the vehicle under control, then grabbed the wheel and yanked Urge toward the edge again. When she did it two more times the Greek at last got the idea and began slowing down. A mile or two later they left the freeway and pulled up at a roadside rest area.

Transits & Levels

A free booklet entitled "How to Use Transits and Levels for faster, more accurate building" is prepared by C. L. Berger & Sons, Inc. of Boston and can be obtained from Catalog Service, P.O. Box 1656, Dept. 88, Richmond, Va. 23213. One is to ask for the above named booklet. My first concern was whether it would be written in language for the non-technical reader and I was pleased to find it prepared in an elementary method with few assumptions taken concerning the reader.

101 uses for a transit and level are given and a select few are exemplified. It illustrates the method of squaring foundations and establishing straight lines for numerous uses. Straight crop rows are laid out with a transit which doesn't sound like a necessity but it can be helpful to the mule pulling the plow.

FIG. 51. DIFFERENTIAL LEVELING.

STEPS IN SETTING UP A TRANSIT.

1st. Set instrument on ground near point, with legs spread to give convenient height. Without reference to point, move legs so that plates are nearly level. Tripod leg screws should be firm but not binding.

2nd. Pick up instrument bodily without disturbing relative position of legs and head.

3rd. Place down again with plumb-bob within 1" of point and bring bob to within 1/4" to 1/2" of point by shifting legs slightly.

4th. Swinging one or more legs in arc of circle will approximately level head without changing materially the position of bob.

5th. Press each leg firmly into ground about same amount, watching position of bob so that it will finally return to within 1/4" to 1/2" of the tack. Plates should still be nearly level.

6th. Bring bob exactly over tack by loosening two adjacent leveling screws and shifting head. Then tighten leveling screws and proceed to level the plates.

Blasting

Explosives are a cheap, highly portable, concentrated source of energy, an industrial and agricultural tool and as such useable and useful to the amateur who has need of such tools. Dangerous? Yes, but only a small hazard with reasonable care.—consider as no more, NOR LESS, dangerous than a gun which has no safety and is never unloaded. Treat accordingly—particularly with regard to whom you allow to handle them! Can YOU use explosives? . . . Yes—with care. Will YOU be ALLOWED to? . . . Probably, but there ARE regulations and they vary too widely for generalisations.

What would you want them for? The possible answers to that question would surprise most people—the uses of explosives range from the moulding of NASA hardware to the manufacture of diamonds! For the amateur though the most likely uses will lie in the making of access roads, foundations, land clearance and drainage. For instance, \$25 worth of explosive will break up 150-400 tons of rock, or lift out and break up a dozen large stumps, or blow a ditch four feet deep, twelve feet wide at the top, tapering to four at the bottom and one hundred feet long. It is often, in outlying areas, cheaper to use explosives for a small drainage or creek diversion project than to pay the cost of getting a backhoe to the site. Also explosives can be used anywhere a man can go, which is often to places machines can't. Even for a simple job like digging a trench for a culvert, a few dollars worth of dynamite used merely to loosen hard-packed soil can easily make the difference between man days of pick work and man hours of shovel work.

The next question is: Where do you go for more information? And the answer to that is. . . your phone book, under "Explosives" in the yellow pages. Try first the nearest big company; du Pont has the most literature, Hercules seems the most helpful. Then try your nearest dealer, your local police, fire chief and Highway Patrol, in that order. Know before you pick up the phone what you want to do and simply ask for advice and help with the regulations to enable you to do it. It is, however, normal to find that about half the latter have little idea themselves, so persist until you have read your local regulations for yourself, if necessary writing to your state capital. It goes without saying that the most useful information anyone can give you is the address of a neighbor who is experienced in handling dynamite. If you are unlucky and have to work entirely from the book, don't worry too much—there isn't any reason why you shouldn't do so safely, with no more than common sense AND RIGID ADHERENCE TO THE BOOK'S INSTRUCTIONS! Without knowledge of the reasons behind the regulations and the book's "Do's and Don'ts", you must not deviate in the slightest. In particular your local regulations for transport, storage and use will be framed to reflect local conditions and hazards—every little detail MUST be scrupulously observed.

Practical literature is restricted to handouts from manufacturers and, for those who have \$6 to invest, Blaster's Handbook from E. I. du Pont de Nemours, Wilmington, Delaware or Canadian Industries Limited, Montreal, Quebec. Imperial Chemical Industries, Limited, Nobel Division, Stevenston, Ayrshire, Scotland, also provides a handbook entitled Blasting Practice. Whilst the handbooks admittedly contain everything, they necessarily therefore only devote a small fraction of their space to the needs of the amateur; moreover, being aimed at the professional, they are neither well laid out nor well written for anyone else.

There is a pamphlet which, despite its small size and vaguely apologetic foreword, is a class above anything else in its field and a model of terse lucidity—"Efficient Blasting through the proper care and use of Safety Fuse" from the Ensign-Bickford Company, Simsbury, Connecticut.

Two final points: if you want to blast near rail, power, phone, or pipe lines, contact the owner; and if you have charged up your first blast and want to know how far to retire and discover that the books become suddenly vague at that point—well, half a mile is a nice round figure. . .

[Suggested and reviewed by Keith Britton, Advanced Blasting Company]

Blaster's Handbook

\$6.00 postpaid

from **WHOLE EARTH CATALOG**

Fig. 289 An opening notch is first blasted in the 14' x 14' base of a 127-foot brick stack.

Old stacks, of both round and square section, whether constructed of brick or concrete, can be rapidly and economically felled by blasting where there is sufficient room. Further, they can be made to fall in the desired direction, or "on line."

The "falling notch" principle a lumberjack uses when he cuts a notch at the base of a tree, is the method employed. This involves blasting an opening cut out of that side of the stack in the direction of fall, and subsequently widening this cut by blasting successive holes, or rows of holes, on each side of it. It is essential to shoot the corresponding holes, or rows of holes, one on each side of the opening cut, simultaneously. In this way the final blast undermines each side of the stack at exactly the same instant and thus it topples over in the desired direction. Sometimes it is of assistance to drill a row of closely spaced holes on that side of the stack opposite the direction of fall. These holes are not blasted but provide a line of weakness so that the masonry will part readily and allow the stack to break away from its foundation when the undermining has been completed.

Fig. 254 A 1.3 cu. yd. boulder before mudcapping.

Fig. 255 Embedding the cartridges of explosive in a thin layer of clay increases the efficiency of the charge.

Fig. 256 Mudcap charges should be covered with a generous coating of mud or sand before firing.

Fig. 257 Results of an efficient mudcap charge.

If several charges in close proximity are to be shot at the same time, firing must be carried out by means of B-Line Detonating Fuse or E.B. caps because all charges must detonate simultaneously; otherwise the first charge to fire might dislodge those on adjacent boulders. Where a single charge is to be fired, a fuse and cap may be used.

Rock varies greatly in hardness, density, cleavage planes, etc., thus charges from two to six 1 1/4" x 8" cartridges per cubic yard may be required. If the rock is very large or its width greatly exceeds its height, the charge should be divided into two or more parts and placed so that they will have the maximum effect. In the case B-Line Detonating Fuse or E.B. caps should be used for simultaneous firing.

Fig. 290 Final blast brings down stack shown in Fig. 289 "on line".

Alpine Fir

SILVER FIR or Pacific silver fir, as it is also called, is so named for the striking silvery white appearance of the under side of its needles. Another name applied to it is lovely fir—implied by *amabilis*—because of its beautiful pyramidal or spire-like form in comparison with the usually dome-like crown of noble fir and lowland white fir, with which it is often associated. The pleasing form of silver fir shows to best advantage in open situations where it is densely clothed to the ground with comparatively short branches. These branches sweep downward and outward in graceful curves.

Fan-shaped leaf of Ginkgo tree is found in no other plant.

Seed pods of Black Locust.

The redwood and its close Sierra relative, the giant sequoia, *Sequoia gigantea*, are the largest, and almost the oldest, life forms in North America, if not in the world.

Accurate ring counts cannot be secured without destroying the tree, but it is assumed that redwoods 300 feet high and twenty feet or more in diameter may approach an age of 2,000 years. Most of the redwoods cut in commercial operations are from 400 to 800 years old. These are from three to ten feet in diameter, and 200 to 275 feet tall.

Adjustable on calibrated posts from 1/2" to 12" thick logs

Thrust roller guides saw over rough bark for easy feeding

HELPER HANDLE — 16 or 18" long — 1 1/2" dia. — 1/2" thick — 1/2" dia. — 1/2" thick

Mobile Dimension Saw

Two issues ago you carried a good report on the "Mighty Mite" saw mill from Portland, Oregon. It's a good saw, but big and costly compared to its main competitor, the "Mobil Dimension Saw"

The reason for this is that Jim May who first developed the saw, has several patented (and I must say very ingenious) features in his "Mobil Dimension Saws" that for most of your readers are very advantageous. Namely these features result in considerable reduction in overall weight and add correspondingly to its flexibility. And it does this without any sacrifice in performance potential. There is also a very significant savings in cost.

My dad and I looked into both saws before we bought our large model "Mobil Dimension Saw". We have been very pleased with it. Jim May's son-in-law, Ron Harriman, who runs the company now, produces excellent workmanship and comes through with fast and dependable parts and service.

I suspect that for most commune type of situations, the smaller models would more than suffice, and pay for themselves with some outside jobs. Here in the Northwest, logs that are left laying in the forest by loggers for various reasons are often very salvageable with these saws.

ONWARD CHRISTIAN SOLDIERS

Oh joyous joy of wondrous joys, look at the lovely world. The sky, the clouds, and feel the wind whipping little dusts against your skin.

A minute ago I bent over to pick up a rock the size of a nickel, but when I touched it it scurried away on the tiniest little footprints I ever saw.

A beautiful intrusion quadruples the illusion.

Confusion.

Confucian.

Ha!

What I'm trying to do is get from here to over there but it's a long, hard way of going, let me tell you.

Oh joyous joy of wondrous joys, look at the lovely world.

The world has a blue ceiling and no walls anywhere to be seen.

And a sandy-colored carpet with a parking lot painted on it.

The bright sand is painful to my eyes, and wondrous to behold.

I've got some sunglasses, but who knows where they are?

Estelle would know, but where's Estelle?

Playing in the dunes.

If I were to call to her she couldn't hear me, because of the constant wind, blowing through my mouth to take my breath away.

Trudge, trudge, trudge. Onward Christian soldiers, over the wasted land. Through heat, sun and wind, in spite of loneliness, fear, isolation, and a twisted tongue he goes on, on, forever on toward the Concrete Picnic Tables, ancient relics of a culture long forgotten, buried by the desert sand.

"I'm coming; you guys. Wait for me, I'm coming!"

Finding and Buying Land

The trick is, helping the seller find you. The best way to do this is advertise. Find out what the land owners read, and advertise there. It may be the bulletin board at the general store or the six ranchers' journals of the north-western states (find at libraries in the area).

Say in your ad what kind of land you're looking for and what you're willing to pay, e.g., "WANTED TO BUY, mountain land, south slope, timber, year-round flowing water, prefer no improvements and minimum roads; 200-600 acres, in northern Oregon or Washington state; will pay \$60/acre if suitable, good cash terms. Mortimer Head, 1111 A St., Portland, Ore., 16161, (007) 242-4242."

This procedure largely by-passes the real estate agents, and good riddance. Most are a foul breed, though one in twenty is all right and can help you.

To find out what land you want takes some research. Shop around locally and get a feel for the terminology and considerations of land buying (clear title, developed springs, grass for 200 head, adjoining National Forest, county road, mineral rights, water rights, NE 1/4 of section 28 R 17 T26, taxes last year, six-months option, etc.) Visit friends who have land and see what they like and don't like about it. Tell everybody you talk to that you're looking for land and let them rattle on.

Finding an area to suit you is partly a matter of maps and partly visits to see how the climate and vibrations are. Write for United Farm and Strout Catalogs for rough (high) land values in various areas.

The most important source of information on a piece of land besides visiting it is the USGS (US Geological Survey) topographical map of the area. Order the index map for the state(s) you're interested in, have someone show you how to use Range and Township to locate yourself, and buy the appropriate maps. At 50¢ apiece they are an outstanding bargain.

Once you get to seriously considering a piece of land go to the County Assessor's office to find out what the County knows about it. They will have records showing what was paid the last time the property was bought and when the sale took place. They also will have maps showing who your neighbors are and where they can be reached. If you're trying to find the owner of a piece of land, that's the way. (Incidentally, wandering around in pretty country falling in love with various sites is no way to get land. It always either belongs to the Government, who won't sell, or some guy who won't sell.)

Bear in mind there is a rural land boom going on. Land that was \$50/acre last year is \$60-70/acre this year. Stay away from developers and their prices. They buy a big hunk cheap and sell little hunks dear. They and the neighbors they'll get you are a pain in the ass.

When you buy land in a place and start living there, you become a citizen of the county and state. Don't be surprised if the other citizens are interested in you. Wouldn't you be?

THIS VALLEY FARM is just one of the many high-yielding farms that are found in the rich and diversified agricultural "horn of plenty" in Washington.

ON KICKAPOO RIVER

No.174—103 acres, \$16,500. Scenic valley recreation farm with 1/4-mile frontage on Kickapoo River! 103 acres, 40 tillable, balance wooded. 4-acre corn base, 2 springs, deep well. Old buildings need extensive repair—6-room house, barn, corn-crib, granary. 2 miles to town. Destined to please at \$16,500, excellent terms. UNITED, Boscobel, Wis.

ALPINE MOUNTAIN CABIN
No.199—10 acres, \$20,000. Rustic mountain cabin located in alpine

valley setting of pines and aspen. Spectacular scenery . . . combination of exotic rock formations, tall whispering pines, white-barked quaking aspen. 10 acres with 650-ft. frontage on rushing mountain TROUT STREAM. Good spring for domestic water supply. Direct private access to national forest, 2 miles of fishing streams and West Elk Wilderness area. 19 miles to college town. Can be yours for \$20,000. LOW down payment. UNITED, Gunnison, Colo.

HIGH COUNTRY JEWEL
No.470—5 acres, \$6,000. Surrounded

on 3 sides by national forest land and within 6 miles of winter ski area. 5 beautiful acres crossed by year-round rushing creek. Covered with aspen, blue and silver spruce trees. Many choice creek-side building sites for your cabin or home. Just below timberline, on good Forest Service road, 11 miles to town, 68 miles DENVER. In heart of excellent deer and elk hunting, very near several high country lakes for top trout fishing. Rare find at only \$6,000, low down payment. UNITED, Conifer, Colo.

Caretaking

Tips on familiarizing yourself with an area—we did this when we moved into Lake County. Read Yellow Pages, cover to cover. The phone book also has other good parts too. Also, want ads and local paper provide much information of interest to the newcomer.

We lucked into a fantastic scene—we are CARETAKERS on a 5 acre farm on Clear Lake. We get free house, utilities and a salary of \$125 per month and also all the fruit and nuts we can eat from the orchard. Fish from the lake, our own garden etc. I report this because I am amazed at the number of CARETAKER POSITIONS open in this area. Check the Santa Rosa PRESS DEMOCRAT—there are usually several caretaker ads at any given time. Our particular "feudal landlord" is a dream—he is only here once or twice a month for a couple of days. Rest of the time place is ours. He is particularly kind to longhairs. Some are not, of course, and generally owners prefer retired couples. But give them a good rap about "youth having more energy and creativity" and they might hire you. Worth a try. We got a garden of Eden—you might too! We don't want to stay here indefinitely, but it makes a great "half-way-house" between city and community.

Kelseyville, CA

Tax Property

About the item in your Spring '69 issue about acquiring tax delinquent property; it will work, I believe, as set forth, but the title could end up being a "shaky" one, and there is always the chance you will just end up paying someone else's taxes and improving his property gratis.

Better deal and more straightforward, is to locate several tax delinquent properties, contact the owner or heirs and offer to buy at a low figure.

Also, in California, tax delinquent property is deeded to the state after a few years (5, I believe) and then sold off yearly at a tax sale auction.

Anyone acquiring property in the above fashions (and intending to keep it) should learn something about "searching the title." Otherwise you might, for example, end up with land with a huge public utility easement over it, or subject to a sewer assessment more expensive than the value of the property.

Title search fees by title insurance firms are often reasonable. These companies will sometimes "search the title" and issue a non-guaranteed "preliminary report" at low cost, anticipating that they will later insure the title. Title companies are also sometimes a source of free plat maps and other information.

Some factors to be considered when doing the land thing: government assessments (taxes & improvement districts) easements, rights of way, zoning, liens, "chain of title" and covenants, conditions and restrictions.

Researching can be done at various offices at the county court house or hall of records. Friendly real estate brokers can also be a big help.

A lot can be learned by phone.

Alaska State Land

I don't know so much about Fed. land up here in Alaska, but the state has a deal going where anyone who wants to take the trouble of coming up here and doing the footwork can stake out 5 acres along interior rivers and isolated coastal areas around Kodiak, the Alaska Penn., Kenai Penn., and "south-eastern." You must be 19 or over, and the land must be surveyed and bought. Costs run around \$200/acre plus surveying (another \$1,000?). I sure hope that anyone who comes up here please doesn't pollute the place, it's bad enough already.

Daniel G. Leen
Fairbanks, Alaska

If You Could Live Here a Year

One can buy land privately from individuals who may or may not be speculators. One can buy and lease land from the State. We are going up to Palmer in a couple of weeks and big on five acres of wilderness. The minimum the state wants for this five acres is \$675.00. One hears about these land auctions through a publication called Alaska Land Lines, which is published by the State Department of Lands, and sent only to Alaskan addresses. Some of their land goes by lease. You can have it five years and then another five, and then if you want to own it you have to hire a surveyor. This is expensive.

Also, there are mineral lands to be had from the U.S., but again you have to have proof of "color", that there are minerals, before they let you use it. I am never own these, and you have to go in yearly and do \$100.00 worth of work on your claims (I think that is right. It has been a long time since I took the course at Community College).

Alaska is 500 miles from north to south, and 1500 from east to west. There are parts of it that have not been surveyed, or even walked on. Alaska is not for an "effete snob". If you can't face realities you couldn't stand to live here. Because the realities are harsh. We have bears, and each year the magistrates go into the bear caves looking for buttons, to declare so-and-so dead. We have had 40 sightings of bears in an around Anchorage this year so far. I am scared of bears. We have horrible weather in the winter. Sometimes. The winters are sometimes cold and long—always long, and sometimes cold. I remember one winter when it stayed less than 30 below for 3 weeks straight. I made the mistake of turning the car handle with a bare hand. Now each winter the palm of my hand hurts where it was frost-bit. We lose people to the elements. There was a guy—a GI—here three weeks at Fort Richardson a couple of years ago. He went for a little hike and got lost. He died less than 100 yards from the entrance to the Fort. They called it exposure, but it was just plain fright, from being lost in the wilderness. I knew a guy that goes on rescue missions. He says all the people he has rescued are out of their heads from fright by the time he finds them—that is, the ones who are still alive.

I have been down to the Land Office a couple of times and I see young long-haired people looking over the maps of what is available for lease or purchase from the State, and I am glad to see this. In spite of the putdown of young people that is going on in some places—and some places there, too—I hope they can winter through. It has always been a saying that if you could live here a year you could stay and would stay. It is possible to live off the land yet, but takes planning and the knowhow.

Peacefully yours,
B. Duffy

Jobs in Alaska booklet

It's very businesslike so's not 2 offend the locals who forget that they too were once strangers here — but having gone thru the job hunting scene here myself in summers 65, 66 & 70, I can say this would have been a handy & welcome tool. (Do you have any idea how hard it is for someone w/ a college education to find any outdoor job? Of course you do...)

I would also suggest that the jobbee have many Form 57's (standard U.S. Govt. employment info. form which one may pick up at any lg. post office) filled out in advance (partially, so you can b.s. your experience to fit the application, and in full, so you can just drop it off and not have to sit in the personnel offices) as that will save much time which could be used legging down other jobs.

Thank you and many etceteras,

Scott Semans

Canada

Agricultural Information

New Canadian immigrants who are setting up farms or looking for suitable sites should acquaint themselves with the publications of the various Departments of Agriculture. In addition to the Canada Dept. of Agric. each province has a department of its own. Most publications are free. The quality however, is subject to great variability. Some are excellent, some are disappointing. (For example "Ontario Vegetable Production Recommendations 1969" contains an excellent and complete variety of information covering all aspects of raising each individual vegetable, while "Ontario Fruit Production Recommendations 1969" is concerned solely with the use of insecticides.) The subjects covered range from very general ("Farming in Canada") to very specific ("Control of the Purple Backed Cabbage Worm in Newfoundland").

The Canada Department of Agriculture will send copies of up to ten publications free to individuals. The List of Publications is available from: Information Division, Can. Dept. Ag., Ottawa. They also offer for sale at \$2 each a great series of soil surveys—very useful to anyone considering buying land for farming.

Each province has its own Department of Agriculture. In Ontario the provincial dept. will send up to ten free publications to each adult resident who requests. The list of publications is available from: Information Division, Ontario Dept. Ag. and Food, Parliament Buildings, Toronto.

Statement of Intent
17 Boyd St.
Victoria, B.C.
Canada

The job market in Alaska is difficult for strangers to understand, since a vast amount of rumor and wildly inaccurate information abound. Get-rich-quick stories are the most common, and few of them are true. Wages and salaries are significantly higher than in the Lower 48, but the high cost of living in Alaska erodes much of the difference. In most ways, the economy of Alaska is similar to that of the rest of the United States. If, however, you want to earn a lot of money in a short time, and are willing to work long and hard, then there are some opportunities in Alaska.

One way to get rich quick in Alaska is to get on the payroll of a company which is willing to pay overtime premiums for long hours of work needed to complete projects on a rush basis. The majority of these jobs, however, are located in "the bush," which is anywhere outside the state's major cities and towns. (In-town construction usually proceeds in a normal daily manner.) Construction projects are the most likely places to have the jobs which pay a lot of overtime, but most of their positions are filled by trained, experienced, union workers.

Other seasonal jobs, such as working on a fishing boat or in a cannery, may offer large amounts of pay for work lasting a relatively short time, but the money will be well earned through gruelingly long hours of very hard work.

Crown Lands

The Acquisition of Crown Lands in British Columbia (Land Series Bulletin No. 11) is the official word on procedure, regulations and the access to further information on obtaining government lands in B.C. (I'd guess that the other provinces publish similar bulletins.) Get it free from the Government Printing Bureau, Victoria, B.C. Comes with 2 maps of B.C. (back to back): No. 1—Land Recording Districts and a list of Land Series Bulletins Nos 1-10 (each is reputed to give info on physical features and economy of subdivisions of the province.) No. 2—Index to Provincial Land Status Maps.—each divides available from non-available lands in a small area of B.C.

The procedures for obtaining gov't land in B.C. sound arduous and in all cases except outright purchase, access is limited to British subjects or immigrants. Nonetheless, far more cheap land appears to be available in Canada than in the States. We'll be checking these rumors, gathering information and looking for land this year. We'll keep you informed.

Bill Dickinson
Marysville, WN

Immigration

The Canadian immigration department practically requires that a prospective immigrant have assurance of a job, evidenced by a letter from the employer, along with a bank statement (savings book, etc.) showing sufficient funds to support ones self and family for a year or so, a couple of thousand will do. Some folks have done this by borrowing such a sum, depositing it in a bank, getting a statement to that effect, then withdrawing the sum, returning it to the owner and retaining the bank statement for immigration purposes. Also, ownership of land is another point in your favor. Even a small parcel (a city-type lot) which are available cheaply through tax-land companies can help establish your sincerity in becoming a useful, purposive Canadian subject, which is what the immigration dept. wants.

—Tracy

RITUAL

"I'm coming, you guys, wait for me, I'm coming!" is what D.R. tried to say, but only garbled idiocy came out. And even if it hadn't been garbled idiocy the people he was calling to could not have understood what he said, because of the ceaseless wind.

They were in a paved rest area just off the freeway, a hard, treeless place with white lines marking off the parking places, and concrete picnic tables permanently established beyond a curb. At the far end of the paved area a big trailer-truck was parked parallel to the curb across a couple dozen diagonal parking lines. Near it a family surrounded a picnic table, eating food. The Greek had established himself seven or eight tables down the line from the family, where he was preparing to do his daily food ritual. He usually did the ritual at sundown, but since they had stopped, and because everybody's nerves seemed a little on edge, the Greek felt a soothing ceremony was called for, to cool the vibe a little, and bring everybody together.

When they first stopped Estelle wandered off by herself among the dunes, but when she heard D.R.'s yell and saw him having trouble negotiating his way from the bus to the table, she went back to help him along. His arm around her neck, carrying him like a drunk, they staggered up to the table in time to observe the Greek setting up his scene.

It was a simple scene to set up because the only food involved was walnuts and water, and no dishes or utensils were involved. The Greek carried his walnuts, already hulled, in a leather bag about the size of a woman's purse. The water was in a gallon plastic jug with a label on it that said, "Pure-O Artesian Drinking Water. Rich in Natural Minerals." The Greek unfolded a black cloth about the size of a pillow case and spread it on the table. He set the jug on the eastward corner of the cloth, and placed the nut bag diagonally across from it with the open top laid out toward the west. As he picked up his first walnut the Greek bowed three times to the east, and then three times to the west as he picked up the jug and drank from it. When he'd chewed and swallowed the walnut he closed his eyes and held his palms together in front of his face in an attitude of prayer.

"F . . . f . . . f," D.R. stammered. "F . . . f . . . f."

The Greek opened his eyes to see who was speaking. Although he'd only been praying about five seconds he frowned as if he'd been disturbed from a deep sleep.

"What's he trying to say?" the Greek snapped.

"He's probably trying to say far out," said Estelle. "D.R. says far out a lot."

"Why doesn't he go ahead and say it, then?"

"I don't know," said Estelle. "Ask him."

"Hey," yelled the Greek. "Get away from those walnuts!"

D.R. had turned away from the Greek and was grooving on the leather walnut bag. The rough side of the leather was out, so that when you rubbed your finger across it, it made a pattern that seemed to D.R. extraordinarily beautiful. He heard the Greek tell him to stay away, but it surprised him when the Greek took him roughly by the arm.

"You're not supposed to get into the walnuts until we've prepared our hearts and minds," said the Greek. "Kindly wait."

The Greek closed his eyes and folded his hands and began again to prepare their hearts and minds to receive the walnuts. Stoned as he was, D.R. felt like his heart and mind were already prepared, but he certainly did not want to disrupt the ritual. The ritual was beautiful to D.R. The Greek was beautiful, the walnuts were beautiful, all the world around was beautiful, beautiful. Inhaling deeply, D.R. folded his hands and closed his eyes, and listened to the Greek's prayer.

Stalking the Wild Asparagus
Stalking the Blue-Eyed Scallop
Stalking the Good Life

Euell Gibbons honestly makes you wonder why we haven't been nibbling cooperatively at the wild Earth all our lives. We'd rather fight and hassle over manufactured products than dine directly on what we can't prevent from flourishing freely around us. Take a congenial trip with Gibbons to the woods, to the beach, anywhere except the parking lot, and let him feed you, tum and head.

Russian Thistle

The young shoots make a very good potherb. Served with salt, pepper and lemon or vinegar we found it to be mild, pleasant and crisp tasting, making one of the very best potherbs we have ever tasted. They can be dressed up with fried bacon and boiled eggs like spinach or creamed and served over toast. Because of the bland taste they can be mixed to an advantage with more tangy plants such as mustard.

Wild Edible Plants

there is a need for a good, big, colorful book on the wild edible plants of the united states, north america, planet, and so forth. so far no one has wanted to tackle the job, mainly i suppose because a book like that would be so expensive to produce that getting the price down for someone who wanted to forage for edible goodies would be tough. this book is neither colorful nor planetary, but if you are going to peck around some natural produce from the rocky mountains west, you should be able to use it to help you both identify and cook your meals. the line drawings are abundant, precise, carefully executed.

For the number of different kinds of food it produces there is no plant, wild or domesticated, which tops the common Cattail. In May and June the green bloom spikes make a superior cooked vegetable. Immediately following this comes the bright yellow pollen, fine as sifted flour, which is produced in great abundance. This makes an unusual and nourishing ingredient for some flavorful and beautifully colored pancakes and muffins. From fall until spring a fine, nutritious white flour can be prepared from the central core of the rootstocks for use as breadstuff or as a-food starch. On the leading ends of these rootstocks are found the dormant sprouts which will be next year's cattails. These can be eaten either as a salad or as a cooked vegetable. At the junction of these sprouts and the rootstock there is an enlarged starchy core the size of a finger joint. These can be roasted, boiled or cooked with meat. In the spring, the young shoots can be yanked from the ground and peeled, leaving a tender white part from six to twelve inches long which can be eaten raw or cooked.

CATTAIL

Green Sea Urchin.

You must develop skills in finding these perfect and formerly unused campgrounds. One way to do it is to get off the beaten track. Study the map and find a small road that leads off the one you are following, then a smaller road that leads off of it, and finally a still smaller road trailing off that. On this last little road one is almost certain to find an ideal camping spot where permission is either not required or easily obtained.

I don't guarantee to make the shelling of black walnuts easy, but I have found that it gets progressively easier with practice. If you stand the nut pointed end up on a solid surface and hit it a sharp blow with a hammer, it will crack into two halves. Stand each half, again pointed end up, and strike it again, and you will have broken it into quarters. Strike each quarter again on the pointed end, and it will break crosswise into eighths this time—at which point the nutmeats will fall out.

COLD DRINKS

In this group are included the various home-brewed drinks such as birch-beer, and the simple summer drinks prepared from acid fruits and used like lemonade. We have not entered the very extensive field of distilled liquors, and there are some people who might object to indication of the ingredients of birch-beer, root-beer and other mildly alcoholic beverages, but no one can object to pink lemonade prepared by bruising Sumach-berries in water or from the juice of Prickly-Pears or Barberries. The number of these refreshing cold drinks is larger than we should have imagined; they may be prepared from the following:

- Spruce (for beer), p. 80
- Hemlock (for beer), p. 80
- Sandbur (grain), p. 107
- Chufa (tubers), p. 108

Edible Native Plants of the Rocky Mountains

This book is an excellent listing of the edible plants of the Rockies. It provides recipes for the preparation of beers and wines, jams and preserves, the cooking of greens and the preparation of dyes, as well as brief histories of the plants' use by historic and prehistoric peoples. The book contains drawings of the plants in their flowering or fruiting stage and lists them by common name as well as scientific name for ready reference.

For anyone seriously considering living off the land, trying his hand at new and exciting dishes or cutting down on the grocery bill, this book is a must.

[Reviewed by Patricia Roberts]

Tragopogon species (4) (Sunflower Family)
 Goatsbeard, Salsify, Oyster Plant

Preparation and Uses: The fleshy roots may be eaten raw or cooked, tasting like oysters or parsnips, according to whom you are speaking. When only a few inches high the young stems, along with the bases of the lower leaves may be used as potherbs.

The coagulated milky juice of these introduced plants was used for chewing by various Indian groups. The juice was considered a remedy for indigestion. In olden times in Greece, Italy, and other Old World areas linen pads were soaked in the distilled juice and applied to bleeding sores and wounds. Pliny records that the juice, when mixed with woman's milk, is a cure-all for disorders of the eyes. *T. porrifolius* is the cultivated Salsify or Oyster Plant.

Habitat and Distribution: The Goatsbeards are found in open ground throughout the West.

Description: These plants are tall, stout, biennial or perennial herbs with fleshy tap-roots, and entire, grasslike, clasping leaves. The yellow or purple flower heads are borne on tall, leafy stems: the matured head resembling a fluffy, giant, dandelion head.

**Mushroom Hunter's Field Guide
Savory Wild Mushroom**

Finding a strange, slimy, luminous colored growth on dark rotting wood is surprise and pleasure; to extend that experience into identifying it and possibly EATING it is even better. For the beginner one batch of mushrooms can occupy a whole day, from finding them, through waiting for a good spore deposit and making a decision, to cooking them. An efficient guidebook is essential to avoid frustrations.

On a tramp through the fields and forests, carry with you a small jar of butter, creamed with salt and pepper. On finding any edible mushroom (except morels or elfinsaddles), collect a few dry sticks and fire them. Split a green stick (alder or willow) at one end. Put the mushroom in the cleft, hold it over the fire until tender, season with the butter. Eat from the stick.
from "The Savory Wild Mushroom"

The McKenny book is compact, but not especially well organized for use. It contains clear and concise descriptions of 83 varieties of fungi, some of them peculiar to the Puget Sound region, the rest common throughout the U.S., and 33 black-and-white and 48 color photographs. There is also an article on mushroom poisons and the many fine recipes make one want to rush to the woods and immediately gather baskets of Chanterelles, Morels and Ceps. Not so easy!

Smith's book, which I prefer, is more technical in language and scope, although, as a field guide, it avoids identification methods involving microscopes and chemicals. It is much more complete, covering 188 varieties with a black-and-white photo of each plus 84 color photos, and it is organized in keys which are super to use if you like being methodical. It is not necessarily true, however, that it is quicker to follow the system: in thumbing through either book, as in wandering in the woods, luck and perseverance further.
[Suggested and reviewed by Sandra Tcherepnin]

164. COPRINUS ATRAMENTARIUS (Inky Cap)

Edibility. Edible, but some people experience a peculiar type of intoxication from eating this species and afterward drinking an alcoholic beverage. I have now discovered three people in Michigan with this type of sensitivity.

Edible and Poisonous Mushrooms of Canada

The world is full of them. They grow in lawns and woodlots, by roads and rivers, in parks and pastures, but most abundantly in the piney woods in the fall. Most people do not see them. They are there, but invisible; outside the range of conscious awareness. Once you become aware of them, they seem to spring up in droves.

For the beginning pot-hunter, *The Savory Wild Mushroom* (Margaret McKenny, U. of Wash. Press) or the *Mushroom Hunter's Handbook* (Alexander Smith, U. of Mich. Press) are excellent non-technical guides. Pretty soon you can spot an Amanita, Agaricus, Russula or Coprinus or such off-beat types as Chanterelles and Boletes. But there comes a day when, after an afternoon's ramble thru a park or forest you come home with about thirty different species, most of which are not in the book. Now what?

There are a number of older and more technical manuals which can usually be found in libraries. *The Mushroom Handbook* by Louis Kreiger has been reprinted by Dover in paperback and so is readily available, but is rather difficult to use.

On a recent trip to Canada I found what I think is the best new book on the subject, *Edible and Poisonous Mushrooms of Canada*. It is authoritative, but still readable, though you might have to keep one finger in the glossary at first. There are new and simplified keys for tracking down over 400 different species, and best of all, most of them are illustrated with color photos taken in the field. With this book, and a lot of patience, you should become a local expert.

Figure 266. *Mycena alcalina*.

All but one of the species have revealed an interesting and striking chemical characteristic that is very constant in fresh specimens. When the Fruit are scratched, bruised by handling, or injured in any way they stain blue, or, if the surface color is yellowish, green or greenish blue. This harmless phenomenon is apparently caused by the oxidation of an enzyme in conjunction with the psilocybin and is a main point of identification. Certain chemical reagents are known to accelerate this bluing. The best, of these indicators, p-methylaminophenol sulphate or metol, gives a constant and strongly positive reaction on the flesh of the stem, becoming very deep violet within 1-30 minutes. This chemical, which is in crystal form, is inexpensive and can be prepared from any chemical house or photographic shop that handles darkroom supplies. Metol will dissolve in about 20 times its weight of distilled water, and the solution must be used immediately since it is unstable. A canteen of distilled water and a small plastic bottle are all the tools needed to make up the solution in the field. Be sure to shake the solution vigorously to shorten the dissolving time.

Mycological Societies

Your coverage of mushroom identification books is fine, but I have graduated from Smith and McKenny (both of which I have) to *A Guide to Mushrooms and Toadstools* by Morten Lange and F. Bayard Hora, Dutton. It is very complete and has color painting instead of photographs, which I like, and every species is shown in color. I belong to the San Francisco Mycological Society and I recommend that anybody who is interested in mushrooms join the nearest mycological group for help with locating and identifying. Write to the North American Mycological Association, 4245 Redwood Road, Portsmouth, Ohio 45662, for the address of the nearest group. There is also a mail-order bookstore which has everything about mushrooms (and also many books on plants, and some assorted other scientific subjects): Lew Heymann, P.O. Box 6448, Camel, Calif. 93921. His catalogs are free and fantastic.

a) Cut the sharp points from top of pineapple. Hold top firmly in left hand and, with a large, heavy knife, start peeling strips from top downward until entire rind is removed. (The top may be removed before cutting off rind.)
b) Remove the eyes by cutting diagonal grooves around pineapple.
c) Cut off top and slice fruit lengthwise into wedges. Each serving then has some of the sweetest and most desirable portion of the fruit. The core may be removed from each slice.
d) If larger pieces are desired, cut entirely through the peeled fruit lengthwise and serve the slice whole.

PRAYER

The Way is uncharted. The map cannot be spoken. Names are in words, but nature lives only in nature. The source of creation is nameless, but the matrix of all is named. The secret eludes eyes clouded by longing. Prejudiced eyes must stop cold at the surface. The secret is self-contained.
May we be mindful of these truths. May we become pure enough to pass through the gate to the root of the universe.

Design with Nature

Ian McHarg is a landscape architect, and as a problem solver, he has taken on the huge challenge that ecology obviously represents to the land planner, making a positive constructive step towards a resolution. From his extensive knowledge of both landscape architecture and the biological science of ecology he has developed a methodology that no responsible land planner, city planner, or large land developer can overlook (nor any affected citizen allow to be overlooked). Through a systematic (and easily reproducible) method Mr. McHarg investigates the relevant ecological restraints inherent in any large planning area. Physiography, hydrology, geology, topology, flora and fauna ecologies, and other natural restraints are individually mapped for the area under consideration. These restrained portions of the area are mapped in varying transparent shades according to the degree of restraint the consideration warrants. By overlaying these numerous graded maps, a final map is evolved which designates where to not develop, where light development is compatible with the land, where specifically restrained development is permissible, and where other types of development (recreational, medium and high density) would be least objectionable.

Mr. McHarg realizes that the great "scabs" appearing on the face of the Earth, and the "puss" that resides within these sores are a tremendous threat to Earth's existence. But, he also realizes that growth is going to take place. To meet this growth with only derisive criticism will do little. Only by developing the attitude of "steward" towards Earth and acquiring the tools and knowledge that are needed to properly care for her, will we survive.

Interspersed with chapters demonstrating the power of his method (including examples of projects his firm has done for clients and cities all over the country), the author describes his experiences and attitudes in moving chapters that express his love for Earth, and the profound reasons behind this love.

It is a beautiful book, beautifully written and illustrated, demonstrating that enlightened man can properly care for his life giver, Earth.

Landscapes

Despite its title, thank God this book isn't another moralistic planner talking about landscapes.

Rather, it is more like a rural historian, who is philosophical, talking about suburbs, highways, shopping centers, neon signs, and poverty, not as enemies, but for what they are: "They are us."

Though it isn't mentioned until p. 132, the important focus of the book (especially for Whole Earth Catalog readers) is the following reality:

At present, fifty-eight percent of our population lives in towns of 50,000 or less; more Americans live in towns of 10,000 or less than live in all of the cities of a million or more; and one out of every four Americans lives in a place with less than 2,500 inhabitants. Most of us, in brief, still live in a small city or in a semi-rural setting, and the chances are that even in 1975 the proportion will still be sizeable.

If I had been the editor of this book, I would have wanted to arrange the chapters differently and put some extra passages in between Jackson's essays. For example, in one essay, he makes a fascinating distinction between (1) farmers, (2) rural residents, (3) wilderness recluses, and (4) city dwellers, using quotes from Thoreau and T. Jefferson. And in another essay (which was the most absorbing one for me), called "The Westward-moving House", he traces an American family through 300 years of home-building history, beginning in the late 1600's in New England (Nehemiah Tinkham, with wife, Submit Tinkham, and six children), through Pliny Tinkham of Illinois, Illinois, and concluding in the 1900's with Ray Tinkham of Bonnaville, Texas. And my impulse would

Agriculture, forestry, recreation, industries that do not produce toxic or offensive effluents. All land uses within limits set by percolation.

As aquifers.

Agriculture, forestry, recreation, open space, housing at 1 house per 25 acres.

Forestry, recreation, housing at a maximum density of 1 house per 3 acres, where wooded.

Forestry, recreation, housing at densities not higher than 1 house per acre.

be to show how this essay is connected with the other one—also how both are related to current migrations and attitudes of many "better world" advocates of today. But, on the other hand, what the hell could I say to a family living in a remodeled bus, or to a non-profit group setting up a business on a 20-acre farm, or to any other readers, in fact, about the relevance of "old fashioned" caring for the land compared with "new-fashioned" use of the land. Maybe it's better that readers dig into this book by themselves for meanings that the editor left out.

Somewhere (over western Kansas, perhaps) it begins to grow dark and at first all one can see is a dark mottled brown world under an immaculate sky of deep blue steel; then one flies over some small rectangular pattern of scattered lights—a farm town—and out of it, like the tail of a comet, stretches a long sinuous line of lights of every color and intensity, a stream of concentrated multi-colored brilliance, some of it winking and sparkling, and every infinitesimal point of color distinct in the clear night air. The stream pours itself into the black farmlands, into the prairie, and vanishes. This of course is the roadside development seen from an altitude of several thousand feet; the most beautiful and in a way the most moving spectacle the western flight can offer, because for the first time you see that man's work can be an adornment to the face of the earth.

One cannot predict the fate of such a book as this. But on its intrinsic merits I would put it on the same shelf that contains as yet only a handful of works in a similar vein, beginning with Hippocrates, and including such essential classics as those of Henry Thoreau, George Perkins Marsh, Patrick Geddes, Carl Sauer, Benton MacKaye, and Rachel Carson. This is not a book to be hastily read and dropped; it is rather a book to live with, to absorb slowly, and to return to, as one's own experience and knowledge increases. Though it is a call to action, it is not for those who believe in "crash programs" or instant solutions: rather, it lays a fresh course of stones on a ground plan already in being. Here are the foundations for a civilization that will replace the polluted, bulldozed, machine-dominated, dehumanized, explosion-threatened world that is even now disintegrating and disappearing before our eyes. In presenting us with a vision of organic exuberance and human delight, which ecology and ecological design promise to open up for us, McHarg revives the hope for a better world. Without the passion and courage and confident skill of people like McHarg that hope might fade and disappear forever.

• Lewis Mumford

This book is a personal testament to the power and importance of sun, moon, and stars, the changing seasons, seedtime and harvest, clouds, rain and rivers, the oceans and the forests, the creatures and the herbs.

These indispensable creatures, performing their vital role in the nitrogen cycle, deserve to be household words, man's great heroes. Yet sadly those who named them had no thought of public honor and familiarity and called them Azotobacter and Clostridium, Rhizobium and Nostoc.

George Wald once wrote facetiously that "it would be a poor thing to be an atom in a Universe without physicists. And physicists are made of atoms. A physicist is the atom's way of knowing about atoms." Who knows what atoms yearn to be, but we are their progeny. It would be just as sad to be an organism in a universe without ecologists, who are themselves organisms.

Every sizeable community exists partly to satisfy the outsider who visits it. Not only that; there always evolves a special part of town devoted to this purpose. . . .

. . . Some urban geographer will be able to explain why the Stranger's Path becomes more respectable the further it gets from its point of origin; why the flophouses and brothels and the poorest among the second-hand shops (now euphemistically called loan establishments—the three golden balls are a thing of the past), the dirtiest and steamiest of Greasy Spoons tend to cluster around those first raffish streets near the depot and bus and truck terminals, and why the city's finest hotel, its most luxurious night club, its largest restaurant with a French name and illustrated menus are all at the other end. But so it is; one terminus of the Path is Skid Row, the other is the local Great White Way, and remote though they seem from each other they are still organically and geographically linked. The moral is clear: the Path caters to every pocketbook, every taste, and what gives it its unifying quality and sets it off from the rest of the city is its eagerness to satisfy the unattached man from out of town, here either for a brief bout of pleasure or on some business errand. . . .

Many factors have helped preserve this kind of communal life in Santa Fe. The city fathers have had nothing to do with it, and there is a large and vociferous element that is ashamed of the town's informality. But it is lucky in possessing a population which is gregarious, and at the same time hostile to police regulation, and which remains loyal to a long-established tradition of group pleasures. Yet something of this color and vitality could be introduced to many other American cities; it is merely a matter of establishing (or re-establishing) the principle that streets are not intended solely for motor traffic but were made for any and every kind of outdoor group activity, from children's games to funeral processions and endless loitering in the sun. All civic architecture is essentially nothing but an appropriate background for this life; and city planning is chiefly justified when it helps preserve and foster informal communal activities.

Plan of Arcodighe (dam site)

To introduce living and working into the masonry of the dam means to transform a monolithic, noncellular system into one that is articulated and cellular. For equal mass the cellular system, not randomly given but structurally conceived, is stronger because it allows selectivity of orientation and dimensionality.

If one then considers the 1:7 ratio of redundancy in the safety coefficient in the dams built in the United States, one can see the wealth of schemes that can effectively and magnificently transform the blind mass into a singing environment.

few people have gotten to see paolo soleri's exhibit of his work at the whitney museum in new york, and not too many can put out \$26 to buy his book (which is well worth it)...but for \$1 you can purchase his poster which comes out each fall. soleri runs a summer school program for architecture students. each year he puts out a poster in the "siltpile series" advertising his school and generally telling what they're into. well anyway, it's a neat poster every year and he's now up to "siltpile no. 11".

Arcology

If I get it right [and getting it at all is something: it takes either lots of work or none at all] Soleri sees the next step in evolution as man's job. He sees that step manifested in an organism and that organism is the city. Soleri says that the first part of his book is the most important. But on seeing the second part it's very difficult to muster much time for the first part. It pays, though, nicely. Soleri refers to Teilhard de Chardin in approaching the understanding of man as a cosmic problem by ascending from physics, chemistry, biology and geology. Western man must rise from his technology and one (I think) way is by being aware (of it) but ignoring it at the same time. The manifestation of a process like this is, I think, a series of drawings like that of the second part of the book. These drawings are like doorways, they're of fantastic cities, wholly improbably but obviously, cosmically, possible. In fact, they are made real just by their presence in one place (the book) and by the interrelatedness of one project to the next, page to page, with seminal sketches appearing in the corners here and there. What's most fascinating is the next obvious steps: the Cosanti buildings in Arizona and Arcosanti, about to begin. He's not starting all at once, big money style but the way cities have always started: little by little. Like Nieuw Amsterdam on the tip of Manhattan Island or whatever city began at whatever river crossing or natural harbor, Soleri is beginning at a crossing of cosmic consciousness.

The Climate Near the Ground

This appears to be the definitive text on microclimatology: the climatic conditions within 6 feet or so of the earth's surface. The climate in this narrow stratum differs significantly from the overall climate, and the book analyzes, in some detail, the relation of soil, water, vegetation, topography, man and animals to the microclimate.

or WHOLE EARTH CATALOG

The risk of bringing about a deterioration of climate by human intervention depends on the type of climate, and is greatest where plant life is fighting for its existence because of a shortage of water or heat. It is possible for very limited intervention into the water balance to produce far-reaching results in the bordering regions of arid zones. Great "regeneration areas" have been laid out around the town of Broken Hill in Australia, the great mining center for silver, lead, and zinc, situated in the middle of arid desert land. Wise foresight indicating that the original sparse vegetation in the area would have to be removed by the inhabitants, a comparatively luxuriant type of vegetation was grown in surrounding fenced-in and irrigated areas, improving the climate of the town, providing recreation spaces, and offering protection against dust storms in summer.

Irrigation has a double purpose: to further the optimum growth of plants by giving them the supplies of water they need, and to increase air humidity during the hottest hours of the day in a dry period; this has the effect of reducing, as far as possible, the passive transpiration of the plant, which is its method of protecting itself against high temperatures, but which makes unnecessary demands on energy. The first of these aims is achieved by watering at night, the second by watering during the day with as fine a spray as possible. The period of watering, its duration, the quantity and temperature of the water must all be adjusted to suit the type and age of the fruit to be protected, and the weather at the time. Irrigation techniques must therefore go hand in hand with microclimatology.

LOVE

"Amen."

The Greek bowed to the west and he bowed to the east, and came up filled with love for everything in the universe. When he saw D.R. leaning against the picnic table with what he took to be a forlorn look on his face he felt apologetic for coming on to him so hard during the ceremony. To make amends he went over and hugged him.

"I love you, man," said the Greek. "I love you, and you and you too, you're all just lovely, and I love you. I love the bus, I love those people down there at the other table, I love that big truck, and its driver, and the drivers of all those cars going by. I love the desert, I love the sky, I love the mountains in the distance, the oceans beyond the mountains, and all who dwell in the lands beyond the oceans. I love all sentient beings everywhere, regardless of their race, color, creed, place of national origin, or species.

"Now perhaps you wonder how it is that a mere mortal such as I have become capable of such boundless love for everything in all creation. I mean, how is it, do you suppose, that a single individual is able to sustain a feeling of love for absolutely everything, twenty-four hours a day, every day, all his life? The answer, my friends, is simple. You all of course know what the ego is. How it is first developed out of the formless void that is the childhood psyche, and then, through strength of the adult will, through ceaseless practice of the yogic disciplines, it is at last obliterated so that that which was torn asunder by the trauma of leaving the mother's womb has been reconciled and made whole again, where all is one and one is all, where the twain not only meet but embrace and join together in eternal union of individual consciousness with the cosmic life force. Well, love is bound up in the workings of the ego in a fundamental and inextricable way. A lot of people are confused by this point, because they are confused by the apparent contradiction built into the notion of coming to consciousness by abandoning the quest for consciousness. The great yogis and mystics and teachers of The Way have all enjoined us as disciples to abandon self-consciousness in striving for total awareness, and yet, as a means of gaining the strength to bring about that abandonment, we are simultaneously enjoined to become more self-aware. How then do we practice self-forgetfulness at the same time we are asked to cultivate self-awareness? A lot of seekers have been defeated by that contradiction, and this is tragic because the way out is actually so simple and easy to see you really feel embarrassed when it finally dawns upon you. The answers to all the great questions are really very simple, just as the simple way of life is the proper path enroute to the Greatest Question. Simplify! Simplify! Simplify! cried Thoreau, and he was right.

its great strength and elasticity

The mechanical stresses that occur in the branch of a tree may be presumed to be the same as in any other cantilever. The material towards the top of the branch is in tension, while the material near the bottom is in compression. If it is to keep a straight course the wood must resist both these stresses equally. How it maintains its apparently predetermined course we do not know.

If we study the wood on the lower sides of branches of coniferous trees, or on the upper sides of branches in broad-leaved trees, we find that it has a distinct structural difference from the rest of the wood. This wood is called 'reaction wood', and it differs from normal wood both anatomically and chemically. In conifers, where it is called 'compression wood', it is darker than normal wood, and the walls of the cells are more heavily impregnated with lignin. The tracheids are shorter than usual, and the wood is denser. The secondary lignified cell wall which is laid down inside the primary wall consists of three layers in normal wood, but in compression wood there are only two layers, the innermost layer missing.

In branches of broad-leaved trees there is no compression wood, but the wood laid down on the upper side of the branch, known as 'tension wood', shows modifications in structure. The vessels are narrower, and the fibres have a thick inner layer—the gelatinous layer—which refracts light very readily and is composed mainly of cellulose instead of lignin.

Recent work has indicated that the formation of reaction tissue is not limited to the wood, for the secondary phloem, the cortex and the cork cambium may also show modified growth.

The study of reaction wood is a relatively new branch of botany, and much remains to be found out before we shall be able to claim to understand its formation fully. Its function, if any, in the life of the plant is at present uncertain, but several prominent workers in this field have expressed the opinion that reaction wood is in some way responsible for the fact that branches do continue growing in the direction in which they start, and do not change their direction of growth as a result of the stresses set up by their own weight.

Water is not sucked up from the leaves, nor is it hoisted from below by root pressure, except, perhaps, in small plants. Our third possibility, that it is pumped up by some intermediate cell mechanism, also appears to be without foundation. One is tempted to say that it gets up by the grace of God, but scientists are chary about calling upon divine intervention in order to explain awkward facts. We must look again at our various possibilities (or impossibilities) and see whether we have missed something.

Turning once more to the theory that water is raised from above we can see at once that there is plenty of force available for the job, for transpiration sets up an osmotic gradient in the mesophyll of the leaf with pressures well above the ten or twelve atmospheres that we need for raising water even to the top of a *Sequoia*. The trouble begins when we try to see how it is applied. Suction just will not do, for we cannot get around the fact that the water barometer cannot exceed thirty-three feet. Some other phenomenon must be involved; something that can enable the pull in the leaves to reach right down into the roots and haul the water up. The answer to the problem seems to lie in a theory first put forward some time ago by Dixon and Joly, known as the 'cohesion theory'. A solid

Longitudinal section of part of a tracheid of the yew, showing the tertiary thickening bands that give the wood of the yew its strength and elasticity.

substance is held together by forces of cohesion between its molecules, which form a rigid crystal lattice that resists being broken. In a liquid the forces of cohesion do not hold so closely. The molecules can slide about over one another but they are still held by cohesive forces and prevented from escaping altogether. Only when a molecule gathers to itself sufficient kinetic energy (energy of movement) to overcome the force of cohesion does it fly away completely—in other words, vaporize.

According to the Dixon cohesion theory, the water in the vessels forms an unbroken column from the roots up to the topmost leaves. The cohesive forces in this column of water resist breaking, so that when the osmotic gradient set up by transpiration exerts a pull on the top end of this column of water, the whole column moves upwards just as the oil dipstick of a motor car comes up when you pull the top end of it. Notice that we have now got rid of the idea of suction and the difficulty of the water barometer. The force that pulls the water up is an osmotic one, and it is transmitted down the stem by the cohesion between the water molecules.

The dodder (*Cuscuta europaea*)
growing on willow

Many so-called primitive peoples deplore our habit of moving (with all our belongings) from one house, or apartment, to another. Moreover, the thought of having to live in rooms that have been inhabited by strangers seems to them as humiliating as buying second hand old clothes for one's wardrobe. When they move, they prefer to build new houses or to take their old ones along.

Antoni Gaudi

If everybody's so inspired by Gaudi, like they say they are, how come there's no new buildings around that look like his?

God damn architects who bore and stifle and preen their chickenyard feathers. Give us more jungle birds like this one. If their buildings are inconvenient, good.

—SB

Views of vaulting in the *Güell Colony chapel*. This type of construction recalls that used on the roof of the *Milá house*. The ribs are brick partitions that achieve structural efficiency without bulk. The construction of such vaulting requires expert craftsmanship, and careful direct supervision. There are scarcely any repetitive elements; but the application of the same directive principle and a use of warped shapes throughout make the work simpler.

These benches are shaped to the human body. In addition their serpentine design facilitates the formation of conversational groups, for those watching children at play on the terrace. Gaudi's designs are not abstract and inhuman as they may sometimes appear. Human needs and their satisfaction are carefully considered. Perhaps it is due to his understanding of these needs, that Gaudi's work has always met with popular acceptance, while often being regarded as eccentric by the more sophisticated public.

To the young man in architecture, the word *radical* should be a beautiful word. Radical means "of the root" or "to the root"—begins at the beginning and the word stands up straight. Any architect should be radical by nature because it is not enough for him to begin where others have left off.

To acquire technique study the materials of which the product is made, study the purpose for which it is produced, study the manhood *in* it, the manhood *of* it. Keep all this present in your mind in all you do, because ideas with bad technique are abortions.

Beware of the architectural school except as the exponent of engineering.

Go into the field where you can see the machines and methods at work that make the modern buildings, or stay in construction direct and simple until you can work naturally into building-design from the nature of construction.

Immediately begin to form the habit of thinking "why" concerning any effects that please or displease you.

Take nothing for granted as beautiful or ugly, but take every building to pieces, and challenge every feature. Learn to distinguish the curious from the beautiful.

Get the habit of analysis,—analysis will in time enable synthesis to become your habit of mind.

"Think in simples" as my old master used to say—meaning to reduce the whole to its parts in simplest terms, getting back to first principles. Do this in order to proceed from generals to particulars and never confuse or confound them or yourself be confounded by them.

So—the first thing to do was to get rid of the attic and, therefore, of the dormer and of the useless "heights" below it. And next, get rid of the unwholesome basement, entirely—yes, absolutely—in any house built on the prairie. Instead of lean, brick chimneys, bristling up from steep roofs to hint at "judgment" everywhere, I could see necessity for one only, a broad generous one, or at most, for two, these kept low down on gently sloping roofs or perhaps flat roofs. The big fireplace below, inside, became now a place for a real fire, justified the great size of this chimney outside. A real fireplace at that time was extraordinary. There were "mantels" instead. A mantel was a marble frame for a few coals, or a piece of wooden furniture with tiles stuck in it and a "grate," the whole set slam up against the wall. The "mantel" was an insult to comfort, but the *integral* fireplace became an important part of the building itself in the houses I was allowed to build out there on the prairie. It refreshed me to see the fire burning deep in the masonry of the house itself.

Simplicity in art, rightly understood, is a synthetic, positive quality, in which we may see evidence of mind, breadth of scheme, wealth of detail, and withal a sense of completeness found in a tree or a flower. A work may have the delicacies of a rare orchid or the stanch fortitude of the oak, and still be simple. A thing to be simple needs only to be true to itself in organic sense.

Style is a free product but, still, a by-product: the result of the organic working in, and out of, a project entirely in character, altogether and in one state of feeling.

In Japanese architecture may be seen what a sensitive material let alone for its own sake can do for human sensibilities, as beauty, for the human spirit.

Whether pole, beam, plank, board, slat, or rod, the Japanese architect got the forms and treatments of his architecture out of tree nature, wood wise, and heightened the natural beauty of the material by cunning peculiar to himself.

The possibilities of the properties of wood came out richly as he rubbed into it the natural oil of the palm of his hand, ground out the soft parts of the grain to leave the hard fiber standing, an "erosion" like that of the plain where flowing water washes away the sand from the ribs of the stone.

"And that's why I'm concerned about you, my friend. I have the feeling that the answers to the great questions that are obviously troubling you are as plain as the nose on your face, but you are just too ego-centered and self-involved at this point to realize that. I've got the feeling that the Word you are so in need of hearing is sounding in the atmosphere this very minute, but that you are too full of the static of your petty mind to hear. I think the first thing we ought to do by way of helping you to find some relief for your condition is to help you forget your name. I've forgotten mine. I don't have the slightest idea what my name is, and its the most wonderful sense of liberation there is. It's like the rebirth that follows the spiritual death necessary to true illumination. One must suffer many deaths on the road to illumination, some actual, some only symbolic. Giving up your name is only a symbolic death, but for many people it is so painful it could well be likened to an actual death. What they fail to understand is that after death is the resurrection, the restoration to life that all the great spiritual leaders have experienced. This experience is available to every individual on one level or another, on planes both gross and subtle, if the individual is truly committed to his quest for the Ultimate Way. So what I need to know before we go any farther is exactly what your full name is. And your place of birth, your astrological sign, your height, weight and rate of heartbeat. Since you are having trouble speaking, perhaps you could just write all of that down in this little notebook here, and then we can get started."

The Greek handed D.R. a worn notebook with the yin-yang symbol drawn on the front in blue ink, and the word "love" written about fifty times on the back. The book had about a hundred pages in it, and nearly all of them were full of writing, and drawings and weird little scribbles too obscure to make out thumbing through. The book excited D.R. tremendously. He wished there was some way he could ask to read it. But that was not the purpose now. D.R. flipped to near the end where the blank pages began, and with the Greek's ball point pen wrote down: "Divine Right (David Ray) Davenport. Finley County, Kentucky. Cancer. Five Feet, Ten inches tall. 158 pounds. I don't know my heartbeat."

"Well, a close estimate will do," said the Greek. And he took D.R.'s wrist in his hand, located his pulse, and began to count it as he watched the seconds tick off on his wrist watch.

The Japanese House

Without getting all sentimental and exotic we're still going to agree that Japanese make better houses than anybody else (they also have the fastest growing economy in the world, but that's another story — or is it?). If you're going to build your own house and don't mind some inspiration on the subject, this book was laboriously made for you. It's a great big Christmas present of a book full of yummy photos and diagrams and details of technique, all of which seems right within reach: I-can-do-it. Nice cure for nothing-can-be-done-be-cause-it's-too-damned-big industrial blues.

\$27.50 may choke you up, in which case get *Japanese Homes and Their Surroundings*, \$2.50 from Dover Publications—straight information on how to hand-make a lovable environment. —SB

SECLUSION IN BUILDING is an essential instrument for establishing, or preserving, the freedom of man. For, only in solitude can man escape from the coercion to which he is subjected when among the masses.

Shōji paper is the "glass" of the Japanese house. Its qualities, however, are of a different nature, and, thus, also are its effects. The light, broken already by the broad overhang of the eaves, is diffused by the paper and creates a characteristic light condition comparable to twilight. This situation does not change basically even if the evening or winter sun hits the paper directly. No glare, no shadows; a general gloom creates a soft, emotional atmosphere. With artificial light in use, the shōji paper shows its reflective-diffusing ability, and at night with lights turned out, might even offer an interesting shadow play the moon has staged with the old weather-worn pine tree. As time passes, the paper darkens. Here and there, a torn piece is carefully cut out and replaced by new, lighter paper. The paper pattern becomes, though irregular, more interesting and lively. The paper ages, as does man.

Shelter and Society

Almost all the books you ever see on architecture are concerned with monumental building, a result of the relationship between architects and wealthy patrons. Seldom do you see anything on buildings by the people, of local materials and in simple harmony with the surrounding landscape.

Here's an exception. On the cover is what at first glance appears to be a primitive Portuguese fisherman's house. On closer inspection, it's a picture of one of Drop City's domes, colorful, funky, having sprung from the trash of "... a wasteful society."

10 types of dwellings are covered, by different writers. A comparison of the pueblo and the hogan, the walled city of Old Delhi, the Norwegian Laftehaus, Villages on the Black Volta, and a fine article by Bill Voyd on funk architecture at Drop City. Many of the photographs are too dark, but you won't find them elsewhere.

It's more of a book on the functions of the buildings than on the external aesthetics.

—Lloyd Kahn

"All is as it should be", says one of the beings. "Nothing is complete," returns the other; "look at those creatures below this mountain, whom we see assembling, then disbanding, looking about, and betaking themselves to shelter."

From the Prologue to *The Habitations of Man in All Ages* by Viollet-le-Duc, translated by Benjamin Bucknall, Architect. 1876.

To the Egyptians, shelter for the dead was more important than shelter for the living; our factories, he argued, suggest that shelter for machines is better served today than that for men or gods: "Shelter seems, indeed, to have been a minor consideration in many of the early cultures."

For the very congruity and harmony which is so frequently a source of admiration and comment in architectural writings on vernacular shelter is evidence of the integration of the building in the life of the community as a whole.

The close link between dwelling and land expressed in the resemblance of the pueblo to a land-form seems to reflect the overall harmony of man and nature. The house is sacred, and so is the whole landscape and everything in it. Corn was more than a food, it was a symbol of life, and corn growing was regarded as a religious activity. Among the Tewa, for example, the greater part of religion centres around corn and, by extension, around agriculture in general. This attitude must influence the form of the pueblo and particularly its siting and relationship to the land; it helps to explain why the pueblo seems such an inevitable part of its surroundings.

Sun movements and solstices are extremely important, being related to ceremonial cycles. The pueblo is carefully orientated: it is related both to mountains ("Life comes from the mountains") and to the six cardinal points and the sacred directions of East and North.

The Office: a facility based on change

Nobody involved in this book is an architect, which is pretty interesting, because most of its implications are architectural. The design principles here apply splendidly to any work or living area which traffics in information or human interaction, from offices to small communities. It's a fine presentation of new theory, and Herman Miller, Inc. now has a line of office hardware behind it. We bought the book and hammered our own furniture out of scrap doors and 2x4's.

The most serious health problem in offices is its sedentary nature. Compelled by lack of choice, we are forced to conduct most office activity in a sitting position. The result, as medical studies and insurance data make clear, is a steady decline in vitality, energy and general body tone.

Of even greater significance is the importance of sight as a window to mental recall. An office with no relevant visual display deprives the human performer of a spectacular recall tool: the human eye as a receptor for the mind.

Three sides with a slightly widened opening appears to be the best enclosure of all as a generality. There is good definition of territory or domae . . . privacy is well expressed and the ability to survey or participate is well maintained.

The management of symbolic representation of reality is the function of offices.

The office in its short evolution has adopted every kind of communication abstraction. Resultantly, we are concerned with reality simulation.

Face to face across a surface maintains formality and a tone of discretion. Ninety degree location, the most natural of all conversational positions, encourages exchange. Side by side positioning allows joint viewing of papers or objects intelligibly.

Structural Design in Architecture

Scope: Load determination, material characteristics, design of beams, frames, cables, arches, plates, thin shells, membranes, space frames.

This is a book of tested formulas that give back-of-the-envelope solutions that are good to within a few percent. Nothing revolutionary. Just very well done. The book is set up in useable fashion—derivations that give a good feel for what's going on, relevant formulas, and realistic examples. Salvadori is a real-world man: he knows where precision is required and where it is not, and that most architects and builders can only handle algebra and trig, maybe a little calculus. So he makes the right simplifying assumptions on complex problems, to produce a book that architects can USE: many structures can be completely designed, and larger, more complex structures can be checked for feasibility.

[Suggested and reviewed by Charles Tilford]

A balloon built by means of two flat, identical spherical sectors with a radius of 160 ft and an opening angle of 30°, supports a live load $q = 30$ psf and is to be prestressed with a safety factor of 4/3.

[Suggested by Jordan Belson.]

Around us was an awesome display. Marge's eye was a clear space 40 miles in diameter surrounded by a coliseum of clouds whose walls on one side rose vertically and on the other were banked like galleries in a great opera house. The upper rim, about 35,000 ft. high, was rounded off smoothly against a background of blue sky. Below us was a floor of low clouds rising to a dome 8,000 ft. above sea level in the center. There were breaks in it which gave us glimpses of the surface of the ocean. In the vortex around the eye the sea was a scene of unimaginably violent, churning water.

Before Johnstown there were several small communities. The flood practically washed them out of existence, like a steamroller crushing toy villages. A stone viaduct was snapped in two as if made of dry clay, then ground to pieces. An iron bridge high in the valley was torn from its foundations by a blow from the edge of the flood. Dozens of locomotives and passenger carriages, hundreds of freight cars, and miles of track were swept forward as the monstrous river pounded down the valley. All these added immeasurably to the battering effect of the water.

During a hurricane on Puerto Rico on September 13, 1928, a ten-foot pine board measuring three by one inches was shot through this Royal Palm tree.

A tornado, like thunder, is heard many miles away. As it approaches, there is a peculiar whistling sound that rapidly changes to an intense roar, reaching a deafening crescendo as it strikes. The screeching of the whirling winds is then so loud that the noises caused by the fall of wrecked buildings, the crashing of trees, and the destruction of other objects is seldom heard.

After each strike we moved in silence for a while, with only the tearing wind and slashing rain. Then the rocks would begin a shrill humming, each on a slightly different note. The humming grew louder and louder. You could feel a charge building up in your body. Our hair stood on end. The charge increased, and the humming swelled, until everything reached an unbearable climax. Then the lightning would strike again—with a crack like a gigantic rifle shot. The strike broke the tension. For a while we would grope forward in silence. Then the humming would begin again [quoted by Colin Fletcher.]

ESTELLE'S COMPLAINT

As desperate as she was for someone to help her drive, and generally hassle the whole bummer of a scene on to St. Louis, Estelle wished she was by herself again. The girl Frieda seemed okay, actually. At least she was cool enough to simply settle into the motion of the journey and keep whatever trip she was on to herself. But the Greek was such an asshole Estelle could not bear to stay in hearing of his voice. What Frieda saw in the Greek Estelle could not begin to imagine, but whatever it was, she hoped she did not hear about it. Frieda was a sad, forlorn little chick, obviously in need of some sort of help, but Estelle just did not have the psychic energy to go messing with her head. Maybe later, if things cooled out a little, they could manage a little chit-chat, but for the time being the only thing Estelle could think about was getting as far away from the Greek as possible.

At two o'clock on a hot afternoon in the middle of the desert she didn't have much appetite for walnuts. But if walnuts were what fate was serving up that day she guessed that was what she'd have. She reached into the Greek's leather food bag, got a handful of nuts, and eating them strolled off toward the dunes she'd walked on a while ago.

The thing that particularly bugged Estelle was the way Divine Right was zapping on the stupid Greek. There he'd been in a stupor for eight hours, sometimes huddling in her arms like a baby, and as soon as he comes out of it what does he do but fall in love with the first wise-man to come along and lay a heavy word trip on him. They were only a few minutes into it together, D.R. and the Greek. But Estelle had seen it happen so many times before she knew exactly what was coming down, and it was a drag. In her mind she saw the next five hundred miles unfolding in a stream of blather from the Greek while D.R. sat beside him dotting on his every word.

Oh D.R., Estelle thought. You're such a goddamn chid. When he was right, when he was clear and cool and up and unhasled, D.R.'s mind was as beautiful to see in operation as anybody's that she knew. And yet he craved other people's words about "truth" and "life" like some poor junkie craving dope. If it was a habit D.R. had, there certainly wasn't any shortage of junk on the circuit they traveled in. As far as Estelle could see there were at least twice as many wisdom-pushers as dope dealers in the world, so how come the cops never got uptight about them? If she'd kept notes on all the philosophies, theories, schemes and plans to bring the world to a state of grace and love and enlightenment she'd heard in the last eighteen months she'd have enough recorded bullshit to fertilize the cosmic compost pile. There'd been a time when she was young, way back there a year or two ago, when other people's enthusiasms could excite her a great deal. But because enthusiasm was all it usually amounted to, Estelle didn't get much out of it anymore. Because D.R. still did, because he was so willing to devalue what was already in his own head and credit fast-talking assholes with some sort of superior wisdom, it divided them, and left them in different places. If she could have believed that he was over there at the picnic table grooving on the food freak simply because he was stoned on acid and everything he saw and heard seemed groovy, it would have been one thing. But Estelle knew that wasn't what it was. D.R. would have homed in on this dude stoned or sober and that was why it bothered Estelle so much. She knew that left out a lot about D.R. She knew there was a lot more to it than that. But right now she wasn't able to consider much that was in his favor. She was pissed and jealous and weary and depressed. If D.R. had any virtues that redeemed him she preferred not to think about them right now.

The classic photograph of a tornado, taken near Jasper, Minnesota, on July 8, 1927
Lucille Handberg

Architectural Design

This is the only architectural magazine we've seen that consistently carries substantial new information, as distinct from the stylistic eyewash characteristic of most architecture journals.

After a year of watching and using AD, it's clear that this is much more than an architectural magazine. It prints lots of news of American creative doings months before any U. S. publication. Its coverage of developments in cybernetics, structure systems, philosophy, use trends (e.g., communes), etc. is extraordinary.

I REPRESENT THE HIGH CAPITAL COST, LOW RUNNING/OPERATING COST SITUATION

Peter Brookes/Dad

Guadi's Parque Guell—"one of the most cybernetic structures in existence."

It is worth noting that the piezoelectric effect has been observed in a number of organic materials, among them wood, bone, tendon and skin and the argument has been put forward by Shamos and Lavine and others that the piezoelectric properties of these fibrous polymeric materials function as stress-sensing devices in living organisms and could account for the evolutionary and self-organizing structural characteristics of living things. In wood, stress concentrations due to wind loads would produce an electric potential proportional to the stress in any part of the tree, which might act as a growth signal, causing greatest growth in the parts that are stressed most.

As a combined sensor/effector device the possibilities are even more exciting. The most obvious and immediately valuable—if vaguely banal—proposition is that of producing a compression structure with infinite stiffness.

This Graded Universe—Lancelot Law Whyte

You should have seen the look on his face when God solved the problem of making an endlessly varied universe. He had already made two. The first was an ideal gas near to maximum dynamical disorder. That was dull; any differences he put into it soon vanished. It was an entropy victory, without order, form, or life.

His second was a world of perfect crystals. That was fun; there were 230 different types, all aesthetically intriguing. But each crystal was homogeneous, and therefore rather inert. It was a cold world (near zero), and left him dissatisfied. What he wanted was a blend of order and diversity, enough order to be pleasing and enough diversity to be continually forming new patterns, its fertility born of differences. Then he thought 'Splendid. I have a divine idea. My next universe will be the scene of two competing tendencies: morphic⁹ processes generating three-dimensional geometrical order, and entropic processes leading towards dynamical disorder. That will make for unending variety, and when they're fluctuating nearly in balance something extraordinary will occur. The morphic processes will keep building ordered units and forming a great hierarchy of structural levels, from parts to wholes, while the entropy processes will tend to disperse the hierarchy. This subtle fluctuating balance will be called "life" by systems that display that vitality in a special mode to be called by them "thinking".'

Beyond Habitat

We've carried Buckminster Fuller, Paolo Soleri, and Christopher Alexander, so here's Moshe Safdie's first book. His first project, Habitat, was a major attraction at Expo '67 in Montreal and established him as a boy wonder in a field that usually requires decades of tooth toughening to succeed. The book is interesting for his ideas of high-rise village life, but even more valuable to the budding genius is his account of the political and economic pressures that shape a project and squash the designer and betray that original sweet idea.

(For an even more revealing perspective on Big Project success, try Albert Spear's Inside the Third Reich. Spear, at 29, was Hitler's architect. I used to think The Fuhrer was a frustrated architect. Turns out he was a successful one.)

Safdie's Student Union for San Francisco State College was initiated, guided, and funded by the students. The building was stopped by asshole trustees.

This was another moment when Habitat sat poised between life and death. At that point Churchill could have backed down before Lapointe's pressure. He could have said, "It's your property, you paid towards making it, and you have some rights to it..." or "What do you think we should do with it?" Instead, he turned round and asked, "Are you prepared to build it? Are you prepared to finance the whole project?" La pointe said, "No." Churchill said, "When you give money to the government you give it without any strings attached. The government owns what is done with the money you have donated. This is our plan. The Corporation owns it."

That was when I realized how strong Churchill really was. He had dealt with the private sector as a government official; there had often been attempts to push him around before, and he wasn't taking it. Right there he saved the project from drifting into the potential problems of the cement companies' uninvolved involvement.

Proposed San Francisco State Student Union

Sweet's Files

It's a shame some of the best tools are the hardest to get to. Though Sweet's are free, they are given only to Public Libraries in cities of more than 250,000 people and to the 10,000 most active architectural firms in the U.S. It's often possible to talk a local architect out of last year's edition if you speak for it early. They do not become obsolete just because they are a year or two old.

Sweet's is essentially a catalog of catalogs, a filing system in a yard of volumes which binds, lists and cross-references catalogs of manufacturers. It covers six areas that I know of: Industrial, Residential and Commercial Construction and Product, Interior and Plant Design. Each file in these areas is a separate entity. The commercial construction file is the one most architects have and for any one building, it is the most useful. It is very helpful when improvising details for it provides a full spectrum of what is already available for the ready-made answers to most problems. Manufacturers usually do a pretty good job with the material they include in the files so there's not much left to question as to how their product works. If there is any question, the manufacturer's representative is usually listed, with his phone number and address. He'll usually bend over backwards to help you if you say you saw it in Sweet's.

BASE DETAIL

Architectural Graphic Standards

If Sweet's is a kind of magic lamp in many architects' and builders' libraries, the genie might well be 'Graphic Standards. This volume has been around for years; its latest edition is its fifth. Whenever the office expert hasn't got the answer, 'Graphic Standards usually does. It is the how-to-do-it book of construction. It doesn't cover dimes but if there's anything else you have in mind, it's probably in there. Older construction techniques (stone masonry, etc.) are covered as well as relatively newer techniques; it's very useful in remodeling and repair work. Everything is done with a minimum of verbiage and a maximum of illustrations and very useable charts and graphs. 'Graphic Standards is so taken for granted by any architecture student or office that it's almost become a challenge to stay away from it; ultimately, however, there's seldom a building built without reference to it in the U.S. today. TOOL.

and be able to perambulate, or pick up the usefulness of many environments

You'll Build Your Next House of Molasses

Molasses used to be an ingredient of cookies that mother made or something to put on hot cakes if you couldn't get maple syrup.

But today, if you visit our laboratory, you can hardly turn around without bumping into molasses. Beyond festoons of Spanish moss behind our home is an entire building made of molasses. It houses the machinery for making more molasses products. To get to it, you walk along a molasses driveway that looks, feels and acts like "black top." Here and there, molasses building bricks are drying in the sun. Inside the building, you walk on a molasses floor, examine samples of hard or flexible molasses sewer pipe that rest on a laboratory table top made of molasses. There are samples of molasses plaques flexible as rubber, molasses plaques as hard as rock.

The 50-foot molasses black-top driveway you walk on would cost the average homeowner about \$50. Less if he did it himself. A five-room house built with molasses adobe brick on a molasses slab, finished with molasses stipple spray outside, troweled molasses plastic inside, would cost a man less than \$1000, exclusive of electricity and plumbing. What's more he'd have a house that would stand a hundred years or more—moisture-proof, sound-proof, self-insulated, termiteproof. It's the cheapest building material in the world.

Naturally, to make these things you don't just take a barrel of pure molasses and start gumming everything up with it. Powdered molasses is the basic ingredient of a new thermosetting plastic that does the trick. By mixing this powdered molasses with plain bunker fuel oil and certain catalysts, we have come up with a thick black Plastic Bitumen we call Plastic B concentrate. By altering the formula slightly, we have made it in three different grades to produce different degrees of hardness.

Plastic B, mixed with clay and sand, produces a waterproof adobe brick hard as concrete. A different mixture of the same ingredients makes a cheap, quick-hardening paving material for driveways, highways, parking lots, tennis courts and landing airplane strips. Substitute clay and a fibrous filler for the clay and sand, and a brand-new plastic is formed, Plastic C. This can be mixed with water and sprayed outside a building to give it a tough stucco finish that won't crack or come loose. Troweled like plaster, Plastic C makes smooth inside walls, floors, ceilings and impervious table tops. . . .

The real secret of Plastic B is the dehydrator, which takes the sticky blackstrap molasses and makes a dry granular substance of it—like brown sand. We had a tough time devising a drier to do the job. Centrifuges gummed up in no time. Freeze driers solidified the stuff in gobs. Hot air only did half the job, and if heat was boosted the molasses caught fire.

Today, in the pilot plant, the blackstrap molasses goes into a hot-air drier of our own invention. Blackstrap molasses is pumped into the top of the big drumlike drying chamber under pressure. There it passes through an area of high heat in a split second. It's powdered before it knows what happened, and falls to the bottom of the drier like snow. But it didn't happen overnight. For instance, until we put in strong, stainless steel pipe, feedlines burst under the tremendous pressure. Hot molasses would geyser all over everything. We spent weeks cleaning molasses out of our hair and scraping it off the walls and ceiling.

Once mixed with oil and catalytic agents, the powdered molasses flowing from the drier becomes a regular polymerized plastic with remarkable properties. Anyone can make Plastic B-brick himself. Take a regular mortar-mixing box, and hoe up what looks like cement. It's actually 65 percent plain sand, 30 percent clay and 5 percent liquid Plastic B. Water is sprinkled on and hoed in until the mixture has the consistency of stiff mortar. The man trowels this into wooden forms, one measures 4 by 8 by 16 inches, or about eight times the size of a regular red brick. The other is 4 by 8 by 8 inches. Off come the forms immediately and oddly enough, the wet bricks stay set. In three days they're dry enough to stand on end. They are laid the same way as conventional bricks.

There's nothing new about adobe bricks, but there's something new about these. The Plastic C acts as a binder and makes them as rugged as concrete. Plain adobe has never been practical in wet country because rain washed it away. Plastic B makes the brick waterproof. We have set bricks in water for 30 days beside other brick. Plastic B-brick absorbed two percent moisture, cement brick eight percent, and regular red ceramic brick twelve percent. Plastic B-bricks have been lying all over the yard in rain, frost and heat for a year. They still look and test as good as new in the jaws of the pressure jack in the laboratory.

We contend that since the bricks are dirt, "they're cheap as dirt." We have determined that it takes 3050 of the big bricks to make a one-story adobe house of five rooms. You'd need a dozen barrels of Plastic B at \$24 a barrel to do the job. That's \$288 for the main shell of your dwelling. You'd set it on a waterproof, Plastic Bized adobe slab. Then, used Plastic B spray on the walls and ceiling—and on the exterior if you want a stucco-type finish. You'll have to buy 2 by 6 rafters and joists. But the whole house should not cost more than \$150 a room, exclusive of plumbing and electricity.

And about that driveway? You can make that yourself, too, if you like and no one will ever be able to tell it from black top. Fifteen pails of plain beach sand to one pail (about two gallons) of Plastic B, and you've got about a square yard of driveway. In 24 hours, it's ready to use. No heavy compacting machinery is necessary, though the more compacting the harder the surface.

We compacted our own driveway with an ordinary lawn roller. Just rake out the Plastic B as you would an asphalt mix, and start rolling. . . .

Probably the most versatile of all the molasses products is Plastic C—which is simply Plastic C mixed with clay and a filler. This can come ready-to-use in 10 gallon moistureproof bags, which can sell for about 60 cents a gallon.

Thinned with water, it can be sprayed on the outside of an old house like stucco, troweled on old uneven floors to level them and give them a continuous surface like rubber tile, spread on table and counter tops to give them a flat surface impervious to acids and alkalis, laid on interior walls like plaster or molded into forms. Since it's waterproof, it's ideal for lining anything from showers to old-farm outbuildings. Eventually, the material will come impregnated with a variety of color, so no painting will be necessary. . . .

To show how it can work on an old building, a 150-year-old cookhouse was falling apart. Using the spray, we have put a complete new surface over the inside walls and ceiling, using about \$6.00 worth of Plastic C. We also troweled the thick material on the old, uneven wood floor. You use a mixture of mostly sand to fill in the low spots. Then a thin layer of standard Plastic C is laid on top. When the floor of the cookhouse is finished, the outside will be sprayed—right over the old shiplapping.

We usually nail tarpaper and fine chicken wire over the surface, so we don't have to fill in all the hollows and consequently use three or four times as much Plastic C.

When complete, the old cookhouse will be tight as a battery box upside down—sealed inside and out against weather, termites and moisture. All for a materials cost of about \$25.

Besides its unique qualities, we expect the demand for this molasses plastic to be high largely because of its low price—which we believe will always be low. Blackstrap molasses has jumped in price per gallon since we started. It's still cheap. But if it gets any higher, we'll switch to wood molasses, which is just as good and much cheaper. Sure it will be synthetic molasses, but Plastic B is synthetic asphalt. How synthetic can you get? As synthetic as necessary.

A number of people have questioned us about the wisdom of using sugary substance like molasses for building material. One woman wanted to know what we'd do to prevent ants and flies from eating her molasses driveway. We told her all Plastic B driveways and roads would have to be posted with ant-sized signs saying "Please Do Not Eat the Highway."

Actually, since the molasses has been completely polymerized, there is no sweetness or food value to be found in it. The experimental driveway only has a normal quota of ants and none of them look like they're eating it. But, you've got to admit that a molasses house really would be "Home, Sweet Home."

Very truly yours,
Robert Morse

FRIEDA'S NAME

So everybody around the old picnic table has something to do now except Frieda. The Greek is teaching D.R. how to do alternate nostril breathing, and Estelle is off brooding among the dunes. That leaves Frieda to entertain herself, and so what she decides to do is work some more on letting go of her name. As we know, the Greek has forgotten his name completely. It took him six months of concentrated effort, but he made it. Frieda is not as strong in the mind as the Greek. She has been at it over nine months now, and where she is at is that delicate halfway point between being totally identified with her name, and forgetting it all together. She has managed to forget how to spell it; it means nothing to her to see the word "Frieda" written down. But when she hears it, the imprint is restored in her mind and her effort is set back a frustrating distance. Becoming nameless in a world where everything is named is a complicated process requiring the utmost diligence and perseverance, but she is committed now. That is the legacy of being the girl friend of the Greek for over a year.

The only thing wrong with that legacy, though, is that now she is known as the girl friend of the Greek. Where is that at? she asks herself. How is that better than being known as Frieda? It has slowly been dawning on her that it isn't better, that, in fact, it is a good deal worse, and suddenly she is resolved:

She stands up, dusts off her pants with her hands, glances at the Greek who is busy teaching D.R. the bellows breath, walks with great dignity over to the picnic table where the family is eating, and asks if she can ride away with them when they go. At first the family is a little uptight about this strange request, but when the girl explains to them that she has been kidnapped and held for ransom, they understand. The big fat momma of the family especially understands. She was never kidnapped, but she was an orphan as a child, and in her heart she carries a vast reservoir of love, pity and protective concern for all waifs and strays. She is also one very tough big fat momma. She offers to go over and beat up on the poor girl's tormentors, and take them before the law. But Frieda says no, that merely to escape will be enough. So the family, the Willitts family, of Oklahoma City, abruptly begins to pack up the food and load into the two-tone green and white Pontiac nearby. Momma shepherds the whole gang in before her, the Greek's former girl friend, two boys about eleven years old, a little girl about six, an old grandfather, and of course Poppa Willitts, who drives. It's crowded, but they manage. Momma Willitts gets in last, and the Pontiac, sagging drastically, eases out of the rest area onto the freeway, headed west.

The Technique of Stained Glass

Alright, you dome builders, now that you've got the sunlight working for you, how about getting it to play for you. There's livelier routes to color than car tops. Stained glass technique, ancient and modern, is here in depth. List of suppliers given. —SB

Catalog

\$25

from:
Whittemore Durgin Glass Company
Box 2065
Hanover, Massachusetts 02339

Besides lead came and the usual type of cathedral glass most people would associate with such work (including even—shudder!—"kits" for beginners), Whittemore-Durgin—for reasons known only to themselves—carry such goodies as World War II Meat Rationing Tokens, antique dog license tags from Bedford, Pennsylvania, old buttons, stop light lenses, and seemingly endless quantities of beads and antique hatpins! (They even operate a hatpin approval service.)

Even if you hate stained glass (though I can't imagine why anyone would bother hating it), whose day would not be brightened by the news that he can obtain

QUIZZICAL YELLOW FISH EYES ON WIRE—As a result of a bad trip (to our attic) we have become almost sole owner of all these glass fish eyes. We can only describe these particular eyes as being mildly interested, but not exactly cordial. It would be of considerable benefit to our general mental outlook if this silent majority (observing us from every angle) could be reduced somehow! That's where you come in. They were made in the early 20's for use in fish lures. The wire can be cut easily, leaving a stub for pressing into soft material such as wood, cork, or tapioca pudding. You can certainly think of many devilish uses for these fine specimens. They would make interesting swizzle sticks, but the wire tastes like Post Office ink. 3/16" to 1/4" diameter. 25¢ each. 10 for \$2.00 postpaid.

Stained Glass Lore

I would like to help you people include another building material in your Whole Earth Catalog. Stained glass.

The two best places to buy stained glass are

Leo Popper
143 Franklin St.
New York, N.Y. 10013

and

S. A. Bendheim Co., Inc.
122 Hudson
New York, N.Y. 10013

which are just around the block from each other.

Popper's is going out of business, however—anyone want to run a stained glass import business?

Almost all the other stained glass shops buy their glass from these two or someone who did so avoid the mark-up.

If you can't visit Bendheim's and spend hours looking at thousands of varieties of glass, it's best to know something about glass varieties. There is no good book about this and the best way to learn is by pilgrimage.

There are four basic types:

1. imported antique style
2. domestic rolled pattern
3. opalescent
4. dalles

The first three are thin sheet glass for leading and the last is thick slab glass for cementing into walls. The antique is hand blown and is usually in bright colors that have a life about them. They are the most expensive sheet glass. German selenium reds and oranges are especially fiery. The French glass usually comes fleshed—a thin layer of a second color. Then there is reamy (bumpy) and streaky (the color is streaked like marble cake). Best glass for fine art windows.

Domestic rolled glass has colors less vibrant. In quantity, it doesn't cost much more than plate glass. Some patterns are double rolled cathedral—covered with small bumps. Seedy—filled with air bubbles. Flemish—large scoops like an apple piecrust. And a flower pattern, etc. Best glass for artsy dangles.

Opalescent glass is the Victorian stuff that looks like someone mixed milk in it or painted heavy enamel on it. It is best suited for Tiffany lamp shades since it distributes the light, especially if the inside of the shade is flashed opal.

The dalles glass is about 8" x 10" x 1". It is generally broken up according to a pattern, laid on a table where epoxy is poured around the pieces. When dry, a stained glass wall is obtained. It is the most expensive. The slab is at least \$4. But can be the most impressive.

So now you are ready to order glass like:

light brown	2 sq. ft.	Flemish domestic
bright red	3 sq. ft.	German selenium antique

Note: OK to cut in 1 ft sq. pieces for shipping.

Enclose about \$2.00 per sq. ft.

Leading is best obtained from White Metal Rolling & Stamping Corp., 80 Moultrie St., Brooklyn, N.Y., except minimum order is around \$75.00

The best book available, still not adequate, is Techniques of Stained Glass by Patrick Reyntiens—a \$15 book from England. Another English book in paperback is Stained Glass by Laurence Lee, Oxford U at \$1.25.

Peter Grant
Kingston, N.Y.

Stained Glass for the Amateur

T. Y. Crowell is publishing *Stained Glass for the Amateur* by Jean Jacques Duval this Fall (1971) for about \$9. Duval also runs a stained glass workshop at 58 West 15th St., New York, N.Y. 10011.

Thomas Y. Crowell Company
201 Park Ave. So.
New York, N.Y. 10003

dear whole earth,

June 7, 1970

Enclosed is a snap shot of my just about completed house. I am in great need of a used soft arm. could you please ask your readers to keep on the look out for some. winter is almost here and im getting a draft from the pit. Thanks, modrog.

Gary Craig
Columbia, Missouri

#861 SCHABLONENSCHEREN (double bladed stencil shears) Available after July 1st, 1970. Be a Schablionenscheremeister! This scissors cuts out paper stencils and eliminates 1.75 m.m. of paper between the blades to allow for the lead came. Used by stained glass studios since early times, it is almost indispensable for any intricate pattern work. \$21.00 postpaid.

#889 SHEET LEAD For silhouettes and other intricate exercises. A pure lead which will readily solder to comes. Easily formed or shaped for work on lempshades, etc. Usually painted black. 12" wide sheets only, sold per running foot, up to 6 feet long. \$3.00 per running foot. Add for postage at the rate of 4 1/2 lbs. per running foot.

#890 LEAD WIRE 1/8" diameter pure lead wire for various decorative effects on stained glass ornaments. 5 foot length, 75¢ postpaid.

Trailer Life

First, let me thank you for the Catalog. I and my friend my dog & cat are exiled to a carnival in Michigan and your catalog is like a big warm letter from the whole counter-culture. My reason for writing is to share with you something of our life style that might help others.

All the families on the show have house trailers and each week we set up our little village in a different (and sometimes a little hostile) place. Like fairground, behind gas stations, ball parks. For this one needs a truck to pull trailer (or heavy car), lots of hoses and electric cords, "Y's" (an object shaped [like a Y] used to connect untold numbers of trailers to the same water hookup.), a shovel to dig a hole if you don't have a self-contained bathroom.

We have a 27 foot 1957 trailer that has been our year-round home for over a year and it's just like an apartment but better. It needed a paint job so we all got stoned and did it pink, yellow, and orange. And I've got the outdoors all around.

It cost \$900 and the only money that we had to spend was for travel, i.e. hitch \$200, tires \$100. The rest has gone for rugs, sound systems, posters orange light bulbs and lots of contact. But its a home and its beautiful. The new trailers are more expensive (\$3,000 & up for one our size) and very sterile.

I don't know about California but the Mid West is full of old trailers & so is Florida. The old folks in the retirement parks trade in sometimes. The only drawback is our neighbors. Carnival people are a sub-culture but not ours. Trailer parks are full of nice middle class folks. But if a group of friendly freaks decided to get back to nature, I think a trailer is easier for the city folks than building a log cabin.

Susan Sullivan
Flushing, N.Y.

Dome Cookbook

A new art form is evolving in the southwest desert. Multi-colored cartop domes, put together with whatever's lying around. Free heat from the sun. Behind much of this innovating stands Steve Baer, a young inventor who generates enough energy to let others moving too.

This tabloid contains the crystallographic theory and junkyard practice behind Baer's domes: from how to distort a polyhedron without affecting connector angles to how to chop the top out of a car without losing your foot. From all we can determine, Baer's theory is unique in architecture. So is his practice; instead of dying of dissertation dry rot, his notions stand around in the world bugging the citizens.

The Dome Cookbook, now in its third printing, is published by Lama Foundation, an experimental community in New Mexico.

Corrales, N.M. 87048

When you are putting up a dome panel by panel you often have to use poles to support the lobbly sides as they close in toward the center. When we were putting up the second to last panel in the shop dome we had three poles in strategic spots to hold the wobbly overhanging panels from collapsing. The poles were nailed at the top so they wouldn't fall away if during a moment's strain the load were lifted up and off of them. The panel was an 8' by 19' and extremely heavy. We put it up with an inadequate crew, two men and two women. We struggled for an entire afternoon the last few inches Albert Mahler pushed from on top of a spool resting on top of the cab of his pickup which we had driven into the dome. It was touch and go, a clamp might slip, Albert might collapse, the poles might buckle. Each one of many failures seemed equally as probable as getting the monster joined to the neighboring panels. A huge shove, some quick work with the crow bar and clamps—Albert eased off and it still held, I took a few more turns on one clamp and added another one—it was a sure thing, we had it in place!

I felt as if the panel had been lifted into place by some incredible wave we had created that now washed back as we put down tools and Albert got down off the cab. But there was one last thing to check—the poles, were they dangerously bowed under this new load. The entire sensation in my head began for a moment to turn inside out when Holly yelled "look at them!" but then I saw what it was—the dome was finding its shape, it had lifted all three heavy poles off the floor, they were hanging from where they had been toe nailed at their tops, swaying slowly. Three important pillars transformed in one moment into three dangling slow swinging pendulums.

flexible plywood pattern on car top

Solar-heated-rhombic-dodecahedron
for Steve Baer

a man is blessed who assists in the building of a solar-heated-rhombic-dodecahedron.

I don't mean to say technology itself is holy (though that too may be an element)

I mean heat rises. Rocks preserve heat. Asymmetrical dwellings can stand by themselves if properly arranged.

No. I mean the shovel in my hands. I mean the cottonwoods by the river.

I mean the dark scent of dust nudged up by a few new drops of rain.

Dammit! What I mean is the cloudburst! (Which drenches us and makes us huddle together in the cold pickup our only shelter.)

Sydney Goldfarb
Speech, for Instance
Noonday Press, 1969

Zome Primer

Gone beyond Dome Cookbook, Baer's investigation of further uses of five-fold symmetry leads toward a kind of universal truss, infinitely flexible in shape and dimension, but finite and handy in connecting hardware. The book is technical. With it and one of Baer's models you can take some surprising trips through the labyrinth of structure where just often enough you meet yourself coming back, elegantly.

FAMILY REUNION

When Estelle saw the girl go up to the family at the picnic table she figured something weird was going on. And when the girl got in the car and drove away with them Estelle decided she'd better go back to the rest area and find out what was wrong.

D.R. was sitting on the picnic table, gurgling and groaning with his eyes closed. The Greek was peering into D.R.'s open mouth like a dentist, trying to see why he couldn't say "OM". Estelle came up behind the Greek and watched him operate for a minutes or two. Then she walked around so he could see her and ask him if he had seen Frieda leave.

"Just a minute," said the Greek. He probed D.R.'s throat with his finger till he gagged. "Now try it," said the Greek. "Just sort of hum it, go 'OMMMMMMMMMMMMMM.'" As D.R. swallowed and warmed up for the try the Greek looked up at Estelle and said "Yeah, I saw her. Looks like she's headed west again."

"But didn't she say anything?" asked Estelle. Do you know why she left?"

The Greek shrugged. "Everybody splits sooner or later," he said. "This was just her time, I guess."

"Awwwrrrr," D.R. intoned. "Awwwrrrrr."

"Mellow," said the Greek, stroking D.R.'s throat. "Make it mellow. It's a prayer, not some sort of challenge."

The Greek turned toward D.R. again, but Estelle leaned and stayed in front of him. "But how do you feel about her going," she said. "Don't you care? I mean, doesn't it make any difference . . ."

"I'm very happy for her is all," said the Greek. "It was time she went. I'm pleased she was clear enough to recognize it."

"She didn't seem very clear to me."

"And what is that supposed to mean?" asked the Greek.

"Nothing. I just feel a little more concerned than you seem to. She seemed very fragile to me."

The Greek laughed. "I'm sure she did."

"And what is that supposed to mean?"

"Well, it's obvious, isn't it? You see Frieda as this helpless little creature who couldn't possibly get along on her own. And I'm sure you think you might have been able to do something for her if she'd stayed around."

"That's bullshit."

"Of course it is. It's all bullshit."

"No it's not," said Estelle. "It's not all bullshit."

"And I would agree with that, too. It's not all bullshit."

"Jesus," said Estelle. "You are really full of shit, did you know that?"

The Greek smiled. His white teeth were as big as thumbnails. His blonde hair glinted in the sun. "Of course I know it. Do you realize that you are full of bullshit too?"

"Yap yap yap," said Estelle. "That's all you do."

"Awwwrrrr," D.R. gurgled. "Awwwrrrrr."

"Mellow," the Greek said to D.R. "Make it mellow. Make it mellow. Make it a prayer."

But "awwwrrrrr" was the best D.R. could do.

"Poor old D.R. Do you realize he can't make a single vowel sound?"

"I've seen him in worse shape," said Estelle.

"You really are a bitch, aren't you?" said the Greek.

"You're a son of a bitch," Estelle hissed. "A goddamn phoney superguru son of a bitch."

"Right on," laughed the Greek. "God, is that ever right on. You're a bitch, and I'm a son of a bitch. Hello, Mother. Welcome to the family reunion."

Order in Space

A new book by an experimental mathematician on order in space. "... space defining, distribution patterns, space filling properties, packing & stacking, economy grids and communication linkages."

There are exciting insights into structure in nature, and exploratory diagrams of the functions possible in space.

Geodesics

This is the first book wholly devoted to geodesics. Good text, clear drawings, introductory text on the basic principles of Fuller's geodesic domes.

Shown are domes of wood, metal and plastic, most of them produced industrially; along with the various domes are detailed sections of hubs, construction methods, and assembly sequences.

The brief text discusses

- polyhedra
- orientation
- breakdown
- frequency
- base truncation
- chord factors (the constants necessary for calculation of different diameter domes).

Diamond packaging sequence, an ingenious pin and hinge system allows diamond components to partially disassemble reducing packagin volume, typical diamond and base support shown. A Fuller Research Foundation Project.

O'Dome

The O'Dome is a lightweight circular structure that can be transported in a station wagon and erected in three hours. Even though the manufacturer seems to be aiming it at Playboy readers for beach cabanas—"instant vacation house"—it looks like a low cost highly portable, well designed unit that could easily be trucked into the woods for quick shelter.

It is of stress panel design (the bend-over sections are the framework as well as the membrane), and modular, meaning you can connect one to another. Tension rings top and bottom hold the panels together.

Different color panels, different sizes, options as to amount of glass.

I assume it's waterproof.

-Lloyd Kahn

- 15' diameter \$1200

Space Grid Structures

A space grid is a means of spanning great distances with little weight, and a few immediate supports. Buckminster Fuller's Octetruuss at the Museum of Modern Art in 1959 was 35' wide and spanned 60' one way, 40' another from one column of supports. It was fabricated of 2" pipe.

Space grids consist of two parallel planes, forming a floor and ceiling; "web" members in between connect them in such a way that external loads are distributed in all directions.

This book is "... an exchange of information about what has been done recently in the development of flat space grid structures. There are photos, drawings, models of structures and joints. The three sections of the book deal with flat double-layer space grid structures, stressed-skin space grids, and fine clear drawings of space grid geometries. Also an extensive bibliography. Very little text; it's not needed as the drawings and photos are excellent.

FIG. 12

Dyna Domes

There are about a dozen Dyna Domes on the outskirts of Phoenix. Each new one built gets a little closer to the city limits, and it's the hope of domebuilder Bill Woods to have the city fathers wake up one morning, find themselves surrounded by domes, and admit the new creatures under the wings of the building codes.

These are good quality, low cost plywood domes, with fiberglass exterior, and polyurethane foam insulation sprayed on the inside. Wood struts are put together with patented metal connectors, seams are filled with high-strength caulk, then taped with fiberglass.

You have the choice of having a dome erected (within 500 miles of Phoenix), buying a kit, or purchasing just the connectors with plans.

Woods has been experimenting for some time with foam-fiberglass buildings, has built a machine that produces the sandwich panels, and is about to market a foam dome.

Complete dome, erected on concrete floor within 500 miles of Phoenix: approx. \$4.00 per sq. ft. floor space.

Complete kit with instructions for erection: approx. \$2.00 per sq. ft. floor space.

Hub connectors, with plans for building it yourself: \$2.00 per strut.

Figure 3

SKELETAL MEMBER

Space Enclosure Systems

subtitled "identification and documentation of cell geometries", wood's book presents both tabulated and graphic analysis of twenty-three volumetric geometrical forms, or, as he more effectively describes them, "space enclosure systems". the result is a beautiful, clear cut little TOOL that can liberate the designer, architect, educator, sculptor, mathematician, and ambitious spirit.

wood has taken this presentation just far enough. his information is formal, clear, simple, good and useful. what stimulates appreciation for what he has presented is what he has omitted. the book is void of the cliché "author's sketches" of possible futuristic applications that too often infringe or undermine the user's imaginative potential. wood allows the application of his data to be the reader/user's choice and opportunity.

[Reviewed by thomas casey]

Wood has written a second volume (OSU No. 205) subtitled "The variables of packing cell design", which does the same thing with a whole new set of solids.

Futuro

Finland, famed for its forests, and finely-crafted wooden structures, has produced the first well-detailed, commercially available foam fiberglass dwelling.

Now being manufactured in the U.S., the Futuro—a shiny elliptical pod—looks like it just landed. It can be dropped in by helicopter (expensive though) and requires no site preparation. It's structurally strong, well insulated, and has retractable stairs. Interior looks plastic and shiny and badly needs some madras bedspreads and non-plastic human touches.

Domebook Two

This is an instruction manual for builders and a story book of some new communities in America. It is the beginning of an information net of people making their own shelters.

It contains instructions—as detailed as we could pull together—on a dozen different types of domes, each with much variation possible. Everything worthwhile from Domebook One is included, there are details on domes we've built since then, and there is feedback from people who built domes from Domebook One.

There are visual and mathematical sections on geodesics, a very complete chord factor section, elliptical geodesics, instructions on models, a section on trace-over paper models and take-off points for various trips.

The building information is better than Domebook One—corrected, modified, clarified. There is now good information on sealing, floors, windows and other construction details. There are fairly complete instructions on foam and aluminum domes we have built, a five page section on domes built at the Ananda community in Grass Valley, a description of a ferro cement dome on a wood frame in Iowa, a beautiful shake dome on a lake in Washington. There are cautionary words on shiny plastics as building materials—don't be afraid to use them, but be aware-beware-of all qualities of the particular plastic and where it comes from before you decide to use it. There is emphasis on building with trash ("our only growing resource"), used materials, whatever is lying around. Funk building, the architecture of necessity.

This book is not so much specifically about domes as it is a call to get you moving, to take things in your own hands, to act. Most important to us in this process is to communicate as we learn, and in the future we'll act as a funnel of incoming shelter information. We plan another book by 1973, probably to be called Shelter, and we may put out supplementary data in between now and then. If you want us to let you know what we do next with shelter, film, video, publications—send us a postcard with your name and address.

Windows and Doors

2 X 4's are used to frame in the windows and the doors. The door is made by dropping perpendiculars to a base triangle. The door can be made to swing either in or out.

A very pleasing window pattern is with three windows in a row. The center window can be made to open and close. We made this window smaller by running the 2 X 4 frame parallel to the struts and hinging it at the top.

Cardboard can be fastened with tabs. They should be as large as you can manage. The slots should be a jam fit. Pinch the tip of the male part before inserting.

We decided on a long arc of window area to follow the sun, 2 doors (full triangles) and full triangle windows at the bottoms of 3 of the pentagons. Right now the windows are covered with 1/2 mil vinyl. Send us glass!

DESIGNING THE FERRO ARMATURE

A. Geodesic Frames

From the foregoing we see that a ferrocement dome can be structured as a self-supporting spherical shell, without formwork. However perhaps the simplest and safest way to describe the domical enclosure is by a geodesic net of wood or metal struts which support the mesh that gets ferrocemented.

Regardless of the size of the dome, a higher frequency geodesic net will result in a more nearly "spherical" shell, and a lower frequency will give a more "faceted" polyhedron. Although little experimental experience is available, it doesn't seem to matter critically to the ferrocement how spherical it is.

If the mesh is abundant and continuous, and if the application technique is sound, then the ferrocement skin will transfer stresses across the dihedral angles of the triangular planes without cracking. (The skin may tend to sag between the struts when loaded with wet cement, giving a tentlike effect.) Therefore, it might be just as good and a lot more convenient to use a low frequency frame of fewer and larger struts, as did the Jensens.

The Bevel Gauge

The builder's best friend at this stage of the game is the trusty bevel gauge. This is necessary because all the 2 X 4's needed for framing in windows and doors have compound angles. A short picture course in finding these two angles:

The most important trick is to make sure which length you are measuring and to be consistent in relating the angles you are finding to that length. If you have never done this before then it is a lesson in patience. It usually takes cutting a few too short and backwards to catch on. Even though we made mistakes we miraculously found a use for all the wood.

THE KEY

Estelle was so furious she went to the bus intending to just get in and drive away and leave D.R. and the Greek to their stupid games. Leave leave leave was all she could think about. Go. Go. Go. Same old story. Same old broken record. Same old thorny point on the never-ending cycle.

She was crying now. That seemed like a broken record too. God, she thought. Do I ever cry a lot. Am I ever one whiny tearful bitch.

Cry. Cry. Cry.
Go. Go. Go.

But Estelle couldn't go because the Greek had taken the key. "You son of a bitch, give me that goddamn key!"

She was about fifty yards from the Greek, and the wind was still blowing.

"What?" called the Greek. "I can't hear you."

Estelle ran a few yards toward the table. "I said you've got the goddamn key!"

The Greek grinned and nodded his head vigorously. "I know it," he called back. "I've always had the key."

"You slimy bastard!" Estelle screamed. She glanced around the ground for a weapon of some kind to kill him with. But her eyes were too full of tears to see. She blanked out for a moment then. The whole world went black as night and Estelle forget everything she knew. When she came to again she was in the bus with the pill box in her hand, looking for a downer.

Dome Model Kits

The Dome East kit costs \$5, consists of nifty hubs and struts. The Domecile kit costs \$10, consists of geometric plastic panels. Models help you visualize somewhat. They may help on rudimentary structure. They also glorify trivial problems and obscure serious ones. Buildings built too scrupulously from models tend to look like models. Build buildings first, then models.

The Owner-Built Home

Ken Kern makes a unique offer to anyone thinking about building his own home: for \$10 he furnishes a preliminary house design, as well as a copy of *The Owner-Built Home*, which is about the most useful book on building available.

For the design, send him a sketch of your building site, along with space requirements and personal likes and dislikes; or you may prefer to get the book first and read the first chapter on 'Site and Climate' before sending in the information.

The book is sound advice on the best low-cost building techniques from around the world: Africa, India, Israel: countries that cannot afford U.S.-style waste. Much of it is not in print elsewhere.

A 1" concrete floor with loading stresses of 450 lbs per sq ft; houses built of earth, woven bamboo and bottles, as well as of conventional materials. How to hook up your plumbing in a simple central core.

Good dope on concrete-proportions, additives such as sawdust or emulsified asphalt for 'comfort cushion' floor. Details on wood framing, how stud wall houses are overbuilt, the strength of threaded nails.

There is much good data on building with rock and earth; how to make a sliding form for rammed earth and a discussion of the strength of rammed earth and soil cement. Why don't you hear anything these days about earth wall buildings?

Inasmuch as there is nothing in bare earth to sell, no commercial group can be found to extol its merits.

Lots more, with a bibliography at the end of each chapter for further research.

Although air is a very poor conductor of heat, the insulating value of an ordinary air space is rather small, on account of the large transfer of heat by convection and radiation. Radiation is largely responsible for the ineffectiveness of air spaces bounded by ordinary building materials, such as are found in frame or other hollow walls. The low insulating value is often erroneously attributed to convection; but, as a matter of fact, from 50 to 80 per cent of the heat transfer across air spaces of ordinary sizes takes place by radiation. If the air spaces were bounded by bright metallic surfaces, the transfer of heat by radiation would be greatly diminished, since clean metallic surfaces are much poorer radiators than non-metallic surfaces, such as brick, stone, glass, wood, paper, etc.

Reflective metal foil (copper, aluminum, or steel) costs less than 3 cents a square foot and can be easily installed. One should remember to keep the shiny side out (or up) and leave a ventilated air space inside (or below), and at least 3/4-inch between the foil and the surface it faces.

About 70% of the sun's heat rays can be reflected from the house by installing a white or light-colored roof. A thin layer of quartz gravel or marble chip, backed by aluminum foil on a built-up tar-and-felt roof is by far the best type of surface for regions suffering a high incidence of summer heat.

A. protective covering on outside
B. air space ventilated to outside
C. vapor barrier envelops room
D. thermal insulation
E. air space ventilated to outside
F. protective covering on inside

Your Engineered House

'To begin this book, and the day, what does it take to get the morning sun into the kitchen?'

A delight to read before designing or building your own home. General ideas on light, heat ventilation, house placement, acoustics, financing. Specific building tips on all aspects of building but mainly post and beam houses.

This is an easy way for a beginner to frame a house (as opposed to stud-wall construction), and it gets a roof over your head right away to keep the rain off while you finish the walls. Most of this information is seldom considered by architects, and is culled from the author's building experiences. You are encouraged and told how to pick up pencil and paper and design your own home—tailormade to your own specifications, aspirations, and finances, and, although not in great detail, how to build it yourself. A discussion and treatment of homes as human environments and a good place to start if you have no design or building experience.

Scenery is what you see from where you live. If your scenery is to cost you nothing, you will leave it where it is, and if that scenery already has character, you will make only minor modifications. You will move yourself around, move the house around, but you will not move the scenery around until you have lived with it for a while as it is.

As a machine designer, I say that when we treat the window as a machine, asking it to perform multiple functions—admit light, admit air, or exclude it according to the weather, keep out bugs in summer, never mind the bugs in winter—and do all this at the twist of a crank without leaking or sticking—the window is bound to become expensive.

If we give the window one function and one only, to admit light, we can have all the windows we want at no extra charge. It is inexpensive to fix panes of glass permanently in place. Any smart carpenter can build a wall of glass about as quickly as he can build a wall of anything else.

As for the ventilator, it's a wooden door on the simplest of hinges, rigid, unbreakable, easy to weatherstrip, easy to screen. One frame does the whole job.

If we keep windows and ventilators separate, we wind up with more light, better ventilation, less trouble, less maintenance, and lower cost.

How well this door keeps the wind out depends on the accuracy with which it is fitted into a frame. In warm, wet weather, when there is no need for a tight fit, the door swells up and sticks. In cold weather everything shrinks and the door admits an invigorating breeze. Refrigerator manufacturers are much smarter about doors. They build them this way:

The moment you stop to consider it, I think you will agree this is the sensible way to build a door. It doesn't have to fit anything. It just closes, flat to flat, and there you are. The domestic hardware people don't seem to have heard about the refrigerator-type door, so you will probably run into trouble getting hinges and latches that will work. When I can't find suitable hardware, I do this:

Canadian Wood Frame House Construction

best way to learn to become a carpenter is to get some wood and a few tools and put them together somehow, however you can, practice, know the material and what you are trying to do with it. (a crosscut on a 2 by 12 is a good exercise) then, when you are ready to build something, either find someone who has built something, or take a good long look at what you are living in now, or read a book. we carry a bunch of carpentry books. their main worth is in the diagrams. from them you can figure out how other builders do it. but don't be bound by rectilinear-bullshit. read a wooden boatbuilding book (page 113) and figure out how to bend wood, build a snailshell house out of warped one-by. or read this book. good and free.

OUT OF PRINT

Figure 27

POLE FRAME: When the poles are used to support the roof as shown in Figure 8, the roof can be installed early to keep the rest of the construction process dry. The extra pole length also helps to brace the structure. With two or three-story structures, the heavy timber frame will take concentrated loads and also reduces fire hazards. It allows flexibility in placing, and possible relocation, of walls.

SPIKE GRIDS: Heavy timber connections standard in bridge and warehouse construction, are less familiar to the house builder. A single curved spike grid, Figure 27, inserted between the pole and the beam substantially increases the strength of the bolted connection.

American Plywood Association

What makes plywood such a desirable building material is its extremely favorable cost/strength ratio. Also, it's quick to install, as each piece you nail down covers 32 square feet.

The American Plywood Association has hundreds of pamphlets available on different uses of plywood: roofs, walls, floors; cabin plans, pole buildings, barns.

COMING DOWN

Maybe D.R.'s acid trip ain't so groovy anymore. Maybe he wonders where Estelle has gone, and why. It's funny stuff, acid. It'll make you laugh, it'll make you cry. It'll make you wonder where your woman is, and why. It'll give you something new to say, but take away your words to say it with if you're not careful. D.R. tried to say "Estelle!" but it came out as a moan. He tried to say, "Forward, on to St. Louis!" but his tongue flapped useless in his mouth.

If in the beginning was the word and the word was with God and the word was God, what are you when you're speechless?

Pretty fucking depressed, if you want to know. Depression is a rocky land-ing. Depression is your parachute not working after a weird re-entry.

Wham.
Grounded.
And it's stony fucking ground.
She's not there to know you're hurt, you can't call for help because your tongue won't work, he don't see your signals because he's talking all the time.

Maybe D.R.'s acid trip ain't so groovy anymore. Maybe that steel band around his head's a headache after all.

Maybe that stained window of the countryside's an actual desert after all.
Maybe the wind is really blowing, maybe the sky is actually overhead.

Maybe Estelle was really crying.
Maybe the time had come.
"Has the time come?" asked D.R.
"Mellow," said the Greek. "Mellow."

Fundamentals of Carpentry

Better know something about tools and materials before you start on this book. (Hand Woodworking Tools, How to Work with Tools and Wood, p. 144). Lots of meat for the beginner as well as the professional. The kind of stuff you might learn working with a good carpenter.

Mostly rectilinear construction, but with ingenuity, the methods are applicable to most wood structures.

Nice appendix with a list of Associations and Institutes, and an excellent list of reference books.

Audel Guides

I've just read a dozen or so Audel Guides, and these are some I felt were particularly useful. Some of the Audel books are quite obsolete, but much to my surprise, many have been written within the last ten years. Several have poor indexes, and some completely lack an index. The books are usually written by experts in the areas or trades described. The information in general seems to be very good.

If you are working with more or less typical American water and sewage systems, either maintaining or building, **Domestic Water Supply and Sewage Disposal Guide** should be a rather useful book. Wells, springs, tanks, pumps (including hydraulic rams!), treatment, septic tanks, water heaters, it's all here, including many useful tables.

The book is weak on the sewage end and has incomplete information on things such as hand dug, jetted and driven wells. Get the WHO book for that.

Vol. I of **Masons and Builders Guide** deals with clays, brick making, mortar, tools, brick laying, bonding, corners and rectangular openings. Vol. II covers arches and anchors, foundations, chimneys, fireplaces, repairs, estimation, and tile work.

These seem very good if you want to get into traditional brick work. The chapters on fireplaces and chimneys seem particularly useful to me. I never could get behind brick work for new construction, though.

Carpentry and Building fascinated me. Written in question and answer style, it covers many problems encountered in construction and remodeling work. Seems that these are questions that the author has received while acting as an engineering consultant for a trades magazine. Excellent sections on insulation and vapor barriers, acoustics, noise transmission and sound resistant partitions, and a beautiful miscellaneous section dealing with things like the pressures in grain bins. Good index.

Building Maintenance is intended for maintenance men in office etc. buildings. Looks like it would be very good for them, less useful for the home handyman. Information is included on painting, plumbing, concrete, carpentry, roofing, glazing, sheet metal, heating and air conditioning. Gives good, brief, and simple directions and assumes that the reader has at least some sense and native intelligence.

No special knowledge is required to use the two-volume set, **Do-It-Yourself Encyclopedia**. If you can get around the projects (!!) in questionable style (style?), there is a lot of good stuff relating to home improvement and home maintenance. A little hard to find your way around in until the second time through, it is actually fairly well organized. Far-out 1950's pictures.

Expert foresters... advise that, although the hickory is a sturdy and persistent grower, a tree which has grown and matured under forest conditions cannot tolerate a disturbance of its root system; also, there may be danger of injuring the tree described if the roots are cut closer than approximately 25 feet along one side. Normally, from a circle immediately outside the crown, the main feeder roots extend outward and downward at an angle of approximately 45 degrees, and sometimes these roots go very deep. In addition, a system of very shallow roots, approximately 12 to 24 inches beneath the surface of the ground, extends outward in all directions. These roots also carry water to the trunk of the tree, and serve to anchor the tree upright in the soil. These are the roots that will be injured by digging for the foundations of the house.

Actually, there is no way to accurately foretell the reaction of the trees. Stay away from the trees as far as possible. The disturbed trees should be supplied with plenty of water and heavy feedings of fertilizer for some time to enable them to regain the loss of strength occasioned by disturbing the roots in the affected areas of the root system.

Carpentry and Building

Water Dowsing.—Although numerous persons consider the forked stick method of locating underground water as a mere "fanciful illusion" the fact still remains that extractable water has been found by this simple method throughout the ages.

Water dowsing consists essentially of the carrying of a forked twig of peach, apple, or maple over the area where the search for water is to be made. The process is performed essentially as follows:

Grasp the ends of the twig (one in each hand) with palms upward. When commencing to walk, the butt of the stick should be pointed upward. As moving water is approached, the butt end of the stick begins to dip downward until the moving water is intercepted at which location the butt end points straight down. At this particular time the forked twig has turned through an arc of 180 degrees. The stick will in some instances break under the grip as the butt dips downward. Pliable twigs will bend down despite the effort to hold them straight.

Most dowers believe this unique ability or power comes to a person with birth. They also believe that this occult faculty can be developed and its use expanded by constant study and practice. It is, of course, a fact that many people have this ability without knowing it, never having had the reason for the experiment. Some students of the matter believe about one person in a thousand has some dowsing ability, although perhaps only about ten per cent of these latter have the ability to become good dowers.

It cannot be too strongly emphasized that no scientific explanation exists for the location of extractable underground water by means of dowsing. The proof exists however, in thousands of usable wells which actually have been discovered by this uncanny method.

Domestic Water Supply

A well designed and properly installed damper is regarded as essential, particularly in cold climates. When no damper is used the throat opening J, should be 4 inches for fireplaces not exceeding 4 feet in height.

Placing the throat well forward has another advantage, namely that of forming a smoke shelf at the damper level. This shelf aids in stopping the down drafts which will almost invariably occur if the back of the fireplace be made to rise vertically, in the same plane as the back of the flue.

The opening above the smoke shelf should be "gathered" or contracted to the size of the flue by corbelling, this being done with the least height practicable. Up to the level of the clay flue lining, the brickwork should not be less than 8 inches thick, because the space immediately above the damper is the hottest place of the chimney.

In small fireplaces, a depth of 12 inches will permit good draft if the throat be properly constructed, but a minimum depth of 16 to 18 inches is advised to lessen the danger of brands falling out on the floor.

In construction of a fireplace the following essentials should be attained. They are:

1. That the flue have the proper area.
2. That the throat be correctly designed and have a suitable damper.
3. That the chimney be high enough for good draft.
4. That the shape of the fireplace be such as to direct the maximum amount of radiated heat into the room.
5. That a properly constructed smoke chamber be provided.

Masons & Builders Guide

Screw Appreciation

You will see by my enclosure that the subject of this letter is screws. Since this is probably too commonplace a title to attract much attention let's call them fastening devices. This particular device is a combination of so many improvements on the standard wood screw that I'll be surprised if someone else hasn't brought it to your attention. In case no one has, here goes.

It's a Sheet Rock Screw. They are made to attach sheet rock to metal studs. They are designed to be driven with a power screw gun. They can be driven by hand, of course, and in fact are easier to drive than ordinary screws. Ideally, however, one should use a good quality variable speed and reversible drill. In the hands of the woodworker the applications are unlimited.

To appreciate the screw, one must break it down to its components:

1. It has a self tap point. No awl is required to mark the location and keep it there. It zips into wood or thin metal.

2. There are two threads. The hi thread is at 30 degrees instead of the normal 60 for faster penetration. The lo thread reduces wobble and provides lateral pressure.

3. The shank is reduced in size giving greater thread exposure and gripping power. I'm told that it holds better alone than the same number of regular screws and glue. My experience with them seems to verify this, but I can't prove it. The narrow shank also eliminates the need to pre-drill in all but the hardest woods and thicker metal. There are minimum splitting problems.

4. The finish is an attractive gray created by a zinc phosphate coating with baked-on linseed oil. It is supposed to be corrosion resistant.
5. The head is a patented shape called "Bugle" head. For the woodworker, the advantage is no countersinking. It pulls down flush with little or no surface damage.
6. The slot is a #2 Phillips, the advantages of which are well known. The pros use magnetic bits and don't even hold the screw to guide it as it's being started. The steel they are made of is so tough it's almost impossible to damage even the appearance of the slot with a spinning power bit.

7. Since the awl, drill and countersink have been eliminated, the speed in driving with power or by hand is obvious. They are equally easy to extract if you make a mistake, want to disassemble your work and/or salvage the screws.

If the above sounds like the manufacturer's sales pitch, it is. I copied most of it from the specifications, omitting the many other advantages that are probably only of interest to the sheet rock people. They are made by U.S. Gypsum Company, 101 S. Wacker Drive, Chicago, Illinois 60606. They come in various lengths and styles. There are variations for plastic, trim, sheet rock to wood, and a plain point for wood only, to mention a few.

After using them, their superiority is so apparent that one feels cheated if he has to use the old kind again. If all this is so, why isn't everybody using them? Why can't you buy them in the neighborhood hardware store? I don't really know. Anyway, I get mine at a building materials supply house that specializes in sheet rock, lath and plastering supplies, etc. They cost between \$8.00 and \$22.00 per thousand. I don't recommend them for the novice or occasional do-it-yourselfer. But for the guy who is "always building one thing or another" they are fabulous and worth obtaining. Instead of being the specialized fastening device they were designed to be, they are damn near universal. The only place I would hesitate to use them would be on a job where shear was important, such as a gate hinge.

WHEN THE TIME CAME

When the time did come, the Greek did not delay. He put the items he'd used in the food ritual back in the leather bag, and carried it and the jug of water to the bus, D.R. following behind. D.R. started to get in the back where Estelle lay sleeping, but the Greek directed him to sit in front with him. D.R. obeyed, although he was uncomfortable in the front. He was close to true distress now. He was confused because he didn't know how stoned he was; he didn't know how far to trust his mind's version of things. He felt a little afraid of the Greek now, but he didn't know if that was just paranoia or his straight mind picking up real warnings from actual stimuli. He very definitely felt threatened, but he could not be sure what by, and that made the moment seem more sinister than ever. His mind was very neatly divided in two. Half of it was clear and half of it was muddy, but it was hard to keep up with which side was which because both sides claimed to be clear, and each denied that it was muddy. The sense was that of being surrounded and infiltrated by enemies, within and without. But the enemies were all unseen, and the clear half of his mind understood that very likely he was imagining the whole thing.

If Estelle had been awake she would have cooled D.R. in an instant. She would have seen that he was feeling freaky, and told him it was okay, to go ahead and feel freaky, that she would remain there before him as a living, concrete presence in a weird and abstract world. But Estelle was asleep and the sound of Urge's motor didn't disturb her. D.R. didn't learn until later that Estelle had dosed herself heavily on downers, but just looking he could tell that her sleep was very deep, that that was only Estelle's body lying there, that her life and soul and spirit were somewhere far away, and unavailable to him. D.R. felt a powerful urge to go to her, though for whose sake, his or her's, he wasn't sure. But everytime he so much as glanced back at Estelle the Greek looked at him out of the corner of his eye in a strangely intimidating way, and froze D.R. in his seat.

Wiring Simplified

other than that this book is a most useful tool for the home electrician, the thing I like about it is that it has a hole punched all the way through it, for hanging over a nail. that is a kind of practicality that all american publishers should learn. everything you'll need to wire your home yourself.

Fig. 4-25. In soldering, do not drop hot solder on cold wire. Heat the wire until it is hot enough to melt solder.

In residential and farm wiring, one of the wires is always grounded, that is, connected to a water pipe or driven ground rod. The grounded wire is known as the *neutral* wire; all other wires are known as "hot" wires. It is most important that you remember the following four points:

1. The grounded neutral wire is *always* white in color.
2. The grounded neutral wire must run direct to every 115-volt device to be operated (*never* to a device operating only at 230 volts.)
3. The grounded neutral wire is *never* fused.
4. The grounded neutral wire is *never* switched or interrupted in any other way.

With one exception (which will be discussed later) white wire may never be used except as a grounded wire. Other wires are usually black but may be some other color, but not white (with the one exception just mentioned) or green.

The white wire must run to every 115-volt device *other than a switch*; the other wire is usually black but may be some other color, but not white or green. Examine a socket or similar device carefully and you will find that one of its two terminals for wire is a natural brass color, the other is a white color, usually nickel-plated or tinned. *The white wire must always run to the white terminal.* In the case of sockets, the white terminal in turn is always connected to the screw shell and never to the center contact of the socket. Switches for controlling lights, etc., never have white terminals.

Fig. 8-22. How wires are connected to the meter base or socket. The bare, uninsulated wire is always connected to the neutral center contact of the socket.

Wood (Coal, Oil) Cook Stoves

Here's a company that makes good, big, old-fashioned wood burning kitchen ranges as well as pot-belly coal stoves in five sizes, huge wood burning furnaces, Franklin stoves, parlor stoves, ship stoves, and more stoves.

These appear to be really well made expensive major appliances. Most are convertible for using wood, coal, oil, or gas as fuel. The cook stoves offer water reservoirs or coils for heating water, warming ovens, extra large ash pans and all sorts of accessories.

National Electrical Code 1968 Guide to the 1968 National Electrical Code Electrical Code for One- and Two-Family Dwellings

The Code is not law, except as adopted by local ordinances, but its requirements should certainly be met as a minimum in all wiring. Check with your local building department for their code or revisions, and permit information if you want your wiring to be legal. In any case, use the Code as a minimum.

The regulations set up seem to me to be quite reasonable and based mostly on safety. It is somewhat hard to use as a reference because it has a poorly organized index. The index is very complete if you can get into its system.

Following the Code strictly will produce a safe installation. Producing one that is convenient, efficient, practical, and allows plenty of room for expansion requires planning and study of wiring books such as Sears and Wards electric wiring books (50¢), or Wiring Simplified.

The Audel Guide to the 1968 National Electrical Code is a non-official interpretation and clarification of the NEC. It is not intended to replace the NEC, but in most cases it would be usable by itself. Its greatest handicap is that it has no index.

For people working only in residences, the new Electrical Code for One- and Two-Family Dwellings is much easier to use than the NEC, from which it is excerpted.

The Forgotten Art of Building a Good Fireplace

About a year ago I became interested in the mechanics and skills necessary for the construction of super-functional living entities and the reconstruction of colonial homes. Recently, during a visit to New England, I took a trip to the Vermont Country Store in Weston, Vermont and happened upon a really funky book by the store's owner, Vrest Orton, on the art of building a good fireplace, one that throws the heat out and does not smoke. The Forgotten Art of Building a Good Fireplace is an earthy treatise on the dynamics of fireplace design.

An inquisitive inventor, Count Rumford of England, formulated the basic and seemingly immutable principles of fireplace design in 1795. These fundamentals have remained virtually unchanged since that time—a span of 176 years. Rumford was a probing fellow, having discerned convection currents and having invented the photometer and a method of boring cannon. He was the first to understand the qualities of radiant heat and used Ben Franklin's observations on fireplaces, especially on the dissipation of smoke.

This quality paperback joyously and simply tells how to design a total, functional fireplace, much unlike today's squat, low abortion, which does not radiate heat properly. Rumford's fireplaces radiate heat warmly into a room's atmosphere and assure that the smoke is drawn upward with ease. Highly recommended for anyone interested in fireplaces.

[Suggested and reviewed by
Stephen Lessels]

The Forgotten Art of Building a Good Fireplace

Vrest Orton

\$2.00 postpaid

from:
Yankee, Inc.
Dublin, New Hampshire 03444

Look at Diagram A. About twelve inches above the lower edge of the lintel or arch (at point Y), on the back wall of the chimney or throat, there must be constructed a small shelf, called the smoke-shelf. This brick shelf, projecting from the slanting back of the fireplace wall, out toward the front, is about three to four inches wide, toward Point X. It is laid horizontally, of course, completely across the entire back wall. This is the air-mixer, the function of which can easily be seen by the arrows in Diagram A, showing movement of air.

This is one of the most important features of Rumford's principles. This three-to-four-inch deep opening is standard and must not vary, no matter how big the fireplace.

Aladdin Kerosene Lamps

Coleman lamps are terrible—they hiss and clank and blind you, just like civilization.

Aladdin is the answer if you need good light and 117ac isn't around. It is bright, silent, and requires no pumping. (It does require some babying to keep the mantle from smoking up; it's like not burning toast.)

British made and effectively designed, the lamps are available in this country from:

Aladdin Heater

You listed the Aladdin Kerosene lamps in the Fall 1970 catalog, but not the Aladdin Kerosene heater (Model "Blue Flame" \$44.95), which was used by Sir Francis Chichester on Gypsy Moth IV and by me on Kodiak Island last winter.

Daniel Earle
Anchorage, Alaska

Aladdin Tips

The lamp's efficiency and utility can be increased by taking two steps, which I've not seen reported anywhere else "in the literature." First, it is not as bright as a pressure lantern; this deficiency can be resolved by taking a second Aladdin Chimney and slipping it down over the first. This increases the overall height with no loss of stability; it just sounds a little awkward. (It's much brighter!)

The second drawback is that the d-mned thing does get blackened up if you turn the heat too high. One way to clean the charcoal off the mantle is to turn the wick very, very low and slowly, very slowly burn it off. This takes, as I recall, from twenty minutes to an hour. The second I learned from an African teacher who walked into my house about three months before I was going to depart and, noting that the lamp was turned too high, casually picked the salt shaker off the table and sprinkled a little salt down into the chimney. The mantle cleaned itself in seconds. I don't know why it works, all I really am sure of is that I hated him for that gratuitous display of African technological superiority for at least the remainder of the evening.

The second chimney, by the way, can be an old one with a few cracks or a small piece broken off. I loved that lamp, especially after the night I tried to catch a Coleman-type lamp from falling off the table. I carried scars for over a month. The Aladdin is a cool burning, lovely piece of machinery.

They were set up about 5 years ago to fill a need, bringing drafting and architectural supplies and technology up-to-date. When you see their store you know they have done it.

Landam Corporation, 2211 Broadway, NY, NY 10024

makes and sells a hot water heater that plugs into the pipe very simply, and heats your water as it runs out. There's

a limit to its total effectiveness, as far as total volume goes, but for a campsite, or house, or trailer living, it does a grand job. It weighs less than two pounds, needs electricity, and costs about \$35.

T. H. Neel
Cambridge, Mass.

Ashley Thermostatic Wood Burning Circulator

This is a unique wood burning stove. It has a thermostat which controls air intake, thereby burns much less wood than an ordinary stove. Will go up to 12 hours without refueling. In cold climates people build just one fire a season, adding wood 2-3 times a day. It takes any type wood, up to two feet long.

One kept us warm when we lived in a chicken coop with cold concrete floors and now an Ashley is the only heat we have in a 900 sq. ft. house with high ceilings.

The firebox is airtight and there is a lever on the air intake you can set for the desired temperature. A temperature-sensitive device (bi-metal helix coil) then automatically regulates air flow to keep heat at the setting you've chosen.

—Lloyd Kahn

This is a mighty good little hard-heatin' cheap working wood stove.

CAPTIVE AUDIENCE

So this is the situation in the bus as they drive out of the rest area: Estelle is asleep in the back seat, Divine Right is some sort of psychic prisoner sitting in the front seat beside the Greek, and the Greek, in charge of the bus now, driving east across the barren, windy plain toward Oklahoma City, is talking on and on about health, truth and love as destinations along the Middle Way. His rap began as soon as they hit the freeway again with a final lecture to D.R. on breathing, and the holy sound of OM, and continued into an explanation of the concept of karma and ways in which images like the Third Eye reconcile Zen and the mystic point of view with all modern psychology from Freud through Reich to Jung. Within fifty miles the Greek had ascended into a description of the physiology involved in the experience of Unitive Consciousness, and within a hundred miles of that he had called D.R.'s attention to the I-Thou theme in the Secret Songs of the Hindus and analyzed the personal aspects of the relationship between Ouspensky and Guirdjieff, which amounted, of course, to a kind of rambling introduction to the Greek's abbreviated version of his own life story.

We'll get into that life story a little later on, but before we do it's important to understand what was happening with Divine Right as he told it. The Greek said, "The problem, of course, is that young people have grown up oriented to a Twentieth Century Einsteinian concept of unitive time while their elders remain stuck in Nineteenth Century industrial time, which is fragmented." D.R. nodded and gurgled a few nonsense sounds. But his attention was not on the Greek. He was thinking about Estelle, asleep on the mattress behind him. D.R. was desperate to get back to her. He wanted to wake her up and hold her in his arms and tell her that he was sorry, that he was going to be a lot better from now on. He wanted her to open her eyes, and recognize him, and include him in her world again. It was awful, feeling excluded. D.R. did not feel in her world or the Greek's, and he had no world of his own to occupy. He was in a vast, dark limbo somewhere and suffering terribly in his mind.

The Indian Tipi

Tipis are cheap and portable. To live in one involves intimate familiarity with fire, earth, sky and roundness. The canvas is a shadow-play of branches by day, people by night. Depending on your body's attitude about weather, a tipi as dwelling is either a delight or a nuisance. Whichever, you can appreciate the elegant design of a tipi and the completeness of the culture that produced it.

The Laubin's book is the only one on tipis, but it is very good. All the information you need, technical or traditional, is here, and the Laubins are interesting people.

FIG. 1. Pattern for Sioux Tipi (18-foot).

Cheyenne

Indians had definite rules of etiquette for life in the tipi. If the door was open, friends usually walked right in. If the door was closed, they called out or rattled the door covering and awaited an invitation to enter. A shy person might just cough to let those inside know he was waiting. If two sticks were crossed over the door, it meant that the owners either were away or desired no company. If they went away, they first closed the smoke flaps by lapping or crossing them over the smoke hole. The door cover was tied down securely and two sticks were crossed over it. The door was thus "locked," and as safe in Indian society as the most strongly bolted door would be in our civilization today.

Later we discovered that the idea of a ventilating pipe underground to the fireplace is the very best way of insuring a clear lodge and the most heat.

Tipis

We have word about three sources in the U.S. of ready-made tipis, and so far Goodwin-Cole is still the best—best construction, lowest cost. They also have tipi liners, which you will need if weather is wet or cold.

100 Tipis Shelter

The Indian way of attaching peg loops, as illustrated, is not only ingenious but easy and sturdy—far better than either sewn or stamped grommets. Insert a pebble about 3/4 of an inch in size on the under side of the cover about six inches above the edge, at a seam wherever possible, and around this pebble tie a piece of 3/16-inch cord. Double the cord, tie it in either a square knot or a clove hitch about the pebble, then join the free ends in a square knot. Marbles will do if you cannot find smooth round pebbles.

It is a joy to be alive on days like this, and when we come back to the tipi, after a long ride or a hike in the mountains, the little fire is more cozy and cheerful than ever. The moon rides high in the late fall nights, and when it is full, shines right down through the smoke hole. Its pale white light on the tipi furnishings, added to the rosy glow of the dying fire, is beautiful beyond description.

*Note: The Nomadics people are heavily back-ordered on their ready-made tipis. They urge you to get their Sew-it-Yourself-Tipi-Kit, which they can ship in 7 days from order.

Another home-crafted tipi you can get is made in Florida, costs \$85 for 13-1/2 ft. (10 oz. duck) to \$145 for 18 ft (10 oz. duck). From: Woodcraft, 1921 Atapha Nene, Tallahassee, Florida 32301.

Yurt

A friend of ours got interested in the yurts used by nomadic people of Central Asia. Yurts are round buildings (tents) made out of a lattice work of sticks covered with sheets of felt. The roof is a truncated cone. The opening serves as skylight and smoke hole.

After building a number of yurts similar to the Mongolian ones out of different materials, Bill decided that he would like to build one out of milled lumber. I helped him construct one similar to the one in the plan. It is not difficult and certainly cheap. I do not know how easy it will be for someone who knows nothing about yurts and carpentry to build one, but Bill usually answers letters and I am sure he will be able to answer specific questions about the construction. He is currently revising and up-dating the plan, incorporating what he's learned in the past year.

Cheap and Speedy Finish

SPEEDY FINISH A penetrating wood finish developed by the U.S. Department of Agriculture is applied super-fast with a weed sprayer. It makes up in a gray-green shade only, but can cover a barn in two and a half hours, costs just 51¢ a gallon to compound. Researchers estimate that it will protect wood for four years. It's recommended for fencing, summer cottages and other structures built of low-grade lumber. The product isn't available commercially, but you can have the formula free of charge. Write the USDA Forest Products Laboratory, Madison, Wisconsin 53705 and ask for: Research Note FPL-0134, "Experimental Chromate Finish."

I found this bit in 'Woman's Day'. Maybe ECF would make a community look like a gray-green prison compound, but it sounds cheap and good. Worth looking into?

The Wilderness Cabin

For more details on log construction, site selection, use of heavy timber tools. This gent has built some cabins. —SB

Cabin on the Yukon River at 50 degrees below zero.

But an even better and more direct method than personal search is to go to the county seat in the county where you want to build. Ask the county auditor for a list of tax-delinquent properties, and the descriptions and plats of each location. During your first free weekend, examine the sites. If you find something you like, pay the back taxes.

When the original owner has failed to pay the taxes for a certain number of years—in many states the period is five years—and you pay the back taxes, you can get what is called a "tax assignment" from the county. Your final ownership paper is about equivalent to a quit-claim deed. This is good enough while you personally own the site. Should you finally sell the property, it is best to have an attorney obtain a Torrens title for you, or procure a warranty deed through legal formality.

SKYLIGHT AND SMOKE HOLE

THE SCHEME

The Greek said, "Some say that God is merely a compromise between the time it takes light to travel across the Einsteinian universe, and the time it takes light to cross a neutron, that space is merely a snapshot of time, and time is space in movement. Personally . . ."

D.R. nodded and mumbled. But what he was thinking about now was his tape recorder which lay in a pile of junk behind the driver's seat. D.R. had a scheme. His muddy mind kept saying the scheme would not work, but his clear mind was convinced that it would. The scheme was to bring the tape recorder into the front seat to listen to the Greek while D.R. sneaked to the back with Estelle. D.R.'s muddy mind insisted it could not work, but his clear mind was convinced the Greek would not know the difference. Surely it was worth a try. The problem was maneuvering the recorder to the front seat without attracting the Greek's attention. All he needed was three seconds. All he had to do was edge off his seat, lean and reach behind the Greek and he would have it. Two seconds, even. Two seconds would be plenty.

Ahead of them on the freeway just then were two big semis making simultaneous emergency stops to avoid hitting a Rambler that was trying to avoid hitting a sheep that had wandered onto the freeway. The trucks were very near to crashing, and it took the Greek five full seconds to hassle the emergency, to slow down and pull into the outer lanes and then speed up, and by the time he had Urge lined out and cruising smoothly again, D.R. was back in his seat with the recorder on the floor at his feet. After that it was a simple matter to turn it on and tune it in to the Greek's voice, and then steal away to the back. The Greek talked on, suspecting nothing.

Corner and Straight Wall Forms for Rammed Earth.

How to Dig a Dome

Our first dome is almost completed. Name Rana Grande from the arched windows that were thought to look like frog eyes. Tomorrow we finish off the first third of the pur and then decorate the dirt dome. Wednesday we expect to carve the mound. Weds afternoon to the vigil. Thursday we finish Rana Grande & let it cure for the grand excavation & dedication Saturday.

The dome of Rana Grande is 12 ft in diameter & 9ft high. It is more or less a hemisere with the front sliced off. (Dont worry about the spelling. I know how to spell but this typewriter doesn't & I dont give a damn.) It is a mound of earth upon which we are puring a 6 to 4 inch shell of cement. Saturday we will excavate the dirt mound and reveal the completed room. It has a fireplace poured at the same time.

This dome method should have real applicability to the alternative community because it is cheap, artistic, organic, romantic, practical. This one is taking fifteen sacks sement @ 1.50, 10 tons concrete mix @\$2, & 15\$ worth of reinforcing bars, screen door (from the dump, and window \$5. Total about \$65.

Another advantage is that there are no skills needed. See one and build one. Simple. You dont even have to be artistic. Tools needed are shovel, wire pleirs (for wiring reinforcing bar together), Concrete mixer not, strictly, required. Do it (mixing) in a box. So the other tool you'd need would be a concrete mixer or hoe with mixing box.

Our domes are built into the side of a hill. Much of the structure will be below grade level when finished. Some of excavated dirt to be used to form a terrace in front.

See diagrams for more explanation.

Virgil Byxbe
 Sweets Mill, CA

Dirt from X(cavation) is thrown on top of hill to finish off dome. The mound is formed partly by excavating a ditch away from a central circle & partly by thowing the excavated material on top.

Cinva-Ram Block Press

As you probably know, this machine is manufactured in Bogota,Columbia, by Metalibec Ltda. We are handling the complete importation of this unit into the United States and pay all the importation charges, such as customs duties, ocean freight and marine insurance, plus forwarding fees and handling charges.

Our selling price for this CINVA-RAM press is \$US 175.00, F.O.B. our warehouse, Tallmadge, Ohio. The freight charges from our warehouse to ultimate destination will be on a "freight collect" basis. The press comes equipped with four wooden inserts to produce different types of blocks and tiles, plus an operations manual. The unit weighs 140 lbs. net, 165 lbs. gross (crated for shipment) and has a gross cubic measurement of 3.0 cubic feet each. With the cost of importation, freight, insurance, customs duties and handling charges which we must pay in bringing these presses into the United States, we are unable to extend any discounts of any kind for the CINVA-RAM block press.

Shipment can be made immediately upon receipt of your Purchase Order, together with your check or money order payable to Bellows-Valvair. Please address your order to:

Bellows-Valvair
 200 W. Exchange Street
 Akron, Ohio 44309

I built two houses here using CINVA-RAM—where the owners made the bricks using my machine. Both buildings were a success and the machine certainly has its place.

However, I cannot afford to produce the block because of the big labor factor: it is only economical for owner-builder construction. (Which is great!) I still prefer the monolithic wall, and use a Magdiel form and soil-cement mixture. All this info can be found in the 2 chapters of my book (Owner-Built Home, p. 94).

Sincerely,
 Ken Kern

FORMS IN WHICH SOIL IS USED:

- Soil is used in construction in the following forms:
- (a) In the form of rubble, cut from the surface of the earth, in pieces or blocks of soil.
 - (b) As bricks, made in wooden forms or molds with soil moistened to the required degree.
 - (c) Moistened soil compacted *in situ* in suitable rigid frames to form monolithic walling (rammed earth).
 - (d) As stabilized soil, by combining it with an agent in order to improve its constructive properties.

Soil-cement roofing

If it is desired to use soil-cement as roofing for a house, the following methods may be used: (a) laths or reeds are laid on the roof truss or joists and nailed down; a plastic mortar of cement and (sandy) soil in the proportions of 1:7 by volume, with vegetable fibres 3 cm in length added as a reinforcement in the proportion of one part to four parts of mortar, is spread over the laths or reeds. The layer of mortar should be 3 cm deep, duly compacted, and its surface should be smoothed with a trowel. After the material has had time to dry and harden, two or three coats of bituminous material are brushed over the surface in order to make the roofing waterproof.

Slow, Heavy, and Sweaty

First off, thanks for a lovely review of my book, Stone Shelters in Spring, 1970. It's had other flattering reviews, but your anonymous reviewer read it and understood it, which was not true of some of the others. You even picked the absolutely best passages to quote. Seems I must have a brother out there someplace.

Secondly, I am probably one of only a handful of your readers who have actually built earth houses. (Mine was in Orinda, Cal., 1963). I have some words of caution about building with dirt:

1. It's more work than with any other material, bar none. It's slow, heavy, and sweaty. You move tons of stuff every day to make a few square feet of wall.
2. Rammed earth and adobe are the most work. They make good walls, but not roof structure, so you don't save very much money. Not usually worth it, unless you happen to like the solidity of those big, thick walls.
3. Earth is great in warm climates, but in any moderate or cold climate it'll give you the rheumatism by thanksgiving time.
4. I built using an African technique that lets you build domes and vaults without formwork. Thus the whole house, roof and all, is dirt, and that's cheap (about \$1/square foot for materials). None of your references cover this sort of thing. Two troubles remain, however:
 - a) It still breaks your back and takes forever.
 - b) This type of construction shrinks and cracks a lot more than adobe or rammed earth—a real problem.

Edward Allen
 Wellesley, Massachusetts

For Stone Houses

I read the letter about rocks for building purposes [p. 21 in the March Catalog]. I'm a geology major, and think I can help a little.

First, he says the land is covered with volcanic rocks. These will fall into three types:

1. Dark, heavy, fine grained basalt.
2. Glassy massive obsidian, various colors.
3. Light weight cellular pumice or scoria.

Of these three, the basalt is the best for building. It's tough, very hard, and weathers slowly. The obsidian is essentially glass, and though stronger than steel, it is easily broken. It is strong enough to build with, but may be too non-porous and smooth to mortar together. It also weathers slowly. The pumice and scoria is no good for uses requiring standing weight, such as a wall. However, it will make an excellent insulator for hollow walls or sub floor fill.

If the rocks are of many different types, you will have to examine each type for three necessary characteristics:

1. It should be hard and heavy.
2. It should be fine grained.
3. It should not weather appreciably.

To check weathering, break the rock and match the fresh surface to the old surface. Only a slightly faded appearance on the old surface is permissible. A different color on the outside as compared to the inside is indicative of severe chemical weathering. Also check the hardness of the weathered surface. If it is flaky or crumbly, it's no good.

Also check the well rounded rocks in any stream beds which may be on the property. These rocks are often the most resistant and hardest

Roy L. Porter
 Virginia Beach, Virginia

Stone Shelters

This is an utterly beautiful book, a study of the people, history, geography, and vernacular architecture in a small area in southern Italy known as the Murgia of Trulli.

The several different types of stone shelters of the region are covered extensively, including cave dwellings hewn from solid stone, unmortared stone domes called trulli, and arches and vaults built with "ragbag patchwork technique" by the masons of Cisternino.

The book is primarily concerned with how the architectural forms came into being and how the building techniques derived from the needs of the builders.

Descriptions and text are clear, photos superb. —Lloyd Kahn

Stone Shelters

or WHOLE EARTH CATALOG

The making of a cave is the antithesis of the usual construction process. A cave is space produced directly by the subtraction of a relatively small amount of solid material from a very large mass. A more conventional shelter, whether it be a trullo, a vaulted stone townhouse, or the reader's own dwelling, is space produced indirectly by its enclosure with pieces of solid material added together.

Tufo is a marvelous material. It is dense enough and hard enough to have served as both exterior and interior finishes, yet soft and fine-grained enough to have been cut into almost any shape for any purpose. Because of the immense height, length, and thickness of the tufo cliffs, great freedom of planning was possible.

Stone Works

Stone walls & buildings. These are actually weaker than they look. It was the wood frame houses that survived the Alaskan earthquake. Cement got no give like wood & stonework is much slower than carpentry.

Still it looks like all time and we went ahead. In planning make sure your foundation extends deeper than the frost will. Here in Maine frost heave is a prime consideration for a stone building could easily be cracked to bits.

Surround the foundation with rocks of any size & type up to grade to allow for movement. Don't pack dirt in there.

As for type of rocks to build with, granite is best. Save your really square stones for corners. Stratified, slate, etc. (I don't know the geological terms) are no good. These sedimentary types are porous and the water they suck up will expand/contract and you're in trouble. If you toss it down on the pile & it shatters there you are. But don't slam it cause anything would crack from that.

Use forms to get the straightest walls. Within these you can lay up vertically faster than without, but time saved is lost putting the forms together so the outside surface should be the consideration for forms. Our walls are straight enough to sight down tho it's a personal aesthetic.

Even with forms, don't just toss the rocks & mortar in. A strong beautiful wall is laid up rock by rock. No other way. I worked with a mason of 60 years to learn to lay fieldstone. Practice is the way. Knowing which rock to choose from your pile. Like a puzzle with no two parts the same. Choosing the wrong rock means that your work comes down on your feet. (So don't be barefoot!) Also cement contains lye that burns like brimstone. Wash the stuff off afore it eats your very hide. After a few weeks you'll have to wear rubber work-gloves as your hands will be most tender.) An old Maine stonemason told me that "Even a round rock has a flat side if you can find it."

After building a while you'll understand this. Lay up a rock for strength always thinking of the rock that will rest atop it. Don't be cheap with the mud (cement) but learn what it won't do. Sometimes a rock will get a better bite on another when they're dry & just have cement around their edges. Like bricks only more tricky. If you decide to eyeball it (build without forms) stretch 2 strings down your outside dimension & lean over & sight down. When you only see one string that's your limit. Careful that a rock doesn't protrude & throw your line off. It's easy to build it too wide.

Have a large pile of rocks to choose from. Tiny to fist size stones are what you need to trip up the biggies that wobble. Little triangular shapes are best. Build a wall that rests on rocks tho, not tiny trigs or cement. The old timers here built walls without any kind of mortar (!) but just skill in laying. Those walls are still solid 130 years later. So LAY up your rocks, don't glue them up.

Progress right around your foundation a layer at a time so that when you come back to the starting point you'll be laying on dry or almost dried wall. This isn't possible if you're using forms. This because you have to build right up several feet & then move this whole rig down the line.

A transitional form of trullo field shelter, nonrectilinear in plan. A main space is joined to a smaller one housing a fireplace. Such shelters are often found with two or three smaller spaces attached to the main space, as illustrated in the small sketches. (Plan and section courtesy Byggekunst, redrawn by the author.)

We built a building 30x36x11 with foundations 4 feet deep on a 1 ft. poured concrete footing. Wall thickness was 1 1/2 ft. up to grade & a foot above ground. Solid enough for Maine but you might scale this down a great deal in a milder climate. (By the way, if you're building stone walls around an existing building it would be most simple, for you already have your forms. Accordingly if you plan to have studded interior walls go ahead & put up your studding & then cover the outside with plywood & build along that. The plywood could be removed when the cement dries & shifted for use again.)

We used an old gas engine to run our mixer. Keep cement from the motor & you'll be ok. Rocks are plentiful in Maine. For special rocks try the seashore or a tombstone dealer for scrap. We got lots of colored marble & granite for a six-pack of Schlitz. Some states forbid selling old tombstones but we got some fragments for the walls. Neighbors consider any messing with tombstones goulish so turn the lettering to the inside. You may have the sheriff's grandmam's rock.

Lay your heaviest rocks around your feet, as lifting gets hard above your chest. Favorite, sentimental, or mystical rocks stand out from eyelevel to about eight feet up. Don't bury that romantic special thing at ankle level. We tried to get a piece of the moon for our wall but NASA never came through. A few meteors might be astrologically favorable for your project. Since our walls went up eleven feet we laid from the flatbed of a 2-ton truck above 5 or 6 feet. This proved to be an ideal mobile staging with room for two masons, mortar box and a large rockpile.

When the walls are finished go back and point up around your rocks. Pointing is a mason's signature. Use pointing cement only in small batches (a mixer full will dry out before you could use it) & a small trowel. The stuff is quick drying & sticks when you flip it in the cracks.

Look around at good walls before you start. Observe or work with a mason if possible. Don't get discouraged. It takes a bit of laying to make those rocks stay up there but you can do it if you can dig it. Consult the *I Ching* on any major problem.

Mark Mendel
Dixmont, Maine

The raw material for a trullo could come from several possible sources. Loose stones from the field were one; quarried stone another. Often a large rainwater cistern or wine tank would be excavated in the rock beneath a trullo-to-be, and would yield a large quantity of good building stone. In later times especially, agricultural transformations were carried out, with great expenditure of labor, to make previously unutilized land suitable for crops. The thin topsoil would be carefully removed and piled to one side, laying bare the limestone bedrock beneath. Then the limestone would be broken out in chunks to a depth of two or three feet. The best stones would be saved for construction, and the rest replaced over the still unbroken strata of the limestone, with the coarsest pieces on the bottom and the finest on the top. Following this back-breaking procedure, red bolo soil from a nearby depression would be carried to the field in baskets and tamped over the loose layers of broken limestone to a depth of fifteen or twenty inches. Finally, the original topsoil would be spread back over the bolo, and the land would be ready for cultivation. The heavy but sometimes infrequent rainfalls would be absorbed eagerly by the shallow topsoil and thick cushion of bolo, and once these soils had reached saturation the excess water would filter into the loose bed of broken rock beneath, from which, retained by the impervious bedrock, it could be slowly reabsorbed by the soil and roots above when needed. This continuous bed of limestone fragments, in addition to acting as an underground reservoir, served to furnish continual chemical fertilization to the soil from beneath, to complement the organic fertilizer added from above.

Sewage was distributed over the fields, working with the natural lime to increase the yield of the crops. ...

The masons of Cisternino were men of exceptional ingenuity. They sometimes laid up walls of regular stone blocks, but in other cases made walls by compacting irregular stones and mortar between wood forms. Their combinations of arches and vaults were often graceful and correct, but more often were brutally expedient, and were most often full-blooded, lusty, folk-art inventions that made some charmingly naive concessions to grace and correctness. Nothing was sacred to the masons but the sheer physical stability of what they built. A half-arch could support a stair, a tilted barrel vault could cover it. A round barrel vault could be intersected by pointed-vault dormers. A triangular piece of vaulting could support a diagonal balcony front if held at its vertex on a projecting stone bracket. A buttress to a building across the street could resist the excessive thrust of a roof vault, or of a too-ambitiously cantilevered balcony. An irregular room shape was easily covered with a skewed vault. Almost anything could be supported or spanned by cutting, twisting, tilting, truncating, or combining the standard forms of vaulting in non-standard ways.

NO RESPONSE

Sad to say, however, D.R.'s clever maneuver did not have the result he was so desperate for. Estelle would have nothing to do with him when he lay down beside her. She wouldn't wake up, nor would her body respond to his as it usually did when they lay down together. D.R. shook her, and lifted her eyelids with his finger. But there was no response, except once, when he tried to hold her in his arms and she moaned and frowned and drew away to the far side of the mattress. D.R. thought he would go crazy when she did that. He sat up in the bed and pressed his hands to his head as if his skull was about to fly apart. In his mind he showed himself a little movie in which Estelle sailed away on a raft while he was drowning. He swam after her but words from the Greek's incessant talk filled the sail and pushed the boat further and further away. If he could have managed it, D.R. would have sneaked back to his seat in front and been the Greek's listener again. But he knew he couldn't bring it off. His mummy mind convinced him he could never bring it off without getting caught and reprimanded by the Greek's accusing eyes. There wasn't anything to do but lie down and try to sleep.

To D.R.'s relief, sleep came almost immediately. It was about four in the afternoon now; it had been fourteen hours since he'd dropped the acid, and of course he was exhausted. His brain felt like it had been washed and hung out to dry. Sleep was the best thing that could have happened to him then, and mercifully it came. He didn't hear a word of the Greek's life story as the Greek was telling it. But later that night, deep in Oklahoma, after the Greek got out and bade D.R. good luck and farewell, D.R. took the wheel and listened to the tape of the Greek's story as he drove non-stop to St. Louis.

Concrete Manuals

Three informative pamphlets on concrete from the Portland Cement Association:

Cement Mason's Manual for Residential Construction is primarily for home patios and walkways, with fundamentals on use of the transit, and instructions on finishing.

\$0.56 postpaid

Concrete Improvements for Farm and Ranch is a good basic instruction manual, with details on many rural applications; how to build forms, tilt-up construction, water troughs, floors, etc.

\$0.56 postpaid

Design and Control of Concrete Mixtures is an engineering bulletin, very detailed, on all aspects of quality control of concrete mixtures.

[Suggested by Fred Richardson]

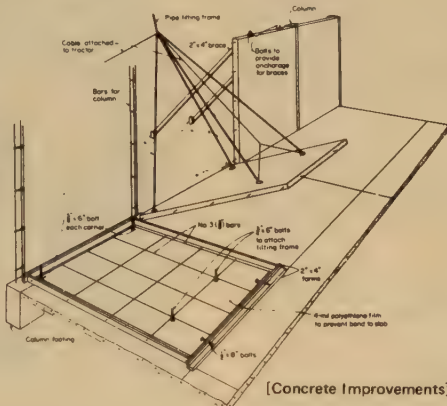

from:
Portland Cement Association
Old Orchard Road
Skokie, Ill. 60076

HARDENED STATE OF LIGHTWEIGHT CONCRETE

Compressive Strength

Lightweight concrete with 28-day compressive strengths of 3,000 to 4,500 psi can generally be produced in the laboratory with cement contents of 425 to 800 lb. per cubic yard, depending on the particular lightweight aggregate being used. Certain lightweight aggregates can be used to make concretes with strengths of 7,000 to 9,000 psi and with cement contents of 565 to 940 lb. per cubic yard. The rate of strength development for lightweight concrete is approximately the same as that for normal-weight concrete.

[Design and Control of Concrete Mixtures]

Tilt-up concrete construction is accomplished by casting wall panels on a concrete floor or other relatively smooth bed and then tilting them to a vertical position. To prevent bond with the wall panel, the floor slab is covered with plastic film or a sprayed-on chemical. Wall panels are usually tilted by a tractor or other lifting equipment. The panels are braced and reinforced concrete columns are cast at the panel junctures to tie them together.

[Concrete Improvements]

Power Joint Cutter

Another method of cutting joints in concrete slabs is with an electric or gasoline-driven saw fitted with a shatterproof abrasive or diamond blade. A power cutter produces a narrow joint that minimizes the possibilities of spalling at the joint due to traffic. The joint is cut in the concrete surface 4 to 12 hours after the concrete has hardened or as soon as the concrete surface will not be torn or damaged by the saw.

[Cement Mason's Manual]

Concrete and Masonry

For a buck this is a lot of information, especially about large-scale concrete work. Good masonry introduction not as thorough as Audels (p. 97).

Laying Rubble Stone Masonry

Workmanship in laying stone masonry affects the economy, durability, and strength of the wall more than any other factor.

A. Rules for Laying

1. Each stone should be laid on its broadest face.
2. If appearance is to be considered, the larger stones should be placed in the lower courses. The size of the stones should gradually diminish toward the top of the wall.
3. Porous stones should be moistened before being placed in mortar in order to prevent the stone from absorbing water from the mortar and thereby weakening the bond between the stone and the mortar.
4. The spaces between adjoining stones should be as small as practicable and these spaces should be completely filled with mortar and smaller stones.
5. If necessary to remove a stone after it has been placed upon the mortar bed, it should be lifted clear and reset.

Figure 4-21. Rubble stone masonry wall showing bonding details.

B. Footing.

The footing is larger than the wall itself. The largest stones should be used in it to give the greatest strength and lessen the danger of unequal settlement. The footing stones should be as long as the footing is wide, if possible. The footing stones should be laid in a mortar bed about 2 inches deep and all space between the stones filled with mortar and smaller stones.

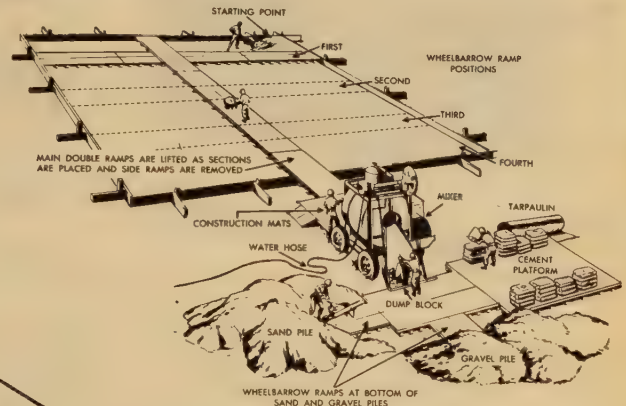

Figure 5-4. Typical organization of mixing equipment and materials.

Goldblatt Tools

An amazing catalog of specialized builder's tools. All manner of trowels and concrete tools, stilts, brick mangers and chisels, concrete saws, scaffolds, knee pads, wheel barrows, hods, tool pouches. Good prices.

The Sea Ranch, CA

Concrete Boatbuilding

Ferro cement is a super strong $\frac{3}{8}$ " thick fireproof material used for boat hulls, consisting of a mixture of sand and cement plastered over a wire framework. It is cheaper and easier than conventional boat-building techniques and very few special tools are needed. This is a textbook on building a ferro cement boat where the authors share details of their considerable experience. There is a fine concise section on how to build, and chapters on reinforcing, mortar mixing, and finish work.

Ferro cement should work well on land . . . let us know if you hear of any F. C. domes.

(a) A rough and ready rowboat can be built from beach sand and cement as follows. Although not in the best tradition of ferro-cement, the form of construction is beautifully simple and inexpensive. It could conceivably have a military application.

(b) First form a mould of damp beach sand. Mix in a little fast-setting cement for the outer layer. Cover with polythene cut and taped where needed.

(c) Next cover with approximately four layers of $\frac{1}{8}$ " chicken netting. Wire tie at overlaps and hold at gunwale with a band of No. 8 fencing wire. Additional bands of fencing wire over the hull add stiffness. Wire mesh to these.

(d) Finally plaster with beach sand and quick setting cement mixed 2 to 1 with a minimum of water. Plaster layer of approximately $\frac{1}{2}$ ", thickening to an inch at the gunwale, more at the keel. After two days, lift hull from mould, patch up inside and where possible sink boat to cure concrete for a few days.

Fig. 10—Shoestring rowboat

Tongue-in-Groove Bricks

Good design on an old idea: stacking blocks—concrete, with grooves and ridges which lock the whole thing together. No mortar required, since everything interlocks. Also makes the blocks reusable. If you move—take your house apart and move it with you. Blocks are sold by franchised dealers of **Wedge-Block, Inc.** 10439 Garibaldi, St. Louis 63131 but the molds for do-it-yourself should be simple to make.

Tom Cryar
Pittsburgh, Pa.

Stack Sacks

Between adobe bricks and formed concrete walls is this other way. You take gunny sack halves, sew them into narrow bags, fill them with sand and some concrete, stack the dry bags up like bricks, pound re-bar down through the bags, frame doorways and such with re-bar, then wet the whole wall with a hose or a rainstorm, let cure, put on the roof (maybe with wet-concrete-dipped gunny sacks for shingles). Trowel on wet concrete for a smooth wall if you want it.

According to Holly Baer, who told us, the main source of information is:

Dicker Stack Sack International
2600 Fairmont Street
Dallas, Texas 75201

They are getting a patent on the device that turns out filled bags. Apparently local franchises can deliver an order of stack sacks to your door. Some people dip them in water, then place them wet.

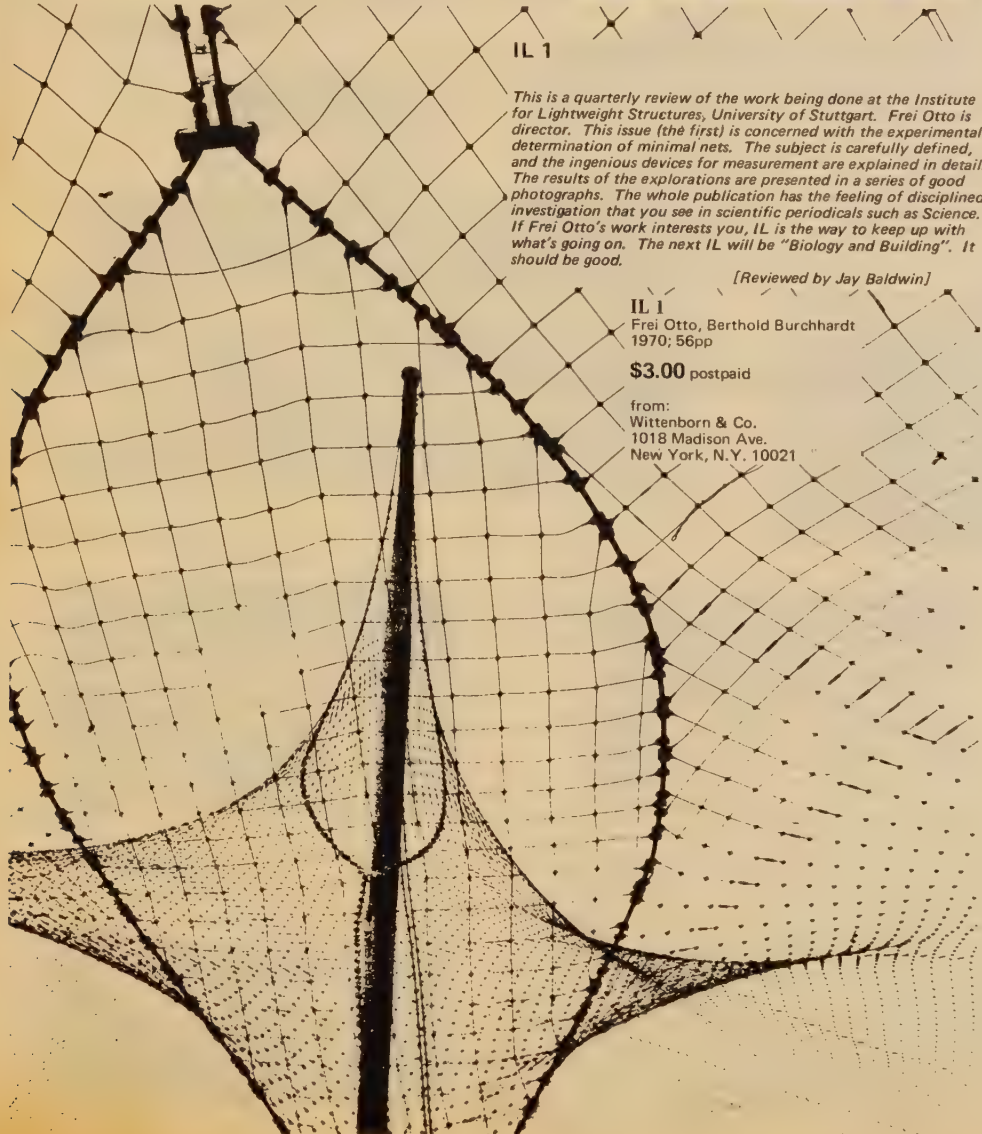

THE GREEK'S LIFE STORY

Before I tell my life story I want to explain where I'm going, and why. My destination is Norman, Oklahoma. I used to be a student at the state university in Norman, and I'm on my way there now to destroy a certain manuscript that I wrote and left there in the library, for posterity. I didn't have any way of realizing it at the time, but leaving that manuscript behind on that campus was one of the worst mistakes I've made in a lifetime filled with mistakes, and the most important thing I have to do at this point in my life is correct that mistake by getting hold of the manuscript and destroying it.

It's got to be destroyed because the story of my life from 1930 to 1955 is told on those pages. Except for that record, that whole early phase of my life is totally lost to memory. I don't remember anything that's in the manuscript, and I've forgotten the name of the person that manuscript is about. It's taken me fifteen years of constant labor to arrive at my present state of mind and I'm proud of that achievement. Yet I can't relax in my condition of forgetfulness because I know that one glimpse at that manuscript would bring it all back again, and my efforts these last years would all have been for nothing. I realize it's pretty unlikely that I would ever accidentally find myself reading the manuscript. There's only the one copy, gathering dust all these years in the stacks of the University library. But as long as that manuscript exists, intact, the possibility exists that I might see it, and I am haunted by that possibility. The very worst thing that could happen to me is to have the knowledge of my early life re-implanted in my mind.

(continued)

IL 1

This is a quarterly review of the work being done at the Institute for Lightweight Structures, University of Stuttgart. Frei Otto is director. This issue (the first) is concerned with the experimental determination of minimal nets. The subject is carefully defined, and the ingenious devices for measurement are explained in detail. The results of the explorations are presented in a series of good photographs. The whole publication has the feeling of disciplined investigation that you see in scientific periodicals such as Science. If Frei Otto's work interests you, IL is the way to keep up with what's going on. The next IL will be "Biology and Building". It should be good.

Wittenborn & Co.
1018 Madison Ave.
New York, N.Y. 10021

The only pavilion of Expo 67 more beautiful than Fuller's U.S. Dome was the West German tent, designed by Frei Otto. He is currently the master of structures whose flexible skin is the prime structural element. Volume One of his 2-volume work is devoted to Pneumatic Structures—air houses plus. Every designer we know who's seen this book has commenced to giggle and point, jump up and down, and launch into enthusiastic endorsement of Otto, design, being a designer, and look at this here. The book is comprehensive in its field, technically thorough, beautifully presented.

Small floating balloons may carry fertile soil in nets or perforated foils.

The best way of retaining the spherical shape is by means of water. This shows a floating steel balloon, retained and centered by a hose.

Figure 9 is a section through a greenhouse set on sandy soil and covered by a transparent membrane with internal drainage. A membrane is also laid beneath the humus layer, and is positively connected with the roof membrane at the inner drainage points and along the outside edge.

The humus layer thus forms a simple anchoring weight.

The floor membrane simultaneously permits moisture control of the soil.

The roofing of such cultivations by pneumatically tensed membranes with internal drainage is seen from the side in Fig. 10. A net of small open mesh floats on the water and carries the humus layer; it is supported both by inflated balloons and by the roof membrane itself which spans the floating fields and is immersed to a depth of approximately 15 cm at the edges.

Frei Otto: Tension Structures

This is a comprehensive collection of the stretched-membrane and pneumatic structures made or proposed by Frei Otto and his friends from 1953 to 1967. The many projects actually done or modelled are shown in photographs (many rather dark). Proposals, and explanations of the structures are shown in drawings and diagrams. The text explains things in a non-technical language. The math is not discussed. There are a number of structures shown that were news to me, and as usual they excited me a lot. Can you dig a dam made of cables and a membrane? Tension structures are economical and graceful, and we will probably be seeing a lot of them soon. If you want to understand them, this book is a good place to start. It's claimed to be the only single volume collection printed in English. The price is something else.

or WHOLE EARTH CATALOG

(Probably cheaper from Blackwell's, p. 2)

For roofs over large areas it is usually necessary to employ structures of relatively low height. Because of the large radius of curvature, large-span pneumatic domes of low "rise" have high membrane stresses. If, on the other hand, the membrane is anchored to the ground not only at the edges but also at one or more points in the interior, then the spans, the radii of curvature and therefore also the membrane stresses are reduced. While retaining the same average height, pneumatic roof structures with low points can be extended at will. They are among the most economical structures for covering large areas and are independent of the structure of the ground over which they span, inasmuch as tension anchorages may be given any desired length and be formed in all manner of soils and even under water. Such roof surfaces have to discharge their rainwater at the low points (structures of this kind are, in principle, conceivable also as vertical or steeply sloping wall surfaces).

Tensile Structures is the complete story on tents and cable nets and like volume one the entire subject is covered in minute detail. The book is intended to show where the thinking and practice on the subject is at this time in history. There is an overview of the whole field, then specifics on cable, net and membrane structures. Each is thoroughly discussed and illustrated with photographs and drawings although graphics here are not as intriguing as in volume one. The last third of the book contains calculations on load-bearing abilities and design. For many readers this will be too technical to understand, much less use. But tensile structures are very exciting at this time, and the book is great for getting people started on experiments and construction. Canvas is a cheap building material. There's a lot to learn here. The forms are very organic, and coverage is complete.

Guyed masts consist of one-dimensional central elements subjected to compression and surrounded on all sides by one- or two-dimensional tension-loaded elements. They thus form three-dimensional systems most suitable for mobile structures. Many contemporary designs of high cranes for wide reaches are variations of this basic system. An elastic central rod can be bent by varying the lengths of the guys (Fig. 3). For this, all cables must be adjusted simultaneously; this is done by synchronized hydraulic presses located at the anchoring point. A similar, but much more mobile system is shown in Fig. 4. A thin elastic central strut carries cantilevers connected to the ground by means of cables.

In living nature the spine of a vertebrate (Fig. 7) is a guyed mobile system, approximately as shown in Fig. 4. A multiple articulated, highly flexible central rod, capable of taking up large compressive forces, is surrounded by a tension-loaded system consisting of many members, which secures the central rod against buckling and bending, while ensuring its complete mobility.

Inflatocookbook

An inflatable is an event, like circus tents used to be. Dogs bark, kids gather, old ladies get up tight, cops drift by, youths take off their clothes.

Inflatables are trippy, cheap, light, imaginative space not architecture at all. They're terrible to work in. The blazing redundant surfaces disorient; one wallows in space. When the sun goes behind a cloud you cease cooking and immediately start freezing (insulation schemes are in the works). Environmentally, what an inflatable is best at is protecting you from a gentle rain. Wind wants to take the structure with it across the county, so you get into heavy anchoring operations.

To give inflatables their well-earned due, they are wonderful recreational structures. High and scary but thoroughly safe. Like an immense water bed, or slow-motion trampoline, or squishy mountain. Person-flinging giddiness maker.

This book of Ant Farm's has all the basic design and materials information to puff up your own dream sky hill. —SB

or WHOLE EARTH CATALOG

If your inflatable is going to be up outdoors in any wind, it will need an anchoring system. For small volume (500 sq. ft. of floor area or less) interior weights should work; these could be sand bags or water bags. Larger structures require heavier anchoring. There are a number of ways of doing it: integrally made tie downs, buried edge, weighted edges, taped edge, or tension net anchors. Buried edge is good for a semi-permanent installation where you can dig a trench. A taped edge is good for a small installation on a smooth floor; tie downs and tension nets are good for sites with existing things to tie to (trees, fire hydrants), or where it would be easy to drive tent stakes or augers.

The anchoring system must withstand not only windloading but also the internal air pressure of the structure. Precise structural calculations should be left to 2 engineers, 3 Ph.D. mathematicians, and a computer, but a little rough math can give you a close enough estimate of what anchors to use. We will deal first with inflation pressure and second with wind loads.

40' VINYL PILLOW Dielectrically welded vinyl pillow with double blowers, net, and earth-auger anchors. 2 doors, variety of colors and weight vinyl. \$2,000-2,500. Rents for \$150/day. Other sizes and shapes (see pentapus) made to order.

The Latest Inflatables

Here's what we've been doing with inflatables recently—at the Media Conference at Goddard, many of us (Cosmic Labs, South-coast) lived in poly bubbles in the woods (300' extension cord) and stayed dry through three days of rain. Very functional and nice.

I've been doing a series of Water-Bubbles for the NYC Parks Department. Their Festival Truck goes to street fairs and provides stages, PA, lites, and Bubbles. We lay down the red carpet (non-woven polypropylene, \$1.75/sq. yd. from Oxite Corp.), inflate zoomy 16 gauge vinyl bubbles with 5000 CFM blower mounted on the truck, tie the anchor ropes to parking meters, lite poles, fire hydrants, etc., attach 1" hose to fire hydrant & 3-way distribution system: one to overhead sprinkler hoses, one to floor sprinkler hoses, one to 4-way direct spray. Add 150 kazoos, cowbells, claves, tambourines—and turn the kids loose inside. They really give it a workout—the carpet protects the bubbles and the kids when they slide and fall. I try to get them involved in putting it up and down. Some do, some don't. The first model was in 8 gauge vinyl—it almost worked, but would usually rip after a few hours. I really hate to tell them. "Don't. . ." I think the new model will take about anything except knives. Even in Hunt's Point and Lower East Side, no knives attacked it.

Now we're in Columbia Maryland working on the Antioch project to put this campus in a 1-acre inflatable using the Goodyear system—12 gauge vinyl reinforced with steel cables with internal drainage points. The site slopes 15%. We'll do earthwork—direct ramming and CINVA Ram—to form an earth berm and interior spaces. Probably also have foamed interior structures. Southcoast is here working on a prototype. Some hassles in zoning, air conditioning, financing—we're working on a grant from Educational Facilities Labs, (Ford Foundation). Project has a fairly high reality-feel about it. I'm working on getting the vinyl metalized—to cut down heat gain. Maybe put silver mylar on the vinyl. The structure will have a double skin for insulation. This makes some problems on duct connections. But it opens up the possibility of sculpting the "ceiling" at will by varying the skin spacing. Goodyear is opening up their research department to us. The whole thing is an order of magnitude of complexity higher than the poly bubbles. But it's still more and better for less.

FINE tape source:
Arista Custom Tapes
Foot of Farm Road
Secaucus, New Jersey
Phone 201-864-3131

Mr. Zymler has been most cooperative and friendly. The tape we usually buy is 5 mil vinyl, \$1.27 per inch of width for 36 yard rolls, in many colors, all good (red, yellow, blue, green, white, black, orange, and others) in case lots. He'll sell as few rolls as you need—15% more for less than a case—fast service—2 days by UPS in NYC area, and ships by air. The tape can be cut in any width. I've been ordering 3" and taping both sides, for heavy-use stuff.

A source for screw-in earth anchors:
A.B. Chance Co.
Jersey Avenue
New Brunswick, New Jersey

\$6.15 for an 8" helix on 1" x 60" shaft, will hold 10,000 lbs in normal soil.

Charlie Tilford
Inflatoenvironmentologist

The personal history that's still alive in my memory begins when I was twenty-two. When I was twenty-two I thought that what I wanted more than anything in all the world was to be a scholar, a student of literature, an expert on the metaphysical poets with particular emphasis on John Donne. I had a bachelor's degree but that didn't seem like enough. I felt like I'd got that degree without ever really reading anything, without ever really learning how to read. I wanted to read, to study, to experience the words of the masters. It seemed like such a gentle thing. The library, the department, the lectures, all were images of utmost quiet and tranquility to me then, and I wanted nothing more than to be quiet, to read and write and think, to live the classic life of the mind right here in the middle of the Twentieth Century.

Graduate school was good the first year. I did okay in the classes, and I was into some personal writing that satisfied me. I didn't take myself seriously as a writer, you understand. But I enjoyed it, it was expression, and I felt like I had a whole lot to express. I remember writing a short story about a flower, a daffodil that learned how to sing. Every afternoon the daffodil would give a concert for all the other flowers in the meadow. The story was published in the campus literary magazine and a lot of people told me they thought it was pretty good.

The problem with my career as a scholar was the Master's Thesis. I did well in the lecture courses and seminars, but I just couldn't hack that thesis. The reason I couldn't hack it was I really didn't want to write a thesis. I'd sit down and try to write about the metaphysical poets and every time I'd wind up saying stuff about myself. I worked over a year on that paper, and when I'd finished I had three hundred pages that simply told my life story from birth through graduate school. Of course I knew the professors wouldn't accept the manuscript as a thesis, so what I did was have it typed up professionally, and bound to look like all the other theses on the shelf. And one day I sneaked into the stacks and when nobody was looking I slipped it up on the shelf and left it there. Then a few weeks later I left the University, I left Norman altogether and entered the next phase of my life's adventure.

(continued)

Vinyl Cements

I have been developing a portable, collapsible, insulated shelter in which I have been using a nylon reinforced vinyl requiring a suitable adhesive.

I would like to advise the person who refers to himself as the 'Virginian' in Pax River, Maryland that Bostik Adhesive Specialists, a subsidiary of USM Corp. in Middleton, Mass., produces an excellent adhesive for vinyl. It is referred to as 4067 a nitrile rubber base adhesive and 7130, a synthetic resin base. Both are excellent and are often used industrially for vinyl inflatables.

James W. Smith
Providence, R.I.

Plastics for Architects and Builders

Whereas architects and builders are comfortably familiar with the "classic" building materials that come more or less directly from nature, plastics, with so many complicated names and such complex manufacturing processes, have not been as readily understood.

Most books on plastics are by and for specialists. Here, however, is a primer on plastics, clear and orderly, that gives the builder, designer, or architect enough basic knowledge to begin thinking of design with the new sophisticated materials.

It begins with a simple description of the molecular structure of plastics—one of the principal keys to their behavior. Once the designer understands this, he is ready to begin exploring the array of materials available.

Then there is basic information, pictures, many drawings on the properties, end-use applications, composites, and manufacturing processes. The designer can then begin to understand what plastics can & cannot do.

—Lloyd Kahn

Plastics for Architects and Builders

Albert G. H. Dietz
1969; 129 pp.

from:
The M. I. T. Press
50 Ames Street, Room 765
Cambridge, Mass. 02142

or WHOLE EARTH CATALOG

There is no escaping the conclusion that design with plastics is design at a sophisticated level.

Light Transmission: Thin structural plastics can transmit a high percentage of incident light, thus providing structure, enclosure, and illumination—a combination unique among structural materials.

Hand layup.

Sprayup

Preform.

Matched die molding.

Bag molding.

Cellulosics: One class of chain polymers is made by modifying cellulose, a natural high-polymer chain:

Various acids will react at the OH points of the cellulose to give a series of "esters" (the organic analogue of salts in inorganic chemistry). The oldest is cellulose nitrate, often thought of as originating the plastics industry when first proposed for billiard balls to save the African elephants from decimation for their ivory.

Stabilizers: Plain plastics, such as polyethylene pipe or polyvinyl chloride sheet, may degrade when exposed to some environments such as sunlight. They must therefore be fortified by stabilizers, such as ultraviolet absorbers and antioxidants. Carbon black, for example, converts polyethylene from a quickly degrading material to one that stands up extremely well to sunlight and general weathering. Other stabilizers accomplish their purpose without necessarily coloring or making the plastic opaque. Care should be exercised to select a properly stabilized plastic for a particular purpose unless it is inherently stable. The subject is far too complex to be treated here. The architect should insist upon assurance that the plastic will have the necessary life for his application.

Thermal Response

Expansion and Contraction: Like all building materials, plastics expand and contract with rising and falling temperatures, but for many plastics the extent of change is appreciably larger than for many other building materials. Allowances in design must therefore be made for these dimensional changes, either by accommodating them in the shape of the component or by providing expansion joints. A curved section, for example, may bulge or flatten slightly without affecting its usefulness. Framing around glazing should allow room for expansion and contraction, and the sealants employed should accommodate such motion.

Design: Expansion and contraction can lead to severe stresses at sharp bends or at points of restraint, such as tight bolts and pins. Repeated stresses caused by temperature changes can lead to fatigue, cracking, and failure. Generous radii and fillets should therefore be provided, and holes for fastenings should be large enough to allow for movement with changing temperatures. Restrained flat surfaces may wrinkle upon expanding and in extreme cases may crack or tear upon contracting. Curved or folded surfaces, properly designed, overcome these problems.

Plastics in Building

With all the sealants, plastic pipes, foams and the like coming into prominence in the building industry, it's handy to have a book like this, which describes the properties and characteristics of the many plastic materials now in use.

There is introductory information on reinforced plastic shell structures, adhesives, roofs, coatings, and reports on the use of plastics in other countries.

—Lloyd Kahn

Both the plastics chemist and the architect are designers of structures. The architect builds with units that the eye can see and the hand can weigh. The chemist's building blocks are tiny molecules, far smaller than one-millionth of an inch, which he strings together to make aggregates called **polymers**. These little chains, barely discernible by electron microscope, are entwined and sometimes tied together to give us the plastics.

Sprayup (Figure 5-11)

The sprayup process lends itself particularly well to the manufacture of large structural polyester based panels. In this process, chopped fibers and resin are deposited simultaneously against a mold surface. The unit used for this deposition consists of a chopper and dual spray nozzles. Continuous strand is fed into the chopper where it is cut to length. Fiber length can be varied from about 1/2 to 2 inches. (The longer fibers are desirable for structural panels because they impart higher mechanical properties.) The fibers are fed into the path of the dual spray nozzles. Separate reservoirs supply one nozzle with catalyzed resin and the second nozzle with accelerated resin. The resin formulation is tailored such that neither component is highly reactive, and therefore, each may remain in the reservoirs for at least several hours. When the products leave the dual elements of the spray gun, they intersect and intersperse, and pick up the chopped fibers before striking the mold. The resin mixture is then ready to cure at a convenient rate as predetermined by the concentration of catalyst and accelerator.

JOINT SHAPES

The shape of the joint has considerable effect on the success of the joint sealant. As a joint moves, stresses are imposed on the sealant that may be more or less severe, depending on the natural or original shape of the joint. The deeper a sealant is in a given joint for a given width, the more "necking" and internal stress occurs in the sealant as the joint opens. As is seen in Figure 10-4 a joint 1/2 inch wide X 1 inch deep "necks" or pulls up within itself far more than a joint 1/2 inch wide X 1/2 inch deep. Consequently, there is a greater chance for cohesive failure with the deeper joint. A similar problem is solved when a sealant is used in a joint in which there is no breaker strip at the bottom or back of the joint, so that the sealant is in contact with three sides of the joint with only the face of the joint exposed. This, again, puts a greater strain on the cohesive strength of the sealant. The obvious recommendation here is to employ a breaker strip or type of backing which will not restrict or restrain the sealant, but will move with it as the joint moves (Figure 10-5).

FIG. 10-4: Effect of joint shape on necking.

FIG. 10-5. Reducing stresses with a breaker strip.

Shrinkage is another characteristic whose importance varies with the use of the sealant. If the sealant is applied in a corner joint as a fillet, shrinkage actually may be desirable in order to have the joint become concave. On the other hand, a sealant put in the 1/4-inch joint between two adjacent porcelain enamel panels cannot have excessive shrinkage or it will shrink into the joint providing an unsatisfactory appearance and also reducing the amount of sealant in the joint, possibly to an unsatisfactory amount. Sealants are available with shrinkage rates ranging from practically 0 to 50 per cent. If a very low order of shrinkage is required, a two-part chemically curing compound will provide shrinkages in the order of 0 to 2 per cent. If a modest amount of shrinkage is permissible and other characteristics unique in the compound are desired, solvent-release type compounds are available with shrinkages ranging from 10 to 20 per cent. For certain applications, sealants with 40 to 50 per cent solvent, providing about that amount of shrinkage eventually, may be entirely satisfactory, e.g., for needle glazing and other small joints where a concave finished joint is not harmful.

Several plastic coatings, including epoxies, urethanes and polyesters, have established themselves as extremely durable surfaces with excellent bonding characteristics. These coatings form their films by chemical action rather than oxidation or evaporation as in the case of the paints. A urethane coating was used for the car shelter and breezeway panels of the South Bend house. This two-part system promises excellent weather resistance and color retention. One clear coat of the formulation was plant applied during fabrication of the sandwich panels. After the initial color coat was mixed and brush applied at the site, an additional coat which contained a pure silica sand for texturing finished the surfaces. The coating has performed well and appears to be particularly able to conceal plywood grain raising and checking.

FIG. 19A-3. Extruded vinyl waterstop. (Courtesy Cementa A.S. Copenhagen, Denmark)

A remarkably designed extruded vinyl (Figure 19A-3) waterstop is being used as a peripheral insulation. The diamond-shaped center portion serves as a mechanical spring. When the concrete expands, the diamond collapses; when the concrete contracts, the diamond expands pushing the fins tightly into position.

Structural Potential of Foam

Plastic foams are entering the building industry. Shot from guns, poured into molds, or vacuum formed, foam is produced by mixing two liquids which expand to form the cellular structure.

Recent technological advances with urethane foams in application, fabrication, and product control have led to the current wave of experimentation. Designers such as Douglas Deeds and Felix Drury are working on structural applications of foam, hoping to achieve free-form buildings.

Equipment for spraying is expensive: a foam rig is \$1,500-7,000, and foam itself runs about 10¢ per board foot (1" x 12", one inch thick) if you're doing your own application, and buying bulk materials. Its biggest applications now are in roofing and as insulation.

This book describes a government sponsored project to determine the potential use of foam for housing in underdeveloped areas. It may well be that building codes, unions, lumber lobby interests, etc., will hold up foam development in the U. S., and that the real advances will be made in other countries. Details are given here on several years of testing various structural applications of polystyrene and polyurethane foams. There are pictures, construction details, drawings, graphs and charts on test results. Since this work was done several years ago, recent improvements in foams may have superseded some of the conclusions.

—Lloyd Kahn

It is clearly to the interest of the plastic industry in the United States to enter the housing field on such a global scale. As the section on marketing aspects brings out, the industry is caught in a squeeze between steadily increasing surplus production capacities and a falling price curve for the basic chemicals. Housing looms as a most attractive mass market—chemicals would be bought by the ton, not just by the pound—but attempts to penetrate the housing field in the United States have been frustrated because of local building code restrictions and the opposition of established interests in the conventional way of building. In entering the housing field, the plastics producers will find better opportunities for success if initially they turn to the emerging countries where the building codes are less restrictive (if indeed any exist at all) and where there is consequently more freedom to develop a new kind of building industry.

All the shells were coated with liquid elastomer before being exposed to the weather. Two approaches were used. One was the use of the two-coat system, neoprene and Hypalon, and the other the use of two coats of Hypalon.

The shells were moved to the site by rolling each one like a giant wheel.

The shell was suspended and loaded with 20 lb sand bags to simulate uniform loading.

Petroleum is becoming increasingly the raw material for plastics intermediates.

Office room transformed into grotto by designer Douglas Deeds, San Diego. Deeds built foam up in layers, as coils of clay are used to form a pot.

Vacuum forming: ABS foam, marketed by U.S. Rubber Co. under the name 'Expanded Royalite'...in sheet form is clamped in a stationary frame, heated, and then drawn into a female mold by vacuum....

The fewer the joints, the fewer are the problems the structure will have to face...lightness in structures can lead to some special problems of anchorage.

The cellular plastics admittedly have certain technical limitations. For instance, they have a low moduli of elasticity and high creep characteristics. These properties definitely restrict the way they can be formed or shaped, if they are to be used as independent structural materials.

Closed cell foam plastics offer excellent thermal insulation (with K-factors usually varying from 0.12 to 0.30) low water absorption and low moisture permeability.

Plastic materials, particularly the foam plastics, unquestionably have a high potential for housing use in the developing areas of the world.

Spray techniques have good possibilities for the construction of total structures using either air-inflated structures or lightweight armatures as form work; the present crude appearance of sprayed foam products can be overcome by mechanizing the spray gun or by using extremely skilled operators.

Plastic Hinges

This tough hinge was flexed 1,000,000 times without breaking. Comes in rolls, about 30¢ per foot. Fact sheet "Polyhinge" from:

Adhesive Engineering Company

these guys are doing what construction people never figured could be done. they take structures like collapsed concrete bridges, jack them back into place, inject some adhesive, and the bridge is stronger than before it collapsed. They print a pamphlet called Construction Adhesives Coatings and Sealants, and they provide information and survey to about every possible application of industrial gluing. alan kalker suggested it, through herb grubb. alan's idea was that there might be an application here for prepoured concrete dome sections. just pour the sections, hoist them in place, and stick them together.

For the first time in my life I began living without a plan. Time and space went out of my mind as concepts as I worked to let go of every memory of my early life. It was a period of wandering, alone, traveling light, sometimes with only a pack on my back, hitch-hiking when I was broke, driving old cars when I could afford to buy them. I would drive the old cars till they fell apart, then hitch-hike again till I got enough money together to buy another old car. I was insane a lot in those days. Half the insanity of my life came from watching my cars fall apart around me, and being unable to fix them. And yet, it was fascinating. I learned much from the experience of those cars. Those cars gave me my first important insights into how all things are made of separate parts, and how those parts come together as wholes. I'd buy a car and drive it thinking that I had bought one thing and then go crazy when it would turn out I hadn't bought one thing at all, but a hundred things, a thousand things that had to fit and work together or they couldn't work at all. Fuel pumps, water pumps, head gaskets, oil filters, coils, tires, tubes, king pins, bushings, rocker arms, brake linings, horns, lights, steering wheels, transmission systems, a thousand parts that needed oil and grease and special measuring of lengths and widths and timings in between. I couldn't cope with that realization at first. There were times when a fuel pump would go out and all I could think to do was walk away, just abandon the entire car. I had no mechanical skill, and no patience to learn any. As I brooded about this idea, as that long string of broken cars forced me, literally drove me into this painful experience of the separate parts of machines, I began to see how everything is made up of parts, how the whole world, the whole cosmos is nothing but an incredibly large heap of parts. And it was then that I went truly crazy. For if all the world was a heap of parts, then where was the guarantee that all those parts would keep on working? Where was the guarantee that the one necessary part that held it all together, the screw or the pump or the axle or the philosophical theory the world just had to have to keep going, was not going to break or wear out or get lost at precisely the moment the world needed it the most?

I think the insight that finally broke me and made me voiceless, took away my very power to utter words, was the recognition that language itself is made of parts, little bits and pieces we call vowels and consonants, verbs, nouns, adjectives, conjunctions, the parts of speech, you see.

The Parts!

Workers of the world; disperse.

Fred Richardson 1970

The report from ALLOY (Spring-1969) is reprinted here in full because the event turned out both significant and unique. A number of personal and inventive journeys made a lasting turn there. Certain issues came clear and common: coyness about money, the uses of structure in events, the bonding of mutual hardship, coherent action without subservience, and our wealth of knowledge and wealth of ignorance about processes closest to us. A faith was built: we have the juice.

SB

The presence of the world is in us all the time. You don't need television or newspapers to know about the war. You can feel it.

Love is joy.
Joy is love.

The framework is made of fencepost pipe they cut to size at the factory. We flattened the ends in a vise and bolted them together. The frame for the whole dome cost about \$180.

It's amazing that a hundred hippies could come together and even eat at all.

Catch-22 says you can't live in a temporary structure.

Except temporarily.

So there she was with a 2-day-old baby hanging off her tit directing the construction of the dome.

There's some far-out pitfall beyond that solution.

You know it isn't working for them when they give it away for people to try out.

The world is one big blank working out its destiny as fast as it can.

If there's one thing we're good at, it's painting stuff up.

New Mexico is the center of momentum this year, and maybe for the next several. More of the interesting intentional communities are there. More of the interesting outlaw designers are.

ALLOY was their first programmatic gathering. Conducted at an abandoned tile factory near La Luz, N.M. between the Trinity bomb-test site and the Mescalero Apache reservation, the conference lasted from Thursday to Sunday, March 20-23: the Vernal Equinox.

The event was initiated and organized by Steve Baer with Berry Hickman. Ray Graham donated the use of the land. Baer had in mind a meld of information on Materials, Structure, Energy, Man, Magic, Evolution, and Consciousness, so he invited individuals with amateur or professional interest in these areas to take responsibility for their coverage in the discourse. He also invited

performances by Libre, Drop City, Bill Pearlman's theatre group from Santa Fe, and the Whole Earth Truck Store.

150 people were there. They came from northern New Mexico, the Bay Area, New York, Washington, Carbondale, Canada, Big Sur, and elsewhere. They camped amid the tumbleweed in weather that baked, rained, greyed, snowed, and blew a fucking dust storm. Who were they? (Who are we?). Persons in their late twenties or early thirties mostly. Havers of families, many of them. Outlaws, dope fiends, and fanatics naturally. Doers, primarily, with a functional grimy grasp on the world. World-thinkers, drop outs from specialization. Hope freaks.

Among the voices here are J. Baldwin, Lloyd Kahn, Steve Baer, Dave Evans, Gandalf, Berry Hickman, Stewart Brand, Steve Durkee, Peter Rabbit, Dean Fleming, and brother anonymous.

How can you exchange with 150 people?

It can't get out of control because it already is out of control.

No one wants to be an audience. You can talk if you give them a dessert at the end. You need some way of recording it, otherwise it devolves into an endless circle of rap.

The mike is a ploy to create structure. It doesn't have to be plugged in.

Everybody's assuming the human potential is a static thing.

We're in some incredible bind that we can't even move around enough to know that we're in it. Maybe the only way you can get in the right place is by rattling. If this thing we're doing isn't a big rattle, I don't know what is.

The whole system is going the wrong goddamn way. We're not investigating what we should be investigating.

These relationships between people have not been based on some kind of appreciation of what the structure of the world is.

We want to change ourselves to make things different.

Materials

J. Baldwin talking

One way of getting a design is by asking the question: How do you use the new materials you have?

There are new kinds of cardboard that approach plywood in strength.

You can stamp out houses like cardboard toys, really cheap. A cardboard house for a family of four would cost \$35 for the shell.

So a \$35 house breaks down in five years...

With cardboard you can do large things quickly, can do 3-D sketches without drawing plans.

Cardboard is cardboard, not plywood, so if you're going to make something out of cardboard, treat it as cardboard.

A temporary structure only needs to meet certain building codes.

You can buy foam crusts really cheap, like 50 cents a pound.

Check out the Encyclopedia of Modern Plastics. McGraw-Hill publishes it.

You could program a structure with built-in squishy places.

Ferro-cemento weighs over 10 pounds a square foot.

The curing is very delicate. It has to cure for like a month.

As it cures it contracts or expands. Concrete will cure under water.

It's fantastically strong stuff. An F-C boat hit a rock going at 12 knots and it smashed the rock.

Have you heard about Maybeck's experiments with gunny sacks? You dip them in concrete and lay them up on the screen like shingles.

The price is starting to come down on foam. The gun is getting better. The fire resistance is getting better.

We've been using silicon car wax on any surface we don't want the foam to stick to.

These foam buildings. They very slowly flow.

Union Carbide can be scrounged for materials.

With Bini-Shell technology you can inflate your foam dome from the ground.

If you want to find out about tape, don't ask 3-M; find a man who's taping something together. Manufacturers are the last to find out about their products. Once you've tried something you can sell the information back to them.

As the temperature changes the tape walks.

Black builder's poly lasts 10 times longer than clear poly.

Lloyd Kahn speaking

Structure, energy

Everyone at first feels this kind of awe for domes and things.

When you talk about energy you talk about the sun. It's difficult to talk about the sun because we're in it all the time. You have to feel it in order to utilize it. One of the real characteristics of energy is that it comes in lumps, and it takes a bunch of people to trap it.

Glass isn't clear. It isn't.

'What do you mean the sun doesn't go around us? It's obvious it goes around us.

I have a particular joy in dealing with things like this.

All your parts have to be in accordance with those sacred lines or it won't fit together. The sacred line is no more than an agreement. It's very helpful if you can describe those things ahead of time.

You can't patent geometry but you can patent linkages.

We want to have a factory. We want to put this cost-rose on everything we produce. What it cost us. How it was made.

If you can just see into something. You don't need expensive equipment, that's for sure.

Here I am bullshitting you all. I don't have a bicycle. I also don't solar heat my house. And I don't live in a dome. I think maybe I'll sit down for a while.

Steve Baer talking

I'll tell you anything you want to know and show you anything you want me to show you about domes, but you probably won't build it because you're too lazy.

What sort of research do we do to use the technology in order to improve our own minds?

We are trying to develop computers that will help human beings to develop computers. The human and computer work symbiotically.

A lot of what goes on in our heads is dictated by what goes on outside. And what goes on outside is subject to our control.

We think there's a whole world open to the human being where he can represent outside himself the symbols and patterns he needs so he can get where he wants.

We've got a new technology for representing symbols.

So all of your thoughts that you had are in there just as you had them when you had the flash.

You've got to know when to stop going in little bits and save yourself up and make a big jump.

Geology means earth logic.

Money is the way that I can easily transfer my energy to you. Economics is the study of transfer of energy in the society.

'It does different things.'

Robert Frank filming

Dave Evans talking

**Man,
Evolution,
Consciousness**

Trust is the reality of the road being cleaned, the trash being emptied.

We're after profit. But we're after the kind of profit we're getting here. Think about what the word profit means for five seconds.

I want to get in and find out what money means. It can make you nervous.

Money makes the transfer so easy that the transfer itself becomes an obsession.

I pray for money.

Kesey says he used to cast his bread on the waters. Now he's saying you got to pick your waters.

How are you going to get money? The thing is that it's fluid. It has to pass between bodies. It doesn't have to be held onto. We're in a transitional world. I've tried to prepare the best water for money to float on.

I smoke therefore I am.

We were brothers before we were dopers.

You can get flashes all kinds of ways. I got a flash once when my parachute didn't open.

You can use dope as a pure design tool.

You don't have to take dope to do things.

You're just saying that there is in reality no guarantee that life will continue. The right to live is a fiction. It's a pretense at a political reality.

Try to understand that although we are different we are all trying to do something. People won't stick with it. This is the tough point. This is the hinge. What are we really doing together. Is it connected? Where is it connected? How is it connected?

Is it possible to be able to have access so that one person is not the only person in the position to know or to do things?

We're involved in an action-reaction game. A lot of the talk is empty cups pouring themselves into one another. Like this. Or what if your cup is full and you try to pour water into it? Look. We assume that we know everything, rather than emptying our cup. Teach me, for I know nothing.

Magic is the manipulation of matter by unseen forces. You can see unseen forces if you want to take the time. How many people here could build a car? How many could refine gas? Could you take care of yourself on the lowest, simplest level? Before we go solving the world's problems I think it's important to know right where we are on this ground.

Steve Durkee blowing helium bubbles

If you've got to junk everything that's been written in order to find yourself in the world, do it.

Am I this 6-foot body or am I something else that could exist beyond it? If we could get enough information maybe we could go beyond the flesh envelope.

You've got to be dissatisfied. You have to know that it's not good enough. It's not giving the juice, you know? The other thing is you have to know there is a possibility. You can grasp the living rod.

The sly man takes the pill. The problem with that is you may be the sly man who opens the door, but there may be nothing there when you open it.

There's a lot of people who want the Apocalypse. Instead of looking at it as the death force, there's a possibility of the emergence of something new, a re-shuffling of the deck.

In times this turbulent the world is ready to follow any man who feels good.

Evolution is at work here as strongly as anywhere.

The main design element of evolution is variability. The times are wierd and a lot of the old forms are hanging on stiff and tight. All of us are going out and trying different things. Each community has its own notions of how to do its own civilization. The more communities the better. Big ones, little ones, urban, rural, travelling, money, no-money. With a lot of them happening, some sets do better than other sets.

You can study the evolution of man by the evolution of his tools. You can study the evolution of tools by the evolution of man.

There's a paradox. Isolation leads to over-specialization. But you have to isolate yourself somewhat in order to make your scene different than the others. Maybe it's a balance. Maybe discrete mixing events like Alloy can help.

You can randomize your behavior a little. Everybody has a notion of who they are, their character, and all their decisions converge toward that notion as if they meet at the grave. With some decisions, why not flip a coin?

Take the path you haven't taken before.

That was the Holy Grail step. When the knights left the Round Table in search of the Holy Grail, each man entered the forest where it looked most impossible to him.

Whatever frightens you, do it. That fear is a valuable key.

Evolution is any dynamically self-organizing system. The process improves itself without external influence. Everything's inherent. Every misfit carries some of the load of making the whole more fit.

Evolution and cybernetics are going to come together. This is the edge of knowledge right now, and it's right at the heart of education, and the schools don't know it.

There you are sawing away on your violin, and every now and then you catch a piece of the symphony. The trick is, when that happens, not to drop your violin.

Intention is a wierd thing in evolution. I don't think anybody understands it, but we're doing it a lot. We're increasingly putting our finger in the pie, and we are the pie, and the finger, and the putting.

It's all those choices that we make. Then we give those to the next people.

If you want to try a new way, you've got to build something.

What is Design?

There really is no better introduction to all that is admirable in design. Baer had to remind me of the book: I had forgotten how much I owe to it. It is full of the kind of lore and wisdom that you immediately take for your own.

-SB

The book is wonderful. Here is a man trying to tell the truth about design and about our lives and civilization. I never heard of him, when I read his book I can't understand why.

Steve Baer

Don't work for success, whether success to you means a degree, position, money, or honours. You cannot reverse the process of nature: since no fruit in spring can produce flowers in the fall, you cannot visualize the harvest before the seed matures into a healthy, full-grown plant. A hot house may grow faster products, but none that can compete with the authentic product of the soil. This attitude will force you to give "no" for an answer more often than "yes", if you are concerned only with the integrity of your production. Then your "YES" will be uncompromisingly sincere. The worst lie is the lie you give to yourself as an excuse for success.

Burn your idols once in a while, and start all over again.

Flout the rules as often as you can in a masterly way. Recipes are for poor cooks. Great chefs make them. The canvas of rules and codes that you have had to learn must be transgressed with vision for any art to be born.

Finally, during all your life as an artist, learn through painstaking experimentation, exercise, and practice, how to acquire a masterly knowledge of your craft.

IN DESIGN, THE SHORTEST DISTANCE BETWEEN TWO POINTS IS NOT THE STRAIGHT LINE, BUT THE SLALOM

Slaloms are curves of natural acceleration and deceleration that represent trajectories constantly controlled by man.

A ballistic missile obeying only initial thrust and gravity will describe an orbit mathematically perfect of the conic section family. But as soon as man sits at the controls, he will make his own orbit, his slalom.

Curves described by a man in movement—a car, a bicycle—on a flat surface, are two dimension slaloms, or curves of the second order that may be approximately analyzed in quadratic equations.

A mountain climber, an airplane, a submarine—as well as a skier—describe third order slaloms that may be analyzed in cubic equations.

The interest of slalom curves for the designer lies in the fact that they are all curves of least effort, and thus represent the most economical pattern of flow.

You may buy this eternally contemporary piece of design in any authentic Chinese hardware shop.

prevailing winds

The Normans, great seafarers before settling down to farming, have devised their farmhouses exactly like the hulls of their ships, anchored them upside down on the land, the bow to the wind and the stern sheltered toward the east. They are like ships that heave-to in a gale. The single chimney crowns the western end of the roof and draws at the least breeze, while the eastern end is wide open like the captain's quarters in the stern of a galleon.

The Ganges Shark (Platyodon gangeticus)

McDonnell Voodoo F-101A (1954)

Design Methods

The discipline of design is misunderstood by many people. This book is going to help explain things. The author briefly presents some of the obvious design failures in our industrial society, such as traffic congestion, noise pollution, etc., and says... "These need not be regarded as accidents of nature or as acts of God, to be passively accepted: they can instead be thought of as human failures to design for conditions brought about by the products of designing. Many will resist this view because it places too much responsibility on designers and too little upon everyone else. If such is the case then it is high time that everyone who is affected by the oversights and limitations of designers get in on the design act."

The book outlines traditional approaches. It then goes ahead and gives a really useful review of thirty five recently developed strategies, a brief description of each, and a way of determining which will likely be most useful to you. Many of the strategies are ways of organizing your information so that your intuition can be well enough informed to act. Several of the strategies are mainly concerned with preparing your head so that it may intuit effectively. Methods of analyzing the results are also presented.

As far as I know, this book is the only overall collection and review of strategies. I see it as a truly useful tool. I've ordered one myself.

The complicated pattern of the network on the left can be transformed into the simple pattern on the right by re-arranging the nodes. This is analogous to the "change of set" which can enable one to solve a previously insoluble problem.

Earthen hut built by the Bamikele tribe in the Cameroons.

I remember a priest explaining the zig-zag arch to me: "Evil is like a rhinoceros. It always charges in straight lines. We break the line of the bridge so that evil cannot cross, but falls over the edge to drown in the deep water in the middle". From A Portrait of Japan, Laurens van der Post, 1968.

Thinking from Several Viewpoints

This is similar to 'thinking in parallel planes' but is directed at the solution to the design problem instead of at the process of finding it. At its most elementary it seems to be the stating of objectives by describing the product as something that 'provides a means' of doing something else.

- (a) study the design situation
- (b) provisionally identify the needs that the design is to satisfy
- (c) identify and analyze the Primary Functional Need (this is the need that if not properly satisfied makes the fulfillment of all other needs pointless)
- (d) explore alternative principles upon which a means of satisfying the primary need could be based
- (e) complete, in outline only, a design capable of satisfying both primary and secondary needs
- (f) review the functional effectiveness of this design
- (g) review the material and work content in producing the design
- (h) review component quality, i.e. freedom from welding distortion, refinements, etc.

The Design of Design

It's superficially a book for design engineers, but should be useful to anyone engaged in the design of physical objects or strategies. Simple and basic. More advanced treatment of design techniques gets you into computers and very sophisticated decision making theory. The main trip is concentrated on getting your head straight so that design decisions of any sort can be made intelligently. There's a good bit of practical advice concealed in a slurry of English Humour. The only book of its type that we know of. Among the better points:

Concentration and then relaxation is the common pattern behind most creative thinking.

Beware of intrinsic impossibilities.

Beware of pseudo-technical words. [He means words like "sturdy," "big", "beautiful", etc.]

Define problems in figures or configurations.

Aim at continuity of energy.

He really gets to the center of the modern-technology-versus-New-Mexico-Funk argument:

If the design of a particular machine or production line is based on the way the process was originally done by hand, it is unlikely to be the final form. The feeding forward by mechanizing a style that was handy when only hands were available is doomed, in the long run, to be superseded by the feeding back of ideas and materials from the physical sciences. Beware of well-dressed arts and crafts.

Structure, Form and Movement

The usual procedure is that R&D comes up with a new process, it's implemented for several years, and then some biologist says Hey did you know porpoises did that? (or snakes did that, or bees or elm seeds). And everybody says My, my, ain't Nature smart.

Herr Hertel and colleagues are trying to reverse the order, learn from nature first, save time and stay humble. (This approach now has a name, "bionics"; a book by that title that's around is terrible.)

This book may be too expensive for its direct usefulness, but it thoroughly displays the approach that research may take to bugs, birds, fish, etc. for yield in navigation, flight, streamlining, etc.

The hand remiges of birds are masterfully perfected to obviate flutter:

- The hollow cross section of the supporting frame consisting of the feather quill is continuous over the entire length and approximates a cylinder, which resists torsion well. This cross section also improves resistance to bending.
- The straight construction of the vanes ensures minimum moment of mass about the quill axis.
- Variations in aerodynamic forces during oscillation affect 25% of the profile depth. Consequently, the form of the remiges, with narrower anterior vane sections and broader posterior vane sections, is appropriate for aeroelastic reasons. In the primary feather shown in figure 65, the resultant of aerodynamic forces lies behind the shaft.

Artificial burrs, 40cm long, made of bio-degradable plastic and coated with plant seeds and a growth-boosting solution. To reverse erosion cycles in arid regions. Student designed by James Herold and Jan Truan, Purdue University.

An ambulance can cost as much as \$28,500. Where are well designed, low cost inserts that would convert any station wagon to ambulance use during a national emergency? With the number and prices of ambulances now, this particular national emergency began about 20 years ago!

Radio receiver designed for Third World usage. It is made of a used juice can, and uses paraffin wax and a wick as power source. The rising heat is converted into enough energy to power this non-selective receiver. Once the wax is gone, it can be replaced by more wax, paper, dried cow dung, or anything else that will burn. Manufacturing costs, on a cottage industry basis: 8 cents. Designed by Victor Papanek and George Seeger at North Carolina State College.

For a long time, I don't remember how long, but it was years, literally years, I could not get all the parts of speech together. Or if I could get them together, I could not get them together in the proper sequence. One week I could speak sentences that had everything in place except the verbs. I just could not remember verbs. I couldn't say, "I am going to town." "I am town," was the best that I could do, and it was maddening. The next week it would be nouns, or adjectives, just . . . missing, that was all. Like not having enough tools or parts to finish putting something together with. And so I would just not say anything to anybody. I wandered lonely through the world muttering "Cheeseburger" now and then, or "Where?" or "When?" or "Why?" Of course my silence was not true silence. In my mind there was utter chaos. My mind never stopped. Day and night it went on and on and on, remembering everything that ever happened, every conversation I had ever heard, playing them over and over, with new embellishments and adornments each new time.

The year it was at its worst I lived in San Francisco. There was supposed to be an earthquake that year. All the talk was of earthquakes, earthquakes. I was into earthquakes in this really heavy way. Earthquakes and Edgar Cayce. I was convinced there was going to be an earthquake, that California was going to tumble into the sea. And my trip was, I wanted it to happen. I wanted California to fall into the sea, and I wanted to fall in with it, to be swallowed up by a thing so big, so huge, so utterly enormous that I would disappear into absolute nothingness. I wanted to see heave and slide and fall with the greatest roar and rumble the world had ever known. And I wanted to go down with it because then I wouldn't have to think about the parts of things. If the parts would not come together and function for me, then let them fly apart, scatter and be gone weightless through the universe. Let freedom reign! Let nothing matter! That was my belief.

Well, of course, as we all know, there was no earthquake. California didn't fall into the sea. I was disappointed but sobored a good deal by the months I spent in anticipation of it. My head felt clearer. I began to speak simple sentences again. I got interested in art. I got interested in the possibility of Atlantis rising again, and I wondered what I ought to do about it. I even sat down one day and wrote a little pamphlet called, "What To Do If Atlantis Rises," and had a few hundred copies printed up. I tried to sell the copies, and when no one would buy them I started giving them away to people passing on the street.

(continued)

Science and Civilization in China

Joseph Needham is a renowned biologist who travelled into unexplored regions of Chinese technological history and became a yet more renowned historian and interpreter of what is for most of us the back of the planet. His series is awesome in size and depth; he's done the mining, but you've got to refine the ore to suit your own purposes. One purpose I know was Vic Lovell's, who found in Vol. I a rich lode of information on Taoism and how its influence helped the Chinese discover and utilize some technology long before the West and also overlook or never utilize other stuff that the West seized on. Another purpose might be taking some of the mechanical inventions of old China—from man-kites to water-wheels—and applying them to the hand technology of intentional communities. There's no source like the source in these matters.

The quotes and illustrations to the right are from Vol. IV, Part 2: Mechanical Engineering. All the volumes are available from the publisher and **WHOLE EARTH CATALOG**.

—SB

Fig. 650. Pictorial reconstruction of the astronomical clock-tower built by Su Sung and his collaborators at Khaifeng in Honan, then the capital of the empire, in +1090. The clockwork, driven by a water-wheel, and fully enclosed within the tower, rotated an observational armillary sphere on the top platform and a celestial globe in the upper storey. Its time-announcing function was further fulfilled visually and audibly by the performances of numerous jacks mounted on the eight super-

imposed wheels of a time-keeping shaft and appearing at windows in the pagoda-like structure at the front of the tower. Within the building, some 40 ft. high, the driving wheel was provided with a special form of escapement, and the water was pumped back into the tanks periodically by manual means. The time annunciator must have included conversion gearing, since it gave 'unequal' as well as equal time signals, and the sphere probably also had this (see p. 456).

Su Sung's treatise on the clock, the *Hsin I Hsiang Fa Yao*, constitutes a classic of horological engineering. Orig. drawing by John Christiansen. The staircase was actually inside the tower, as in the model of Wang Chen-To (7). The historical significance of the mechanical rotation of an astronomical instrument (a clock-drive) has already been discussed in Vol. 3, pp.359ff.; cf. also p.492 below.

Gibbs' Paradox

Experience suggests that as two diffusing gases become more and more alike the change in entropy due to diffusion should get smaller and smaller, approaching zero as the gases become identical. The fact that this is not the case is known as the Gibbs' Paradox. Bridgman explained it in the following fashion: in principle at least it is possible to distinguish the dissimilar gases by a series of experimental operations. In the limit, however, when the gases become identical there is a discontinuity in the operations in as much that no instrumental operation exists by which the gases may be distinguished. Hence a discontinuity in a function such as change in entropy is to be expected.

Hubble Effect

Distant galaxies show, in their spectra, red shifts which increase proportionally with the distance of the galaxy. This effect is consistent with the hypothesis of an expanding universe.

Huygens' Principle. (Huygens-Fresnel Principle)

Every point of a wave can be considered as the centre of a new elementary wave. The resultant wave produced by the interference of all these elementary waves is identical with the original wave.

Archimedes' Principle

When a body is immersed in a fluid there is an apparent loss in weight which is equal to the weight of fluid displaced.

Archimedes' Spiral

A point, moving uniformly along a line which rotates uniformly about a fixed point describes a spiral of Archimedes. The equation is: $r = a\theta$.

The Way Things Work

Best book for the bathroom we've seen. Nibble your way to knowledge of technology. Each two pages of the book is a bunch of text and a bunch of diagrams on all the big and little gadgets and processes you can think of, ball-point pens to data-processing. If you develop time travel, it might be interesting to take this book back to the sixteenth century and leave it under some European's pillow. (Now think about contact with alien civilizations.)

The Engineers' Illustrated Thesaurus

I like this book better than The Way Things Work. It lists concepts, structures, and processes strictly by function instead of by object. So as you page through, the elements start adding up in your head in bizarre combinations. Let's see: if we attached a mercury switch to a geared-down rotor on the windmill and connected it to a strobe light, then whenever our heads kaleidoscoped we'd know the wind was blowing 20 miles an hour and we'd halt all traffic on the pedestrian suspension bridge before it went harmonic and tossed all our visitors in the canyon.

And then one night a strange thing happened. I was walking through that little park on Clay Street in San Francisco, that steep one with all those old Victorian houses around it, and I gave away a copy of my pamphlet and wound up in conversation with the guy who took it, this young spade kid who had the most intense brown eyes I have ever seen. And before long a couple of other people came up and joined us, and there I was, sitting on a park bench with six or eight or maybe even ten or twelve people around, some of them on the ground, some of them just standing with their arms folded, listening to me come on about Atlantis, about my experience with the earthquake, and my difficulties with language. And they listened. And when I tried to quit talking they wouldn't let me. And finally they invited me over to someone's pad, and I kept on talking. I have no idea now what I said, but I talked all night. By morning when someone served tea and toast, there must have been fifty people in that apartment, and it was as if we'd all come through a magnificent thing together. They were as amazed as I was. No one knew what had happened, and yet, everyone knew. And it was a grand and beautiful thing. All I did was talk. I didn't know what I was saying myself, half the time. It was as if the Lord had taken my tongue and used it Himself, as if I was but a mere vehicle for His message. I said wild stuff, crazy stuff, stuff no one had ever said before, and the people just could not believe what they were hearing.

They began to come to me individually for advice, and I advised them to do incredible things. One young man came and said he was having sexual problems, and he asked me what he should do. I knew instantly. He should run for political office. I told him that, and it changed his life overnight. I don't know why I told him that, and I don't know for sure if he went away and ran for office. But I did see him some months later and he said everything was fine, just fine, and he shook my hand and he hugged and thanked me for the advice. A middle-aged black man who had come into a good deal of money came to me just fraught with worry and asked how he should spend it. I asked him where he had grown up. Dothan, Alabama, he said and I said good. Take that money and hire five hundred other black men, and all of you go rent or buy the finest black suits, with black hats, black canes, and black top coats and black sun glasses, and starting on a Monday morning begin drifting into Dothan one at a time, every hour or two another one of you just sort of amble in and walk down the street, and just kind of look in the windows as if nothing much is going on, and don't speak to each other, act as if the town is not slowly filling up with five hundred well-dressed spades, a few at a time, maybe seventy-five a day, and do that for a week, until by Saturday there's all five hundred of you there on Main Street, walking around. And this spade did that. He actually did it, and I saw him about a year later and he came up and shook my hand and said Man, you are fantastic.

By then, of course, I began to believe I was. People would come and listen to me, and later pat me on the shoulder and say to me, trust it, man, whatever far-out thing it is that you've got going, trust it. And that's what made the difference. I got so I could trust it. It was like having a big bully who's always picking on you, pushing you around, snatching your cap off your head and getting into your lunchbox and now and then actually beating up on you on your way home from school suddenly turning out to be your best friend. It was like help from some source you never had counted on before. It was like getting access to some demon that's always scared you so bad you've kept a tight lid on his cage. And then somehow you go so crazy you lose your grip on his cage door and out he comes, ripping and snorting, only instead of eating you up or beating your ass he says hello boss, whose ass would you like me to whip for you today. And off you go, the two of you, heading down the road looking for some action. And what you know as you go along is that no matter what the action is, you're going to be good at it, you know you're going to come out on top of whatever you run into because you've got this big demon out there working for you because he digs you for letting him out of his cage.

It's like this kid, comes up to me one time in Seattle and says his family has kicked him out because they thought he was queer. He asked me what I thought he ought to do. Without hesitation I told him I thought he ought to go and read *Finnegan's Wake* into a tape recorder, then call his family up long distance and when they answer turn the record on and walk away and leave them to deal with it. And that kid did that, and I saw him some time later and he shook my hand and gave me this big grin and said thank you, man, thank you.

It's a far-out thing, having people come up to you and say thanks for helping them. I guess one of the reasons my life went sour again was I got to liking that part of it too much. I got so I waited for it to happen, and when it didn't it would bug me. There was a recognition I wanted from people that was almost like having a name again, and sourness was the only possible consequence of such craving to be named. That wonderful period of my life went away, and was followed by another time of despair. It was that despair that drove me on into a truly committed effort to forget my name, to forget everything I could recognize myself by. It's painful, laborious work to lose your attachment to identify, but I believe that once I destroy the manuscript telling my early history, I will have gone past the last serious obstacle to becoming Infinitely Nameless. I don't want to say that categorically. To say it categorically would be a speculation upon the future, and the future is of no concern to one who is truly nameless. I can say—and this is a confession—that I have got this close to destroying that manuscript twice before, and each time was unable to go through with it. In 1962 I got to the front entrance of the library and couldn't go in. In 1966 I made it to the very stacks where the Master's Theses are kept, and turned around and left empty-handed. So it's not for me to say how this new effort to burn the manuscript will turn out. All I know is that I'm on my way to the University again, that I'm still trying, and that I believe that if one perseveres in a righteous cause, he must eventually succeed.

Introduction to Engineering Design

Out of a whole section of books on design in the Engineering Library at Stanford, this book looked far the best. Recently Steve Baer (dome and solar designer) came across it on our editing tables, sat down and paged, then got up and hurriedly wrote a letter to a friend about the book and its author. I asked Steve to pick out some useful quotes and pictures and he wouldn't. "Look anywhere you open it," he advised, then ordered a copy.

Contents of the book include: The Engineering Problem Situation, Design Project Organization, Information and the Need Analysis, Identification of the Problems, Information Sources, Synthesis of Alternatives, Estimation and Order-of-Magnitude Analysis, Engineering and Money, Preliminary Design, Engineering Problem Modeling, The Iconic Model, Conceptual Representation, Expansion of the Criterion Function, Checking in Engineering Design, Optimization, etc., etc.

WATER SUPPLY FOR MOUNTAIN CAMP

For another simple example, let us estimate how we would bring water from a running stream into a tank (let's say a 50-gallon gravity tank) to supply water for a vacation cabin in the woods. A natural supply point is 100 ft away upstream, guaranteeing among other things a clean, continuous water supply. Our problem is transport. Shall we use pipe, an open rock-lined channel in the ground, or a wooden flume or trough? See Figure 7.4.

As we think about this, we discard the open channel in the ground as too easily contaminated. The pipe could be laid on the ground; and the wood flumes could be suspended from tree trunks and possibly covered as shown by the dashed "board" in the illustration. Thus, we have two reasonable ways of doing this job; the questions now concern cost and convenience.

Next we check the sizes needed. If we wanted the 50-gal. tank filled in 15 min, we would need a flow of about 4 gal./min. This is a stream of water about as big as a person's finger when the water is flowing two feet per second, as shown by the equation in the footnote† deriving the cross-sectional area, A, of the stream.

This area would require a pipe one inch in diameter. If we were using the wood "vee" channels, we would need two boards each about three inches wide to avoid splashing over, or one-half board-foot per running foot of channel (per foot of channel length). (A board-foot is one square foot of wood, one inch or less thick.)

Now we need to arrive at costs. The most convenient reference is a broad-coverage catalog (such as that of Sears, Roebuck), in which wood, metal, and other supplies can be found listed at retail prices. Of course, one can also phone the retail plumbing or lumber suppliers. In any case, we find

Wood: 15¢-20¢ / board-foot in the sizes we need
1 in. iron pipe: 30¢ / ft
½ in. copper pipe: 58¢ / ft (One size smaller than iron pipe for the same flow rate.)

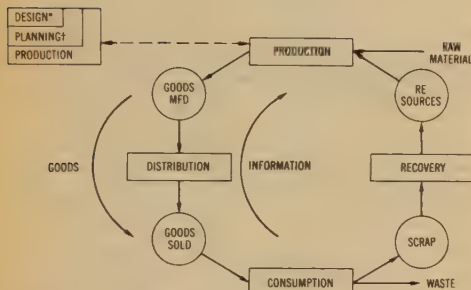

Assuming one-half board-foot for each running foot of wood channel, the comparisons are

Wood: 10¢ / running foot, materials only
Iron: 30¢ / running foot, materials only
Copper: 60¢ / running foot, materials only

Since we would do the work ourselves, the cost of labor is disregarded, and it seems that wood should be our choice. On one final check though, we ask whether these are all the choices. Someone suggests plastic pipe, so we look that up: It is corrosion-resistant, flexible, easily connected, sanitary; it has a smooth interior; it could be in one piece and simply laid on the ground. It seems to be a natural choice. The price of ¾-in. diameter plastic pipe is 10¢/ft; 1-in. diameter is 16¢/ft. Considering the labor needed with wood or iron pipe, or the cost of copper tubing, and the plastic's sanitary advantages, the plastic pipe (high-density polyethylene) is certainly the preferred choice.

Thus our final estimate is the use of this plastic tubing, probably ¾-in. diameter at 10¢/ft.

$$\begin{aligned} \dagger A &= Q/V \quad (\text{area} = \text{flow}/\text{velocity}) \\ \text{where} \\ Q &= 4 \text{ gal./min} = 1000 \text{ cu in./min} \quad (1 \text{ gal} = 231 \text{ cu in.}) \\ V &= 2 \text{ ft/sec} = 24 \text{ in.}/(1/60 \text{ min}) = 1500 \text{ in./min} \\ A &= \frac{1000 \text{ cu in./min}}{1500 \text{ in./min}} = 2/3 \text{ sq. in.} \end{aligned}$$

* DESIGN is a part of PLANNING
† PLANNING is a part of PRODUCTION

Technology and Change

The subtitle of this book is "The impact of invention and innovation on American social and economic development". The author studies this area in the light of experience in several industries, one of which is the building industry, where change has been slow in coming. This book will be of interest to its intended readership in industry. But on a larger scale, it offers an answer to that teeth-grashing question: "Why does the 'establishment' resist change?" Or for that matter, "Why does everybody resist change?" This is one of the neatest and best explanations I've seen (perhaps because it so closely matches my experiences as a Professional Designer). It will be interesting for those who wish to better know their Corporation As An Enemy as well as to those who wish to equip themselves and their organization to better deal with inevitable and intentional change. One of his more interesting points is that "revolutionaries" are often a reactionary force instead of being truly revolutionary; they are the conservatives, especially where technological change is concerned. Lots of subversive stuff here. Recommended reading for changebringers.

The crucial form of experiment demanded by the technological, institutional and normative changes of our time is experiment in norms and objectives. The erosion of the objectives of the Technological Program leaves us with more information than we can handle and requires the attempt to create situations in which new objectives can emerge.

Unexpected success is no less destructive of the rational view of corporate activity than is unexpected failure. When the addition of carbon black turns out to increase the strength of rubber; when the book-mending tape turns out to have a multiplicity of unexpected consumer uses; when the new plastic, designed for a cheaper molding process, turns out to perform well in a completely different application—the corporate manager can only react with a wry smile. In ways he did not understand, and was unable to state before the fact, things have gone well; but what has he learned that will prepare him to cope with the next time?

Corporate behavior is based on regular, orderly, linear, predictable processes—the extension of the industrial manufacturing process itself. How is it to absorb invention?

What used to be stable divisions in our community are no longer stable:

- the division between education and work, and with it, the view of the young as learning and the old as established;
- the division between labor and business;
- the old regionalism;
- the old divisions between race and race and class and class;
- the division between the change-oriented outcasts (inventor, poet, therapist) and the stable society;
- the division between "good" creative private enterprise and "evil" controlling Government.

The call to Revolt has as much appeal as the call to Return. It is an alternate response to the destruction of the myth of stability. In effect, it says that the old objectives are hollow and inadequate. There is oppression, slavery, humiliation, constraint and injustice. There is no Promised Land in sight. Revolt against these things! The call to revolt need not produce its own image of a Promised Land. It takes its image from the present against which it reacts. It gets its concreteness from the life it refuses to accept and is, in this sense, a form of conservatism.

If we cannot be inattentive to change of objectives in our society and cannot accept the silent calls of return and revolt, what is left? How do we ever tolerate and stand up to change in objectives?

Ideas, Inventions, and Patents

Patents are one of those facets of the establishment that both baffle and infuriate people. It's a complex business. This book gives the clearest and most comprehensive explanation of the whole patent bit that I have ever seen. It is at the same time, a reference book intended to help you understand patents, and an unintentional denunciation of the whole process. The author shows why we have to have patents, what good they do, and how to get one. He also shows how to get around patents, how long you have to wait, and how much it will cost. He reveals the human biases involved in the patent office, and admits that the government is so poorly organized that they may issue conflicting patents to two different parties at the same time! The book is indexed in a way that permits you to easily find answers to questions. If you need to know something about patents, this is it.

Human Engineering Guide

Buy this book and keep it at hand at all times if you design or build anything that will be used by, for, or come in contact with people. Concise statement of ideas both through the informative writing and clear illustrations. The authors have followed their own guidelines and produced a device (this book) which will do well what it was designed to do, transfer a large amount of information between people. If you want information on human engineering, design of equipment and work space, vision, audition and body measurement, it's all in this book chapter by chapter. The above categories are a partial list of actual chapter headings. This book should be used by all design engineers, but it is not necessary to be a design engineer or even an engineer to use it. Really fundamental ideas clearly stated can be understood by anyone.

Where possible, work should be held by jigs or vises so that hands may be free to operate.

Hesitation - or the temporary and often minute cessation from motion - should be analyzed; its cause should be accounted for and, if possible, eliminated.

When a click in one ear leads that in the other by about 0.03 millisecond, the sound just begins to shift toward the first side; when there is a time difference of 0.65 millisecond or more, the sound appears completely localized on the side of first arrival, this localization remaining until the time difference becomes so great (3 milliseconds or more) that fusion is lost and the sound is heard separately in the two ears.

Jigs & Fixtures for Limited Production

This book is a manual of tactics for making inexpensive jigs. It's intended mainly for machine shops, but it can be quite handy for anyone who has to make a number of similar parts, such as for a dome. Jigs are also handy when a single part has to be done with high accuracy. Anyone who is into making things or repairing various artifacts could learn a bag of tricks from the book. The author shows how to convert commonly available objects into jigs; a vice into a drilling jib. There's a chapter on making epoxy tooling. The language is non-technical, with most of the terms being defined. For most makers, it won't be bedtime reading, but will be a good reference when the problems get tough.

Fig. 2-4. Master part method of transferring hole locations.

If an item does not warrant special tooling, there may be an economic advantage in using the master part system. The system, as the name implies, uses a simulated or actual part fabricated to slightly closer tolerances than the intended product and used as a template or jig.

When a master part is used as a jig for locating holes, the master and the part to be worked are clamped together as shown, and the hole locations are transferred from the master to the part with a duplicating punch. If possible, hardened bushings are inserted into the master part, making it possible to transfer holes directly by drilling. The addition of drill bushings improves accuracy and increases tool life.

As to what constitutes prior knowledge of an invention in this country, the courts interpret the term "invention" here in its restricted legal sense as meaning a completed and operable device or system. Mere knowledge of the conception of an idea for an invention is not sufficient prior knowledge to defeat an applicant, or patent, of one who is the "first inventor" in the true sense of being the first person to make or complete the invention in operative form. This interpretation was handed down by the United States Court of Customs and Patent Appeals in a test case brought to clarify the meaning of this section of the Patent Act of 1952.

As soon as the invention is conceived the inventor should sit down and write out a detailed description, complete with a drawing where the subject lends itself to graphical representation, and as soon thereafter as possible he should disclose and explain his invention to someone who can understand it and who will sign his name and the date at the end of the written description, as a witness to the disclosure on that date. Very often this will be the earliest date that the inventor can prove, even though he may have conceived the invention in his mind much earlier.

Drawings from two patents later issued to Glenn Curtiss when courts finally decided that he was the inventor of the Flying Boat.

Since humans are used to evaluating things with "all their senses" from the time they are born, it is natural for them to expect this. Each of the sensory inputs, in fact, raises the level of confidence of the operator in what he is receiving - thus the converse of this, i.e., lack of certain inputs, tends to reduce the operator's confidence in the information he is receiving.

PART THREE

EDDIE'S FUNERAL

The mourners were lying around the room on mattresses, smoking hash between hits on nitrous oxide. Nearly everybody there was a St. Louis dealer, and since Eddie had been a dealer The Native thought it would be nice if sample's of everybody's stuff was done, in honor of Eddie's passing. Somebody do grass. Somebody else do acid. Somebody else do DMT. Somebody else do IT-290. Somebody else do STP. Somebody else do peyote. Somebody else do mescaline. Somebody else do psilocybin. Somebody else do reds, and everybody share the laughing gas to tie the whole thing together, in honor of Eddie's passing.

But that was just The Native coming on, just The Native doing his usual thing. The Native got his name because he was always talking about how nobody's a native anymore. Nobody lives where he was born, nobody's got real roots any more, and that's why people are so unhappy. The Native grew up in the Ozark Mountains of Missouri. He was so homesick most of the time, all he ever talked about was his family and his old home place back in the Ozarks. People at home have got identity, said The Native. They've got a history, and their lives are full of the most beautiful rituals. The Native loved rituals, and he wanted Eddie's funeral to be one, an elaborate ceremony where everybody would take a different kind of dope and then do communal things like chant and sing and mourn poor Eddie's passing.

But none of the others were up to it. There were eleven people at the funeral, besides The Native. Blue Ox was there, and Gilded Lilly. Chuck, Friendly Persuasion, City Girl and the Crosstown Rivals, plus Reed and Winston and Divine Right Davenport and his chick who had just blown in from somewhere. They had all been Eddie's friends, and they were all just as sorry as The Native that Eddie was dead. But the hash and the nitrous oxide and three TV sets all going at once were all that they could handle right then. "Give me the hose," said Bert of the Crosstown Rivals. Bert's rival, Norton, had been sucking on the laughing gas almost two minutes now, and Bert was getting antsy. His last flash had been all about time, it had taken him down the passageway to the very door of the rose garden, but as he was about to go in the flash had started to wear off. Against his will he'd come reeling up the same passage he had taken down, and that was a disappointment. If he could have gotten the gas hose when he was supposed to, he could have made it back down in time to keep the dream intact, for even though he'd become conscious again the footprints still echoed clearly in his memory and showed the way back to the garden. But stupid Norton had the greeds and wouldn't let go of the hose.

(continued)

Direct Use of the Sun's Energy

The best book on Solar Energy that I know of. Any curious and intelligent person can learn a great deal about our planet and ourselves by reading this book about ways of using sunlight. There are many numbers in the book but the math never goes beyond 8th grade arithmetic. The book is clear and simple whether talking about heating water—

For general domestic use of hot water for bathing and washing dishes a temperature of 135°F (57°C) is considered adequate and 20 gal per person per day is a reasonable consumption. In many sunny climates these requirements can be met with an insulated storage tank and solar radiation absorber which has an area of 0.75 ft² gal⁻¹ of hot water. A family of four would need a tank of 80 gal and a solar absorber of 60 ft².

or photochemical reactions—

The photo dissociation of iodine (I₂) molecules into atoms absorbs most of the visible light of the sun with a considerable amount of energy which cannot be retained. It is immediately evolved as heat during the exposure to light.

I read the book on a Greyhound bus in Texas two years ago and it has changed my life and my way of thinking.

Solar Energy Society

More on solar energy: there is a Solar Energy Society, an "international professional organization devoted exclusively to the science and technology of solar energy applications", to quote their statement of purpose. They disseminate information on solar energy applications through the quarterly journal Solar Energy. Regular membership in the Society is \$15 per year, which includes a subscription. Alternately, subscriptions can be ordered at \$15 a year from the Subscriptions Manager, Pergamon Press, Headington Hill Hall, Oxford, England. The Journal is of high scientific quality and the technical articles are probably a little too technical for the layman. The Society just moved its world headquarters from Arizona State University, Tempe, to the National Science Center, 191 Royal Parade, Parkville, Victoria, Australia. There is a newly-formed US section, c/o Smithsonian Radiation Biology Laboratories, 12441 Parklawn Drive, Rockville, Md. 20852. Write there for membership info in the USA.

WATER SUPPLY, Storage and Purification

Butyl Products Ltd

The Butank Family Rainwater Tank provides a ready supply of water for the household and ensures ample water supplies during the dry season. Rainwater runs off the collecting basin straight into the tank and is suitable for washing, for watering the vegetable garden and similar uses.

The tank consists of a long-life butyl rubber-bag, lined with a novel, simple-to-make form of concrete, laid in plastic tubular skins. The tank is covered to prevent loss by evaporation and to keep the water clean.

Three sizes of tank are available:
1,000 gal (4,546 l), 2,000 gal (9,092 l), 3,000 gal (13,638 l).

The Butank is supplied in a do-it-yourself kit and can be constructed by unskilled labour under limited supervision.

Illustrated instructions adjacent
Long-life butyl rubber is flexible, completely unaffected by any weather conditions, chemical or mould. Other important butyl applications: low cost reservoir linings, water channel liners, river training, dams, weirs and static or transportable storage tanks for water and chemicals.

Rural Industry

This guide catalogs several hundred tools, all manufactured or distributed by CeCoCo (Central Commercial Co.), and all applicable to what they term "cottage industry". In quaint English translation CeCoCo editors spell out the small scale cottage industry concept:

In almost all developing countries in the world, there are determined efforts to achieve material economic progress and emphasis is being carried out to induce a shift in the structural pattern of the economy from one basically agricultural to one that is agro-industrial in character to assure an increasing level of national production within the framework of economic and social stability which does not require much of foreign exchange to insure its growth. That is very important to select such industries which do not need foreign exchange in obtaining raw materials.

AGRICULTURE, Cultivation

Ransomes Sims & Jefferies Ltd

The Emcot

Many thousands of these oxen draught ridging ploughs are being used in developing countries where crops are grown on the ridge to combat soil erosion.

The Emcot ridging plough is used for crops such as groundnuts, cotton, tobacco as well as for cattle feed and vegetables.

The Emcot has replaceable earth wearing parts and is of solid construction for long life.

Adana (Printing Machines) Ltd

The Adana "Eight Five" Printing Machine Universally acknowledged to be the finest hand platen printing machine in the world. Smooth, rapid and easy in operation it produces printing of the highest quality. Sturdily built to stand heavy and constant use, it is small enough to occupy only a minimal space and light enough to be easily portable.

The Adana is so simple to use that even a beginner with no previous knowledge of printing can soon be producing first class work at speed. Chase 8 in. x 5 in. (20.3 cm x 12.7 cm) inside.

Two composition inking rollers. Duplex roller runners fitted with two diameters to counteract atmospheric changes and for heavy or light contact with type face.

Uses standard printers' type.

Weight complete: 33 1/2 lb (15.2 kg).
Overall size: 23 in. x 13 in. x 19 in.
(58.4 cm x 33 cm x 48.3 cm).

Price ex works: £25.10.0.
complete with fully illustrated instruction book.

The high cost of living in the urban areas, nevertheless reduces the workers' real income. Money incomes in the rural areas is lower than those in cities but the cost of living is equally lower compared with urban living. The full development of cottage industry in the rural areas, can provide additional forms of incomes on the part of rural families, which could reduce the influx of population to cities in quest for employment. This ultimately would minimize social problem in urban centers.

The tools listed in this catalog are absolutely fascinating. One spends hours studying specifications, diagrams and photos of CeCoCo "making" machines. (In the Wire Products section, for instance, one finds Paper Pin Making Machine, Staple Pin Making Machine, Hair Pin Making Machine, Safety Pin Making Machine, Snap Button Making Machine, Nail Making Machine, Barbed Wire Making Machine, Chain Making Machine, Zip-Fastener Making Machine, Etc.)

CeCoCo was established in 1916, but refers to an association with a manufacturer of animal-drawn farming implements since 1863. They maintain an exhibition and demonstration farm center at Ibaraki. On the back cover of their guide book one sees photos of dignitaries from all countries of the world visiting CeCoCo center.

For dragging, you can get your shoulder into a bowline at the end of the rope, but if someone is needed to help you, you have to make a loop in the rope without using its ends. This can be a *man-harness knot*. Take up enough for the loop (Fig. 4C), and start to make an overhand knot in it (Fig. 4D). Instead of completing the overhand knot, grasp the opposite side of the loop through the part-knot and pull it through (Fig. 4E). To keep the knot in shape while doing this, hold one part of the rope under your foot while pulling upwards on the other part, and outwards at right angles to the loop.

143. To break a heavy cord or string, take a turn of the cord around the left palm. Revolve the left hand so the cord is twisted in front of the palm, and wind the standing part several times around the fingers. Wrap the end (which is longer than illustrated) several times around the right hand, hold everything firm and jerk stoutly. In each of the two methods given the string crosses itself at right angles, one part being held rigidly while the other part is strongly jerked.

My first impression was that the weakening effect of this harsh crossing was the important factor in causing the string to break invariably at this point. One of the "lads" quoted in dictionary and encyclopedia knot discussions is that "the strength of a knot depends on the ease of its curves," and of course a right-angle crossing provides the unesiest curve that is possible within a knot.

2064. *Latching* is an old method of attaching a drabber to a jib, or a bonnet to a fore and aft sail. Nowadays it is the method employed by circusmen in assembling the canvas sections of the tents. A series of eyelets in the upper section of the sail are opposite a series of loops, termed "keys," in the headrope of the bonnet. Starting at one side, a key is rove through the opposite eyelet and hauled to the next eye. The next key is rove through its opposite eye and through the key that was first led. This process is continued until the center is reached. The process is then repeated, beginning at the other edge of the sail. The two center loops, being twice as long as the rest, are reef knotted together. Captain John Smith described them in 1617, calling them "latchers."

2065. The *Chinese cimlans* is the grandfather of the present-day differential chain hoist. One end winds, while the other unwinds, and the right end of the barrel, being larger than the left, winds or unwinds a greater length of rope than the left end, with each revolution of the crank.

A knot having been tied or projected, the next thing in order is to 'work' it, which means to draw it up snug while molding it into proper shape. The slack should be worked out very gradually. This is a matter of no less importance than correct tying, and often presents a more difficult problem, requiring both patience and practice. Carefully fair the knot, and, once having arranged the cord in symmetrical form, never allow it to become distorted, even momentarily.

Ropework, Knots, Rigging

The definitive text is *Encyclopedia of Knots and Fancy Ropework* by Hensel and Graumont available from the Cornell Maritime Press, Cambridge, Maryland. The Ashley Book of Knots is comprehensive and charming; however, the Encyclopedia is comprehensive and usable (i.e., diagrams are clearer and instructions are easier to follow). I own Ashley and if I had it to do over again I'd buy Graumont. Also, the last time I looked the Encyclopedia was \$12.00 at least \$2.00 cheaper than Ashley. Actually, all most folks will ever need is Handbook of Knots by Graumont, \$2.00 from Cornell Maritime. It handles every working knot of general use and then some. If it is splicing that is of special interest *Splicing Wire and Fiber Rope* by Graumont and Hensel is all you need (plus a fid, serving mallet, assorted marlinespikes) to splice, worm, parcel and serve. I've spoken to several master riggers from Eleventh Avenue in Manhattan to Gloucester all of whom spoke highly and exclusively about this book. It is in hard cover for \$3.00 also from Cornell Maritime. It is printed on high quality glossy paper to withstand the constant use by greasy hands, a book that's a real tool.

Speaking of rigging, there is a terrific future for qualified riggers. Ski lifts all have their cables spliced and all the tent and net structures of the larger type currently on the drawing boards will have to use wire cable which must be spliced in order to maintain the strength specs (knotting cuts down as much as 50% wire bolts as much as 25% on stated strengths, a well executed transitional splice will leave over 95% strength). Rigging is a demanding and exacting craft with a long and honorable tradition. It may be the second oldest profession as rope (hemp) was one of the earliest invention of man.

On macramé, which I always thought was square knot fancywork, there is a store in Brooklyn, C.E. Herwig, where you can see the best of fancy ropework and get all the supplies you need like different size, quality, color twines. I think they're on Clinton Street in the Brooklyn Heights section.

Harvey Kalmeyer

"Give me the goddamn hose!" said Bert. He reached to take it out of Norton's hand, but Norton, although he was unconscious by now, held it in a slobbery death-grip, and Bert was too stoned to fight him. As usual City Girl had to mediate. Gently she worked Norton's hands loose, and gave the hose to Bert as Norton fell over in City Girl's lap. Bert put the hose in his mouth and inhaled until he flashed. He wanted the rose garden again, but all he got was Billy Graham silently rapping at him on the top left television screen.

The three TV's were in the corner of the living room opposite the entrance to the kitchen. The big set on the bottom was a brand new color one that Eddie had bought only a week before he was killed. The other two were black and white, and small enough to sit side by side on top of the big set. The sound on the top left TV was turned up, but that's the one Billy Graham was on, and nobody wanted to hear him anyway. He was okay to look at, but the picture everybody wanted sound to was the quiz show on the big TV, in which newly-wed couples got a lot of free stuff if they knew the right answers.

The competition on the newly-wed show was between three young couples, the Morrissions, of Buffalo, New York; the Littons, of Oneonta, New York, and the Baileys, of Maryville, Tennessee. The funeral party was instantly unanimous in its hatred of the Baileys, because it was so obvious that their highest aim in life was to get to Knoxville where Charles would run for city attorney, and Rita would be an active Vol booster. As Rita pointed out when she introduced herself, she was a graduate of the University of Tennessee, where she had been very active in extra-curricular affairs. When she mentioned "extra-curricular affairs," the audience laughed. Rita blushed but laughed too. "I didn't mean it that way," she said. Every time Rita and Charles said anything the people at the funeral hissed and booed and called them stupid motherfuckers.

Everybody was kinder to the Morrissions. They dug Mrs. Morrison especially because she was so straight-forward and upfront in her manner. Her manner said: okay, by god, I'm on TV now, and I'm going to win every goddamn thing I can while I've got the chance. The people at the funeral liked Mrs. Morrison for that, and until the mid-program commercials Blue Ox, Gilded Lilly and Winston rooted hard for her and her husband to win.

As the program went on, however, the group sentiment slowly shifted to the Littons of Oneonta, and by the end of the program everybody at the funeral was solidly behind them. They were the truly engaging couple. Roger Litton was short and, at twenty-seven, a little jowly already, and Betty was having her weight problems too. They were handsome enough in the face, but there wasn't any getting around it, the Littons of Oneonta were fat, and because the Morrissions and Baileys, particularly that prissy Rita, were trying to come on so chic and "now," the people at the funeral loved the Littons all the more. They were fat, and they were modest, and they were also damn clever. The subject of the day was World Religions. The Littons weren't theologians or anything, but they knew that Buddha was enlightened under a bo tree, and that it was Jesus who'd said, "Straight is the gate, and narrow is the way, which leadeth unto life, and few there be that find it." The Morrissions and the Baileys didn't know shit about world religions. When the question man asked Mr. Morrison what country was most closely identified with Zen, he guessed Persia. When he asked Rita Bailey who was the author of the Bhagavad-Gita, she said, "Mahatma Gandhi!"

When the scores were added and Roger and Betty Litton pronounced the winners, of a new Maverick, fifty cartons of Marlboros, a fur coat for the Mrs. and a set of golf clubs for the Man of the House, plus a year's supply of parakeet food and a forty-eight hour vacation in Barcelona, everybody at the funeral applauded except Divine Right and Estelle, who had sort of withdrawn from it all and were sulking quietly in separate corners of the room. Roger and Betty hugged each other. As the program credits streamed across the screen they walked arm in arm off the stage into their new life together.

"Turn to channel four," said Chuck. "It's time for the hypnotism man."

or most newsstands.

New Scientist

New Scientist is the best evidence we've seen that there are new scientists in the world, young, politically aware, irreverent, active. Every week here's yet another New Scientist (if you get behind reading, it's hopeless), full of actual news, critique, and gossip of the research world. The magazine is British, so you get perspective on U. S. accomplishments (flattery nonetheless), and report of world-wide activities unreported in most American journals. The Ariadne column is a gem.

A weird case coming before the court at Oakland, California, results from the discovery that a computer was emitting more data than it had been asked for. After investigation police suggested that an unauthorized program had been run through the computer at the coded command of another computer belonging to a different company. The police obtained a warrant to search for electronic impulses in the memory of the suspect machine. The case (involving trade secrets) and its outcome should make legal history.

Science

I have to acknowledge I've gotten more useful tips from this magazine than any other technical or scientific journal.

Our Fragile Environment

The quality of the environment, ecology, and pollution problems have recently become matters of concern everywhere. My own personal explanation for this outburst of interest may be peculiar to myself, but I would like to know whether my explanation sounds a responsive chord in the minds of others. I date my own reawakening of interest in man's environment to the Apollo 8 mission and to the first clear photographs of the earth from that mission. My theory is that the views of the earth from that expedition and from the subsequent Apollo flights have made many of us see the earth as a whole, in a curious way—as a single environment in which hundreds of millions of human beings have a stake.

One view in particular is awe-inspiring—with Africa in the foreground and the whole profile of the Mediterranean very clear. One stares at the whole Mediterranean, looking from outer space much as in an atlas, but not as a drawing. Much of our most commonly taught history centers around that little sea, a mere patch of the hemisphere, which once seemed to its inhabitants to be the whole world.

Looking at the blackness beyond the sharp blue-green curve, trying to see even the place where the thin envelope of atmosphere and the solid earth meet, the curious word "fragile" comes to mind. To be on the earth and think of it as fragile is ridiculous. But to see it from Out There and to compare it with the deadness of the Moon! I suspect that the greatest lasting benefit of the Apollo missions may be, if my hunch is correct, this sudden rush of inspiration to try to save this fragile environment—the whole one—if we still can.

John Caffrey
American Council on Education
Washington, D.C. 20036

If we look at man's use of energy, the future of fossil fuels or fission is measured in centuries; only deuterium or sunlight can carry us through a long history of industrial life. Our history is now marked on a time axis by one single pulse of fossil energy, rising from the axis and falling back to it again in about a millennium. We are in the first fourth of that pulse today. Right now men add as much heat to the earth's surface as the natural flow of heat by convection

and conduction from the earth's hot interior does, and we face a tenfold rise in man's activities. For the first time in so central a parameter as energy men will have worked on a geologic scale. (Of course, the sun sends 1,000 times more heat to the earth's surface; we shall not cook ourselves that way!) Still, our myriad stacks and tailpipes aggregate to more heat than Krakatoa, Etna and the Valley of Ten-Thousand Smokes.

Globe-Trotter's Peril

The painful, nauseating but feverless disease known as "traveler's diarrhea" has often been blamed on a change in water or climate, on chilled drinks and on other dietary indiscretions. Its actual cause now seems to be known; it appears to result from the sufferer's ingestion of the intestinal bacterium *Escherichia coli*, but a bacterium that belongs to a strain different from those he already harbors.

Murder at Thank God Bay

PROBOSCIDEA

"O thou, who in former times didst wondrously magnify our appropriations, that the Marcites might be humbled; cut not back the sustenance of thy servants in the days of tightness which are upon us; but grant, we beseech thee, a renewal of thy support, that we may reap such a harvest of peaceful uses and spinnings-off as will move the people to glorify thine administration. Amen."

Internal pollution is being brought about in three ways: by the ingestion and inhalation of the products of our already polluted external environment; by our daily intake of chemical additives and impurities pre-packed into the food we eat and drink; and by the vast number of medicaments with which we regularly dose ourselves—more often than not unnecessarily. That some realization of the danger of this last factor is dawning was conveyed to me recently when in the United States. Among the seemingly endless mundane daily television commercials I was agreeably surprised to find one sponsored by the Blue Cross-Blue Shield Health Insurance Company, going something like this. "Got a headache? Why wait? Take an aspirin. . . Indigestion? Quick! an antacid. . . Can't get to sleep? A pill will help you. . . Feeling down? Take a . . ." The voice fades—pause—deep voice concludes with slow measured emphasis. "Have you thought that you might be killing yourself?" For once, advertising was used to say something that showed not only unexpected foresight, but something meriting constant repetition.

Grassland used as a car park can easily degenerate into a quagmire. British Ropes Ltd. has made a one-inch mesh polypropylene net which can be used as an inexpensive way of stopping land from becoming boggy and rutted through use by cars, caravans etc. The net is spread over grass and pegged down. The grass will grow through the net, and can even be mowed without damaging the net. The net has been tried out at Sywell Aerodrome near Northampton and has helped keep the airport open under conditions which would previously have led to damage to the surface. Polypropylene nets might also be useful on river banks and they could help stabilize other earthworks and protect freshly seeded areas.

If we were to judge by the sales of Spock's books, we would have to conclude that many parents of nonactivists must have put the Spock advice on their bookshelf, if not into their practices. But the studies of young activists suggest that their parents (often trained in, or well read in, social science fields where Freudian theory and Spock's advice held considerable sway) reacted more favorably to this advice than did the parents of nonactivists. Parents of activists expressed more frequently than others a belief that their own parents had been too harsh, too remote, too unfriendly, too strict, and too arbitrary. They indicated that they hoped to make things different for their children, and they expressed a belief in the efficacy of Spock's advice. Concomitantly, activists, more frequently than nonactivists, described their parents as lenient or not strict.

Thus the suggestion is that the young activists of the 1960's were "Spock marked." More pertinently, several studies in child psychology suggest that the love-oriented methods of discipline advocated by Spock tend to foster close identification of the child with the parent and corresponding acceptance by the child of his parents' values and expectations.

A contradiction of popular beliefs about activists is indicated here, for this evidence suggests that the young activists of the 1960's, far from being the rampant deviates that they were often said to be, were, in fact, conformists. They were conforming, through identification, to a model presented by their parents. . . .

When we look to the studies for such signs of psychopathology as excessive anxiety, neurotic preoccupations, general paranoid beliefs, delusional thinking, diminished self-esteem, loss of self-control, excessive dependency, flattened affect, irresponsible interpersonal relations, lack of drive, hysteria, depression, extreme hostility, and psychopathy, we fail to find that such behaviors were any more common among activists than among comparable samples of non-activists. Moreover, in the direction of positive mental health, the evidence indicates that activists were relatively high in self-respect, self-sufficiency, intellectual orientation, and concern for others and relatively low in ethnocentrism, possessiveness, and dependency.

There is a need, a transient need, a violent need for being just yourself, resting, recreating, talking in your own terms about what you have learned from all the cultures, scientific and non-scientific, before you and around you. During that period you want to be almost alone, with just a few friends. You want to be undisturbed. You want to be free to think not for an hour at a time, or three hours at a time, but for two days or two weeks, if possible, without interruption. You don't want to drive the family car or go to parties. You wish people would just go away and leave you alone while you get something straight. Then, you get it straight and you embody it, and during that period of embodiment you have a feeling of almost divine guidance. Then it is done, and, suddenly, you are alone, and you have a need to go back to your friends and the world around you, and to all history, to be refreshed, to feel alive and human once again. It is this interplay between all that is richly human and this special, concentrated, uninterrupted mental effort that seems to me to be the source, not only of science, but also of everything that is worthwhile in life.

Edwin H. Land

Free reprints

Bill Dickinson says you can always get free reprints of articles in *Scientific American*, *New Scientist*, etc. by writing to the authors. They all have hundreds of copies.

Popular Science

Of the three, Popular Science, Popular Mechanics, and Mechanics Illustrated, consistently the somewhat better is Popular Science. It's a good source for current applied science reporting and basement technology. Most of the tool sources we list advertise in the magazine.

Picture fuddling by computer

Can you identify this face? It's a well-known President who freed the slaves and was shot in Ford's theatre. Still stumped? Try viewing it at arm's length, or squinting, or jiggling the page rapidly. This picture represents a Bell Labs experiment to learn the least amount of visual information a picture can contain and still be recognizable—of some concern to designers of Picture-

phones. Here a computer has given a portrait into 200 squares, each rendered in an even tone of gray along an intensity scale from one to sixteen.

Have parka, will travel

Are you a post-doctoral scholar, graduate student, or upper-division undergraduate "between 20 and 30 years old, of even disposition, with some knowledge of electronics"? Would you like to train for a one-year stint manning scientific instruments in the fields of gravity, seismology, meteorology, or terrestrial magnetism? And would you, incidentally, like to spend that year at the South Pole? Then there just might be a job for you. Inquire of the Institute of Geophysics and Planetary Physics, U. of California, Los Angeles 90024. Hurry!

Popular Mechanics

Equal Time for Responsible Spokesmen . . .

Gentlemen:

I have not had the pleasure of seeing your catalog, nor of communicating with you previously. I have, however, seen the page from the catalog in which you say *Popular Science* is "somewhat better" than *Popular Mechanics*.

This doesn't anger me, because you have a right to your opinion. But it does concern me, and I'd be interested in knowing what caused you to arrive at such a conclusion.

I have been the editor of both *Popular Mechanics* and *Popular Science*, so I know the editing philosophies of both magazines. I won't take anything away from *Popular Science*, which continues to be an excellent magazine. (Their star contributor, Dr. van Braun, is a holdover from my regime.)

However, *Popular Mechanics* has long been Number one in circulation, including newsstand, and in advertising. When I became editor of *Popular Mechanics* five years ago, I considered it a step upward.

We think we do a better job in reporting and illustrating science, inventions, aerospace, exploration and the like. We're sure we do a better job on ecology (including a monthly "Pollution Fighters Newsletter"), outdoor recreation, home repair and workshop ideas.

Although *Popular Science* has recently adopted the slogan, "The What's New Magazine," and now groups all new products in an 8-page section, I believe an item-by-item count would show that *Popular Mechanics* runs at least as many news items, scattered through the magazine. And we have come up with such important "scoops" in the past year as General Electric electric garden tractor, Perry Submarine's 2-man "Shark Hunter," Sylvania's Magicube flash bulbs, and Polaroid's recently patented shutterless camera.

I am sending you several recent issues of *Popular Mechanics*. I hope they will cause you to change the opinion expressed in your catalog. If they don't I'd still be interested in your reactions.

Sincerely yours,

Robert P. Crossley
Editor

Things That Go Bump

The center of the galaxy may be emitting intense bursts of gravitational radiation, according to evidence reported at the recent annual meeting of the American Physical Society by Joseph Weber of the University of Maryland. . . .

If Weber's detectors are indeed responding to gravitational radiation, what could be the significance of emanations predominantly from the center of the galaxy? Einstein's general theory of relativity predicts that gravitational waves should be produced by matter that is accelerating with respect to the observer. "Evidently," says Weber, "matter in the center of the galaxy is either collapsing or being rearranged on a grand scale."

A stove that will burn almost any type of coal without giving off smoke has been developed by the South African Council for Scientific & Industrial Research. The aim, of course, is to reduce air pollution. In addition, council says, the new stove cannot overheat, yet develops temperatures for ordinary cooking and uses less fuel than a conventional stove.

Basic features of the stove are a firebox grate with a set of front bars only 4 in. high, to make sure the fuel bed is shallow (with a thick bed, the upper layers of fuel receive air robbed of its oxygen by the lower layers, and smoking results); a hot plate that is actually the upper surface of the horizontal flue; and a single door that serves both as fire door and ash door. The door has a novel variable-size air opening in its lower half. This opening admits air to the underside of the fire and makes it possible to cut the air supply down to bank the fire, or to increase it to achieve the optimum working temperature.

To prevent overheating, the stove is designed so, when the door is opened to add fuel, excess air enters above the fire and the draft is reduced. Thus, opening the door to increase the heating rate above the optimum point will result in cooling the stove down rather than heating it up.

Product Development and Design

Product Development and Design monthly magazine, 200-400 items reviewed descriptively each month, 600 or so ads for unusual items related to developing all sorts of products. Info and samples are available on check-off card type access system. Subscription free to qualifiers which must mean anyone in any type research; they sent it to us and we seem mainly to be researching our own heads and we didn't ask for it. It is really a mind blow for the "mechanically inclined" or short-cut freak. In the last few years everything you ever thought would be a helpful little gadget or variation has been manufactured and is available. This is one place you'll find out about it. Especially if it's new. It must be invaluable to investment freaks cause it's good access to technology's rate of growth and the movement or dynamics of it in the small item part of the spectrum. It really seems to supplement the Thomas' Registers and is full of useful stuff often available in sample form for free or a small charge to stimulate use of the item and a market for it. *Product Design & Development*, Bala-Cynwyd, Pa. 19004. Reader (subscriber) qualifying application form on request.

THE HYPNOTISM MAN

The hypnotism man was a little old sawed-off Jew with a goatee who stood with his hands folded at his chest like a teacher about to say "now children." He spoke in a wonderfully deep and resonant voice, but he wasn't nearly as handsome and pleasant to look at as Billy Graham. So The Native, ritual-freak and prankster that he was, decided to rearrange things a little. What he did was fuck up the picture image on channel four so that you could hear the hypnotism man without seeing him, while you looked at Billy Graham on channel three of the top left TV. As a kind of sub-plot, some bulldozers were hacking down a mountain in a strip-mining operation in Kentucky on channel seven of the TV next to Billy Graham.

"Far out," said Reed.

"Groovy," said Bert of the Crosstown Rivals.

"Move your fucking knee," said Bert's rival, Norton.

After some stirring and shifting around and some goings and comings to the bathroom, everybody settled back onto the mattress for another half hour of good fun.

"Good afternoon," said Billy Graham. "And welcome to today's session in self-hypnosis. I hope you've done your homework since yesterday, because today's lesson will require considerable strength of mind if you are to complete it successfully. You will remember that yesterday I asked you to practice being very quiet, all by yourself, for at least half an hour. I hope that most of you did that, for you will find, as you continue in self-hypnosis, that several minutes a day of simple quiet will add greatly to your capacity to count yourself into a trance. Being quiet for a few minutes each day is like planting a little seed in your mind that can grow and grow all through the day, and help you to stay calm and alert. So if you did not practice since yesterday's session, I urge you most strongly to sit quietly for at least half an hour before tomorrow's session.

(continued)

Handbook of Chemistry and Physics

Among handbooks this one is unusually wealthy in basic information. Its 6-figure math tables are the standard (they're obtainable separately: \$6.50 from Chemical Rubber). Its chemistry and physics tables constitute a comprehensive inventory of invisible effects. It doesn't teach you how to use or even read the inventory, but if you know-how, here's the know-what tool chest.

The Tools and Rules for Precision Measuring

A good basic book for "mechanics, hobbyists and home workshop owners." The title describes it well. Being a Starrett publication, it naturally shows only Starrett tools, but the information is good for almost all makes. Its information is primarily on Micrometers, Dial Indicators and Gage Blocks, although it covers other tools briefly. Has several useful tables in the back.

Athol, Mass. 01331

Man is a tool-using animal. Weak in himself and of small stature, he stands on a basis of some half square foot, has to straddle out his legs lest the very winds supplant him. Nevertheless, he can use tools, can devise tools; with these the granite mountain melts into light dust before him; seas are his smooth highway, winds and fire his unwearied steeds. No where do you find him without tools. Without tools he is nothing, with tools he is all.

Thomas Carlyle (1795-1881)

GEOMETRY
Geometrical Constructions

	To construct a parabola: Divide line AB into a number of equal parts and divide BC into the same number of parts. From the division points on AB draw horizontal lines. From the division points on BC draw lines to point A. The points of intersection between lines drawn from points numbered alike are points on the parabola.
	To construct a hyperbola: From focus F lay off a distance FD equal to the transverse axis, or the distance AB between the two branches of the curve. With F as a center and any distance FE greater than FB as a radius, describe a circular arc. Then with P as a center and DE as a radius, describe arcs intersecting at C and G the arc just described. C and G are points on the hyperbola. Any number of points can be found in a similar manner.
	To construct an involute: Divide the circumference of the base circle ABC into a number of equal parts. Through the division points 1, 2, 3, etc., draw tangents to the circle and make the lengths D1, E2, F3, etc., of these tangents equal to the actual length of the arcs A1, A2, A3, etc.
	To construct a helix: Divide half the circumference of the cylinder on the surface of which the helix is to be described into a number of equal parts. Divide half the lead of the helix into the same number of equal parts. From the division points on the circle representing the cylinder draw vertical lines, and from the division points on the lead draw horizontal lines as shown. The intersections between lines numbered alike are points on the helix.

Polyester & Fiberglass

Fiberglass is a cheap strength material, comparable to wood & steel. It is weatherproof, land or sea, & is colored or translucent. The fabrication is very different, however. Since the material is applied as a glass cloth & a liquid plastic, it assumes complex & curved shapes almost as easily as simple shapes. This enables a breakaway from the lines & planes that wood & steel come in into free form & organic shapes. Since fiberglass is formless, a mold is usually necessary. Making a mold is cheap but time consuming & the mold can be used many times. A boat hull or a chair are naturals for fiberglass. We used it to make a 5' diameter parabolic dish for a mirror. It would be a cheap & effective way to turn Frei Otto's (see Vol II, Tensile Structures, of WEC) incredible shapes into houses.

This is a nitty-gritty book. It tells you what to ask for at the store. It has names for all the mistakes we made. It enables you to learn so much from your first fuck-up that the second one works. It comes as close to someone standing there showing you how to do it as a book can, which is perhaps not so close. The lack of emphasis on safety procedures is a perhaps a fatal flaw. An aspirator should always be used when sanding fiberglass & the liquid resin should never come in contact with your skin—use rubber gloves.

It is now used for making automobile bodies (Chevrolet's "Corvette" has an all-glass body), and for making a permanent boat coating. Many manufacturers are using it to produce washing machine agitators, vacuum cleaners, "glass" fishing rods, dent-resistant tanks for chemicals and acids, protective safety helmets, Marine bullet-proof vests that weigh only eight pounds and will stop most shrapnel and small-arms fire, electrical insulation, laminates, precision-molded housings for machinery, skis, fishing tackle, chairs, futuristic furniture, garden furniture (Impervious to rain and sun), trailers, bathtubs, even coffins. And you can make any of these!

POLYESTER PLASTIC RESIN is a thick viscous liquid about like corn syrup to which a catalyst (and sometimes an accelerator) is added. It sets up hard and stiff yet has the resiliency to resist repeated hammer blows when used with fiberglass. Polyester alone is brittle in thin sheets. Fiberglass adds strength.

There are many different formulations of Polyester on the market. The variety of properties that can be obtained from this one plastic is amazing, but as there are many Polyester manufacturers, of course there are many different Polyesters, each made for laminating and/or casting, but with properties that vary slightly, and with several different manufacturer-recommended catalysts and accelerators. It is always wise to follow your dealer's recommendations on the catalyst system to use. Then experiment with other systems if you want to.

Plastics

How does a person who becomes interested in plastics find out all there is to know about plastics? One solution may be to spend the rest of your life walking from plastic company to plastic company finding out what each are doing. This would be OK if you were looking for something to do for a long period of time. But if you are longing for a comprehensive review of the world of plastics and/or some good solid reference material on the subject, then I suggest *Plastics in the Modern World*. It is an interesting little Pelican Original pocket book by two Englishmen; E.G. Couzens and V.E. Yarsley. Part one contains: *The Theory and Practice of Plastics* which discusses the physical, chemical and behavioral aspects of plastics, while also explaining the manufacturing processes involved in plastics production. Part two of the book concerns itself with the domestic application of plastics and the utilization of plastics by industry.

[Suggested and Reviewed by Michael Rosenthal]

A special application of plastics is in concrete mixing: the addition of 4 per cent of epoxy resin to coat the sand and aggregate particles before water-mixing is said to increase the tensile strength 2½ times. Reduction in shrinkage and crack tendency can be effected, along with an increase in tensile strength by using a 32 per cent aqueous dispersion of vinyl chloride, or styrene-butadiene copolymer, while an acrylic liquid modifier, known as 'Sonocrete', is used for producing a surface resistant to water and salt. The most recent development in the use of plastics concrete mixes is known as 'Estercrete', a general name given to products made by mixing unsaturated polyester resins, ethylenically unsaturated monomers, and Portland cement.

New Science of Strong Materials

Why does glass sometimes shatter and other times bend like a spring? A new field of science involves the study of materials as a whole, rather than in their special chemical, physical, and engineering aspects. Scientists have been investigating the atoms and molecules upon which the mechanical properties of materials depend, and this book is a clear explanation of some of the discoveries being made. Nothing beyond high school math, and a very palatable treatment of an exciting new science.

If easy, cheap production of sufficient accuracy can be achieved by small units then we may be able to reverse some of the centralizing trends of the Industrial Revolution and perhaps, in part, to set ourselves free from the worst tyrannies of mass production. There may then be more room for individualistic skills and for individual tastes — perhaps we shall all feel better for it. However there is very little research going on along these lines at present and I am afraid that the Satanic Mills have still quite a long future before them.

Figure 11 Beam theory — a beam may be considered as made up from a number of separate panels.

The first thing we discovered was that we could get high strength from almost anything from Epsom salts to sapphire. Provided it was in the form of a thin whisker, it did not matter what the chemical nature of the stuff was or by what method the whiskers were grown. We must have worked on well over a hundred different substances and there was absolutely no doubt about it.

The worst sin in an engineering material is not lack of strength or lack of stiffness, desirable as these properties are, but lack of toughness, that is to say, lack of resistance to the propagation of cracks. One can allow for lack of strength or stiffness in design but it is much more difficult to allow for cracks which catch the engineer unawares and are dangerous.

The choice of adhesive is determined by price, the nature of the substances to be joined, the strength of the bond required, and the appropriate glueing process. Thus phenol-formaldehyde and urea-formaldehyde glues are used chiefly for bonding wood, especially plywood; they may be either hot- or cold-setting according to the composition used, and P.F. resins give joints resistant to boiling water. The phenol glue gives the stronger joint, but leaves a dark glue line. The urea resin are cheap, colourless, easily handled, and extensively used in furniture, where moisture resistance is not important. They can also be applied in separate layers, that is with the resin on one surface and the hardener on the other, and where heating is required, radio-frequency heating of the 'glue line' can be employed. In general plastics glues have the advantage over screws and nails that they avoid local stresses and give joints of great strength.

"Now. Today we are concerned with time expansion. A lot of people have different notions of what time expansion is, and they approach the phenomena in a variety of different ways. But the thing that all the ways have in common is that time expansion implies a more intense experience of the present, the here and now. I'm sure that many of you sitting there listening to my voice are still not actually here in this moment, with me, now, as I talk to you. Your minds are filled with thoughts of other people and other places, of experience that has already happened or that you are waiting on to happen, or that you wished had happened or would happen. This is very common. Indeed, it is the way most people go around in their minds all the time. And it is a most wasteful, and actually harmful, destructive way to conduct your mental life. What we are going to do today is play a little self-hypnosis game that, once you master it, can be useful to you in helping you to learn how to live in the present in a natural, vital way.

"So, if you will, lie down now, and make yourself comfortable on the floor, or on a mat, or mattress, or whatever you are lying on. Let your body sink and relax into the floor. Feel the relaxation begin in your toes and flow up through your legs, into your thighs, feel it flood your mid-region and swell on up through your chest. Relax your hands, relax your elbows, and your arms and your shoulders. And let the tensions go out of your neck, and your jaw muscles, let your entire face relax and settle naturally against your bones. Feel the relaxation flowing through you from your toes right up through your scalp, and feel your breath going in and out evenly and without effort.

Clearinghouse

Its full name is "Clearinghouse for Federal Scientific and Technical Information," it's managed by the U. S. Department of Commerce, and it's quite a service. All current unclassified R&D (research and development) done for or by the Government is available through Clearinghouse; this amounts to 30,000 new documents each year. Specific accesses are: U. S. Government Research and Development Reports (December 1,000 new documents twice a month), \$22/year; Fast Announcement Service, for as many as 57 subject areas, delivered constantly, \$5/year; and Technical Translations, twice a month, \$12/year. These are indexes. Once you find what you want you order a paper copy (hard copy) for around \$3 or micro-film (microfiche) for around \$65. The following examples of listings are from the Fast Announcement Service.

[Suggested by Jon Dieges]

Last Year Cheaper

Thomas Register can often be gotten FREE (also last year's) by approaching industrial libraries, or even the local Public Library, who generally get swamped by everybody's old edition. Big businesses make a real thing out of keeping up to date and Thomas doesn't update with supplements—new 7 volumes every year.

International Yellow Pages

Wes Wilson was asking about listings of manufacturers in Europe. May I suggest International Yellow Pages. Look for it in the library. When he finds the countries he is interested in then approach the telephone company as he has done before.

The International Yellow Pages is now at least three times as big as 2-3 years ago. Fascinating reading.

There are many other sources of the type of material he wants. Most of it has a price tag but usually not too much for what is covered.

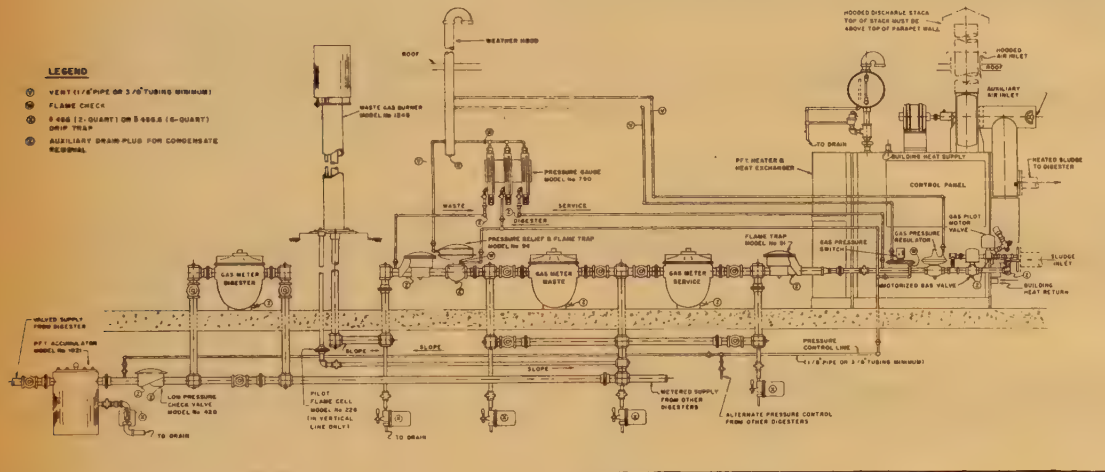

How about contacting Chambers of Commerce located in this country? As an example: Swedish American. While in the library find a New York, San Francisco, or any large city telephone or city directory for a list of such Chambers of Commerce.

Have fun.

Lefax Data Sheets

Since 1910 Lefax Publishing Company has been producing data sheets on an enormous number of technical subjects ranging from athletic fields, dimensions of, to 1,3-butadiene, thermodynamic, properties of. Some are useful and some seem useless. The best part of the Lefax system is that you only buy the ones you want. Anything from 14 pages on Steam Boilers (30¢) to a complete library with a file cabinet (\$140). Even single pages are obtainable, but you must buy 25 of each at 15¢ each. The best buys seem to be broad topic loose leaf binders like the Handi-Fax do-it-yourself home owners manual which cost \$5 to \$10 for 200 to 500 pages. Data books on such topics as Diesel Engineering, Machine Design, Home Heating, Piping Data, Lumber Data, Surveying Tables, A.C. Motors and Generators, Mining Geology, etc. at \$2 each also look reasonable. Much of the data is ageless, but some seems rather outdated. This isn't always a disadvantage, though, since "old-fashioned" methods are often more useful to the amateur than "modern" methods. All data sheets are 3-3/4 in x 6-3/4 in., a convenient size to carry around and are loose leaf so you carry only the useful ones. Catalog is free from Lefax Publishing Co., 1315 Cherry Street, Philadelphia, PA 19107. I guarantee you'll find information you didn't know you needed.

AD-691 231 -- THE INFORMATION THEORY ASPECT OF TELEPATHY, I. M. Kogan, U.S.S.R., 1969, translated from Russian, July 69, 26p.

AD-677 116 -- A SOLAR-ILLUMINATED ALGAL PHOTOSYNTHETIC EXCHANGER, R. L. Miller et al., Martin Co., Denver, Colo., for the Air Force, June 68, 26p. . . . Describes a continuous culture system for studying the use of solar energy for algal growth and photosynthetic gas exchange.

ORDER: PB-180 051 -- TRITON CITY -- A PROTOTYPE FLOATING COMMUNITY, Triton Foundation, Inc., Cambridge, Mass., for the Dept. of Housing and Urban Development, Nov. 68, 131p.

AD-681 047 -- WHAT IS MEMORY THAT IT MAY HAVE HINDSIGHT AND FORESIGHT AS WELL, H. Von Foerster, Univ. of Illinois, Urbana, for the Air Force, Jan. 69, 61p. . . . Discusses the phenomenon of physiological memory from the viewpoint that memory is embedded into the totality of cognitive processes and considered as a computational operation rather than a storage and retrieval problem.

AD-681 752 -- A FIFTEEN-YEAR FORECAST OF INFORMATION PROCESSING TECHNOLOGY, G. B. Bernstein, Naval Supply Systems Command, Washington, D. C., Jan. 69, 187p. . . . Uses SEER (System for Event Evaluation and Review), a technique that incorporates the consensus of participant experts, to produce a technological forecast of what is expected to occur in the information-processing industry.

PB-180 665 -- THE INFLUENCE OF DESIGN ON EXPOSED WOOD IN BUILDINGS OF THE PUGET SOUND AREA, E. W. Schein, USDA, Pacific Northwest Forest and Range Experiment Station, Portland, Ore., Sept. 68, 50p. . . . Identifies the best existing design solutions to exposure hazards.

AD-680 168 -- SPIRAL GENERATION OF BUILDING SHELLS: OR MILITARY CONSTRUCTION, A. N. Collshaw and R. D. Graham, Dept. of the Army, Ohio River Division Labs., Corps of Engineers, Cincinnati, Ohio, Nov. 68, 30p. . . . Discusses immediate and potential applications of the spiral generation construction process to military construction. Included are permanent, semi-permanent, and temporary construction.

PB-182 401 -- BUILDING CLIMATOLOGY, PART IV: NOISE, National Swedish Institute for Building Research, Stockholm, 1968, 86p. . . . Annotated bibliography of literature dealing with the following aspects of noise: (1) subjective reactions to sound, noise, and vibration, (2) objective methods of registering sound and noise, (3) noise situations, (4) fighting noise (technical and legal steps to improve noise climate) and sound insulation, (5) acoustic planning, and (6) theory of sound propagation.

AD-678 571 -- TAN-O-QUIL-OM TREATMENT FOR FEATHERS AND DOWN, G. Cohen, U.S. Army Natick Labs., Natick, Mass., Aug. 68, 80p. . . . Describes a process for treatment of feathers and down that uses a tanning agent and a water repellent and is applicable to both landfowl and waterfowl feather filling materials. Feathers treated by the process have increased filling power that is durable to laundering. Are free from dust, are exceptionally clean, and will not develop an odor even when wet.

AD-685 850 -- WATER SUPPLY IN COLD REGIONS, A. J. Alter, Cold Regions Research & Engineering Lab., Hanover, N. H., Jan. 69, 94p. . . . Discusses the influence of a cold environment on sanitary engineering work and services, water supply engineering in cold regions, and water supply during military field operations. Report includes a bibliography.

AD-688 132 -- POLYURETHANE FOAMS: TECHNOLOGY, PROPERTIES AND APPLICATIONS, A. H. Landrock, Picatinny Arsenal, Dover, N. J., Jan. 69, available in paper copy only, \$15.50, 257p. . . . Discusses state-of-the-art of urethane foams. Topics covered are: chemistry of urethane foam process; types of polyurethane foam; methods of manufacture; toxicity of raw materials; adhesives and other methods of joining; surface coatings; foam properties; test methods; military and space applications; economics and costs; comparative properties of other foams; specifications and standards; trade designations; and definitions of terms. Report includes a bibliography of over 700 references from the open literature, government project and contract reports, commercial bulletins, and conference papers.

AD-686 723 -- WIND SURFING--A NEW CONCEPT IN SAILING, J. R. Drake, RAND Corp., Santa Monica, Calif., Apr. 69, 23p. . . . Describes various board and sail configurations used in wind-surfing. The hand-held fully-articulated sail in an entirely new means of propulsion and control.

This one is great, a stand-up surfboard with a ball-joint flexible-boom sail. Surf in, then turn around and surf out. Design and instructions.

How to Invent

Last month, when I visited you in Menlo Park you invited me to write about inventing, and what I would have liked to read that might have been helpful when I started inventing 15 years ago.

I'm enclosing some material on my most recent work, a so-called "patent network" in which a direct relationship exists among four inventions. Each of the inventions is illustrative of a different kind of invention in the sense that each was arrived at in a different way:

The SunBird kite was developed accidentally in an effort to work out a method of preventing kites from diving out of control. (An example of trying to invent B and coming up with A.)

The compression tension kite that turned into a cabana is an example of simply recognizing that something that my hands had done was an invention.

The stressed skin structure is an invention which I regard as inexplicable insight (except that, in retrospect, it is the logical relative of a claim in my compression tension patent).

The modular building system was a deliberate attempt at compromise; an effort to combine a multiplicity of stressed skin modules into a cohesive unity, but the selection of the octant as the basic module was intuitive.

Most investigators of the "creative process" seem to agree that invention is non-sense. . . a subconscious, alogical activity which is the unique output of the human random-access memory when triggered by appropriate stimuli. It's nonsense when it happens, but after the fact it makes very good sense indeed.

Since the memory is involved it follows that the broader and deeper the experiences recorded in the memory, the greater the arsenal which can be drawn upon by the subconscious for its synthesizing activity. A rather long-winded way of saying, "if you're going to invent, it's a good idea to have a broad understanding of how the real world is put together; how things work; how things are made; and how the hands and their extensions, tools, make them."

The best inventor I know is Mother Nature. She holds most of the basic patents, (maybe all of them), so perhaps evolution is one way to get the job done.

Another way is accident. I've heard it said that an average chimpanzee turned loose on a typewriter, would eventually turn out every word in the Bible, and I suppose that his cousin, turned loose in my workshop, would have eventually put together both the SunBird Kite and the Modular building.

I just couldn't wait. Time's growing short.

Don Gellert

Kit is \$6.00, and can be purchased from

During the research which preceded final development of the Sun-Bird, the inventor explored the work of Alexander Graham Bell, (who was a pretty serious kite flyer himself), and developed a compression-tension modification of Mr. Bell's tetrahedron kite.

While the structure was not notably successful as a kite, a pair of Siamese cats took up residence in the prototype, and led the inventor to the development of a new modular housing system on which three patents have been issued during the last 18 months.

Figure 3 shows the fabric tetrahedron as modified into a compression tension structure.

A variation of this structure, using a curved spine and semi-rigid surfaces (instead of fabric surfaces) without the external compression members is shown in Figure 4.

Figure 5, an interlocking dome system using the same module.

A FULLY CONTROLLABLE TETHERED GLIDER

If you hear talk about a kite that can: write your name in the sky; dive, loop, spin, hover on command; plunge into the water swim around and take off again; fly in formation; dance to music. . . and stuff like that the gadget that actually performs that way is a SunBird Aerobatic Kite.

A two-part invention which was developed more or less by accident, the SunBird consists of a delta wing kite, with independently movable wings, and a control reel that handles each of the two control strings and allows them to be payed out or reeled in simultaneously.

Kite flying is a sport, and the SunBird is a piece of durable precision engineered sports equipment. It takes skill to use it, and time to develop that skill but after a dozen flights or so, when you've mastered the control system it's the nearest thing to a tree-eating kite there is.

While the SunBird Kite included in the kit is considered to be the best controllable kite ever developed, the SunBird Control can be attached to almost any kite, and instructions for attachment to other kites are included together with full instructions for handling the Control System.

These designs have been rendered in fabric, urethane-covered fabric, cardboard, aluminum and urethane covered aluminum, free-standing urethane, plywood panels, steel-lath-and-concrete. The largest span to date is 26 feet (for a single module and was fabricated as a free-standing urethane dome.)

The advantages of the system lie in its power to develop, out of plane surfaces, extremely strong, thin shell structures with curved surfaces imply.

Readers interested in experimenting with the structure are invited to correspond with the inventor. Background theory material and representative designs are being assembled for reproduction and will be available at \$2.00 per copy together with a license to erect experimental structures. Commercial applications may be arranged on an individual basis.

Figure 5

Figure 2

"As your body has settled into deep rest, your mind has been relaxing too, emptying itself until now it is cool and clear and free of all images except those I will suggest to you with my voice. Your mind is like a wall with absolutely nothing on it, no shape, no form, no color. It is empty and at rest, ready to receive the image of three boxes, three simple boxes sitting side by side in the middle of the empty space of your mind. The boxes are all the same size, and they are sitting in the same positions, with their fronts toward you, so that you can read the words written on the front of each box. Except for these words, the boxes are just alike, three neat boxes, very simple and clean of line, sitting next to each other in your mind. On the front of the box on the left is the word 'Past.' The box on the right is labeled, 'Future,' and the box in the center is labeled 'Present.' Keep seeing all three boxes sitting there together, now, but pay particular attention to the box on the left, the 'Past' box. Think about that box a minute, and think about the word 'past.' And as you think about the word 'past' begin to put into the box all those things in your mind that you ordinarily associate with the word past. All your memories, all your recollections, all your backward longings. . . everything in your mind that has anything at all to do with the past put it into the box on the left, and when you have done this, close the lid.

"Now you have closed the lid on the box marked 'Past.' Continue to see all three boxes in a row, but turn your attention now to the box on the right, in particular, the one marked 'Future.' Think about the word 'Future,' and as you think about it, begin to fill up the box on the right with all those elements in your mind that have anything at all to do with the future. All your ambitions, all your plans, every forward longing, every expectation, the very concept of the future, put in the box now, and when you have it all in, close the lid. The past and the future are now closed. You don't have to think about either of them again. The three boxes are still there, side by side in your mind, but the only one you are interested in now is the one in the middle, marked 'Present.' Turn all of your attention to the box in the middle marked 'Present.' Concentrate your entire mind on everything you can grasp that belongs to this particular present moment of your life. Everything that is, now, put in the box marked 'Present,' and watch, notice how the box in the middle is beginning to grow in size. You continue to put in it everything that you can possibly get hold of in this moment, this now, but as you do the box is growing, getting larger, it is swelling in length and height and breadth. You continue to put in it all the elements of the here and now that you can get hold of, but as you find them and put them in, you discover more and more of the present that should be included in the box.

"And as the middle box grows, the other two boxes on either side get smaller and smaller in proportion. They get smaller and smaller as the box in the middle gets larger and larger. And gradually the box in the middle begins to crowd the other two boxes out of your mental picture. Their place is being consumed by the box in the middle, which you continue to fill with every stray possibility out of the world of here and now. The two boxes on the sides are so small now you can barely see them. And now they are gone.

"Now there is only the box in the middle, the 'Present,' box, still swelling, still growing, getting larger and larger with every breath you breathe.

"And now the edges of even this box begin to disappear into the limits of your picture. It is beginning to lose its form, its identity as a box, it is turning into pure space now, pure light, and inside it is every aspect, every partical of now, of here, of this single, living breathing, on-going instant of your life."

Meccano

Meccano, originated by Frank Hornby, a Liverpool inventor, in 1901, was the prototype miniature metal construction system. American children are familiar with Erector, European kinder with Trix and Marklin, but they all spring from Hornby's original brainchild. Meccano is sold today from open stock, and in sets ranging in price from \$2.00 to \$160.00. There are hundreds of extra specialized parts available, and power units including two sizes of clockwork motors (these are genuine governor-controlled drives, not flimsy windups), four different electric motors operating on 4½ volts D.C. to 240 volts A.C., and a reversing steam engine. Meccano gears are machined brass with setscrews; most other parts are stamped and plated steel. Auxiliary sets are available for making gear transmissions, mechanisms such as intermittent drives, and generators. Plans for many complex models are available from the factory, and there is a monthly Meccano Magazine with projects such as regulator clocks described in detail.

The point of all this is that if you want to breadboard an invention or a machine, Meccano is a tested, economical way to do it. Many laboratories in England carry stocks of Meccano parts to build test models with. Meccano is available in a few stores, such as Sears, in the United States, but you are better off ordering it from major British toy suppliers such as Beatties of London, 15 Broadway, Southgate, London N. 14, or Manley's, Lombard Road, Merton, London S.W. 19. After more than half a century Meccano is still a viable mechanical system. It's also a pretty good toy.

[Suggested and reviewed by Dr. Morton Grosser]

Formulas, Methods, Tips and Data

Toothpaste, soap, detergent, chemical cleaners for drainpipe & toilet bowl; paint stripper, radiator quick flush, paints, dyes all have cookbook, electric mixer & stove & mixing bowl behind their shiny marketable exteriors. You eliminate several steps in the cycle between your natural resources and your products when you brew them at home. Some things (like soap) can be better quality than you buy. Some are less expensive. Unities emerge at the level of chemical ingredients which are not at all visible in the supermarket. And even if you go back to shelf-ware at some point in the future you do so with different eyes.

BASIC SOAP FORMULA. To make 9 pounds of pure, hard, smooth soap suitable for toilet, laundry, or soap flakes, follow this simple recipe:

Cold water	2½ pints
Pure flake lye	1 13-oz. can
Clean fat (tallow or lard, or combination)	6 pounds
6 pounds of fat is about 6½ pints of liquid fat.	

Slowly pour the lye into the water in a Pyrex, iron, or enamel vessel (Caution: Don't spill lye solution on your skin, clothing, or furnishings, as it is extremely caustic). Stir until the lye is completely dissolved. Then let it cool to the correct temperature as shown in the table to follow.

Melt fat to clear liquid and let cool to correct temperature as shown in table, or until the fat offers resistance to the spoon. Stir occasionally to prevent crystals from forming. Pour the lye solution into the fat in a thin, steady stream with slow, even stirring. (Rapid addition of lye solution or hard stirring is apt to cause a separation.) A honey-like consistency is formed which becomes thick in from 10 to 20 minutes.

Henley's

Henley's was first published in 1907, and is a fascinating mixture of obsolete and still useful formulas and processes as advertised. Some are useful but obscure (formulas for fire-eating); Some are useful but who cares? (formulas for furniture glue not as good as what you can buy); Some are frighteningly incomplete (the section on explosives); Some are bizarre (a hair pomade containing Spanish Fly); Some you can get better elsewhere (ceramic glazes); Some are funny (remove frost from windows by swabbing them with sulfuric acid); Many brews require chemicals not easily available, but sources are given (mostly in New York) and there is a glossary or outmoded terms. Some of the formulas might be of historical interest (how to make harness grease). It's not a pretty book; every copy I've seen has printing flaws, probably due to worn plates. I've been happily thumbing through my copy now and then for many years. I've never used anything from it.

[Suggested and Reviewed by Jay Baldwin]

Pour the thickened mixture into a wooden box that has been soaked in water and lined with a clean cotton cloth wet in water and wrung nearly dry. Place in a protecting pan. Cover with a board or cardboard, then with an old rug or blanket to retain the heat while it is texturing out. Leave it alone for 24 hours.

To remove the soap from the mold, lift it by the ends of the overhanging cotton lining. Cut into bars by wrapping the soap with a fine wire and pulling the wire through. Place so air can reach it, but avoid drafts and cold. Aging improves soap. In 10 to 14 days it is ready for use.

TEMPERATURE TABLE. Follow these temperatures closely:

Type of fat	Temp. of fat	Temp. of lye sol.
Sweet lard or other soft fat	98 degrees F	77 degrees F
Half lard and tallow	105 degrees F	83 degrees F
All tallow	125 degrees F	93 degrees F

Unistrut

Unistrut is great stuff. You can make houses, furniture, partitions, stage sets, boat trailers and just about all sorts of things out of it, and can take them apart later and use the Unistrut again. It comes in several sizes, in several metals and finishes, and is completely adjustable. I've used it for such diverse things as tables, store interiors, pack frames, animation stands and camera dollies, telescopes. Unistrut is distributed nationwide, but locally there may be competitors that offer cheaper prices and different finishes. Good for space frames such as Fuller's octet truss.

Similar in use but not in sophistication is "Giant Erector Set" slotted angle that goes under a number of trade names. It's usually called "slotted angle" or "metal lumber" in the Yellow Pages. It's particularly good for shelving and camping bus interiors, where 2 x 4's are not really suitable. A good brand is AIM (for list of distributors, write Tom Jackson, Interlake, 4903 Pacifica Blvd., Los Angeles, CA). It costs about the same as finished lumber and takes no skill at all to use. Comes with bolts and nuts and a simple table to calculate loads. Also Good Stuff.

Anti-Freezing Solution for Automobiles.—In the average size (90 qt.) automobile engine radiator, if 1½ gallons of ethylene glycol is used, together with 10 oz. of sodium chromate, the radiator and engine block will be protected to -20° F., and the cooling system will at the same time be protected against destruction by corrosion.

Anti-Freezing, Non-Corrosive Solution.—A solution for water-jackets on gas engines that will not freeze at any temperature above 20° below zero (F.) may be made by combining 100 parts of water, by weight, with 75 parts of carbonate potash and 50 parts of glycerine. This solution is non-corrosive and will remain perfectly liquid at all temperatures above its congealing point.

Anti-Frost Solution.—As an excellent remedy against the freezing of shop windows, apply a mixture consisting of 50 parts of glycerine dissolved in 1,000 parts of 62 per cent alcohol, containing, to improve the odor, some oil of amber. As soon as the mixture clarifies, it is rubbed over the inner surface of the glass. This treatment, it is claimed, not only prevents the formation of frost, but also stops sweating.

FIRE EXTINGUISHER (For Automobiles).
Mix well together:
98 Parts of Carbonate of Soda
2 Parts of Oxide of Iron

When this mixture is thrown on a fire carbonic gas is liberated. This gas being heavier than air, smothers the fire.

RED FOR WOOL. For 40 pounds of goods, make a tolerably thick paste of lac dye and sulphuric acid, and allow it to stand for a day. Then take tartar, 4 pounds, tin liquor, 2 pounds 8 ounces, & 3 pounds of the paste; make it in bath with sufficient water, and enter the goods for ¾ hour; afterwards carefully rinse and dry.

Small Engines Service Manual

Velodur

The following is from a Navy report.

-SB

DESCRIPTION

Velodur-metal is a molecular bonding metal that can be used to bond materials together without heat or energy. Its components are macro-molecular substances and atomized steel and aluminum particles which form a metallic bond. It can be used on steel, aluminum, copper, brass, zinc, concrete, tile, glass, wood, rubber, cast iron, and synthetics. Two or more unlike metallic materials may be bonded together with no electrolytic action taking place. Velodur-metal is nontoxic, nonflammable, it has unlimited shelf life, will resist heat up to 570 degrees F, and will not conduct electricity. The standard bonding metal consists of two-components, an activator and a base. These two components are mixed by volume on a 1 : 1 ratio. The curing time is 3-4 hours; after this time Velodur-metal may be drilled, threaded, machined or ground. Velodur-metal also comes in a rapid form, mixed on a 1 : 1 ratio also, that allows repairs on tanks, piping systems and other pressure vessels while still under pressure. Velodur rapid cures in 4-5 minutes. However, the Velodur rapid will not hold up as well as the standard Velodur. After using the Velodur rapid to stop the flow of pressure the Velodur standard metal should be applied over the rapid for the best and lasting results.

USS NANTAHALA (AO 60) — Butterworth heater, upper level, forward engine room, expansion joint was badly deteriorated along bottom and continually leaking due to several holes. Welding or brazing were impossible. Velodur-metal was applied using fiberglass cloth as a void cover with excellent results. The operating pressure and temperature of this heater is 125 psi and 400 degrees F.

Velodur Metal Technical First Aid Kit Contains:

- 2 1/2 lbs. Velodur Metal Standard
- 1/2 lb. Velodur Rapid
- 1 bottle Special Cleaner
- 1 yard reinforcement tape
- 1 spatula
- 1/2 pt. Velodur Fluidizer
- 1 measuring cup

Electric Motors

This book gives a few principles on motor operation fundamentals, then describes in more detail several types of ac and dc motors and the control and starting devices needed to run them. Some curves of operating characteristics and a brief trouble-shooting guide are given for each type of motor. There is enough information to get a feel for the differences between the many types of ac and dc motors which exist, but it would probably be difficult for a layman to use this book to select the proper motor for a given application without outside help. It is probably also necessary to have a basic understanding of simple electricity theory (see the Basic Electricity series by Rider Publications) before reading Electric Motors. Nevertheless, it is a fairly complete survey of available motor types, all under one cover.

Home Appliance Servicing

This is the most useful book on home appliance repairing that I have seen. It is intended for the serviceman, but it is written clearly enough to help anyone who knows how to use a screwdriver. Covers small and large appliances like ranges (gas and electric), refrigerators, & air conditioners.

Reading the appropriate section before calling a repairman would be good insurance against padded repair bills.

With top lighters, pilot flames generally should be adjusted so that the top of the flame does not come in contact with any part of the lighter. An impingement of the flame on cold metal will usually produce either an undesirable odor from the incomplete combustion of the gas or an undesirable carbon deposit. Pilot outage and odor are sometimes experienced with lighters that have a solid top lighter hood; these conditions are caused by an accumulation of carbon and dirt in the dome and around the air ports of the hood and can usually be corrected by drilling a 1/8-inch-diameter hole in the top of the hood.

Float. Sometimes used to refer to the coarser grades of single-cut files when cut for very soft metals (like lead) or for wood.

Overcut. The first series of teeth put on a double-cut file.

Point. The front end of a file.

PAINT—Carboline Protective Coating, Vinyl, Series K.

A strongly adhering self priming top coat for wood, metal or concrete. It is easy to apply and the dry film retains good flexibility and provides excellent abrasion resistance. Thin films afford exceptional protection in moist atmosphere and are recommended for dark room and laboratory maintenance. Series K paint is primarily a maintenance protective coating for general use in mildly corrosive atmospheres. It is easily applied with brush or by spraying, dries rapidly, keeps idle time of facilities to a minimum and requires no separate primer for surfaces in good condition. Dries to a glossy finish when used over Carboline primers and provides maximum protection when so used.

May be applied directly to wood, metal or concrete. Galvanized and non-ferrous metals require priming with 53082-10 wash primer and 53083-10 intermediate primer to assure best adhesion and longest top coat life. May also be used as a refresher coat over other vinyl coatings. In many cases it may be applied directly over well oxidized coatings of other paints but a test application should always be made first to check for compatibility.

Coverage: 320 square feet per gallon in a 1 mil coat. Recommended film thickness 3 mils. Thickness per coat 1 1/2 mils (dry). Drying time to touch, 10 to 15 minutes; to over coat, 2 to 4 hours. For thinner see 53080-75.

AA573 Epoxy glue—World's strongest adhesive. It handles the toughest bonding jobs. Comes in handy two-tube package. The great strength of the glue is achieved by a chemical reaction of the resin and hardener when they are mixed in equal quantities. Glue will bond all metals, wood, leather, masonry, pottery, rubber and most plastics to themselves or each other. It is transparent, flexible and waterproof. Sets in 4-6 hours.
1/2 oz. tube kit (1 resin, 1 hardener) Kit \$.98

AA322 Handy Memo Timer. Here is a pocket-sized, Swiss made 2 hour time alarm. Easy to use. Set the dial from 5 minutes to 2 hours. A gentle buzz sounds when the time period is up. Only 1 1/2" in diameter and weighs about 1 ounce. Easy to read with clear gold figures and a red indicator against a handsome black background. Has convenient key holder on strap.
Each \$5.85; Dozen \$60.00

AA39 Instant Cold, a product designed primarily for first aid purposes but can be used when it is desired to cool a specimen where ice or refrigeration is not readily available. The chemicals necessary to get the cold are packaged in a plastic pouch. By squeezing the pouch, the chemicals are mixed and in about two seconds 20° cold is created in the pouch. Stays cold for about 30 minutes. The plastic bag will conform to the shape of many items. Does not deteriorate on the shelf. These bags are excellent for use in first aid to control swelling, reduce internal bleeding, reduce pain, etc. These are for one time use only.

Per carton of 2 \$ 1.88
Per case of 8 cartons of 2 12.00

AA40 Instant Heat, a product similar to above but with the reverse property of being able to provide heat when you are not near a source of heat. Will provide heat for about one to two hours.

Per carton of 2 \$ 1.88
Per case of 8 cartons of 2 12.00

AA415 Plastic graph sheets. New gridded sheets are laminated so that the printing is permanent. One side has a matte finish for pencil plotting. The lamination and matte finish features permit unlimited reuse of the same gridded sheet. Each sheet is approximately 8 1/2" x 11", punched for standard ring binder. Grids are printed in red for good contrast between the grid and the plotted data.

Model	Type of ruling
A	4 x 4 to the inch

Beware of HyLab

I am a cameraman working for a film company on location in Colorado, and am a California resident. I am writing in regard to a very unfortunate incident which has recently happened to me.

In your March 1970 Supplement you listed the HyLab Company, Box 8625 Chicago, Ill., and described them as selling chemicals to small laboratories. Because my son has a chemistry set and I often have need for chemicals in my profession, I wrote them at the end of May requesting a catalog and/or price list. I received a letter from them in the middle of July in which they explained they were sorry but they were out of business and could not help me. Last week a friend of mine that is a deputy sheriff in this town informed me that the town marshal had received a letter from "a chemical company" informing him that I was ordering chemicals to make LSD and that I should be placed under observation.

This allegation is absolutely untrue and I consider it a flagrant violation of my civil rights and an invasion of privacy. In the light of recent activities of the FBI in libraries, the action of the special police unit in Santa Barbara, the Kent State incident, just to name a few, I am very concerned. I don't know if this company is an FBI or police front but I don't like it. I am very upset that you would list a company like this in your catalog without a more complete investigation of it. I wonder how many of your readers (without better contact with their local police than I have) have innocently written this company and are now on police lists or are under surveillance as potential subversives. I would hope that you could print some kind of warning to your readers to avoid this company.

We appreciate and enjoy your catalogs but now we must wonder if we write for anything that might be considered illicit such as books on drugs or pot, political books, chemicals, etc. that we may end up on the same or other police lists for observation.

If you should decide to investigate I hope we hear from you.

I am also writing Senator Alan Cranston, HyLab company, and my lawyer.

Larry G. Logan

17-8140 DEMINERALIZER—Water, La Motte Filtrion

Designed to supply small amounts of chemically pure water where elaborate equipment is impractical. It can be attached to a faucet with its own flexible connection. Fifteen pints per hour can be demineralized, with a capacity of 120 grains.

Modern Plastics

Issued monthly and technically oriented, it covers the latest plastic products, manufacturing, and engineering. It's full of ads, and there is a free product literature card at the back of the magazine: you circle the appropriate number and the manufacturer mails you information.

Included in your subscription is the annual **Modern Plastics Encyclopedia**, the most comprehensive text available on plastics. It is mailed out each October & consists of a summary of the year's trends in plastics, information on polymer science, a textbook of fundamental plastics, a directory of 3600 companies, & reference data on plastic properties & characteristics. The **Encyclopedia** also has free product literature cards.

—Lloyd Kahn

[Suggested by Michael Rosenthal]

PVC film provides airtight lining for the inflated Fuji pavilion.

Giant polyester balloon

Construction will soon start on a 34 million-cu. ft. balloon that will require more than 13 acres—well over a half-million sq. ft.—of 1/2-mil polyester film.

Dacron polyester threads, bonded to the film (Du Pont's Mylar), reinforce it to make the balloon capable of lifting a 7-ton instrument payload. A foot-wide section of the reinforced film is said to be able to support a 1000-lb. load. Fabricating the balloon will require that some 37 miles of seams be sealed with a thermoplastic adhesive.

The balloon will be constructed by G.T. Schjeldahl Co., Northfield, Minn., under a \$400,000 NASA contract. It will be sent aloft by the U.S. Air Force in New Mexico next fall, and will supply a stable support for cosmic ray detection equipment and monitoring devices at a constant altitude of approximately 20 miles.

Pocket-sized tent

Folding your tent and stealing away in the night is a simple maneuver with a new one-man shelter that uses no poles, stakes or ropes. Called Inflat-A-Tent, the all-film tent has sealed-off sections that form supporting ribs when inflated by mouth. It weighs 28 oz., forms a shelter 7 ft.-long and 40 in. wide with a full floor. Deflated, it is easily rolled up and stowed. Produced by Ute Mountain Corp., Englewood, Colo., to retail at \$9.95, the tent is heat-sealed with film made of Union Carbide's high-impact copolymer resin, DQDA-1824.

New honeycomb construction panels

A new RP sandwich panel for curtain walls and other interior and exterior applications is produced with a choice of paper or aluminum honeycombs. Called Glamoursdale Unicomb by its producer, Dimensional Plastics Corp., Hialeah, Fla., the lightweight panels are 5/8 in. thick, with both surfaces simulating cleft slate.

Standard sheet size for the panels is 4 by 10 ft. They are available in a variety of colors and veining.

Prefabricated plumbing wall. A conceptual "wet plumbing wall" of modular design (John A. Stahl, B. F. Goodrich Chemical Co.) incorporates rigid PVC piping, rigid urethane foam, glass/polyester faces, rigid and flexible PVC extrusions, and vinyl-jacketed electrical wiring. Fundamental is the concept that all plumbing connections are made into the pipe-bearing wall.

The likelihood of an anti-air-pollution ban on lead additives in gasoline at some time in the 1970's could drastically affect the demand for and the supply and price of propylene, an important feedstock for making polypropylene and a variety of other plastics. The additional propylene would be required in gasoline to replace lead additives.

Acrylics: new look for church windows

Panels of colored acrylic make up translucent chancel window in Denver church. Circles are 10 ft. in diameter, window is 50 ft. high. Acrylic skylight admits daylight to altar area.

Urethane foam is sprayed onto cloth 'tents' draped over inflated weather balloons. Openings for windows and skylights are cut with hand saw. Walls are 2 to 4 in. thick

Kerodex Barrier Cream

I have been using Kerodex Barrier Creams by Ayerst Laboratories, Inc., New York, N. Y., for years with excellent results. These creams are applied to the hands before you start working with irritating chemicals. I find them especially useful when working with paints and concrete. With paints the solvents don't hurt my hands and paint does not stick to them as much as it does without. With concrete I can work the concrete with my bare hands (being less than expert with trowels) without having the skin dry out and shrink.

They are also supposed to be very good for protection when working with resins or liquid plastics. I've never used them for these substances. I have used them when working fiberglass insulation with good results. Also have pulled poison oak with only the cream as protection.

Comes in two types: No. 51 for dry work; if you get it wet you must reapply at once. No. 71 for wet work like concrete.

Available in most drugstores here. There is a complete list of things it protects against included in the box.

(continued)

Welding Craft Practice

If you have access to either a gas or an electric unit then all you need is the correlated volume of Welding Craft Practice and a lot of patience (whilst your hands learn what your ole brain says they should be doing) to begin transmitting the base metals. These books give a complete description of the equipment used in oxy- and arc welding plus a detailed accounting of the methodology from lighting the blowpipe to testing the strength of the finished weld. The potentially dangerous situations in storing transporting and welding with gas under pressure, and the precautions necessary for using electric arc are outlined in clear competent british prose. If you're going to learn welding on your own read the safety sections of the book first and return to them so that your safety consciousness is well programed before picking up the striker.

The Art of Blacksmithing

A warm book that makes me want to learn blacksmithing. Bealer presents the history and methods of smithing in a fashion very useful to a person learning the trade. An excellent coverage of tools, most to be made by the smith himself. Bealer collected this material from many old smiths and then tried it himself in his own forge.

LIGHTING UP BLOWPIPE

Turn on both gas supplies and set correct pressures as before. Slowly open acetylene control on blowpipe until it is purged of air and acetylene is issuing freely (note and remember the pungent smell of the gas), and light at the tip of the nozzle using a spark lighter. The resultant diffused, luminous, but sooty flame is pure acetylene burning in air. Turn up the fuel gas supply until the smoke vanishes from the tail of the flame and the nozzle is now working at its normal capacity with a suitable gas velocity. The flame now, although cleaner, is still of a relatively low temperature. Open the blowpipe oxygen-control valve slowly and note the change in the character of the flame as the oxygen is introduced. The body of the flame turns blue with the formation of a hazy white zone which decreases in size with the development of a small greenish-white cone at the end of the nozzle. Continue increasing the supply of oxygen until the white "feather" of excess acetylene just disappears, leaving a clearly defined inner cone. This is a correctly adjusted neutral flame consuming equal quantities of acetylene and oxygen from the welding gas supplies and a further amount of oxygen from the atmosphere.

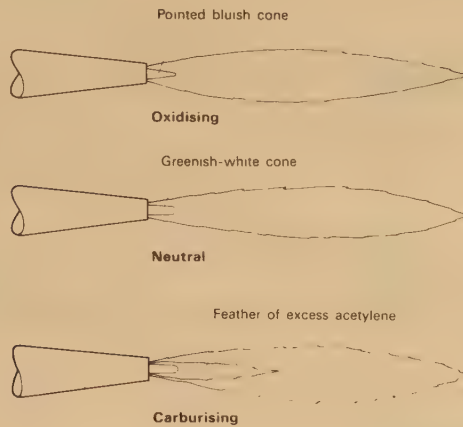

FIG. I.18. Types of flame.

Wright Winch

In March 1970 \$1 Cat. (p. 16) Jimmie Silverthorne Suggested a cable winch for getting unstuck. ABSOLUTELY!! and I recommend the "Wright Type 'R' Pull-a-way, Model 2 B" at about \$35. Over seven years, mine has loaded nearly all the timbers to frame a two-storey house with oak, hauled both my VW Van and 1/2-ton pick-up from ditches, bogs, brooks, muddy fields, snow-banks and the ocean, (all would have been call-a-tow-truck jobs without it), removed and installed numerous VW and detroit engines, loaded and unloaded heavy shop machinery, and done many dozens of other useful things for me. Its beginning to show a little wear now, but not too much.

Its cast Aluminum and so light enough to pack into the woods, as well as rust-proof. Works covered w/ snow without binding up, and all moving parts can be worked w/ mittens on so you dont get frozen to it when, say... you want to release it. One minor short-coming: The release-pawl spring wears out at about one every two years. Order two or three spares of Part No. R043. Spring, at about 35¢ ea. at the same time you order the winch.

Its made by WRIGHT HOIST DIVISION, American Chain & Cable Co. Offices in York, Pa. Also Atlanta, Chicago, Denver, Detroit, Los Angeles, N.Y., Phila, Pittsburgh, S. Francisco, & Bridgeport, Conn.

Far superior to all other makes I've used, which is about five.

STRIKING THE ARC

Select a 10-gauge electrode for your first practice at striking the arc. Set the current regulator to 117 amperes. For material use 3x3/8" mild steel flat bar approximately 7 in. long (flat bar is more suitable than plate because it is much easier to cut, either with shears or power saw). Next, direct the tip of the electrode towards the practice plate. Do this a number of times with the current switched off. When the electrode touches the material, quickly draw away to about 1/8" from the surface. Do not worry about the correct angle of electrode at this stage. When this exercise has been practised a number of times and one has the "feel" of the electrode, switch the current on and practice striking the arc. Remember to keep the welding screen in front of your eyes and, when the electrode touches the plate, very slightly scratch the surface. When the arc burns quickly draw away to approximately 1/8". The arc will still continue to burn if the electrode is 1 in. or more away from the surface of the plate but the arc must be kept short in order to control the deposition of the weld metal.

Should the electrode "stick" to the plate, do not snatch and twist to try and free it as this will only result in the piece of flat bar being lifted from the bench still attached to the end of the electrode. The correct procedure is as follows: keeping the screen in front of the face, switch off the welding set at the switch fuse, which should be located on the wall of the welding bay. Then give the electrode holder a sharp twist, which will free the electrode from the plate. The electrode and the plate may be hot, so exercise caution if attempting to touch either of them. Before continuing after the electrode has been freed, inspect it to ensure that the coating at the tip is not damaged, as in most cases the coating will be broken. The arc is very difficult to strike with a bare wire and a fresh electrode should be taken if damage has occurred.

FIG. II.9. Electrode angle arc length.

Yankee Winch

Well,

I'm finally writing a letter to an institution (that is to say something that is not a friend or one of the relatives at Christmas.)

I'd like to tell you about a thing I just got. It's called a Yankee Winch. It is manufactured by Yankee Mechanics Inc. in Newport, N.H. They cost for the large one \$150. It is a hand operated winch that is rated a 1-1/2 tons. The tests on it done by some laboratory in N.Y. showed the winch could lift 8,500 lbs without damage to the unit. A lot of other really impressive stuff.

Winch comes with 60 ft of cable.

I don't know how the company is as to catalogs or service because the owner of the company is a friend of the family. His name is Bill Ruger, is the owner also of Sturm Ruger & Co. Inc, a firearms manufacturer. Anyone who knows about these guns know that they are built with quality.

I'm a C.O. so not too big on them still the man believes in quality in his products so I'm sure that the company is as top notch as his winch.

Hope I've helped you fuckin long hairs.

Zip McCann
Putney, Vermont

Generally, I have tried to describe and illustrate only the fundamental techniques of the trade, and show how these techniques were used on a few familiar items. I hope that others may find my material interesting enough to acquire the tools of the smith and actually practice his techniques to the point that some of the ancient techniques and tools will be rediscovered for the benefit of modern man. If the ancient aurochs can be reconstituted through selective breeding of modern domestic cattle, it seems possible that the ancient smith may be waiting within a few modern men.

\$289.00

Lesto Orbital Action Jig Saw

Expensive but worth it. Follows a scribed line as accurately as a jig saw, cutting "smooth as a baby's ass" with no jumping around. Uniquely, it also can cut as rough and fast as a sabre or bayonet saw, humming through the toughest wood (up to 2-3/8" thick), soft steel (up to 1/4"), and a remarkable assortment of other stuff. It does this without any change in speed or power, changing only the kind and nature of the cutting stroke. Its hard to explain how this works, but it does. The fastest cuts are done with the easily adjustable orbital movement set for full swing, similar to the sort of rocking motion you use with a large hand saw for rough cuts. The minimal swing is like the motion used in cutting thin stock or accurate cuts. Almost 40 different blades are available, saw types as well as knife and rasp types, fitting it for reinforced plastics, laminated fabrics, soft rubber, asbestos cement, wood-metal laminations, and the usual and unusual metals and woods. Should be perfect for dome freaks. Lighter and more compact than ordinary sabre saws, it also can be used for hours without your arm feeling like it was dropped in a mixmaster and without your ears stuffed with cotton.

This Swiss goodie is hard to find since it is distributed as an "industrial power tool" through specialized distributors who service factories and wholesale hardware stores who sell to the construction industry. . . 20% off "Industrial Net [List] prices" is usual from the latter if you insist. While most of the so called "industrial power tools" may be irrelevant to our uses (e.g., demolition hammers), it is disturbing to find some of the best tools, designed for long trouble free use and low operator fatigue, being available only to those "in the trade." Perhaps other CATALOG readers know of similar small "industrial" tools that should be better known.

Fred says—

Buy "Vise-Grip" brand. None of the other similar locking plier wrenches are as good. The other sizes of Vise-Grips are just as good as the Jr.

"Vise-Grip" is like "Channellock". Brand name, not a generic term. Both better than others.

Loctite Technology

Mechanics, especially those working on old, frapped-out machinery, will dig Loctite. Anything threaded will stay together and not vibrate loose if you use the stuff. This is God's gift to the motorcycle fixer. The same company also makes a glop that you can use to make gaskets with right on the part; and for those engaged in putting new bearings in VW transmissions, they make a bearing seating compound that enables you to use wobbly old transmission cases instead of throwing them away. It works.

[Suggested and reviewed by Jay Baldwin]

Loctite Technology Catalog from:
Loctite Corporation
North Mountain Road

Cheaper Than Loctite

On page 48 of Fall 69 four dollar catalog a review of Loctite products. Being a professional motorcycle mechanic for six years, I'd like to suggest a cheaper alternative to keeping nuts & bolts from falling off. 3M weather stripping cement. Whereas if Loctite primer is not used first, Loctite won't stick. Every trace of oil and dirt has to be removed. 3M can be used as a gasket, if flowed onto the gasket surface and allowed to set up first (but not recommended—only in emergency) and as a cement to keep loose handlebar grips from falling off etc. etc. The one drawback to using 3M on nuts & bolts is the yellow color. If looks not important 3M easy and cheap. Loctite products very good, but expensive, especially for home repair, and must be used carefully—with primer every time.

Dick Tetz
San Francisco, CA.

Go-Jo NO-LOK

The counterpart to Loctite. Anyone who has ever put a machine back together in imminent fear that the garped-up old threads are going to jam & that he's then going to twist the head off a bolt, or anyone who has ever had to apply lots of Liquid Wrench & swearing to get a bolt off will dig it. You put it on the threads of a bolt and that bolt just slips in and won't ever lock up. I was amazed the first time I used it; makes bolts feel like brand-new. I'm not sure if it makes things more prone to coming loose from vibration — in motorcycle applications it may be best to use lockwashers or safety wire.

Price varies; my father paid 95¢ for a little can; I paid \$2.00 for a really big one. Best obtained through auto parts supply houses. A little hard to find; in some places contacting jobbers or distributors may be necessary.

Bill Houghton
Fairfax, CA

Another brand is Never-Seez.—Fred.

Cutawl

Peace. . .
I wish to recommend a tool: the Cutawl, model K-11, from The Cutawl Corporation, Bethel, Connecticut 06801.

The company calls it "a high-speed, portable precision cutting machine for all types of sheet materials". It is sort of a "super sabre saw", but instead of rotating the whole tool with the Cutawl you rotate the blade only with a large thumb knob. It uses over a dozen different blades some of which are saws, some chisels, some knives.

It is used mainly in the display, theater and sign trades for cutting such things as large letters, outlines of drawings, valances, etc. from materials like homosote, foamcor, plywood, and plexiglas. It will also cut other things like asbestos, leather, linoleum, cloth (2-1/2" thickness of wool), paper, cork, thin metals (up to 30 gauge carbon steel). The manual lists over 100 materials.

A circle cutting attachment is available (about \$13) with which you can cut perfect circles from 3/4" to 48".

The Cutawl is expensive (\$225 plus \$3 postage) but with even minimal care it will last for years. There are some still in daily use after 30 years. Also, if you contact one of the service centers you might be able to pick up a reconditioned one. (I understand the Model 10 would go for about \$135.)

I plan to build my house next summer and will use a Cutawl for forming molds and jigs for the casting. It is a great tool and I love mine. Peace. . .

Keith Richards
Philadelphia, Pa.

The place is in City Girl's name I didn't understand how that could be with Eddie dead although I'm rested and feel better and it's clearer now than it was We found the apartment and I called my sister and asked her to send me fifteen dollars and she said fine that Uncle Emmitt was sick at the homeplace and might not live that she had plenty of room and for me to come on And then out of my past box comes us going down that long hallway in the funeral home crawling out of my past box over toward the future like some future corridor we'll all walk down some day And then Eddie's place and these same people being hypnotized and City Girl is there in my past box presiding and she says Eddie was shot dead in an alley not far from the bus station Stay away from bus stations Death lurks in bus stations posing as the candy man Ask the people who've been killed there they'll tell you ask Eddie Ah the mystery of it all the questions gone unanswered Where is Eddie's spirit now What's happening in his body Lying there in its high school graduation suit hands all folded a stupid rose in his lapel and dust upon his rose and half a haircut on his head Goddamn Momma give him a crewcut rather than half of nothing Why did you go halfway He's dead You want him back as your baby boy Why didn't you take him Why didn't you go through with it Give him the full cosmetic treatment and be satisfied Eddie would have dug that He wouldn't have given a shit Eddie dug you Momma And I did too and still do and it's very sad to see you standing here so sad like this weeping over the body of your darling baby boy shot down in an alley I stayed at your house Do you remember me Stayed there with Eddie four days one time fighting hepatitis Eddie's old man couldn't dig it He disappeared into the news and let us swirl around him like a wind But you Momma You were all right You were Eddie's Mom

Eddie's Mom recognized me at the funeral parlor But she wasn't glad to see me because of Eddie's hair Goddamn Momma if you wanted it short you should have had it cut full short You should have given that boy a crewcut like you wanted You're the one who's living now You should have pleased yourself before anybody else How long has it been since you pleased yourself Since anybody pleased you You tried to half please yourself and half please Eddie and now nobody's pleased but it's not too late to do something about it.

I swarm out of my future box with a foot-long pair of scissors right into that funeral parlor to open Eddie's box His last and past and present future box And give him a good short haircut like his Momma wants Let's do it Momma it's not too late Right there it sits Right there it is What's left of Eddie's in that box and we could do it if we tried Eddie's mother says what are you doing now I say working at the Save-More Store Oh Do you live in St. Louis now I say yes mam for a little while anyway I sure am sorry about Eddie And she cries some more and City Girl says Eddie had been shot dead in an alley not far from the Greyhound bus station and all I could think to do all I could think to do was go out was go out and get a job and work four hours at the Save-More Store and buy fifteen pieces of Kentucky Fried Chicken with my earnings.

Snap-On Tools

Outstanding very expensive mechanics tools. If you're professional they're worth it. Otherwise no. Check yellow pages, call, and they'll send delivery truck of samples.

Hardware Products Springs

Hardware Products two-page catalog of springs contains more useful data than a dozen handbooks. It lists actual, stock springs of varying wire diameters, outside diameters, and lengths, with spring rate (the increase in pressure per inch of squeeze or extension) and the price per spring, postpaid! The charts make it easy to select the right size spring, compression or extension, for whatever job you have.

CATALOGS

a bunch of catalogs for catalog's sake. people learn from catalogs. if there was only one way to do a thing, then there wouldn't be any reason to choose between this and that; catalogs are wishbooks, where you can match what you want with what you need; catalogs are dictionaries where you can learn the vocabulary, talk shop.

-jd

Grainger's

Motors and fans primarily. Plus melange of other industrial and home tools. Branches all over U.S. Wholesale only; you better have letterhead and/or resale number.

GOV'T SURPLUS

[All reviews by Alan Kalker]

GOVERNMENT SURPLUS FOR NON-PROFIT GROUPS
There is, in theory, a very special deal for local government and private non-profit educational groups. You may qualify if your shell has been labeled a non-profit corporation or foundation even though your purpose is not solely educational, e.g., a church. GSA and DOD popperity is available through special direct and State administered programs. It will take several weeks to qualify for these programs, but don't stop there; also get your name on the regular lists open to all. In one part of the special program the Government donates the stuff free to a State agency that administers its distribution. The State agency then sells it to the qualified non-profit group for what it costs them to handle it.

Outside - Used - Poor Condition
Total cost \$1000
Est. total wt. 1750 lbs. 1 EACH

DEFENSE SURPLUS Much of the surplus you see in your neighborhood Army and Navy store may have come from a nearby Department of Defense retail store where you can buy small quantities from Uncle exactly as the store owner did. While intended to be open to all, the retail stores are becoming more difficult to find and visit. Your neighborhood store owner probably will not help. Many Defense Surplus Sales Offices (a list of these come when you request a Department of Defense Surplus Bidder application [below]) have retail stores, but they may not know of retail stores in nearby Defense installations. There seems to be no central list. You can try asking for "surplus property disposal officer" at all local large Army, Air Force, etc. bases. If you get someone, ask the day and time the retail store is open as well as the building number. Competitive bid bulk lot sales are basically simple once you get into them, but none of the information the Government sends you will allow you to believe a non professional can figure it out. "Sale by Reference," a Department of Defense term for non retail sales, includes methods no more esoteric than an auction. The only way to find out easily about these non retail sales is to put your name on the DOD mailing list for sale announcements. For the DOD there is one central address for the continental United States. You must ask specifically if you also want announcements of sales in Alaska, Morocco, etc. In exchange for your name and address to the below central office, you will get a bidder's application form asking which kinds of things you are interested in purchasing and which geographic regions you will purchase from. Check every type of thing you conceivably may need, since adding another category will take at least six weeks. Check at least two nearby geographic regions, and all geographical regions if you are interested in vehicles, boats, regions, aircraft. When your "bidder's application" is returned you will receive a pamphlet entitled "Sale by Reference" containing page after page of impenetrable small print, **DO NOT CHUCK IT OUT**, save it for yea shall need it. Also, save the sale catalogs for "sealed bid" sales for about 6 months. Get in the habit of looking at the mailing label on your sales announcements. Every two months or so the numeral 2 will appear in the middle of the first line, and you must send back a post card saying you are still interested in receiving the announcements. If you forget, it will again take at least six weeks to get back on the mailing list.

Department of Defense Surplus Sales
P.O. Box 1870
Battle Creek, Michigan 49016

this is a page or so of alan kalker's research on the paperwork necessary to get ahold of those fifty dollar jeeps we've all wetdreamed for so long. individuals can indeed buy things at the same price that straight-shooting ralph pays to stock them in his aceycuey bargaincenter armory and good deal warehouse surplus outlet. read carefully, follow alan's steps, because it has to be done correctly to work.

-jd

The following pamphlet is a bit sketchy, but it seems to be the only general guide around. It will at least give you current addresses for fuller information on special problems.

Total cost \$6450
Est. total wt. 9000 lbs. 1 EACH

DEFENSE SURPLUS BID ABSTRACTS The most formidable DOD sale by reference technique is the "sealed bid." You must mail a written offer in before a certain date, but unlike an auction you will have no idea of what others have bid since all bids are unsealed simultaneously. There is a commercial service that can at least give you a starting point. Suppose you see an announcement for a sealed bid sale for 600 lbs of assorted rotary, toggle, and sensitive electrical switches, unused, excellent condition, that cost the government about \$9,000; what would you bid? If you had been keeping the last six months of DOD sealed bid catalogs, you could find similar items in a past sale. Then write Bidder's Service Company for an abstract, which you will receive by airmail, and find the winning bids. In the example: \$56.79 for the whole lot. Interested in a bus? 29 passenger buses in fair condition go for \$590 (1957) Chev to \$690 (1961 Ford); 1961 Dodge 37 passenger models in poor condition fetch \$378-455. While the Kelley Blue Book might be some help in the case of vehicles, the abstracts indicate what the pro dealers will bid for all of a similar model. The abstracts now give not only what every bidder offered on every item in a particular sale catalog, but the name and address of each bidder, so you can pick out the pro's. In addition you might want to contact the successful bidder to buy part of a lot. With the abstract you will know exactly what he paid for it.

GSA (CIVILIAN) SURPLUS The General Services Administration has charge of getting rid of all government junk now owned by the Department of Defense. They sell an incredible variety of stuff. Not only old Post Office vans, but also Forest Ranger's old horses, and kilns from closed Job Corps Centers. GSA tends to be more diffuse than DOD. Except for vehicles, sale items are often scattered about in remote locations, a procedure that dissuades the professional surplus buyer. GSA does not seem to have any retail stores, but is experimenting with fixed price sales of Post Office motor scooters. GSA puts a price between \$37.50 and \$175.00 on the scooters depending on their condition. After an inspection period of about a week, the doors fly open at 9:00 am on a specified day and it's first come first served. Remnants are offered following days until sold. Since the 1/2 ton walk-in Post Office vans currently go for from \$120 to \$180 at GSA spot bid sales, it is difficult to know why anyone would want the scooters. Particularly when scooters in operable condition are often set at more than \$100.00. The walk-in vans have 110 cubic feet enclosed bodies and with some thought could almost be a camper. Spot bid sales are the favored method of GSA sale. While bids are submitted in writing like a sealed bid sale, they are opened item by item in your presence and the winner announced as in an auction. When, for example, 10 identical vans are sold, you will know the winning bid on the first before you must submit your written bid for the second. There is no single central office for GSA sales information. You must request each geographical regional office to put you on the list.

REINCARNATION

One by one, the people at the funeral sat up and rubbed their eyes. The hypnotism program was only half an hour long, but everybody had the feeling that two or three hours had gone by. The TV sets were off now. The cool, blank tubes were as much a surprise to whoever had turned them off as they were to any of the other mourners at the funeral.

"Who turned the TV's off?" asked Winston.

"I don't even remember them going off," said Norton.

"I think you turned them off," said Norton's rival, Bart.

"No, man," said Norton. "I don't know who turned them off."

"We have a mystery in our midst," said City Girl.

For a little while the room was quiet, except for the sound Estelle made as she flipped the pages of a book on Etruscan art. "M...m...maybe it was Eddie's g-g-ghost," D.R. stammered.

Everybody in the room except Estelle turned to look at Divine Right. It was the first time he had spoken since the night before. His silence had become such a fixture in the room it was as if a piece of furniture had been moved out when he spoke.

"I can dig that," said Chuck.

"I can dig reincarnation," said Winston. "But I don't believe in ghosts."

"It's all the same shit," said Reed.

"No it isn't," said Gilded Lilly. "Reincarnation is an established fact."

"I had a dream once about reincarnation," said The Native.

"I dreamed I was a lizard in a previous life."

Friendly Persuasion asked The Native what that had felt like.

"It was pretty weird. I mean, I liked it. I liked crawling around that close to the ground. I liked the point of view. When I die, I hope I'm a lizard the next time around."

Bert shook his head. "It don't work that way," he said.

"You're never the same thing twice."

"Bullshit," said Norton. "Sometimes you're the same thing three or four times in a row."

Bert started to argue with Norton. But as he was about to speak, his energy suddenly failed him. Arguing with Norton about reincarnation just didn't seem worth the trouble right then, so he kept quiet. For a while everybody kept quiet. Finally City Girl got up and went to the kitchen. For a moment it seemed as if her departure might produce some kind of conversation. But it didn't. Ten or fifteen minutes went by. The only sounds in the whole apartment were Estelle shuffling pages and City Girl clinking dishes in the kitchen.

Silvo Hardware

Tools tools tools tools. Brand names. Mostly good stuff. Several quality levels on almost all items. If you know what you want, it is probably here. Prices good, sometimes not as good as U. S. General. I have been pleased by their service on returned items. Takes about two and a half weeks to West Coast. Minimum order \$10.00. Silvo is a place you can go to. U.S. General is not.

U. S. General Supply Corp.

Again tools, tools, tools. Brand names, catalog number is the manufacturer's model number. More junk than Silvo, and I think they sell their mailing list. At least I get lots of junk mail that I trace to them. Prices sometimes better than Silvo, service somewhat worse. Good to compare the two, as they have different prices and different things. \$20.00 minimum order. Net costs are coded into the item number. Divide the numbers following "E" by two. Audel books are 15-25% cheaper than publisher prices.

Palley's

There are many so-called "surplus" stores, most with some sort of specialty. They usually have started as war surplus, but now include all manner of industrial surplus, some of which is surplus for good reason. Some stores also carry cheap shoddy junk and "seconds" that are not at all bargains. Shopping for surplus can be tricky, but if you know what you are doing you can often do very well. It is helpful to know something about the merchandise in question and what it would cost at a straight supplier. It is better to shop in person rather than by mail because some examples are in better condition than others, and the catalog descriptions are often incomplete. It is also easier to haggle. You should keep in mind that there may be repair parts problems with surplus machines, and that it is unwise to depend upon a certain item being always available. Some otherwise succulent tidbits may turn out to work only on 27 volts DC; a bummer. Keep in mind that the "it may not be here tomorrow" feeling in a surplus store can hypnotically lead the unwary to bringing home a bunch of junk that "may come in handy later". Ingenious persons can often work wonders with aerospace stuff.

Palley's is known as the largest surplus house in the country. The most recent catalog lists mostly industrial surplus. Pumps, generator sets, storage tanks, fans, switches, power tools, vehicle winches, and gasoline engine powered carpenter saws and drills are among the items useful to the commune. They can get you specific stuff, and will haggle quantity prices.

"GREAT LAKES" AIR COMPRESSOR

Reciprocating power driven air compressor... 2 stage. Horizontal design. Puts out 2.3 CFM at 85 PSI. Operates on 27 volts DC, 8.7 amps and rated at 1/6 HP. Complete with 4000 RPM Delco motor. Overall size 11" x 5-1/2" x 4-1/2". Motor No. A9354, compressor 100-627-2.

AC-4

\$19.88

Surplus Center Equipment Catalogs

Not only are these catalogs handy to the man who may need such parts, but they can also serve as idea-generators for solving certain mechanical problems—thumb through the pages. Some of the parts are better hunted locally where you can see, try, discuss with salesmen and haggle. Some are rare and good deals. Best suited to the mechanically hip, especially away from big city sources. All "surplus" is risky stuff unless you're familiar with it.

Complete common battery dial telephone with hang-up handset enclosed in a cast steel case with cast steel door to provide complete, weatherproof protection. Heavy spring latch holds door closed securely and prevents wind or vibration from swinging it open.

• Phones are complete with brackets for mounting on wall or pole. Equipped with 3/8" pipe thread openings for conduit connection. Size 12" x 9" x 7". Shipping weight 27 lbs. (Available with or without lock and key on door.)

Airborne Sales

Airborne Sales Company is not the usual surplus melange. Emphasis seems to be on electrical, electronic, pneumatic, hydraulic and mechanical systems and attendant parts and pieces. Their stock includes both new and used, marine specialties, tool room items and "hard-to-find" things and stuff. Pumps and motors for a variety of applications and power sources are available. Tired of your smog producer? Develop your own electric car with motor No. 1893 (their 1965 catalog), a \$259 Westinghouse product for \$29.75. Gauges, tools and fittings are available for much of the pneumatic, electronic, hydraulic and mechanical systems common to aeronautic and space programs.

TRIPS WITH EDDIE

Again it was Divine Right who broke the silence.

"The first t...time I ever had acid was in the G.G..Grand C.C..Canyon, with Eddie," he stuttered. "We were d..d.driving from L.A. to Shockey's p..p.place in Taos and stopped off at the C.C..Canyon and Eddie said let's go down in the fucker and drop acid. We called it our G.G..Grand Canyon trip. About every half hour Eddie'd say, what k..k.kind of canyon trip you having, D.R.? And I'd say g..g.grand, man, g..g.grand."

Friendly Persuasion was rummaging in her bag for a cigarette. Without looking up, she asked D.R. what was grand about it.

D.R. had to think about that. If his tongue had been healthy it would have been easy to rattle off a whole monologue about the Grand Canyon acid trip with Eddie. But his tongue was not healthy. D.R. had his voice back now, but he had to be careful with it. He had to conserve his words, spend them carefully, or else stuttering would take him over completely and reduce his words to mere babble again.

Speaking very slowly, looking at Friendly Persuasion, who had stopped fishing in her handbag while he answered, D.R. said, "Because we were t..t.ten million years d..d.deep in the earth, by that r...river."

Friendly Persuasion looked thoughtful a minute. Then she said, "Anybody got a cigarette?"

"I've got some, wait a minute." City Girl called from the kitchen. And she came into the living room carrying a tray loaded with cups and milk and honey to put in tea. She set the tray on the floor in the middle of the room, and went back to the kitchen to get the teapot. Before she sat down she got a package of cigarettes off a shelf behind the TV sets. As she settled cross-legged on the floor by the tray, Blue Ox got a clear look up her dress at her pubic hair.

**HAND SABRE SAW GETS IN
WHERE OTHERS CAN'T**

Exceptionally handy miniature sabre saw solves many problems in model making, pattern making, jewelry work, other small-scale projects. Cuts straight or curved.

Usefully shaped Swedish steel blade is .018" thick, has 26 properly set teeth per inch. Extends 1 1/4" from holder. Cuts wood, plastics and soft metals including aluminum, copper, brass, etc.

Comfortable hardwood handle. About 7" long over all. Complete with two blades.

- T-1685 Sabre saw & 2 blades \$1.05
- Three & up Each 90¢
- T-1686 Spare blade Each 30¢
- Per 6 blades Each 20¢

PATTERN TRACER IS TIME SAVER

Pattern tracer or "pounce wheel" is for transferring paper drawing or other design or pattern onto work. Just draw tool along lines. Toothed wheel makes series of tiny perforations thru pattern, resulting in easy-to-see series of tiny dots in workpiece. Eliminates layout errors. Dots don't smudge or rub off to cause mistakes.

Used by dressmakers, tailors, artists, model makers, sign painters, designers, many others.

Modelers: Wheel marks on wood, cardboard, foil, etc. resemble row of miniature rivets.

1/4" diam. free-turning steel wheel. 21 teeth per inch, for finest work. Swivels for caster action to follow intricate curves. Locks for straight work. About 5" long over all. Brushed aluminum handle 5/16" diam.

- S-1394 Pounce wheel & handle \$1.75
- Three & up Each \$1.55

STRIP-STRAP DOES 1000 JOBS

Handiest steel strapping made. Can be bent, curved, twisted, shaped to meet any need. Clever locking tabs make it self-securing. Or you can nail it, bolt it, screw it or even solder it.

Makes clips, clamps, hangers, brackets, reinforcements, in a flash. Cut it with scissors!

Soft steel, 3/4" wide x 0.017" thick x 7 ft. long. Zinc plated against rust.

- T-1684 Coil of STRIP-STRAP 60¢
- Three coils & up Each 50¢

**STAINLESS STEEL PLIERS OF SURGICAL
INSTRUMENT QUALITY**

True surgical instrument quality. Forged of AISI 420 surgical stainless steel, heat treated to Rockwell C50-55 hardness for maximum toughness. Beautifully mirror polished all over.

Box joint for permanent jaw alignment. Finely serrated jaws for firm grip. Special grooves in jaws hold washers, other objects, edgewise without slippage.

Jaws taper to fine points about 1/16" wide for finest miniature tasks. So precisely fitted that they'll grip a single hair.

- T-1666 Stainless steel pliers, 6 1/4" \$6.95
- Three & up Each \$6.35

**NOW, WIND YOUR
OWN SPRINGS**

Here's a simple tool of unusual versatility. Winds extension, compression, torsion springs. Any diameter, length or pitch. Any gage of spring wire up to about 1/8" dia. Use round, flat or square wire.

Use it with a vise or lathe or drill press. Complete instructions included. (Spring wire is available at most large hardware stores.)

About 4 3/4" long. Entirely of iron and steel.

- R-1694 Spring winder \$5.50
- Three & up Each \$4.95

CYANIDE

A very efficient cleaner for movements as well as jewelry. Kept in sealed, friction top cans.

SODIUM CYANIDE (EGGS)

One egg in one quart of water makes an effective cleaning solution.

CL-520 — 1 Lb. Can Ea. \$1.50

POTASSIUM CYANIDE (GRANULAR)

Used for the same purpose as Sodium Cyanide but stronger and quicker acting.

CL-525 — 1 Lb. Can Ea. \$2.35

JTK-2

This kit is the result of careful research and consultation with tool engineers. It was originally developed to meet the needs of large electronic-assembly plants employing many technicians, engineers, and scientists. It contains all of the tools necessary to accomplish 99% of the jobs, yet it is priced below the individual cost of the tools it contains. There is no sacrifice of quality—only the tools of well-known, preferred manufacturers (mostly American) are included. The tools are furnished in a steel, hammerlock finish tool box with catch and padlock eye.

\$44.50

SWIVEL BENCH VISE

Swivel base permits jaws to be swung to any angle and locked in place. Jaws are polished and milled for close fitting. Twin guide rods assure parallel action. Body has a small anvil and has been enameled to prevent rust. Clamping device will fit on bench up to 2" thick.

No.	Jaw Dimensions	Each
	Opening Width	
48-464	2 1/4" 2 1/2"	\$9.85

How to Borrow Tools and Keep Friendship

If a man can trust you with his tools, there isn't a hell of a lot more he has to know about you. How trust is made:

When you borrow the tool, have him check you out on it, even if you know it cold. That'll encourage him and insure you.

Agree on a time it will be returned by. Return it by then.

Return it either to his hand or to the exact place you picked it up from.

Use it carefully. If you break it, replace it immediately, preferably with a better one.

When you're finished, service it. Sharpen it, oil it, fuel it, fix it. If his tool comes back improved, he'll let you have anything he's got.

If you make him loan you something out of guilt, you'll be sorry.

Gerstner Tool Chests

If you enjoy reading this catalog you are probably the kind of person that is seized by an irresistible urge to open all those beautifully fitted little drawers in antique cabinets. You can satisfy the urge in your own home thanks to H. Gerstner & Sons, Inc.

They make superb wood cases that will hold small interesting things of almost any size and shape: machinist's chests, medical instrument cases, boxes for artists, photographers, dental hygienists, and so on, ad infinitum. The thing that sets Gerstner apart from their competitors is their concern with quality. You can buy a box from them that will stand with perfect aplomb on your Chippendale end table. Their cases are made of polished quartersawed oak, American black walnut, or can be covered with black leather or vinyl. Prices range from \$27 to \$85, and one look will convince you that their products are a rare bargain in an injection-molded age. Their service is personal and quick; illustrated literature is available. You can get factory seconds at reduced prices, too.

日本指物師処

The Japan Woodworker
fine quality woodworking tools from Japan

We have personally traveled to Japan to select Quality tools. These tools come from Miki city in the Kansai area of central Japan. Miki city toolmakers have made tools for Japanese carpenters for over 500 years in this same area.

Japan has a long history of wood construction and the carpenters perfected their craft at a very early date in history. These carpenters raised their craft to what is considered by many today to be an art in itself. The tools they used were of the highest quality and ingenious in design. The steel used in high-quality Japanese tools is of the finest grade found anywhere. This steel is to this day hand forged and tempered by a process that was known as early as the 13th century in Japan and not equaled in Europe until the 19th Century. The characteristics of this steel is a hard, sharp edge that remains extremely sharp even after repeated use. However, these tools must be used with care and for their intended purpose as the edges are more brittle than the softer, less sharp steel used in lower-quality tools.

MK 301 Heavy duty Chisels: Sets of nine or ten chisels each, ranging in blade width from 1/8" to 2" wide. The tang is heavy duty and the sturdy oak handle has a steel ring to prevent splitting from normal pounding. These durable chisels are good for mortising and general woodwork. \$7.00

Home and Workshop Guide to Sharpening

Make a distinction. Call it the first distinction. (See p. 12.) Minds do this (mine needs sharpening, judgement dull) and blades do this. Slice: two.

This book shows how to sharpen everything, to make your distinctions fine.

Tool Chests

A note on the Gerstner tool chests. In the old days, craftsmen made their own tools and tool chests. When they went for a job, they didn't turn in a resumé, they hauled their tool chests in and the boss looked them over. On the basis of the quality of the work, he was hired or not. Tools and tool chests were very personal things.

Max Pepke
New York, N.Y.

Leather Cases

Ray Gfellow, casemaker, Polson, Montana. Mr. Gfellow makes very good leather pouches and case. Most of his equipment is designed for geologists, but he lists a number of leather pouches that can be carried on a strap over your shoulder.

His cases are the best I've seen. The leather is very heavy and everything is riveted. You just look at them to see how good they are. They just look it and feel it.

I ordered a map case which fits on my belt. It carries a foldup, pencils and rulers. After juggling everything it pack you appreciate it. His prices appear fair: \$18.00 for the case I just described.

He has a pamphlet catalogue available from him directly (but he's really slow) or Lemont Scientific, Inc., Pike St., Lemont, Pa. 16851.

Steve Schlossman
Belchertown, Mass.

Japanese Saws

Traditional Japanese saws have a variety of forms to facilitate their elegant joinery. But all cut on the pull stroke using two hands (foot holds wood). Many are double-edged, one rip and one cross-cut. They are light, thin, precise, and tireless.

To use a typical western saw after trying one of these is to induce nightmares of two-hundred pound marines hopping through rice paddies on one foot.

Can you help locate a source of Japanese tools for those who like to walk quietly through the woods?

Ken Freidus
Warren, Maine

P. S. I think there is an importer in Seattle.

Japanese Saws

I noticed one of your correspondents was looking for Japanese Saws PP50, March cat. Tell him to try Japan Artisans 15 West Ferry St., New Hope, Pa. 18938 Mrs. Cooper & Mrs. Allison are great people, & will do mail order on Unbreakable items. They are the only source I've found for saws, also for Japanese papers, etc.etc.etc. ONLY place for Tea chest paper!!!!

PS Soaking an Ax handle in water is fine for a temporary job, but when the wood dries it will shrink more, & flying Ax heads result. (A BUMMER)

Blue Ox poured himself some tea. "One time me and Eddie and Winston were stoned on peyote, out in the desert," said Blue Ox. "And the goddamn stars attacked us. You remember that, Winston?"

Winston nodded and grinned a little as he dipped a spoonful of honey into his tea.

"I mean," said Blue Ox. "I mean, like, where do you run to when the whole fucking Milky Way is after your ass, answer me that?"

"You could close your eyes," said Bert. Norton snorted. "Close your eyes. That's exactly what you'd do is close your stupid eyes."

D.R. leaned across the mattress and touched Estelle's shoulder. "You want some tea?"

Estelle shook her head and flipped another page. "One time over in Afghanistan," said Reed. Reed was wrestling with a pillow, trying to fold it so it would support him as he drank his tea.

"One time over in Afghanistan, me and Eddie had gone over there, to be big time dealers. We had four thousand dollars between us, and the plan was to score this incredible amount of hash, bring it back and sell it for a million dollars and retire from this fucking shit. So there we are fucking around goddamn Kabul, and who do we run into but this really spaced out American cat who says the best hash deal in the country is in this other town about fifty miles away. So he turns us on and shows us around a little, and tells us how to get to this other town. Of course we're all hot to go, but the thing is, his directions are pretty fucking weird. Like, I don't know how many roads there are going out of Kabul, but the one he put us on was this fucking dirt trail going north across this totally empty country. Not a house, not a road sign, not a goddamn thing except this fucking rut they call a road going north into the country out of Kabul, just me and old Eddie bouncing along in this old taxi; this other friend of Eddie's had scored somehow and left it there for us to use because he was going to be gone, some shit like that, I never did understand that car and I was too stoned at the time to care. So anyway we're on this dirt trail, bouncing along looking for this fork in the road see, and this guy who's supposed to be out there giving directions.

Use the longest screwdriver convenient for the work. More power can be applied to a long screwdriver than a short one, with less danger of its slipping out of the slot.

Hold the handle firmly in the palm of the right hand with the thumb and forefinger grasping the handle near the ferrule. With the left hand, steady the tip and keep it pressed into the slot while renewing the grip on the handle for a new turn.

If no hole is bored for the threaded part of the screw the wood is often split or the screw is twisted off. If a screw turns too hard, back it out and enlarge the hole.

A little soap on the threads of the screw makes it easier to drive.

Basic Hand Tools

A good, basic hand tool book (like the title says) and cheap. Covers machinists, wood working, and metal working tools. Use, care, and sharpening.

Notes on Simple Hand Tools

In a \$1 Catalog I saw someone give out that you should tighten the loose head of a hammer by soaking the hammer in water overnight. Later, someone corrected this, noting that the wood would again shrink, leaving the head loose and ready to fly off without warning. It was then suggested that the remedy was to use a 6-penny nail

Hand Woodworking Tools

Best book on hand woodworking tools I have seen. Detailed information on care and maintenance, including sharpness, for each tool covered. Goes into individual tools much more thoroughly than more general books like the Stanley book. Has a very clear section on transit-levels and builders' levels.

REMOVING WASTE STOCK WITH A DRAWSHAVE

How to Sharpen the Cutters on an Auger Bit

1. Select an auger bit file. A good "second cut" half round or three cornered file may also be used providing its size fits the surfaces to be reduced.
2. Rest the bit on a board with the screw down. Tilt the bit so that the cutter can be sharpened (see Fig. 10-14).
3. Apply the flat serrated side of the file to the under side of the lips, the side toward the shank. Never file the side toward the screw. Use forward strokes to produce the filing action. File well back into the throat. Do not leave the edge too blunt, the ideal to seek is a gradual taper from a keen edge.
4. Reposition the bit and file the opposite cutting edge in a like manner. Both edges should be filed to the same level to produce chips of equal thickness.

FIG. 10-14 SHARPENING A CUTTING LIP

FIG. 9-38

FIG. 9-38

with the head cut off as a wedge. NOT TRUE! I buy most of my tools used, from junk dealers. This is a good method—even with only limited experience with tools, you will find it easy to tell when most tools are merely damaged and salvageable—or destroyed beyond repair. And I have plenty of used hammers. Almost every used hammer I've ever seen has been "fixed" with a nail driven into the haft, and this is one reason why the market is flooded with used hammers. The nail ruins the handle—ruins it. And doesn't do a good job of tightening, either. If your handle is loose, it can easily be fixed by soaking the hammer in Rightose Linseed Oil. Or you can get a wedge, for chrissakes. If you can't get a wedge, make one. Just carve it out of hardwood and pound it in with a wooden mallet.

Axes. Keep them sharp. Never pound on them with anything. Never use the poll (head) as a hammer. Ruins the axe by slowly mashing it out of shape. It also sometimes causes the axehead to crack right through. You then have a loose axehead that can fly off and kill. When splitting big logs, use a wedge inserted in the split—hammer on that.

Chisels and plane irons. To test for sharpness, do not use fingertips or try to shave your forearm. Instead, draw edge of fingernail across the edge of chisel lengthwise. This sensitive but neglected instrument will communicate with you instantly if it runs across a rough edge or dull spot. Try it. Needless to say, keep all edge tools sharp at all times. Saves time and money, prevents injuries. Naturally, you will have to take some time to learn to sharpen your tools properly and quickly. Few people do. But if you do, you will never go back to dull tools again unless you feel a distinct need to punish yourself.

Screwdrivers. For driving screws only, please. Drop this book right now and run down to nearest junk dealer. Purchase from him a large (8-12") old screwdriver that has been mutilated by misuse, abuse, ignorance and stupidity. Take it home. Pass it among your kinsmen while gathered in a circle. Fondle and recognize this tool. Burn incense and repeat this mantra:

This is the tool for opening paint cans.

This is the tool for prying up planks.

This is the tool for chopping at plaster.

This is the tool for breaking down crates.

Repeat until everyone realizes that that is what the old dead screwdriver is for. Indeed, it no doubt came to be dead because it was used for just those purposes. If you use it in like way, you will contribute mightily to the longevity of many other screwdrivers. When buying good screwdrivers, here is the quickest way to spot a bad one: bad screwdrivers almost universally have skinny, grooved plastic handles with hard sharp edges on the grooves. You want a fat, generous handle at all times. Generally avoid chrome-plated screwdrivers too—cheap metal underneath.

Wrenches. Why do mechanics buy expensive assortments or dozens of one-size-only wrenches when it would be cheaper and more convenient to buy one big good happy adjustable wrench? Because they value their knuckles more than gold. Also, even the best adjustable wrench is easily maladjusted by a stray finger touch. Then it slips off, bugging the work and clobbering your knuckles. The high initial expense will eventually pay for itself by eliminating costly bandages.

Rusty tools can often be salvaged by use of Naval Jelly (trade mark). This is a gooey poison jelly that eats rust. Expensive, so try to get it by the gallon in big hardware stores for better quantity price. The worse the rust, the longer it takes, but it will eat almost any rust you feed to it. Smells, but can apparently be used in closed spaces—label doesn't say not to. Read label anyway—you'll want to know what to do if it gets somehow in your eyes and stomach. Apply it thick and puddly—if you let it dry on the rust it's almost as bad as the rust. If you don't let it dry on the work, you just rinse it off with water, presto.

Please wear goggles. Please wear face mask. Please wear work apron. Not all the time, naturally, but whenever you realize that you won't be able to see for the wood or paint chips, breathe for the dust, or survive for getting clothes caught in the sawmill. Incredible how many people maim themselves because of neglect in this area. Don't you do it. You hurt more than just yourself, you also become a burden on your community, interrupting their work as well as your own. We are all living on the edge of a precipice: it is the responsibility of each of us not to fall off—OK?

Tape measures, yardsticks and rulers can be troublesome. First off, measure everything every time, and you will significantly reduce the chances of reading 3/8" for 3/16" or some other such dumb-ass humiliating error because you will become increasingly familiar with your tool. Use only one measuring device on a job. They are not all the same, and if you construct the frame of a four-drawer dresser using a simple, six-inch machinist's rule (highly recommended by skilled cabinetmakers), and then make all the drawers with a Stanley tape measure because you lost the machinist's rule—the drawers won't fit, that's all.

Don't get casual with power tools—they are as or more dangerous than loaded firearms. After the electric drill—a true little beauty—most common is the handheld portable circular saw—usually a 7" blade, 1/3-1/4 HP motor. Capable of slicing lumber all day, capable of wreaking incredible and irrevocable carnage in a second of careless use. Basically a primitive tool, please remember that all of the sophistication of modern medicine can do little for power saw wounds except to stop the bleeding. With all power tools, great awareness is needed. You MUST be able to see, simultaneously and at all times, BOTH of your hands, the business end of the tool, the switch and the power cord, and people who may blunder into your way. A lot to cope with; extreme care and concentration recommended.

Screws go easily into even hardwoods if 1) you ream out a pilot hole with a drill bit of correct size or, preferably, a screw-mate (a screw-shaped drill bit) and 2) scrape a little soap or candle wax onto the thread of the screw.

Handsaws. Buy the best you can get. Cheap ones are shit—although they may not smell, they are stinkers to work with. Cheap or dull saws will exhaust you, and fast.

Glue is handy and effective if you read the directions. Gluing with-out applying pressure by clamps or even 3 dozen phone books is a waste of time and materials.

Cultivate old heads. Use modern technology too, but not when old methods are simpler, cheaper, better, stronger. Old heads—pipe fitters, plumbers, carpenters and the like—have often learned many things handed down to them, or discovered by themselves when they had to make do on short notice and shorter cash. (Old heads with Depression experience and prepwork tool experience, for example, are storehouses of beloved information.) Many of these old craftsmen have no one in their families who want to know about old outmoded crap like helping oneself, and will often willingly impart knowledge to you. Seek them out—you will do yourself—and them—a great service by it. Most of what I know of tools was taught to me by a grand old head, George Kelm, who took me into his workshop and helped me learn things that have since provided endless hours of usefulness and pleasure.

Planecraft

If you work with planes and enjoy woodworking, *Planecraft* is a book to read. It gets into hand planes, their uses, care, and sharpening in a depth I didn't know was possible. The book teaches methods for hand making joints I thought were practical only with machines. These methods are relatively simple and fast, but require skill.

Sharpening for Plastics. Plastics, Perspex, Formica, plywood having resin type cements and so on are notorious for their quick blunting of plane blades. Where only small amounts are to be planed, or when this type of work occurs only infrequently, the ordinary sharpening can be used, the quicker blunting of the blade being accepted as a necessary nuisance. If the work comes frequently, however, it is worth while keeping a blade specially for that work, grinding and sharpening it at a blunt angle somewhere near 80°-85°. An edge of this type will last sharp longer than a normally sharpened one. Special steels have been tried for the work but they are relatively expensive and cannot ordinarily be sharpened by the user, and hence have been ruled out. Instead of sharpening all the angle from one side, one user at least has been very successful using a blade sharpened at the normal angle, and then a grinding taken off the face side of the blade, thus making a cutting angle approximating to the one recommended above.

Fig. 28-3(b)

To the cabinet-maker, the Circular Plane is of great service in the making of circular frames and serpentine work; and to the carpenter in making circular frames for windows and doors. To the wheelwright, of course, it is indispensable.

Rent It

Dear WHOLE EARTH CATALOG:
A very important tool that I think should be mentioned are rental companies. They will rent ANYTHING, tables, saws, trucks, etc. Ask about insurance, transportation clauses, and read ALL the fine print. On some large equipment like dump trucks, cranes, you may need to hire an operator and also trailers are needed for some stuff. The type, kind, and quality vary greatly so go easy. Check your Yellow Pages or ask at the local hardware store. The companies go under names like U-Rent-It, Rent-A-Tool, U-Haul, etc.

Yours Truly,
David Smith
Mendham, N. J.

Gilliom Power Tool Kits

Gilliom is a company which sells and manufactures plans, kits and parts for power tools. They carry a 12 inch and 18 inch Band Saw, a Belt Sander, a 8" tilt table bench saw, a shaper, a 10" tilting arbor floor saw, and a combination drill press-lathe. Can buy either the plans (\$1.00) or the kit. The plans and kit make it possible to build your own power tools with Gilliom parts at a fraction of what a pre-assembled tool would cost. The metal parts are included in the kit and you can build the housings out of 3/4" plywood. The plans are simple to follow.

That was his job. He was a roadsign. Every day this guy goes to the forks of the road, and he sits there, and people coming by ask him which road to take to where ever they want to go, and this guy tells them. The government pays him and that's his job. Only when me and Eddie get there see, the guy ain't there. He's gone. We're at this crossroads out in the middle of nowhere, three roads going three different directions and the guy who's supposed to be the roadsign ain't around. We hang around all day waiting for him to show up, but he never does. It blew me out. That fucking Eddie wanted to toss a goddamn coin, or throw the Ching or something, and just take a road and see what happened. But it was too freaky for me, man. It pissed Eddie off but I couldn't help it. I mean, I was really counting on that guy being there and when he wasn't, the first thing I thought was nark. Maybe even CIA. I didn't want no part of that shit. We wound up not even buying any hash in Afghanistan, except just some to have around and smoke. It was heavy shit.

Reed sipped his tea as everybody laughed at his story. Most of the people at the funeral had heard it before, had heard Eddie tell it, in fact, and so the laughter was muted, very gentle and low-keyed. Reed lifted the teapot to refill his cup, but nothing came out.

"I'll put some more water on," said Gilded Lilly. She got to her feet and tip-toed through the people to the kitchen.

Craft

Woodcraft Supply

Some years ago, a large, dour Scot, Mr. Eaton by name, was trying to teach Boston schoolboys how to cut a clean mortise with machine-made carbon steel chisels. He couldn't, and being a Scot and stubborn, he began to import fine hand tools from across the water. He had to buy more than he needed, and he sold the surplus, reluctantly, from a dark cobwebbed shop on North Washington Street. To his surprise, he found that other craftsmen had also thrown shoddy tools through cellar windows in fits of frustration. North Washington Street has been torn up, and Mr. Eaton has passed on to the great workshop in the sky, but his company has become the Woodcraft Supply Corp., 313 Montvale Avenue, Woburn, Massachusetts 01801. It is a unique enterprise that operates contrary to the accepted principles of American business. As any hardware store owner will tell you, no one today will pay \$47.50 for a nickel-plated fitted wood case. You can buy one from Woodcraft—if you are willing to talk about it for an hour and enjoy a good cup of home-brewed tea. Have you ever had your forearm shaved as clean as a baby's with a 1-pound paring gouge? You're not likely to have the experience many other places. The same personal touch is apparent in everything handled by this unusual company. (They sell a German cabinet-maker's bench of polished red beech that is seven feet long, weighs 300 pounds, is fitted with two built-in vises, and would make most furniture companies blush with shame. \$235.) Woodcraft Supply publishes a large-format illustrated 30-page catalog full of tools that you will never see anywhere else. It costs 25 cents, and you will be a rare craftsman if you don't order something after one pass through it.

German Woodcarving Tools

Several months ago I began looking for high-quality woodcarving tools at a reasonable rate. I found that the availability of any tools was not very good (at least in Salt Lake City) and that those available were very expensive.

A German neighbor, who may be considered a Master of the Art, gave me this address and said that the quality couldn't be higher:

Carl Heidtmann
563 Remscheid - Hasten
Unterholterfelder Str. 46
West Germany

I ordered eighteen tools and eighteen handles and sent them \$35.00. There was no duty charged me, but I'm told that sometimes (supposedly according to the amount ordered, but in fact the customs agent seems to be the determining factor) a small fee is charged. Eight weeks after I placed my order I received the tools in the mail, well wrapped in wax paper, and \$3.50 credit towards further purchases.

For those who aren't in a great hurry, the quality of the tools seems well worth waiting for.

The catalogs are free, but mine is in German and I'm not sure they have them in English.

Sincerely,
James Jones
Salt Lake City, Utah

(ur Deitel) Nr. 11 20 22

About Woodcarving

In any locale suitable wood may be found for woodcarving. Suitable scraps may be obtained—often free—from lumber yards and furniture making shops. Trees that are "sacrificed for progress" at the hands of real estate developers may be excellent if discovered shortly after being felled. They should be cut to desired sizes, and thick trunks are best when quartered, with wedges & ax or with a chain saw. Fresh wood should have all naked surfaces sealed with paraffin so that slow, controlled drying occurs to prevent checking. Leave the bark in place. The time required for adequate drying will vary with the type of wood, the size of the piece, and the ambient humidity. For the impetuous who can't wait for completely dry wood, coat with linseed oil after each carving session. This seals the wood and also provides a nice, low-gloss natural finish but at the same time precludes the use of stain, varnish & shellac. (I think shellac gives carvings a cheap plastic look anyway.)

Tools

Obtaining good carving tools may be a hassle, especially outside large cities. I have found several good sources for tools:

- 1) Ashley Iles, Ltd.
Fenside
East Kirkby
Spilsby, Lincs.
England
- 2) Woodcraft Supply Corp.
313 Montvale Ave.
Woburn, Mass. 01801
- 2) Craftsman Wood Service Co.
2127 Mary St.
Chicago, Ill. 60608
(tools and wood)
- 4) Brookstone Co.
Dept. C.
4 Brookstone Bldg.
Peterborough, New Hampshire 03458

All the above will send catalogs on request. Ashley Iles has the best prices but the selection varies with what is in production at the moment and the service is slow.

A round-headed mallet is essential. It allows the carver to devote full attention to the cutting edge of his chisel or gouge. It's hard to miss with a large, round mallet, and even if you do, the blow is softer than that from a claw-type hammer.

WHAT WOULD YOU HAVE DONE?

"What would you have done?" Friendly Persuasion asked The Native.

"What do you mean?" said The Native.

"At the crossroads. What would you have done?"

"Do you mean would I have gone with Eddie?"

"What would you have done, Winston?" asked Friendly Persuasion.

"I would of gone with Eddie," said Winston.

"I would of thrown the I Ching first," said Chuck. "They should have thrown the Ching and gone with it."

"Not me, man," said Norton. "I would of gone with Reed straight back to Kabul and got my ass out of there."

As people began to talk about what they would have done or not done in Afghanistan, Divine Right looked around the room for a copy of the I Ching. Chuck's mention of it gave him the idea to throw it, then and there. He didn't have anything in particular he wanted to ask. He just felt like it would be a good idea. When there was an opening in the conversation he asked City Girl if there was a copy of the I Ching in the house.

"There's Eddie's copy," said City Girl.

"You going to throw the Ching, man?" asked Reed.

"Yeah," said D.R.

"Groovy," said Gilded Lilly as she came in the room with fresh tea. "Let's ask it which road they should have taken in Afghanistan."

"I'd rather ask it what Eddie's been reincarnated as," said Blue Ox.

"I'd rather ask it how you get a job like the road sign guy had," said Chuck.

"Oh man, wouldn't that be far out?" said Norton. "Wouldn't that be a fantastic job?"

"Shit," said Gilded Lilly. "Just sit out there and give people directions, send them this way, send them that way."

"Yeah," said The Native. "And people you didn't like you could send them the wrong way. Have a whole network of your buddies in charge of all the intersections, fucking cops come up and say, which way is Kansas City? and you'd say that way, mother-fucker, and send 'em to Gallup, New Mexico."

"Yeah," said Chuck, "but good dudes, send them to the grooviest places there is. Have this big farm, see, have this incredible big spread in fucking Oregon, or Colorado, or some place. And when a really good cat would come along, that's where you'd point 'em."

"I'd rather ask who killed Eddie," said Norton. "Some son of a bitch killed Eddie and we don't even know who it is."

"You can't ask shit like that," said Bert. "You can't ask specific questions."

"The fuck you can't," said Norton. "I ask it specific questions all the time."

"If you're not going to ask which road to take in Afghanistan, I don't want anything to do with it," said Gilded Lilly.

"I'm going to watch TV myself," said The Native. And he rolled across the floor and turned on the color television.

As the sound of television began to grow in the room and people quit talking about Afghanistan and the I Ching, City Girl motioned for D.R. to follow her. Together they stood up and picked their way across the people scattered around on the mattresses and disappeared behind the bedroom door.

Craftsman Wood Service

Much the same stuff as Constantine's Wood Catalog. Some things cost less, others more. Craftsman has some things Constantine doesn't, and vice versa. If you use one of them, you really need both. Craftsman has almost anything you could think of for fine woodworking, from the wood itself to books telling you how, and including tools, cabinet hardware (more kinds of hinges, for example, than you could imagine), and upholstery supplies. If you would like to try your hand at making a violin, they can provide you with an instruction book and all the materials (no ready-to-assemble kit, praises be).

How to Build Your Own Furniture

Unlike most books on do-it-yourself furniture, *How to Build Your Own Furniture* by R. J. DeCristoforo contains no plans on how to build your own furniture. What it does contain is information on what should go into the design of a given piece of furniture to make it function properly. If you have ever built a table that wobbled or a drawer that wouldn't open, you will appreciate this book.

The book gives a wealth of information and illustrations on techniques and methods of quality furniture craftsmanship. There are chapters on materials and general design and construction with separate chapters on each of the different categories of furniture (such as tables, chairs, desks, chests, etc.). The book is very concise and the instructions and illustrations are easily understandable. This is definitely a standard work for the designer-craftsman.

Choose from a wide variety of hinges to suit a specific project...

Tenon inserted in a slab can be considerably reinforced by a wedge in a slot cut in the tenon to spread the tenon tightly in the hole. Don't make the wedge too thick or you will have trouble getting tenon to "seat".

Improved setup for clamping irregular work. The "clamp" consists of two hardwood bars, two nuts and bolts and a couple of lengths of line.

The Wheelwright's Shop

Wow. All you want to know (almost all) about wheelwrighting. Selecting trees, cutting and seasoning lumber, choosing the pieces for the various parts, shaping the stocks, spokes, felloes (rhymes with bellies). Tyreing, bending, boxing, etc. Plus much about building waggons and carts.

All this through the eyes of a man, caught up by Ruskin with the idea that man's only decent occupation was in handicraft, running a wheelwright's shop through the 1880's. Interesting view of machines displacing skilled craftsman.

GEORGE STURT

The Wheelwright's Shop

CAMBRIDGE 175 66 001 22 78

The special problem the sawyers knew how to tackle looks simple enough at the outset. What was it, save to get the timber—the oak, the ash, the elm, the beech—slip or slithered into sizes that experts might handle afterwards? Experts already had thrown the timber; others had carted it to the yard; another still—the master-wheelwright—had marked it into lengths and was at hand to direct the sawyers throughout; and what else was there for them to do, except supply mere brute strength? That looked about all they were fit for, with their stupid brains and brawny arms.

Yet, in point of fact, they themselves, you found, were specialists of no mean order when it came to the problem of getting a heavy tree—half a ton or so of timber—on a saw-pit and splitting it longitudinally into specified thicknesses, no more and no less. What though the individuals looked stupid? That lore of the English tribes as it were embodied in them was not stupid any more than an animal's shape is stupid. It was an organic thing, very different from the organized effects of commerce.

Bamboo is one of the most extraordinary plants that exist. It flowers perhaps once in a hundred years, and then it dies. It grows faster than anything in the world. In fact, it is sometimes possible to see it growing, just as one can see the hands of a large clock moving: there are recorded instances of bamboo's growing four feet in a single day. In a grove in spring the vitality of the surrounding green pillars is almost palpable. While the stem is growing above ground, the root stops: when the stem has finished, then comes the turn of the other. Bamboo also possesses the characteristic of making its complete growth in about two months only. Thereafter it remains the same size as long as it lives.

But bamboo is interesting for much more than this: it is the most universally useful plant known to man. For over half the human race, life would be completely different without it. The East and all its peoples can hardly be discussed without bamboo's being taken into account. Accepted as a mere fact of life or prized for aesthetic reasons, it touches daily existence at a thousand points which vary as widely as its employment in literary metaphor and its use in the walls of houses. It serves the most mundane purposes, and the most refined: dwellings are constructed from bamboo; it is widely used for eating and drinking utensils and for countless other household implements. Ubiquitous, it provides food, raw materials, shelter, even medicine for the greater part of the world's population. The interlocked roots of a bamboo grove restrain the river in flood and during earthquakes support the insubstantial dwellings of country villages.

Dish scourer of split bamboo

Regarded as a material to work, bamboo shows itself "grateful"---to use the artisan's term. It is flexible yet tough, light but very strong. It can be split with ease, in one direction only, never in the other; it may be pliant or rigid as the occasion demands; it can be compressed enough to keep its place in holes; after heating, it can be bent to take and retain a new shape. It is straight and possessed of great tensile strength.

Conestoga Wagon

You can still see their ruts on the American land and the American consciousness. Something about spacious skies and twenty more miles and men who feared God but not six straining horses. Six h.p. for freight across the Rockies, can you do that Detroit?

This is a buff's book. A definitive admiration of the wagon, its gear, its construction, its routes, its use, its beauty.

BED & RUNNING GEAR, RIGHT SIDE

So one piece after another was carved out. Now a new pleasure---to fit those pieces together to make the whole complete. The wheel was given the proper "dish"---an arch effect, the tire was the "shew back" and the hub the "keystone," thus giving greater strength to the wheel to carry the greater strain when on the low side of the road; the axles were tapered so that the spokes would stand vertically from the hub down and carry the load and all the angle given from the hub upward; also the wheels were given sufficient "lead" to prevent the hubs from running hard against either the collar or the linch pin.

Bamboo is valuable in controlling soil erosion in areas that are poorly adapted for other crops. It grows well both on steep hillsides and along the banks of rivers, its most important features being the interlocking root system, the mulch it produces from its leaves, and its habits of propagation without attention. The sympodial types are best suited for this purpose.

Perkins Reedcraft

reedwork takes time. that's probably why there are so many cane bottom chairs sitting around with the bottoms poked out. my dad learned how to weave reeds a few years ago, had a lot of trouble finding literature on the craft. the perkins people sell reed and provide the newcomer with good lessons on the basic weaves as well as carrying a complete line of weaving materials.

BEDROOM SCENE

City Girl lay down across the mattress and reached for some books on a little stand next to the far wall. She straightened up again with Eddie's Ching in her hand.

"I don't want to throw it right now, but if you want to, this is Eddie's."

And she held the book out to D.R.

D.R. took it, but his mind was on City Girl now. Without having anything in particular to say, he felt like he wanted to talk to her, or at least to sit there in the room with her a little while. Something like that was on her mind too, because when D.R. sat down on the mattress beside her, City Girl put her arms around his neck and hugged him. They sat holding each other a moment. Then they fell over on the mattress and lay together a long time locked in a very tight embrace. It wasn't a sexy embrace. It was, actually, but the sex was only one element of something else that was going on between them. City Girl didn't have on any underwear, and D.R. could feel her plainly against him. His leg more or less on its own wedged in between her legs right up into her crotch, and her great breasts pillowed roundly against his chest. And yet it was all just a part of this other, larger thing between them that was going on. City Girl kissed D.R. two or three times on the mouth, and once he kissed her very deeply with his tongue. But nothing led to anything. It was just a crushing physical hello between two people who had a special bond between them, and when they'd said that hello they drew apart and lay on the mattress looking at each other.

Finally City Girl sat up and pushed her hair back and leaned on a pillow propped against the wall.

"I guess we're going to talk about Eddie being dead," she said.

"I g..g..guess so," said D.R. "Is that what you want to d..d..do?"

"Fuck, I don't know what I want to do. All I know is Eddie's dead, and that's just the farthest out thing I ever heard of in all my life."

"How sad d..d..do you feel?" D.R. asked.

City Girl shook her head. "I don't know. Not very, I guess. I don't get sad much."

"I'm fucked up in the head m..m..most of the t..t..time," Said D.R.

"Are you sad now?" asked City Girl.

"Yeah."

"You look sad. You look damn beat up, if you want to know the truth. And that chick, what's her name?"

"Estelle."

"Jesus. Where'd you get with her?"

"Altamont."

"I was at Altamont."

**Colonial Craftsmen
Colonial Living
Frontier Living**

Are these fine Edwin Tunis books really practical? No, not on the face of it. They tantalize you with detailed sketches but sketchy details of old crafts and tools, those very crafts which have long been obsolesced by machinery.

So what's the value? The value to the CATALOG is nostalgia. These books service the desire of our market to back the hell out of 20th Century confusion.

And just now, nostalgia may not only be powerful, but in the big picture very practical, if carried out. One educational route out of a dead end is indeed back. Go back, start over where it feels good, get it right this time. Not for everybody, for sure; just enough to unstack the deck a little, enhance the variety of mistakes and opportunities available.

The dolphins went back, and they're doing all right. —SB

The Chandler

A colonial housewife never threw away any fat. She rendered it and stored it in pottery crocks. In very early days the family burned it in grease lamps for light, but it was a smelly, smoky light and candles were better. The mistress could make "taller dips" by repeatedly dipping wicks into hot tallow and cooling, between dips, what adhered. Some families owned tin molds that would cast as many as a dozen candles. The traveling chandler brought along his own big molds that cast six dozen at once. He strung them up with the loosely spun tow-linen candle-wick that the house provided, melted down some of the harder fat, and cast a year's supply of candles. The softer fat the chandler turned into soap by boiling it, outdoors, with lye. As he boiled, he stirred with a wooden paddle, always in one direction because of a superstition that the soap would fail if he didn't.

Wolf trap

One way to corner a squared-log house so the joints will drain

Frontier Living

Where there are no official police, any group of people will make shift to police itself. The pioneers were beyond the reach of law, but they managed to restrict misbehavior within certain limits. They were especially severe with anyone who injured the group. Minor offenders, like petty thieves or those who shirked their share of community work, were "hated out." They cut the culprit out of all social activities, but they by no means ignored him. On the contrary, they conferred unpleasant nicknames on him that were not merely whispered behind his back. One and all told him loudly what they thought of him any time they met him.

The top social occasion of the backwoods, even more popular than a funeral, was a wedding. The festivities began at the bride's home and there seems never to have been a church ceremony. Indeed, there is no mention of religion at all in any of the old accounts except one note that marriages were sometimes postponed until a parson showed up.

The Ring-tailed Roarers and their female counterparts had full scope at weddings. Those who were not invited were likely to ambush the groom's party and attempt to kidnap him en route to his nuptials. The women often made a similar attack on the bride. We aren't told what happened when these forays succeeded. By established custom, the bride's father set a quart of whisky on his cabin doorstep, and from a mile away the male guests staged a wild horse race to get it. The winner carried it back in triumph to give the groom the first swig.

Frontier Living

Wattle-and-daub cabins supported on "crockets"

Colonial Living

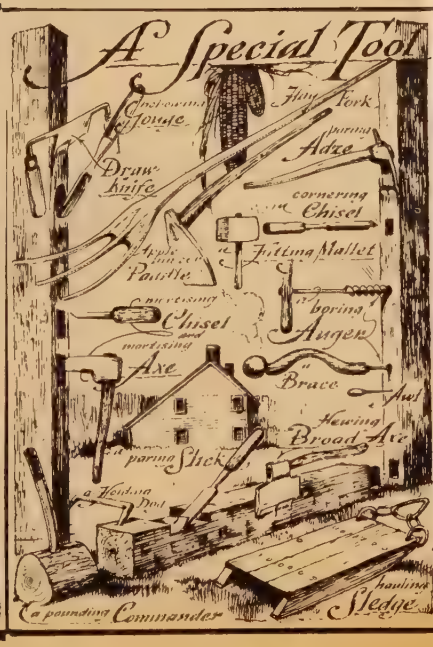

Once temporary shelters had been set up and the "wolves who sat upon their tails and grinned at us" had been driven back a little into the woods, the next order of business was to give land to each settler. At Plymouth they tried holding all the land in common, but it didn't work. At Salem and Boston and other later towns, a space was set aside for the church and a large area as a common pasture; what remained was divided up as building sites. The choice locations went to the governor, the ministers, and the other elite in strict order of precedence, the rest being distributed by lot among the common folk.

The interior mechanism of a windmill

or WHOLE EARTH CATALOG

The wheel shown is made of odds and ends. The shaft is an old Ford axle. At top and bottom are the original ball bearings of the car. The flywheel is from an old circular saw and is filled with cement. The wheel head is a clutch plate fitted tightly on the shaft end, and filled with plaster. The plaster was next turned true and recessed to hold bats of a certain size, by nailing a temporary tool rest across and turning the plaster as if it were wood on a lathe. The rounded front guard is half of an old paint pail. And the seat is one of the older style, made of cast iron, from a hay rake. The cast iron ones are much superior to the pressed steel variety. I show this wheel because it has proven very handy.

KINDS OF STONE

Of all the stones used by the colonists for grave markers none has better resisted the weather than slate. The neat inscriptions on slabs of polished slate show even the light scratches that served as guides to the letterers. Artists should consider this when selecting stones on which to work. Slate is a pleasant material to carve. I have carved a full-size portrait relief in gray slate, direct from life, and I found it possible to use a wooden mallet and wood-carving chisels on the stone. To be sure it took the finest edge off the chisels, but not much more than this. A fine toothed claw chisel is good for roughing out. One soon becomes accustomed to the grain. Files, rifflers, sandpaper, and pumice all help in finishing.

SECTION I: On Working with Wood

- CHAPTER 1. Evolution of the New England house; restoring old houses. 23
- CHAPTER 2. Furniture construction; ways of joining wood; furniture designing. 39
- CHAPTER 3. Use of small machines; wood turning. 51
- CHAPTER 4. Finishing and refinishing materials; how to clean your brushes; wax polishes; oil finishing; staining and weathered effects. 62
- CHAPTER 5. On the art of cutting, engraving and printing wood-blocks and linoleum blocks. 70

SECTION II: On Working with Clay

- CHAPTER 1. Finding local clays; preparing clays; proportioning the ingredients; slip-casting. 83
- CHAPTER 2. Simple methods of making pottery. 93
- CHAPTER 3. Firing pottery without a kiln; how to build a simple wood-burning kiln; a finer kiln; oil and gas fired kilns; gauging temperature; setting the kiln. 98
- CHAPTER 4. The potters' wheel; building a wheel; how to throw. 108
- CHAPTER 5. On decorating; three-dimensional; two-dimensional; combined techniques. 116
- CHAPTER 6. On making glazes; chemistry of glazes; making a ball-mill; applying glaze; using soluble materials; overcoming difficulties; glazes and slips for specific purposes. 119

SECTION III: On Working with Metals

- CHAPTER 1. How to work with sheet metals; tin; pewter; copper, brass, nickel silver and sterling silver; soft soldering; shaping by hammering in a hollow block; how to shape cooking vessels; how to line copper cooking vessels with tin. 139
- CHAPTER 2. On forging iron; making tools; grinding and sharpening tools. 152

SECTION IV: On Working with Stone

- CHAPTER 1. How to build an efficient fireplace. 163
- CHAPTER 2. On stone carving; kinds of stone; direct carving; sundials. 167
- CHAPTER 3. Lime mortars; cement mortars; stuccos and plasters. 173

SECTION V: On Working with Color

- CHAPTER 1. A brief essay on color; earth colors; spectrum colors. 177
- CHAPTER 2. How to paint in fresco; preparing the wall; preparing the design; preparing the colors; starting the work. 181
- CHAPTER 3. On the art of dyeing with old vegetable dyes; preparing and dyeing wool; dyeing linens. 189
- CHAPTER 4. On the art of printing on fabric with wood-blocks; dyeing medium; printing; steaming; further experiments. 200

In many Welsh tanneries it was customary to keep one or two large mastiff dogs, and it is said that as soon as market hides were delivered to the tanyard, each one was pegged to the ground so that the dogs could bite off any fats and flesh that adhered to the skins. The mastiffs were, of course, useful to guard the premises and to keep control of the vast number of rats that always infested tanneries. In addition the dogs' excreta when mixed with hot water was essential for treating certain types of soft leather before tanning.

They didn't say anything else for a minute, and in the silence D.R. looked around the room. The room wasn't much bigger than the mattress on the floor, but it had so much shit on the walls it looked like an infinite universe. Eddie had only lived there with City Girl a couple of weeks, but in that time he had painted serpents and dragons on every wall and ceiling. Behind a tall, skinny plant of some kind in the corner Eddie had painted a jungle of green leaves on the wall, with a vine running through them and little orange and purple dragons crawling up and down the vine. There was a red dragon on the ceiling. On the wall opposite the window a long yellow snake stretched from the corner near the floor to a corner near the ceiling, diagonally across. Light streaming through the strings of colored beads hanging down over the window made the whole place seem like an exotic tent in a curiously happy and benevolent jungle. The pictures were recognizably Eddie's, but something about them was very different from other stuff of Eddie's D.R. had seen. There was a precision in them, an order in the general arrangement of things. The place said something about Eddie that was not familiar to D.R. It looked as if Eddie had intended to stay in this apartment a while, and D.R. could not get used to that idea. He wanted to ask City Girl what she and Eddie had had going, but he couldn't bring himself to. What he wound up saying, without actually deciding to say it, was that he had gone to look at Eddie's body in the funeral home the night before.

"You said you might do that," said City Girl.
"Yeah. M..m..me and Estelle went."
"How was it?" asked City Girl.
"A bummer."
City Girl asked D.R. how Eddie had looked.
"F..fucked over."
"Did he have a ring on?" asked City Girl.
"I d..d..didn't see one."
"I guess his mother took it off."
"The undertaker m..m..might have t..t..taken it off."
City Girl shook her head. "No. It was her. She wasn't going to bury little Eddie-boy with that ring on his finger."
"D..d..did you give it to him?"
City Girl nodded.
"I m..m..might b..b..be able to get it b..b..back for you," said D.R.
"Nah," said City Girl. She scooted across the mattress and stood up. "Nah. Fuck it. It was just a ring. You got the book?"
"Right here."
"You can have that book if you want it," said City Girl.
"D..d..don't you want it?" said D.R.
"I think you're the one ought to have it," City Girl said.
"Eddie told me about you. Eddie talked about you a lot. Hey, you want something to eat? I'm hungry."
D.R. shook his head.
"Okay," said City Girl. As she left the room, she leaned over and touched D.R.'s face with her fingertips.

Price Guide

Foxfire

Probably no region in the country has been written about, "explained" and "interpreted" any more than the Southern Appalachian highlands, that mountainous area embracing parts of Georgia, North Carolina, Tennessee, Virginia, Kentucky and on up into West Virginia. And yet, no region is as little known or more misunderstood. Most of the writers and film documentarians who have paid attention to Appalachia have suffered from one social/economic bias or another, or, what's worse, a pasty sentimentality inherited from romantic writers of the John Fox Jr.-James Lane Allen school. Even native writers all too often fall victim to the same stereotypes and clichés that have marred so much of the reportage in the national media.

There are, however, scattered here and there through the Appalachians, a few small journals who are truly in touch with the place they claim to represent. And one of the best of these is *Foxfire*.

Foxfire is a quarterly publication concerned with researching, recording and preserving Appalachian folk art, crafts and traditions. A typical issue contained articles on quilting, chairmaking, soap-making, home remedies, mountain recipes, feather beds and home-made hominy, plus regional poetry and book reviews. One issue was devoted entirely to log cabin building. These are not superficial "feature" articles, but definitive, detailed treatments of traditional skills and crafts that have come close to dying out of our culture.

Foxfire would be a credit to a group of professional folklorists. But when you consider that it is edited and published by high school kids at the Rabun Gap-Nacoochee School in Rabun Gap, Georgia, it becomes impressive indeed. The thing I like most about it is the way these kids are looking immediately around them for their inspiration, instead of taking cues from New York and California. In their own way, these people are as hip and sophisticated as any young people putting out a magazine on either coast. More so, even. They're cooler, more adult. Next to *Foxfire*, most "underground" papers seem written by children shrieking at Daddy (or cops, or Nixon) because he won't let them smoke grass or smash store windows. *Foxfire's* editors and writers (and some excellent photographers) seem to me as aware of what's wrong with the world as anyone. The thing that distinguishes them from their shrill counterparts in the cities is the absence of fad, slogan and cliché as they set out to improve the world. These kids in Georgia are living in a real world, studying real things, and in consequence they are creating a wonderfully real publication in *Foxfire*.

POTATO CANDY

Peel and boil one large white potato. When done, mash up with a fork, add a little salt, and pour in a box of confectionate sugar. This makes a stiff dough.

Roll out on a dough board that has been well floured in a layer 1/4 inch thick. Spread peanut butter all over top. Roll up like a jelly roll (make two rolls if you like). Put this in the refrigerator.

Cut with knife. Serve. Good any time.

The churner said the chant in time to the up and down movements of the dasher as indicated below. The arrows indicate the dasher movement:

```

Come butter come +
+
Come butter come +
+
Peter standing at the gate +
+
Waiting for a butter cake +
+
Come butter come. +
    
```

Plate 3: Legs are shaped with a shaving horse and drawing knife.

Choose a tall maple, the trunk of which is about 8 inches in diameter and slightly curved. This curve will produce the sloped back obvious in Figure 2. If you would rather the back be straight, choose your maple accordingly.

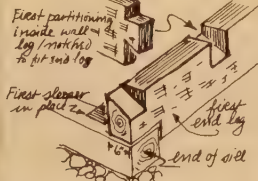

Saw a 3'6" length out of the curved section of the trunk for the back posts; a 1'8" length out of the straight section for the front posts; and a 1'4" length out of the straight section for the backs.

At the same time, choose a tall, straight-grained white oak 4"-6" in diameter. From the trunk, cut one 16" length, two 14" lengths, and save the rest for splits.

Quarter the maple sections to be used for posts. Split out the heart. Then round the quarters off using first an axe and then the shaving horse. (Plate 3.)

It is now time to choose the placement of the inside walls. If you wish to have a wall running the length of the house, its first log should be laid in place next. If the wall is to run the entire length of the house, cut a log to that length, hew it down to 4" in width, and cut dovetail notches in the ends.

Don't worry about the placement of the inside doors. They will be cut after the wall is completed.

Nature and Art of Workmanship

Seems like just about everybody I know is making things lately—pots & dishes & clothes & bags & belts & blouses. I read in Newsweek or somewhere that this is the New Renaissance—Mebbe so. But it doesn't feel good to see a lot of home made things when they are also poorly made. Romanticizing the hand-made is a naive reaction to the problem of a machined-plastic environment. The Nature and Art of Workmanship is an attempt to define the aesthetics of craftsmanship in a classical scholarly mode. It has clear insight and sound criteria for judging the quality of the objects that surround us without the blanket rejection of technology that is trapping many people in an alternative life-style of shoddy creativity.

[Reviewed by Terry Gunesch]

Can you wash your clothes in it? "Yeah, you can. Just take that, y'know, like we used to—we took our clothes and put our soap on 'em and rub 'em and boil 'em. People don't do that now. And I ain't afraid t'wash my hands in it! That there lard kills th'lye." Why do you stir it so much? "It requires it. It wouldn't make if you didn't dissolve it good. You got t'get it thick like jelly y'know. Y'can't leave jelly 'till it gets right."

Branch Lettuce

Mertile Lamb: "Well, there is one kind we call branch lettuce. It's kindly a long leaf thing, and it grows in the wettest damp places like where moss grows. As it gets older, it has a red cast to it. And you take it and cut it up like you do the tame lettuce, and put your onions in it, and pour your hot grease on it. It tastes just like tame lettuce."

or **WHOLE EARTH CATALOG**

There is a very present danger that, as the kinds of medium-scale diversity which free workmanship used to impart to building become less readily available, what little can be had in that way will be over-played and in the end travestied. We do not want every piece of concrete to show board-marks, every piece of paving to be cobbled, every piece of masonry to be random rubble, every piece of brickwork to be left unplastered. There is a place for all those things, but such elephantine capers unaccompanied by diversity at smaller scales become merely ludicrous. What we want is diversity which begins at the smallest visible scale and develops continuously upwards from that; and even then we do not want it always and everywhere. Vitamins are necessary to life, but only in small amounts. Take them in large amounts and they make you ill. So I believe it is with diversification in workmanship. I do not suggest it is more—or less—than a vitamin: not a diet: not a panacea: merely something which, though we may not take much notice of it, we need to have.

Ruskin said 'If we build, let us think that we build forever'. Shall we say 'If we build, let us remember to build for the scrapheap'? Shall we make every thing so that it goes wrong or breaks pretty quickly? I think not. Men do not live by economics alone. There is a question of morale involved. A world in which everything was ephemeral would not be worth working for. There are overwhelming social and aesthetic arguments for durability in certain things even if, as we are told, there are no economic ones. These are:

First of all, the things we inherit from the past remind us that the men who made them were like us and give us a tangible link with them. This is a thought to set off against the knowledge that life is short. Hitherto it has been inconceivable that any one generation should discard all the equipment it has inherited and replace it completely. That may yet become possible. Even if it does, it will still be imperative for each generation deliberately to make some of its equipment so that it lasts and survives its makers.

Secondly, if you are making a thing so that it goes wrong or breaks, then, however honestly you state the fact, two other facts remain. One is that you are putting as little into the job as you decently can. The other is that you are in a fair way to force its user to spend his money on replacing that thing instead of for some other purpose. He may be glad to replace it, in an age of materialism and the passion for novelty. But why should we all be compelled to keep spending money on renewing our car, our cooker and our refrigerator? These things for some people are merely means to other ends in life. Why should he not save the money so as to pursue those ends the better: altruistic, learned or artistic ends, say? Things which are made to fail early should be made maintainable and repairable, so that a man who cares for something other than novelty and status-symbols can make them last his time respectfully while he gets on with his life. Optional durability is what we want.

Buddhist Economics

The Buddhist point of view takes the function of work to be at least threefold: to give a man a chance to utilize and develop his faculties; to enable him to overcome his ego-centredness by joining with other people in a common task; and to bring forth the goods and services needed for a becoming existence. Again, the consequences that flow from this view are endless. To organize work in such a manner that it becomes meaningless, boring, stultifying, or nerve-racking for the worker would be little short of criminal; it would indicate a greater concern with goods than with people, an evil lack of compassion and a soul-destroying degree of attachment to the most primitive side of this worldly existence. Equally, to strive for leisure as an alternative to work would be considered a complete misunderstanding of one of the basic truths of human existence, namely that work and leisure are complimentary parts of the same living process and cannot be separated without destroying the joy of work and the bliss of leisure.

From the Buddhist point of view, there are therefore two types of mechanization which must be clearly distinguished: one that enhances a man's skill and power and one that turns work of man over to a mechanical slave, leaving man in a position of having to serve the slave. How to tell the one from the other? The craftsman himself, says Ananda Coomaraswamy, a man equally competent to talk about the Modern West as the Ancient East, "the craftsman himself can always, if allowed to, draw the delicate distinction between the machine and the tool. The carpet loom is a tool, a contrivance for holding warp threads at a stretch for the pile to be woven round them by the craftsmen's fingers; but the power loom is a machine, and its significance as a destroyer of culture lies in the fact that it does the essentially human part of the work." It is clear, therefore, that Buddhist economics must be very different from the economics of modern materialism, since the Buddhist sees the essence of civilization not in a multiplication of wants but in the purification of human character. Character, at the same time, is formed primarily by a man's work. And work, properly conducted in conditions of human dignity and freedom, blesses those who do it and equally their products. The Indian philosopher and economist J.C. Kumarappa sums the matter up as follows:

"If the nature of the work is properly appreciated and applied, it will stand in the same relation to the higher faculties as food is to the physical body. It nourishes and enlivens the higher man and urges him to produce the best he is capable of. It directs his freewill along the proper course and disciplines the animal in him into progressive channels. It furnishes an excellent background for man to display his scale of values and develop his personality."

If a man has no chance of obtaining work he is in a desperate position, not simply because he lacks an income but because he lacks this nourishing and enlivening factor of disciplined work which nothing can replace. A modern economist may engage in highly sophisticated calculations on whether full employment "pays" or whether it might be more "economic" to run an economy at less than full employment so as to ensure a greater mobility of labour, a better stability of wages, and so forth. His fundamental criterion of success is simply the total quantity of goods produced during a given period of time. "If the marginal urgency of goods is low," says Professor Galbraith in *The Affluent Society*, "then so is the urgency of employing the last man or the last million men in the labour force." And again: "If . . . we can afford some unemployment in the interest of stability—a proposition, incidentally, of impeccably conservative antecedents—then we can afford to give those who are unemployed the goods that enable them to sustain their accustomed standard of living."

From a Buddhist point of view, this is standing the truth on its head by considering goods as more important than people and consumption as more important than creative activity. It means shifting the emphasis from the worker to the product of work, that is, from the human to the sub-human, a surrender to the forces of evil.

While the materialist is mainly interested in goods, the Buddhist is mainly interested in liberation. But the Buddhism is "The Middle Way" and therefore in no way antagonistic to physical well-being. It is not wealth that stands in the way of liberation but the attachment to wealth; not the enjoyment of pleasurable things but the craving for them. The keynote of Buddhist economics, therefore, is simplicity and non-violence. From an economist's point of view, the marvel of the Buddhist way of life is the utter rationality of its pattern—amazingly small means leading to extraordinarily satisfactory results.

Tea began as a medicine and grew into a beverage. In China, in the eighth century, it entered the realm of poetry as one of the polite amusements. The fifteenth century saw Japan ennoble it into a religion of aestheticism.—Teasim. Teasim is a cult founded on the adoration of the beautiful among the sordid facts of everyday existence. It inculcates purity and harmony, the mystery of mutual charity, the romanticism of the social order. It is essentially a worship of the Imperfect, as it is a tender attempt to accomplish something possible in this impossible thing we know as life.

The Philosophy of Tea is not mere aestheticism in the ordinary acceptance of the term, for it expresses conjointly with ethics and religion our whole point of view about man and nature. It is hygiene, for it enforces cleanliness; it is economics, for it shows comfort in simplicity rather than in the complex and costly; it is moral geometry, inasmuch as it defines our sense of proportion to the universe. It represents the true spirit of Eastern democracy by making all its votaries aristocrats in taste.

Craft Shops/Galleries

*Craft Shops/Galleries USA is a directory of workshop showrooms, galleries and shops selling American crafts. It contains the names and addresses, regular exhibitions, and crafts media handled by over 600 outlets. This is a potentially invaluable guide to: 1) craft collectors; 2) craft makers; 3) shopkeepers or future shopowners who would like to hear from No. 2 and reach No. 1. (All shops interested in being contacted by craftsmen are marked with an *) Additionally, it contains other sources of information on craft exhibitions.*

This booklet is published by the American Crafts Council, a non-profit organization founded in 1943 to stimulate public interest in and appreciation of the work of craftsmen. [Suggested and reviewed by Judith Greer]

When will the West understand, or try to understand, the East? We Asiatics are often appalled by the curious web of facts and fancies which has been woven concerning us. We are pictured as living on the perfume of the lotus, if not on mice and cockroaches. It is either impotent fanaticism or else abject voluptuousness. Indian spirituality has been derided as ignorance, Chinese sobriety as stupidity, Japanese patriotism as the result of fatalism. It has been said that we are less sensible to pain and wounds on account of the callousness of our nervous organization!

Why not amuse yourselves at our expense? Asia returns the compliment. There would be further food for merriment if you were to know all that we have imagined and written about you. All the glamour of the perspective is there, all the unconscious homage of wonder, all the silent resentment of the new and undefined. You have been loaded with virtues too refined to be envied and accused of crimes too picturesque to be condemned. Our writers in the past,—the wise men who knew,—informed us that you had busy tails somewhere hidden in your garments, and often dined off a fricassee of newborn babes! Nay, we had something worse against you: we used to think you the most impracticable people on the earth, for you were said to preach that you never practised.

In joy or sadness, flowers are our constant friends. We eat, drink, sing, dance, and flirt with them. We wed and christen with flowers. We dare not die without them. We have worshipped with the lily, we have meditated with the lotus, we have charged in battle array with the rose and the chrysanthemum. We have even attempted to speak in the language of flowers. How could we live without them? It frightens one to conceive of a world bereft of their presence. What solace do they not bring to the bedside of the sick, what a light of bliss to the darkness of weary spirits? Their serene tenderness restores to us our waning confidence in the universe even as the intent gaze of a beautiful child recalls our lost hopes. When we are laid low in the dust it is they who linger in sorrow over our graves.

Sad as it is, we cannot conceal the fact that in spite of our companionship with flowers we have not risen very far above the brute. Scratch the sheepskin and the wolf within us will soon show his teeth. It has been said that man at ten is an animal, at twenty a lunatic, at thirty a failure, at forty a fraud, and at fifty a criminal. Perhaps he becomes a criminal because he has never ceased to be an animal. Nothing is real to us but hunger, nothing sacred except our own desires. Shrine after shrine has crumbled before our eyes; but one altar forever is preserved, that whereon we burn incense to the supreme idol,—ourselves. Our god is great, and my name is his Prophet! We devastate nature in order to make sacrifice to him. We boast that we have conquered Matter and forget that it is Matter that has enslaved us. What atrocities do we not perpetrate in the name of culture and refinement!

GEORGIA

Atlanta

★ THE SIGNATURE SHOP AND GALLERIES, 3267 Roswell Road. (Zip 30305, Tel. 237-4232) 9:30-5:30, Mon.-Sat. Blanche Reeves, Sally Adams, owners. Pottery, wood accessories, jewelry, holloware, flatware, metal sculpture, wall hangings, rugs, woven accessories, glass, enamels. Occasional exhibitions.

ESTELLE AGAIN

D.R. started to throw the I Ching by himself when City Girl went out, but he didn't have any coins on him. He was focused so well on what he was about to do he didn't much want to interrupt it to go outside to ask somebody for some coins. But then he considered that maybe that was part of it, that maybe his not having any coins on him was crucial to the reading somehow, and so he yielded to that and went into the living room.

The scene had changed a good deal since he and City Girl had left. Everybody except Estelle was drawn up in front of the TV to watch an old Charlie Chan movie called *The Big Secret*. Friendly Persuasion and Winston had a joint going back and forth between them that nobody else seemed much interested in. They were all into the number Charlie Chan was doing with the Door to the Mystic Palace. The door was about twelve feet high, and made out of some kind of shiny metal, with a big dragon embossed upon it. You could tell just by looking at it that a tank would have a hard time breaking it down. And yet, by fiddling around with the eyeballs of the dragon, old Charlie was about to spring the whole thing and enter the Mystic Palace. Everybody was so into the program D.R. didn't want to disturb them, so he did the next best thing and went over to Estelle in the corner.

"Have you got any coins?" asked D.R.

Estelle looked up at D.R. It was the first time their eyes had met in what seemed like days. D.R. and Estelle had been waging some kind of silent combat ever since his acid trip, and the business with the Greek. Neither of them knew what the issue was, but they both knew that it was serious, whatever it was. Except for the four hours D.R. worked at the Save-More Store they had stuck close together ever since they got to St. Louis, but their minds were in separate, and hostile, galaxies. They had only been in St. Louis thirty six hours, but that, too, seemed like days. Eddie being suddenly dead had lifted St. Louis out of time onto a plane where each moment is forever. Death is an infinity, and so is thirty-six hours of life in St. Louis when you're not speaking to someone you ostensibly love. I ostensibly love you, Estelle, thought D.R. And ostensibly I love you too, thought Estelle. The meeting of their eyes was filled with cold, ostensible love and both thought what in god's name is happening.

Craft Tool Plans

You do not seem to hit the pattern sources, I suppose your readers don't really need these detailed plans like my readers do. But one example will suffice perhaps—For \$2 one can secure a detailed, dimensioned plan to build a 4-harness, 6-treadle jack loom. Pattern Catalog No. 396 and it includes a materials list. Order from Mr. N. Rockler, Craftplans, 8011 Lewis Road, Minneapolis, Minnesota 55427. A catalog showing the plans he has patterns for is available for 25 cents, same address. He includes three types of spinning wheels and a sundial packet as well as the more usual jig-sawn jiggers and clocks and more or less standard subjects like bars of little interest to Whole Earth people. But for a catalog of plans I'd put Craft Patterns Studio, Elmhurst, Illinois 60126 first on the list—they have more in greater variety and though their catalog is more (50 cents the last time I heard from them) their plans are generally cheaper.

Lura LaBarge

GOING THROUGH CHANGES

The I Ching was what was happening. Estelle took three pennies out of her bag, handed them to D.R., then turned back to her book. The way she did it, the way she fished in her bag for the coins and handed them to him as if he was collecting for the Heart Fund or something, infuriated D.R. He came close to throwing the coins right in her face. His next impulse was to jerk the book out of her hand and fling it across the room.

Fuck it! he yelled inside his mind. Fuck it!
In the bedroom with the door shut D.R. took his place on the mattress again and worked at cooling his mind with some of the breathing exercises the Greek had taught him. He tried to do alternate nostril breathing but he was so stirred up he didn't have enough patience to hold his breath for sixteen counts. Bellows breathing was easier. Huffing and puffing, doing them in sets of twenty, then twenty-five and finally thirty-five, D.R. stoned himself on breathing, his mind joined him on the mattress and at last he felt cool enough to toss the coins.

He didn't feel that way long. The first goddamn throw came up fucking Stagnation and he didn't want to read about it. He knew it was a sin not to accept the reading but he didn't give a shit. He threw the coins again. It came up Adversity and Weariness. He threw them again. It was The Estranged this time. Opposites. Fuck opposites. He threw them again. It was Ku, Decay, with changes in the third, fifth and sixth nines which gave him Abysmal, The Abyss. Fuck it. It was Eddie's I Ching, it was Eddie's room, fuck it, Eddie's dead, and Divine Right threw the book across the room, then burst into the living room and told Estelle to get off her ass, they were going to the Western Union office.

Estelle looked up at D.R., half expecting to be afraid. But she wasn't. She got up and went out with him, but she definitely wasn't afraid.

Metal Techniques for Craftsmen

If you read this book, you'll know more about metalworking than just about anybody you know. International in scope, it covers an incredible collection of techniques from many countries and cultures. The various techniques are presented with a complete set of instructions for each one and are illustrated by excellent photographs, often of native craftsmen doing their thing. Tools are described and illustrated in detail. Everything is described in detail. Reading this book will take you right up to that point where you'll have to do it awhile yourself to get into it any further. This is a real assembly of diverse information, some of it hard to find, and a metal-crafter-jeweler should be into new things within an hour of getting his hands on it. This is one of those rare and super books written by someone that wanted to lay his trip on others. Well worth the money. The "definitive text", as they say.

Forge welding is the oldest welding process. Wrought iron and mild steel can be welded in forging by heating the parts to be joined till they are brilliant white-hot and emitting sparks. The metal at this point has reached a condition of surface plasticity. The parts are then brought into contact quickly, on top of each other, and hammered together. They fuse into one unit. Butt joints can be welded by first upsetting the ends to be joined, to thicken them, then reheating the ends to welding temperature, placing them together, and hammering them. The original thickness is maintained. If the metal is absolutely clean, free of oil or cinder, no flux is necessary, because the slag in wrought iron acts as a flux. The force to be exerted by the hammer depends on the mass and size of the parts being joined.

Greek bronze wire fibula, "spectacle type," tenth-eighth centuries B.C. (Geometrical Period). Back view. Length: 5 5/16 inches. This pin, including the pinstem and catch, is made entirely of one continuous piece of wire. Metropolitan Museum of Art, New York. Fletcher Fund, 1937.

Sterling silver necklace utilizing 18-gauge metal, by Mary Ann Scherr. Length: 16 1/2 inches; each unit: 3 1/2 inches by 1/2 inch. The intaglio pattern was created with an etching solution of half nitric acid and half water and was then oxidized.

SAND CASTING OF ALUMINUM. Sand casting is the best-known and most frequently used casting process. (For a procedural discussion, see page 325.) The method used for aluminum is the same as that used for other non-ferrous metals, with care taken for temperature control. In small sand castings, a section of 3/16 of an inch is considered the minimum possible. The surface of sand castings depends for its character on the fineness of the sand used. For large castings, coarser sand is advisable. Aluminum sand castings generally have smoother surfaces than other sand cast metals, partly because of the lower melting point required of the metal, and partly because the sand does not burn into the surface of the casting.

There are different ways of approaching the subject of jewelry making. Some begin by having the student or beginner take for the first problem one that calls for the use of wire bending and soldering. Others give a problem calling for the introduction of a variety of processes in one piece. Experience shows that the best and most satisfactory results are obtained both from the student's point of view and the consideration of the finished product when the student is led to advance from the simple problem to the more complex by a series of elementary problems carefully graded. The beginner has not only to learn the processes involved in the making of a piece of jewelry but also to master the various tools used and to learn the limitations of his material. Although the number of tools used in jewelry making are few, it seems best for the beginner to take them up one or two at a time and plan his problem accordingly.

The Processes involved in jewelry making are as follows:
Sawing, Filing, Bending, Carving, Embossing or repoussé,
Soldering, Stone Setting, Polishing, Coloring, Pickling,
Modeling, Casting, Annealing.

Creative Glass Blowing

This well-illustrated and carefully written book begins with the statement "Any one can learn to blow glass." To a large extent, the authors, one of whom is a professional glass blower, succeed in making that statement believable. However, the first 50 pages are concerned with the tools of the glass blower and I found myself wondering, "Yes, but can anyone learn to be a pipe-fitter, metal worker, carpenter, and electrician?" If you can do those things, there is little doubt that this book (and several hundred dollars worth of tools and related supplies) will enable you to blow glass—probably creatively.

Don't expect to take up glass blowing casually, with just this book, but if it is a hobby to which you can commit yourself seriously this book would be an excellent investment, for starters.

There is a page at the end that lists sources of tools and materials. Unfortunately, there are only a few suppliers mentioned, all of whom are in the East. Alas, we westerners need a special supplement, obviously.

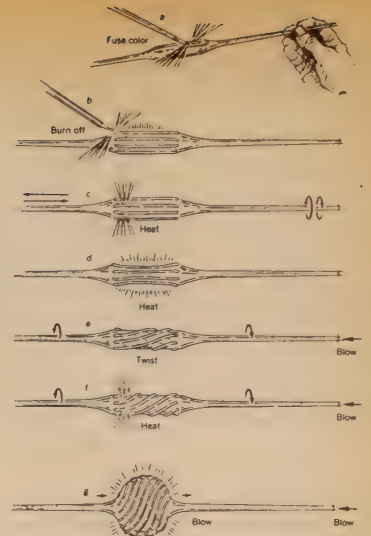

Figure 4-25.

Here, then, is the first skill you must develop in the course of becoming a glass blower: the knack of rotating hot glass at a rate that precisely counteracts the force of gravity. The trick is not difficult to master if you follow a few simple rules. First, never soften more glass than you need for making a desired form. If you intend to impart a rounded shape to the end of a rod, heat only the tip. Second, never soften the material more than necessary to accomplish your objective. Obviously, stiff glass is easier to control than runny glass. Watch the work as it softens and changes form. Alter its position in the fire to take advantage of gravity, or to offset the effect of gravity, as the case may be. This is accomplished by rotating the work.

ANGEL'S FARM

The money from D.R.'s sister turned out to be twenty-five dollars instead of the fifteen he had asked for. At some earlier point in their trip together such a delightful surprise would have sent D.R. and Estelle into little dancing ecstasies and racing to the nearest candy store to buy a bag of jelly beans. But they were so far from joy right then that ten times that amount could not have given them pleasure. D.R. put the money in his pocket and went outside where Estelle was waiting, leaning against a telephone booth.

"I want to call Gail," she said.
"C...call?"
"I want to call Gail. Give me a dime."
D.R. felt in his pocket. The Western Union lady had given him some change but it was all in quarters.
"Give me a quarter, then. I'll get it back. I'm calling collect."
D.R. handed Estelle a quarter. She went in the phone booth with it and slammed the door. A few minutes later D.R. saw her bang the receiver on the hook and storm furious out of the booth.
"Shit?"
"Wha..wha..what . . ."
"Her old man answered and refused to accept the charges. Shit."
"Let's p.p.pay for the c.c.call. We can af..ford it."
"Fuck it," said Estelle. "Let's go."
"Let's c.c.call the Flash," said D.R. "He'll accept it."
Estelle shrugged. She was leaning against the bus now, her arms folded across her chest, looking at the sidewalk. "Call him," she said. "I don't care."
D.R. went in the phone booth and asked the operator to connect him with the Anaheim Flash in Anaheim, California. He listened to the phone ring, he listened to the Flash tell the operator he would accept the charges. He heard the Flash's soft, laconic voice say, "Hey man, what's up?"
"N..n..nothing." D.R. stammered. "N..n..nothing's up. We just wanted to call somebody. We're in St. Louis."
"What's wrong, man?" asked the Flash. "You sound like you got epilepsy or something."
"N..n..no," said D.R. "It's this th..thing, it's my t..t.tongue. It's getting b..b.better. Listen, d..d.did you hear about Eddie?"
"Yeah," said the Flash. "Fucking bummer."
"We g..g.got here after it happened. We b..b.been in St. Louis t..t.two days."
"That's two days too long for me," said the Flash. "You better get back out here to the land of sun and fun. Where's Estelle?"
"Right here," said D.R. "You want to sp..sp.speak to her?"
"Sure. Put her on. I've got a message for her from Angel."

Cutting intricate forms from Styrofoam and other cellular plastic foams is easy with this 6 volt hot wire cutter, which you can make at home if you are handy. As the diagram indicates, you can make the entire structure out of wood, plus the following parts, available from your local radio parts store and hardware store: transformer, filament 6.3V @ 10 amps; switch, double throw, single throw; red indicator light; fuse holder and fuse; insulator; nickel chrome wire; plug and rubber coated wire; notched bolts and nuts; spring.

A Sculptor's Manual

This book is a well organized presentation of the basic processes behind sculpture. Detailed processes are made to seem simple, but not oversimplified; it remains obvious that a good deal of patience will be required to cast a bronze by the lost wax method. People who do not know what technique will suit them best and who want a solid footing from which to experiment, will find *A Sculptor's Manual* most useful. It encourages you to attempt the forms you have imagined, by showing you how.

The nine chapters cover plaster usage; foundry practice; flame and electric welding; plastics; cement; stone and wood; repetition casting; general construction; finishing; and surface coatings. Cross referencing, a glossary, and 27 diagrams make the book all the more usable. British sculptors will find a buyer's guide at the end of each chapter. Americans are referred to the yellow pages, Bernard Klein's "Guide to American Directories" and the "Thomas Register" (see p. 23 of the CATALOG) to find sources for materials.

At the back of the book is a section of 22 photos of finished sculpture, just enough to intrigue and egg you on without being pushy.

The development of plastics has been continuing since the end of the last century and the term plastics now covers a complex of materials of which those dealt with here form a small and relatively simple part.

Firstly, there is the vast range of thermosetting plastics materials which are manufactured as liquids in two or three component parts. These are the polyesters and epoxy resins. They require reinforcement and are formed in a one-way process.

Secondly, there is an even larger range of thermoplastics, manufactured in powder or chip form and fabricated into very thin sheets which are subsequently laminated to provide whatever thicknesses may be required. They are structural materials—either flexible or rigid—and are formed under heat in a reversible process: raise a thermoplastic object carefully to the

temperature at which it was formed and it will revert through the sequence of forming operations back into a sheet.

Thermosets are built up with glass-fibre reinforcement over female mould surfaces and subsequently painted if required, though mass-pigmentation can be effected before lay-up.

Thermoplastics can be bent and formed when hot, either freely or by mechanical forming, e.g. they can be injected under pressure into moulds. These materials can be bonded with adhesives, welded together by high-frequency vibration, screwed over a frame or welded with hot gas and a filter rod. It is possible to vary the mass-pigmentation of various thermoplastics by laminating a screen-printed surface onto the rigid sheet.

Lost Wax process or cire perdue. A lengthy and complex process. Join all wax runners, risers, etc., with a wax knuckle by modelling with a hot spatula. Reinforce grog with chicken wire. Before removal from kiln, reinforce surface with plaster and scrim. Keep sprue clear of sand, etc.

The process has changed little since the Greeks brought it to a pitch of achievement, and it is still so demanding that very few foundries exist. Their services are very costly. If you have a sculpture in clay, wax or plaster, and it is of a nature that demands faithful reproduction, there is no doubt that bronze—far denser than aluminium. cast by the Lost-Wax process—quite different from sand-casting—presents the only method of preserving the form and texture accurately.

This is an extremely complex and variable method, though large works can be cast more cheaply if it is followed up to the point at which the wax has been cored— or just to the production of the wax (without runners or core)—and the result is then given to a foundry for casting. If the foundryman produces a bad result, however—it will be your fault.

Candlemaking

I've been making candles for about a year now as a supplementary income for family of me, wife and bouncy baby boy, and I think I can make some useful suggestions and at the same time do a review of some candle supplies.

First—wax. *Don't buy wax in the grocery store.* It comes in one lb. boxes for sealing jelly and is prohibitively expensive. I used to buy wax from a local hobby store (American Handicrafts—if you don't have anything against using names), until I noticed that their supplier was in Phila. So I went to the supplier and got it much cheaper. Until someone told me about getting wax from the oil companies which have refineries in Phila. So now I get wax from Atlantic-Richfield, delivered to my door (300 lb—five 60 lb cartons; six 10 lb. slabs per carton minimum order for free delivery) for only 12¢/lb. Compare that to the hobby store price of 11 lb. for \$3.50 = 32¢/lb. So try getting wax from oil companies near you.

Next—molds. American Handicrafts has molds which work pretty well, but they are somewhat limited in variety. Another source of molds—somewhat higher in price but also excellent quality is the Pourette Mfg. Co., 6818 Roosevelt Way N.E., Seattle, Wash. 98115. They also carry dyes, scents, wick, etc. etc. You can also use things like milk cartons, wine bottles, light bulbs, shampoo bottles, or sand to mold candles. Or if you have access to materials—sheet metal—and rods—soldering iron and sheet metal press—make your own molds.

Third—dyes. The best place I've found for dyes is the J. & E. Polish Co. 1036 Monroello St. Brockton, Mass.

They have about 2 dozen colors—including shrimp, sunshine yellow, cherry, red red, and mandarin to name a few neat names. The dyes are 1/2 oz. cakes of "concentrated" candle colors (at \$3.50 per dozen) and are advertised as coloring 10-15 lbs. of wax but I've done much more sometimes.

J. & E. Polish also makes the best concentrate perfume oils I've used. They have about a dozen scents including hollyberry, coconut, apple blossom & cinnamon. (And the coconut really smells like coconut!)

Pourette carries the widest variety of wick I've found. I don't advise using string—candle wick is woven with a single tight strand so it bends over and burns right and is also treated chemically I think.

I think that's about all—wax, wick, dyes & scents. One warning—candle making can be a messy process if you spill wax around, so put down newspaper. Another warning—heat wax in a double boiler—*never directly over a flame.*

Go to a restaurant or cafeteria and get empty cans. If you're lucky, they will have both 4 & 5 quart cans, which will make great free double boilers.

I forgot to say that you will probably have your choice of melting points if you get wax from an oil company. After experimenting with several I have found 143-148° wax the most versatile stuff.

If I'm not careful this is going to turn into a book on candle making so I think I'll stop here.

RULES TO REMEMBER

To get the most out of your mold, abide by the following rules:

- Never strike it with a hard object.
- Never place it in an oven with a temperature exceeding 175 degrees.
- Never scratch the interior with a sharp instrument or abrasive.
- Never loan to friends unless they know how to care for it.
- Store in a warm, dry place to prevent rust; keep covered to protect interior from dust.
- If you should find it necessary to clean your mold of contaminated or "stubborn wax," use one of these methods:
 - Easy Method. Pour your next candle with the wax at 230 degrees. This usually cleans the mold and absorbs stubborn wax.

Celebration! Candle Supplies

We have a candle "factory" and shop here in Northern Michigan. In our attempt to produce the best quality candle at the lowest cost we have experimented with many dye and scent manufacturers, wick making companies, mold makers etc. We now have excellent sources for our materials and find that, since it is cheapest to buy them in large quantity we are in a position where we can break the supplies down into smaller quantities and resell them. Not only are our supplies better than anything we've found available to the general public, we can under cut everyone else's prices.

Here, for example, are how our prices compare to others: Dye—we can provide enough dye to color 20 lbs of wax for 30 cents. Pourette, a national candle supply pusher, will sell you enough to do 10 lbs for 25 cents. American Handicraft, a chain store—I don't know if they are on the West coast or not, will sell you dye for 12 lbs. for 39 cents—and it's very poor quality. Michael's, an other craft chain sells dye for 50 cents—they don't say how much it will color but from the way it looks and feels I know it won't color 20 lbs. Even the local "head" shops dye is 39 cents for 12 lbs worth of dye. And let me stress that our dye is of a much higher quality than any of the above. I've enclosed samples of our orange and lemon yellow—we have many other colors.

Scent runs much the same:

- Celebration! — 1/2 oz. for 50 cents; 1 oz. for \$1
- Pourette — 1/2 oz. for 75 cents
- Am. Handicraft — 1/2 oz. for 69 cents; 1 oz for \$1.40

Again our scent is of a higher quality. Most craft companies dilute the scent before they sell it and this damages potency. Both American Handicraft and Pourette say their 1/2 oz. will scent 3-4 lbs of wax—we usually figure our 1/2 oz. will scent 608 lbs of wax.

Wick—we have an excellent source of wick. The most important part of a good burning candle is the wick—we have a fine metal core wick which we use in everything from our 3" diameter candles up to our 7" diameter candles. In our 3" candle it consumes all the candle, in our 4" diameter and larger candles it burns a well down into the candle—with the proper amount of steric acid (we can sell for \$1.00 a lb compared to Am. Handicraft—69 cents for 4 oz) this wick will not flood out. It's great. We can sell it for 10 cents a yard—Pourette is 15 cents a yard and Amer. Handicraft is even more—and of disgusting quality. We have other sizes also but this is best.

We also have molds but currently I can't estimate those prices—but they will be good.

Because our prices are cut to the bone we will have to charge for postage—but Pourette and American Handicraft both do that even with their high prices.

Due to the fact that we are currently renovating one floor of a beautiful old building to move our shop into and making the dirty, old, big basement over as a new location for our "factory", plus we have back orders for wholesale candles—and on top of that I am trying to finish up my undergraduate crap at Michigan State University, I have not gotten the catalog of our supplies together yet. This is why I am sending you the above information, and samples, instead of our catalog. I think from the information I've included you can see that we are trying to do a good thing. If you think we might fill the need for a candle making materials supplier in the Whole Earth Catalog it would be wonderful. You could run our name and address telling people to write to us for our catalog. If you could also ask people to send 25 cents to cover printing costs it would help us out a great deal.

Thank you for taking the time to read this. I hope it works out. Thank you also for doing the Whole Earth Catalog—you have really fulfilled a need. I'll miss you when you stop but I think your idea of "stopping" would be a good one for others to follow.

Peace,
Bill Decker

D.R. stepped out of the booth and handed the phone to Estelle.

"Hi baby," said the Flash. "How's your life?"
"Fucking miserable," said Estelle. "How's yours?"
"Better than yours, obviously. What's going on?"
"It's too long and too weird to tell," said Estelle. "What's happening in California?"
"Angel bought a farm in Oregon," said the Flash. "Two hundred acres. Her and Speed. They're into goats and bee hives."
"Far out," said Estelle. Suddenly she was smiling, and there was genuine cheer in her voice. "Far fucking out. They really did it."
"Two hundred acres," said the Flash. "I was up there the other day, it's really a neat scene. She was asking about you."
"Fantastic! Tell 'em hello, okay? Tell 'em I'll come see 'em."
"Will do," said the Flash. "Any other news, comments, hits, reports or flashes from the hinterlands?"
"It's grim," said Estelle. " 'Nuff said."
"Well," said the Flash. "Every cloud has a silver lining, and the darkest hour is just before dawn, and such like bullshit."
"You're stoned," said Estelle.
"Ah, yes, the blessed stoned. As a matter of fact, the old fire is waning a bit, I better go stoke it up a little. But listen you guys, call me again, you hear? I'm interested in your fate."
"Sure," Estelle laughed. "We'll give you a weekly casualty report. Listen honey, it's nice to talk to you. Take care, okay?"
The Flash said he would take care. Estelle hung up then, and as soon as she did the smile vanished from her face. Without saying a word to each other, D.R. and Estelle went back to City Girl's apartment to get their stuff, and to tell everyone goodbye.

Pioneer Pottery

Michael Cardew is a big gun, careful man, good potter, and the book is complete in a systems way. He starts in giving lessons in geology for potters, puts the reader's head down into the earth with the clay, and then runs through most of the materials tools techniques forms receipts and principles I've ever heard mentioned. An honest book, looks you right in the eye.

\$12.00 plus postage

from:
Blackwells (see p. 2)

Practical potters have always had an instinctive knowledge of clay, and were able to make good pots with it although they (like the rest of the world) did not really know what it was. But during the past forty years a great deal of fundamental research on clays has been done, throwing a flood of new light on a field in which previously there had only been fogs, obscurity, guesswork—and mud. Potters, it is true, cannot hope to be scientists; but unless we try to learn something about all this new knowledge, we shall remain for ever at the 'animistic' level, with no real enlightenment on the ancient problems of why some clays are unpredictable and temperamental, while others are reliable and cooperative.

Let us begin with Geochemistry. The Earth, the warm-hearted fertile *Magna Mater* in whose bosom we all live, has been described by one geochemist as 'a projectile of nickel steel, with a slaggy crust.' The general picture of the earth presented by geochemistry is a slightly kinder one than this, since it provides a hydrosphere, an atmosphere and even a 'biosphere' to clothe the slaggy crust—the lithosphere—with decent verdure. It is estimated (1924) that the upper ten miles of the lithosphere or crust consist of:

95 per cent igneous rocks
4 per cent shales
0.75 per cent sandstones
0.25 per cent limestones

A Potter's Book

We've carried this book as a little footnote to our pottery section. After talking with a few potters, and looking at the book a little, we've decided, I've decided, it has been decided, maybe it hasn't been decided, that this is the best all around pottery book. Leach pretty well covers the field, with good emphasis on Japanese techniques, particularly sound on glazes, ample diagrams, kiln plans, nice advice.

\$3.60 from Blackwell's (see p. 2)

This book is the outcome of thirty-three years' experience of making pots by hand processes in the Far East and in England. During twelve of those years I had unique opportunities of gaining an insight into the spirit and methods by which early Oriental pottery was made. Here I have attempted to state these simply and openly, and to relate them to our Western need, primarily for the sake of other potters who suffer inevitably from the almost entire loss of our own birthright of traditional craft lore. But this book is also intended for students and teachers, for lovers of good pots and sound craftsmanship, and finally for those to whom the cultural meeting of East and West is the prelude to a human society. Out of my dual experience I have tried to formulate a criterion by which good pots may be recognized in a manner similar to that by which an ever-changing but nevertheless continuous classic standard encourages the appreciation of fine architecture, painting, writing and music.

Raku has two disadvantages which should be mentioned together with those qualities which obviously recommend it to the artist, the craftsman and the school; it is porous when new, and it is comparatively fragile. With use the pores of the body and the crackle of the glaze gradually fill up, so that even a raku vase will eventually cease to leave a damp mark behind it even on a polished surface. Its fragility, due to low temperature firing, necessitates the making of pieces with fairly thick walls, handles, and spouts. For this reason it is not advisable to make thin table-ware of raku. A harder preliminary firing of the biscuit will strengthen the body, but at a sacrifice of the peculiar soft character of the glaze and its crackle. The Japanese do make pottery of this kind, using soft coloured glazes over stoneware biscuit, and call it 'Kochi' (Cochin China ware), but it requires a kiln which will go to high temperatures.

Free Fire Brick

I don't know anything about kilns except that fire brick is very expensive stuff. Noble Jasper Brinton solved this problem whilst reducing waste at the same time. He sought out and made friends with some engineers at a glass factory a few miles from his home. He was able to persuade the company officials to let him proult in their dump. Every few years, many glass companies must tear down a kiln because the intense heat is literally eating the bricks up. The old bricks are thrown on the dump, going to waste, but Jasper says they are still perfect for ceramics kilns. Like I say, I know nothing of kilns, but I've seen a kiln that Jasper built with old fire brick, and it sure as hell looks like it works.

Pottery

Authoritative and scrupulously organized with concise explanations accompanied by 388 lucid photos, Pottery presents an exceptional technique of throwing.

The rudiments seem preferable to those redundant techniques I learned. In addition are many finer techniques I never thought of.

Teach yourself to throw with this book or use it as I would to cleanse myself of bad habits. This is the only appealing pottery book I have ever seen, but it only covers throwing.

CATALOG

Two main pressures tend to centre the rotating mass of clay:

A downward vertical pressure. This pressure is most easily applied by the outside edge of the palm of the right hand. The forearm points to the centre of the wheel and is steadied by resting on the edge of the wheel tray. This pressure exerted alone tends to displace the clay into a wider form.

An inward horizontal pressure. This pressure is most easily exerted by the wrist end of the palm of the left hand. This forearm also points to the centre of the wheel and is steadied by resting on the edge of the wheel tray. This pressure exerted alone tends to displace the clay into a taller form.

In practice these two pressures are only rarely applied singly. Small and medium sized pieces can generally be centred by the simultaneous application of the two pressures.

The two pressures isolated in the two previous photographs are here shown combined. Every opportunity should be taken while centring of achieving additional steadiness through contact of the hands with each other.

There are other centring holds than the one illustrated. All involve an application of the same two pressures.

Throwing is the process of shaping an even mass of soft plastic clay by hand on a wheelhead revolving at speeds varied by the thrower.

Turning is the process of paring away excess clay from a leather hard form.

Trimming with a needle or pin

The revolving wall is gripped lightly between the fingers and thumb of the left hand. The right hand holding the needle is steadied on the left thumb.

The needle is pushed through until it touches the fingers of the left hand.

The left hand then grips the clay slightly more firmly and both hands rise forwards and upwards.

LEAVING ST. LOUIS

Gilded Lilly and the Crosstown Rivals had split while D.R. and Estelle were gone, and the others were asleep or half-asleep in odd places about the room. City Girl had gone into the bedroom by herself and closed the door. The only person who was on his feet was Reed, in the kitchen looking for stuff to make a sandwich out of.

"Get your money?" he asked.
D.R. nodded. "I g.g.guess we'll t.t.take off now. Anybody want to g.g.go to Cincinnati?"
"Somebody going to Cincinnati?" said a voice in the living room. It was Friendly Persuasion. She'd been asleep in the corner where Estelle had sat earlier. She was sitting up now, yawning and scratching herself through a hole in her sweater. "Somebody going to Cincinnati?"
"We are," said Estelle. She was in the living room, looking around to see if they were forgetting anything.
"Far out," said Friendly Persuasion, and she leaned over and shook The Native, who was stretched out next to her. "Hey. Wake up. You want to go to Cincinnati?"
The Native opened his eyes long enough to say sure. Then he closed them again and turned over. Friendly Persuasion got to her feet and went to the kitchen where D.R. had joined Reed scrounging for food.
"Hey," said Friendly Persuasion. "No kidding? You got room? You got room for The Native too?"
"Sure. We g.g.got a b..b.bus."
Friendly Persuasion looked at Reed. "Do I want to go to Cincinnati?"
"Nah," said Reed. "You don't want to go to Cincinnati."
"But I do! I know a lot of people in Cincinnati."
"You don't want to see those people," said Reed.
"Don't! No shit?"
"Nah. Go on back over there and go to sleep." Reed had made a sandwich out of rice and some old chili. He took a bite, then held the sandwich out for Friendly Persuasion. She took a bite, and went back to the living room to talk it over with The Native.

"Hey, wake up," she said. "We got to decide."
"Decide what?" mumbled The Native.
"Are we going to Cincinnati or aren't we?"
"Sure," said The Native. "We're going to Cincinnati."
"I don't think I want to go," said Friendly Persuasion. And suddenly she knew for sure that she didn't. "Hey," she said to Estelle. "Hey, honey. Thanks, but we're not going, we changed our minds, okay?"
"Whatever's right," said Estelle.
"Yeah, I was just there a month ago. Fuck it." And Friendly Persuasion lay down on the floor beside The Native and soon went back to sleep.
Estelle snapped the duffle bag shut and set it beside the door. D.R. and Reed came in from the kitchen, eating chili and rice sandwiches. D.R. handed one to Estelle, then picked up the duffle bag and threw it over his shoulder.
"Well, see you around," D.R. said to Reed.
"Goodbye," said Estelle.
"Yeah, wow, man," said Reed. "Good to see you guys. Carry it on, okay?"
"We'll see you around," said D.R.
They left then.
Reed closed the door behind them.

or WHOLE EARTH CATALOG

Design for a wood burning kiln with double crossdraft circulation. The bottom section is used for "Bizen" effects where a lot of flashing is desired, while the upper section is relatively free of direct flame and fly ash, and can be used for regular glazed wares.

Refractory blocks, slabs, skewbacks, arches, or door blocks may be made on the job using castable materials. In fact, it is possible to make the whole kiln from a castable material. Refractory castable mixtures are made from a suitable aggregate, such as firebrick grog, insulating firebrick granules, vermiculite, or perlite bonded with calcium aluminate cement. Calcium aluminate cement is similar to portland cement, and when mixed with water will set up in a hard, solid mass. But unlike portland cement, it is refractory and may be heated to red heat or higher without exploding or melting. Most brands of calcium aluminate cement may be used at temperatures in excess of 1300° C.

To cast a shape, a form must first be made. Forms may be made of wood or plywood, securely fastened at the corners, or in the case of curving forms, of bent plywood or masonite suitably reinforced. The forms may be given a light coat of grease to prevent sticking. The aggregate is prepared by crushing old firebrick or fragments of used insulating firebrick. The aggregate should be made up of particles of various sizes, from about 3/4 inch in diameter to grains as small as sand or smaller. The proportion of very fine particles should not be too great, however. The aggregate is then mixed dry with 1/5 of its volume of cement. Water is added to this, and the mass is mixed in a mortar box until it is of plastic consistency. It should be well moistened, but not so wet as to flow. The mixture is then shoveled into the mold and rammed into place so as to leave no air pockets. The material will set in a few hours and may then be removed from the mold and cured in a cool place for several days. When thoroughly dry, cast shapes may be incorporated into the kiln structure.

Jon Kaplan on Wheels and Kilns

As a potter, I thought I'd give you some thoughts about some materials, equipment, books, etc., which people might find useful.

Potter's wheels: The kick wheel made by Pacifica Wood Crafts which you had in Spring 1970 is a fine piece of equipment. Its reasonably cheap, durable, and a good tool. I know people who have them and they have a lot of good things to say about them. The only bad thing though is the cost—the standard wheel is now above \$100 plus shipping. Check the latest issue (number 6) the Mother Earth News for wheel plans which I developed along with a potter friend. Total cost—about \$65.

Estrin Wheels—a Canadian corporation which also has other potter's equipment. They offer four wheels of different flywheel weights, with or without motors, from \$109 to \$164 plus a \$6.00 crating charge on all models.

Oak Hill Industries—1301 North Utah Street-Davenport Iowa 52804. They offer a standard kick wheel in a kit form. You can get fly wheel weights of 80, 110, and 140 pounds. It has a plywood frame with a cast aluminum wheel head. You can either buy it as a kit or preassembled. It seems like a good wheel.

Westwood Ceramic Supply—14400 Lomitas Ave., City of Industry, California 91744, has a dynamite electric wheel with an automatic feed back circuit which proportions out the amount of electricity relative to the force being generated by the potter on the clay. Its an electric wheel with gear reduction system. Seems like a fine tool. Unfortunately, their catalog doesn't have a price for the wheel.

Skutt Ceramic Products—2618 East Steele Street, Portland, Oregon 97202. They make one electric wheel for \$324.95 which is a pretty heavy price. I have used one and know other potters who have and its really beautiful, except for the price.

Oscar Paul Corporation 522 West 182 Street, Gardena California 90247. They make three electric wheels which have different motors in them. Prices range from \$275 to \$350. Has a nice mechanical drive system.

Randall Pottery Inc. Box 774 Alfred New York 14802. They make perhaps one of the finest kick and motor driven wheels around today, except for the price. They have a standard kick wheel for \$270 which can be motorized for an additional \$155 so the grand total comes to \$425 for their motorized wheel. They also have a special wheel for \$565 with a bunch of accessories totaling about \$100 so there's a wheel going for \$665. I have used a Randall electric for a long time previous to the one I built now and it is a really fine wheel, except for its price.

Kilns: If you're into gas kilns, build your own. Don't buy a gas kiln cause you'll be ripped off by its overwhelming price. You can get 1000 K-23 insulating fire brick for about \$300, or less if you shop around for seconds. I got 1000 of these for half price. You can make your burners out of standard pipe fittings and use a vacuum cleaner for forced air. For burner plans, write to Alfred University, Alfred New York 14802 (Ceramic Dept) and ask for the schematic for the "Alfred Burner". They will charge you for a Xerox copy (probably). You can get burners from Pyronics Incorporated 17700 Miles Ave. Cleveland Ohio 44128. You can pretty much get a burner designed to your specifications cause they have a lot of designs. I bought two of their 10ET torches with pilots, safety switches, and some other garbage for a total of about \$160 which was the most expensive part of my kiln.

Books: The only trouble with Rhodes Kilns is that it leaves a lot out which you either have to find out for yourself or find out by trial and error. Other than that, it is quite good. Clay and Glazes for the Potter by Rhodes is a fine book, and that's about all you should really know. Nelson's Ceramics a Potter's Handbook is ok if you'd like a historical development of the art included with the technical.

Other ditties: If you're into building a kiln, write to the A.P. Green Company, 1018 East Breckenridge St., Mexico, Missouri 65265 and ask for their Pocket Refractories Catalog. Its free and has tables, product information, details of constructions, etc., all about refractories, and is about 200 pages for free.

Ceramic Supplies

most of this information was given to us by Bruce McDougal, who runs big creek pottery, davenport, california, 95017, his studio looks like a fine place to learn and work pottery.

-jd

You asked for some comments on pottery suppliers and gear: And I have some opinions, so here you are . . . The enclosed is a list of suppliers that I am more or less familiar with, some of whom I do business with regularly, others I just know about. There are many more good ones I am sure, and if I've missed any that's because I don't know about them.

-Bruce McDougal

Westwood Ceramic Supply

14400 Lomitas Avenue
City of Industry, Ca. 91744

Complete line of clay, glazes, glaze materials, chemicals, tools, wheels, kilns, etc. Good service & prices. Write for catalog (free)

Western Ceramic Supply

1601 Howard Street
San Francisco, Ca. 94103

Complete line of materials, clay, wheels, etc. Prepared glazes. Excellent source for enamels at good prices. They have a good kick wheel. Write for catalog (free)

W.E. Mushet Co.

725 Bryant
San Francisco, Ca. 94107

Kilns, repairs & service. Refractory materials & equipment.

Ceramics & Crafts Supply Co.

490 5th Street
San Francisco, 94107

Clays & Glazes (westwood)—at better small lot prices than you can get from L.A.) Materials of all kinds. Lockerbie wheels. Write for catalog (free)

Leslie Ceramic Supply

1212 San Pablo
Berkeley, Ca. 94706

Clays, glazes, kilns, wheels, materials, molds, tools, An excellent all-around source in the east bay.

Thorley Pottery Supply

1183 Industrial Avenue
South Gate, Ca. 90280

Kiln shelves, and I don't know what else. An excellent source for fired clay shelves in large sizes that will take cone 10-11 reduction firings without trouble, at about 1/3 the cost of Silicon Carbide. Also excellent posts.

Electro Refractories

18765 Fibreglass Road
Huntington Beach, Ca. 92647

Also excellent kiln shelves that will go to c/10-11 at a fraction of Silicon Carbide. Ask for Comp 104. They do not have the range of large sizes that Thorley has. Compare prices in your size.

Pyro Engineering

200 South Palm
Alhambra, Ca. 91801

Thick slabs for fiber plates, etc. (mine are 2" thick)—I don't know what else they have—I suspect shelves also, and etc.?

Denver Fire Clay Co.

3033 Blake Street
Denver, Colorado 80205

Complete line of kilns, wheels, glaze materials, etc. Excellent small power wheel. One of the original kiln builders. Bought out Dickenson years ago & now makes that kind also. Catalog (free)

Castle Clay Products, Inc.

1055 South Fox Street, Unit No. 2
Denver, Colorado 80223

Catalog free.

American Art Clay Co.

Indianapolis, Indiana 46200

An old company, making kilns, wheels, & selling all kinds of supplies. Oriented toward schools, their kilns are built massively & with all kinds of safety controls available to satisfy the most picky fire marshal. More expensive than some. Write for catalog (free)

The Craftool Co.

1 Industrial Road
Wood-Ridge, N.J. 07075

Tools for ceramics & many other crafts. Catalog, \$1.00

Kemper Mfg. Co.

P.O. Box 545
Chino, California 91710

Kemper specializes in making hand tools for the potter & sculptor. They do a good job, have a wide selection, and offer quantity discounts for direct sale. Write for catalog (free)

Sculpture House

38 East 30th Street
New York, N.Y. 10016

Hand tools for sculptors & potters—a complete line. Catalog (free)

A.D. Alpine Inc.

353 Coral Circle
El Segundo, Ca. 90245

Kilns, mainly—also wheels and other ceramic gear. Their kilns have for many years been the poor potters friend, because they have sold so many that they are easier to find second hand than almost any other (at least in the west) They take a little experience to fire, but are excellent, reliable and long-lived. Catalog (free)

Duncan Ceramic Supply

5649 East Shields
Fresno, Ca. 93727

This is reported to be a remarkable place, well worth visiting if you are in Fresno. They have an excellent line of low fire glazes, and other supplies. I don't have their catalog, but they come highly recommended, and I think they probably have one. (free???)

Jack D. Wolfe

Another ceramics supplier, lowest prices in New York area. They have a jet black clay.

Jon Kaplan on Clays and More Kilns

Clays:

The Fenton Foundry Supply Company
134 Gilbert Avenue
Dayton, Ohio

Has the cheapest prices on all bentonites, and super cheap prices on Redart Clay (\$2.50 cwt.) and Jordan Stoneware (\$3.50 cwt.) They are nice people to deal with. (free brochure)

Cedar Heights Clay Company
50 Portsmouth Road
Oak Hill, Ohio

They mine and manufacture the Cedar Heights brands of clays, including Redart, Goldart, Fireclays, etc. If you pick up the clay at their place, prices are good—Goldart \$25.00 a ton, Redart, \$37.00 a ton. (free catalog and samples)

George Fetzer Ceramic Supply Company
1205 Seventeenth Ave.
Columbus, Ohio 43211

Fetzer is a really fine person with really low prices. He used to have the lowest prices for clays and glaze materials last year, but they have gone up a few cents, but still are some of the cheapest I have found. He has a grand selection of glaze materials, clays, some tools, and some other things like cones and Tyler screens. (free catalog)

Standard Ceramic Supply Company
P.O. Box 4435
Pittsburgh Pa. 15205

Standard is a huge operation and their prices are really good. They have perhaps the most complete line of clays and glazes, next to Fetzer. They do a lot more business than George, mostly to schools, but a lot of my potter friends and I do some business with Standard. They carry a lot of tools, Randall wheels, Alpine Kilns, and a lot of good stuff. (free catalog)

Rovin Ceramics Supplies
6912 Schaefer
Dearborn Michigan 48216

Rovin is a bunch of freaks with a lot of stuff, medium prices. Have cheap price Crusader electric kilns, and they are one of the few distributors of the Shimpo Wheel. They have a lot of stuff, and a free catalog.

Other things:

Engineered Ceramics
Division of Sola Basic Industries
P.O. Box 1
Gilberts, Illinois 60136

They just had a run on kiln shelves, cone 15 and way above. They were seconds, at \$5.00 each and are outasight, I bought a whole bunch. They make high temperature refractories, like saggars, setter tiles, etc. One of the nicest companies I have dealt with. The shelves are far superior than silicon carbide, and new are pretty cheap. The seconds, if any are still left, are like new, with perhaps a little chip or an iron spot. (free brochures—Hycor Alumina—ask for)

Pyronics Incorporated
17700 Miles Avenue
Cleveland Ohio 44128

Manufacturer of combustion equipment for industry, kilns, etc. I have two of their burners on my kiln with blowers and safety valves, etc., cost me about \$150.00 total. Put out a 200,000 BTU flame of 20 inches long. (Free catalog I think)

Johnson Industrial Furnaces and Burners
Johnson Gas Appliance Company
Cedar Rapids, Iowa 52405

Some blower equipment. Don't know much about it. (free catalog)

Kiliam Gas Burner Company
1240 Sout Bannock Street
Denver Colorado 80223

More burners, better than Johnson, more selection. (Free catalog. ask for drawing No. M-957-D, also P-12 and P-8 burner info.)

Peace

Jon Kaplan
Cleveland, Ohio

PART FOUR

THE FIGHT

Driving through Vincennes that night D.R. and Estelle had their worst fight since they had been together. The immediate issue was whether or not they would spend the night in a motel in Vincennes. Estelle wanted to, was desperate to in fact. But D.R. wanted to keep going. Once the quarrel over motels began, all of Estelle's latent frustrations and grievances toward D.R. surfaced and for about fifteen miles she shrieked and cried and cursed like a mad woman, and when D.R. just sat there not responding she became almost hysterical. At one point she started beating on him yelling, "You clutz, you bastard, answer me!"

D.R.'s response was to turn the radio on and tune in an Indianapolis talk show. "I don't know, I just don't feel very balanced," a man was saying.

Estelle snapped the radio off. With a final "I hate you!" she crawled through the bus onto the mattress in back and covered her head with a sleeping bag.

All weaver's books and supplies edited with Sarah Kahn (and Carole Beadle advising).

Craft & Hobby Book Service

Mail order only, Craft & Hobby Book Service offers a free, comprehensive and invaluable catalog of books for weavers and needle-workers. Only source for many of the titles listed. Books from all over the whole earth on hand-weaving, spinning, dyeing, loom-building, knitting, rug-making, macramé, embroidery, tapestry, lace-making, knots & knotting, textile design. Newly revised & expanded catalog includes select titles in related fields: textile printing, batik, tie-dye, costume design, folk & primitive art & crafts, bead-work, color theory. Each book is well reviewed / catalog is thoroughly indexed / service is prompt & personal / books may be returned if not found suitable.

Byways in Handweaving

The book is concerned with rare weaving techniques and patterns from ancient Egypt & Peru, modern Guatemala, Scandinavia, the South Pacific, Atlas Mountains and various American Indian tribes. Most of the weaves are for narrow bands but many may be adapted for wider fabrics.

There has been a great resurgence of interest in both card- and inkle-weaving since this book was first published in 1954. Both sections include clear text, many pattern diagrams & fine color illustrations of finished pieces. The rest of the book is concerned with a number of other little-known techniques; "primitive" only in the aspect of being non-loom, or requiring only the simplest of materials. There are examples of twined weaving as practiced in many parts of the world as remote from one another as Persia, the Subarctic & the South Seas. A fascinating chapter on braiding & knotting includes a group of Indian, Egyptian, Chinese & Peruvian braids, belt-braiding, Osage braiding. Another section deals with some very subtle and beautiful belt-weaves of Peru, Estonia & Guatemala.

Included in the book are techniques ranging from those simple enough for a child or for use in occupational therapy to some rather difficult & intricate methods which should be quite stimulating to experienced weavers.

Weaving is for Anyone

Rich & inspiring, the theme & theory of this book is that anyone can weave on almost anything. Included in one volume are instructions for making simple and inexpensive looms and a variety of techniques for weaving on these looms. There are directions for looms made of cardboard, picture frames, boards & nails, boxes; there are round looms, bag & backstrap looms. There is a discussion of Peruvian, Chilkat, Salish, Navajo, Ghanaian & Coptic weaving & beautiful illustrations of these techniques and the looms on which they are woven. There are illustrated definitions of weaving terms. A chapter entitled "Weaving from Nature" suggests that a walk in the garden or woods can yield some fine weft material. Over 230 drawings & photos. A good general sourcebook, full of both turn-on and good practical information.

OUT OF PRINT

Simple Smyrna Knot

For this time-saving knot you will need cut lengths of yarn 2-1/2 to 2-3/4 inches long. Lay the ends of one exactly together with finger and thumb and pull the loop over the latch hook... (1) Then push the hook upwards under two cross-threads of the canvas (2).

Lay the ends of the yarn over the latch into the hook and pull the hook downwards, which will make the eye close (3). When the ends of the yarn have been pulled right through the loop the knot is completed. Tighten it by pulling the ends of the yarn (4).

The photograph shows a row of this simple Smyrna knot. To make a square yard of rug reckon 40 to 45 hours of work. Dreher canvas is suitable for Smyrna technique.

Speed Tufting Tool

Dearest Earth,

I realize it ain't polite to turn someone on to a hooker—but I felt it my duty to do so.

You may have already heard of this device—but just in case ya ain't I bought a rug hooker which finishes off a 2' x 3' carpet in about 4 hours in your own design, and in different lengths. And for all those capitalists, a 2' x 3' rug can be made for under \$3 & I've sold 'em for as much as \$30! So.

The dojabber is a mere \$14.95! can you dig it? I didn't think so.

Here's where you pick one up

Columbia Minerva Punch Needle, Postpaid \$2.75

We use this Punch Needle with yarn only, but it is sometimes used with cloth strips. It is the most practical and versatile punch needle we know. Most of the rugs made at the Ruggery are made with this Punch Needle. Comes with 2 size points. Adjusts to give 10 different length loops from 3/8" to 7/8". Good for quiet sitdown work.

Instructions for making rugs or wall hangings with a Columbia Minerva Punch Needle. Diagrams. A booklet by George Wells, \$1.00

Covers everything from threading the needle and spacing of stitches to backgrounds and finishing. With these instructions and no lessons you can make good rugs. Punch needles have proved to be the most popular method for "hooking" with yarn.

Susan Burr Shuttle Hooker, postpaid \$3.50.

Wooden handles—shaped like a guitar. Works better with "rags" than it does with yarn. It is not adjustable for height of loop. Rag loops approximately 3/8", yarn hooks slightly shorter.

CINCINNATI

At the edge of Cincinnati D.R. pulled into a Gulf station and parked around the side by the tire rack. Since their argument the night before, and the cryptic statement over the radio by the guy who didn't feel very balanced, D.R. had been into balance as a concept. About to enter Cincinnati, he wanted to stop at the station and spend some money so his wealth would align with the inner grammatical logic of the city he was coming to. D.R. had lived in Cincinnati, and in the smaller towns north toward Dayton—Middletown, Hamilton, Franklin, Miamisburg—the last ten years of his life, and yet this very day was the first time he had ever really flashed on the word Cincinnati. There he was, driving along, considering the concept of balance while Estelle slept furiously in the back, when suddenly the word "Cincinnati" popped up on a highway sign. Fantastic, D.R. thought.

Cin
Cin
Nat
I.
How balanced, how smooth the word Cincinnati. Both in form and content. Content equals sin two times, add one natty. Natty sin. Four vowels in Cincinnati, three i's pierced by a single a.

Cin
Cin
Nat
I.

Four syllables. Four vowels and four syllables, ten letters in the word all together. Four and four are eight, plus ten is eighteen. I've got eighteen dollars and eighty cents, an imbalance of eighty which it won't take me a jiffy to rectify if this old boy will wait on me.

"Excuse me," said D.R. "How much are those fuses there?" He was looking at a sign above a box of fuses that said, "Why be helpless when fuses blow? A few cents spent for a box of fuses will save you possible delay or danger later on."

"Do which?" said the attendant in a high, nasal, hillbilly whine. He was busy making coffee on a hotplate over by the roadmaps.

"Those fuses. How much are they?"

"Twenty cents apiece," said the attendant.

"Good," said D.R. "I'll take four."

The attendant picked out four fuses and stepped with them to the cash register, yawning as he rang them up. It was about five in the morning, barely sunrise. It was hard to tell if this was an all-night station or the start of a brand new business day.

As the attendant pecked the various keys, D.R. felt a deep sense of well-being glowing inside him. Eighty cents from eighteen eighty left eighteen exactly. How perfect, how balanced, how lovely the word exactly. Ex. Act. After the act. It reminded D.R. of the I Ching hexagram called After Completion, the one about the importance of tuning the flame beneath the kettle exactly right, so that it burns with a precise intensity. Precision, D.R. thought. Precision and intensity. Those are the keys.

"That'll be eighty-three cents," said the attendant, yawning again.

D.R. looked at him. "How much?"

"Eighty-three cents."

"Why the three cents?" D.R. asked, and when the attendant said sales tax D.R. thought: fucked in the ass by a tax.

D.R. was not enlightened by any of this experience, but it edged him a little further along the way.

Your Handspinning

THE book on handspinning.

The book commences with a discussion of wool & sheep, then come chapters devoted to sorting a fleece, learning to make a continuous yarn & the art of carding & spinning wool. There is an excellent section on the construction, use & maintenance of spinning wheels & hints on buying a wheel. There is information on the cultivation & preparation of flax, and the spinning of fibres such as silk, angora rabbit, camel & other animal hairs. There is a chapter on plying & the making of fancy yarns and a section devoted to the preparation of spun yarns for use—washing, bleaching, etc. The book concludes with a chapter on machine spun yarns: counts/ qualities & defects/ fibre identification. Illustrated with many line drawings. —SB

Dog Combs, etc.

Many dogs yield combs or clippings which can be spun into useful yarns by whichever method is best suited to the length and character of the fibres. Poodle clippings, for example, make a very pleasant "woollen" yarn while the lustre of Spaniel hair needs a worsted spin. The addition of a little oil prior to combing or carding may make spinning easier.

Combs or clippings should be stored until wanted in an air-tight container in a cool place, preferably with a moth deterrent such as paradichlorbenzine.

No instance of the use of cat's hair for spinning has ever come to light but it would be quite possible to spin combs of a fine haired Persian, especially carded with suitable wool. The author's experiments with a mixture of Siamese and camel are not to be recommended!

The Indian Spinner

If you are looking for an interesting new type of spinning wheel which is relatively inexpensive compared to the standard antique or new wheels, consider an "Indian Spinner". They are much easier to learn to spin on, especially if you can spin yarns with a spindle. The nicest feature is the ability to handle very thick yarns as well as the thin threads you get with a standard wheel. Its design is simple and functional, being similar (if you are familiar with the parts of a spinning wheel) to that of an enlarged "mother-of-all" of the standard wheel. The Bobbin holds a great amount of yarn. The spinner head can be attached to an old type treadle sewing machine or purchased with a wood treadle to match the spinner. The Spinner Head alone costs about \$25, with a treadle base \$43.50. These prices are for the plywood spinners; they also come in fancier woods at fancier prices. They are available through the Handcraft House, 1942 Marine Drive, North Vancouver, B.C., Canada. They publish a small catalogue for \$.50.

[Suggested and reviewed by Carole Beadle]

The first fibers of the fiber supply caught to the yarn.

Ashford Spinning Wheel Kit

I thought I tell you something about the Ashford Spinning Wheel Kit. I am a "spinner" from way back and this wheel—it took about 6 months to get here—is just great, well balanced. It is easy to put together and finish. Even the inexperienced spinner will have few problems with it. I am zipping off the skeins like nothing even to real fine weaving threads.

By the way it is quite worthwhile to wait for the items from New Zealand. The price alone Spinning Wheel \$31.—as compared to old or new ones here none under a \$100.—. Quality wool 10 lbs \$7.00 delivered to you as compared to making a long trip somewhere and picking up much inferior wool which is a pain to card, wash & spin for the same price or more.

[Reviewed by Ursula Schramm]

HANDSPINNING

Art & Technique by Allen Fannin

Garnetting. The use of previously spun yarns, which have been broken up or garnetted, as it is called, is another way to design yarns with texture. This method is generally not employed by hand-spinners, though it no doubt should be. The system of using fiber that has been reprocessed or garnetted from spun yarns, and then respun is primarily used in a mill situation for producing lower-quality goods. However, as a design device, there is much potential for the handspinner.

The flyer wheel. (A) stock (B) legs (C) treadle (D) pitman (E) drive wheel (F) drive wheel posts (G) drive band (H) flyer assembly (I) tension adjustment.

Made-Well Spinning Wheel

This company is run, I am told, by an Indian tribe. It is located in a very small town in Canada. The company doesn't have a phone; I tried to call once. They make excellent quality products.

Spinning Wheel ea \$45.

Cards ea. \$6.

Carding machine (crank model) ea \$25.

These are approximate Canadian prices. They are subject to change periodically. There is also duty when having them sent into the U.S., but I consider the wheels and cards of better quality than any I have seen and worked with. The prices (even with duty) are less than wheels manufactured in the U.S. They have no outlets the wheels must be ordered direct.

Try Tintex

Larry Koenigsberg's letter on pg. 7 of the January Supplement concerning Rit dyes are my sentiments exactly. A white back I dyed a T-shirt in Rit dyes. The colours were O.K. till I washed it and wow did it ever fade. I've found Tintex dyes to be more reliable — they hold their colour when washed and are brighter to begin with. They work great on cottons (even if it's stay press material), silks and linen. Tintex dyes are quite a bit cheaper than the Procion dyes Larry suggested (35¢ for a 2-1/8 oz. box), and due to the fact dyeing has become so popular they now come in a wide variety of brilliant colours (now one doesn't have to mix colours as one had to produce brighter colours). This saves time and money as well.

There are some of the new colours that I've found are exceedingly good:

- Butterscotch
- Tiger Lily — a brilliant orange
- Cranberry Red
- Plum — a beautiful purple

If you don't want your colours to run or fade when you wash them put them in vinegar or very salty water before you wash them. I've found it helps a great deal.

Dye Plants and Dyeing

This book I consider about the best that is available on its subject and would make an excellent basic handbook for the beginner. It contains historical information as well as the basic steps to dyeing, recipes, and articles about dye plants from various regions and countries. So, no matter what part of the country you live in, you will find a variety of plants and recipes which you would be able to use. There is enough information in this book which should enable you to start your own dyeing and end up with satisfactory results . . . which is not true of all natural dye books. The one difficulty in using it, however, is that there is no index.

or WHOLE EARTH CATALOG

How to prepare the dye solution by chopping, then soaking and boiling the plant parts, and straining them out before adding their color to the dye bath, is told on pages 13 and 14. Briefly, here are the basic directions for the actual dyeing of wool:

Have wool clean and moist.

For each pound, use 4 to 4½ gallons of dye bath.

Enter wool when dye bath is lukewarm.

Heat slowly to simmering point and let simmer half an hour (longer if required), moving wool gently back and forth.

If dye bath gets low, lift wool, add hot water, mix in well, and return wool to pot.

Rinse dyed wool first in nearly boiling water, then in several waters of gradually lowered temperatures.

When rinsing water is clear, squeeze moisture out of wool and dry in shade.

THE COACH'S PANTS

D.R. didn't feel like going out to his sister's place till things got a little more balanced, so they drove into downtown Cincinnati and parked around the corner from the Greyhound bus station. They figured that would be a cheap place to eat, and besides that, D.R. wanted to change clothes and wash up some. He didn't want to disguise himself in cleanliness for his sister's sake, and her family's, but he didn't want to scare anybody either. He looked pretty freaky for Cincinnati. He and Estelle had been drawing stares since the streets began to fill with people going to work. What D.R. really wanted was for his appearance to not be a factor one way or another. That wasn't very likely, considering his hair, but maybe a change into more or less straight clothes would at least keep the whole how-you-look thing at some low plane out of everybody's way. If that could happen he figured he stood a good chance of bringing this day into balance after all.

D.R. fished around in his duffel bag for the shirt and pants he'd bought at the Goodwill in California. The shirt was gray with little blue pin-stripes up and down it. It had wide, french cuffs and a button-down collar, although when he put it on he didn't button it down because the button on the left side was gone. The pants were brown, frayed at the pockets and shiny at the ass and knees. They'd probably been part of a suit worn by the manager of a discount store, or perhaps by a small town high school coach about to leave athletics and go into administration. Probably he coached about four sports. Leaving it to go into administration would mean going back to college, of course, and finishing up the old M.A. Probably he would do it in summer terms. Ten or twelve summer terms, ten or twelve more football, basketball, baseball and track seasons and he'd be all set. Maybe he would even get a new suit somewhere along the way and build his wardrobe again, after the loss of his brown pants.

Suddenly it occurred to D.R. that the reason the pants had wound up in the Goodwill on sale for twenty cents was that the coach had died. A heart attack, most likely, maybe cancer. D.R. didn't like to think about the coach being dead. The thought of him being dead put things out of balance again. To keep from thinking about the coach D.R. read the graffiti on the walls of the toilet stall as he rolled his old dirty clothes up in a wad.

Suck on this one, Hard Hat America, someone had written in ink. I'm over thirty, college educated, liberal, have long hair, and make \$45,000 a year.

Next to it someone had replied, in crayon: When they aren't sucking a big dick, all Long Hairs are skin divers for Roto-Rooter.

Above the toilet paper container someone had scratched with a knife: If you've got it all together, what's that all around it?

And then as D.R. was leaving the stall he read on the door:

There are times when the wolves are silent and the moon is howling.

That one sort of got him. He stood there looking at it a long time, wondering if it would make things more balanced or less for him to write something on the wall. Finally he took a stub of pencil out of his pocket and wrote: I am a balance freak in a dead football coach's pants.

Schacht Looms

Would you please consider the inclusion, in your Spring catalog, of the weaving equipment being manufactured by the Schacht Spindle Co., 646 Pleasant St., Boulder, Colorado.

As a long-time weaver, and author of weaving books, I can recommend the four harness loom. It is especially helpful because of the portability, and possibility of a long warp. This equipment is very well made.

Enclosed, brochures and a photograph of three of the pieces of equipment made by these people.

Thank you.

Very truly yours,
Jean Wilson

P.S. Am also enclosing a brochure and announcement of my first book, Weaving Is For Anyone, and the second one, due out any week now—Weaving is Fun. A third book is now at the publishers, and a fourth one is being prepared. (Book 3, Weaving Is Creative, all of the Weaver-controlled weaves.)

Wind Bell Inkle

May I pass on to you and your readers some information regarding inkle belt weaving which I found very helpful? The Wind Bell Inc., 5714 Kennett Pike, Centerville, Delaware stocks an American style (table model) inkle loom for \$10. Having had friends who have paid up to \$30 for inkle looms, I was rather dubious about this model, but have completed the 18th belt on it and find it outstanding.

There is also a wonderful little book entitled Weaving Inkle Bands, by Harriet Tidball, (\$4.00, Craft and Hobby Book Service, P.O. Box 626, Pacific Grove, California 93950) which illustrates in easy to understand fashion the various patterns one can use in weaving these belts.

Carol D. Westfall
Baltimore, Maryland

Dawson Inkle

Another good inkle costs \$14 from:

Don Dawson
25 Tintern Lane
Portola Valley, CA

Nelson Waist Loom

For weaving up to 24" wide, do it in your lap with a back-strap and save. 13" loom \$6. 25" loom \$12.

Robert C. Nelson
69 Pleasant St.
Concord, Mass. 01742

Good Karma Loom

We're writing to turn you on to a hand-loom—the 18" Good Karma Continuous Warp 4-Harness Loom with Tension Adjustment. This is a superior hand-loom, very high quality and low cost. It's hand-crafted and hand oil-rubbed, obviously made with loving care. It's constructed of hardwood members pegged together with wood pegs to create a very rigid, esthetically pleasing and extremely versatile hand-loom. The only metal necessary is two wing nuts on the tension adjustment bar.

This loom may be used for controlled tabby or four-harness pattern weaving, Rya, tapestry, lace weaves, rug making and other weaving where a reed is not necessary. The warp goes directly on the loom. Heddles are attached last and may be changed with ease. This loom weaves fabric up to 18 inches wide with warps either four feet, seven feet or ten feet long. It comes with complete instructions and a 20 inch tapered hardwood shuttle.

It is easy to operate, making it ideal for beginners, yet offers a myriad of possibilities in weaving complex large pieces. This loom is for the whole family. Your kids will want to weave too—ours are doing quite well. They have their own loom now so we can have a turn, yet despite the use, the quality is such that they'll be in use in the family for years.

The price is \$26.00 postpaid from Neal Patterson; Good Karma Looms; Route 1, Park View Terrace; Chadron, Nebraska 69337. It's also available at the Whole Earth Access Company in Boulder. Neal guarantees it completely—if anyone is dissatisfied, they can return the loom undamaged and postpaid within a month after purchase, and he'll give a complete refund.

He does other good things with looms, too, including a 9 inch Super Inkle which we especially like. His future plans include floor looms and traditional style spinning wheels. He's really open to new ideas and wants to supply what the people need. I'm sure he'd send you any information you want, but you might enclose a self-addressed stamped envelope, as he personally handles all inquiries.

Up here in the Colorado mountains we've been learning to spin wool on a hand spindle and are beginning to size up the dogs and the goats for shearing!

Sher Herdt and Dale Kellogg
Boulder, Colorado

Pioneer Loom

A breakthrough. Table looms 10", 15", or 20"; available with 2, 4, 6 or 8 harnesses. A unique warping system which saves time and permits great flexibility in design. Since the heddles & reed are open, and the frame is extendable, the warp can be one continuous thread taken from a ball of yarn. The usual warping sequence is simplified into one operation that takes only minutes to complete. No extra equipment is needed; the loom itself can displace warping board, lease sticks, hook & raddle.

Because the warp can be one continuous thread (or several continuous threads used alternately), design can occur spontaneously without previous exacting calculations. Warp threads can be adjusted from one dent to another & from one heddle to another even after weaving has begun.

Why haven't looms always been made like this?

Prices range from \$94.50 for 10" 2-harness "Sampler" to \$169.50 for 20" 8-harness "Craftsman."

Looms

OK, serious looms. The best is Gilmore, but you'll have to wait 6 months until they catch up with your order. Next best is Macomber. Then Lorellyn. Also check out Harris, Newcomb. If you're discriminating and patient and want a buy, you'll write to Sweden.

—SB

Gilmore Looms

...Lastly, you are advertising LeClerc Looms, which are not the best, merely the most advertised. I am an experienced weaver and have woven on most brands. I heartily recommend GILMORE for anyone who is actually interested in weaving, rather than just playing-like. They are less expensive, better made, and much more efficient both for set-up and during weaving. The harness frames lift right out for quick heddle changes between weaving projects, a unique warp advance system is used, the rising shed is sure and versatile, workmanship is unsurpassed. When speed is important these features are vitally important. I have an 8-harness 46" very heavy rigid Gilmore (\$350) [or compact \$315]. LeClerc's comparable model Nilart 8-harness 45" is \$457 (!) and inferior. Grok on that and send for a brochure: Mr. E. E. Gilmore, Gilmore Looms, 1032 North Broadway, Stockton, California 95205.

Lorellyn

After shopping for a floor loom at a decent price I've come to the conclusion that making one is the only cheap way out. However, an alternative might be a product of Lorellyn Weavers who are located near Grass Valley, California. Mr. Crandall makes a quality loom at about half the price of many others I looked at. He is a good conversationalist and loves to answer weaving problem questions if you drop in. Go pick up your loom and learn a lot. Crandall has been into weaving for way over 30 years.

14 inch, two harness table model	\$35.00
20 inch, four harness floor model	\$65.50
30 inch, four harness floor model	\$85.50

Prices are F.O.B. Chicago Park, California. Larger looms are available and you can request info about these. Crating charges run \$2.50 to \$3.50.

Looms From Sweden

These are fine looms that are cheaper than equivalent looms on this continent. Cheaper, including shipping and customs (there seems to be no tariff category applied directly to looms so persuade customs officer to classify it as a sewing machine which is the lowest rate conceivably applicable. If he's nice he'll do it automatically). Not only does this firm offer good quality equipment:—these looms are built in more or less the traditional Swedish loom design (weaving having been long a prime activity in Sweden); and with the high degree of wood craftsmanship Sweden is noted for (in case you didn't know, Sweden is noted for wood craftsmanship, along with all else) Therefore they are damned good to look at & just have sit around when not being worked upon (maximum wood/minimum metal). Also available are the standard weaving accessories: warping racks, etc. and spinning wheels and tapestry looms. Profusely illustrated catalog available—specify English supplement or know Swedish.

Glimskra Vävstols Fabriken

Vävskedsverkstad
792 00 Mora
Sweden

Harris Loom

I was dismayed to read in your March supplement about the unhappy experience of Karl Smiley in his search for a loom; and I thought some information about a loom designed and made in Vancouver might be of help to him and some of your other readers. The maker of the loom is H.C. Harris, of North Vancouver, B.C., Canada, and the looms can be ordered from Handcraft House, 110 West Esplanade, North Vancouver. The table model, 22 inch, 4 harness, sells for \$55.00; and a treadle version of the same loom costs \$85.00. Anyone living out of Vancouver would have to add shipping costs which I have been advised would not exceed \$10.00, and persons living in the U.S.A. would have to find out about customs, but even with these added costs the loom is a bargain, sturdy, attractive and well designed.

Jean Mallinson
West Vancouver, B.C.

TERMINAL

As D.R. came out of the men's room he was flashing on the word terminal. T—E—R—M—I—N—A—L. I am in a terminal. The end of a line. Three vowels, an e, an i and an a. And three syllables, three very neat and pungent syllables each with a vowel nestled in its middle like a jewel. How balanced. How very balanced is the word terminal, in content as well as form. At a terminal people arrive and depart, they begin new journeys even as they are ending old ones. Both things happen at a terminal, it goes both ways. It's like calling graduation commencement. Commencing as you end. Indeed, because you end. Like living because you die. That's a very religious idea. Bus terminals are very religious places. Look at this room. A waiting room. People gathering in off the streets to wait together for the next thing in their lives. A place to come and wait. Waiting as a form of worship, sitting in these pews. Estelle is there in a pew. She could very well be praying. Praying and waiting, waiting and praying, how balanced, how even.

I wonder if she'll like my outfit.

"How do you like my outfit?" D.R. asked Estelle.

He had come up from her blind side, down the lane between the rows of pews, and his voice startled her and made her jump. She looked around at him, and smiled. But it was a feeble smile. Estelle seemed confused. Then D.R. noticed there were tears in her eyes. He sat down and put his arm around her and asked her what was wrong.

Estelle shrugged his arm away. "Nothing's wrong," she said.

"But you're crying."

"I'm not crying," said Estelle.

"But you are, honey. I see the tears in your eyes."

"Please don't say I'm crying when I'm not," said Estelle.

"I'm all right."

"But honey . . ."

"Oh!" Estelle exclaimed angrily. And she got to her feet and moved several seats away.

D.R. followed her and tried to put his arm around her again.

"Estelle, something's wrong . . ."

"You're hassling me is what's wrong!" Estelle turned to look

D.R. in the face then, and when she did the tears spilled over and she really began to cry. She looked awfully sad to D.R. then, quite weak and helpless and worn down, and he wanted more than ever to take her in his arms. But the same pleading that had been in her voice was in her eyes now. She truly wanted to be left alone. D.R. leaned back in his seat and gazed around the room. A minute or two later he leaned over and whispered that he would be right back. Then he got up and walked to the row of telephones by the wall on the far side of the room.

2 More Yarns

Knitting, Weaving and Crochet Yarns

Here's two more super yarn addresses:

Someplace, 2990 Adeline Street, Berkeley, has 28 beautiful rainbow colors of pure wool as well as mill ends (good value), odd lots, macramé, embroidery and weaving supplies. Send fifty cents for a sample chart of standard stock colors.

Mairi Macintyre, Ltd., Fort William, Scotland, has a wonderful assortment of "Scotland's Finest Woolens." The Shetland colors; pheasants, grouse, flint, blue kyle, crag rose, and peacock to name a few. They're the most beautiful I've ever seen. Send 25 cents to cover cost of postage and color chart. They come by boat so it takes a while. I ordered yarn from there 10 years ago and several of the sweaters I made are still going strong. Mairi Macintyre works out the postage on orders and sends along an invoice with orders. International Money orders are the best form of payment. I believe orders valued less than \$10 will come in duty free.

Jeanie Darlington
Miranda, Calif.

Icelandic Yarn

At about 1/2 the price sold for in this country—if you can get it. For weaving and knitting. Exceedingly warm, soft, and durable. Hand washed, carded, and spun natural (undyed) wool. In six shades (code Nos for ordering appended):

White	Farve 54	Páti 145
Light grey	56	2
Med. grey	57	47
Rusty brown	66	275
Tan	53	56
Dark brown	52	244

The color of the wool is the color of the sheep. Which is a nice thought.

CUM Yarn Samples

Though one can stockpile free & usually mediocre yarn catalogs, \$3 sent to CUM brings a large binder filled with sample-cards of handweaving yarns of finest quality, large color range, yet cheaper than dime-store knitting worsted.

CUM is now set up to handle U.S. orders; their catalog/price list is in English, gives price per pound in dollars, unlike other European yarn houses. Samples include 1 & 2-ply woolen yarn, rug, tapestry & knitting yarns, worsted, cotton & linen yarns, rug warps, twine. All yarns are mothproofed; prices average less than \$3/lb. for yarns of high quality, esthetically and structurally. Delivery time approx. 6 weeks by ship, less than 2 weeks by air.

Natural Yarns

I would like to suggest handspun yarn from Paula Simmons. Yarn like this really makes it worth one's while to weave or knit. Undyed, unbleached yarns that come in many shades and mixtures of cream, red, brown, grey and black—the Simmons sheep grow that way. I once saw a pelt from one and am sure it could double for costly fur.

Will's brown sweater is super warm, soft, nearly waterproof and BEAUTIFUL.

The yarns are in many thicknesses so you can make a bear sweater or a delicate baby garment. Mrs. Simmons also weaves from her yarn and sells the product as well as giving you advice on knitting or weaving with it yourself.

Peace,
Janet Bloch
St. Louis, Missouri

Paula Simmons
Suquamish, Washington

Price is 92 cents per ounce, plus postage. Yarn is completely pre-shrunk, in center pull balls.

The Complete Book of Progressive Knitting

*This is the most complete knitting book that I have seen. It discusses yarn, its qualities and history, and gives clear instructions on the basics of knitting. Where other books only give directions cryptically written as 'K1, *Y.O., K2 together *K1 repeat this row for the desired no. of rows,' this book tells you how to figure out the desired number of rows for all types of garments from sweaters to suits. The only real drawback I could see was the book's illustrations. [Reviewed by Lois Brand]*

or WHOLE EARTH CATALOG

The knit stitch is the foundation of all knitted fabrics.

Position of the Hands. The needle containing the loops to be knitted is held in the left hand with the needle underneath the hand as in Plate XVI. The other needle is held in the right hand as one would hold a pen or a pencil. There are many ways of holding the yarn to be worked over the fingers, but whatever way is used there should be no tensed muscles and no stiff fingers. Knitting for relaxation requires no tension. It is preferable that the yarn be fed over the fingers of the right hand. This is the only way different colored yarns may be worked in a pattern without having a long loop at the back of the work.

The yarn passes over the index finger of the right hand, around the middle finger and is held by the other fingers. It is the way in which the yarn is held that makes the tension of the stitch. There should be absolutely no gripping of either the yarn or needles. The knitting should be worked with ease and the yarn drawn smoothly through the fingers.

PLATE XVII.

Buttonholes are knitted as the fabric is being made, not slashed as in sewing. Therefore, it is advisable when knitting garments, to knit the side on which the buttons are to be fastened first. In this way the position of the buttons may easily be ascertained and marked, and hence be a guide for the buttonholes. This is important especially where the last buttonhole should be at the neck line. Decide upon the size of the button. If bands are used, the buttonhole is made in the center of the band. The width of the band usually depends upon the size of the buttonhole, that is, if a buttonhole requires 4 stitches, the band should be at least 8 stitches wide, allowing 1/2 the width of the button on each side of the buttonhole.

Method. The position and size of each buttonhole having been ascertained, bind off the necessary number of stitches at this point. Continue to complete the row as previously, and back again to where the stitches have been bound off. The stitches are added the same way as the second method in the Chapter on Fundamentals.

Note. Turn the work to the wrong side to add the stitches and back again to the right side after they have been added.

After the garment is completed, the buttonholes should be finished with buttonhole stitches, using the same yarn if possible, or should be reinforced with binding on the wrong side.

Garments of pure wool yarns are hard to ignite even with an open flame, because wool is slow to oxidize. This is a great protection in the home, especially where there are young children.

Wool may be knitted or woven into fabrics of delicate sheerness, unsurpassed by any other fiber, and lightness is one of the essentials of modern attire.

Armhole Formation

The shoulder to shoulder measurement is 18 1/2 inches.
15 1/2 x 6 sts to the inch. K1 st.
An even number of stitches is always better in calculating any change of shape in knitting, therefore we shall use 90 sts for the required number across the shoulders.

America's Knitting Book

Did you know that sweater sizes aren't standard? I didn't. Gertrude Taylor tells you how to choose your correct size by glancing through the pattern direction: Add the no. of stitches in the complete bust line and divide by the stitch gauge. This will give you the correct size. Be warned to add 3 inches to your actual measurement for ease.

America's Knitting Book contains all the information needed for a beginner in an easy to understand style.

"Do not hold needles like a pencil. Perch up on top of the needles." How many people quit before starting because it was too hard to hold needles like a pencil?

The instructions are good and the graphics don't look like 1940. There is also lots of stuff that's far too advanced for me to really comment on except to say that I felt that I could do it with the instructions given.

The Improved Horizontal Buttonhole

Starting at the front edge, work two stitches (or whatever your pattern calls for), bind off the next four stitches (or whatever your pattern calls for). Work to the end of the row. On the next row, work until you come to the hole, then turn your work around and "knit on" four stitches as in making the regular buttonhole, then pick up the front loop of the first bound off stitch and slip it onto the needle next to the knit-on stitches. Then turn your work around again and work to the end of the row (2 stitches). On the following row, work two stitches then knit together the "picked-up bound-off stitch" and the last stitch of the knit on stitches.

This buttonhole may be used whenever you are working with knotty or nubby yarns and cannot plan on hand-finishing the buttonholes. If you are working with smooth yarn, you will be hand-finishing the buttonholes, and it is not necessary to use this improved buttonhole.

TELEPHONE CALL

D.R. dropped two nickels in the pay phone and dialed his sister's number. But as soon as he heard it ring he hung up and took his nickels back when they came clanging down the shoot. Then he was so pissed at himself for not completing the call he hit himself on the leg with his fist. As the force of the blow spread outward through his thigh and turned to pain it made him feel so one-sided and imbalanced he had to hit himself on the other leg to keep it all from toppling over.

There weren't many people in the bus station that hour of the morning, and no one was using any of the other booths. So D.R. stayed in his booth after his aborted call to think things over. He guessed that was what Estelle was doing too. Thinking things over. Her pose even resembled that of The Thinker. D.R. saw her through the window in the door of the phone booth. She hadn't moved since he left her. She sat turned to one side, one hand propping up her forehead, her elbow on her knee. She looked very unbalanced sitting like that, very awkward and unnatural. To balance it, D.R. sat up very straight in the phone booth, with both feet flat on the floor and his hands on his thighs, palms down. That did it for a minute or two. But then D.R. realized that his left nostril was stopped up, and that his breathing was very unbalanced as a result. His solution was to move his right foot until the heel was off the floor, getting the right foot out of phase as compensation for his malfunctioning left nostril. That felt pretty good. He held the position the next few minutes as he tried to think things over.

What in the goddamn hell's going on? In the long run I really couldn't say, but in the short run, to tell the absolute truth about it, what's going on is I want to leave Estelle here and go on out to Marcella's by myself. To check things out, you dig? I want to go see where it's all at with them see what kind of vibes I get, sort of break the whole thing in easy-like, and bring Estelle out later. Marcella doesn't know about Estelle. I didn't mean to hold the information from her. I just more or less didn't tell her I was travelling with a chick. And I don't want to go busting into their house with a lot of weirdness and heavy vibes and freak everybody out, that's all. It's very simple.

D.R. eased his pose then, and slumped over, relaxed. His little rap with himself wasn't at all conclusive, but somehow he felt better for it. The thing to do was call Marcella and tell her where he was and that he'd be coming on out after while. That was the thing to do.

Encouraged, and determined this time, D.R. put the nickels in the phone again and started to dial. He put his finger in the hole, he felt the cold metal of the thing you dial against his finger, he put his finger right up there in the old hole and started to dial. And then didn't. Instead he placed the phone on the little metal shelf, ran to the next phone booth to get that number, then came back to the first booth and dialed it. When the phone in the next booth rang he went around and answered it.

It was for Estelle. "Hold on a minute, please," said D.R. and he went over to the seats and told Estelle she had a phone call. Slowly she lifted her head to look at him. She wasn't crying now. Her eyes were red, but they were dry, and very clear. When D.R. took her by the hand and tugged, she did not resist. She followed him to the phone booth and went into it as he directed. Then D.R. went to his booth, picked up the receiver and after clearing his throat said, "Hello, Estelle? This is Divine Right Davenport. I want to talk to you."

Knitting Dictionary

The best book that I have found on knitting and crochet stitches is:

Knitting Dictionary: 800 Stitches, Patterns, and Knitting, crochet, jacquard techniques. (\$1.95)

This is the most complete book that I have found. It is well organized and explains things so that if you know the basic knitting stitches you can follow it. Besides being all the above it is small enough to be easily carried with you. When I was in Vancouver B.C. over Christmas I found one there and latched on to it. Upon returning to school in Ohio, I went to a bookshop downtown and there was a whole stack of them. It's really great!

The Knitting Dictionary is distributed by

Silk

Silk yardage from Thai Silk Company, 311/6-7 Surawongse Road, Box 906, GPO, Bangkok, Thailand

I don't know that the item warrants a review as such. It is just the most beautiful fabric I've ever seen. When you see it you know you must wear it. I've never seen their incredible colors in any other fabric. Comes by the yard, 40" width, 3 or 4 different weights, solids (which are really made with warp & weft of different, sometimes complementary, colors) and gingham-type plaid (1" or 2" checks.) When I wrote, ca. 2 years ago, they would send generous samples for 1 genuine U.S.A. quarter.

Space—considerable work space—is needed for the practice of basketry, and it is a rather messy operation because of the necessity for keeping material damp. It is therefore not a craft that can be pursued in a corner of the living room (while looking at television). It also calls for a patient and careful temperament.

Most kinds of reedwork last a very long time, if they are well made in the first place, but naturally they do not stay clean indefinitely. Reed and willow can be brushed or washed in clear warm water. Soap should not be used as it tends to lodge in the cracks. Raffia work can be washed with soap and water. It should be allowed to dry naturally away from a fire, though if it is left out in the sun, it will become slightly bleached.

The Illustrated Hassle-Free Make Your Own Clothes Book

We have a new game in our commune which consists of shouting, at appropriate moments, such inventions as "Right arm!", "Outta touch!" and the like. Revolution takes all sorts of forms these days, & making your own clothes is one way to play fiddle-fuck-around with fashion-sexism, consumption-pushing, & related evils. Not to mention such personal benefits as being comfortable, feeling good, & looking however you want to. This simple & charming book sure seems to give you all the basic information you'll need to get into it, plus numerous patterns & ideas. And probably sufficient inspiration to carry you into lots of new creations on your own. Outta style! Right size! and so forth.

[Reviewed by Diana Shugart]

Note: The price on this nice book is ridiculous. Wait for the \$1.95 paperback in 1972.

my espadrilles

Sharon was in Formentera without a pair of shoes and the sand so hot on her feet. Under the porch of Mark and Julia's house was an abandoned pair of espadrilles with a hole in the right toe. They fit but she didn't dig the hole. She sewed it up with some wool Julia gave her but thought, "That looks silly." Unbeknownst to her, she had used the Overcast Stitch (see p. 17). So, what she did next was sew a flower onto the shoe. This was her first attempt at embroidery. Then she sewed a butterfly on the left toe to balance out the effect. When the espadrilles wore to nothing, she put the butterfly in a plastic bag which sits in our sewing room in San Francisco.

At some time or other, everyone has had an indispensable pair of pants—jeans or chinos. And just like Roy Rogers when Trigger died, they are loathe to part with them until the irreversible moment when these pants rip at the knee. Rather than stuffing them—as was Trigger's alleged fate—the pants can be turned into cut-offs by a mere snipping off at the knee. This, then, is re-cycling in its most common incarnation. Just as organic wastes are re-cycled, clothing scraps can be used again, old clothes can be magically transformed by a bit of imaginative remodeling, rips can be repaired and all sorts of things can be re-made into perfectly pleasurable, wearable garments without having to be thrown out.

Mariposa Codpiece

There is more than one kind of smocking. What we give you here is English smocking, in which the fabric is first evenly gathered on the wrong side, and gathers (pleats) are held together by embroidery on the right side. Evenness in gathering is essential. Striped (1/8" or checked (1/8" or 1/4") fabric provides a built-in guide, and is highly recommended, especially for beginners. With striped fabric, horizontal guidelines must be added on wrong side with pencil and yardstick, placed to correspond more or less with the embroidery pattern.

Successful Sewing

1. Contains a good list of equipment with reasons for having each item.
2. Contains a good chapter on the selection, use and care of a sewing machine for you.
3. Contains a clear explanation of sewing processes generalizing whenever possible, and not creating a lot of special cases.
4. Contains a complete section on fabrics, fibers, and finishes including background, use, properties and home laundering instructions.

Practice sewing straight. If you have never used a sewing machine before, it is a very good idea to start by sewing practice lines, angles and curves. One sewing machine manufacturer, Viking Husqvarna, produces practice sheets (domestic science teachers and college lecturers can make block applications for classroom use) and they have given me their permission to reproduce two of them here. . . . Sew along the lines keeping as accurate as possible. Do not watch the needle but keep your eyes on the sewing line. If you wish you may sew without thread on these practice squares, though it is perhaps more encouraging if you do use thread.

Practice patterns.

FOR MARKING

*Dressmaker's Carbon Tracing Paper and Tracing Wheel (11)—For transferring pattern markings to fabric. Paper comes in several colors. Wheels come with or without teeth. See MARKING.

*Tailor's Chalk (12)—Also used for transferring pattern markings to fabric. Clay chalk comes in red, white, and blue, in squares or in pencil form.

French seam. This is the traditional seam for fine, hand-sewn lingerie, but whether sewn by hand or by machine, a French seam can also be extremely useful for other garments, and especially for fine garments for babies and young children, where frequent washing might cause an unfinished seam to fray or unravel.

Like the flat fell seam, the French seam is produced the "wrong way"—the wrong sides of the fabric are placed together for stitching, so that the raw edges appear on the right side of the article.

Instead of stitching on the seam line, stitch nearer to the raw edges of the fabric—say about 3/8 in. from the edge of the fabric. Trim the seam allowance slightly; turn article to the wrong side. Fold along the stitched seam line so that the right sides of the fabric are touching. Press along the fold, and make a line of tacking stitches 3/8 in. from the fold. Then stitch. No raw edges should be visible on the right side of the fabric; nothing looks worse than a French seam where strands are trapped in the seam, and there is almost no way of getting rid of these untidy ends once the seam has been stitched. Finally, open and press.

The Standard Book of Quilt Making and Collecting

i can remember the feelies, the little yarn tie-together things, on my baby quilt, and lying there, wherever, twisting them, between thumb and nose-picking finger, like i would a nipple, now. ah, quilts. this book is the only one i know of that really gets into quilting. illustration and patterns for about two hundred different beauties.

-jd

In general, the following materials are a good selection for any patchwork quilts:
Body of quilt. Muslin (first choice), linen, broadcloth, cambric or percale.
Designs. Gingham, percale, calico, shirting, or broadcloth.

Of course you may make your quilt of silk, woolen, or sateen. The block background and pieces in the design must be of the same material. One last word of warning: measure all your materials carefully and be sure that you have too much rather than too little. Colors are exceedingly hard to match, even in the same shade from another bolt.

Herringbone Stitch and Threaded Herringbone Stitch

Bring the needle out on the lower line at the left side and insert on the upper line a little to the right, taking a small stitch to the left with the thread below the needle. Next, insert the needle on the lower line a little to the right and take a small stitch to the left with the thread above the needle. These two movements are worked throughout.

Maltese Cross

This decorative motif is worked in a way similar to Interlacing Stitch. The inter-twining of the Herringbone Stitch must be worked accurately, otherwise the interlacing cannot be achieved. Bring the thread through at (A) and take a stitch

Fig. 1

Quilt Making

In answer to the section on quilts in the Fall 70 issue of the catalog.

1. \$2.50 is too much for Mt. Mist. You can get it cheaper by writing Mt. Mist. We only pay 92 cents a roll.
2. Don't use cotton or dacron batten, and tie your quilt together. After 3 or 4 washings the cotton balls up and separates into wads. A good quilt must be made to last at least 10 years.
3. For the same reason, we could not advise using old clothes. You can't tell how they will hold up. Use an old army blanket or some such blanket.
4. Quilt patterns are regional. In isolated places like Appalachia you can run into patterns you can't find other places. Eaton's Book of Southern Highland Crafts lists many. Mt. Mist lists generally known ones. Many patterns also are known locally by different names. The quilt pattern you show in the catalog above the needle is an Hawaiian adaption of quilt patterns taken over by the missionaries, then adopted by the Hawaiians into land, sea-flower patterns—and then later taken back over here in that form. When we were demonstrating quilting at the Smithsonian Craft Festival last summer in Washington, D.C. — a Hawaiian lady rushed up to us, and asked where we had gotten the Hawaiian pattern. Mrs. Johnson, who had made the quilt—just knew it as a pattern "from across the waters." I later wrote to the Honolulu Academy of Fine Art and they sent a catalog listing some of these patterns.

5. There are other ways to quilt other than tie or completely quilting a quilt by hand—

1. Quilting every other block. You can do this in the evening while sitting in a rocker.
2. Quilting by machine—either quilting the quilt with a straight or zig zag stitch after the quilt is finished,—or to quilt the square in the machine, then join the squares together and finish the raw edges (which should be top side) with a finishing strip of cloth. I am enclosing a picture of a finished quilt made in this method. A beginning machine quilter might find it easier to quilt like this in small squares, rather than tackling the whole quilt.
3. Don't limit yourself to traditional patterns. Create your own. One of our most successful quilts is a tie-died sheet or large piece of muslin hand quilted in the patterns the tie dye has made. Anybody can piece together a pattern, but care should be given to figuring out what you want to do, cutting a pattern out of cardboard, and then getting all your pieces cut just right. I always think that the hardest thing to do about quilting is to cut the pieces ahead.

7. Patchwork skirts are easily made from 1/2 a full bed size quilt top. I don't recommend a cotton batten filler, it makes the skirt too heavy. We put in a muslin lining, the same as the quilt, and then hand quilt a pattern in alternating squares.

8. Quilting patterns common here:

N34 NEEDLEPOINT

The author writes: "This book is intended for the person who wants to do more than just fill in backgrounds of needlepoint canvases with the half cross stitch. It is intended for the person who wants to use needlepoint as his personal art medium. In this book you will find designing techniques which apply to needlepoint. There are over fifty needlepoint stitches here for you to try. Experiment with them, combine them. Mix them as YOU please." Fully illustrated. 87 stitches and variations. 158 pages, 8 x 10 1/2. 1964.

Craft & Hobby Book Service (p. 164)

THE CONVERSATION

D.R. said, "Estelle, we've got to talk."
 Estelle didn't reply immediately. She was looking out her window at an old lady buying something at the magazine stand. She was the oldest looking person Estelle had even seen in a place like a bus station and she was fascinated. The lady had on a long winter coat and a furry hat with two white feathers on the side. She carried an umbrella on her right arm, an enormous pocket book on her left, and leaning against her leg was a large shopping bag running over with stuff. She'd been standing at the counter long enough to buy reading matter for a year but when she turned away, after going through a very complicated money routine with the clerk, all she had was a candy bar.
 "Hey, Estelle? You there?"
 "I'm watching a lady buy a candy bar," said Estelle. "Do you see her?"
 D.R. hadn't noticed the old lady, but now he looked over toward the magazine stand. They watched as she stooped over to put the candy in her shopping bag. The bag was so full of stuff she had to shift the parcels on top just to make room for the candy. Estelle held her breath for fear the bag would tear and spill its contents all over the floor. But it held, and after a good deal of ruffling and shuffling and hassling with her umbrella and pocket book, the old lady finally got herself together enough to pick up the shopping bag and walk around the corner toward the loading zones.
 "Wasn't she beautiful?" said Estelle.
 "She was very far out," said D.R. "Estelle, listen. We've got to talk."
 "What do you want to talk about, D.R.?"
 "I don't know," said D.R. He had to clear his throat. He cleared it twice, but it was still raspy when he said, "It just seems like everything's getting weird, that's all. I feel totally weird."
 "Maybe it's something you ate," said Estelle.
 "It's not anything I ate. It's this sense I've got. It's this feeling."
 "You sound very far away," said Estelle. "Is this a long distance call?"
 "You're the one who sounds far away," said D.R.
 "I sound far away?" said Estelle.
 "Yes. You're talking to me very weird."
 "I'm talking to you weird?" said Estelle.
 "Yes you are. And you know it too. You're fucking me up is what you're doing."

Knot Note

Step-By-Step Macrame (p. 155) has sold 500,000 copies in about 2 years. Does that many people tied in knots reflect some enormous cats-cradle of American psyche going on? —SB

Macramé, the Art of Creative Knotting

Although designs for knotted pieces differ according to locale and use, there are very few individual knots. Virginia I. Harvey has collected photographs of traditional knotted pieces throughout the world and presents them in a book called *Macramé, the Art of Creative Knotting*. She carefully diagrams the half-knot, square knot, double half-hitch, diagonal double half-hitch, vertical double half-hitch and other knots. The basic knots are described in detailed instructions for making a sampler. Following the pattern for the sampler will give the beginner experience in doing the knots, and show how combining just a few types of knots can offer large pattern variation.

This book is the best reference manual of knotting technique available. It offers information on all facets of macramé, including discussion on planning, mounting, shaping and finishing a knotting project. Tools and materials are displayed. There are photos exhibiting how different fibers worked in the same pattern can vastly alter visual and textural effects. The pictorial history of macramé and examples of contemporary knotting projects offer plenty of design ideas for more advanced macramé craftsmen.

Knotters interested in explicit directions for traditional macramé purses can obtain patterns by sending \$1.10 to: Pesch Art Studio, 28 Colonial Parkway, Dumont, N. J. 07628 with a request for "Macramé Bags," Booklet A.

Two cork squares glued together and covered with paper marked off into 1" squares helps keep lines and angles of cords even. Pins are used to hold cords in place as they are worked.

Beads are an important Macramé adjunct. They provide a surface enrichment compatible with the raised knot shapes and a relief to straight knotting. One problem is to find interesting beads with holes large enough to accommodate double, triple, and more cords required for knotting. There are several ways to overcome the bead problem. Some suppliers are beginning to create beads with large holes. If these are not available, buy strung Indian beads, Hippy beads, or bamboo curtain beads and cut them apart. You can easily create your own ceramic and papier-mâché beads. When bead holes offer resistance to threading, use a fine wire for stringing or dip the ends of the cords into melted wax, shape the ends to a point, and let the wax harden to make stringing easier.

Tie and Dye

This is the only book on tie-and-dye that is available in this country. A few other books briefly discuss tie-and-dye, one of the simple means of fabric design, suitable for school-children, blah, blah, blah. But Ann Maile treats tie-and-dye like an ancient and complex folk art. Not that she is pedantic. She very clearly explains how to accomplish all the traditional and intricate effects possible with limited materials and free-flowing organic imagination. Tie and dye is such a simple art form that many people have already discovered it, and are doing it without any books to tell them how. So why buy a book?

You can buy bolts of machine printed tie and dyed drip proof, smear dry never iron cotton, . . . pretty far out. But the question isn't to be or not to be far out. The question is whether you are into the craft of tie and dye in order to create beautiful objects or just weird artifacts. If you want to really get into it, the book seems really useful and inspiring. If not—well, . . .

Textured squares

SEWING TECHNIQUE OR TRITIK

Outlining Shapes in Oversewing

Oversewing or whipping stitch can be used very successfully to outline any shape drawn on the sample. Whether further stitching or binding is added within the shape is a matter of choice. This way of outlining does not bunch the cloth up to quite the same extent as a running stitch outline. The scale of the actual stitching may be quite small, about 1/8 in. across, using single or double Sylko, or up to 1/2 in. wide, with double thread. The width of the stitches, that is the amount of cloth picked up on the needle, each time it is inserted into the cloth, decides the thickness of the outline, and their density determines the tone. For instance, a clear-cut resist outline will need more stitches per inch than a medium toned contour.

Variation in the thickness and tone of the lines should be exploited in working out designs.

It is almost impossible to get fine delicate designs on coarse fabric, but, on the other hand, with fine cloth any degree of fineness or coarseness in a pattern is possible.

Method

Draw or trace the design on cloth. Decide which are to be made thick dominant lines and which not so outstanding. With the appropriate cotton or thread, single or double, knotted at one end, begin to sew a little to one side of the line. Take each stitch over and under it at any angle between 30 deg. and 60 deg.

D9 BATIK ART AND CRAFT

\$ 7.50

Nik Krevitsky. Profusely illustrated with examples of a wide variety of batik and related processes. Step-by-step photographs show the reader how various results are achieved. Work by students and well-known artists is included, most of it created with a minimum of tools and equipment. Besides true batik, the book includes material on direct painting on fabric, crayon-resist drawing and wax-resist egg decorating.

Batik for Beginners

Batik-dyed cloth looks like a stained glass window, when it works, and like the dog was sick, when it doesn't. This is a reasonable beginning text. For even simpler information, Stephen Blumrich at 3223 Hyde St., Oakland CA 94601, has a \$1 pamphlet, Resist Dye Technique.

or WHOLE EARTH CATALOG

Another difference between working on paper and working on material is that cloth is pliable and therefore the wax is liable to bend and crack as it is put into the dye. You will have noticed this. It is a characteristic of batik, and one of the recognized techniques, that you use this quality of cracking to add richness and pattern to your design. The cracks may be ordered, to a definite pattern or area, or they may be random cracks used to give a cracked texture over the whole or part of the surface.

To "crack" the design, the whole surface of the cloth is waxed and left to go cold. In frosty weather a few minutes out in the cold air is sufficient to make the wax brittle. If the wax is brittle, the cracks will be clean and fine. If it is not cold enough outside, put the waxed cloth into cold water for a few minutes.

"I'm fucking you up?" said Estelle.

"Yes. I feel entirely fucked up. I feel like I'm going out of my goddamn mind if you want to know the truth. And you're giving me all this shit over the telephone."

"I'm giving you shit?" asked Estelle.

"Yes!" D.R. yelled. "Yes! You are."

"Well listen, D.R. Do you mind if I ask you a question?"

"Ask me anything you want to," said D.R.

Estelle said, "Do you think you're giving me shit too, by any chance?"

"If I am I don't mean to," said D.R.

"You mean you don't know if you are or not," said Estelle.

"I mean I don't mean to, if I am. But you mean to. You're really fucking me up."

Estelle said, "What if I told you you were fucking me up just as bad?"

"Well, I'd probably talk to you about it," said D.R. "At least I'm trying to talk to you."

"That's very good of you," said Estelle. "That's very decent. I appreciate it."

"Jesus, Estelle, you're really coming on to me weird, did you know that?"

"I think the whole conversation's weird," said Estelle.

D.R. waited before he spoke again. He cleared his throat, then cleared it again. "Well see if this makes it seem any weirder to you."

"What?" asked Estelle.

"I said see if this makes it seem any weirder to you."

"See what?"

"I haven't said it yet. I'm getting ready to say something."

"Oh," said Estelle. "Excuse me."

D.R. cleared his throat. "I'm thinking the thing to do is for me to go on out to my sister's house by myself. Before I take you."

"What's so weird about that?" asked Estelle.

"Doesn't that seem sort of weird to you?"

"Not really. You want to go check it out, is that right?"

"Yeah. Just check it out. Kind of ease into it with them."

"That seems cool to me," said Estelle. "Why did you think that was so weird?"

"I don't know. Now that I've said it, it doesn't seem so weird any more."

"Is that all you were going to tell me?" asked Estelle. "Is that why you got me on the phone?"

"That's it," said D.R.

"Can I come out of the phone booth now?"

"You're free to go anywhere you like," said D.R.

"Thank you," said Estelle. She hung up then and came out of her booth. But D.R. stayed in his to call his sister Marcella and tell her he was coming out to see her after while.

Osborne Tools

always wanted to be a saddlemaker. closest i've come so far is drugstore cowboy sandalmaker. try cutting a sole bend with a pocketknife, or punching holes with a screwdriver, and you begin to appreciate good leatherworking tools. osborne is the best.

Osborne No. 155

Revolving Punch, 6 Tube. Forged steel frame, fully polished. The threaded cutting tubes are hardened and tempered. Length of punch 8 1/2". Furnished with tubes sizes 0, 1, 2, 3, 5, 7.

Price each \$15.00
Extra tubes each \$1.00

THE SKIVE Osborne No. 925

Makes a remarkably easy job of skiving. Increases both speed and accuracy. This essential tool is fitted with a Schick razor blade. Price each \$1.50

SCRATCH AWL
Osborne No. 478

Sharp pointed, tempered blade 2" long - for piercing leather, sewing and a variety of uses. Price each \$0.30

HOLLOW HANDLE DRAW GAUGE
Osborne No. 51 1/2

Hollow handle draw gauge. Used for cutting leather strips. All metal. Polished head, slide and blade. Japanned handle. Cuts straps any width up to 4".

Price each \$13.75 Extra blades each \$1.20

Cheap Leather

A friend of ours wanted leather but couldn't afford the \$25 or so for the hide and ended up buying a fresh hide from a local slaughter house for \$3 or so and tanned it himself. We personally don't feel inclined towards doing such a thing but he came out monetarily and is richer for knowing how to do it.

Dennis and Becky Crowe

How to Make Cowboy Horse Gear

A highly practical book on the uses of rawhide. Included is a section on how to cure "green leather" and make your own rawhide. When braided, leather is strong and durable. This book illustrates the use of rawhide for "horse gear"; there are certainly other situations where leather braiding can be used to advantage.

or **WHOLE EARTH CATALOG**

Sonny Strong has passed over the Great Divide, but his way of making rawhide lives on.

This is it: When the hide or skin is taken off the carcass and while the body heat is still in it, spread it out flat with the flesh side up and salt it down with 40 or 50 pounds of fine stock salt. This is for a mature hide. For a yearling or calf skin use half the amount of salt. Spread the salt evenly and fold the hide over so the hair side is out and the flesh sides are together.

Leave the hide in a shady, dry place for from a week to ten days. It is important to salt the hide while the body heat is still in it, Rickman emphasizes. So if you do not actually remove the hide yourself, get the person who does the work to salt it down for you. The salt runs the blood and glue out of the hide before it congeals and Rickman feels this is important in keeping the hide pliable.

Leather Braiding

met a guy named Joe Ria at a rodeo. he had a traveltrailer full of fancy braided horse gear done by Yaquis somewhere in the southwest, and was making his go as a middleman. beautiful work, mostly in rawhide. bruce grant has written other leatherwork books, among them, the cowboy horsegear book that has been carried in the catalog. i think this is his best book. deals with the fundamentals of cutting, braiding, knotting, lacing, and applique in leather.

Leather Notes

You list Osborne leather tools (C.S. Osborne & Co., 125 Jersey Street, Harrison, New Jersey) as the best available. Unfortunately this is true; they've been the best for many a long year—I'm still using tools my grandfather got from them 50 or so years back and they're still better than anything I can find now—including Osborne. They are living on reputation and a corner on the supply of most serious hand tools for leather. Many of the illustrations in the latest catalog bear only passing resemblance to the tool now turned out. If anyone knows where to get good English or German tools, I'm told these do exist of the old quality. I'd like to see it in the WEC in addition to Osborne and (grinace) Tandy. Good small diamond stitching awls are especially hard to come by. Also a source for a quality stitching horse which is to a leather smith what a loom is to a weaver.

Also would like to recommend Modern Leather Design by Donald Wilcox, Watson-Guption Publications, N.Y. as a good intro for leather work. It's a 12.50 monster and there are more complete instruction manuals like General Leathercraft by Raymond Cherry (Tandycraft for about \$2) but Wilcox catches the essence of leatherlove. "Leather is Sensuous. It has a texture, a color, and smell; to feel it, to see it, to smell it, is to excite the senses. Of all the raw fabricating materials known to man, leather is perhaps the most sensuous. A fabric that can, of its own, stimulate the senses has an exciting potential for hand craftsmanship." "Alright, so maybe you'll say that everybody doesn't respond to the same thing. I agree. You've got a point. But I sill insist that you test your own sensory responses to leather. If you don't respond to leather, then you'll have a real problem working with it. If leather says nothing to you, if it leaves you cold as being simply a pile of dead animal material heaped upon a tabletop, then chances are that you've got nothing serious to offer it as a material for your own design exploration." This guy loves the stuff and is great for instilling (rejuvinating) the spirit in you. Covers all essentials of techniques—especially good section on tools,—and also provides a good list of other books and sources (East Coast mainly) for materials. Read it!

Peace be with you

Community

The Joyful Community

Who ought to review this book is Ramon Sender, who grew up in a Bruderhof community in New England, and honors his education there. Ramon is the most thorough commune personality I've known. A consummate tape-music composer and grass-reed musician, for five years he's been the gentle fiber of Morning Star and Wheeler Ranch, two of the wooliest anybody-come communes ever. Did Bruderhof give him his skill and his joy? I now believe it.

Ramon's out of reach of telephones, so I'll have to make my own assertion: This is the best and most useful book on communes that's been written.

The Joyful Community
Benjamin Zablocki
1971; 537 pp.

\$1.45 postpaid

from:
Penguin Books
7110 Ambassador Rd.
Baltimore, Maryland 21207

or WHOLE EARTH CATALOG

The Bruderhof is a community unlike any I have ever seen. When I first visited it in the winter of 1965, I felt as if I had wandered in a dream into a medieval village, or into a world outside of history where neither time nor space existed. Never before or since have I felt the presence of brotherly love so permeating a place that I felt I was breathing it. I have visited close to a hundred contemporary communes and studied the history of those of the last century. The Bruderhof can be classified with neither the new nor the old. It is not at all a typical case. I present this study not as a key to the understanding of some larger social movement, but because I feel that the problems that it raises and the solutions that it offers are fundamentally related to our society's quest for *fraternité*.

The Bruderhof is a federation of three colonies located in New York State, Pennsylvania, and Connecticut. The colonies are known as *hofs* (rhyming with the English word 'loaf'), which is German for 'dwelling place', and Bruderhof means 'dwelling place of brothers'. The total population of the community numbers about 750 men, women, and children holding all goods and property in common. The Bruderhof supports itself through a communal industry—the manufacture and sale of high-quality and expensive wooden toys, most of which are bought by schools. In 1970 the community is celebrating its fiftieth birthday. It was founded in Germany in 1920, and has since undergone migrations to England, Paraguay, and finally, in 1954, to the United States. It is held together by its common religion—a radical, fundamental Anabaptist Christianity.

A most striking thing about the Bruderhof is the people. Here are no rugged, bearded Amish peasants transplanted from another age but, for the most part, sophisticated, middle-class, college-educated individuals. The population is highly diversified in background—ex-millionaires and ex-tramps, holders of post-graduate degrees and grade-school dropouts, a dozen nationalities, and as many religions. Unlike the Hutterians and Amish, the Bruderhof has never become a blood-related ethnic group. The community still has some of its original members and is beginning to raise a fourth generation of 'sabras' children but it has remained constantly open to a stream of new members from the outside world. At the time of this study, the majority of Bruderhof members were converts who had joined within the past ten years. This combination of survival through at least three generations with a continually open membership policy is a major accomplishment, often striven for but rarely achieved among communitarian groups.

Many communes eventually reach some sort of compromise between anarchism and the need for structure. But a few do a surprising flip from anarchism to authoritarianism, instead and place themselves under the power of some charismatic leader. This dramatic reversal cannot be explained entirely by the need for structure. It very likely has something to do with the dangers inherent in releasing feelings which has been long repressed.

The absence of money gives a storybook atmosphere to Bruderhof villages. People seem more colorful, more involved in each thing they are doing, because they are doing it for its own sake, not with the thought of some abstract reward. Even the money that does sometimes come into people's lives takes on something of a magical character. A communal treasurer, called the Steward, keeps track of financial affairs and disburses small sums when needed. When two Brothers were chosen to represent the community in an anti-war demonstration in Washington, D.C., I went with them. They spoke to each other of what an adventure it was to be driving a car of their own, with money jingling in their pockets, thinking about what kind of restaurant to choose for supper. Children sell worms to fishermen along the river. The pennies thus earned become a precious secret and a source of prestige in the peer group. But I met one nine-year-old girl at Woodcrest who didn't know what a dime was when I showed her one.

Economic decisions are made by the Brotherhood or by executives with authority delegated by the Brotherhood, as are all other Bruderhof decisions. When the new Woodcrest dining room was built, samples of various shades of paint were put on a wall and a Brotherhood meeting was called. After a long debate, no opinion could be reached. So they decided to paint one wall the color that the majority favored and then re-evaluate the situation. After the dissenters saw how that one wall looked, they decided to go along with the majority. On the other hand, when new curtains were needed for a communal meeting room, the Housemothers and a few women from the Sewing Room chose the cloth.

Kibbutz: Venture in Utopia

This book is a straightforward description of one Kibbutz. It is the history, the problems, and the moral codes of a community which began in 1920 and has grown steadily since that time. Over a span of several generations it has grappled with problems, both economic and social, which are similar to problems faced by the community movement in the United States today.

The book examines critically and sympathetically the issues of poverty, marriage, education, comfort, and communication as it has been dealt with over the various periods of this Kibbutz.

While the book is of limited practical value as a how-to-do-it text, it offers a long term perspective on the difficulties and advantages of the community way of life.

But this emphasis on youth and on the equality that exists between the young and the old create a potentiality for a condition of inequality—an inequality in which the young assume the superior, and the old the inferior, status.

The kibbutz, it will be remembered, was originally conceived as a means to an end—the creation of the new man. Instead of the selfish, aggressive personality created by urban capitalism, there would emerge, as a result of the new social order, a kindly, altruistic personality. This end has not been achieved.

Instead of cooking and sewing and baking and cleaning and laundering and caring for children, the woman in Kiryat Yedidim cooks OR sews OR launders OR takes care of children for eight hours a day. She has become a specialist in one aspect of housekeeping. But this new housekeeping is more boring and less rewarding than the traditional type.

Communitas

This book has been around for a good while, and it's still holding its own as a lucid gathering of the elements to think and design with on the subject of community.

or WHOLE EARTH CATALOG

A major problem of every intentional face-to-face community is its 'cash-crop,' its economic role in the great society that has no integral way of life but has a most integrated cash nexus. Usually the problem is not enough money or credit to buy needed mass-produced machinery. But let us mention a touching example of a contrary problem. The Macedonia (pacifist) community made pedagogic toyblocks for cash, and distributed them, at cost of production, to like-minded groups like progressive schools; but the blocks became popular and big commercial outfits wanted a large number. Macedonia was then faced with the following dilemma: these commercial jobbers would resell at a vast profit; yet if Macedonia itself charged them what the market would bear, the community would itself be contaminated by commercialism.

Yet perhaps the very transitoriness of such intensely motivated intentional communities is part of their perfection. Disintegrating, they irradiate society with people who have been profoundly touched by the excitement of community life, who do not forget the advantages but try to realize them in new ways. People trained at defunct Black Mountain, North Carolina, now make a remarkable little village of craftsmen in Haverstraw, N. Y. (that houses some famous names in contemporary art). Perhaps these communities are like those 'little magazines' and 'little theaters' that do not outlive their first few performances, yet from them comes all the vitality of the next generation of everybody's literature.

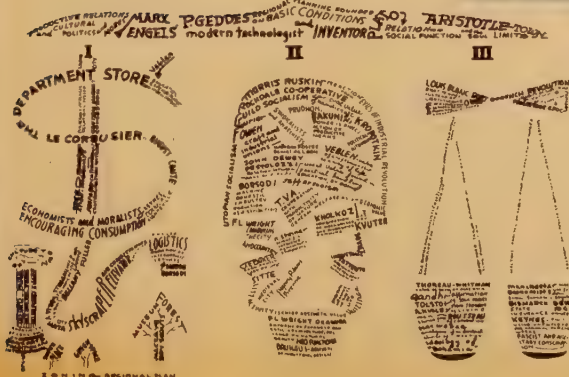

ARRIVAL

If your niece is on one arm and your nephew is on the other, does that automatically balance it? Or do their actual weights have to be accounted for? If their weights have to be accounted for, it's hopeless. But if you can go by how it feels, if a nephew automatically balances a niece, out of their own internal, organic, cosmic, natural reasons, then it's cool and doesn't matter if this particular nephew knocks me and my niece and all of us on our asses.

"Herschel you stop that?" Marcella yelled from the kitchen. She was just coming out with a tray of Pepsi Colas for D.R. and the kids. Herschel had started wrestling with D.R. as soon as he got out of the bus in the driveway. He was nine and about three sizes too big for his age. He wasn't fat, he was just big and husky, in the mold of his father Doyle, who was six feet three. Herschel wrestled with D.R. coming through the house, as he hugged Marcella and gave his niece Debbie a lift and a brief ride across the kitchen, and then he continued to wrestle him right on out the back door and into the yard. When Debbie wanted to join in, D.R. suggested they not wrestle any more, but play the lift-and-swing game like in the old days. That was okay for a minute or two. Herschel swung from the right arm and Debbie swung from the left, and for a minute or two the lift-and-swing game was cool. But then Herschel decided that what he wanted to do was lift and swing and wrestle at the same time, which he proceeded to do by getting a firm lock around D.R.'s waist with his legs as he hung suspended from D.R.'s sagging forearm. That was when Marcella mercifully appeared with the Pepsi.

"You stop that I said," Marcella snapped at Herschel. There, her voice softer as she placed the tray on the little green metal table, "Your Uncle David is tired, honey. He's been traveling."

(continued)

Drop City

Peter can write fine. Drop City was the first of current crop of weed patch communes. The first dome-funk display in the U.S. The first nose-tickle of America's country sneeze. How to risk your life repeatedly and keep laughing. It's a good story.

Drop City is a fucked-up mess, Drop City is completely open, completely free; I own it, you own it, because we know that all energy comes from the same place. Ten domes under the skydome, overshadowed by the Rockies; silverdomes, domes that are paintings, multicolored cartopdomes and one black dome.

Droppers live out of the garbage dump. We know about garbage. The people of Trinidad call us Dump City—they know where it's at. They call Droppers when they want garbage picked up. It delights them to watch us rummaging around in the schmutz; it delights us too. An incredible number of people can live off the garbage heap of the U.S. Drop City is built on the garbage dump of a dying town of ten thousand strung-out coalminers. Think what can be done with L.A.—N.Y.—San Francisco—Des Moines—Dallas! The most beautiful place in Drop City is the dump, the garbage dump of the garbage pickers. It's our greatest resource.

Luke Cool taught Droppers to design domes, build solar heaters, make dwellings in which a family can live in comfort and beauty. Luke Cool is the king of the junkheap, teaching Droppers and the world how to USE things. Jump up on top of the car with an axe and chop 'um out, all around the edges just like a can opener, stomp, pop out the back glass, use it for a window, slip off the mirrors, use them for a solar cooker, pull out the insulation, use it, USE IT; make a honeycomb sandwich out of beer cans and plywood—fantastic strength—and USE IT.

So they had us, A.C.L.U. and all. But Curley and I couldn't resist going down to the welfare office for a final confrontation. We sat down with the supervisor and laid our heaviest rap on him about what welfare really means. That we're all on welfare, absolutely dependent on every other human being, plant, animal, earth, air, fire, water for our welfare and we'd fucking well better start looking out for our collective welfare or there isn't going to be any welfare to look out for.

As we put it on him, the supervisor's face got redder and redder. He started chomping and puffing his fat cigar faster and faster, and when we got up to leave, he was in a blind fit of rage. He began pounding his desk with both fists, bouncing and clattering pencils, pens, paper-clips and ashtrays with every blow, and screamed like a little girl having a tantrum, "YOU HAVE NO RIGHT TO BE POOR!!!"

We fell out the door laughing hysterically.

And B. the moneyman. The hardest gig of all, the moneyman—everyone is always hitting on you. Your face disappears and is replaced by a dollar sign. Everyone is determined to help the moneyman on his road to enlightenment by relieving him of some of his material goods. The Droppers were no exception.

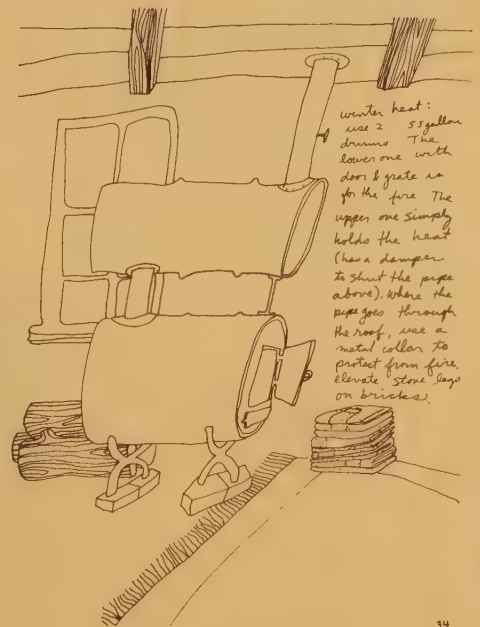

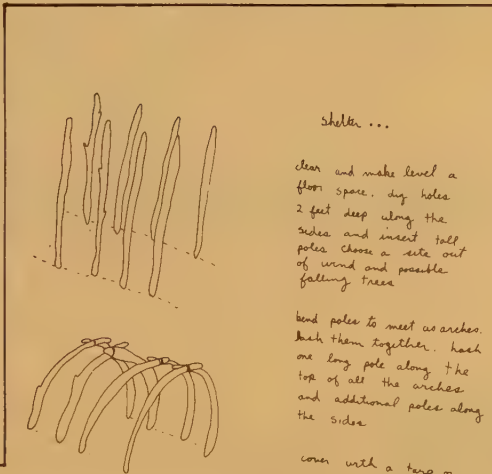

One Christmas Ishmael wrote a play. All of Drop City was to be the set, all the Droppers would be the cast. It was gonna be good.

Ishmael tacked a casting list on the bulletin board in the Complex. The Droppers were to choose their own parts, and they did. Everyone accepted his role.

The hardest time in a commune, particularly Drop City, is the time after the building gets done. While everyone is working together on actual construction the energy is centered, there is fantastic high spirit, everyone knows what he is doing all the time. But after the building is done, comes a time of dissolution. There's no focus for the group energy, and most hippies don't have anything to do with their individual energy.

Handling time, learning what to do with total leisure, is one of the most important lessons to be learned in a commune. What we do with our time is our choice; there's no compulsion to work or play or anything anymore. We have to learn how to really use time—every second—because if we decide to lay around on our asses, it isn't long before time gets heavy. Rebuilding a world is a full-time job, a continuous job. We've got to learn to be conscious of the Great Work all the time.

In a way the time of dissolution was good; a period of service. But instead of going higher, we were on the merry-go-round. Curley and Drop Lady left, Clard and Suzie left, John McHaley said, "Who Pays For The Rain," and I suddenly realized what Curley had been trying to tell me all along: It's all free, it all flows from the Cosmic Force, all energy comes from the same place and it's free—but I'd learned it too late. Instead of a community of people dedicated to getting it together on the highest possible level, Drop City became a decompression chamber for city freaks.

Living on the Earth

this may well be the best book in this catalog. this is a book for people, so, if you are a person, it is for you. if you are a dog, for instance, and you can't read very well, it just might be for you too, because of the drawings.

earthworms turn decay & waste into rich odorless humus earth. They are the best compost shredders going. To greatly enrich your garden's topsoil, set up a worm colony in your compost box. Keep it

moist & shady. Start with sifted dirt & well rotted organic compost and you will gradually get to where you can give them fresh organic garbage & they will take care of it. see the earth worms turn garbage into treasure.

ladybugs, praying mantids & birds protect your garden from assault by insects.

Gary Snyder has written of Suwanose Commune which clings to a (live) volcanic island off the south of Japan, and of Nanao who wanders around injecting energy and absurd purpose into fellow humans. Nanao visited Libre, in Colorado, a while ago. So last summer Dean and Linda Fleming from Libre visited Nanao's Suwanose. These are three of their letters home.

-SB

AFTER HITCH HIKING 10 DAYS SWEATING & STARVING WE ARRIVED IN KAGOSHIMA HOPING TO REST & GATHER SUPPLIES FOR SUWANOSE. WE FOUND THAT THE BOAT LEFT IN 3 HOURS. WE RAN THROUGH ALLEYS LOOKING FOR RICE & SOY BEANS & FINALLY BOARDED THE SHIP. THE 26 HOUR TRIP WAS ALL ROCKING & SWAYING—WITH NO FOOD & MASHED WITH PEOPLE. THE ISLANDS WE PASSED ARE INCREDIBLE & BEAUTIFUL. ONE IS COMPLETELY DESERTED & IS VERY FAR OUT LOOKING. IF YOU KNOW ANYONE WHO IS INTERESTED LET US KNOW.

FINALLY AT SUNSET—SUWANOSE! WHAT AN INCREDIBLE COLOR DISPLAY, MUCH LIKE LIBRE BUT ALL REFLECTED IN THE WATER WITH 6 SMALL ISLANDS IN VIEW. WE'RE LIVING IN A BAMBU HUT THAT NEEDS THATCHING ON THE ROOF, SO WE'RE CUTTING BAMBU & TYING IT TOGETHER WITH VINES. IT'S INCREDIBLE HOT IN THE MID DAY SO ALL WORK STOPS & EVERYONE WORKS ON HIMSELF DURING THAT TIME.

THERE ARE 9 BUZOKU & DEAN, LIA & I. THERE IS A FARM—FIELDS OF CUCUMBER' SQUASH' WATERMELON' ONIONS' BEANS & NOW HOPI CORN TUCKED IN THE BAMBU FOREST. MUCH HARD WORK, THE SOIL IS VOLCANIC ASH & VERY POOR FOR GROWING. WE MUST HAVE COW SHIT IN BASKETS FOR FERTILIZER. ALL MEALS ARE EATEN TOGETHER & EACH DAY IT IS SOMEONE'S TURN TO COOK. ONE BUZOKU IS AN INCREDIBLE SWIMMER WHO CATCHES MANY FISH EACH DAY, VERY GOOD.

SUWANOSE IS A TOUGH PLACE TO LIVE.

WE'RE NOT PARTICULARLY WELCOME & WE MUST MAKE A PLACE FOR OURSELVES. WE HAVE NO MATERIAL OBJECTS, A 3 TATAMI HUT THAT IS FALLING IN, CANNOT SPEAK JAPANESE, & MISS THE MOUNTAIN LIFE, BUT WE ARE LEARNING MUCH ABOUT OUR NAKED SELVES. WE ARE ALSO LEARNING ABOUT NAKED COMMUNITY & RELATIONS WITH OTHER PEOPLE. EVEN DEAN WANTS TO HAVE COMMUNAL MEALS & LIVE IN THE SMALL DOME MAYBE WHEN WE RETURN. THE DOME KNOWLEDGE' FAM KNOWLEDGE & LIFE STYLE ARE OF NO USE HERE. IT IS COMPLETELY DIFFERENT IN CLIMATE & AVAILABILITY OF BUILDING MATERIALS. ONLY THE KNOWLEDGE OF HAVING DONE THESE THINGS IS OF HELP & THE STRENGTH DEVELOPED THROUGH PERSEVERANCE. TAKE CARE OF OUR HOME, GARDENS & MOUNTAINS & ABOVE ALL EACH OTHER.

Love,
Linda

CLIMBED, BEFORE DAWN, TO TOP OF CRATER TO PAY HOMAGE TO ONOTAKE (GOD OF EVERYTHING HERE—MATES WITH THE SEA ON FULL MOON) PEERING INTO IMMENSE, ROARING INFERNO OF SULPHUROUS GASSES FROM EARTH'S OWN BOWELS. IF GREENHORN IS THE GREAT GRANDMOTHER, THIS IS THE BABY! LEARNING TO SKIN DIVE, TRIBESMAN SATAN MY TEACHER—EVERYDAY WE CONSUME HEAPS OF SASHULI (RAW FISH). HOPI CORN WE PLANTED LEAPT FROM THE GROUND IN + DAYS! NOW VERY TALL—WE PRAY. LINDA AND I CLIMB OUR FAVORITE LAVA BOULDER AT SUNSET, MAKE LOVE, SING, READ TO EACH OTHER FROM BOOKS OF CONSCIOUSNESS, PAINT & DRAW. LIA HAS A HAPPY SWING IN BANYAN GROVE' WE ARE BLACK FROM SUN, GETTING CLEAR, LEARNING ABOUT LIBRE! HOLD TO LOVE MORE, BE CLOSER TOGETHER. WE WILL RETURN, PROBABLY IN OCTOBER—GAVE OUR MONEY TO ASHRAM BUT HAVE AIRLINE TICKETS AT LEAST TO CALIF. SO MUCH WE MISS ALL DETAILS OF OUR LIBRE LIFE YOU CANNOT IMAGINE. WE ARE WORKING, VERY HARD, ON IT ALL AND SHOULD BE ABLE TO CHANGE FOR THE BETTER SOON. THE REST OF JAPAN, AS A PLACE TO WANDER AND LEARN, VERY RAPIDLY BECAME OBSOLETE IN THE FACE OF THIS ASHRAM—MUCH THE WAY THE U.S. BECOMES, RELATIVE TO LIBRE, ONLY MORE SO—I VISITED THE OTHER BUZOKU AND THIS IS THE ONLY TRUE ONE—HONTO! GOD IS LOVE. EVERY DAY A TEST, AT NIGHT MORE SO! UNPOLLUTED, VIOLENT, NEVER RESTING, HUT CAVING IN ON OUR HEADS, PRIMITIVE ASS—BUSTER!! IN FACT I CAN'T IMAGINE A MORE OPPOSING PLACE TO CLEAR INANE COBBEWS OF APATHETIC CONSCIOUSNESS. YES AND YES! ONOTAKE MAY YET LEARN TO LOVE US—OR VICE VERSA AS EVERYTHING HERE IS! KNOW THAT WE LOVE YOU & WILL BE BACK SOON.

Dean

Japan Kibbutz Association

tetsu kishida runs the japan kibbutz association, 2-5-7 chome, akasaka, minato-ku, tokyo-to (runs it but watched over by financial godfather), tel. 03-583-3280; he speaks english, has lived on kibbutz in israel, helps run an exchange program where at least 100 japanese go to israel for kibbutz living each year, he has a list of 100 japanese communal farms and will help arrange for foreigners to visit (and work and live) on these farms.—self-addressed envelopes, with international postage coupons would facilitate response. also some knowledge of japanese (sam martin's pocket books easy japanese and english-japanese dictionary helpful and cheap) before arrival is helpful. tetsu's wife, kyoko, wants to do a japanese whole earth catalog and would appreciate help from any source—and a japanese whole earth catalog would be really something! your friend, michael howden, san francisco

LIBRES—ON THE MOVE AGAIN AFTER 4 WEEKS ON THAT VOLCANO. WE WERE CHASED OUT BY THE GODS IN NO UNCERTAIN TERMS. AN EARTH-RIPPING TYPHOON CAME, FLATTENING OUR LITTLE HOUSE AND BURYING EVERYTHING WE OWNED IN MUD. FORTUNATELY, THE RAIN LEAKED IN SO THOROUGHLY THAT WE HAD MOVED TO A COW BARN BEFORE SHE WENT DOWN BUT IN THE BARN, FLOATING IN PISS AND DEBRIS, WE WERE ATTACKED BY MITES SO HIDEOUS AS TO MAKE THE EVER-PRESENT MOSQUITOES SEEM PLEASANT. THEN THE HEAT RETURNED AND THE VOLCANO SCREAMED SHOOTING BLOOD-RED CLOUDS UP THOUSANDS OF METERS IN THE SCORCHING SKY. THE TRIBE, I'M SURE, WAS RELIEVED TO SEE US GO, AS THEIR GUILT OVER OUR TRIBULATIONS, ESPECIALLY LIA'S, WAS MOUNTING. FIRST WE HITCH TO THE PRAYING MANTIS TRIBE THAT LIVE ON AN OLD FARM WITH RIVER NEAR NICHIMAN IN SOUTHERN KYUSHU, ABOUT 20 BUZOKU WERE THERE WORKING HARD IN THE HEAT EVERYDAY AND GORGING ON GOOD FOOD AND GETTING VIOLENTLY DRUNK ON SHACHU EVERY NIGHT. SHADES OF MEXICO AND QUITE UNLIKE THE NEW AUSTERE ASHRAM. WE STAYED AS LONG AS WE COULD BUT THE PACE WAS TOO GREAT FOR US AFTER FALLING OFF A FEW CLIFFS AND DANCING THRU THE FLOOR' MUCH GOOD SPIRIT HERE, MORE NANAOS DREAM THAN HEAVY PRESENT-DAY SUWANOSE. BUT ALL THAT BOOZING IS TOO MUCH, SO OFF WE HITCHED OUT OF KYUSHU, UP THE WEST COAST—NOW IN KYOTO TAKING A SHORT 2 DAY BREAK WHICH, IN TRUTH, WE HAVE NOT HAD SINCE LINDA AND LIA ARRIVED. WHATEVER IDEAS WE HAD ABOUT THE BEAUTIFUL JAPANESE LANDSCAPE (WHICH IT SURE IS) HAVE NOW BEEN SOMEWHAT COLORED BY THE INCREDIBLE INTENSITY OF HEAT AND BUG AND MAD BUZOKU. TOMORROW WE ARE HITCHING TO HOKAIDO TO SEE THE MOUNTAINS AND RIVERS AND RUGGED COASTLINES. TO EXPERIENCE A COOL EVENING OR SEE LAND WITHOUT PEOPLE, TO BE ALONE TOGETHER FOR THE FIRST TIME SINCE VIGIL. WE HOPE TO LIVE CHEAPLY ENOUGH TO BE ABLE TO STAY UNTIL OUR AIRLINE TICKETS ARE VALID ON OCT. 1ST AND THEN COME FAST TO OUR OWN LAND AND OUR OWN PEOPLE LIBRE!!! MEANWHILE, IN FACT, THIS IS A VERY FAR OUT EXPERIENCE FOR ALL THREE OF US AND FULL OF TRULY GOOD PEOPLE AND PLACES. WE HAVE SEEN AND BEEN ACTED UPON BY THE EXTREME SOUTH AND NOW WE MUST SEE THE NORTHERNMOST TIP OF HOKAIDO TO GET A FULL IMAGE. THE PHENOMENA OF LINDA AND LIA'S ADJUSTMENT HAS BEEN IN ANSWER TO MY PRAYERS. LINDA IS NOW STRONG, COMPLETE & DIGGING HITCH HIKING—PAINTING TOUGH LANDSCAPES—LIA HAS BEFRIENDED A THOUSAND JAPANESE, OLD & YOUNG, SPEAKS WELL, HAS OUTGROWN ALL HER CLOTHES AND EVEN TASMANIAN—SHE IS NOW A GOOD HITCHHIKER!! LOVE THEM! LOVE YOU!

Dean

"Where have you been traveling?" asked Debbie. Debbie was four. She wore glasses, watched TV and drank a lot of Pepsi.

"Well, all around," said D.R. "East. West. North. South. All around, actually."

"How come you're so tired?" asked Herschel. Herschel had always been D.R.'s big buddy on previous visits. But he was in Little League this year, and was so good at it he'd gotten a little arrogant.

"Well," said D.R. "Let's just say traveling can be pretty hard work sometimes."

"I've traveled, and I don't think it's hard," said Herschel.

"I've traveled all the way to Kentucky," said Debbie.

"That's enough, now," said Marcella. "You kids go on around in front and wait for daddy."

Debbie leaped at the suggestion. Carrying her Pepsi in both hands she ran around the house yelling "Daddy, Daddy!" Herschel was a little more cool. He went away, but not so far that he couldn't hear what was being said by the grownups.

"Go on," said Marcella. But Herschel sat down where he was and began to play with the ice in his glass.

"Lord I think I'm the one's tired," said Marcella. She filled her glass from the quart-size Pepsi bottle and carried it around to the front of her chair. Slowly she eased herself backward and down, moaning under her breath as if every bone in her body pained her terribly.

Marcella was only twenty-eight, but one of her games was pretending to be about three times that old. She and Doyle had been married nearly ten years, but she didn't look any older than most twenty-eight year old women with two children. She was tall and rangy and rather flat-chested. In high school she had been famous for her legs. Girls still played high school basketball in Kentucky in those days. She had been quite a good athlete, but it was her long, trim legs that made her truly distinctive on the floor. Men had always been hot for Marcella because of her legs although she had never allowed herself to acknowledge that. In the old days in the mountains she had seen herself as a big goof. Now she saw herself as some sort of senior citizen with a sense of humor. She and Doyle only had the two children, but Marcella made it seem as if she was an ancient matriarch of an enormous brood that had used up her life and left her a feeble old crone before her time.

"Lord but it's awful to get old," she said as she settled back in her chair. "I wouldn't ever do it if I was you David. I declare I wouldn't."

"You always say that," said D.R.

Marcella grunted. In a voice trembling with mock decrepitude she said, "You better listen to an old woman's advice now, child. I declare you better."

She laughed at her role and her lines. Then she took a sip of Pepsi, turned to Divine Right and with a sad expression on her face told him about their Uncle Emmitt, who was close to death at the homeplace in Kentucky.

Communes

I'd call this the hardest-working, most effective of the commune publications. More than others it fosters variety, it carries detailed reports from working communes, it gets into substantial how-to information. It's British, with right worldly perspective.

Not an Escape but a Confrontation

In an amplifier negative feedback is applied to improve the stability and the quality. This is done by taking a sample of the output and applying it in opposition at the input. It is very effective and its only disadvantages are, it lowers the gain slightly and necessitates a feedback loop.

This may be used in analogy when considering the function of a commune in society. The aim is the betterment of society, the isolation from society is very relative and more geographical and cultural than economic.

When an individual becomes disenchanted with society he tends to become a floater, society waste, as he no longer contributes: he drops out. This dropping out allows a period of quiet, a first taste

of freedom— freedom from the duties imposed from without. Duties from parents, teachers, employers and society-in-the-mass. This kind of freedom is enjoyed for a while until further disenchantment occurs, being a limited freedom and realisation of this brings about the discontent.

To enter into society once again in such a sensitive state would be self-ruinous and self-effacing. To do this is accepting defeat and once again to run with the herd resulting in a half-hearted way of life once again, but more conscious sorrow. The alternative is to form your own closed circuit of life—sustaining activity, to have a creative aim.

Not knowing how one can fit into society in a creative manner a further period of quietude is necessary, but one in which the struggle for survival doesn't become all encompassing. To do this one must become economically independent and the purest way to this end is to live without luxury, with sufficiency and no more. This can be done most effectively in a group and naturally in a group entertaining a similar search would be the ideal.

A community.

Eventually people covering such a protracted project will mature into their own creative mood and a suitable mode of activity will surely result. Such an individual will then know his own most effective life-loving waywardness and on returning to society will not be caught up in the swirl of events but will be able to produce real individual action, from within what he has created as himself, instead of outside influenced micro-patterns of society-at-large.

This is negative feedback, though its net result is positive.

A mental institution provides positive feedback. As its small output reinforces the original input and causes excessive diharmonious action resulting in an unstable society of low quality.

Tentative Group

The Tentative Group has run into difficulties and no longer exists as a group.

FISH-FARMING COMMUNES

This is a suggestion only, as yet, so I will open up the discussion of the idea's value as I see it. There are three big factors: (a) For those interested in rural communities, reasonable arable land is or can be expensive— as we all know who owns the wealth and it ain't us— taking it off them may require revolutionary force— but there is something one can do quite cheaply (by comparison) in the meanwhile, as part of the process. (b) There is a world food shortage (or at least a "Third-World" food shortage; we should grow more of our own in Europe and import less from outside. (c) There are, in this country, many hundreds of smaller streams, still unpolluted on cheaply available semi-moorland ground (even near industrial areas) which with a series of small dams that would draw a minimal amount of the natural environment, would make an excellent cooperative fishing industry. Fish ponds are very important in the food economy of thickly populated countries like China, Japan and Indonesia. If you're one of those vegetarian extremists who don't believe in eating fish, the best fed parts of the World are those who have access to large scale fishing resources, i.e., Kerala in India, Coastal China, the Greek Islands, and the sea-going parts of Western Europe. The ancient Celts used to believe 've 'gods' lived in the sea and that to kill fish was a dire act of sacrilege; this belief died out, not only because of religious changes, but because human population increase meant that land resources available were inadequate for supporting it by themselves!

**Modern Utopian
Alternate Society**

These two seem to just barely stagger along from issue to issue. Modern Utopian is American, somewhat theoretical, and occasional source of useful news from particular communes. Alternate Society is Canadian, somewhat political, an occasional source of useful news from particular communes. Both rely heavily on reprints.

Perhaps the largest area yet to be settled in North America is Northern Ontario, comprising over 360,000 square miles of territory with a population of only a little more than half a million. Northern Ontario is as varied in terrain as it is large in size. Covering some 1000 miles between the Provinces of Quebec and Manitoba, and extending north from North Bay to James and Hudson's Bay, Northern Ontario is a land of tens of thousands of clear lakes, rugged hills of Precambrian rock, endless tracts of timber and an almost limitless freedom to exercise ones own abilities in creating a better life.

While much of Northern Ontario is unsuited to any kind of agriculture, being either too cold or rocky, numerous areas exist within Northern Ontario that offer excellent possibilities. One such area is NEAR NORTH. The "near north" or southern extremity of Northern Ontario is approx 300 miles wide, covering the distance from Ottawa River on the east to Lake Superior in the west and extending for 50 miles north and south of that line. Largely low-land, many tracts of good farmable land exist, and in some places, have been developed. The entire area is well served by all forms of transportation and has within its boundaries, one third of Northern Ontario's population.

Alternate Society

In economics, Sun Hill received some money through donations, but by far the bulk of its income came from the performing of "outside" jobs, either individually or in groups.

Most of the money earned was pooled. Members contributed what they could and drew what they needed. Petty cash was kept— at the inspiration of Heinlein's *Stranger in a Strange Land*— in an open box by the main door, from which members took what they required, and recorded on a wall-hung paper what they had spent, and for what they had spent it. Though this door-box system may be ideal in a situation as described in "Stranger" (where money was incoming freely and in adequate surplus of needs) our meager income (and the resultant need for tighter budgeting) eventually forced the curtailment of this practice. We had resolved that each adult member be entitled to receive a minimum of \$2/week "personal money" for purchases exclusive of necessities. Actually this was rarely dared to be drawn from the precarious amounts of money on hand.

One might conjecture that great and hot disputes arose from so casual and communal a system of sharing money, but somehow they did not. I suppose this was because, in our zeal for Community, such matters were not given great weight, and each member was fairly conscientious and reasonable in his handling of his finances.

Initially, little effort was made to accurately anticipate expenses and make assurances of sufficient income to meet them. Money was simply spent as needed until it was gone, and then everything waited until more was available. No "reserve" was ever attempted, and unexpected large bills (such as auto repairs) usually automatically meant going further into debt. Eventually, we evolved an adequate system of accounting and financial planning. Money was segregated for different anticipated uses. We could then be assured that, when an urgent (anticipated) expense came up, the money earned for it was unspent. Money that was spent was noted on the "expense" sheet and, at the end of the month, broken down into categories to help us anticipate future needs in each category. At the beginning of the month, projected income and outgo for the coming month was compared, and our money-earning-and-spending activities adjusted to suit.

Sun Hill's most successful economic ploy was not in making money but in contriving not to spend it. Monetary expenses were generally contained by obtaining our material needs in as crude and unprocessed form as possible, supplying our own labor wherever possible, and— largely— by simply doing without. Were it not for the savings thus realized (and the collectivization of consumption) Sun Hill would have undoubtedly "gone under" financially, for income was always meager.

Modern Utopian

Dune

Dune is rich re-readable fantasy with clear portrayal of the fierce environment it takes to cohere a community. The metaphor is ecology. The theme revolution, the hard-worn return to balance.

"These things are so ancient within us," Paul said, "that they're ground into each separate cell of our bodies. We're shaped by such forces. You can say to yourself, 'Yes, I see how such a thing may be.' But when you look inward and confront the raw force of your own life unshielded, you see your peril. You see that this could overwhelm you. The greatest peril to the Giver is the force that takes. The greatest peril to the Taker is the force that gives. It's as easy to be overwhelmed by giving as by taking."

"And you, my son," Jessica asked, "are you one who gives or one who takes?"

"I'm at the fulcrum," he said. "I cannot give without taking and I cannot take without..." He broke off.

New Alchemy Institute

Here is a fantasy proposing to integrate solar heating, aquaculture, and agriculture in projects in New Mexico and the tropics. Technologically knowledgeable. The booklet probably costs something from:

The New Alchemy Institute, East
Box 432
Woods Hole, Massachusetts 02543

Fraser Darling, in his perceptive studies of remote Scottish peoples, showed how self-sufficiency was a positive force in their lives. The most independent communities were far more diverse and socially alive than the single industry towns and those heavily dependent on a life-line to the outside. He also found that they coped far better in their dealings with the world at large. Equally important, the independent communities cared for their environment and were less prone to despoil it for short term monetary gain.

WINTER GARDEN GALLERIES

COMBINING SUNLIGHT CONCENTRATION, EARTH HEAT RETENTION, HEAT FROM DECOMPOSITION OF COMPOST AND MINIMIZATION OF HEAT LOST TO THE WINTER SKY

A Clue That Communes Are Real

Have you noticed that recent commune life in various areas of the U.S. is strongly reminiscent of Indian life in those places? The political Iroquois and Cherokees of the East Coast. The easy-going defenseless West Coast Indians. The structural, mystical pueblos of New Mexico.

—SB

Stock Letter No. 1

My wife, unborn child and I are looking for a place to get back to God. We have looked at what is offered by U.S. and Canadian society and don't feel it has what we are looking for. I went two quarters at the U. of Wash. and from my own experience plus talking to others don't feel that a formal education is what I'm seeking. Work is fine, but only when constructive and meaningful; jobs that are these are few.

What we are looking for is a communal farm that could use two healthy human beings. (almost 3)

What we have to offer is youth (both 19), a will to learn and grow and faith.

Our financial situation is quite good as I am from an uppermiddle class background.

We have been vegetarians for more than a year now and believe in the organic way.

If you can help us in any way we shall be eternally grateful.

Love and Peace,
Jim and Penny Kelso
Seattle, Washington

Stock Answer No. 1

All the communes are crowded and seldom can use newcomers unless they have money to dispense or unusual practical skills.

Community is a matter of making, not finding. Start your own.

Whole Earth Catalog

Stock Letter No. 2

Gentlemen.

I am a graduate student at the University of California, Davis, and am working on a project involving "Intentional Community Organization." After looking at the Spring 1969 edition of the Whole Earth Catalog, I realized that you might be able to assist me. At present, I am trying to compile a list of communes, collectives, hip colonies, and other forms of communal organizations in the northern California area. The list will serve as a population from which a sample will be selected to be used in a study of child rearing and socialization.

The geographic area which I am interested in is northern California and western Nevada bounded on the south by Big Sur and Fresno.

I am specifically concerned with the items listed on the attached sheet, but any information or leads you might be able to supply would be of great benefit. If, at a later date, any of my findings become pertinent to your interests, I would be happy to share them.

I think the Whole Earth Catalog is relevant and interesting. I hope you'll be able to keep publishing it for a long time

Your time and efforts are very much appreciated.

Peace,
Frank Nicassio
Davis, California

Stock Answer No. 2

Communes aren't too interested in being studied, unless you feel like paying them.

Whole Earth Catalog

Comment

The Whole Earth Catalog is staying out of lateral communications among communities, yearning communers, social scientists, reporters, etc. for two reasons. (1) the job is massive; we can't handle it. (2) communities are beleaguered enough without us adding to the load.

-SB

CLAP CLAP FOR PATTICLAPE

Patticake had her strange bladder pain diagnosed in town the other day. Yes, Yes, we have genuine gonorrhoea right here on the farm. It was a riot watching her trying to get up the gumption to tell George that she had given it to him the night before. Ha Ha.

We don't want a commune. We want a community.

Ken Babbs 1969

The Commune Lie

One reason we promote communes is that there's no better place to make all the wishful mistakes, to get your nose rubbed in your fondest fantasies. (Sometimes a mistake works; that's gravy, and an obligation. The CATALOG was a mistake that worked.) Everybody has his own version of The Commune Lie, for example:

We'll let other people take care of us.

We'll let God take care of us.

Free lunch. (Robert Heinlein)

The Tragedy of the Commons (Garret Hardin)

We'll all be honest.

We'll all be selfless.

No rules.

Possessions are bad. Privacy is bad. Money is bad.

We've got the answer.

All lovely pitiful lies, and so, surely, is their denial. Do you know of any better, more rewarding labyrinth? And speculation won't get you around even the first turn.

Here are artifacts recovered from the midden heaps of the commune summer at Ken Kesey's farm, from the Hog Farm's first year in New Mexico, and from WHOLE EARTH correspondence.

-SB

Food food food food
crisis crisis crisis crisis

The people in the kitchen, hard-ass Paula in particular, say there just isn't any food worth mentioning for supper or any other meal in sight. Here is what we need quick:

- salad vegetables except lettuce
- cooking vegetables
- brown sugar
- honey
- non-instant powdered milk
- don't waste money on fucking peanut butter

Course this food thing is really a drag, y'know, takes money, takes labor to cook it, why down at the store we can get pop-top lunch for \$1.25 per six cans. The little babies like it in their bottles, and we can all cook those 200 pounds of brown rice in it, mmmmgood.

GEORGE'S ART OBJECT

George is way out in front in the All Asshole Farm Aesthetic Cotillion for the day: He discovered a bedpan with a turd floating in it on the bathroom floor. Good Hunting, George.

SO YOU WANTA FUCK THE EARTH?

(an editorial)

Got your rocks off yet, Hippies?
Had your belly fill of goodies?
Have you looted your fill?
If so, take a gawk at the mother lode.
Messy, ain't it?
Yeah, that's right, man, you been
Fucking the earth rotten.
Now clean it up and take care of yours.

The Mormons were saved by Seagulls.

Think Dirty----

Things grow in dirt
The underground movement is necessary if
you're going to plant stuff and grow it.

FREEDOM RINGS LOUD
(in our poor ears)

EMMIT'S CONDITION

David I don't know if you remember the Godsey family or not, but they use to run that little store where the post office was there at the mouth of Trace Fork when me and you was kids. Mr. Godsey was the postmaster in those days. After he died they give it to Mrs. Godsey, and she's run it and the store ever since, although the Lord only knows why Trace Fork would have a post office, they ain't over three families lives on that creek anymore. They've stripped that whole holler and then auger-mined it and most of the people that lived there when me and you did's moved away. But, Mrs. Godsey's there, and it's her that's been writing me letters about Emmitt. She written me twice in the last two weeks, and I written her once and sent her our phone number. I told her to call me collect any time she thinks I need to know something about Emmitt, and so yesterday she called and said the poor old faller's worse off than ever. She's really a dear woman, Mrs. Godsey is. She's known us I don't know how many years. She was Grandma's age. She remembers when Grandma and Grandad first moved to Trace Fork when they was just a young married couple. You ought to remember her, David, you use to go in there and buy candy from her when you wasn't any bigger than Debbie. Kind of a skinny woman, with the sweetest little voice you ever heard. Well, anyway, the poor thing, she's none too well herself, and I don't think she's actually been up to the homelapce to see Emmitt. But she sends her boy Leonard up, and from what Leonard says, Emmitt's so weak now he barely can get out of bed. Said he can get up enough to do his cooking, and goes out to feed his chickens and his rabbits. Emmitt keeps rabbits now Leonard said, and manages to feed 'em. But said he couldn't garden, and when something goes wrong around the place he can't fix it, and that he's just going to have to have some help or be moved out of there, if he lives at all. I told Mrs. Godsey on the phone that we'd try to see about helping him someway, but I swan I don't know of a thing any of us can do. He won't leave the place, he's the contrariest old man that ever was. I'm worried sick about him, and Doyle is too. Mrs. Godsey's letters are in the house. After supper I'll get 'em out and let you read 'em.

Discipline on The Hog Farm

The Hidden Dimension

"Don't try to reform man," says Fuller, "reform the environment." This book tools you to do it. Here is fascinating information on how we relate to space and each other through space. If you know how you want to feel and act, you can design a place to ensure that, or, equally, to make it impossible.

—SB

... To increase the speed of motorists in tunnels, it is necessary to reduce the number of visual impacts that flash by at eye level. In restaurants, libraries, and public places, cutting down on movement in the peripheral field should reduce the sense of crowding somewhat, whereas maximizing peripheral stimulation should build up a sense of crowding.

... The Aivilik have at least twelve different terms for various winds. They integrate time and space as one thing and live in acoustic-olfactory space, rather than visual space. Furthermore, representations of their visual world are like X rays. Their artists put in everything they know is there whether they can see it or not. A drawing or engraving of a man hunting seal on an ice floe will show not only what is on top of the ice (the hunter and his dogs) but what is underneath as well (the seal approaching his breathing hole to fill his lungs with air).

... corner situations with people at right angles to each other produced six times as many conversations as face-to-face situations across the 36-inch span of the table, and twice as many as the side-by-side arrangement.

Although man is a self-domesticated animal, the domestication process is only partial. We see this in certain types of schizophrenics who apparently experience something very similar to the flight reaction. When approached too closely, these schizophrenics panic in much the same way as an animal recently locked up in a zoo. In describing their feelings, such patients refer to anything that happens within their "flight distance" as taking place literally *inside themselves*. That is, the boundaries of the self extend beyond the body. These experiences recorded by therapists working with schizophrenics indicate that the realization of the self as we know it is intimately associated with the process of making boundaries explicit.

In discussing olfactory messages with a psychoanalyst, a skillful therapist with an unusual record of success, I learned that the therapist could clearly distinguish the smell of anger in patients at a distance of six feet or more. People who work with schizophrenics have long claimed that they have a characteristic odor. Such naturalistic observations led to a series of experiments in which Dr. Kathleen Smith, a St. Louis psychiatrist, demonstrated that rats readily distinguish between the smell of a schizophrenic and a non-schizophrenic. In light of the powerful effect of chemical message systems one wonders if fear, anger, and schizophrenic panic may not act directly on the endocrine systems of nearby persons. One would suspect that this would be the case.

Village Planning in the Primitive World

Successful small community design must fit the local physical environment and at the same time render clear the community's social system and its religious system. This book has 78 pictures and eight detailed written accounts of village systems that have worked for bushmen, Cheyenne Indians, Trobriand Islanders, the Yoruba, Mbuti pygmies, and others. The systems are diverse, compelling, and mind-opening for approaching the design of one's own community.

Oiling and stowing the tools. (artifact/tools: now there's a topic.)

When a storm blows in, covering the south wall with rain and blotting out the mountains. Ridges look new in every light. Still discovering new conformations—every cony has an ancestry but the rocks were just here.

Structure in the lithosphere/cycles of change in rock/only the smallest percentage sanded and powdered and mixed with life-derived elements.

Is chemical reaction a type of perception??—Running through all things motion and reacting, object against object/there is more than enough time for all things to happen: swallowing its own tail.

[Earth House Hold]

REVOLUTION IN THE REVOLUTION IN THE REVOLUTION

The country surrounds the city
The back country surrounds the country
"From the masses to the masses" the most Revolutionary consciousness is to be found
Among the most ruthlessly exploited classes:
Animals, trees, water, air, grasses

We must pass through the stage of the "Dictatorship of the Unconscious" before we can Hope for the withering-away of the states
And finally arrive at true Communionism..

If the capitalists and imperialists are the exploiters, the masses are the workers, and the party is the communist.

If civilization is the exploiter, the masses is nature, and the party is the poets.

If the abstract rational intellect is the exploiter, the masses is the unconscious, and the party is the yogins.

& POWER comes out of the seed-syllables of mantras.

[Regarding Wave]

The Effective Executive

Wherever there's a bunch of people doing something, somebody is bearing executive relation to the group, usually badly, so that he's unhappy and the group is unhappy, and nothing much is going on besides frustration. But some leaders are good, and with them a lot happens and everybody feels good. This book takes a deep look into how "good" executives behave in common. The generalizations that emerge are useful to anybody with responsibility, from the honcho of a commune to the goddam Pope.

1. Effective executives know where their time goes. They work systematically at managing the little of their time that can be brought under their control.
2. Effective executives focus on outward contribution. They gear their efforts to results rather than to work. They start out with the question, "What results are expected of me?" rather than with the work to be done, let alone with its techniques and tools.
3. Effective executives build on strengths—their own strengths, the strengths of their superiors, colleagues, and subordinates; and on the strengths in the situation, that is, on what they can do. They do not build on weakness. They do not start out with the things they cannot do.
4. Effective executives concentrate on the few major areas where superior performance will produce outstanding results. They force themselves to set priorities and stay with their priority decisions. They know that they have no choice but to do first things first—and second things not at all. The alternative is to get nothing done.
5. Effective executives, finally, make effective decisions. They know that this is, above all, a matter of system—of the right steps in the right sequence. They know that an effective decision is always a judgment based on "dissenting opinions" rather than on "consensus on the facts." And they know that to make many decisions fast means to make the wrong decisions. What is needed are few, but fundamental, decisions. What is needed is the right strategy rather than razzle-dazzle tactics.

These are the elements of executive effectiveness—and these are the subjects of this book.

The definition of a "routine" is that it makes unskilled people without judgment capable of doing what it took near-genius to do before; for a routine puts down in systematic, step-by-step form what a very able man learned in surmounting yesterday's crisis.

We know very little about self-development. But we do know one thing: People in general, and knowledge workers in particular, grow according to the demands they make on themselves. They grow according to what they expect to be achievement and attainment. If they demand little of themselves, they will remain stunted. If they demand a good deal of themselves, they will grow to giant stature—without any more effort than is expended by the nonachievers.

To tolerate diversity, relationships must be task-focused rather than personality-focused. Achievement must be measured against objective criteria of contribution and performance. This is possible, however, only if jobs are defined and structured impersonally. Otherwise the accent will be on "Who is right?" rather than on "What is right?" In no time, personnel decisions will be made on "Do I like this fellow?" or "Will he be acceptable?" rather than by asking "Is he the man most likely to do an outstanding job?"

The least-known of the great American business builders, Theodore Vail, was perhaps the most effective decision-maker in U. S. business history. As president of the Bell Telephone System from just before 1910 till the mid-twenties, Vail built the organization into the largest private business in the world and into one of the most prosperous growth companies.

That the telephone system is privately owned is taken for granted in the United States. But the part of the North American continent that the Bell System serves (the United States and the two most populous Canadian provinces, Quebec and Ontario) is the only developed area in the world in which telecommunications are not owned by the government. The Bell System is also the only public utility that has shown itself capable of risk-taking leadership and rapid growth, even though it has a monopoly in a vital area and has achieved saturation of its original market. . . .

"Our business is service" became the Bell commitment as soon as Vail took over. At the time, shortly after the turn of the century, this was heresy. But Vail was not content to preach that it was the business of the company to give service, and that it was the job of management to make service possible and profitable. He saw to it that the yardsticks throughout the system by which managers and their operations were judged, measured service fulfillment rather than profit performance. Managers are responsible for service results. It is then the job of top management to organize and finance the company so as to make the best service also result in optimal financial rewards. . . .

Vail's third decision led to the establishment of one of the most successful scientific laboratories in industry, the Bell Laboratories. Again, Vail started out with the need to make a private monopoly viable. Only this time he asked: "How can one make such a monopoly truly competitive?" Obviously it was not subject to the normal competition from another supplier who offers the purchaser the same product or one supplying the same want. And yet without competition such a monopoly would rapidly become rigid and incapable of growth and change.

But even in a monopoly, Vail concluded, one can organize the future to compete with the present. In a technical industry such as telecommunications, the future lies in better and different technologies. The Bell Laboratories which grew out of this insight were by no means the first industrial laboratory, not even in the United States. But it was the first industrial research institution that was deliberately designed to make the present obsolete, no matter how profitable and efficient.

There is serious need for a new principle of effective administration under which every act, every activity, and every program of government is conceived as temporary and as expiring automatically after a fixed number of years—maybe ten—unless specifically prolonged by new legislation following careful outside study of the program, its results and its contributions.

The Peter Principle

The principle is: a person rises to his highest level of incompetence and then stays there forever because nobody likes to fire the formerly competent. Now you don't need the book, which is mostly a witty dance through ramifications of the principle. Once you're caught in a Peter Principle blind alley, some escapes are: 1) stop pressing up and go sideways, 2) slide back a bit and change direction, 3) quit completely and start over, 4) put curtains and tasteful paintings on the walls of your alley and wait it out.

Miss Totland, who had been a competent student and an outstanding primary teacher, was promoted to primary supervisor. She now has to teach, not children, but teachers. Yet she still uses the techniques which worked so well with small children.

Addressing teachers, singly or in groups, she speaks slowly and distinctly. She uses mostly words of one or two syllables. She explains each point several times in different ways, to be sure it is understood. She always wears a bright smile.

Teachers dislike what they call her false cheerfulness and her patronizing attitude. Their resentment is so sharp that, instead of trying to carry out her suggestions, they spend much time devising excuses for not doing what she recommends.

Miss Totland has proved herself incompetent in communicating with primary teachers. She is therefore ineligible for further promotion, and will remain as primary supervisor, at her level of incompetence.

The difference between cases of Pseudo-Achievement Syndrome and Final Placement Syndrome is known as Peter's Nuance. For your own guidance in classifying such cases, you should always ask yourself, "Is the person accomplishing any useful work?" If the answer is:

- "YES"—he has not reached his level of incompetence and therefore exhibits only the Pseudo-Achievement Syndrome.
- "NO"—he has reached his level of incompetence, and therefore exhibits the Final Placement Syndrome.
- "DON'T KNOW"—you have reached your level of incompetence. Examine yourself for symptoms at once!

Up The Organization

This book has an amazing amount of truth, some of it pretty radical truth, about how to run an enterprise, whether it's a business, a school, a commune, or a government.

A lesson very few have learned: If you want to approach the head of XYZ Corporation, call him cold. Tell him who you are and why you want to talk to him. A direct and uncomplicated relationship will follow.

The common mistake is to look for a mutual friend—or a friend's friend on his board, in his bank or investment bank or law firm—to introduce you. This starts all sorts of side vibrations and usually results in a half-assed prologue by the intermediary, who is apt to grind both edges of his own ax.

All decisions should be made as low as possible in the organization. The Charge of the Light Brigade was ordered by an officer who wasn't there looking at the territory.

There are two kinds of decisions: those that are expensive to change and those that are not.

If you can't do it excellently, don't do it at all. Because if it's not excellent it won't be profitable or fun, and if you're not in business for fun or profit, what the hell are you doing here?

Admit your own mistakes openly, maybe even joyfully.

Encourage your associates to do likewise by commiserating with them. Never castigate. Babies learn to walk by falling down. If you beat a baby every time he falls down, he'll never care much for walking.

Hiring. To keep an organization young and fit, don't hire anyone until everybody's so overworked they'll be glad to see the newcomer no matter where he sits.

DEPARTURE

Ordinarily the talk about their Uncle Emmitt would have led D.R. and Marcella on into a general rap about other relatives, and the old days as children in Kentucky. But there were too many distractions for them to go very far with it that afternoon. D.R. was thinking about Estelle waiting at the bus station, and Marcella kept interrupting herself to hassle her children. About fifteen minutes into their conversation Herschel spilled his Pepsi and came demanding more, as Debbie started waiting around in the front yard. Marcella waited for Debbie to come running around the house to be comforted, but when she kept on crying where she was, Marcella jumped to her feet and ran around to see what was the matter. D.R. poured Herschel's glass full of Pepsi, and started to refill his own. But then he decided the thing to do was go in and call Estelle and see what was going down back at the old bus station.

"Herschel old friend, why don't you stay here and guard this Pepsi Cola while I go in the house and use the telephone. Okay?" "Who are you going to call?" asked Herschel.

"I've got to call a man about a dog."

Herschel said, "You do not."

D.R. said, "I'm going to call the weather man and ask him to send us some rain."

"You're a turd," said Herschel.

"That's no way to talk to your friend."

"You're not my friend," said Herschel.

D.R. said, "I thought me and you were good old buddies."

"You're a queer," said Herschel. "Why don't you go somewhere and have a car wreck?"

"If I did that we wouldn't be able to wrestle any more, now would we?"

Instantly Herschel leaped onto D.R.'s lap. Together they fell out of the lawn chair onto the ground. D.R. started tickling Herschel in the ribs which made him squeal with laughter, but fight back twice as hard. Herschel crawled onto D.R.'s back as D.R. struggled to his feet. Together they staggered toward the house, scuffling and laughing, both red in the face from the effort.

By the time D.R. and Herschel had wrestled their way back in the house Marcella had evacuated Debbie to the bathroom, where she was having Medi-Quik sprayed on a not very badly damaged knee. Even without Debbie's commotion in the bathroom it would have been impossible to make a phone call with a nine year old orangutan on his back, so D.R. told Marcella he was going out to a pay phone to make a long distance call. Marcella tried to get him to use their house phone, but when D.R. said he wanted to go out she told him about a pay phone over in the shopping center. At the mention of the words "shopping center" Herschel started screaming and yelling for permission to go along. When it was clear he wasn't going to be allowed to he yelled "I hate you," at D.R. and slammed the door as hard as he could. As soon as D.R. got in the bus he fished a roach out of the ash tray, and by the time he found the phone booth in the shopping center he was blessedly stoned.

Far-out is fine. Who's minding the store?

The Moonlighter's Manual

Moonlighting means having a second job. Lots of people don't have a first job or want one. Birds of this feather flock economically together and pool resources for rent, food, dope, etc.—which still requires some modest income. Moonlight-type work may be the answer. Most of the income-sources in this book are part-time, or do-at-home, and involve low commitment of psyche (an advantage they have over stealing or dope peddling). The book includes a good list of technical training schools. —SB

BE A LOCKSMITH

Picking locks, installing them, or making keys, freeing people from locked rooms, or getting them into their locked homes and cars, is an art that mystifies most people, thus making the locksmith in any town a respected craftsman. But actually, almost anyone who can work with tools and has a steady hand for dealing with tiny objects can master this craft and make a secure and profitable living from it. Generally this is a job for a self-starter, whether he pursues it full time or part time. The more than three hundred tools of the trade are the secret; they really do the work.

Earnings

Some beginners report averaging \$3 to \$10 an hour in their spare time, while learning, and those who set up their own shops, either in their homes or in a small, rented downtown store, come closest to the higher figure. And it's almost 100 per cent profit.

Hours

Variable. This job can be placed on a regular workday basis if you concentrate on installing and replacing locks and key-making, and there are always many jobs that can be done in spare time at home. But there will always be emergency calls, too, and these can mean an hour's rush work at any time of day or night.

Requirements

If you can concentrate on simple diagrams, follow instructions and handle small tools, you can learn this trade quickly, studying in your free time at home and gaining practical experience by working with actual car locks, home locks, safe locks, and padlocks. You'll also need a car for transportation, of course.

Future

Some large-traffic supermarket and department stores are glad to set up a locksmith with the space he needs, just for the service to their customers, although they will expect a commission or rent for their ideal situation. But opening your own shop is a distinct future calling, and you can double your earnings by selling locks, keys, and safety devices, too.

Accounting For Everyday Profit

I do wish we'd had this invaluable book when we started business. Instead we fumbled around, lost track of things, invented procedures, got hints and requirements from Portola Institute, hired people with some experience, and after two years arrived at an excellent bookkeeping and accounting procedure which is just like what's in this book.

HOW TO BUILD A MONEY RE-CYCLING DEPOT FOR \$30
OR

DO YOU KNOW WHERE YOUR SAVINGS ARE TONIGHT?

Remember when they burned the Bank of America in Isla Vista, California? Well, they're burning it again in IV right now, only this time the Bank isn't going to be able to rebuild so easily. This time they're burning it legally, in fact they've got a charter from the federal government to do it — by forming a "credit union."

IV's Community Council has started the Isla Vista Community Federal Credit Union as sort of a *money co-op*. Members save there just as they would at a bank — their deposits earn dividends and are insured up to \$20,000. But instead of lending money to defense-disoriented conglomerates or agri-mega-businessmen, the credit union makes loans *only to its own members*. The idea is to build up the economic vitality and self-sufficiency of the Isla Vista alternative community by creating a co-operative "people's bank."

Loans must be OK'd by a credit committee elected by the members. The money can be used for anything from buying a truck to defraying medical expenses to paying tuition to financing a tractor. There doesn't have to be collateral unless the loan is more than \$2,500. A brochure from the Credit Union National Association suggests what kind of loan criteria are used: "For a community credit union, making loans on character happens to be especially easy, because it is a friendly association of neighbors. The members know each other. They do not have to investigate each other . . . Hence, whenever a loan application is being considered, the members of the credit committee can concentrate on the question, 'Will this loan help the borrower?' " And because the credit union is a non-profit, tax-exempt association, it can make loans at easy-money interest rates.

The IV credit union operates out of a corner of the Community Council's office. It pays its manager \$25 a week to keep office hours Monday through Saturday, two hours a day. In its first six weeks it signed up 120 members, with share deposits of \$25,000. About \$5,000 has been loaned out to members so far — one loan, for example, went to finance the inventory of a text-book co-op. Another was to help a member buy tires for his truck. The credit union has contracted with the county welfare department to sell food stamps. The county will pay IV's people's bank \$1.00 every time a member buys stamps! Eventually, the credit union's board hopes to do a bail bond service and finance co-operative housing.

The Counter-Economy seminar at the Free University of Berkeley, which we co-ordinate, has formed an organizing committee to apply for a charter for a credit union of the members of the Free U. (Every credit union must be

Officers of the Isla Vista Credit Union go over accounts. left to right, J.C. Simmons (President of the Board), Rosemary McLeod (Chairman of Credit Committee), Mike Tejeda (Vice-President of Board and Chairman of Educational Committee), seated Marla Mercer (office manager).

formed among a group of people who share a "common bond" — work for the same employer, belong to the same church, labor union, fraternal, professional, co-operative or other association, live in the same community or neighborhood, etc. The class has laid out \$30 in fees, which will be reimbursed as soon as the credit union begins to wail. The class polled its 23 members and discovered that all together they had \$7,910 (!!!!!) sitting in banks doing nothing socially, morally, existentially, or esthetically justifiable — money that could be easily liberated and sluiced back into a community of friends and neighbors. This credit union will consolidate the economic resources of people who belong to the Free U. and use them to fund potentially self-sustaining co-operative businesses — an automobile repair service, for instance, and a dressmakers' co-op — by making loans to members. Ultimately it could serve as the clearing-house for a labor exchange that would make it unnecessary for us to be constantly handing each other government forms with numbers all over them every time the roof needs fixin'. The "People's Bank" founded by our anarchist friend Pierre-Joseph Proudhon in Paris in 1849 was, after all, designed to *eliminate* money!

There's one problem with credit union loans — they can only be made to members who are likely to repay — they aren't grants. The class discovered that Leopold's, Berkeley's non-profit record store, raised a \$2,500 grant for a legal defense fund during the Cambodia-Kent State crisis by asking people to pay a "voluntary tax" of 25 cents an album. The class has discussed the possibility of collecting a "voluntary tax" at the credit union — 25 cents per transaction, say — toward an "alternative community chest" that would be allocated by proportional vote of the membership to community institutions that won't be able to pay the money back, like the Free Clinic.

If you're interested in setting up a credit union as a focus for economic experimentation, write William A. Atkins, Credit Union National Association, 1617 Sherman Ave., Box 431, Madison, WI 53701. Atkins will load you down with literature and refer you to the local office of your state's Credit Union League, which will send a consultant to speak with your group and, after the cash begins to recycle, supply all kinds of technical help and logistical support. If you'd like to check out the Isla Vista Credit Union Newsletter, send a self-addressed stamped envelope to 970 Embarcadero Del Mar, Goleta, CA 93017.

While you're at it — we're putting together sort of an "alternative economy cookbook" that will include reports of how people are getting and spending without laying waste their powers. Are you involved in some kind of enterprise or other economic or post-economic behavior or thinking that is in the least bit counter-cultural, counter-economic, over-the-counter, under-the-counter or off-the-wall? If so, we'd like to hear from you:

United Security Accounts

WRITE CHECKS ON YOUR SAVINGS ACCOUNT;
EARN INTEREST ON YOUR CHECKING ACCOUNT

United Security Accounts is for real. Ask any banker.
They all go tut tut and look envious.

—SB

United Security Accounts® are a combination of savings and checking accounts. Interest-bearing savings (4½%) serve as collateral for 15 to 45-day free check loans, with the obvious advantage that money spent is effectively earning interest. The accounts offer unlimited free checking with no minimum balance (a \$100 deposit is required to open an account but need not be maintained); in return, you have to watch out for a few tricky features. When the free loan period is up, a loan starts costing you 9%, retroactive to the writing of the check, and savings are *not* automatically withdrawn to cover it. You can withdraw savings and apply the money to the loan yourself, though you may lose several month's interest if you do; but the accounts are most satisfactory if you deposit enough each month to cover the previous month's checks. A deposit intended to cover a check-loan must reach the bank after the check has cleared; otherwise it goes to the savings account and the loan will remain outstanding.

The checks come with an identification card and look quite distinctive. Probably as a result, they are almost as easy to cash as local checks.

The bank says the accounts are released in blocks and are not always available. I don't know how much trouble they may be to get (I had no wait at all). Don't send a deposit, just a letter of inquiry, to

Citizens Bank and Trust Company
Chicago, Illinois 60648

Duane Small
Louisville, Ky.

Far as I can see, you've covered *Everything* but this: This check is written on a checking account which provided free printed checks, free postage for deposits, free, complete monthly statements that anyone can understand and...get this...*Maximum Savings Account Interest* on my MAXIMUM account balance. All this plus Federal Deposit Insurance. My account has been with them for years, and I won't tell you how much interest they've paid me for my *Checking Account* money! Top that!

"Did you really think that we want those laws to be observed?" said Dr. Ferris. "We want them broken. You'd better get it straight that it's not a bunch of boy scouts you're up against—then you'll know that this is not the age for beautiful gestures. We're after power and we mean it. You fellows were pikers, but we know the real trick, and you'd better get wise to it. There's no way to rule innocent men. The only power any government has is the power to crack down on criminals. Well, when there aren't enough criminals, one makes them. One declares so many things to be a crime that it becomes impossible for men to live without breaking laws. Who wants a nation of law-abiding citizens? What's there in that for anyone? But just pass the kind of laws that can neither be observed nor enforced nor objectively interpreted—and you create a nation of law-breakers—and then you cash in on guilt. Now that's the system, Mr. Rearden, that's the game, and once you understand it, you'll be much easier to deal with."

A VERY DIFFICULT DAY

"Hello?"
"Hello, Estelle? This is David Ray Davenport, the famous truth seeker. I'm calling to see if you or any member of your immediate family might have a truth to tell today."

"Where are you?" asked Estelle.
"Ahh," said D.R. "A good question. A very good question. Right now I'd say I'm cruising at about ten thousand feet. And what's that I spy below me there, off to the right, nestled in a little cluster of twenty-one thousand dollar suburban houses on the outskirts of Cincinnati? Why, I do believe it's one of those hippie buses, painted up all garish and weird, surrounded by children and a smattering of curious adult on-lookers. But wait! That curious on-looker smashing the headlights with his fists. That's no adult. That's a kid! A two-hundred-pound, nine-year-old kid. And look! Oh my God! The kid! He's gone wild! He's beating the poor hippie about the head and ears, he's hitting him with a Pepsi Cola bottle. Help, help, someone! Someone call for help!"

"Where are you?" asked Estelle.
"Mam, I regret I am unable to give out that kind of information. Heavy stuff is going on. Mad villains are everywhere. Insanity rules, and only a total clamp on all information will save the day. I can, however, reveal this much: my nine-year-old nephew is actually a dwarf with incredible supernatural powers. Only an hour ago, before my very eyes, right in my own hand, by god, he transformed a Pepsi Cola bottle into a turd. Imagine. A turd. It was awful. It was disgusting. And then, you'll never believe what he did next. There I am sitting in the back yard of this little twenty-one thousand dollar suburban home with a big piece of shit in my hand, and he says: 'you're going to have a car wreck. He lays this curse on me right there, he says, Motherfucker you are about to crash! It's been really heavy, mam. I've really had a very difficult day."

Understanding Foundations

It tells you some about how to raise money and a lot about where to look.

OUT OF PRINT

Perhaps the greatest, most time-consuming, and least productive activity among fund raisers today is random foundation door-knocking. Amateurs, especially, are guilty of this. But professionals, who should know better, are offenders too.

Everyone who has ever applied or is about to apply to a foundation for a grant wonders whether there is some magic formula for a successful application. If there is one, it is simplicity.

The desks of foundation officials around the country are piled high with applications characterized by verbosity, pomposity, and vagueness. Make your application short, simple, and clear, and it will stand out.

Most foundations have no standard form which applicants fill out. A good approach is a simple letter of one or two pages (even the most complex subjects can be boiled down to this length) or a short proposal accompanied by a covering letter of introduction. Sometimes it is worth calling a foundation first to discuss your project before going to the trouble of preparing a proposal.

Don't hem and haw on money. State figures and try to stick with them. If you need staff, you will need to pay them. How much? If you need office space and equipment, check out all costs before going to the foundation. If materials, transportation, or other items are involved, include them. If it is a one-time grant, say so. If not, make it a two-year, or three-year, or more, request. Foundation officials are money handlers and, as such, are most concerned with sound fiscal management. They cite poor financial administration as a key factor in grants rejection.

Every applicant wonders whether or not he should include endorsements in his proposal. By all means, if there are reputable people in the field who are familiar with your work, the organization, and its programs, endorsements are valuable. Foundations have a high regard for expertise. The backing of respected people puts a useful stamp of approval on any project.

After making your proposal or writing your letter, don't expect quick response. Most foundations are extremely busy and take a good deal of time before responding to letters or applications. Certainly do not expect an early grant. Foundations generally have board meetings several times a year, at which time those proposals which have passed the scrutiny of the executive director, the program administrator, or the person concerned with applications, are considered. It is infrequent that an applicant will receive funds in less than six months' time after his application.

On Free Money

From my limited experience, the realm of foundations and grants is one of the most cynical in the American economy. Generally when you approach a foundation they are friendly and half-receptive. They consider your project promising if a little naive, and they'd like to see you write up a proposal on it. You spend a month learning how to write proposals and a month writing this one. They keep it six months. Your idea has died of dry rot. Then they request that you re-write the proposal to accommodate (whatever) and it might go through next time the board meets. Do this three times, and you have died of dry rot.

Most actual grants I know of were initiated by the donors, not the donees. The most effective way to get grant money is to be Highly Visible.

I don't know why foundation and government money is so often toxic to projects. Maybe because the process becomes so easily dishonest. Do me no favors, and I'll tell you no lies. Or is it the belief that there's such a thing as a free lunch that is the root lie?

—SB

The Foundation Directory

The reference book of foundations. Gives addresses, finances, officers, purposes and activities. Foundations are listed by state, which is intelligent, since grants are usually given locally.

On Getting by Without Money

Disassociation with the economic bag of any society is difficult unless you are very rich or a Trappist monk. This article is for those who have no savings, no inheritance no trust funds and no desire to remain in a money-oriented rut (there are so many other ruts to explore).

What I have to offer here is not all-inclusive—just merely information that I have acquired firsthand as my family (wife and 2 kids) and I have tripped along.

When we first started on the trip, our first concern was food—a needless concern in this country—we went to the local grocery store and asked for the vegetable and fruit discards. Everyday in this country grocery stores—all of them—throw away about 4 garbage cans full of edible food. Food that is 'spotted', 'overripe', 'bruised', or ugly. The quality and quantity of the throw-away food depends very much on the type of ownership of store and its clientele. One man operations or family owned stores keep everything—chain operated stores throw away good food all the time. The easiest way to get vegetables from a store is to ask for them. Sometimes you score, sometimes not. The store I got vegetables from gave me enough to feed 31 people, 10 chickens and start a good compost pile—2-3 boxes everyday. Stores catering to the elite of this society have the most throwaways—no blemishes or bruises allowed,—but they tend to be selfish with their garbage. Stores like Safeway, etc. are best bets.

Another source of food is Government Surplus Food obtained from your local welfare office. In Santa Cruz County (Calif.), a married man with 1 child earning less than \$200 a month is 'entitled' to 20 lbs. of flour, 3 lbs. of oatmeal, 5 lbs. of corn meal, 1 lb of bulgar, 3 lbs. of rolled wheat, 3 lbs. of rice, 5 lbs. of butter, 10 lbs. of powdered milk, 3 lbs. of lard, 2 lbs. of dried peas, 1 lb. of peanut butter, 5 lbs. of cheese, plus canned vegetables, dried fruit and fruit juice.—each month. These foods are

Many foundations have accepted the doctrine that their limited funds should be used chiefly as the venture capital of philanthropy, to be spent in enterprises requiring risk and foresight, not likely to be supported by government or private individuals. In their fields of special interest they prefer to aid research, designed to push forward the frontiers of knowledge, or pilot demonstrations, resulting in improved procedures apt to be widely copied.

Support for current programs, if it comes at all from foundations, must usually be sought from the smaller organizations, and especially those located in the area of the agency, well acquainted with its personnel and its needs. Most small foundations, and some larger ones, restrict their grants to the local community, or state. Immense variety exists; the interests and limitations of each foundation need to be examined before it is approached.

Where there is evidence that the applicant has not bothered to find out the field of interest of the foundation, or has made a general mailing, the cost of even a formal declination is scarcely warranted; wastebaskets are available in any required size.

Sample listing:

San Francisco Foundation, The
351 California Street
San Francisco, California 94104

Community foundation established in 1948 in California by resolution and declaration of trust.

Purpose and Activities: Grants principally for welfare and welfare planning, hospitals, education, health and mental health, culture and the arts, and conservation in the San Francisco area unless otherwise specified by donors. Report published annually.

Financial Data (year ended 30 June 1965): Active capital, \$6,736,824 (L); gifts received, \$686,287; expenditures, \$681,326, including \$639,793 in grants.

Officer: John R. May, Executive Director and Secretary.

Distribution Committee: S. Clark Beise, Chairman; Daniel E. Koshland, William H. Orrick, Jr., Vice-Chairmen; William R. Hewlett, Treasurer; Christian de Guigne, Mrs. Alfred McLaughlin, Emmett G. Solomon.

Trustees: Bank of America, The Bank of California, Commonwealth National Bank of San Francisco, Crocker-Citizens National Bank, First Western Bank and Trust Company, Golden Gate National Bank, The Hibernia Bank, Pacific National Bank of San Francisco, United California Bank, Wells Fargo Bank.

good trade items—we traded for eggs and non-food items. —examples—made arrangements with a group living on a farm. They didn't 'qualify' for welfare food but had an abundance of barnyard stock. We traded. We had food, another made sandals. We traded. We had cornmeal, someone raised a lamb—we had meat, they had meal. The best way to trade is to give it all away—when it's time, it will come back.

Next to free food, you need cheap food. Most bakeries sell day-old bread—we used to get about 13 loaves of french bread and 5 dozen rolls for \$1.00. (This helped feed the chickens too.) Egg Ranches sell flats of eggs below market value—we got cracked eggs for less than 1¢ each (cheap enough to feed the dogs, along with the canned welfare meat). Also, farmers markets and flea markets are good places for cheap good produce. Most important of all—bulk purchases of wheat and rice are very wise investments.

Cheap clothes are available at the Goodwill, Army Surplus Stores, Rummage sales and Flea markets. Rent is the real bummer and we never solved it completely until we moved into our camper. However, rent can be lessened on a trade for rent basis. I got 3 weeks free rent in agreement to clean up the house I was moving into. One friend got a big house for 3 months in exchange for repairs. Another got a year's free rent—the first 6 months in exchange for repairs and the last 6 months in trade for a sculpture he did. With the camper, rent is not the problem it once was.

I built my camper for about \$125.00. I got nearly all of the lumber at the city dump and at construction sites (you could start a lumber company from their scrap pile). The stove in the camper came from a trash pile and I traded a window for the sink. The icebox was given to me. The \$13 foam rubber mattress on our bed cost \$5 at the Flea Market. Four of the five tires on my truck were free—I got them from behind the Santa Cruz County auto maintenance building. They use tubeless tires and they don't repair them. They throw them away—it's covered by taxes. Service stations and department stores sometimes throw away usable tires.

Transportation is hard—mostly luck. I've been given 1 car, 1 truck and I bought an excellent running car for \$20 trade.

Medicine. In emergency, go to the county hospital, look for trade situations. I know of a dentist who did work at cost or trade for long-haired people. Another friend worked at a Veterinary Hospital to pay for his dog's operation. Look behind the doctor's office. I found 700 tranquilizers at the dump.

Tools and furniture may be gotten at Goodwill, flea markets and rummage sales.

If you look around, you may be able to find a mechanic who will work for exchange of things other than money—there are lots of things you can do.

You don't have to be rich to drop out—but it helps.

7th Day Adventist Organic Food

COLLEGE DALE DISTRIBUTORS, is run by seventh day adventists, very nice people and this is their wholesale list. I haven't used it personally, but I do shop at their retail outlet and am very pleased with their service and quality of merchandise. A really nice thing about these people, is that health foods is a part of their religion, and their retail outlets in this area are really mind busters. Aisles of good food, all at reasonable prices, and without the stench of hypocondria that I've encountered in some health food stores, (as well as the high prices). In general, if you are new in a neighbourhood, and you're interested in eating right, the best people to go to are the Seventh Day Adventists and ask them where they get their food. There was a Buddhist monk that came up here to live several years ago with a little house and a back yard on the outskirts of town, and coming from Hong Kong did not know the various ways of gardening here in the US, and it was the Seventh Day Adventists that taught him organic gardening. They have a restaurant near this wholesale outlet where we eat occasionally and they are very nice.

Feed is cheap food

Items such as brown rice, whole wheat flour, wheat germ, cracked wheat, rye flour and dried beans are available at most supermarkets, but they are cheaper at farmers' co-ops and feed and seed dealers. To locate one of these outlets, check the yellow pages under headings Feed Dealers, Seed Dealers or Grain Dealers.

Here's a comparative list of prices obtaining now in the Pacific Northwest. Obviously availability and pricing will vary locally and regionally.

Item	Supermarket price per pound	Feed Dealers' price per pound
Brown rice	25¢	18¢
Wheat germ	50-75¢	20¢
Whole wheat flour	14¢	10¢
Whole wheat flour	14¢	10¢
Rye flour	20¢	10¢
Pinto beans	25¢	16¢
Small red beans	17¢	17¢
Large red kidney	33¢	33¢
Split peas	21¢	17¢
Pearl barley	25¢	14¢

THE DIFFICULT DAY CONTINUES

"It sounds like it," said Estelle.
D.R. asked Estelle what kind of day she was having.
Estelle thought it over. "Kind of thoughtful," she said.
"Kind of thoughtful, eh?" said D.R.
"Yeah," said Estelle. "I've been doing a lot of thinking.
D.R. asked her what she'd been thinking about.
"Different things."
D.R. asked her to tell him about one of them.
"I guess I've mainly been thinking about us not stopping in Vincennes last night," she said. "Do you remember that?"
"Where?" asked D.R.
"Vincennes. I wanted to stop and get a motel, and rest some. I wanted to take a bath, sleep in a good bed, we talked about it, do you remember?"
"Sure," said D.R. "I remember that. That was in Vincennes."
"Well," said Estelle. "That's what I've been thinking about."
"All day?" D.R. asked.
"Just about," said Estelle.
"What have you been thinking about that for?"
"I don't know," said Estelle. "I guess I just really wanted to stop at a motel in Vincennes. I guess I was just awfully disappointed that you didn't want to, and it's just stayed on my mind."
"I'll be darned."
"You'll be what?" asked Estelle.
"Darned."
"Darned, did you say?"
"Yep," said D.R. "I'll be darned."
"What else will you be besides darned?"
"I don't know," said D.R. "What else is there to be?"
"Quite a lot of things, actually," said Estelle.
"Well," said D.R. "Don't tell me about them."
"I wasn't going to," said Estelle.
"Yes you were," said D.R. "But don't. I don't want to hear about it."
Estelle asked D.R. what he did want to hear about.
"I don't want to hear about a goddamn fucking thing."
"Well, I guess the thing for me to do is hang up, then," said Estelle.
"Where are you, a phone booth?"
"I'm at the ticket counter, D.R. you paged me, remember?"
"Are there people around?"
"A few."
"Can they hear you?"
"Probably."
"There are people around me too," said D.R. "But they can't hear me, and I fucking well can't hear them, and I like that very much."
"Are you in a phone booth?"
"I'm in a fantastic phone booth."
Estelle said, "Well I'm not. And I think I'm probably disturbing the ticket man, although he is certainly being very nice about me using his phone. So I guess what I'm going to do, D.R. is hang up now, and if you come down here after while I'll see you. Okay?"
"That sounds about right."
"Well goodbye then."
"Yeah. So long, Estelle."
"Goodbye honey," said Estelle.
D.R. sat in the booth a long time, listening to the dial tone.

Protein

Nutrition for humans is primarily PROTEIN. People short on it get sick and despondant. And dead. In the big picture there's a shortage of protein. Here are two sources.

Meals for Millions puts out a powdered protein that works as a supplement or additive. —SB

Modern Protein Food
1800 Olympic Blvd.
Santa Monica, CA 90404

Instant Protein (which is 80% protein). FDA won't let them sell in larger lots than one pound.

1 lb. can \$3.00 postpaid

from:
A. G. A. Inc.
Marine Biochemicals and Drug Division
70 Oak St.
Norwood, N. J. 07648

"Instant Protein" the first FDA-approved food grade fish protein concentrate to appear on the market will be available to household consumers in mid-May.

Alpine Geophysical Associates, Inc. manufacturers of Instant Protein say they plan to market the product initially in New York and New Jersey supermarkets, and branch out into New England later.

The light colored powder has only a faint aroma of fresh fish, its makers say. Blended with many foods, it adds no fish flavor, but fortifies them with animal protein at a low cost per serving.

Consumer testing of Instant Protein has shown that it blends successfully with flour products, such as cakes, breads, rolls and cookies, and with rice products. Mixed with these materials at about the ten per cent level, it produces almost no change in basic cooking characteristics. In most cases, all that is noticeable is a slightly intensified color.

The powder can also be added to a basic spaghetti sauce, its makers say, to produce meat-type sauce stock that provides about half a person's daily animal protein requirement for around six cents.

John McClaughry
Lyndonville, VT

The Fish Protein Story

Dear folks:

A reply to reader Don Symons (January, p. 46).

Fish protein concentrate has a long and dismal history. It was invented by an elderly, idealistic scientist, Dr. Ezra Levin of the VioBin Corporation, Monticello, Illinois, who thought he had a handle on curing the protein deficiency problems of the world.

FPC uses trash fish, entrails and all. After a patented process of chemical washings, the product is a gray odorless tasteless powder that lasts forever without refrigeration, contains a very high percentage of animal protein, and is cheap cheap cheap compared to the protein equivalent price of beef, say.

Unfortunately, an unholy combination of Dr. George Larrick, then (1965) administrator of the Food and Drug Administration; Hoard's Dairyman and other milk producers interests; and midwest wheat growers, fearing its use as an additive to breads, etc. branded the stuff "filthy" and unfit for an FDA identity standard. Four years of political battles followed, involving the National Science Foundation (or Academy of Sciences), Bureau of Commercial Fisheries, Interior Secretary Udall, etc.

I think the Catalog is great. I may be the only right wing nut who thinks so. Up here I am viewed as sort of a combination Paul Goodman and Max Rafferty, if you can figure that one out.

Yours,

Rep. John McClaughry
Jeffersonian Republican, circa 1790
House of Representatives
Montpelier, Vt.

Fish protein concentrate, once heralded as the big weapon in the war on hunger, remains an illusive dream despite the best efforts of Government and private business to produce it commercially.

About two months ago the Agency for International Development quietly canceled a \$900,000 contract with the Alpine Geophysical Corporation to produce 970 tons of the flour-like food additive for Biafra and Chile.

Contract penalties of \$6,000 a month were running against the producer when it proposed termination late in November.

The feasibility of commercial production of the odorless and tasteless additive made from whole fish and with a protein efficiency ratio of 80 per cent had been demonstrated in the laboratory of the Interior Department's Bureau of Commercial Fisheries at Beltsville, Md., about five years ago.

But bad weather and worse luck plagued Alpine from the contract signing in the fall of 1968 until its termination. Severe winter storms throughout New England delayed the delivery and installation of new equipment at the New Bedford, Mass., plant for three months.

A short harvest of Atlantic hake and hake-like fish then pushed up the price of the raw product to double the level expected. Finally, much of the ultimate product did not measure up to the standard set in the contract specifications. By that time it was Nov. 1, after which hake is not available.

Still, Alpine is not thinking of giving up. It hopes eventually to realize something from its \$3-million investment. With the aid of Federal and university scientists the company is now trying to discover what went wrong with its process. Only 70 of the 265 tons of the concentrate inspected could pass the test of contract standards for protein efficiency.

The New Bedford plant was closed a month ago but will reopen Feb. 1. By that time Alpine hopes to have a solution to the problem of lack of uniformity in the separate batches produced by the same process.

Insect-Food

Re: Recipes for eating insects.

This recipe comes from parts of Asia and Africa. Insect fried peanuts into crickets' abdomen (preferably cleaned). These prepared crickets are then fried. They are supposedly very tasty to those whose palate accepts them.

James Do (J.D.)

On page 49 of your July catalog, "J.D." asked for recipes for eating insects. I found this one in Science Digest for June, 1970, page 21. That's volume 26, number 6. I quote:

1 pint termites
1 Tablespoon vegetable oil
½ teaspoon salt

Remove termite wings, if any. Spread termites on stone to dry in sun. Put oil in pan and spread dried termites on it. Toast over hot coals until almost crisp. Sprinkle with salt.

"It helps the flavor, say those who have tried the recipe, if you eat the termites in handfuls."

Science Digest credits the Bantus with this recipe and reminds readers that there is "lots of vitamin B" in termites. Termites aren't all that plentiful in most of the U.S., but I suppose that the recipe would be just fine for ants.

Frank Walsh

Grasshopper Jam?

There's a bright side in the battle against the bugs, which is one front in the larger war against pesticide pollution and worldwide hunger.

"If we can't beat 'em, we'll eat 'em," cherry predicts Dr. Howard A. Schneiderman, dean of the school of biological sciences at the Irvine campus of the University of California.

"In the event we start to lose the battle, the war itself is not really lost," he says. "For insects themselves are an excellent source of protein. Eating bread fortified with insect meal (is) no different than eating bread fortified with fish meal."

Proteinwise, that is.

This is not a recipe, per se, for insects but it does imply that insects are very good and could be used to eat; probably should be used to eat!

Pam Newbury

Perma-Pak

The best source we've seen for storeable foods is this outfit in Utah which caters to keep-a-year's supply Mormons. The prices look remarkably good on a wide range of stuff from brown rice (\$14.95/100 lbs) to crispy chips of spun vegetable protein (\$44.95/25 lbs). They have a "Year's Food Supply" deal for \$189.95 (360 lbs., FOB Salt Lake City). —SB

Calorie Cost Table

Dear Friends,

You might be interested in my latest creation Calorie Cost Tables. It is based on the data in Composition of Foods and Pantothenic Acid, Vitamin B6, and Vitamin B12 in Foods, but the data is presented in a different way. The tables give the number of calories of a given food one would have to eat to get 70 grams of protein, the number of calories for 800 mg of calcium, etc. The idea is that the number of calories one eats per day is nearly fixed, so that a food with lots of vitamins and lots of calories may not be as good as a food with less vitamins and very few calories. In addition since one food may be fairly rich in many nutrients and another may be very rich in one but poor in others, I have given a single "overall" figure to facilitate a general comparison of foods.

The low calorie costs of vegetables have induced Irene and me to move in the direction of vegetarianism. For those who have gone further in this direction the vitamin B12 column should be of special interest. Since vegetables have almost no vitamin B12, vegetarians often have a deficiency. The strict vegetarians who avoid even milk and eggs are really in trouble unless they take a B12 pill.

We plan to sell the tables at \$3.

How to Buy Food

A collection of U.S. Dept. of Agriculture publications including information on fresh meat, fish, dairy products, fruits and vegetables and frozen and canned goods. Also has sections on what government gradings mean; pointers on when higher quality is worth the price, on storing food—where and for how long, and seasonal bargains. All in all informative and full of reassuring rules of thumb.

How to Buy FOOD

Salmon

Briggs-Way Company
Ugashik
Alaska 99683

This is a small family-type business that seems really dedicated to a quality product. They catch and pack within hours, fresh Alaskan salmon that is so tender and delicious it's fantastic—it comes in case lots of 12, 24 or 48 jars (1/2 lb glass home-canning jars) for about \$1 pr jar. Absolutely no chemicals are used and great care is taken to see the salmon doesn't come in contact with anything contaminating. Even their salt, when they use it, is sun-dried. Their service is extra-ordinary.

[Suggested and reviewed by
Renaïs Faryar]

EMORENE BRIGGS with freshly caught red salmon, which generally weigh between five and eight pounds.

Yeast

for M/M Peter Ruppell
Hearth, Ontario

who inquired about making yeast for bread in the Jan. Catalog

2 oz hops
4 qts water
1/2 cup salt
6 med. potatoes
1 qt flour
1/2 cup brown sugar

(Takes 4 days) Boil hops in the water for 1/2 hr. Strain & cool to lukewarm. Place in earthen bowl, add salt & brown sugar. Mix flour with part of the liquor then add the remainder. Let this stand until 3rd day. On 3rd day add potatoes which have been boiled & mashed fine.

Let stand a day, strain & bottle. The mixture should be stirred frequently & kept warm throughout this process.

After the fermented mix has been tightly bottled, stored in refrigerator or cool place, it will keep about 2 mos. Shake mix before using—allow 1/2 cup mix for one commercial cake or pkg of yeast.

1 DAY METHOD

Add 1 qt water to 1 pt hops. Simmer 20 min. Add cornmeal until of thick mush texture. When cool, work more corn meal in & pat into cakes. Dry & store.

These are from *Rare Recipes & Budget Savers*, a compilation from a Wichita Ks paper column, "Home Town News." It has a lot of funky homespun items like Root Beer, Shoo Fly Pie, Hand care for cement workers, Curing feathers for hats, etc. \$1 from Wichita Eagle & Beacon Home Town News, 825 East Douglas, Wichita, Kansas.

Apple Cider

I think the New World needs a cider press like my father's daddy used. I will tell you how to use it. Can you tell me where to buy it?

It's important that you get cider apples from trees that were not sprayed. You can't wash or peel apples if you want good cider. You wouldn't want cider from sprayed apples anyway.

The little dirt you will have on "natural" apples assures that the cider will become tart. That's the first sign you can have the hard cider that made Thanksgiving in the Virginia mountains more than a pious holiday.

Choose Jonathans, Virginia Beauties, or other tart and not-so-large apples. Grind them up—the press usually comes with a grinder—or chop them if you have patience but no grinder. The ground apples are called pumice.

Dump the pumice into the wooden drum of the press. Turn a screw on top and a piston forces the juices down out of the mash.

Strain the juice with a sieve or a milk-strainer. Do not collect it in galvanized pails. You may be poisoned if you do. Glass jugs are best.

Do not bother to drink it yet. It's still just juice.

Aging, which takes from a couple of days to a week or more, makes the juice into cider. As the juice ages, a sediment forms near the bottom. Don't drink the sediment, but don't filter the next batch to eliminate it, either, because it's necessary for the hardening process.

Even if you don't take alcohol, you probably will like the bite cider made this way has when it has begun to age.

Keep check on the aging. When the cider is as strong as you like it, you may strain it through a cheesecloth, chill and serve. Cider can age too long to be palatable. Straining stops the fermentation.

It is possible to make "clean" cider like you see by the roadsides in Virginia and Michigan, but for the work you're going to have to do anyway you might as well pay a buck. "Sold" cider must be pasteurized in some states, which keeps it from hardening. I think that makes a fine breakfast drink, but is not much for heartiness.

Love,

John Hopkins
Chicago, Ill.

About Tea, Coffee, & Spices

I SUGGEST:

About Tea, Coffee & Spices by John A. Murchie (catalog)
FREE from:
Murchie's
1008 Robson Street
Vancouver 105, B.C.

REVIEW:

That tea is useful and relevant to education is beyond doubt. If its good tea. This delightful mail-order catalog list a variety of teas, coffees, & spices. I've been drinking their tea for years and can swear to the following: IT's quality is better than the "gift teas" (Ming, Spice Islands, etc.) which come in fancy boxes and run about \$5/lb or so. And their prices are better: \$2.50/lb for the highest grade of most teas (plus some postage). Their service is good. Tea arrives in Portland in less than a week. I haven't tried their coffee or spices. It's refreshing to see somebody keep a family tradition (since 1894) of quality.

SHORTER REVIEW:

Good tea at a good price. Good service.

In the Name of the Earth

Specialty Coffees

McNULTY'S OFTEN OBTAINS RARE AND EXOTIC COFFEES SUCH AS JAMAICAN BLUE MOUNTAIN, TANZANIAN, ALTURA COATEPEC, ETC. THESE ARE GENERALLY POSTED IN OUR STORE WHEN AVAILABLE. YOU MAY REQUEST NOTIFICATION OF THE ARRIVAL OF ANY COFFEE. YOU ARE PARTICULARLY INTERESTED IN.

MAIL ORDER CUSTOMERS MAY ARRANGE TO HAVE UNUSUAL COFFEES SENT REGULARLY, EACH MAILING A DIFFERENT COFFEE. A GREAT GIFT.

DIAL TONE

I'm sitting in a phone booth on the sidewalk in a shopping center in Cincinnati, Ohio, listening to the dial tone. I am also counting the little holes in the ear and mouthpiece of the phone but that is only a secondary activity the dial tone is the soundtrack for. As far as I'm concerned, this dial tone is the most important activity going on in this whole shopping center right now, although that dumb fuck in the T-shirt and bermuda shorts who just now peered in at me as he walked by would no doubt disagree. What that dumb fuck needs is to get his brain reamed out with the dull end of a dial tone some day and maybe he won't be so goddamn nosy. Goddamn nosiness anyhow. I don't give a goddamn what any of 'em out there do, I'm not nosy. As far as I'm concerned it's every bit one enormous colossal fucking goddamn bore. As far as I'm concerned, these sights I'm seeing through all these little windows in my booth are just bad movies projected from somewhere on the other side. I'm in a little room where the walls are movie screens, a very futuristic idea, you dig? Like, you don't go to movies anymore. You don't go in some big room with a lot of other people. You just drop your dime in the slot and go in a little one-man booth by yourself and they project weird movies onto the walls, play movies all around you, under your feet, over your head, and what you do is sit on this little seat and pick up the sound track over a telephone, and what the sound track is today ladies and gentlemen is pure, uninterrupted dial tone.

Yes sir. Stick with us and we'll show an ever-changing panorama to your eyes while your ears are soothed by wonderful dial tone. It's like a long column of dark blue smoke winding through your ear and down all the little avenues of your brain. It curls, it winds, it coils, there's something very snakelike about a dial tone. It's smoky, but there's a lot about it that makes you think of snakes as well. It's like a snake so long it's head and tail are completely lost, all you can see is his long smooth body rippling around your brain, sliding in it and through it and up it and down it, along all the secret avenues and hidden passageways and tunnels of your brain. Don't be nervous about this snake. Treat this snake right and he'll do the right things inside your head, watch him and he will show you places in your brain you didn't even know were there. And yet, it's just a sound, an ordinary dial tone on the telephone, it's just a simple sound track for the movie about a very angry lady standing around outside the theater, waiting her turn inside.

Joy of Cooking

Adele Davis and Ohsawa to the contrary, I'm of the school that dietary schemes are out-front paranoia. A healthy mind insures a healthy body & vice versa; and what's needed more than special diets are common sense and good cooking. No food badly prepared is good for you. If you simply insure that all you eat is fresh, unpoisoned, and well prepared, the vitamins and proteins will take care of themselves. Rombauer's Joy of Cooking is the American bible of food & is essential in any household where food is enjoyed. Not only are her recipes enjoyable, but she goes into the basic structure of food & food preparation techniques that give the novice a good idea of what's happening in the kitchen.

Certain vegetables and fruits should not be stored together. Apples give off an ethylene gas that makes carrots bitter, for example, and onions hasten the spoilage of potatoes. Watch for other such relationships. Do not wash vegetables until you are ready to use them and then do not soak them, except as indicated, because moisture tends to leach away the water-soluble vitamins.

If you are willing to cut down on refined starch and sugar items, especially fancy baked goods, bottled drinks and candies, a higher percentage of the diet dollar will be released for dairy products, vegetables and fruits. Do not buy more perishable foods than you can properly store. Use leftovers cold, preferably. To reheat them with minimal loss, see page 139.

A new therapy for the treatment of small burns about the hands is to plunge the burned area into cold water.

Climate and age also change protein requirements. The colder the climate the greater the need. And no matter what the climate, growing children, pregnant women and nursing mothers need a larger proportion of protein than the average adult.

Cooking in mountainous country is an art all in itself. If high altitudes are new to you, watch for the high altitude cooking symbol which will give you formulas for adjusted ingredients or temperatures.

ABOUT HERBS

Confucius, a wise man, refused to eat anything not in season. Everyone who has tasted the difference between food served with fresh rather than dried herbs knows how wise he was. Few herbs can be bought in a fresh state at market, but the most important ones can be easily grown in a small sunny plot. We know, for we have grown and used all the culinaries in this section. Therefore, we beg you to exercise your green thumb at least on those whose evanescent oils deteriorate or almost disappear in drying. Chervil, borage, burnet and summer savory suffer the greatest losses. And those mainstays—chives, tarragon, parsley and basil—can never in their dry form begin to approach the quality of their fresh counterparts. Even the flavor of sage when fresh can be so delicate as to be almost unrecognizable.

FINES HERBES

This classic phrase connotes a delicate blend of fresh herbs suitable for savory sauces and soups, and all cheese and non-sweet egg dishes. Fines herbes are usually equal parts of parsley, tarragon, chives and chervil—although some other milder herbs may creep in. Their charm lies in their freshness and the quality they achieve when minced together with a sharp knife and added the last minute to the food being cooked, so their essential oils are not lost.

Fannie Farmer Cookbook

Fannie Farmer is considered by many to surpass Joy of Cooking in the quality of its recipes. It's not quite as comprehensive. It is printed in paperback. —SB

POTATO PANCAKES

Grate and drain
3 medium-sized raw potatoes
Add
1 tablespoon flour or 2 table-
spoons dry bread crumbs
1 tablespoon cream, sweet or
sour
1 egg, beaten light
1 teaspoon salt
Grated onion or onion salt to
taste
Stir well. Cook by spoonfuls in
Hot bacon or other fat
turning once. Or cook in one
big pancake. Serve with meats,
with
Applesauce, cranberry sauce or
sour cream
to spoon over the pancakes.
Serves 4 or 5.

POPOVERS

A perfect popover is crisp on the outside, tender and moist inside. The secret of success is simple—do not overbeat the batter, and be sure the popovers are thoroughly baked when you take them from the oven. Test one to be sure.

Set the oven at 450°. Butter muffin pans or glass or pottery custard cups. Beat until light
2 eggs
Add
1 cup milk
1 tablespoon melted butter
1 cup all-purpose flour
¼ teaspoon salt

Beat until evenly blended (30 seconds in an electric beater). The batter should be like heavy cream. Add more milk if necessary. Pour into the pans, having them ¼ full. Bake 20 minutes. Reduce the heat to 350° and bake about 20 minutes longer. Makes 8 to 12.

Bacon Popovers. Add to the batter ¼ cup crumbled cooked, crisp bacon.

Purefoy Hotel Cookbook

My thing being cooking—I'm letting you in on something that your conscience MUST compel you to share.

Several years ago I was browsing through the high-priced cookbooks in a large Department store. In several expensive books on Southern cooking I found most of the better recipes were credited to the "Purefoy Hotel Cookbook". My mother is from Alabama and I knew she had the original. I wrote to the small town in Alabama wherein it originated to see if there were any old copies around. Ho! The little unassuming classic is not for \$10-20 but \$3.25 from:

Mrs. Robert P. Purefoy
P.O. Box 98
Talladega, Alabama 35160

This book is the real thing and if you ever wondered what happened to old-fashioned cooking and household knowledge—it's in this little book. This is the Old South, meaning fancy cleaners (that pollute) weren't available and "store bought" goods are limited. Included hints on cleaning, sewing, making wines, etc. and has the rather unusual virtue of being authentic. Also excellent tips on stain removal—great for those of us who can't or won't just throw away and replace.

One note—The basic ingredients called for are generally "unprocessed", esp. hams. The hams in the book refer to hard "country" hams, now considered a luxury. (By the way—for those who are involved in raising everything—in the Old South, everyone didn't have a smokehouse. Hams and bacon were often "plain", i.e. sugar cured. They were rubbed down daily with a 50/50 sugar and salt mixture and shelved for air to circulate around until hardening. After each rub—sprinkle well with pepper.)

Also: The Joy of Cooking; I suggest that people try to find old editions, preferably WW II vintage. The recipes include many extras on saving money due to rationing. Besides, it's cheaper used.

Jerry & Maria Merchant
Tampa, Fla.

INDIAN CORN STEW

2 medium onions, chopped fine	1 medium can tomatoes
½ green pepper, chopped fine	2 teaspoons sugar
2 tablespoons butter	1 teaspoon salt
1 pound ground beef	2 tablespoons flour blended with 2 tablespoons cold water
1 No. 2 can whole kernel corn (2 cups)	1 can cream of tomato soup

Cook onion and green pepper in frying pan with butter for 5 minutes. Add meat and allow to brown well, stirring frequently. Add corn, soup, sugar and salt. Simmer for about 15 minutes, stir in blended flour and water, cook for a few minutes and then serve. This is a very delightful luncheon or supper recipe. Serve together with a mixed fruit or vegetable salad.

PUREFOY FRIED CHICKEN

1¾- to 2-pound chicken is nice size to fry.

Pick, wash and cut in pieces the size you wish. Salt and pepper a few minutes before frying in order for the seasonings to go through. Beat an egg and pour over it.

Have your fat hot but not so that chicken will scorch easily. Dredge in flour, piece by piece (do not let it lie in flour as that will make it gummy) and fry nice and brown, turning it twice while it is cooking.

Fry chicken in a heavy iron skillet with a tight fitting lid. This holds the steam and cooks it better. Any good grade of vegetable shortening will do. Have fat deep enough to cover about half the chicken.

HOMEMADE SOAP

Melt 5 lbs. fat and strain through cheese cloth. Dissolve 1 lb. can of lye in 1 qt. cold water and let stand until cool. Add fat slowly, stirring constantly. Mix together 3 tablespoons borax, 1 teaspoon salt, 2 tablespoons sugar, ½ cup cold water, and ¼ cup ammonia. Add to first mixture. Stir all until thick and light colored. Pour into a pan lined with cloth. Mark into bars before soap becomes hard. When hard, break pieces apart and pile so soap may dry out well.

TO SHARPEN MACHINE NEEDLE

When sewing machine needle becomes dull, just sew across sandpaper several times and result is a sharp needle.

A TIP TO CANDLELIGHT LOVERS

Place your candles in the refrigerator for about 24 hours before you intend using them. This will keep them from burning down so fast or dripping so badly.

CREAM OF PEA SOUP

If the peas are very young and tender, cook a few pods with them.

Cook together for 5 minutes
2 tablespoons butter
1 tablespoon chopped onion
Add
2 cups fresh or frozen peas
¼ teaspoon salt
1 teaspoon sugar
2 cups water

Cook until the peas are soft (about 20 minutes). Put through a sieve or whirl in an electric blender. Add

1 cup top milk or milk and cream
Heat slowly. Season to taste with
Cayenne salt or mace
Pepper
Sprinkle with
Chopped parsley
Serves 6.

Quick Pea Soup. Use cooked or canned peas the same way, but cooking will not be necessary after the onion is cooked.

PEANUT BUTTER COOKIES

Set the oven at 350°. Cream together

¼ cup butter or margarine
½ cup peanut butter
Beat in
¼ cup white sugar
¼ cup brown sugar

Stir in
1 egg
¼ teaspoon vanilla
¼ teaspoon salt
¼ teaspoon baking soda
1 cup flour (preferably pastry)
Arrange by teaspoonsfuls on cookie sheets. Press flat with a floured spoon or mark with a floured fork. Bake until firm (about 10 minutes). Makes 60.

Quantity Recipes

In a commune I lived in in New Mexico we had two major problems: food and sex. This book will go a long way to helping you solve the first. What a drag to take down the Joy of Cooking, find something really groovy to fix for yourself and friends and have to spend a half an hour multiplying all the ingredients by seven or eight knowing that you couldn't possibly need a cup of oregano in the chili, but that's what your figures say. We ate some pretty bad experiments and several of the women and men shied away forever from anything but the lettuce salads. Enormous pots of food take a certain skill or they become enormous pots of glop.

In my opinion the recipes are basic, that is, I would add here and there seasonings, etc. to make the food special, new, hopefully an experience and not just another meal. Like all cookbooks this finally becomes a guide rather than a road but it will show you a road and act as a guide until the process becomes intuitive. Also, after a few weeks, or months, cooking creatively can get a bit strained. Cookbooks will pull you through with the advantage of this one already being adjusted for a large group. One of the best dollar tools a community could buy.

Another means of decreasing the cost of a recipe is by extending the more expensive items with cheaper ones. Meat stew is used as an example:

MEAT AND VEGETABLE STEW

Yield: 50 servings

3 servings per pound of meat	Price per unit	5 servings per pound of meat	
15 pounds beef	\$10.65 \$0.71/pound	10 pounds beef	\$7.10
1 cup onions	.01 0.03/pound	1 cup onions	.01
2 quarts carrots	.14 0.06/pound	3 quarts carrots	.21
2 quarts potatoes	.12 0.04/pound	3 quarts potatoes	.18
1 quart celery rings	.09 0.13/bunch	1 1/2 quarts celery rings	.14
1 1/2 quarts (2 3/4 pounds) peas, frozen	.45 0.18/pound	2 3/4 quarts (4 pounds) peas, frozen	.72
Total cost	\$11.46	Total cost	\$8.36
Cost per serving	\$0.23 (\$11.46 ÷ 50)	Cost per serving	\$0.167 (\$8.36 ÷ 50)

The cost of left-over foods used in recipes should be included when figuring costs.

Average serving size and cost of serving, 1966, are given in the appendix.

The Tassajara Bread Book

You'd expect Americans to have a particularly reverent attitude toward bread—it's been in our history since early colonists learned corn bread from the Indians. Trappers had their hard tack, gold miners their sourdough. No such attitude seems to have survived. Instead, bakeries today offer us tasteless cotton-textured white conglomerations and little else.

Here's a breadmaking guide that stands on profound respect for simple, wholesome ingredients and a "ripening, maturing, baking, blossoming" process, that turns a glob of dough into a fragrant food fit for any man's meal. Good bread is always magically more than the sum of its ingredients.

There are recipes for breads yeasted and unyeasted, fruit-filled loaves, sourdough, pancakes, pastries, muffins, and various favorite snacks from the Tassajara kitchen. This Zen cook knows the true nature of bread.

TASSAJARA YEASTED BREAD

The fundamental Tassajara Yeasted Bread recipe.

(Four loaves)

- I. 6 c lukewarm water (85-105°)
 - 2 T yeast (2 packages)
 - 1/2-3/4 c sweetening (honey, molasses, brown sugar)
 - 2 c dry milk (optional)
 - 7-9 c whole wheat flour (substitute 2 or more cups unbleached white flour if desired)
- II. 2-1/2 T salt
 - 1/2-1 c oil (or butter, margarine, etc.)
 - 6-8 c additional whole wheat flour
 - 2-4 c whole wheat flour

Dissolve yeast in water.

Stir in sweetening and dry milk.

Stir in whole wheat flour until thick batter is formed.

Beat well with spoon (100 strokes)

Let rise 60 minutes.

Fold in salt and oil.

Fold in additional flour

Fold in additional flour until dough comes away from sides of bowl.

Knead on floured board, using more flour as needed to keep dough from sticking to board, about 10-15 minutes until dough is smooth.

Let rise 50 minutes.

Punch down.

Let rise 40 minutes.

Shape into loaves.

Let rise 20 minutes.

Bake in 350° oven for one hour.

Remove from pans and let cool, or eat right away.

TIBETAN BARLEY BREAD

The only bread you need to know how to make, the greatest. (One large loaf)

2 c barley flour

4 c whole wheat flour

1/2 c millet meal (or roasted sunflower seeds or roasted sesame seeds)

1-1/2 t salt

2 T sesame oil (for flavor and lightness; if no sesame oil, you can use all corn oil)

2 T corn oil

3-1/2 c boiling water

Pan roast barley flour in 1 T sesame oil until darkened. Mix flours together with salt. Add oil, rubbing flour between hands until oily. Add boiling water, using spoon to mix until dough begins to form, then mixing with hands, keeping hands cool by dipping them in bowl of cold water. Mix until earlobe consistency. Knead until smooth. Place in oiled pans. Cut tops lengthwise. Proof 2-6 hours or overnight. Bake at 500° for 20 minutes on middle shelf, then 450° for 40 minutes on top shelf. Crust will be tough but inside tender. If at first you don't succeed, don't be discouraged. Try baking at 350° for 1-1/2 hours.

The Natural Foods Cookbook

Since one of the prime problems of the switch-over from supermarket foods to real foods is where to find them—this book begins appropriately with a check list of basic natural foods followed by a list of supply sources. From there on it's one fine and healthful recipe after another: basics (how to make yoghurt & cheeses, yeast, sprouts, whole grains) to Delights (herbed mushroom casserole, lemon-honey jelly with a few geranium leaves.) Concludes with a list of suppliers of appliances (grinding mills, vegetable steamers, yoghurt incubators).

BAKED INDIAN PUDDING

- | | |
|-------------------------------|---|
| 1 quart milk | 1/2 teaspoon ginger, ground |
| 1/2 cup cornmeal | 1/2 cup molasses |
| 2 tablespoons soy flour | 3 tablespoons nutritional yeast |
| 1/2 cup sweet cider | 1/2 cup dried fruit, chopped (optional) |
| 1/2 teaspoon salt | |
| 1/2 teaspoon cinnamon, ground | |

Scald milk in top of double boiler over direct heat. Make paste of cornmeal and soy flour in cider. Blend with milk, cover and cook over hot water for 20 minutes. Add rest of ingredients. Remove from heat. Turn into oiled casserole. Bake at 325° F. for 2 hours or until set. Serve hot, topped with yoghurt. Serves 6.

SQUASH-CHESTNUT SOUP

- | | |
|---|---------------------------------|
| 1 quart stock | 1 bay leaf |
| 1 cup squash, cubed | 1 cup milk |
| 1 onion, chopped | 1/2 cup milk powder |
| 1/4 cup celery and tops, chopped | 1 teaspoon soy flour |
| 1/4 cup carrots, cubed | 3 tablespoons nutritional yeast |
| 1/2 pound chestnuts, shelled and boiled | 1 sprig parsley, minced |

Heat stock. Add vegetables, chestnuts and bay leaf. Cover. Simmer until vegetables are tender. Remove bay leaf. Blend milk, milk powder, flour and yeast. Add to soup mixture. Heat thoroughly. Serve garnished with parsley. Serves 6.

WALNUT-CHEESE LOAF

- | | |
|--|----------------------------------|
| 1 cup walnuts, ground | juice of 1/2 lemon |
| 1 cup hard cheese, ground | 2 eggs beaten |
| 1/2 cup wheat germ | 1/4 teaspoon salt |
| 1/4 cup soy grits, soaked in 1/2 cup stock | 3 tablespoons nutritional yeast |
| 2 onions, chopped and sautéed | 1 teaspoon caraway seeds, ground |

Combine all ingredients. Turn into oiled loaf pan. Bake at 350° F. for 30 minutes. Serve with favorite sauce. Serves 6.

CALLING THE FLASH

It was such a good movie, in fact, D.R. couldn't resist calling the Anaheim Flash and telling him about it. He pressed the lever down, let it up again, put in two nickels, dialed 0, and when the operator answered he asked her to put him through collect to the Anaheim Flash in Anaheim, California.

"Where are you now?" asked the Flash.

"I'm at the movies in Cincinnati, Ohio," said D.R.

"Far out," said the Flash. "What's on?"

"Well," said D.R. "Right now it's a short subject about this lady waiting outside a phone booth for this freak to quit talking and come out."

"That sounds like a pretty good movie," said the Flash.

"Listen," said D.R. "You obviously ain't heard the latest yet. Cincinnati is the new film capital of the world. There's been an incredible revolution here. I mean, like, it's so new it's only about half an hour old. I mean man you talk about interface. I mean, like Cincinnati is fucking Frontier City. You know what they got here? This is no shit. They got these little one-man theaters all over town. Pay your dime, go in, sit down, and the whole thing comes alive with movies from every which direction. It's really heavy stuff, man. I mean, like this lady, I mean she's about to go crazy right on the fucking sidewalk. It's super far-out."

"What about yourself?" asked the Flash.

"You mean me?" said D.R.

"Yeah," said the Flash. "You don't sound too goddamn sane yourself. What are you on, anyway?"

"What am I on?" said D.R.

"Yeah," said the Flash. "It's an ordinary enough question."

The Impoverished Students' Book of Cookery, Drinkery, & Housekeeping

A brief intelligent introduction to cheap food preparation.

—SB

[Suggested by Derek Shearer]

What to Do with Left-Over Bread

Never throw out any dry, left-over bread. Slice it, dip it in a mixture of egg-milk-sugar-vanilla-and a dash-of-salt, fry it in butter and you have French Toast. Cube it, sprinkle with melted butter and garlic salt, brown it under the broiler, and you have Croutons. Roll or grind it into crumbs, put them in a plastic bag, and refrigerate, and you'll never have to buy bread-crums. Or just use it dry as a doorstop.

Heloise

If you can get by the "little-wifey-in-the-kitchen-where-she-belongs" atmosphere of these books, there really are many useful hints. In keeping with the little wifey bit, a goodly proportion of the hints are directed towards things that might not interest younger people these days. How many of us worry about cleaning lampshades? On the other hand, using a plumber's friend as a washing machine is fine, and I've cleaned up many an oil spill with Kitty Litter. How about using a sewing machine with no thread and a big needle to punch the holes for hand stitching leather? Ants won't cross a chalk line in your floor, flies won't visit a garbage can with old crankcase oil in the bottom, Epsom salts in beer will frost a window, a light rub with shortening after defrosting will make the next defrost a quick affair. But...chocolate toast? Read em standing at the newsstand.

From Maine: "This is a good hint for wives who have tried to DRY OUT HUNTING BOOTS overnight. I used to hang them upside down over a furnace, stuff them with paper and the like but they were still almost impossible for my hunter to pull on for the next hunt. Then I found that if I reversed the vacuum hose on my vacuum cleaner (so it would blow), inserted it in the boot and let it run, the boots would be bone dry within minutes. Much comfort for him and what a time-saver for me!"

How about THAT? It also works on wet shoes. NEVER try to dry boots over heat of ANY kind. RUINS leather! I know. I tried. They curled up and died.

From Nevada: "How about licking the CORNER OF THE ENVELOPE instead of licking the stamp? I just don't like glue."

It's so! You won't believe it, but try it next time you want to put a stamp on an envelope. Sure keeps the nasty tastes away. Many people have asked why they don't put cherry, chocolate, or lemon flavor in glue on stamps. Most say the flavor they taste when they lick a stamp has yet to be identified—except that it "ain't" good.

WILD, BUT IT WORKS!

Frozen peas can be shelled very fast with a wringer-type washer. Put a pan on one side of the wringer to catch the peas and the pods go on through. You will think peas will go through the wringer and be mashed the moment the pod hits the wringer, but they will pop out before they go through. A very fast job can be done this way.

GRILLED TROUT

The smaller the trout or other fish, the hotter the grill should be. If the fish breaks or sticks when you turn it or take it up, then odds are that you didn't let the metal get hot enough at the onset. Too, grease the grill well at the start.

Either salt the inside and outside of the trout up to an hour before broiling, or sprinkle the inside with freshly ground black pepper and lemon juice just before it goes on the heat. Whole fish may be split or not, depending on the size and on your preferences. Even when the fish has a thick skin well cushioned with fat, brushing frequently with melted butter will add to the flavor. Once the translucency of the flesh has clouded to opaqueness, the fish will be ready for serving.

Paprika butter melted over grilled trout enhances both appearance and flavor. This can be easily prepared beforehand by melting in a skillet, proportionately, a tablespoon of butter, mixing in 1/2 teaspoon of powdered onion, and cooking over low heat until golden, constantly stirring. Allow this to cool, cream with a teaspoon of paprika and butter, shape into about 1-teaspoon portions and relegate to the refrigerator.

FRIED MUSSELS

Mussels, widely available in both fresh and salt water, afford considerably more food than a similar amount of clams or oysters because their shells are so thin. One of the tenderest and most delicate of shellfish, mussels can be deliciously cooked in all the ways oysters and clams are prepared. If you live along the California coast, though, be sure to avoid them when they are quarantined from May to October because of their eating a plankton poisonous to humans during that period.

All you have to do to prepare mussels is scrub them well, preferably with a wire brush and either pull off the beard (the stringy piece connected to the inside of the shell by which they cling to rocks), or cut it off with the point of a small, sharp knife. Don't use any that stay opened when handled. Incidentally, if you steam your mussels and any have remained closed, discard these without opening them, as the shells will be filled with mud.

For temptingly fried mussels, briefly steam them with a small amount of water in a covered pot until they open. Then discard all black parts, and if you haven't already bearded them, do this now. Dip in beaten egg. Then roll in either fine cracker or bread crumbs that have been salted and prepared to taste. Fry very lightly in butter until a creamy golden yellow.

SEA MOSS BLANCMANGE

The seaweed called Irish moss (*Chondrus*), common along the Atlantic shores of Canada and the United States where it can be gathered at low tide, cooks up into a delicate blancmange which is so digestible that many drug stores stock it for invalid diets. You can harvest this moss at any season, wash it well in fresh water, and then dry it for future use. Spread out in the sun, it bleaches a pearly white.

When ready to cook, soak 1/2 cup of this iodine-rich marine alga, also called carrageen moss, for 20 minutes in enough cold water to cover it. Then drain and pick out any discolored bits. Add what is left to a quart of milk in the top of a double boiler. Cook over boiling water for 30 minutes. Then strain the milk.

Stir 1/4 cup sugar, a teaspoon vanilla, and 1/4 teaspoon salt into the strained milk. Turn into cups or molds that have been immersed in cold water, chill in the refrigerator until firm, and then serve with cream and sugar. A topping of wild strawberries really sets these off.

Let's Cook It Right

I'd recommend Let's Cook It Right just for plain easy delicious recipes, down-home-style, even if it weren't for the nutritional advice, which is also well worth getting ahold of. Sure, Adelle Davis is kind of a fanatic, but I've learned a lot from her in the past year about how to cook without destroying food value. As it turns out, this often means cooking quicker and tastier anyway. Since she explains the nutritional principles behind her methods, you can easily learn to apply her methods to recipes from other cookbooks. I particularly like the sections on variety meats, which are often neglected, and on baking (though it's a shame she chickens out on cakes). And it's extra nice the way she watches out for your budget.

Parsnips are often disliked largely because of the abominable method of cooking them in water, which they soak up like a sponge. They are most delicious if not touched with water after they are thoroughly washed. Even when they are steamed, sugar quickly dissolves out; if overcooked only a few minutes, the pulp becomes waterlogged and mushy. Parsnips cook quickly; hence recipes which advise cooking them twice should be avoided. Since the sugar in parsnips burns easily, the heat should be kept low after they have been heated through.

LIVER WITH APPLES

Mix together well:

3 chopped unpeeled cooking apples
1 chopped large onion
1/4 teaspoon salt
freshly ground black pepper-corns

Place in oiled baking dish:

1 pound sliced baby beef, pork, or veal liver

Cover liver slices with apple-onion mixture; top with:

4 slices bacon cut in half
generous sprinkling paprika

Add:

1/4 cup hot water

Cook in moderate oven at 350° F. for 20 minutes.

The Grub Bag

I wouldn't be too surprised if somebody has already reviewed this book. I got it about four hours ago at a bookshop that had just gotten it in. Until now I didn't believe there was such a thing as a book that couldn't be put down. (With all due respect, I didn't even read the Catalog in one sitting). Now that your appetite is thoroughly whetted, the book is called *The Grub Bag*, by Ita Jones. She's written a series of food columns for the *Liberation News Service*, but as far as I know, this is her first book.

This isn't the first time that a cookbook has been written with philosophy and politics lacing the recipes, but it is the first one I've seen that doesn't look as though the recipes are the author's but the wit and wisdom are somebody else's.

Ita Jones seems to have a slightly different attitude towards food than most cookbook authors. She reminds me of a physics prof I used to have who wanted his students to consider the full range of possibilities of a physical concept instead of cranking through problems to which the concept obviously applied. (For instance, did you know that a good way to figure out if you're in a space station or not is to jump off a chair? Man is at least as sensitive to the angular rotation of a space station as he is to variations in gravity—your head would feel as if it had been kicked by a mule). Anyway, Ita Jones has that same kind of open-mindedness. If you were writing a book about cooking, would you think to include a chapter on cannibalism? Even if you had read *Stranger in a Strange Land*?

Some of what I thought were the more memorable things she said appear below. As an exercise, in reading the book yourself, you may want to look for something that occurred to me—her writing reminds me just the least little bit of Thoreau's writing in *Walden*. (reincarnation?)

For most Americans, eating has become truly one-dimensional, instead of the amazing art of combining the fruit and flesh of the earth into experiences worth remembering.

Eat a meal and know that it was eaten a thousand years ago, and tasted close to what it tastes like now to you. Know that what was used in this dish was used not by choice but because it lived or grew in the area (even in life the ingredients were inter-related), that those who lived in the desert ate that which arose from it and returned to it, and that those who lived by the water ate that which was part of it, and that we have lost this link (among others) between ourselves and our surroundings because in Colorado we eat fish, and near the harbors, lamb.

Pineapple tops can become beautiful strange plants. Slice off the crown and place it, cut side down, in a saucer of water. After it has begun to grow again, plant it in sandy compost and keep in the sun.

The seeds of grapefruit, oranges, lemons, and tangerines are usually tossed away, but even these grow into shiny plants which are happy indoors. Wash the seeds and plant them, three or four to a pot, in sandy soil. Keep in a warm, dark corner until they have sprouted. Then move them to a window sill. If you put them outside in the summer, the woody parts will develop, giving you small graceful trees.

Another thing I'd like to mention is that this book is *definitely* for those of us who need step-by-step instructions just to boil water. Absolutely *nothing* is missing from her directions.

I suppose it's also worth mentioning that none of the recipes require things that are really hard to get or expensive. There isn't any of this jazz about "procure the hind toes from twenty willow ptarmigans..."

I think that even people who have been cooking for fifty years could find some things to interest them. For instance, there are recipes for home-made yogurt and home-made curry powder, which aren't all that difficult to make but just don't appear in the average cookbook.

Zen Macrobiotic Cooking

A good place to start with Macrobiotics (the philosophy of eating as a means to vitality and rejuvenation).

This book is more recent, pleasantly readable, liberal and digestible than the writings of the system's founder-master Georges Ohsawa. However, once you read this, you may get into the others. Also a monthly publication.

(Reviewed by Lloyd Kahn)

In Japan it is known as yin and yang. Here, in America, it goes by the rather chemical terms of acidity and alkalinity. For instance, you eat something acid and have heartburn; common knowledge tells you to take something alkaline, Alka-Seltzer, perhaps. Acid foods are rich in potassium; alkaline, in sodium.

A few do's and don'ts

Learn above all to cook rice and to cook it well. One condition is to use a heavy cast-iron pot. Prior to cooking, wash the rice with cold water in a strainer. While cooking, never stir the rice, and keep it covered.

Sometimes when you cook rice, the bottom of the pot is slightly scorched. This part is yang. It is very rich in minerals and very good for yin people.

HOMEMADE CHRISTMAS SOUP

1. Heat a few tbsp. oil in a large pot and in it brown one meaty soupbone and one large chopped onion.
2. Add just enough turmeric to make the onions yellow, 1½ tsp. salt, pinch of pepper, 5 or 6 whole cloves, 1 bay leaf, ¼ tsp. thyme and generous pinches of allspice and sage, and sauté for a few minutes.
3. Add 1½ to 2 qts. water, part of which can be liquids saved from canned or cooked vegetables (corn juice is especially good) and about 4 tbsp. barley.
4. Cover and simmer very slowly for around 2 hours.
5. Now add 3 medium raw potatoes peeled and cut into small pieces, a couple of carrots cut up, and any leftover vegetables or noodles you have on hand. A bit of leftover cooked oatmeal is also very good. Add a small can of stewed tomatoes or a ripe tomato, chopped, and 1 pkg. of dehydrated vegetable soup, which can be omitted if you can't find it. Simmer another half hour or until the vegetables are tender.
6. While the soup continues to simmer for a few more minutes, remove the bone from the pot, and when it's cool enough to handle, cut off all possible meat, dice and return meat to the soup. Turn off the heat.
7. Let the soup "stand" for at least 5 minutes before serving with a simple salad and good cheese and bread. Cheap red wine goes well with soup, probably because it is the staple drink in countries where this sort of soup has long been made.

Goodcookbooks

Larousse Gastronomique in English

the history of the civilized use of food articles on all kinds of Western food & a little oriental full access to the secrets of the ultimate in Western cooking not for "the modern housewife" read about what you are eating at the dinner table! "It is very difficult to think about anything but food when eating."—Gertrude Stein

(Please include a word of caution about Rambauer-Becker next time: the instructions are over-simplified; the recipes are hodge-podge; there are a great many obvious errors in the use of the symbols & you have to refer all around in the book. Also, the OLD Fanny Farmer should be reprinted. Classical American cooking, for the faint-hearted)

How to Cook a Wolf—by M.F.K. Fisher

A humanistic survival book for periods of shortage and extreme poverty (such as WWII in Europe) (when it was written) in Western societies. Very funny & a little sexy. World—publisher, Cleveland. Still in print??

"To work! To Work! for Heavens sake! The Wolf is at the door!"

(do you hate the French? You have hardly anything French in your whole thing. They are great. [Yeah.—SB])

Frederick Ted Castle
New York, N.Y.

"What am I on," said D.R. "I think that what I am on is intensity. Intensity and precision. I feel very intense and precise today."

"Is that what they're dealing in Cincinnati?" asked the Flash. D.R. laughed. "Yeah. You get it out of the vending machines in these little theaters."

"Well," said the Flash. "It sounds like old Cincinnati is really where it's at."

"Most definitely," said D.R. "Without question. Most definitely."

"Listen," said the Flash. "Where's Estelle?"

"The bus station. Hey Flash, listen: is it cool that I called? I mean, I know this is on your bill. But you got money, right? You still got all your money?"

"Still got it," said the Flash. "Okay, and you can stake me to this call, right? I mean I don't want to impose it..."

"Carte blanche, man," said the Flash. "You sound to me like you need a friend."

D.R. laughed. "Well, we all need friends, Flash. But I'm all right. I've just got stuff on my mind. A lot of new stuff is going on. I mean, two days ago I couldn't even talk. I've been kind of bummed out, but I feel pretty good now. Hey Flash?"

"Yeah, man." "Listen, I really thank you for the use of that card. It really saved our ass."

"No sweat," said the Flash. "What's Estelle doing at the bus station?"

"Hanging around. Hey Flash, guess what my nephew said this afternoon. He's this nine year old jockstrap in the Little League, see, really far-out kid. I come in, our first conversation he says, 'You're a turd.' And then he says, 'You're a queer, why don't you go out and have a car wreck?'"

"Nice kid," said the Flash. "No man, I mean he's far out. It's pretty wild around here."

"So you've already seen your sister."

"Yeah, I was out there. Say, man, what time is it anyway?"

"It's eight o'clock in California. Listen, old friend, I'm worried about you. No offense, but it sounds to me like Cincinnati ain't no healthy place for a righteous dude to be."

"Ahh," said D.R. "It's all just a movie. It's just another quadruple feature happening simultaneously all around, it's okay."

"That's what you say," said the Flash. "But that ain't how you sound. I'm afraid you're not trusting in the Lord enough."

D.R. laughed. The Anaheim Flash asked him what was funny.

"What you said. I heard that as a line of dialogue from the lady in the movie. It's pretty funny."

The Anaheim Flash asked D.R. how the lady was getting along. "Not too good, I'm afraid. The freak won't get out of the phone booth. She's got her nose up against the screen now, peering right in on him."

"Why don't the freak kiss her?" said the Flash.

"Flash, you're a genius," said D.R. And D.R. puckered up and leaned forward and kissed the movie screen as the woman, horrified, drew away.

"Did he kiss her?" asked the Flash.

But D.R. was laughing too hard to answer. He laughed so hard and so long he finally had to tell the Flash it didn't look like he was going to be able to go on with the conversation. The Flash said he guessed he'd hang up then.

"But listen, man, stay cool, you hear? You take care, and tell Estelle she's much loved, okay? Tell her Angel really wants to hear from her."

"Right," said D.R. "And I thank you for talking to me, I really do."

"Anytime, man," said the Flash.

The Anaheim Flash hung up then, and D.R. went on listening to the dial tone.

Remember—

Yogurt

Here it is! The definitive yogurt recipe, courtesy of me. No special equipment, no watching the pot for hours & fussing about keeping it a special temperature—AT ALL.

Equipment:

1 large pyrex (or otherwise heat-proof) mixing bowl
Measuring cups, spoons
Jars to store the yogurt in
Oven

Ingredients:

3 cups instant powdered milk
½ tsp. unflavored gelatin
1 tbsp. sugar (optional)
1 large can evaporated milk
3 tbsp. yogurt
Water

Instructions:

Soften the tsp. unflavored gelatin then add boiling water to make 1 cup. Add 1 tbsp. sugar (this takes the "edge" off.) and let the mixture cool a bit.

Preheat the oven to about 275° (250-300° range is O.K.)

Mix 3 cups instant powdered milk with 3 cups water. Add 1 large can evaporated milk, 2 more cups tepid water, and the gelatin mixture.

Add 3 tablespoons yogurt and stir thoroughly.

Cover the bowl, put it in the oven, and TURN THE OVEN OFF.

Leave it overnight, or about 8-10 hours.

Makes about 2 quarts, and is "fool-proof"

J. Lundquist

HOW

Baking Soda

For 15 cents, you can buy a humble tool that replaces a lot of fancy-priced ones: Arm and Hammer baking soda.

Potential uses—

- 1) **Toothpaste.** Mix soda with salt, for the kind of toothpaste oldtime Texas dentists used to say was better than storebought.
- 2) **Acid indigestion tablet substitute.** Just take a little soda with a glass of water.
- 3) **Scouring powder.** Especially good in refrigerators, because it deodorizes.
- 4) **Sunburn ointment substitute.** Spread on paste of soda and water.
- 5) **Putting out kitchen fires.**
- 6) **Maybe even baking??**

anonymous

Bibble Ledbetter adds:

For those who still smoke you can put some on your car ash trays to absorb the odor and safely snuffs your cigarette out.

It's a great refresher when added to your bath.

Use it when I clean my iron skillets, cutting boards, knives, etc. It not only helps to remove baked on foods but it does not leave a detergent taste to the equipment like the above that tend to absorb odors.

Plus a pound costs only 21 cents.

Bibble Ledbetter
Washington, D.C.

Safer Than Shell Pest Strips, Easier Than Swatting

Another suggestion: Fly * Paper. Absolutely non-toxic and it works almost as well as pest-strips. The type I use is Aeroxon which is made by Aeroxon products, New York, N.Y. and which I bought at my local hardware store.

Tom Davenport
Delaplane, Va.

Crunchy Granola

We have not read all of the supplements so we don't know if you have had printed recipes for crunchy granola. If you haven't—here is one: MIX

- 4 C rolled oats
- 1½ C shredded unsweetened coconut.
- 1 C wheat germ
- 1 C chopped nuts
- 1 C hulled sunflower seeds
- ½ C sesame seeds
- ½ C flax seed
- ½ C bran
- 1 C ground roasted soybeans

HEAT—

- ½ C oil (soy, sesame or corn)
- ½ C Honey
- ½ t vanilla

ADD

honey-oil mixture to dry ingredients and mix (mixture will be very dry)

SPREAD

mixture on oiled cookie sheet or jelly roll pan (cookie sheet with sides) & bake at 325 degrees about 15 min. until light brown.

All measurements are approximate and it's nice to improvise with ingredients, too. However, you make it, it will be much, much better than any commercial varieties.

I would like to know of good books on vitamins, lecithin, pollen, ginseng, jujubes, etc. (I can't even spell them but am interested to know what they do for you.) Everyone I ask explains them a little to esoterically for my plasticized head.

Thank you.

Philip & Elizabeth Schnazerson
Berkeley, Calif.

Applause

We've been using the Granola recipe sent in by P. & E. Schnazerson. It's been working fine. We've made up to 15 lbs at a time (at 35 cents to 45 cents per) (to get 15 lbs of granola you have to multiply their recipe by 6.) Our next batch will be about 75 lbs because it's almost become a staple in our houses. We may also sell it. With anywhere from 3 to 6 people mixing, spreading, turning etc. we've gotten the whole process down to an art. Everyone knows their job. The hardest part is cooking because you have to turn it over every 3-5 minutes. Important!: turning granola on the cookie sheets (same as you'd turn earth) is most important near the end of the 15 minute cooking period. So you may wait 5 minutes from when you first put it in the oven, then 4 then 3 then 3 again then maybe 1-2. People should figure it for themselves, tho, vibration cooking is where its at.

We've been using the Corona Mill with great satisfaction. Whole wheat kernels (from a local grainery) cost about 4 cents a lb. The kernels can also be boiled like rice or beans (first soaked overnite, tho) for an interesting meal.

David I. Schuchman
Grand Rapids, Michigan

P.S. Flax seeds in recipe should be ground, or chewed very well.

Applause

Help!! Please! I found a fantastic and easy yogurt recipe in your catalog (not the latest, but the one before that. I have been using it for a couple of months, but when I went to look for it last night, I couldn't find it anywhere!! Do you think you could help me get another copy? There were two on the same page—the one I want used powdered dry skim milk, evaporated milk, gelatin, water & 1 T of sugar. I would really appreciate anything you could do to help, as this is what I've been giving my husband for lunch & it's the first yogurt he would not only eat but ask for. Thank you, thank you.

Karen Barnes
N.M. Bch, Fla.

How to Make Butter and Cheese

Chr. Hansen's Laboratory, which sells vegetable-base butter coloring, cheese color tablets and cheese rennet tablets, have some great illustrated charts on Butter and Cheese making, and a 24-page booklet How to Make Cheese. They're all free. We've reproduced the essential steps here. Goat Husbandry (page 64) has several good recipes for butter and cheese using goat's cheese.

1 Ripen Cream, If Desired

Butter may be made from either sweet or sour cream, both of which should be free from any off flavors. Butter made from sweet cream has a mild, creamy flavor. But if a more flavorful product is desired, allow the cream to ripen at 65-75 degrees F. until thick and mildly sour.

2 Bring Cream to churning temperature

In summer: Usually 52-60 degrees F.

In winter: Usually 58-66 degrees F.

Sweet Cream: Keep cool as possible until just before churning.

Sour Cream: Hold 2 hours at churning temperature. Churning Temperature is correct when butter "comes" in 30-40 minutes. If cream is too cool, churning will last too long, and give hard butter. If too warm, churning period will be too short for complete churning, and soft, greasy butter will result.

3 Rinse Churn with scalding water; then rinse and chill with cold water

Treat butter ladles, paddles, worker and printer the same way and place all but the worker in a pail of cold water until needed.

4 Strain Cream into churn

In order to work efficiently, the churn should be only about one-third full, or at least not over one-half full. If too full the churning period is prolonged.

5 Pour Butter Color into cream [sic]

Measure the amount of Butter Color needed and pour it into the middle of the churn, without letting the color touch any wooden parts. The quantity needed varies with the season, is highest in spring just before cows go on pasture when 2-3 teaspoons of "Dandelion" Butter Color per 10 gallons of cream may be needed (cream with 20%-30% butterfat).

6 Close Churn and start turning

Start churn at speed to produce the greatest concussion, which can be determined by the sound—about 60 revolutions per minute for the common barrel type of churn.

7 Permit Gas To Escape

After a few revolutions, stop churn, bottom up; remove cork to permit the escape of gas. Repeat this 2-3 times during early stages of churning.

8 Churn until Butter "Comes"

Wait for the change in the sound of the cream, and for thick mushy mass to appear on glass in churn. Then turn churn several times more, and stop to examine butter granules.

9 Stop Turning when granules are size of wheat grains

When sound of cream in churn changes watch the granules through the glass and stop churning when the butter granules are the size of grains of wheat.

10 Draw Buttermilk

Let the buttermilk out of the churn through the hole at the bottom of the churn. Run through a strainer to catch any particles of butter.

11 Wash Butter

While the last of the buttermilk is drawing off, prepare the wash water: Pure, clean water, twice the quantity of the buttermilk, and about the same temperature. After all buttermilk is drawn off, replace cork and pour one-half the wash water into churn. Replace cover and turn churn rapidly about four times. Draw off wash water and repeat washing.

12 Salt and Work Butter

Rinse "worker" once again with hot and then with cold water, leaving worker wet. Weigh butter. Spread butter with ladles on worker, in a layer about 2 inches thick. Sift salt onto butter—½oz. salt per pound butter, or more or less according to taste. Press butter (do not rub or smear it) into thin layer, fold into a pile and press again. Continue working until salt evenly distributed and butter has desirable grain and body. If you do not have a butter worker, you can still do a good job by working the butter with your ladles or paddles right in the churn or in a large wooden bowl. This should be done by gathering the butter into the form of a ball, pressing it into a thin layer and then repeating this process over and over again until the salt and moisture are well worked in.

Vegetarian Cookbooks

For the Giant Computer if It wants It. Here are the best vegetarian cookbooks I know of right now, being good tasting, wholesome, full of life, and good loving food. Not all of them are entirely vegetarian, but I've found them all good books when it's time to eat.

A Good Cook. . . Ten Talents
Frank and Rosalie Hurd, 354 pp., ring binders, colour pictures, \$7.95 from:

Allegan Health Clinic
120 Cutler Street
Allegan, Michigan 49010

Big natural food cookery and uncookery Bible: "...What you need is less temporal food and much more spiritual food, more of the bread of life. The simpler your diet, the better it will be for you."

Tried and True Vegetarian Recipes
Shilla Judd, 66 pp., \$1.50 from:

Shilla Judd
984 Oxford St.
Berkeley, Calif. 94707

Mouth-waterers, some of them incredibly delicious.

Gar Shu Vegetarian Cookbook
Sanctilean, 94 pp., ring binders, \$3.50 from:

Upland Trails Press
c/o Della Haney
P.O. Box 736
Coolidge, Arizona 85228
make checks payable to "Della Haney"

Gar = sun shine
Shu = vegetal

Cosmic Cookery
Katherine Ash, 44 pp. hand drawings, \$2.00 from:

Messiah's World Crusade
234 Hawthorn Avenue
Larkspur, Calif. 94939

Hygienic Cookbook and Vegetarian Recipe Book
276 mimeographed 8 x 11 pages, \$5.50 from:

Health Research
70 Lafayette Street
Mokelumne Hill, Calif. 95245

Eight old-timey turn of the century books in one. . .totally wholesome. . .one of the best.

Cooking with Grains and Vegetables
29 pp., 8 x 11, \$1.00

Cooking Good Food
35 pp., 8 x 11, \$1.00 both from:

Erewon Trading Co.
8003 Beverly Blvd.
Los Angeles, Calif. 90048

or

TAO
303-B Newbury Street
Boston, Mass. 02115

Yogi Cookbook
Yogi Vithaldas, Susan Roberts, 126 pp., \$1.75 from:

Pyramid Publications
444 Madison Ave.
New York, N.Y. 10022

"Discover the amazing health secrets of the ancients. . ." Indian curries, sweets, and spicy stuff.

Cookless Book
Mrs. Richter, 88 pp., \$2.00 from:

Tobe's
P.O. Box
St. Catharines, Ont.
Canada

Raw food recipes and fruit jumbles, salads. . .cookless.

Tassajara Bread Book
145 pp., \$2.95 from:

Shambala Publications, Inc.
2010 7th St.
Berkeley, Calif. 94710

Make it whole, and chew it up, bread that tastes, and feels good to make.

Vegan Kitchen
43 pp., rings, \$1.50, from:

American Vegan Society
Box H
Malaga, New Jersey 08328

Completely non-animal, no meat, fish, fowl, dairy products, honey, only stuff that grows on the earth.

Zen Cookery
74 pp., rings, \$3.50 from:

Ohsawa Foundation
1434 North Curson Blvd.
Los Angeles, Calif. 90046

Practical macrobiotics, traditional eating way Japan country rivers brown rice.

Food Combining Made Easy
Herbert Shelton, 71 pp., \$1.00 from:

Jaffe Brothers
P.O. Box 636
Valley Center, Calif. 92082

Learn what mixes with what, so it can get digested without too much hassle.

Scientific Nutrition and Cookbook
(for those interested in the vegetarian way of life), Donna Grey Kelley, about 100 pp, (mimeo, 8 x 11), \$3.50 from:

Donna Kelley
1305 Palm Ave.
Beaumont, California

Tells what's what in nutrition, why, and how, Yummy recipes, and sage advice for children of Light.

Vegetarian Cookery
Dr. Pietro Rotondi, \$5.00 from:

Dr. Pietro Rotondi
1916 Vista del Mar Ave.
Hollywood, Calif. 90028

The Soybean Cookbook

This cookbook is listed because too many vegetarians I know are looking too unhealthy. It's particularly poignant when said vegetarian is pregnant and brain-starving the child. Soybeans are extra rich in protein; they're cheap, and not hard to grow. Now would some professional nutritionist let us know if they flat-out replace animal protein? Steve Durkee got laid up for a month last summer because of too little protein in the diet at Lama. They're on vegetable protein now. Is it working, Steve?

-SB

[Suggested by Barbara Kirshenblatt-Gimblett]

Note: Lama now has goats and a cow.

The Soybean Cookbook
Dorothea Van Gundy Jones
1963; 240pp.

HOW TO MAKE SOY CHEESE

Soy Cheese From Milk

Soy cheese is made by allowing soy milk to sour and curdle. When it is made commercially, lactic, tartaric, or citric acid is used; but acid is not necessary when a small amount of cheese is made at home. Set the soy milk in a warm place to sour and thicken. When thick, cut it into chunks with a knife, place these in a pan, cover them with water, and bring to the boiling point. Strain through cheesecloth, wringing the curds as dry as possible. Season with salt and a small amount of soy sauce. The fresh cheese can be used like cottage cheese and can be stored in the refrigerator for several days.

Soybeans are an excellent means of making a low-cost diet nutritionally safe. They are one of our cheapest sources of nutritious protein. A few cents' worth of dry beans will serve four to six persons and give them the food value of greater quantities of meat or fish. Soy flour or grits, at the cost of a few cents, can step up the protein content of a dish to equal the more expensive animal protein foods.

Soy

...Finally a word about soybeans. As a pediatrician I'm able to pass on the word to you from the professional nutritionist friends of mine about the relative value of soybean compared to animal protein. Flat-out on a weight for weight basis soybeans have more protein and more essential amino acids than sirloin beef. Period. "Normal and Therapeutic Nutrition," by Corinne H. Robinson, 13th. Ed., pp. 822 and 825, NY 1967. The problem is more complicated, however, because the above superiority of bean over beef is with whole beans, and does not take into account such goodies as the foods are prepared (boiling, for example, destroys some amino acids) or if the beans are in the form of a milk or flour. Soybeans despite their superiority over beef in the Proudfit-Robinson data are rather poor in methionine, for example, and in no way should they be considered a kind of miracle food capable of meeting all human nutritional needs.

The take-home lesson of the day is that whole populations have done quite well on diets that were largely vegetable, but that the proper nutrition was accomplished by the mixture of supplementary vegetable proteins, such as barley, wheat, and soy proteins. Corn, for example, is terrible in lysine. Soybean, on the other hand, is fairly good in lysine, and experiments have shown that corn and beans are better utilized when they are taken together. It is not necessary to ingest large amounts of first class, All American Soy proteins like meat, milk, eggs, and fish, providing you take in mixed amounts of supplementary vegetables, as the majority of the people in the world do, such as cereals, millets, legumes, nuts, oilseeds, common vegetables, and leaf and grass protein. I'm sorry to hear one of your friends in Lama fell ill while on a vegetarian diet. But in no way should this be construed as an indictment against the vegetable. There is emerging increasing evidence that the only feasible solution to global malnutrition in the seventies is the development of cheap, high protein plant mixtures, with considerably less rape of the ecosystem. Hope I helped.

Sincerely,
Henry Abraham, M.D.
University of Arizona
Tucson, Arizona

Soy and Sprouts

Good simple info: Recipes for the Use of Soybeans and Sprouting, free from:

Sterling H. Nelson & Sons, Inc.
525 South 4th West
Salt Lake City, Utah 84110

"Meat"

Have you ever published a recipe for home-made wheat gluten? This is a basic meat substitute and very easy to make, forming the basis of many of the commercially produced, canned substitutes, notably Worthington and Loma Linda vegeburger, vegetable scallops, dinner cuts, vege-cuts, etc.

Mix 2 1/2 to 3 cups of water with 8 cups of flour (gluten flour is easiest, but ordinary white flour will do), enough to make a firm ball. Soak under water overnight. The next day, keep kneading the dough under water and pouring off the starchy liquid, replacing with fresh cold (tap) water until water is clear during kneading (no more starch - this is where gluten flour was nice). You now have Wheat Gluten (the protein of flour) in the form of a large, rubbery ball.

For eating, slice into thin steak size, roll in batter, and grill or fry; chop into fine pieces and use in stews; or put through meat grinder and you have vege-burger, which can be used in many of the same ways as hamburger (ground beef).

As the gluten is tasteless, much like a hunk of sponge, disguises are necessary. Yeast extract, soya sauce, vegetable salts, wines, and, in general, anything you can think of, improve flavor considerably. (Perhaps you can find someone to tell you about preparing tofu as well.)

DOYLE

When D.R. left the phone booth he intended to go directly back downtown to the bus station. But then when he passed Clark Street he figured since he was that close he'd pop in on Marcella and see what those people were up to. When it turned out that what they were up to was supper D.R. didn't see any way to leave gracefully without eating something, especially since Marcella had fixed a place for him and had served smoked ham and chow-chow in celebration of his arrival. The family was already seated at the table in the kitchen when D.R. walked in, except for Marcella who was stirring something on the stove. Doyle was at the head of the table browsing through the Enquirer when he looked up and saw D.R. in the doorway.

"Dadburn your hide, where you been?" Doyle shouted. He scooted his chair back and got to his feet so hard the dishes on the table rattled. "I come home early on account of you and there you was out and gone already. How you doing, Buddy, I declare it's mighty good to see you."

Doyle came across the floor like a coal truck and gathered D.R. into his arms. Then he stepped back and took D.R.'s hand in both his own and pumped vigorously up and down.

"I said to Mars I said dadburn the like of him anyhow, me taking off work early to come and see him, and then him not even be here. Where you been, boy, you 'bout to miss your supper."

"Don't listen to him, David," said Marcella. "He's tickled to have you as an excuse to quit early."

"Daddy home early," said Debbie.

Herschel got out of his chair and crossed the room to where the two men were standing. As they talked he tried to worm in among their legs and stand between them.

"Here now, you little sneak, you sit down, we're getting ready to eat."

"I want to sit next to Uncle David," said Herschel.

"You sit where you always sit," said Doyle. "David's place is all laid out."

Herschel made a face of disappointment, but he obeyed his father. He dropped to his hands and knees, crawled under the table and sat on the other side.

"Feistiest thing ever was," Doyle said proudly. "He's turned into a regular devil!"

"You need to brag about it," said Marcella.

"I ain't a bragging," said Doyle. "I'm just stating the plain facts. Ain't that right David?"

"That's right," said D.R. "Doyle's just telling the facts."

"What I want to know is how that bus of yours is running," said Doyle. "I told Mars when you called the other day, I said I bet that boy's got car trouble. She said you'd of said so if you had and you know what I said? I said shoot, the thing about David with his cars is he don't know when he's got trouble and when he ain't."

Doyle broke out laughing at his joke, and D.R. laughed too. Doyle was a mechanic, and partners with his cousin Vernis in a filling station and garage. The year before, when D.R. had stopped off at Marcella's and Doyle's, Urge had had a burned valve and D.R. didn't know it. That anybody could drive a car with a burned valve and not know it amazed Doyle, and fascinated him at the same time. Doyle had given Urge a valve job for free, and Vernis had banded a few dents out of the body. If they'd known at the time that D.R.'s intention was to use his bus to help Eddie transport about a zillion bricks of marijuana to Chicago they'd have been less generous with their work. But the general freaky appearance of the bus, and indeed, of Divine Right himself, had disturbed them not at all. Doyle understood that his brother-in-law was some sort of mild outlaw. But he assumed, as Marcella assumed, that whatever it was D.R. was into was only a phase, as Doyle's own youthful outlawry had been a phase, and it never occurred to any of them to withdraw their affection just because the kid was in a phase. Till Doyle was drafted into the army, back in the 1950's, he had terrorized the roads of Eastern Kentucky as a coal truck driver. In the army he'd been court-martialed twice for going Awol, and general insubordination. He spent eight weeks in the stockade at Fort Hood, Texas and described them later as the best eight weeks of his entire army career. Doyle was a settled family man now, a father, a tax-payer and, as of the previous month, a member of the Church of God. But there was a natural empathy between him and Divine Right, and in spite of the widening differences in their lives they remained among each other's favorite people.

The Wok—A Chinese Cookbook

Gary Lee knows *chinese cooking* and his book for the beginner presents all the great techniques and traditional ways in a well-designed readable format. The wok is the central tool in any Chinese kitchen and its quick-fry principles are here explained clearly. Double-frying, steaming, and the lesser known traditions of the looo and dah-bin-lo are covered. I'm really impressed by this book; it tells more about Chinese cooking than any other Chinese cookbook I've investigated. Lee says he's going to write another book about the fancy dishes, although I wouldn't consider beef and lettuce soup, sweet and sour fish, or steamed minced pork with salted eggs to be drab fare.

Useful Odds & Ends

For those unable to afford a flour mill—an old food mill—the kind everybody's mother has—can be purchased 2nd hand for less than a dollar, is a pretty good substitute. The flour is like a combination of wheat germ & flour—makes an excellent bread—and is very economical. The grinding keeps you strong.

For flesh eaters who believe in bearing the remorse for their actions—hang some California bay (laurel) in the carcass to keep away the flies, or use it as a flea collar or in your dog's sleeping quarters. Hang it on the wall, pop it in the soup.

Weave rags & old clothes into rugs on a frame with nails on either end in lieu of a loom. Weaves up fast if cut in inch strips. Makes a beautiful covering for floors & walls & keeps out wind & wet. Using string for warp, cost is about 10 cents a rug. Results with colors & designs unlimited.

Polyethylene sheeting a phenomenal material for all occasions. Put it under flooring for a dry, draft free floor use it as extra insulation on walls & windows when its cold. Put a water tank atop your house covered with black polyethylene—hook up pipes & fixtures—voila hot running water on gravity pressure. Polyethylene makes an excellent green house over a 2x4 frame certainly cheaper than glass.

Boil eucalyptus leaves in water and use the resulting infusion on poison oak. A very good astringent.

Dutch Oven

A very handy item for the tipi dweller or commune is the dutch oven. A low cast iron cooking pot with three short legs and a flat lip-edged cover. It is used in the hot coals of your camp fire or buried with hot coals in the ground. The results are fantastic! A source for dutch ovens: Lodge Mfg. Co. A paperback book on dutch oven cooking, Old Fashioned Dutch Oven Cookbook by Don Holm.

or WHOLE EARTH CATALOG

The camp Dutch oven, either iron or aluminum, can be permanently damaged by pouring cold water into a hot oven, or uneven heating such as putting only half the oven or lid on the coals, by careless packing while traveling (the legs can be broken off or pushed up through the bottom by too much jostling), and by rust and corrosion.

The lid, turned upside down on the coals or on the pot, can be used for frying eggs, bacon, or grilling hot cakes. When using more than one oven, the second can be stacked on top of the first without the necessity of spreading more coals on the ground.

One should probably call the aluminum model the *contemporary* Dutch oven, which has some advantages and some disadvantages when compared with the traditional cast-iron model. The aluminum model is the only one that can be backpacked by a hiker. It costs about the same as the ironware. But it has a much lower fuel requirement, which can lead to trouble. The trick is to use from one half to two-thirds less fuel or heat to start with and control the heat more carefully.

The old camp Dutch oven evolved through centuries of experience. It was designed for cooking complete meals on open fires without the need for other appliances. (A shovel, pothook, and grease swab come in handy, though.) Its thick construction distributes the heat evenly and thoroughly from a small bed of coals assisted by the tight-fitting, flanged lid.

It can be hung over an open fire, set down in the fire, or buried in a pit of coals. It is at once a kettle, a frying pan, an oven, a pot, and even a stove, all in one portable utensil.

On a camping or hunting trip you can prepare a roast or stew, or even shepherd's bread, go away for a half day or so, only to return bone-tired and happily find a rib-sticking meal waiting for chow down.

For hole-in-the-ground cooking, dig a pit larger and deeper than the camp Dutch oven. Line it with small stones or aluminum foil to prevent loss of heat through the ground. (Be sure to select a site that is pure mineral soil and not full of humus, or you may be the cause of a forest or range fire, which will make you extremely unpopular in most parts, podner.) Build a fire in the hole and let it burn briskly an hour or so, or until there is nothing left but hot coals. Remove some of these, place oven in pit with the rest, and rake the coals back over the oven.

Cover the whole ball of wax with fresh dirt in a blanket about four inches thick. Most dishes require from four to eight hours cooking in this way. The cooking can be hurried along by building another fire on top of the dirt.

STEPS IN CHINESE-FRYING

1 - Wok must be very dry and clean. If not it will burn before coming to the right high temperature.

2 - In all Chinese dishes there are two basic parts; the principal and the compliment. The principal is the meat, and the compliment is usually a vegetable. In Chinese-frying you always cook the compliment first.

3 - Calculate the amount of oil you will need to cook the compliment (1 tablespoon is usually enough for a small portion). Preheat wok to a very high temperature, put oil in wok and then add compliment immediately. This is very important, do not heat the oil in the wok before adding your compliment otherwise the food will stick to the wok. The term used for this by professional cooks is "hot wok - cold oil".

4 - When the compliment is almost 3/4 done, take it out, set aside, and keep it warm.

5 - Clean the wok with a paper towel, reheat to a very high temperature again and add about 3 tablespoons of oil to cook the principal.

6 - Note: Only 1/2 of the seasonings will be added to the marinade - the other 1/2 will be added when the principal and compliment are combined. In this way, the seasonings will be well blended.

7 - When the principal is about 3/4 done, add the compliment and remaining seasonings. Never add your seasonings before this time or the food will become soggy - except in cooking tough vegetables such as cabbage or green pepper. In that case, add a very small pinch of salt only when first cooking them.

8 - A very short period of time (about 2 - 3 minutes) is all that is needed for a good Chinese-fry. You will not have time to measure all the seasonings when you want to add them. Therefore, it is very important that you have them all ready beforehand. Use five or six very small containers (small saucers, pieces of paper, etc.), measure out the seasonings you will use, and place them on these containers before you start to cook anything. Place them within easy reach in the order in which you will use them.

9 - Add the seasonings separately with an interval of at least five seconds between each addition, mixing constantly and gently yet swiftly. Bring the food from all directions to the center so that it will be evenly blended and cooked.

10 - When the recipe calls for water, you can use chicken broth instead. You do not always need to use all the water called for in a recipe - only what you need to make a little gravy. Some vegetables have sufficient natural moisture to necessitate only a little water.

11 - The sesame oil is always added last. Its function is to give a pleasant aroma to the food - if it is included too soon, the aroma is lost. It should be added immediately before the food is served.

Home Canning of Fruits and Vegetables

You can buy a book on this subject for \$5, or you can get these perfectly adequate Government booklets at 20 cents apiece.

Beans, Lima or Butter	Shell. Wash. Sort according to size. Scald. Chill.	Small 2 Medium 3 Large 4
Beans, Snap, Green or Wax	Wash. Remove ends. Cut as desired. Scald. Chill.	3
Beets	Wash and sort according to size. Trim tops, leave 1/2 inch of stems. Cook until tender. Chill. Peel and cut as desired.	Small 30 Medium 45

Soap, etc.

TO DRY CORN FOR WINTER USE

Sweet corn is the best. Husk it. Have a pot of boiling water—put your corn in & let it boil 3 min—then cut it from the cob & put it in pans in a warm oven. It must be stirred frequently, when perfectly dry, put away in bags. When wanted for use, soak it all night, next day boil it an hour with a little salt; before serving stir in a little flour, pepper & butter.

TO FRESHEN WALNUTS

When Walnuts have been kept until the meat is too dried to be good, let them stand in milk & water 8 hrs. and dry them—fresh as new they will be.

TO MAKE AN IMPROVED CANDLE

Make the wick about half the usual size, & wet them with spirits of turpentine; dry them, before dipping, in the sunshine & the candles will be more durable, emit a steadier & clearer blaze.

WATERPROOF BOOTS

A pint of boiled linseed oil, half a pd. of mutton suet, six ounces of clean beeswax, & four ounces of rosin, are to be melted & well mixed over a fire. Of this, while warm, but not hot enough to shrink the leather, lay on plentifully with a brush over new boots or shoes, when quite dry and clean. The leather remains pliant. The New England fishermen preserve their boots water tight by this method, which, it is said, has been in use among them over 100 years. They can stand in water hour after hour without inconvenience.

TO MAKE SOAP FROM ASHES

To prepare a lye for soap, take a barrel without a bottom & place it on a board that has a trough to convey the water into another vessel; cover the bottom with straw, then sprinkle over a couple quarts of lime; fill the barrel with ashes; turn on cold water, a pail at a time—slowly! Continue to turn on water, at intervals of 3-4 hours the 1st, 3rd & 5th days. When the lye becomes strong enough to bear up an egg, put to 15 gal of it, 11 lbs. of grease, heated to the boiling point. Stir it for 5 min. every day, till it forms soap. If it doesn't in 1 week, add a half of soft water.

NOTES ON SOAPMAKING

- Never use lye on aluminum utensils (lye acts upon them). For small batches of soap, enameled or granite ware is suitable and for larger batches, an iron kettle may be used.
- All grease should be pure and clean to obtain soap with a clean, wholesome odor.
- Measure accurately. Be careful about temperatures.
- Ammonia, kerosene, carbolic acid, etc., when added to soap help it little, if any, as the lye usually neutralizes them. They increase cost and may make soap harsh on skin.
- Coldness makes a hard, brittle soap.
- Excess lye makes a coarse, flinty soap that will crumble when shaved. Soap should have a smooth, velvety texture that curls when shaved. It should not bite the tongue when aged.
- Use the all-purpose soap for toilet soap, a shampoo, for washing prints, lingerie, hose and other delicate fabrics.
- The following fats (for soapmaking) are listed in the order of their desirability: Tallow, lard and their combinations, olive oil, other vegetable oils. Mineral oils will not make soap.
- Poultry fat should be combined with other fats, as soap made from it alone is soft and spongy.
- Aging always improves soap. Soap made from lard or soap that has been boiled requires longer aging before it becomes hard and ready for use.
- Instead of storing rinds and meats scraps, extract the fat; store in a tightly covered container in a cool, dry place.
- Make the fat into soap as it accumulates and let the soap age rather than allow the fat to get too old and rancid.
- There need never be a failure in soapmaking. If separation occurs, it can be reclaimed.
- Where you find your grease has become rancid or contains materials other than fats, boil in large quantity of water, allow to cool, skim off grease, and then follow the directions in the recipe for soapmaking.

SALVATION

When everybody was seated they bowed their heads while Doyle asked the blessing. D.R. had never heard his brother-in-law ask the blessing before and he couldn't resist keeping his eyes open to watch him. Marcella had been a church goer all her life, and the kids had been going to Sunday School since they could walk. But the blessing had never been part of mealtime in their house before, and D.R. was a little astounded. What was surprising was the quality of Doyle's prayer. It was short and simple, but, for Doyle, strangely articulate and obviously sincerely felt. He thanked the Lord for the food they were about to eat, for the house they lived in and the comforts they enjoyed. He especially thanked Him for David's safe arrival, and for the privilege of gathering together as a family once again. Doyle seemed to sense that the ritual surprised D.R., for when he had said Amen and Marcella started serving the food, he began talking about his recent conversion and baptism into the church Marcella had been attending for years.

"Of course," said Doyle, "I'm new in it, there's a lot I don't understand. But as far as feeling good about something, David, I never felt any better about a thing in my whole life than I do this."

"We've already got him taking up the collection," said Marcella. Doyle laughed. "I'm surprised they trust the likes of me with their money."

D.R. laughed at that, and went on to congratulate Doyle on his decision. "But I have to say I'm pretty surprised," he added. "I mean . . ."

"Honey you ain't a bit more surprised than I am, let me tell you. Why sometimes I even forget I've gone and done it. At work I'll rip out a big cuss, and along about four in the afternoon I get to thinking how good a big old beer would taste after work. But then I'll find myself in church on Sunday morning, singing hymns and listening to that little preacher, and it's sort of like waking up out of a dream."

D.R. asked Doyle to tell him how he came to his decision. The question embarrassed Doyle a little, and he took a big mouthful of food to keep from having to answer right away. D.R. watched him as he chewed. Doyle had always been very lean as a young man, but in the last few years he'd begun to accumulate flesh around his middle, and in his neck and cheeks. His face was losing its angularity and taking on a roundness that made him seem boyish and middle-aged at the same time. Doyle was thirty-four now, but as he bit down on his food the tendons in his big jaw flexed beneath his skin, and for a second the old toughness, and even meanness, of his youth was restored to his face, and for some reason D.R. found that very moving. He loved Doyle. And he loved Marcella. When he wasn't with them he really didn't think about them all that much. But now, sitting with them in their kitchen, sharing food, looking at their faces, at the faces of the children, smelling the raw, familiar odor of their home and hearing the old familiar notes in their strange voices, D.R. suddenly felt a little overwhelmed. It was a rush, a strange high that caused tears to work behind his eyes, and some deep longing to stir inside his chest. If D.R. had been called on to speak just then he wouldn't have been able to. Doyle was having his own difficulties speaking, but at last he swallowed his food and in a low and more serious tone he began to tell about the process of his salvation.

Passport to Survival

If these are your fat years, read this book and lay aside some wealth for the lean. If these are the lean years, here's how to survive them till the circle turns again.

The four foods for survival are wheat, powdered milk, honey and salt—they will keep indefinitely when properly stored. Mrs. Dickey bases her survival diet on these ingredients and enhances them with 40 more supplementary foods varying in degrees of storability and nutritional value. Then she gives more than a hundred recipes that almost all use only these four basic survival foods and water.

There's no question but you'd eat well on this diet. From wheat flour, honey and warm water you can grow yeast and thus make bread. Derive wheat gluten from wheat kernels and eat a very high-protein, incredibly versatile meat substitute. Everything from spaghetti and tacos to puddings and taffy is produced rather miraculously. Supplementing with yogurt (from powdered milk) and bean and seed sprouts gives a fairly rounded regimen.

Emergency procedures and the forethoughts stored here will serve you come holocaust, catastrophe, or unemployment.

or WHOLE EARTH CATALOG

Fat-free powdered milk, when kept dry and reasonably cool, stores with little change for over 15 years.

Chapter 7 Menu — Saturday Breakfast

Variations:

- (1) Mix wheat grass in blender, using as small an amount of water as possible. Strain, and add a small amount of the green liquid to the cream sauce.
- (2) Wrap wheat stems in tiny bundles with noodle strips. Serve in a casserole, covering with cream sauce.

Packaging the four survival foods—wheat, milk powder, honey and salt—in five-gallon cans has been a project of different groups who have been awakened to the need for emergency storage. Each can contains one month's food supply for one adult person: 27 lb. of wheat, 5 lb. of powdered skim milk, 3 lb. of honey, up to 1 lb. of salt.

Honey has other virtues. . . As it is essentially a concentrated extract from the plant kingdom, it undoubtedly contains numerous minor components which contribute in some degree to man's nutrition. It will come as a surprise to many to learn that a tablespoonful of honey contains as much vitamin C as a medium-sized apple, and that this same quantity has three times as much iron as the apple. It also possesses the same quantity of protein and nicotinic acid as the apple and a somewhat higher content of riboflavin. Nevertheless it must be recognized that honey, like the apple, is far from a complete food. Its greatest virtue lies in its pleasing flavor.

No. 19. Creme Gluten A La Emergency

Gluten No. 12b Wheat grass No. 6
Cream Sauce No. 70

Form the gluten in marble-size balls. Bake and simmer in stew broth No. 77. Mince wheat grass grown in soil and cut when 1-1/2 inches high. Add gluten balls and grass to cream sauce and serve immediately.

Butchering, Processing and Preservation of Meat

Vegetarians may turn their heads. (Some visited Kelsey while he was slaughtering a cow. "They like to watch the blood gush just like everybody else.")

One advantage of doing your own butchering, you get to thank the animal personally, and see him personally all the way through what you're doing together. There's nothing abstract about it. This book has the whole story. Farm animals, game, fish, canning, smoking, making sausage. How to eat your friends and waste nothing.

—SB
[Suggested by Jim & Sue Walton]

FIG. 16. Homemade beef hoist. A simple method of hoisting a beef carcass is illustrated in these sketches. A fork or rake handle or gas pipe is slipped through incisions between tendon and shank bone; ropes are suspended from tree limb or other support (wide apart at top) to height of hocks below. To free ends of rope are tied short sticks, as 2-foot pieces of broom handle or equally strong material. These are placed inside the shanks and are used as levers for winding up ropes around fork or rake handle, as shown. Two men wind up the rope around pipe or handle. When beef is at right height, another pipe or handle is laid across between ropes and ends of sticks to prevent unwinding. As the beef is raised the legs are spread farther and farther, as desired.

Comment on Ashbrook

If you are going to go native or at least semi-fringy, you had better figure out a way of beating Safeway to the price of a pork chop. In other words, if you are going to beat the system, Ashbrook's book will show you how. (At least in the meat department).

Want to butcher a steer? He tells you how to do it in the minute detail you need if you have never done something like this before. Same goes for hogs, sheep and lambs, game animals and poultry and wild fowl.

After you have the animal cut up he tells you how to freeze it, can it, salt it and even smoke it. Want to make your own sausage? He tells you how.

This is the most complete book I've ever seen on the subject. From how to select the right knife to what to do with all the left-over fat (make soap with it— he shows you how).

Ashbrook knows what he is talking about, 40 years as animal husbandman and biologist with the U.S. Dept. of Agriculture and Interior. You can forget about all those 15 cent pamphlets from the USDA, this one book is all you need.

OUT OF PRINT

FIG. 69. Sawing the backbone.

FIG. 27. Sticking the hog on the ground. The feet and legs of the man holding the hog are pressed against the shoulders of the animal to prevent it rolling.

The ease with which lambs and sheep can be dressed makes them a convenient source of fresh meat for family use. Lamb is the flesh of young sheep. Handy-weight 25- to 45-lb lamb carcasses yield comparatively small cuts. The entire carcass is small enough so that with home refrigeration a family can consume the meat before spoilage occurs. Portions of lamb can also be frozen or canned. Some cuts can be cured satisfactorily. It can be kept as an emergency food reserve or as a source of variety in the diet.

A lamb carcass chills quickly and cures easily. Lambs generally dress out about 50 per cent, which means that an 80-pound lamb will make approximately a 40-pound carcass. The trimmed leg roasts from a 40-pound carcass will weigh about 6 pounds each; and the shoulder roasts, about 5 pounds apiece. There will be about 7 pounds of breast and neck and 8 pounds of loin and rib to be roasted or cut into 30 medium-thick chops.

A Complete Guide to Home Meat Curing

Cured Domestic Rabbit. Rabbits can be cured whole or cut in pieces. Wash rabbit and place in a clean container. Make a curing brine by mixing 1/2 cup of Tender-Quick in 2 cups of water. Pour enough brine into the container to completely cover the rabbit.

Allow to cure 24 hours, then take it from the brine, wash, and it is ready to cook. If it is not to be cooked immediately, place in the refrigerator and cook within 3 to 5 days after it is cured. Cured rabbit may be fried, broiled, baked or stewed.

Tender-Quick brine draws out the blood, firms the meat and improves the flavor.

Wild rabbits and small game placed in Tender-Quick brine before being cooked will have an improved flavor and it helps reduce the strong game taste.

Quaker City Hand Grain Grinder

We've switched our loyalty from Bell Grinders (good meal, but no flour) to Corona Mill (flour on two grindings) now to Quaker City (flour on one grinding). The new champ, better bits, finer adjustment.

Atlas Juicer

I want to inform you and hopefully through you, your readers of a top quality tool for sustenance and nourishment. I enclose descriptive material on both models manufactured by Juice Master who is a little-known firm that produces top quality farm equipment.

Either the Atlas Juicer or the Atlas Princess are far superior to any of the juicers now on the market such as Braun. The Atlas costs more but the value is there in terms of materials used (no plastic) and the construction (a 10 year guarantee on the Princess and a lifetime guarantee on the Atlas Juicer).

We now have used a Princess model for one year and find ourselves appreciating fruits and vegetables in a new and exciting way. Our diet has been improved manifold and we now savor drinks ranging from carrot and cabbage juice to grape and apples juice.

For people living together it will be a useful piece of equipment.

Note, that although the retail price is high, it is extremely fair given the quality of the item. In addition you can buy either model at a discount if Juice Master does not have a sales representative in your area. Further reductions in price are available if you qualify to become a dealer—by simply ordering three units.

Lee Electric Four Mills

The best bread is made from wheat ground just before baking.

This is a small electric grain grinder manufactured by an old dependable company. A unique feature of this machine is that it grinds the entire grain kernel, including the germ and brah, into fine flour. (Other mills generally discard the germ). You fill the hopper and an automatic feed admits the proper amount of grain into the stone grinding chamber. The carborundum grinding stone never needs redressing, the mill does not get warm enough to impair the nutritional value of the flour, and fresh stone ground flour . . . pass the bread!

[Suggested and Reviewed by Lloyd Kahn]

Meadows 8" Household Stone Burr Mill

Considering the cost of an electric mill such as the one sold in the store this item is high. However the Lee mill will grind only a small amount of flour and is slow for use in a community mill such as this mill would be ideal for. It will grind a hundred pounds of fine flour an hour. Such a community mill or a small co-op could supply a community with organic whole wheat flour for 6 to 8 cents a pound, depending on their source of wheat berries. Deaf Smith County wheat berries are 6 cents a lb. FOB Hereford, Texas. Freight on wheat is funny. The best I can figure out is that it would cost about \$1.00 per 100 to ship it from Hereford to SF; if and only if you buy one complete truck load as only wheat can be in the truck if the truck contains wheat. Trucking companies say wheat is "exempt" and when you deal with wheat you are dealing indirectly with the Govt.

Big Bell Grinder

You might be interested in the C.S. Bell mill model 2 (2MC). In your very first issue you showed the small Bell mill and then later replaced it with the Corona grain mill. The Corona is far superior to the small Bell mill but the big Bell (No. 2) is far superior to the Corona. And far more expensive: about \$30.00 as opposed to \$13.00. But well worth the money. On the East Coast it is distributed by the Erewhon Trading Company.

And an excellent book is The Soil and Health published by Devin-Adair. This is a classic work in the field of organic farming by Sir Albert Howard. Howard also wrote An Agricultural Testament and was the major influence on J.I. Rodale among others. Along with Plowman's Folly and Farmers of Forty Centuries (and the long out of print Topsoil and Civilization) one of the indispensable written works in the field.

German Steam Juicer

I have something you might be interested in—I had been looking for it myself, ever since we survived on it after WWII in Germany. It is most ingenious. We used it on an iron stove—in the clipping it gives two prices—one for gas, one for electric—but I am sure it can be used on a woodburning or whatever other stove as well. We even sliced or chopped sugar beets and used this juicer maker to draw out the juices completely, then we simmered these to make a great sirup, without all the extra water to boil out, as you would if you cooked the beets the conventional method. This juicer is so simple: in the upper part goes anything you want to juice—it just simmers away, and out of the siphon tube comes the clear natural juice as it is, no sugar. It can be canned right into glasses or bottles. Rhubarb is delicious, even to people who usually don't like Rhubarb.

I noticed a California Concern imports (manufactures?) these, so I am not trying to translate the German but if you want you can send for the english brochure and directions from them.

Hoping you can use this—I am sure using mine.

DOYLE'S STORY

"I think the thing that finally got me serious about it, David, was my brother Clarence getting killed in a rock fall, down home, back in the spring. I don't know if you ever knew Clarence or not . . ."

"I remember him," said D.R. "He used to work at Blue Diamond."

"That's him" Doyle went on. "Older than me, and not so long, as he used to say it. Of course it's been a while since he worked at Blue Diamond. They shut down over there right after we all moved up here, I remember that because Clarence come up here to live a while, but he never liked it enough to stay, and for the last nine, ten year he's been in and out of them little old dog-hole mines, mostly over on Second Creek, and for a while there on Trace Fork till they stripped it. He was working for the Combs brothers over on Second Creek last March when a piece of rock fell on him. The whole roof caved in and crushed him, just like that. He never drew another breath after that rock caught him."

"I didn't know that, Doyle," D.R. said solemnly. "I'm sorry to hear it."

"Well, it was a sad time, I tell you it was," said Doyle. "It like to broke poor Mommy's heart. She was his favorite, you know. He was her first, and he lived there next door to her, and doted on her, and took care of her, him and Carlene. It was just the worst thing that could have happened in Mommy's life, and there it was, him dead just all of a sudden, and there wasn't a thing on earth anybody could do about it except bury him."

"Clarence's funeral was the saddest time," said Marcella. "Awful sad," said Doyle. "Just awful sad. We went home for it of course. You remember the church there at the mouth of the creek, I guess. I doubt they's over twenty members of that church left around there, so many's moved away. But for Clarence's funeral it was full, people come from far away as Hyden, and Hazard. They was one of his old army buddies from Pike County heard about it and come. Brother Fugate preached, and there was singing, and old Mr. Stacy got up and preached some too. What was bad about it though, as far as Mommy was concerned, was Clarence never had been saved. And so naturally there was a lot of talk about the rest of us. Mommy cried and cried, and pleaded with me, and my brother Lee. She cried all weekend and pleaded with us to join the church. I don't know if you remember Lee or not, David . . ."

"I remember him," said D.R. "I remember all these people. Brother Fugate baptized me and Marcella right there in Trace Fork, I sure remember him."

"Well," Doyle went on. "You can imagine how it was then. To please Mommy, and ease her all I could, me and Lee promised her we'd think about it. I don't know what Lee's done, I ain't heard from him since the funeral, but I got back up here and that whole business was all I could think about. But the funny thing is, although I wouldn't want Mommy to know this, it really wasn't anything that she said that made me change my mind."

Doyle paused then to eat some more, and take a drink of milk.

Hand Washers

A BEAUTIFUL WASHING MACHINE IS MADE OUT OF USING A "PLUMBER'S HELPER"—PUMPING IT UP AND DOWN IN ANY SUDSY LAUNDRY CONTAINER FROM BUCKET TO BATHTUB

NORMAN SOLOMAN
BERKELEY CALIF.

We asked Dale Fritz, a Peace Corps agricultural specialist and former Volunteer for Technical Assistance (VITA), who has years of experience overseas.

As it turned out, Fritz himself is the father of a simple hand-operated washing machine that has been featured for years in the Agency for International Development's (AID) *Village Technology Handbook*. What is the operating principle of the machine, we asked Fritz.

"Agitation, just agitation," he replied.

"You could take a stick and stand there and stir it," he added, "It's just the motion of the water. The clothes don't even have to move at all... It's just the water moving back and forth through the clothing that does the cleaning. The soap breaks down the dirt; and the water carries it away."

Well, we asked, if that is the principle, are there any other solutions to the washing problem that are simpler than yours?

Sure, he said. If you have a vehicle, throw your clothes into some kind of a closed container—like a milk can—add soap and hot water and put the container onto the back of your machine. Leave it there all day as you make your rounds—preferably over the roughest available roads—and when you get back in the evening you'll have a load of clean clothes.

That method has been used by bachelor ranchers in the western United States for years.

Ice Cream Freezer

I'm sure there are many lovers of home-cranked ice cream (and who isn't one?) who have been somewhat dismayed at the chincy ice cream freezers now being turned out with their predominately plastic parts. These people can now write for info and prices to the White Mountain Freezer Co., Winchendon, Mass. 01475 and be sure of getting a solid, quality piece of machinery that will last for years. There are two models available, the Mod. 643 White Mountain triple-motion, in sizes from two to 20 quarts and whose folder I have enclosed, and the Mod. 642 Arctic double-motion in 2, 4, 6, and 8 quart sizes.

I have never seen these freezers sold in the mainland U.S. though when I was in Puerto Rico in 1964 on a school trip I saw them in various hardware stores along with kerosene lanterns and stoves, and treadle-driven Singer sewing machines (new ones!). Often in San Juan one would see a street vendor with two of the large 20 quart freezers mounted on his pushcart selling nickel cups of ice cream to passers-by.

Garbage Diverter

One of the handiest gadgets in electric kitchens, as any upper middle class housewife can tell you, is the garbage disposer. Chuck onion peels, egg shells, moldy yoghurt, etcetera into it, flip the switch, and presto! All the stinky wet garbage disappears down the drain, born by clean water.

As the ecologically enlightened know, that stinky garbage is also potentially rich garden soil. There is something in my Scot's cells that rebels against this kind of waste. So the other day I asked a mechanic friend to create for me a device I had designed to capture the ground-up organic material before it goes down the drain. He did it. Now I am using the disposer's ground-up output plus the water in my garden instead of running it out into Bolinas lagoon.

I call the gadget Margot Doss's Little Jim Dandy Garbage Diverter and have applied for a patent.

The gung-ho back-to-nature buffs may shriek:

1. That it uses electricity
2. That you can do the same thing in a blender
3. That composting does the work in time

The answer to all these is yes, of course. Apart from that, a blender must be cleaned after every use, and the gunk that comes out of the Diverter is ground so fine it speeds up the composting considerably. I hope the Little Jim Dandy Garbage Diverter will introduce a lot of people to the mystique of organic gardening.

I expect to be able to put together the Diverters for less than \$10 each, if there are 5,000 orders. If there are more, the price will go down a little because quantity buying should make a difference.

If your readers seem interested, I will also sell the plans for one sawbuck. Anyone who wants a reservation on this trip should send a self-addressed legal sized envelope and \$1 to Little Jim Dandy Garbage Diverters, Box 447, Bolinas 94924. Or a ten-spot. Depending on whether he wants to round up the raw parts himself or have us do it.

Cordially
Margot Patterson Doss
Bolinas, California

Ultra-Sonic Dishwasher?

The home dishwasher probably wastes as much or more water than a garbage disposal unit. Certainly it can be improved. Watchmakers and jewelers are beginning to use small "sonic cleaners" that clean watches and suchlike with high-frequency sound waves. Why can't a dish washer be built on the same principle?

Bill Marsano
Radnor, PA

"Doyle started having dreams," said Marcella.

"I did," said Doyle. "It was the unusualist thing that ever was. After we got back from Clarence's funeral I commenced to dream about him ever night. And if it wouldn't be him it would be somebody else that had died. My father, your all's father, or somebody in my acquaintance whose death I knew something about. It was just death ever where I looked, it was all I could think about. I got afraid I was going to die, or Marcella, or one of the kids, you can ask Marcella here, it was really an awful thing to go through. Nothing like that had ever happened to me before, and I just couldn't understand it. Ever night I'd go to bed and lay there all night thinking about death and dead people and dying and I'd think: well surely I'll get over this tomorrow. But then when I'd get to work there it would be, right up in front of my mind. I couldn't hardly work. Vernis noticed it and asked me about it. Some of our customers even noticed something was wrong. This all went on I guess a month or more till finally I just had to do something about it. And so Marcella called her preacher up and asked him to come over and talk to me about it."

"He's a real nice man, David," said Marcella. "He's from Kentucky too, just smart as a tack. You'd really like him."

"Half of Cincinnati's from Kentucky," said Doyle. "This is briar-hopper country sure enough."

"How well I know," said D.R.
"I'd say it improves the place about five hundred per cent myself," said Marcella, and everybody came out of their seriousness to laugh hard at that.

When they'd hushed, D.R. asked Doyle what he had said to the preacher.

"Shoot. I just told him the truth of it. I told him I thought I was going crazy. I said I was having dreams and couldn't sleep and couldn't work, and terrible headaches. I told him I was afraid I was about to die. But that little preacher was the sweetest to me that you ever saw. I was about half embarrassed to be talking to somebody about that kind of stuff, but I mean he seemed to know what was going on in me even before I told him. He asked me if I was a Christian. I said no. He asked me if I'd like to be one. I said I hadn't thought about it. You know what he did when I said that? He bust out laughing. Just laughed and laughed and laughed. I didn't know what to think. Then he said, oh yes you have. I said what do you mean? He said oh yes you have been thinking about it. Then suddenly he quit laughing and looked me right in the eye and said, what are you afraid to die for? I said ain't everybody? He said we ain't talking about everybody, we're talking about you. What are you so scared to die for? What makes you think that's so awful? And just about the time I begun to wonder if he was crazy why he got out his bible and commenced to read about Jesus, and about dying, and about being re-born, and I begun to see what he meant. He must of talked to me two or three hours that night. And the next night, and the next."

"He stayed till two o'clock in the morning one time," said Marcella.

"He can just talk rings around you. He can say stuff you think ain't never been said before, he's really clever. He come over the to: th time on Friday night, and guess what he said. He said he wasn't going to come see me no more. He said if I wanted to know what he had to say he was preaching ever Sunday morning at eleven o'clock, and for me to be there. And I ain't missed a Sunday since. And after three times I confessed, and then about a month ago they baptized me, and I've slept good ever since."

Winemaking

At some time in everyone's life he's collected together raisins, sugar and baker's yeast in a gallon wine jug and eagerly awaited the product. More often than not this resulted in an overly sweet, low power, cloudy "amber brew" that discouraged him from further efforts at wine making. Amateur wine making though long practiced is only slowly evolving from the "word of mouth" phase. These two British books are the best that I've seen; however, one does not learn wine making by reading books—he learns good habits and a feel for the techniques of wine making. From there on it is a matter of how much imagination one has, since amateur wine makers have made many delightful wines out of the most unlikely ingredients (Flowers, potatoes, parsnips, rose hips, rhubarb, etc.). Bravery's book (*Successful Winemaking at Home*) is scientific and meticulous with details. He says all wine recipes in his book have been tested personally and are of excellent quality if you follow his general rules for making good wine—and I believe him. However, they are for single (Imperial) gallons (5 quarts) which I feel hardly makes it worth the trouble unless it is a very special recipe. Five gallon spring water bottles are more convenient sizes for tested recipes and thirsty friends.

Berry's book (*First Steps in Winemaking*) is worth while because he has many photos and diagrams of apparatus which I feel is essential to one's initial concept of the process. He has a lot of "hints" and so forth, many of which are sound, but if there's a discrepancy I would stick to Bravery's interpretation. Both books and many others not mentioned have recipes which should get you started. Wines can be made all year if you are willing to experiment.

A few things to remember: Read the principles of wine making carefully; wine and yeast are gentle things and they have to be cared for. Wine yeast is very important and well worth purchasing from dealers. (If you have an idea of sterile transfer techniques and the knowledge that it only takes one little yeast cell you can devise ways of making one commercial culture of yeast grow two years worth of wine.) Equipment can be expensive at specialty stores but wine is easily made in 10-20 gallon polyethylene garbage cans, "clipped" five gallon water bottles (at 1.50 per) at spring water dealers, fermentation locks of the plastic variety, a J shaped siphon to avoid "racking the lees. Temperature is very critical and I recommend a thermostatically controlled heater or room or perhaps an immersible fish tank heater. Tap water has yeast killing chlorine in it: to remove it boiling is probably the easiest, tho if you're doing 20 gallons it can become tedious—chlorine will escape if left to the air for a day or so. Add Sodium Bisulfite (Sodium metabisulfite & Campden to the British); it is an inhibitor to all wild yeasts and many bacteria, but wine yeasts are resistant to it, so you encourage your special yeast's growth and avoid spoilers. It also allows you to avoid heating to sterilize the whole batch. A stronger solution can be used very nicely for sterilizing clean bottles, etc., without affecting the taste of the wine. Lastly one should call the Feds and register (it's free) and avoid a possible hassle.

[Reviewed by Dr. James Fox.
Suggested by Tom Wellman]

Dr. James Fox says that you can use sodium bisulfite as a sterilant in wine recipes. This is not true... bacteria and fungus find NaHSO_3 such good food that it's hard to keep a solution on the shelf. Sodium metabisulfite has no other common name, and is $\text{Na}_2\text{S}_2\text{O}_5$, and I recently bought a pound of Baker Reagent Grade "Sodium metabisulfite" for \$1.50, this being enough to treat 1750 gallons of wine.

He also states that Bravery's recipes are for 5 quart gallons. Bravery says, "The reason for using 5 quarts of water in these recipes is that we are using enough ingredients for a gallon of wine. If we used only one gallon of water we would end up with about three quarts of wine because about a quart will be lost during boiling and other operations." (p. 55, *Successful Winemaking*...)

This last isn't very important, but the metabisulfite bothers me, because only a chemist could catch the error, and most of your readers are likely to be misled, with possibly unpleasant results.

Sincerely,
Frank Deis
Richmond, VA.

Berarducci Brothers

You may have reported on the products shown in the Berarducci Brothers Manufacturing Company catalog (McKeesport, Pa., 15132).

If not, it might interest your readers to have a source of crocks, Barrels, Fruit crushers and wine presses, Pizelle irons, various graters, sausage stuffers, coffee roasters, ravioli machines and noodle machines. Berarducci winery equipment is also shown in most other winemaking supply catalogs, but is less expensive in this source.

Ralph Auf der Heide
Santa Barbara, CA

Many old recipes advocate far too much sugar, with the result that the winemaker is disappointed when the yeast fails to use most of it up, and he is left with a syrupy, almost undrinkable concoction.

As a good rule of thumb, remember the figure 3—3 lbs. to the gallon of liquor for a medium wine. Half a pound less will usually produce a dry wine, half a pound more a sweet. Below 2 lbs. of sugar to the gallon the wine may not be strong enough to keep, above 3½ it may well (although not always) be sickly sweet.

Rose Hip Wine

One of the finest of all home-made wines; its flavour is unique and it has body and bouquet that take a lot of matching. Rose hips abound in early autumn and it matters not whether they are gathered from your own rose trees or from the hedgerows. They should not be used until they have taken on their winter coat of red or orange according to the type.

4 lb. rose hips, 3 lb. sugar, 1 gal. water, 1 oz. yeast.

Wash the hips well in half a gallon of water in which one Campden tablet has been dissolved. Crush the hips with a mallet or chop them. Put them in the fermenting vessel and pour on half a gallon of boiling water. Boil half the sugar in a quart of water for two minutes and when cooled a little add to the rest. Add the yeast and ferment the pulp for seven days.

Then strain out the solids and put the strained liquor into a gallon jar. Boil the rest of the sugar in the remaining water for two minutes and allow to cool well before adding to the rest. Cover as directed or fit fermentation lock and leave to ferment in a warm place until all fermentation has ceased.

HOME POT STILL

Home Brewing Without Failures

It's an interesting book, but awfully hard to use in this country, because it's very difficult to get decent materials for brewing. It is, after all, against the law to make your own beer (at least in California). Wine is legal; up to 200 gallons a year may be made by the head of a family (a real Italian law). In Berkeley, for instance, you can buy Blue Ribbon canned malt extract at most large grocery stores, also probably corn sugar (dextrose) in most. You can buy a bottle capper and bottle caps, and a decent yeast starter at a winery. But Bravery's recipes call for a number of pretty esoteric ingredients.

There are two places to buy brewing supplies through the mail that offer a really good selection. One is Wine-Art Sales Ltd., 1108 Lonsdale, North Vancouver, B.C. This is the nicest mail order house I've ever dealt with. They have a free catalog of beer and wine making supplies. When you order from them, you send no money. They send you the stuff, and a bill, with a discount for American money, and you send them the remittance. I hope no one burns them, because it's really nice to establish such a basis of trust in the cold mail order world. Shipping charges are not expensive, except on heavy stuff, and the wait is only about two weeks (to Calif.).

I would suggest that anyone who wants to get into beer making should use Bravery's book as a point of departure, maybe order some of those nice yeasts, particularly the liquid ones, and other small stuff from Canada or England, but make do with canned malt extract, locally available sugars (yellow-D is a good one, though beer made with it is sometimes a little hard to start), maybe some molasses for extra body.

You should know that Bravery's recipes generally make very, very heavy beer. The heavier the better for me, but it's a long way from Lucky Lager, or even Heinekens and Tuborg. If you like light beer, use less sugar (use corn sugar, too), less malt, and more water. If you use a hydrometer, as Bravery recommends, you can figure out the alcohol content of your beer before you start it with the yeast.

Contrary to what a lot of people believe, a home brewer of at least thirty years experience told me to never save a yeast starter from batch to batch, but to start with a new and good one every time. Yeast gets contaminated with wild spores very easily, and your batches are likely to get worse and worse instead of better and better. Also, he says, you should ferment your beer at low temperatures, 60 degrees or lower, as at higher temperatures, the yeast starts producing alcohols you don't want, like toluene and acetone.

In general, the best way to brew is to experiment, and keep notes, so you can duplicate a really good batch when it comes along.

Bravery's Super Stout

2 lb crystal malt
2 lb patent black malt
1 lb black treacle
3 lb white sugar
3 oz hops
2 small level teaspoonfuls salt
½ oz citric acid
yeast
nutrient

and add salt and two ounces hops. Bring to boil and simmer gently for forty minutes. Add remaining hops and simmer hard or boil for a further five minutes.

Put sugar, treacle and citric acid into the fermenting vessel and strain the mash on to it through fine muslin. Stir well, making sure all sugar is dissolved and make up to four gallons with boiling water.

Cover with sheet polythene as already directed (p. 51) and leave to cool to 65° - 70°F. Add yeast and nutrient and leave to ferment for six-eight days.

If using hydrometer, take readings after five days until 1.005 is recorded and then bottle. If hydrometer is not being used, allow fermentation to go on until beer becomes "flat" and then prime—add sugar to recommence fermentation—and then bottle. If draught beer of this sort is wanted merely bottle the beer when it has gone "flat". Improves with keeping for six or more weeks, though it may be used as soon as all yeast has settled and the beer is clear.

OAK BARRELS for fermenting. Adds an air of "the good old days" home brewing operation. PARAFFINE LINED BARRELS does not add wood taste as charred barrels do, but is easier to clean and doesn't leak.

1920	one gallon	10.00
1921	two gallon	11.00
1922	five gallon	12.90
1923	ten gallon	18.90
1924	fifteen gallon	18.30
1925	thirty gallon	28.20
1926	fifty gallon	41.50

The Wynne Table

How To Make Booze

Reading this book, I start to yearn for a wine cellar, 10 ceramic crocks, cupboards full of dry and fresh ingredients, long wooden stirring spoons, mead tables and friends enough to provide for partying every night, starting out with the light beers and finishing up on the floor with the dark wines. This book is, not counting the historical references and mythological stories, entirely practical. Written by a former(?) student of no doubt many serious years and some wisdom who says about the book's purport: "... the idea was a simple one: to write a book about wine making and brewing based on the thesis that the person reading the book could actually do it."

He tells you the ingredients needed, the equipment necessary, and half necessary and slightly necessary, and how to make it, then the procedure to follow, how long to ferment, how long to age, what to do if something screws up at a point in between, how to bottle, where to get EVERYTHING the cheapest, what ingredients make it taste this way, what fruits that, heresy and incorrect rumored procedures. Covered are home brew, white lightening, wine, mead and distilled spirits, bathtub gin; at the end are remedies for hangers. Drawings by the author of equipment to use.

... members of the Vast Unwashed resort to additives—chiefly varieties of resins, powdered isinglass, gelatin—added either to the crock or to each bottle. Ineffectual. Live with the sediment as you live with sweat and labor. Ours is a postlapsarian world. Open each bottle carefully and pour slowly, and when the sediment begins to move to the mouth of the bottle, stop. Pour quarts into pitchers if practical. About a quarter of an inch of each bottle will be wasted, but consider this your tithe. It is little enough, and full of tares anyway.

Mead may be purchased even today in this country at the larger liquor stores, usually imported from Denmark. All imported mead I have bought has proved to be quite unsatisfactory, and resembled only distantly what mead really should taste like. If you want good mead—and once you have tasted it, you will—you must make it yourself. Fortunately, it is simple to do so.

Wine, that universal beverage, became an alcoholic beverage almost through the back door. Basically, wine is a food, and its alcoholic content is primarily a preservative. (And there is much to recommend it over monosodium glutamate.)

... it probably should be pointed out that equipment of almost incredible variety is offered for sale by supply houses specializing in such truck. ... Also, in most large cities there are malt shops which sell large varieties of malts, yeasts, and sugars, as well as crocks, barrels, patent syphoning devices, etc. ... Of course, anything you buy through such speciality outlets carries a premium price. Bottle caps, for example, cost about three times the price charged by your local hardware or grocery store. Malt syrup—the same brands you find on the supermarket shelves—cost about twice the supermarket price when you buy them from "brewers' supplies."

How to Lessen the Damage of Booze

Alcohol (and speed) causes brain damage, they're sure. [No certain rap on other light dopes, but those they're sure of.] Alcohol robs the brain of B vitamins, and cells die. You can counteract the effect by eating manufactured white bread, which is fortified with B vitamins. Of course, if you're into juice to get drunk and a little deader and well hungover, watch out for bread.

From Jim Fadiman
who got it from researchers
at Stanford

Balloon Wine

We made a gallon of wine once without saccharimeters, vapor locks, wine cellar or any other special apparatus. It wasn't exactly a 1961 Chateau Margaux but it was potable and fun. Friends will ask of the gallon jug near your heat register, "why is there a balloon on that bottle?" to which you can respond with all sorts of nonsense.

The wine will be a sweet concord sort. If too sweet you can cut the sugar by 1/2 or one cup but you can't go much beyond that because all that sweet stuff is your assurance of proper fermentation.

This is all there is to it. Thaw one large (12-13 oz.) can of frozen grape juice concentrate. Combine it with 4 1/2 cups of sugar and one package of dry yeast. Put into very clean gallon jug and fill to the shoulder of the bottle. Mix it thoroughly. Then tie a heavy (maybe 10 cent) balloon over the mouth of the jug. Let it all stand at room temperature (maybe near the heater in winter) for 21 days. The balloon will erect and then expand. If it deflates before 21 days your vintage is ready. If the balloon blows off, just tie on another. At the end of 21 days the hooch is ready whether the balloon goes down or not. Crazy, yes? We got the idea from a Delmer Robinson who wrote it up in the National Observer. He said when he published the idea in his local paper, town stores quickly ran out of balloons!

Kam
Nevada City, CA

THE SECOND DEPARTURE

When D.R. got ready to leave the house again after supper he didn't tell Marcella and Doyle he was going to the bus station. He said the call he'd tried to put through earlier in the afternoon hadn't happened, and that he wanted to go out to a pay phone and try again. Doyle laughed, thinking he understood: D.R. was going out to call up his sweetheart in California, and he didn't want a bunch of prying kin folks listening in.

"I don't blame you," said Doyle. "You can't get any privacy with nosy people like Marcella around."

Marcella put her hands on her hips. "I beg your pardon." Then she doubled up her fists and put up her dukes and said she guessed she'd just have to teach Doyle a lesson. Doyle made a fist too, and swung it at Marcella slowly enough for her to grab his arm and commence to bite it. "I'll eat you up if you're not careful," she said.

"Not in front of everybody," said Doyle, and he winked at D.R. as Marcella blushed and tried to kick Doyle in the ass.

"You big goof, you get out of the kitchen."
"Ha," said Doyle, leaping out of the way. "See how mean she is, David? You're going to have to tame down while David's here, Miss Pritchett. Me and David just might beat you up good."
"Shoot," said Marcella. "Kin folks sticks together where we come from, don't they David?"

Doyle said, "Get her, David. Let's just beat the tar out of her." Doyle moved toward Marcella then. She squealed and ran to the corner of the kitchen and grabbed the mop. D.R. laughed and for a moment pretended he was going to help Doyle whip Marcella.

But then he backed away and said he better go on and make his telephone call. Doyle walked him to the door.

"You need any money or anything?" said Doyle.
D.R. shook his head. "No. It's cool."
"We'll see you after while then," said Doyle.
D.R. waved and Doyle closed the door behind him.

PARKING

There were several empty parking places near the entrance to the bus station but D.R. felt like putting Urge back where he had been that morning, just for old time's sake. He circled the block and pulled into what he thought was the same space, but once he turned the motor off he wasn't so sure that was it. Maybe it's the next one, he told himself, and he backed up one space and turned the motor off again. This one felt a little better, but it still wasn't right. It wasn't balanced. That morning there had been a Fiat in front of Urge and a Ford behind, and D.R. was sorry they had been moved. If the Fiat and the Ford had remained in place they would have balanced it, but with them gone there just wasn't anything out there for a fellow to depend upon. When D.R. really wished for in his heart of hearts was to see a sign that said, "This is where you parked this morning." As it was, there was no indication of any kind that D.R. had ever been on that street before, except the memory of it in his mind which he just didn't feel like trusting at all right now. D.R. moved the bus three more times before he finally just arbitrarily chose two lines to park between. It seemed like a very reckless thing to do, but he was so late getting back to the bus station as it was he really didn't have much choice.

Burgundy

Claret

Champagne

More on Semplex

Everything for anybody into his own wine, or thinking about it. Homemade wine is good, cheap; fun to make and drink.

Semplex of USA is the American agent for a very good English firm. Most of their material is imported (nobody in the USA makes it) and expensive compared to English prices, but cheaper than available anywhere else I've found. Their service is excellent and personal.

They supply everything from pure strains of wine yeast (cheap and really necessary for good wine) to chemicals and incidentals for the more advanced freak. They also carry an excellent stock of books on winemaking from England, Germany and the USA. (I recommend "First Steps in Winemaking" by C. J. J. Berry, \$1.95)

Anyone can easily make a really good (not merely a non-poisonous) wine for about \$1.40 a gallon.

[Reviewed by Tom Wellman]

MONTRACHET WINE YEAST:

A new product put out by a large company which supplies many commercial wineries. It is in active dry granulated form and is sealed in a foil envelope under inert nitrogen gas to increase its shelf life. It is a high quality product and each envelope is adequate for 5 gallons of must. Can be used for any type of wine and is very simple to use because it can be added directly to the must without prior starting.

Nippa Sauna Heater

The Japanese-type bath, with a wood-burning firebox, is excellent, but the fireboxes are hard to make and impossible to buy from Japan. The Japanese bath also uses a lot of water, which can be a problem if you have to pump or carry water any distance.

One answer is the sweat-lodge/sauna. An earth-lodge will do, or better a cedar-lined room with a high bench and a drain in the floor. Carrying hot rocks can be tiresome; the best arrangement we've found is this wood-burning sauna stove made by the Nippa company in Michigan. We use the WC 22 model, holds a lot of wood, heats 15 gallons of water to a rolling boil in 20 minutes, heats the rocks on top at the same time, doesn't use much wood actually, and keeps the sauna room hot for hours. Expensive, but will last several lifetimes and keep maybe 2 dozen people clean & happy.

Out of 25 companies contacted, this is the only wood-burning sauna heater located.

Aboriginal Sweating

Your suggestions for outdoor living have been extremely enlightening. One suggestion — the aboriginal sweat house or sweat-lodge has a long history in N. America and most likely has its adaptive advantages. The Finnish and other similar Scandinavian saunas are perhaps the only extant parallels in the Western World — and unfortunately are costly and require a certain amount of skill to construct. However the aboriginal sweat house takes many forms — all of them easy to construct and if done right have nearly the efficiency of an expensive sauna. I have personally constructed two — after Nez Perce practices — and have surprised many of my friends with their heat-holding capacity. The sweat house ritual is varied and complex — some groups separate the sexes, i.e. don't sweat together (Nez Perce for example); others sweat communally. The social, psychological and physiological advantages of sweating are numerous and not to my knowledge adequately researched (Finnish data is best). This Nez Perce (contemporary) sweat house will sweat four to six:

You need:

- 5-7 green, usually deciduous, poles, approx. 15' length
- 1 ball sturdy twine or if a purist, rawhide strips
- blankets — Nez Perce uses blankets of wool, old coats, clean gunny sacks, any pliable insulating material of cloth will do, get plenty!
- 2 pitch forks
- One 20 gallon can — not absolutely necessary
- 2 18'-20' sticks, 1' or so in diameter

First — you will need a location near water (usually a stream) — cleared of all brush and undergrowth. An area 30' in diameter will do depending on local conditions. Stream must be deep enough to allow submergence of one's body.

Next — shape of wickiup type lodge will be semi-hemispherical about 8' or so in diameter. Construct frame by holding green poles in proper shape over a fire (small) and slightly dry poles which will hold curved shape better. Tie poles together with twine thereby maintaining shape.

DIAGRAM #1

Next — Cover frame with insulating material — 3 or 4 layers will suffice. Leave no spaces! Lodge must be nearly airtight. I use an initial layer of plastic tarping to aid in heat retention — although I dislike its negative appeal. Leave a door just big enough to enter — you can hitch a cross-piece to the frame of the lodge and hang several blankets off it making sure an adequate seal is formed.

Next — dig a small depression inside the door and to the right — this becomes the receptacle for the red-hot rocks. Should be 10' deep and 25-30' in diameter. Line this hole with good rocks (see definition of a good sweat rock, which follows).

Next — gather 30 or so sweat rocks. A good rock is hard to find. My best luck has been with slightly vesicular basalt, subangular and about twice the size of a brick. Test rocks by heating over fire to a red hot glow — sprinkle over with water. If the rocks spit and hiss but do not explode or crack — you may have a good rock. River rocks have been my best source, i.e. subangular basalt cobbles. Granite is too heterogeneous.

Next — gather wood — the best wood is usually the hardest to procure. Most deciduous wood burns hotter but is harder to find. I use anything I feel right about. Never cut a green tree for firewood or for any stupid reason: Use dead wood, stumps. You need a lot. Build your fire place next to, but not too close to, your sweat lodge, which is hopefully next to, but not too close to, the water. Stack your fire logs, crosscrossing to achieve a sturdy and fairly flat top, on which you evenly distribute your rocks. Fire is fairly big and hence you will need adequate precautionary measures.

DIAGRAM #2

Next — light fire — usually takes 45 minutes to an hour or even longer depending on wood. The rocks fall thru to the ground and become ash-covered. This is where the pitch forks come in. The rocks should actually be red hot and you will need them to pass the rocks into the house. One individual must receive and arrange the rocks in the receptacle pit so he will need the two sticks. By the way, the house is only about 3/4' high in the center so this individual is on his knees. The pitch fork will facilitate cleaning burning ashes and embers from the rocks in the transferring process — these ashes would cause smoke in the lodge. Line floor of lodge with clean gunny sacks — cheap and available at any feed store.

Next — after rocks are all in place, all can climb in (naked of course) and enjoy. The host tends the rocks by sprinkling small amounts of water on top which cause increased humidity. I use pungent water, made by using certain roots; these cause a delightful fragrance I grove on. Sweat house lore says you should be serious or at least not too playful. When you are well heated and feel ready for the water — do indulge. Most serious sweaters consider the plunge into the water and the accompanying sensations to be the best part of sweating. Three times in the sweat house should be enough — an effective contraceptive too.

An existing sweat house:

Communal Bath

We have been using a "Furo" (Japanese Bath) or (Japanese Bath Ritual) for some time here in Hawaii. The Furo is as old as fire itself for it consists of a large body of hot water and a bucket! The basic principles are as follows:

1. Wash by first wetting oneself with a bucket of water outside the tub.
2. Soap up luxuriantly with soap (as in a shower).
3. Rinse with another bucket of water.
4. Then slip into the furo for a therapeutic spacious bath in sparkling clean water of about 100° Farenheit.

The unique advantages of this method of bathing are many. However, the most important are—water economy (5 to 10 gallons per person), the ability of a furo to accommodate several bathers at one time, the establishment of communal bathing rituals so important for the spirit as well as the body.

The sketches and details I've enclosed are one cheap and simple way to build a Furo for a community. If manufactured fuel is not readily available, a copper bottomed Furo can be built for wood or coal heating.

If additional information regarding the construction of communal baths is needed, please write to CBS and Associates, Inc. and we'll be glad to help in any way possible. Also, any suggestions, improvements or information on other existing installations would be appreciated.

Aloha,

Nick Carta

The simplest form of the family sauna is a one-room hut built of logs, with a large rudimentary stove upon which rocks are placed . . . The heat of the sauna is non-radiant; that is, it does not radiate directly toward the bather but rather is absorbed by the stones which emit the heat into the air. The indirect heat is gentle and constant . . . The stones are heated until they become red hot . . . ideal temperature 190-200 degrees . . . water is thrown on the stones but the air remains dry because moisture is instantly absorbed by the wooden walls . . . traditional sauna includes beating with leafy birch branches, washing, and a plunge in a nearby lake or roll in the snow outside. Then follows a necessary rest while the body cools down completely.

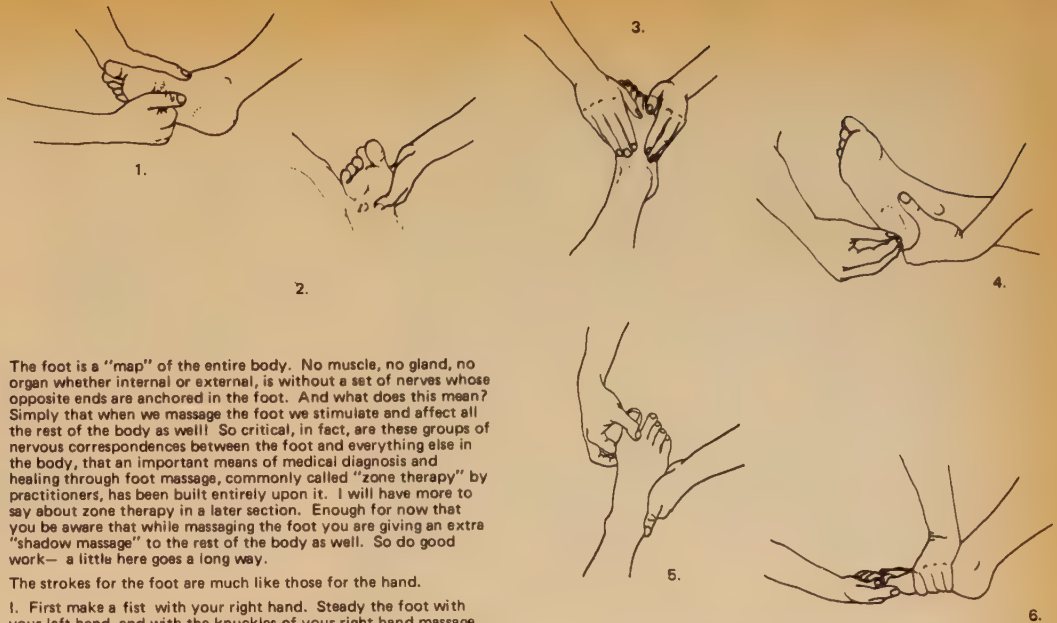

BUILDING A FINNISH SAUNA

A practical arrangement: 1) small stools used as steps; 2) steps; 3) rail for propping up feet; 4) platform; 5) headrest.

Interior walls and ceiling are often built of kiln-dried, unfinished redwood, which does not shrink, does not warp, and is a poor heat conductor. Another excellent wood is cedar, which not only shares redwood's good properties but also emits a pleasant odor and does not stain with moisture.

Nailing should be done with hot-dipped galvanized nails to avoid stains from rust; nails should be counter-sunk whenever it is likely that a bather will touch them in the hot room. Tongue-in-groove paneling disposes of this problem in wall construction; benches can be screwed from below.

The foot is a "map" of the entire body. No muscle, no gland, no organ whether internal or external, is without a set of nerves whose opposite ends are anchored in the foot. And what does this mean? Simply that when we massage the foot we stimulate and affect all the rest of the body as well! So critical, in fact, are these groups of nervous correspondences between the foot and everything else in the body, that an important means of medical diagnosis and healing through foot massage, commonly called "zone therapy" by practitioners, has been built entirely upon it. I will have more to say about zone therapy in a later section. Enough for now that you be aware that while massaging the foot you are giving an extra "shadow massage" to the rest of the body as well. So do good work— a little here goes a long way.

The strokes for the foot are much like those for the hand.

I. First make a fist with your right hand. Steady the foot with your left hand, and with the knuckles of your right hand massage the sole. Move your knuckles in small circles; press hard. Be sure to cover the entire sole, including the bottom of the heel.

II. Next go over the same area with the thumbs of both hands. Hold the foot in place with your fingers and work both thumbs at once in small circles. Again cover the entire sole. Go slow. Be thorough. Remember those thousands of nerves connecting the foot with the rest of the body.

III. Next work the top of the foot, using your thumbs in the same way. Again be vigorous and be thorough; don't let any tiny patches escape unmassaged. When you reach the lower half of the foot— in other words when you near the ankle and the heel— you will find it easier to use the tips of your fingers. Circle the ankle bone itself— the round bony protuberance about the width of a half dollar on either side of the ankle— several times with your finger tips, doing both sides at once.

IV. When you finally reach the lower end of the heel, gently lift the foot from beneath the ankle with the left hand and work the bottommost edge of the heel with the tips of the finger and thumb of the right hand. Press hard.

V. Next look at the top of your friend's foot and find, just as you did for the hand, the long thin tendons running from the base of the ankle to each toe. Run the tip of your thumb, pressing firmly, down each of the valleys that lie in between these tendons. Start at the base of the ankle and end at the tiny flap of skin between the toes. As for the hand, you may, if you wish, gently squeeze this flap of skin by pressing the tip of your forefinger against its underside as your thumb passes over its top. Do each valley one time.

VI. Now the toes themselves. With your left hand hold the foot steady; with the thumb and forefinger of your right hand grasp the base of the big toe. Then gently pull, twisting from side to side in a corkscrew motion, until your thumb and forefinger slide off the tip of the toe. Do each toe in turn.

VII. Finish the foot just as you did the hand. Clasp the foot between your hands, one palm along the sole and the other along the length of the top, and for a moment allow yourself to be still. Center yourself and become aware of your breathing. Try by breathing into your hands to allow the energy circulating in your own body to mingle with that of your friend's.

THE SEARCH IMAGINED

As D.R. pushed through the heavy doors of the terminal he made up a little drama in his mind about how it would be if Estelle was not there waiting for him. He saw himself entering the big waiting room and first looking toward the seats they had occupied that morning. Estelle was not there. The only person in that whole row of seats was a woman with two children, one of them a baby asleep in her lap. D.R. walked by her to the seats they had sat in and paced up and down in front of them, looking at them thinking: Estelle sat here, and I sat there. He looked at the seats, and all around the big room for some sign of Estelle. He considered asking the woman with the children if she had seen a girl in jeans and a Mexican shirt, but she looked as if she didn't want to be disturbed. Her baby was asleep, and she was half asleep herself. For a second in his fantasy the woman with the children turned into Estelle. She didn't stay Estelle very long but for a moment it was very convincing. She had Estelle's dark, round eyes and her skin was dark and mellow like Estelle's. She looked up at D.R. once, sort of blankly, perhaps wearily. Then she was no longer Estelle, which was good because if she had stayed Estelle the fantasy would have ended without the kind of freak-out D.R. wanted to go through over his lost love. He glanced at the half-asleep mother again, then walked away quickly to look for Estelle in the coffee shop.

Estelle was not in the coffee shop.

She was not at the ticket counter.

She was not at the magazine stand, or over by the lockers, nor was she outside in the loading zones, leaning against a post. The whole big sleepy bus station yawned Estelle's not being there and closed its eyes again. D.R. tried to wake it up. He tried to force its eyelids open with sticks, and when it yawned he tried to stir it by pouring tar into its mouth. But the mouth slammed shut and swallowed everything that had ever happened until that moment. The hours D.R. and Estelle had been together in that bus station slipped down its long esophagus into subterranean bowels, and no amount of screaming would bring it back again.

D.R. was muttering little fretful cries by the time he went into the phone booth Estelle had occupied. First he went into his own booth, then into her's. But Estelle was not there. He tried calling her, he memorized the number, went back to his booth and dialed. But Estelle didn't answer, and D.R. sat there on the stool muttering little fretful cries. He thought about calling the Anaheim Flash to tell him Estelle was gone, but somehow he didn't have the energy. But then suddenly he did have the energy, and he put in a dime and told the operator to get him the Anaheim Flash in Anaheim, California. The operator got the Flash's number, but a strange woman answered. The Flash was out. D.R. said it was an emergency. The woman asked if she could take a message. No, said D.R. There wasn't any message. But when the woman started to hang up he shouted Wait! Wait! Yes, there is a message. Tell him Estelle's gone. Tell him to find her and take care of her and tell me where she is. The woman said she would give the message to the Flash. D.R. said thank you and hung up, then sat there muttering little fretful cries as he tried to imagine where oh where in the whole wide world Estelle might have gone away to.

The only place left to check out was the ladies restroom, and D.R. strolled around to it, and began pacing back and forth outside the door. As women went in and out he tried peering through the door but he couldn't see very much, and the women looked at him suspiciously. Then he thought of a scheme. He watched four women go in, then waited until they came out again. One, two, three, four. Obligingly they came out as they went in, one behind the other, and when number four was out D.R. made his move. He threw open the door and yelled Estelle! He yelled it again, Estelle! Estelle! as he ran the length of the ladies room, stooping to peer under the stalls. But Estelle wasn't there, and the only thing D.R. could think to do was go in the coffee shop, order a Coke, play a sad hillbilly song on the jukebox and feel his heart break into pieces.

BASIC Y. The players alternate turns. On his turn a player fills in one region of the board with his color (the two players use different colors). Each player tries to get a "Y" in his color, that is, a continuous area in his color which touches all three edges of the triangular board. The player who succeeds in this wins. Figure 2 shows the final position in five games played on the board shown in Figure 1. In each of the five cases [X] has won by getting a "Y" in his color.

Figure 2

Dear Friends,

— Sep 10, 70

When I opened my July catalog to Fun & Games on p42 and saw the recommended books for Go my hand reached for my forehead and my mouth said "Oh, no!". Now while I owe a debt to Lasker & Smith for teaching me something of the game of Go, much better books have become available in English in the decades since then. Sadly, if you look in the local bookstore or in Books in Print you are likely to come to the conclusion that the books listed in the July catalog are the only books available.

The better books are available from JAPAN PUBLICATIONS TRADING CO., INC. (and a few bookstores also carry them).

The book to learn from is How to Play Go by Kaku Takagawa, \$2.00.

Takagawa is one of the greatest modern Go players, so that what he says is reliable. Although this book is elementary, if you truly master it you will be able to play a decent game of Go. An important thing to remember when reading it is that if at any point you think what Takagawa is saying is not true, then it is time for you to study the situation in more detail until you find out why it is true.

The next book to study is Go Proverbs Illustrated by Kensaku Segoe, \$3.50. Go proverbs are a painless way to absorb a wealth of information which will raise your strength considerably.

These two books will cover your needs until you get serious. When you get serious the major literature is in Japanese, although there are a few more things in English. There is Vital Points of Go by Kaku Takagawa, \$3.00. Takao Matsuda offers (or at least offered 7 years ago) an excellent correspondence course with his text and personal instruction. The American Go Association could supply Matsuda's address. I understand there is also a translation of a book by Sakata, another of Go's greats.

If you live in a large city look up the Nippon Club or the Nihon Kiin in order to locate some good players. One should play the best players he can, as playing against other beginners will develop bad habits. Go has a handicap system which allows players of considerably different skill to play.

Lest you think that Go is only a game let me tell you my favorite Go story. Several years ago when I was in Princeton, one of the most promising young professional Go players visited this country to encourage Go playing. He told us the story of how he got to be a professional Go player. When he was a young boy he played much Go and became very good. He decided that he wanted to become a professional, so he went to see a Go master in order to become his student. The Go master played him one game to see if he really had talent. Deciding that he was indeed a promising Go player, he took him on as a student. After that master and student had many sessions together, but Go was never discussed. The subjects of conversation were politics, art, philosophy, etc. Presently the master said that their conversations indicated that the young man now had the depth of view to become a professional Go player. To make certain, they played one more game and, as the master had expected, his student was indeed of professional quality.

In the big envelope I have included my contribution to strategic games. I like to think that Y is inherently even a better game than Go. However, Go has many centuries of people devoting their lives to exploring its possibilities. This gives Go a richness that no newly developed game can ever match. A few centuries from now, who knows?

The rules for Y are all on one page. By all means play the game before reading the rest of the text.

Peace,
Craig Scheidel

Boffers

We hereby nominate Jack Nottingham for a Nobel Peace Prize for the first significant advance in weaponry since the encounter group. As Gerd Stern used to say a lot, "contact is the only love," and these foam swords permit contact—with an un-pulled punch and no corporal damage. However the release of interpersonal energy is only one of the uses of boffers. They are a fine game, builder of psychic and physical skill. For one thing you learn about temper: it's an obstacle and a hazard—you get cut to pieces every time. You learn about other stuff as well, no teacher required; the wisdom is inherent in the doing. As the inventor proclaimed at the end of a public boffing match at the Fillmore West: "The sword is mightier than the pen."

Waterbaths

It seems silly to me that bathtubs, into which we place our fragile frames, if we have bathtubs, should be made of such hard materials as porcelain & enamel. If we can have waterbeds, we ought to be able to have bedbaths— sort of waterbeds turned inside-out. Do you know of any suitable soft materials, fabrics that will stand repeated wet-dry cycles and still stay soft, cuddly, and clean?

Joe Sonneman
Juneau, Alaska

Decide how you want your floor/where you want plumbing—drains— etc. to be/put pilings where necessary to support floor/floor support pilings don't have to be set as deep as perimeter pilings/nail floor supports (joists—2 x 6's or bigger) to floor support pilings deck with whatever's available—we used cull (bark on one side) 2 x 4's good side up.

Cut 3" PUC pipe into 4" lengths/drill 3/8" holes at 5 or 6 equal points on PUC for pentagonal and hexagonal hubs/cut 2 x 4 structural members to proper lengths and angles/drill 1/4" holes in centers of angled member ends.

Use 3/8" x 2" lag bolts with washers to fasten hubs to members/let bottom members "float" until entire structure has been erected/use ratchet wrenches to screw hubs to members/4 or 5 people can center dome structure on floor/spike dome down to floor.

Cut skin material (exterior plywood—tempered masonite—sheet metal— celotex (very risky) into proper triangle sides/nail skin material to structural members/ring shank nails are best/3/8" skin material is good enough/2" is really good/4" is risky.

Sealing is hardest part of building dome/many methods may be used/ we haven't got a perfect answer so maybe you should experiment with sealers and calks—etc./fiberglass strips and epoxy works pretty good but is brittle and expensive/tar and membrane works pretty good but has to be redone every 2 years and is very funky to work with and looks funky/silicone sealant works good but it is very expensive/hypalon and neoprene calks work pretty good but are expensive/the hypalon and neoprene calks are easiest to work with since they are applied with guns/we've just heard of a material used to cover calked fishing boat decks called HI-BALL you use it like fiberglass except burlap is used rather than fiberglass calk/we've also just heard about ferro-cement which sounds like the best system yet/it can be sprayed on/ the plastics are imperfect yet but much work is being done in that direction/plastics will soon evolve into the best and cheapest dome materials.

We use rock wool insulation/full thick (3 5/8") batts/stapled to the structural members and the exterior skin/one community used pearl-ite for insulation/fiberglass batts also work but aren't as efficient as rock wool batts.

Use 1/2" sheet rock for [obliterated] seams may be taped and spackled or not.

Put in doors and windows any way you like, using structural members as supports for glass and alter structural members to accommodate doors/in all the domes we've had anything to do with, the doors have been different/so there seems to be no set formula for doors and windows.

For covering the exterior skin use epoxy paint—or Alumination (a trailer paint made of powdered aluminum—asbestos fiber and tar)— or a really high quality paint.

For ventilation put 3 or 4 hinged flaps in triangles around bottom layer of dome/these flaps can be sealed in winter/also there should be a vent in the top of the dome (a skylite that opens and closes is one way—a revolving vent is another way) to prevent condensation from forming on inside skin of dome.

Good Luck!!!!

THE SEARCH

But that was all just a little trip in D.R.'s mind as he pushed through the front doors of the terminal. It wasn't real. D.R.'s heart was not really breaking. His head was, but not his heart. His head was shattering into splinters but his heart was beating on nice and strong as always. He went in the station, checked out the waiting room and the coffee shop, glanced around the magazine stand, and out into the loading zones. He looked around the bus terminal for ten or fifteen minutes, and when Estelle didn't turn up he got in his bus and drove on back out to his sister's house.

Koehler Method of Dog Training

What you train your dog to do and not do is up to you. How to train him is this book's entire concern. Koehler is over-argumentative, but his method is well-regarded for effectiveness.

Koehler Method of Dog Training

from:
Howell Book House Inc.
845 Third Avenue
New York, N. Y. 10022

\$5.95 postpaid

or WHOLE EARTH CATALOG

All is in readiness: you've got the mental equipment to start training a dog and to deal with those who would confuse you; your dog is at least six months of age (the old bromide to "wait till he's a year old" [and the house has been destroyed] has been debunked). So regardless of breed, there is no reason to delay training.

Make sure that your command is really a command, not a request, and that it is simultaneous with your first step. Again, he cannot learn to start on command if you stand there looking at him after you've told him to heel. You're moving, so keep your mouth shut and don't look back. No second commands, no invitational tugs; lock your leash hand to your body, keep your left hand off the leash, and walk. Yanking, backward glances, and coaxing gestures would merely postpone the lesson that your dog must ultimately learn—THAT HE MUST SOMETIMES DO THINGS THAT HE DOESN'T WANT TO DO. So, if you love your dog, let him learn this inescapable fact early and in the simplest way. Whether it goes against your teddy bear instincts or not, it's the truth.

POISON PROOFING

The vile names that his deeds call forth are probably taken as a compliment by the twisted mind of a dog poisoner. Convictions seem altogether too few and the sentences for the crime too light. The only source of satisfaction for a dog owner lies in poison-proofing his dog.

The materials you'll need are a low-priced battery-operated fence charger, and enough light, insulated wire to run from where you will conceal the unit to the different areas where you want to proof your dog against eating food. Regardless of the spots where you set the charger, the dog shouldn't see it or hear it and be warned that something strange is taking place. Both the fence charger and suitable wire can be obtained at a hardware store for a price that is small to one who feels the need to protect his dog.

At a place where the dog is particularly vulnerable to a poisoner, we'll make our first set-up in your yard. Lock your dog up so he cannot watch. Set the fence unit in a place of concealment, attach the ground wire to a pipe or a rod in the ground, and the live wire to the place designated. Run the other end of the charged wire to the spot where you feel someone might be likely to toss a bit of poisoned food. Bare half an inch or so of the end of this wire. On this bare end, stick a bit of meat, or other moist food that would appeal to your dog. Starting an inch back from the food, bend a couple of angles in the wire so that the bare part and the food will be held free of contact with the ground. Turn on the fence charger. Let the dog out into the yard.

When your dog has had opportunity to develop resistance to food found in all areas where a poisoner might toss it, you can supply experience that will make him form an equal aversion to any food offered by hand. You'll need an outsider to help you. Possibly you can exchange services with another dog lover who might want to protect his pet. As with the case of something being found on the ground, run the bare tip of the live wire into the tid-bit. Now, however, it is offered in the person's hand, insulated from his skin by a rubber glove or a bit of cardboard, plastic, or other non-conductive material. Change situations and strangers until you feel that in or out of the house, no one could coax your dog to eat anything he might offer.

Why has the dog the inhibition against biting his fellow's neck? Why has the raven an inhibition against pecking the eye of his friend? Why has the ring-dove no such "insurance" against murder? A really comprehensive answer to these questions is almost impossible. It would certainly involve a historical explanation of the process by which these inhibitions have been developed in the course of evolution. There is no doubt that they have arisen side by side with the development of the dangerous weapons of the beast of prey. However, it is perfectly obvious why these inhibitions are necessary to all weapon-bearing animals. Should the raven peck, without compunction, at the eye of his nest-mate, his wife or his young, in the same way as he pecks at any other moving and glittering object, there would, by now, be no more ravens in the world. Should a dog or wolf unrestrainedly and unaccountably bite the neck of his pack-mates and actually execute the movement of shaking them to death, then his species also would certainly be exterminated within a short space of time.

The ring-dove does not require such an inhibition since it can only inflict injury to a much lesser degree, while its ability to flee is so well developed that it suffices to protect the bird even against enemies equipped with vastly better weapons. Only under the unnatural conditions of close confinement which deprive the losing dove of the possibility of flight does it become apparent that the ring-dove has no inhibitions which prevent it from injuring or even torturing its own kind.

NATIONAL ANIMAL TRAIL SCENTS

Be it rabbit, bobcat, opossum, squirrel, coyote, deer, skunk, mink, bear, fox, lion, or coon, National Animal Trail Scents are the next best thing to the real McCoy. Leaves a "hot", live game trail that enables you to quickly train even a "city" dog to trail and be "straight" on anything from a coon to a lion. Simply apply to a weighted canvas and drag for a trail; when at the end of the trail, hang in bush, or tree where it is out of reach of the dogs. Many leading trainers have said, "It's one of the trainers greatest aids." In ordering, specify type of animal scent desired. Comes in easy to handle, non-breakable Polyethylene squeeze bottle.

HEAVY CHROME PLATED HEAVY DUTY CHOKE

Designed for powerful, stubborn dogs. The extra strong, twist link chain gives control over strongest dog. 12 to 24 inch length, specify size.

The Goshawk

Those who enjoyed the falconry scenes in *The Once And Future King* will not be surprised to know that *White learned it all from a hawk*. This book chronicles one of the damndest duels there is between species, as memorable as the longest swordfight of screen history at the end of which James Mason salute and dives out the castle window into the waiting moat.

Is it strange that out of battle this intense comes sympathy this intense?

In teaching a hawk it was useless to bludgeon the creature into submission. The raptors had no tradition of masochism, and the more one menaced or tortured them, the more they menaced in return. Wild and intransigent, it was yet necessary to "break" them somehow or other, before they could be tamed and taught. Any cruelty, being immediately resented, was worse than useless, because the bird would never bend or break to it. He possessed the last inviolable sanctuary of death. The mishandled raptor chose to die.

So the old hawk-masters had invented a means of taming them which offered no visible cruelty, and whose secret cruelty had to be borne by the trainer as well as by the bird. They kept the bird awake. Not by nudging it, or by any mechanical means, but by walking about with their pupil on the fist and staying awake themselves. The hawk was "watched", was deprived of sleep by a sleepless man, day and night, for a space of two, three, or as much as nine nights together. It was only the stupid teachers who could go as far as nine nights: the genius could do with two, and the average man with three. All the time he treated his captive with more than every courtesy, more than every kindness and consideration. The captive did not know that it was being kept awake by an act of will, but only that it was awake, and in the end, becoming too sleepy to mind what happened, it would droop its head and wings and go to sleep on the fist. It would say: "I am so tired that I will accept this curious perch, repose my trust in this curious creature, anything so I may rest."

This was what I was now setting out to do. I was to stay awake if necessary for three days and nights, during which, I hoped, the tyrant would learn to stop his bating and to accept my hand as a perch, would consent to eat there and would become a little accustomed to the strange life of human beings.

TRAINED GOSHAWK "GAIETY GIRL"

And oh! the agony of patience, the brooding and godlike benevolence which had been exerted. At the thousandth bate in a day, on an arm that ached to the bone with its L-shaped rigidity under the weight of the bird, merely to twitch him gently back to the glove, to speak to him kindly with the little mew which of my conversation he seemed to like best, to smile past him at space, to reassure with tranquillity, when one yearned to beat him down—with a mad surge of blood to the temples to pound, pash, dismember, wring, wrench, pluck, cast about in all directions, batter, bash, tug, and stamp on, utterly to punish, and obliterate, have done with and finally finish this dolt, cow, maniac, unteachable, unutterable, unsupportable Gos.

To fly: the horrible aerial toad, the silent-feathered owl, the hump-backed aviating Richard III, he made toward me close to the ground. His wings beat with a measured purpose, the two eyes of his low-held head fixed me with a ghoulish concentration: but like headlamps, like the forward-fixed eyes of a rower through the air who knew his quarry, The French called him *ramour* as well as *cuisinier*. Too frighteningly for words (when I had taken him up to bring him to the well—and given him the shred of beef with which he was always rewarded for a voluntary jump—he had flown to my shoulder and fixed his talons in the unprotected flesh, taking me by the scruff of the neck), too menacingly he flew, not toward the at-right-angles-held-out beef, but directly toward my face. At five paces nerve broke. I ducked, still holding the beef at the stretch of my arm, and stayed covering for two beats of the heart.

Falconry is as old as Babylon. It has never been a dead sport, and it does keep on developing. At the present moment it is developing in America, where young and enthusiastic and progressive falconers are doing wonders by not fussin'. If a good American falconer would come over to Europe and show us how he does things, it would make the old fogies blink.

Page 209 of *The Last Whole Earth Catalog*, in a review by SB, encourages the buying of hawks, lower on the same page is an ad

offering hawks for sale. Please, please, you are unintentionally undoing the work of hundreds of U.S. Falconers who distinctly discourage the commercial trafficking of birds of prey.

If you need confirmation of this contact the North American Falconer's Association, the largest and best falconry establishment on the continent. They have a large number of people in the Bay Area.

The problem is that hawks are decreasing in numbers due to pesticides, shooting, and habitat destruction, while would-be falconers are increasing. The only way an inept falconer can get birds is by buying them from people like the Florida Animal Dealers who supply sick, imported or stolen birds (and often totally wrong types of hawks) to beginners who have no idea of how to properly treat a raptorial bird. The result is a good number of dead hawks every year.

Falconry is a time consuming, exacting and very difficult sport. There are few good falconers. Advertising the sport can only end in harming the declining populations of the birds and the reputation of falconry. I urge you to withdraw your falconry ads as soon as possible from further printings of the Catalog. Or at least rap with somebody down there who knows about hawking—please!!

—Bud Anderson, Seattle

The Art and Practice of Hawking

I gather from *Natural History* that falconry is flourishing in the U.S., possibly to the detriment of some of the wild hawks who are becoming endangered species. Many falconers feel bound to capture wild birds; they are not helping the situation. If enthusiasts will buy and breed hawks instead, says *Natural History*, they can reverse their effect and be a significant help.

T. H. White was using obsolete books and methods with his goshawk. For more current and more effective technique this book has most of what you need.

As for passage hawks, you must remember, when teaching them to wait on, that there is much more danger than there is with eyesses. The longer they are kept on the wing, and the higher they go, the more chance there is of their spying some bird passing—perhaps some old familiar quarry, of which they have struck down scores for themselves—and making off after it. The very fact of being in the air, and feeling the free breeze as it lifts their wings, must remind them forcibly of old days of liberty, and slacken the ties which bind them to their new master. Be extra careful, therefore, in the case of all passage hawks, and most of all with the haggard, to watch for any signs of returning native wildness. Fly her in a country where chance quarry are not likely to appear. If she "rakes away," or wanders far from you in making her airy circles, call her back before it is too late. Fly her always when she is quite sharp, even if you have to give her little or no exercise on some of the intermediate days between one lesson and the next. You may die her now upon "washed meat." This is meat washed in cold water and squeezed dry, so that a part of the nutriment originally contained in it is lost. It is, of course, less palatable and less sustaining. But it should be used in moderation. The old falconers seem to have given it much more often than we do now. But for some reason or other the nineteenth century hawk, if at all habitually dieted on this distasteful food, seems to lose pluck and power as well as weight.

SATURDAY MORNING

Divine Right stayed in Cincinnati all day Saturday and half of Sunday, but only two things of any real interest happened to him. He watched Saturday morning TV cartoons with the kids, and then on Sunday morning received an important message straight from God. More might have happened if D.R. had been open to it. Marcella wanted to get out the family photographs and talk about the old days, and Doyle wanted to take D.R. to his shop and teach him how to give Urge a tune-up. But it was obvious that D.R. was preoccupied and perhaps even upset about something and they didn't want to impose upon him. Marcella had sensed something was wrong when she got her first look at D.R. Friday afternoon. Doyle had felt it too as they were talking during supper. D.R. didn't get back to the house after his second phone call till way after everybody else's bedtime and so Marcella let him sleep through breakfast the next morning and Doyle went on to work by himself.

D.R. likely would have slept right on till noon if the kids hadn't turned the TV up so loud when the cartoons began. Marcella was outside spraying bug killer on the roses when she heard the noise. She had specifically told the kids to keep the volume down while their uncle was asleep, and when she heard it booming through the windows she got really mad. She rushed in the house, jerked both kids to their feet and was in the process of spanking their asses when Divine Right came into the living room, yawning. Marcella snapped the television off and ordered the kids to go out in the yard and play. Debbie had begun to cry as soon as her mother burst into the room, and now she was clinging to Marcella's legs, pleading for forgiveness. Herschel almost cried but at the crucial moment he got hold of himself and stomped his foot on the floor instead.

"Shoot," said Herschel. "I wanted to watch Johnny Hero." "I'm going to Johnny Hero your little butt if you don't get out of here," Marcella snapped. Then, to D.R., "I'm sorry, David. This place is a madhouse this morning."

"That's all right," said D.R. "I feel pretty crazy myself." He was sleepy and groggy but he smiled and gestured with his hands to show that everything really was okay. It wasn't okay with Marcella yet. She was debating whether or not to whip Herschel for stomping the floor, and Debbie was being a perfect nuisance clawing at her legs.

But the moment passed. Marcella bent over and picked Debbie up, and held her, and Herschel, who had been lurking in the doorway, slunk back in and sat down beside D.R., and very close to him, on the couch. Marcella told D.R. there was coffee made, and juice, and to call her when he was ready for breakfast. D.R. thanked her and said he would. Marcella carried Debbie outside with her, and when the storm door slammed, Herschel ran to the TV and tuned in Johnny Hero again.

All I saw finally at was crowds, great crowds, ever ever growing, and all getting even with mummy, I WON'T clean my room, I WON'T pick up my toys, I WON'T wipe my ass! Filth, unbelievable, hepatitis, and puppy black shit, burning axe handles as you told me of. It's wonderful, wonderful (I guess) getting it all out into the open, free, or whatever, but I do prefer a modicum of elegance, cleanliness, frequent bathing, showers are really wonderful. This is called rambling, what comes up, no offense intended, heh, none accepted? We of course we all of us ARE what you might call different, clean, patronizing them, black shit puppies all. So here then am I, hair getting shorter, clothes getting neater, though I'd take a great deal to sew me into shirt and tie water coolers daily commute train with ulcers and heartburn, but who needs that, there are other possibilities, eventualities, have one's cake, eat it, save it, store it, and also give some away to the needy.

It is, of course, Subud which has driven me insane, has reduced me to the wreck you are now reading with growing horror and apprehension. But it was grass before that, night war, drugs of all sorts, speed nitrous oxide, amyl nitrite, nitroglycerin tablets sublingually, desoxy for the lovely speedy flow, hash and alcohol rendered cannabis, romilar tablets and syrup, the odd terp and codeine for inner and outer coughing spells, DMT, STP, those initials we all know well, peyote eating, and all the jollies of my early years when, from heights unguessed, I looked into the future and thought: what kind of groovies will we be swallowing fifty years from now? Can it get any better than this? Answer: I don't know. But then, after the umpteenth acid trip and the billionth joint, I thought: Hm... have to... go out and... I don't know... sit or... read a book on... zen? And Where doesn't it end up, pernicious thoughts like this? I have given up nearly all visible vices and am now attacking the invisible ones, which are even harder. How do I know they're vices? I don't. But, when I do them, a gigantic mailed fist or smiling face or great roaring tide goes KERRRRRRRRRRWHOPPPPI and I soon get the idea. So my urge toward the participation mystique is now directed into this organic Indonesian brotherhood of which I am a part.

Additionally, there is/are/will be little children, of whom I see several around whenever I go home at the close of the day. I have seen them in their numbers all about me through the turning years, little and snotty, trailing after mummy in the orgiastic revel, tagging after dad who's dealing grass in the haight, dancing their little scared dances with the big folk at the Fillmore, neglected in the corner with diaper full of shit, 'Now listen, honey, there's peanut butter in the cupboard, there's toys in the backyard, now for chris sake go and GROOVE, will you? Make your scene? (sotto voce) God, they're wonderful aren't they? So pure and unspoiled.' The little tads grooving with their secret illicit cap guns like their squarer

BRAIN DAMAGE IS WHAT WE HAD IN MIND ALL ALONG. CHROMOSOME DAMAGE IS JUST GRAVY.*

brethren in secret play with their weenies. Everybody's got their hook. I knew a girl once and she was very groovy, you know her too though I won't mention names, she often had the term 'beautiful' applied to her, would do anything for anyone, a friend in need indeed, two little kids, you know, and one of them would dictate such BEAUTIFUL poetry to her mommy and had such a BEAUTIFUL mind, you know, such a beautiful soul, except that she usually put her little friends on a very bum trip because she had such a desperate need, don't you know, to be a little girl with a mommy and a daddy and a backyard and schoolmates and games and playing doctor and being cuddly and that rap. Little brother was groovy, too, but when mommy had to go out (HAD TO) she would often lock him in a little closet for his nap, a little closet made over into a little bedroom with a little bed and little stuffed animals and a lock... on the door... from the outside. I used to think of the house burning and the little bed and the little stuffed animals and of the little boy burning and burning together into what they and we all are made of...

Is that a morbid trip? Anyway, has an extremely regulated life, lots of regularity, regular naps, regular meals of regular food, regular old mommy and daddy and big brother and is he ever groovy... he laughs so much it makes me cry, you know. At any rate, this can't go on forever. Perhaps one day I will do some more stuff, maybe theater, if such exists that doesn't subtract me from my real life, which is my family. But then maybe simple anonymity, a quietus from the everlasting pressure to be an innovator, among the first, at the source, the root, the avante garde. Maybe that's all over, and all that's ahead is that quiet and regularity that digs so much. That wouldn't be so bad.

Pipe Dreams Unlimited Pipes

There's other good ones, maybe better. These came recommended by a number of our readers for their intelligent design and cooling stoning effectiveness.

Pipe Dreams Unlimited
Box 468
Mendocino, CA 95460

Below the pipe bowl is a filter chamber which you tamp full of your favorite smoking mixture. The hot resins that normally irritate your throat and clog the insides of conventional water pipes are trapped in the filter. Thus, while the smoke loses its harshness, the smoking mixture in the filter becomes increasingly strong.

The two cooling coils are copiously perforated with aeration holes, allowing many tiny bubbles to travel thru the water delivering a moist, smooth-drawing smoke.

The wide-mouthed water chamber accommodates ice cubes to further aid the pipe's distinctive cooling properties.

The optimally proportioned porcelain bowl reduces the burning temperature, and yet one light burns all the mixture in the bowl.

All two hose models have one-way valves which allow each hose to be used without the other having to be corked or held shut.

- Hints
- * Use ice cubes whenever possible.
 - * The water chamber should be approximately 2/3's full of equal parts water and ice.
 - * For the filter chamber to be effective it should be firmly packed about 3/4's full-tamp down the smoking mixture in the filter until the pipe has the draw you prefer.

To Keep Your Pipe Sweet
Between uses, empty and rinse the water chamber.
If the filter picks up an unpleasant odor, empty and rinse, then let the smoking mixture dry. (use very low heat if you use an oven)

or WHOLE EARTH CATALOG

This book is addressed to the broad public to report an important breakthrough in medicine. Treatment of several hundred schizophrenic patients, during twelve years, proves beyond a shadow of a doubt that niacin or nicotinic acid speeds improvement and recovery of schizophrenics and keeps them out of hospitals. Among acute cases diagnosed in early stages the effect of niacin is usually dramatic and profound. Full recoveries are often made in a few months, hospitalized cases become well enough for out-patient care, chronic mental patients of years standing can sometimes fully recover, and extremely serious cases are improved.

Working with other scientists, the authors have established that schizophrenia is basically a physical illness caused primarily by disturbances in the biochemical balance of the body and that this is determined by genetic disposition.

Evidence has accumulated that schizophrenia may be due to a defective adrenal metabolism which results in production of a subtle poison in the blood of its victims.

In varying degrees, from mild to shattering, this schizophrenic toxin interferes with normal brain function and creates bizarre disturbances and changes in perception, mood, thought, personality so common in schizophrenia.

These two scientists also discovered a new therapy for schizophrenia which relies on a simple, harmless, cheap, and highly effective vitamin— vitamin B-3, also known as niacin, nicotinic acid or nicotinamide. Massive doses— 3,000 milligrams per day, or several hundred times the normal dietary requirement— successfully counteract the schizophrenic toxin.

Schizophrenics Anonymous, the newest idea in treatment of the mentally ill, with chapters in Canada and the United States launched at the suggestion of Drs. Hoffer and Osmond, has proven that "schizophrenics can work together toward solution of their difficulties."

Medical men and scientists have available to them publications by Dr. Hoffer, compiling information from the research in Saskatchewan, and giving results of the clinical trial of massive doses of niacin on schizophrenics beginning in 1952. Now, Drs. Hoffer and Osmond have written a pioneering work addressed directly to schizophrenics and their families, mental health workers, and the interested lay public.

In clear simple language, the noted doctors cut through the confusion, misconception and myths that have surrounded this disease, obscuring its reality and compounding its tragedies.

This book will be a godsend to many victims of this dread disease, and their families. It is bound to create a groundswell reaction which can give schizophrenics the right to be considered physically ill. Then they can benefit from a society informed and mobilized properly to treat them for their illness.

Treatment of Schizophrenia

Perhaps you have been depressed for the past few months. For no good reason that you can think of you suddenly burst into tears, or you have moments of panic you can't explain. Your work no longer interests you. You are fatigued and miserable.

At the same time you may be having frightening experiences such as seeing flashing lights, noticing changes in people's faces, or feeling peculiar changes in your body. Something is happening to you and no one has been able or willing to tell you what it is.

Perhaps you are now taking tranquilizers and occupational therapy at a clinic? You are possibly making regular visits to your psychiatrist for deep therapy to "root out the source of your troubles buried in your psyche" Although you are willing to cooperate with your doctor to the best of your ability, you are frightened because you are not feeling any better, and you are convinced that you never will.

Or perhaps you have a close relative— a parent, or a child, or a sister or brother— who has, unaccountably, become very difficult to live with? Perhaps he has frequent outbursts of temper and moments of unreasonable suspiciousness? He sometimes says things which frighten you and does peculiar things which seem quite irrational to you. He may be receiving treatment for some vague "nervous" or "emotional disorder", but you have noticed little— if any— improvement.

What can you do now? Where can you go for help?

Millions of people all over the world are faced with the same dilemma you face today. There is nowhere they can go for information, and no one who can tell them why they feel the way they do, or what they can do about it. Mental health associations in England, Canada and the United States do not have any literature to which people like yourself can refer.

But for you, for your relative and those with similar problems, help is available. It is up to you to see that you get that help. We will describe here a treatment program for schizophrenia which we have developed and found effective in our own work, and which we think is the best available. We will furthermore examine what part other members of the treatment team— hospitals, nurses, family, community, and yourself— must play in this effort. For effective treatment of schizophrenia requires all the resources that can be made available to you. . .

Phase One Treatment

You have Phase One schizophrenia if you have been sick a short time and you are still able to cooperate with treatment in your own home. It may be that you are not sure you are ill or that you are unable to take your medicine regularly because you are forgetful. You can still be given phase one treatment if you have someone in your family, or a friend who will remind you when you should take your medicine.

We suggest you take either nicotinic acid or nicotinamide as your basic medicine, as both vitamins have the same effect on you. Both substances are B vitamins; nicotinamide was once called vitamin B-3. Nicotinic acid (this is also called niacin) has an advantage which nicotinamide (also called niacinamide) does not have. It lowers the fatty substances, cholesterol and fatty acids in the blood. These substances play a role in hardening of the arteries. Since hardening of the arteries (arteriosclerosis) can lead to high blood pressure and senile changes in the brain, it may be desirable to use nicotinic acid in cases where these additional changes are present.

We have to start with one. If we start with nicotinic acid you will be given a prescription for one month's supply at a dose level of three grams per day. They are available in one-half gram tablets. You will take two half-gram tablets after each meal. The first time you take them you will probably have a marked flush. About one-half to one hour after you take the tablets you will become aware of a tingling sensation in your forehead. Then your face will turn red and you will feel hot and flushed. The flush will spread down your body. Usually it will include your arms and chest, but very rarely will your whole body flush. There is no need to be alarmed. This is a normal reaction to this vitamin. There is no change in your blood pressure and you will not faint.

You will be uncomfortable the first time and you might be wise to take the first tablets in the evening while lying down in bed. Each time you take the pills the reaction becomes less strong and, within a few days to a few weeks, you will have become accustomed to them. Eventually as long as you take the medicine regularly, you will stop flushing altogether, or it will be so mild it will not trouble you. Some patients like to take the nicotinic acid right after meals.

Sometimes patients are bothered by the acidity of nicotinic acid. If this happens to you, you can take one-half a teaspoon of bicarbonate of soda with the tablets. If, however, after you have taken nicotinic acid regularly as prescribed, and you are troubled by it, you may be advised to stop it and to take nicotinamide instead. Nicotinamide produces no flush at all, and for this reason it may be preferable for some patients. It does not lower cholesterol, but can cause some nausea.

The treatment you would be on would, in addition, depend on how old you are and what other physical complaints you may have.

Note. The use of niacin is to restore a chemical imbalance. It may take weeks or months to take effect. If it does the trick for you, you will probably need to take it for the rest of your life, like insulin for a diabetic. No drug company is getting rich off niacin (one reason for slow promotion of the treatment in the medical field); it's cheap.

Jim Fadiman told us that a good outfit to get in touch with is the American Schizophrenic Association, 56 W. 45th St., New York, N.Y. 10036. An effective service organization similar to Alcoholics Anonymous.

—SB

Megavitamin Therapy

Word has been drifting around for some while now about the use of massive doses (like 3 grams) of niacin (vitamin B-3) as a sanity drug. For example, to help terminate or lighten a bum LSD session. To alleviate anxiety states. To accomplish, with time, possible cure of schizophrenia. This pamphlet has all the basic information you need, including suppliers of niacin.

Megavitamin Therapy
20 pp.

\$0.25 postpaid

from:
Aurora Book Companions
Terminal Box 5852
Denver, Colorado 80217

The megavitamin therapy is not intended to cure vitamin deficiencies. For that, generally, much lower dosages are needed, and natural vitamin preparations are recommended. Physicians using the megavitamin therapy know that the illnesses treated by it are not vitamin deficiencies.

The megavitamin therapy is used for schizophrenia, neurosis, hypoglycemia, alcoholism, anxiety states, malaria, arthritis, senility, hypertipemia, hypercholesterolemia, coronaries and LSD poisoning.

In the megavitamin therapy the vitamins are used to balance the faulty body chemistry. They were selected because they are inexpensive, can be taken orally, and have no dangerous side effects, even if taken in large dosages for a short period, or continuously in the maintenance dosages.

Person to Person

Barry Stevens is a lady with one of the best popularization formats going. She's taken significant papers of current action in humanistic psychology, and embedded them in a rich collection of her own non-professional living and applying. The papers are by Carl Rogers, Eugene Gendlin, John Shlien, and Wilson Van Dusen. Most of the excerpts below are from Barry Stevens.

I saw the Hopi look at Cab so equally that he drew Cab down to his own level—precisely, and not one bit lower—so that they seemed to be two people eye-to-eye. I was so impressed by this that I looked up to the Hopi as though he were some sort of god. The Hopi turned to me with that same strong equality in his gaze, and I felt myself being drawn up until we were on the same plane.

You must have a career,' they said.
I don't want a career,' I said. 'I want a career,'....

he made the poets whom I knew seem suddenly like phoney copies of themselves, as far from real as the man who saw in a Rorschach blot where most people see two men, "The shadows of the silhouettes of the ghosts of two puppets."

Abstract talk seems to me not only 'in front of the face' but not even in this room or this world. It is like rumors about something real.

Sidney Cohen says 'Our visual mechanism must have evolved with the goal of keeping the organism viable rather than with the aim of seeing things as they are.' Do I sometimes see things more nearly as they are? If I do, is this 'hallucination'?

JOHNNY HERO

Last week's episode: Thanks to a timely warning by his ever-watchful guardian, Spider Woman, Johnny Hero narrowly escaped being buried alive in an avalanche caused by Trickster, the notorious henchman of the Black Dragon. In a duel fought at the very entrance to the forbidding Cave of Fear, Johnny subdued Trickster and bound him tightly with silver web provided by the ever-faithful Spider Woman. Thus did Johnny Hero overcome another dangerous obstacle in his struggle to liberate the Crystal Crown from the clutches of the Black Dragon, and lift gloom from the Land of Mee.

The Stress of Life

It has been suggested that this book be reviewed with the thought in mind of its being included in the WEC. Now before going into the criteria for that, it should be stated that the entertainment value, or readability of this book is high. Further note that according to a quoted review the book "... is very readable. ... You will experience ... Dr. Selye's persuasive enthusiasm." Yet another (not quoted in the book) says it can be read "... with considerable pleasure." And thus spake (also sprach) the Library Journal: "... orchids upon this ... incomparable exposition. ..."

In the reading—this applies chiefly to the first 4/5ths of the volume—a word of advice is picked up from a review quoted in the book itself and credited to the American Journal of Public Health. The book, happily, does not contain "... a mass of data of questionable relevance. ... but the reader is cautioned to ... maintain balance amid Dr. Selye's persuasive enthusiasm." These words gain weight when one is apprised that they were written for the reviewing journal by Ancel Keys, one of this country's great physiologists.

Now back to the WEC. The WEC states that the criteria for listing something in its pages shall be four in number, videlicet: 1) useful as a tool, 2) relevant to independent education, 3) high quality or low cost, and 4) available by mail. This book immediately meets criteria 3 and 4.

Criterion 2 is a sort of double-barreled one that depends not only upon the nature of the book but also upon what the reader does with it. Dr. Selye epitomizes the relevance to independent education in his dedication: "This book is dedicated to those who are not afraid to enjoy the stress of a full life, nor too naive to think that they can do so without intellectual effort." So let us now say that criteria 2, 3, and 4 have now been met.

In order to determine if the book meets criterion number one as well, let us first quote the author, "... recommend that only physicians, or readers who are at least reasonably familiar with current problems of physiology and medicine, should read this book from cover to cover." He directs the rest of us cats to first read Book V (the volume is divided into Books I-V incl.) in small installments of ... ten to twenty pages at a time. Now it turns out that Book V contains "... the practical implications and applications of the stress concept in everyday life. ... Hence, criterion number one is going to be met by the contents of Book V—a mere matter of 52 pages—or it is not going to be met at all.

Let us now diverge a bit. "The main purpose of this book is to tell ... what medicine has learned about stress." It should be noted in passing that there is a glossary at book's-end to help out on the technical terms. The main subject of the book is the G.A.S. (general adaptation syndrome) which comes to be called the stress syndrome; and conversely, the stress syndrome, I suppose, may be said to be a GAS. First, one should mention that a syndrome is merely a collection or constellation of related signs and symptoms which is characteristic of a disease or condition of malfunctioning.

The G.A.S. is the sum-total of all non-specific changes that occur in the body during the time it is being acted upon by a stress-producing agent (stressor). These non-specific changes occur in three stages, 1) alarm, 2) resistance, and 3) exhaustion. Number 3 eventuates, if it continues, in death. Most stresses are only severe enough to produce stages 1 and 2. Going through 1 and 2 repeatedly in one's lifetime constitutes "adapting" to things. Various degrees of failure to adapt, Selye says, result in various disease or degenerative conditions.

Aerobics

On the horizon the tiny figure of Johnny Hero running, on and on under a stunning sun, closeup of his surging determined face, sweat running, Johnny running, training for the big match next week; the credits roll by. That's Japanese television cartoons, every night. I was impressed. Our TV tends to show a guy in a chair eating something. Or on a table under muzzled doctors who are having an argument about surgical technique.

—SB

It turns out that the index of physical fitness is not strength, stamina, or quickness (though these inevitably follow if you're fit) but rather, the body's ability to use oxygen. I am an ardent athlete and sports freak of all kinds and spent nine years as a competitive swimmer, so I feel I can judge in these things. I also participated in the testing which resulted in the book (at Lackland AFB, Texas) while in the Air Force, so what is said is so. This tool can save a lot of time and energy to put you in top shape with about an hour's work a week. No kidding. I do about 3-4 times; that but you have to do the basic or you're shortchanging yourself, your future existence, and your loved ones.

The main objective of an aerobic exercise program is to increase the maximum amount of oxygen that the body can process within a given time. This is called your aerobic capacity. It is dependent upon an ability to 1) rapidly breathe large amounts of air, 2) forcefully deliver large volumes of blood and 3) effectively deliver oxygen to all parts of the body. In short, it depends upon efficient lungs, a powerful heart, and a good vascular system. Because it reflects the conditions of these vital organs, the aerobic capacity is the best index of overall physical fitness.

212 Health Community

Now to get back to the question of criterion number one—the use of the book as a tool. Up to page 258 it is not useful as such to the general reader. Selye says, "All we have said up to now helps to guide treatment on the part of a physician," and "... even dietary treatment must be controlled by a competent physician. All this book can do in this respect is to help the patient understand why his physician prescribes a certain regimen; it could not presume to be an adequate preparation for self-treatment along such purely medical lines." BUT, "... there are many things I have learned from the study of stress, which the physician cannot use but the patient can. I particularly want to share these lessons with you. ... OK, reader, you are now on your own, and you will indeed find out that criterion number one is met.

Stress is essentially the rate of all the wear and tear caused by life. It will take a whole book to explain the complex mechanisms through which the body can reduce this type of wear and tear. But let me say here, by way of an introduction, that although we cannot avoid stress as long as we live, we can learn a great deal about how to keep its damaging side-effects to a minimum. For instance, we are just beginning to see that many common diseases are largely due to errors in our adaptive response to stress, rather than to direct damage by germs, poisons, or other external agents. In this sense many nervous and emotional disturbances, high blood pressure, gastric and duodenal ulcers, certain types of rheumatic, allergic, cardiovascular, and renal diseases appear to be essentially diseases of adaptation.

The important difference between the discovery of America by the Indians, by the Norsemen, and by Columbus is that only Columbus succeeded in attaching the American continent to the rest of the world.

It is not to see something first, but to establish solid connections between the previously known and the hitherto unknown that constitutes the essence of scientific discovery.

Paracelsus (whose true, but somewhat bombastic, name was Theophrastus Bombastus von Hohenheim) was a famous Swiss physician who lived during the sixteenth century. In his treatise on "Diseases Which Deprive Man of his Reason," he stated that "the best cure and one which rarely fails is to throw such persons into cold water."

Disease is not mere surrender to disease, but also fight for health; and unless there is fight there is no disease.

The Israel Army Physical Fitness Book

Everybody I know's doing pushups. Kesey claims there's another wave of creativity coming, and he's doing pushups to get ready. Lloyd just finished editing his dome book, and he's doing pushups to get his head and body back in phase. I'm doing pushups out of some grotesque nostalgia for the Army (U.S.). Low-rent yoga, that's what it is. Sure enough, on a few square feet of prison cell or meditation hut, it can make you feel dedicated and well. —SB

What is disease—not any one disease, just disease in general? This question lingered on in my mind, as it undoubtedly has in the minds of most physicians of all nations throughout history. But there was no hope of an early answer, for nature—the source of all knowledge—rarely replies to questions unless they are put to her in the form of experiments to which she can say "yes" or "no." She is not loquacious; she merely nods in the affirmative or in the negative. "What is disease?" is not a question to which one can reply this way.

Occasionally, if we ask, "What would you do if ... ?" or "What is in such and such a place?" she will silently show you a picture. But she never explains. You have to work things out yourself first, aided only by instinct and the feeble powers of the human brain, until you can ask precise questions, to which nature can answer in her precise but silent sign language of nods and pictures. Understanding grows out of a mosaic of such answers. It is up to the scientist to draw a blueprint of the questions he has to ask before the mosaic makes sense.

Fortunately, it is not so much the existence of things that we do not know, or about which we are too uncertain, that handicaps our research, but the existence of things we do know and about whose interpretation we are quite certain—although they may turn out to be false. Lack of equipment, or even lack of knowledge, is much less of a handicap in original research than an overabundance of useless materials or useless (and sometimes false) information which clutters up our laboratories and our brains.

The term adaptation energy has been coined for that which is consumed during continued adaptive work, to indicate that it is something different from the caloric energy we receive from food; but this is only a name, and we still have no precise concept of what this energy might be. Further research along these lines would seem to hold great promise, since here we appear to touch upon the fundamentals of aging.

In the acute phase of the alarm reaction (A.R.), general resistance, to the particular stressor with which the G.A.S. had been elicited, falls way below normal. Then, as adaptation is acquired, in the stage of resistance (S.R.), the capacity to resist rises considerably above normal. But eventually, in the stage of exhaustion (S.E.), resistance drops below normal again.

Adaptability can be well trained to serve a special purpose, but eventually it runs out; its amount is finite.

The fact is that a man can be intoxicated with his own stress hormones. I venture to say that this sort of drunkenness has caused much more harm to society than the other kind.

... It is not easy to tune down when you have reached your stress quota. Many more people are the helpless slaves of their own stressful activities than of alcohol. Besides, simple rest is no cure-all. Activity and rest must be judiciously balanced, and every person has his own characteristic requirements for rest and activity. To lie motionless in bed all day is no relaxation for an active man.

Starting Position: Stand with feet apart, trunk bent forward, arms raised sideways.

Movements: 1) Bend your back and drop your head while crossing your arms downwards.
2) Back to starting position, bringing arms up sideways.
3-4) Rest in starting position.

Explanation: In the starting position, arms should be at the sides and pulled forward, in line with the head. Eyes front. When the arms are crossed downwards they should be fairly loose. Be careful to keep knees straight.

THE AEROBICS CHART PACK RUNNING EXERCISE PROGRAM (under 30 years of age)

STARTER *

WEEK	DISTANCE (miles)	TIME (min)	FREQ./WK	POINTS/WK
1	1.0	13:30	5	10
2	1.0	13:00	5	10
3	1.0	12:45	5	10
4	1.0	11:45	5	15
5	1.0	11:00	5	15
6	1.0	10:30	5	15

After completing the above starter program, continue with the Category I conditioning program below or, if you wish to speed up your program, take the 12-minute test of fitness. If you take the test, find your category from the table at the beginning of the chart pack (page 52). If your category is I, II, or III, continue with the appropriate category below. If your category is IV or V, follow the instructions in the note at the bottom of page 56.

* Start the program by walking, then walk and run, or run, as necessary to meet the changing time goals.

[Army Field Manual FM 21-20, Physical Readiness Training, is a lot more comprehensive. Order from the Government Printing Office.]

Emergency Medical Guide

No book can substitute for a physician's care. Self-treatment of disease can be worse than no treatment at all. But the proper use of a home health manual may be invaluable in recognizing serious diseases and emergencies, rendering first aid, and treating common medical problems which do not require a physician's assistance. Outdoorsmen and members of isolated farms and communes, especially, should have on hand as much medical information as possible.

Henderson's Emergency Medical Guide is a useful book, including illustrated sections on bandaging techniques, mouth to mouth resuscitation, injuries to extremities, poisoning, snake bites, emergencies of infancy and childhood, and home care of the ill. Emphasis is placed on the prevention of accidents and disease. Some situations are covered which are not generally considered emergencies (except by the patient) such as painful menstruation. A chapter on normal human anatomy and physiology is included in order to make the rest of the book more intelligible to those giving first aid.

Artificial Respiration

If the victim is not breathing, act rapidly and decisively!

1. Have an assistant summon help by calling the fire department first, then a doctor. Or ask the fire department to summon a doctor.
2. Do not waste time with a drowning victim in trying to hold him upside down to empty lungs, etc. A small child, however, can be held by the feet, head down, for four to seven seconds, no more, to drain lung secretions.
3. With an adult, place flat on back, with feet slightly higher than head. But do not fuss. The positioning should not take longer than a few seconds. Hold up the chin by supporting it with the hand, pinch the nose together, and put your mouth over the victim's mouth and blow.

Blow hard enough to make the chest rise. If the chest does not rise, it means that the chin is not being supported upward enough to clear the airway in back of the throat. The blowing should be as hard as blowing a whistle, but not so hard as blowing up a balloon. Blow twelve to fifteen times per minute.

4. With a small child, it may be impossible to pinch the nostrils together while blowing. With a small child, then, blow over both the nose and mouth. Blow just hard enough to make the chest rise and fall. Blow fifteen times a minute.

DO NOT GIVE UP! AT TIMES IT MAY BE NECESSARY TO DO THIS FOR SEVERAL HOURS PROVIDING THERE IS STILL A HEARTBEAT.

Closed Chest Cardiac Massage

1. RECOGNITION:

If there is a cardiac arrest—that is, heart stoppage—from drowning, a blow on the chest, electrocution, shock, insect bites, or other cause, there will be:

- a. No pulse.
- b. Dilated pupils.
- c. Shallow or no respirations, usually the latter.

2. TREATMENT:

This requires two people. Place the victim on his back on something firm. Give mouth-to-mouth resuscitation, as already described. Someone else should summon the fire department or a resuscitation squad if one is available, then a doctor.

In the meantime, put the heel of one hand on the lower one-third of the sternum (breastbone). Place the second hand on the first. Depress the chest. The sternum should move about one or one and one-quarter inches.

Exert your body weight straight downward, not toward the upper chest or abdomen. Do this forty to sixty times per minute, while someone continues to give mouth-to-mouth resuscitation.

Periodically check the eyes. If circulation is adequate, the pupils will start to get smaller. Also check the pulse for a palpable beat, and the respirations to see if they have started.

When the pulse and respirations are working, continue to watch the patient closely for twenty-four hours, at least, or until the patient is under a doctor's care. The heart may stop again, whereupon the procedure will have to be repeated as often as necessary.

Family Guide Emergency Health Care

This booklet is designed as a reference guide for use with a 65-hour free course on making like your own doctor (not first aid but for real treatment) in times of disaster. The full "Medical Self-Help Training Course" may be a bit difficult for the non straights to get into, but the Family Guide has most of what you need to know (if you supplement it with a good technical reference).

Apparently not available on direct sale from the Government Printing Office, but may be readily obtained by writing a fairly straight letter to your local State Department of Public Health.

your local
State Department of Public Health

A first degree burn only reddens the skin and if it does not cover more than 25 per cent of the body, usually is not serious.

In second degree burns blisters develop and there is now the very real danger of infection. Extensive second degree burns will require giving additional fluids to the burned person. Do not apply grease or salve. Cover with sterile or clean dressing.

Third degree burns even in a relatively small area are serious. The injury is deep and the underlying tissue has been destroyed. Keep this type of burn clean to avoid infection.

EPILEPSY

It is important to keep the victim of the attack from aspirating or choking on vomited matter, but since most attacks will terminate harmlessly by themselves, regardless of what you do or do not do, just protect the victim from injury and bide your time. When he recovers, do not be unduly sympathetic—you may only embarrass him. Give him a drink of water or tea, protect him from curious onlookers, and be sure that he is well enough to go on his way or that he is taken home. If the condition is more serious, see that he gets to a hospital.

As this week's story begins, we hear Johnny Hero saying to Spider Woman, "Golly, Spider Woman, it sure is dark in here." "Here," says Spider Woman. "Eat this." And she hands Johnny Hero a magic pearl. Except for the white of Johnny's blinking eyes, and a string of magic pearls glowing like coals around Spider Woman's neck, it is pitch dark in the cave. Spider Woman is invisible, but her presence is always known by her necklace of magic pearls. Moving across the dark toward Johnny's eyes is a pearl which seemingly has detached itself from the string. As Johnny swallows it, a circle of light slowly illumines the Cave of Fear.

"Wow," says Johnny. "Look at that!" He points to a pool of water bubbling and steaming in a shallow depression on the floor of the cave.

"Look!" Johnny exclaims with mounting excitement. "There's another one! And another! Look! Golly, Spider Woman, there's pools of steaming water everywhere!"

"Careful," says Spider Woman. "Those pools are the footprints of the Black Dragon. They look shallow, but actually they're a thousand miles deep."

"Golly," says Johnny. "I sure would hate to . . . fall in one!"

"You'd never be seen again," says Spider Woman. "No one has ever survived a fall into the dragon's footprint."

Suddenly Johnny Hero is seized by an idea. "But listen, Spider Woman. If those are the Black Dragon's footprints, I bet we could follow them right to the dragon's lair!"

Spider Woman is slow to reply. When she does, you can tell by the heaviness in her voice that she is troubled.

"That's right, Johnny. But there's just one thing."

"What's that, Spider Woman?"

"I can go with you no further. If you follow the footprints to the dragon's lair, you must go on alone."

"Alone!" Johnny exclaims. "But Spider Woman. Why?"

"I cannot explain now," says Spider Woman. "Are you willing to go on alone?"

"Golly," says Johnny. "I've got to go on. There's no one to take back the Crystal Crown and lift gloom from the Land of Mee but me."

"Very well," says Spider Woman. "But there are many perils along the way. You'll need these pearls."

With invisible hands Spider Woman removes the necklace of magic pearls from her neck and hands it to Johnny Hero. Johnny looks at them in astonishment.

"But Spider Woman! I shouldn't have these pearls!"

"Do as I say!" snaps Spider Woman. "There isn't much time." Reluctantly Johnny accepts the magic pearls.

"I must go," says Spider Woman. "Good luck, and godspeed."

"Thank you, Spider Woman," says Johnny. "Thanks for everything." Then, his voice trembling, he adds, "I'll never forget you, Spider Woman."

As the wind of Spider Woman's departure ruffles his tousled hair, Johnny Hero puts the string of magic pearls around his neck. With a scornful glance at the steaming pools of evil, he sets off into the cave, making a circle of light wherever he goes in the dark and murky cavern.

"I'M JOHNNY HERO!"

Herschel leaped to his feet and started running around the living room in circles shouting "I'm Johnny Hero! I'm Johnny Hero!"

D.R. yawned and stretched out on the couch. "Not me, kid," he said, closing his eyes. "I'm so tired right now I don't even feel like David Ray Davenport."

D.R. slept on the couch all day nearly. After supper he went back to bed again and slept the whole night through.

The Merck Manual

In 1850 type-packed pages this book covers most of the possible illness and injuries that can occur to human beings. Each difficulty is described, symptoms are discussed and suggested treatments are indicated.

The writing is extremely technical and is designed as a ready reference for practicing nurses and physicians. Unless you are at ease with the unusually colorful language of modern medicine you will need a medical dictionary to fully understand this book.

While a considerable portion of the advice given is sensible and does not require a doctor's presence, much of the book will not be of use to persons who do not have access to medical supplies. This book is not intended in any sense for primitive or simple living conditions; it does not describe alternatives if medical treatment is not available nor does it suggest folk treatments in lieu of hospitalization. However, if you want to understand what is going on when a member of your family or community is seriously ill, this volume can be helpful. There is an excellent index as well as a special section devoted to specific prescriptions and special therapies. The excerpts given below illustrate both the common-sense and the technical aspects of this volume.

[Reviewed by James Fadiman]

[Innovator reports that many prescription drugs can be obtained without a prescription and at low cost from veterinary supply houses. —SB]

DYSPEPSIA ("indigestion")

Treatment
General: The patient should eat a balanced diet (see DIETS, Normal Diet). At least 1 hr/meal should be allowed. Food should be chewed thoroughly without haste and not constantly "swilled down" with liquids. When possible meals should be taken in a pleasant, quiet, relaxing environment. Smoking immediately before meals should be prohibited. Food should be properly cooked, appetizing and eaten in moderate amounts. Following a meal, the patient should avoid excitement.

HEAT HYPERPYREXIA (sunstroke, heatstroke, thermic fever, sirsias)

Etiology: prolonged exposure to excessively high temperature or the direct rays of the hot sun, combined with exercise and lack of air circulation are the responsible factors. . . .
Symptoms and Signs: Onset may be sudden or may follow complaints of weakness, headache, vertigo, anorexia, nausea and precordial distress. . . . The temperature rises rapidly to 105 or 106 F. or higher. Convulsions and projectile vomiting may develop and are of serious import. . . .
Treatment: heroic measures are indicated and must be instituted immediately. If the rectal temperature is 106 F. or over, an ice water tub bath or a blanket soaked in water is indicated, and the skin should be rubbed vigorously until the temperature falls. . . .

DISTURBANCES IN ELECTROLYTE (Mineral) METABOLISM

Dilutional hyponatremia will occur when excessive water is given to a patient in whom antidiuretic hormone activity (postoperatively, or in bronchogenic carcinoma, head injuries, or porphyria) or a low glomerular filtration rate is present. Movement of the water from cells in E.C.F. with a high glucose concentration may produce a temporary hyponatremia.

Emergency Medical Books

Re-references to baby and birth outside of hospital. This is a tricky subject. . . however in isolated areas it could happen and not by choice. I have a Red Cross Instructor's card, but we don't teach child birth in our courses. However I was President of our local ambulance company (two Cadillac ambulances for a town of 1,500 population. . . not bad eh?) for a year or so; and also have the N.Y. State training certificate for ambulance attendant. Issued by State Health Dept. after lengthy instruction and exam. etc. Required by all ambulance attendants, drivers, etc. who work for pay but NOT required for volunteer "Free" service such as ours. And have been teaching first aid for perhaps 40 years or more in army, scouting, etc. So have collected a lot of material on the subject. Strongly recommend following for people outside range of quick medical help (2 or 3 days from doctor, etc.) This is NOT first aid. . . but "medicine".

"Emergency Victim Care & Rescue" by Div. Vocational Education, State Dept. Education, Columbus, Ohio. . . contains excellent chapter on childbirth. Costs 3 or \$4 as I remember. A big volume of 327 pages. . . lots of good dope on rescue, knots, etc.

"Emergency Care of Sick & Injured". . . Manual for Law Officers, Fire Fighters, Ambulance and Rescue Sqds and Nurses" By Committee on Trauma American College Surgeons, edited Robt. Kennedy, M.D. Pub. by W. B. Saunders Co., Philadelphia, Penna. A tiny book of only 122 pages and expensive—abt. \$2. but very up to date and excellent chapter on child birth.

"Ships Medicine Chest and First Aid at Sea" by U.S. Dept. Health, Ed. & Welfare, Public Health Service. Obtain from Supt. Documents, Govt. Print. Office, Washington, D.C.

Big cloth bound volume of 428 pages, many color illustrations, including some color plates on VD symptoms, etc. Price \$3.50 and a real BARGAIN, written for captains of vessels without a doctor aboard. Good chapter on birth of baby, also covers contagious diseases very well, symptoms and treatment. A life saver for those out of reach of doctor in isolated areas.

"Being Your Own Wilderness Doctor" Dr. Kodet & Bradford Angier. Staekpole Books, Cameron & Kelker Sts., Harrisburg, Pa. 17105 \$3.95 clothbound book of 127 pages. Very simply written, good on modern antibiotics, but you must get prescriptions for many of these drugs. . . excellent on kits for travel in wilderness areas. (See p. 273)

I could mention many more books, but these are excellent. I assume anyone interested has the American Red Cross First Aid Handbook which should be the starting point of your study. Try and needle your library into stocking some or all of these books or chip in with your group to lower cost. It is more important to study in advance than when a patient is bleeding or seriously injured. Your local Red Cross chapter can arrange to give you their first aid courses. The life you save may be your own or that of a loved one!

THE PUSHER

Dear Dr. Hippocrates

Long-hairs are doing new stuff with their bodies and nervous systems that occasionally needs medical attention or perspective. Communication was blocked, however, by the social understanding that they aren't supposed to be doing that stuff. Dr. Schoenfeld and his medical advice column in the underground press cut through the blockage, and here came a spout of information as weird as it was useful. Good answers made the questions good.

For cosmetic reasons and sex appeal, I have been interested for some time in removing my pubic hair. I initially tried scissors which left stubbles; a safety razor leaves red marks and bumps which are both unattractive and painful. An electric razor is better but still unsatisfactory. I called an electrologist who removes hair, but she found my request most peculiar and refused to undertake the work.

Can you suggest a solution to the problem? Is there any reason to believe removal of pubic hair would be either unhealthy or dangerous?

Most Middle Eastern women routinely shave their pubic hair but I leave to you and your chafed friends the question of whether this practice will enhance your sex appeal. It does not seem medically dangerous.

Cautious use of a depilatory or one of the newer electric razors would seem the best solution to your problem. I would advise against permanent removal since you might someday move to a colder climate.

Note: Judging from the volume of mail received in response to the preceding question and answer, shaving pubic hair is definitely not confined to the Middle East. Excerpts from three letters follow:

A leading manufacturer of safety razors (Gillette) recently placed on the market something called a "Scardy Kit." The ad dealt with the problem of very brief bathing suits but the letter from the girl who shaves made me wonder. Perhaps she needs instructions in the use of lather or brushless cream.

She will have far better results if she uses an electric hair clipper such as the ones barbers use. The OOOO blade is the finest one and will not leave unsightly stubble, irritate the skin or cause abrasions.

For shaving, use alcohol—it eliminates abrasions and little bumps. This was told me by a psychiatrist.

I have seen countless old films in which Oriental bartenders slip their unsuspecting customers a "Mickey Finn" which invariably flashes them out of their skulls in about thirty seconds. Is there any such drug that, taken orally, would put a person out in less than a minute?

Two types of "Mickey Finns" were allegedly used. One was chloral hydrate, a sleeping preparation, which induces sleep after twenty or thirty minutes. Like barbiturates, it is especially powerful when given with alcohol.

Another "Mickey" favored by bartenders was a strong laxative, a favorite method for getting rid of undesired customers. But only in Hollywood do "Mickey's" work within one minute.

Could you please tell me if it is possible to become pregnant without coitus if ejaculation occurred outside the vagina?

Pregnancy without coitus is possible if semen is at or near the entrance to the vagina. This may occur even if a girl is wearing underpants, according to some now well-informed female sources.

Perhaps this helps to explain the phenomenon of virgin births. But it still seems a poor way to become pregnant.

Are there any ways to get birth-control pills besides having to go to a doctor to get the prescription?

No and for good reason. The doctor will take a medical history and do a gynecologic examination, including a Pap or cancer smear, to determine that there are no conditions which would be caused or made worse by taking birth-control pills. You should see your own physician or you may be eligible for care at your local health department or Planned Parenthood office. Doctor's aren't so bad. Some of my best friends...

(The following letter was sent air mail special delivery from New Orleans.)

Dear Dr. Schoenfeld:
Is it true that smoking incense can make you high? (I am mainly referring to the Joss incense sticks from India.)

Love,
Paul

Dear Paul:
I have not been aware that smoking incense could make one high. This effect would have been discovered thousands of years ago if it were true.

Are you sure it's incense you're smoking?
Sincerely,
Eugene Schoenfeld, M.D.

Complete Home Medical Encyclopedia

Just about everything that could happen to your body is discussed in this fat paperback. Acne, actinomycosis, anthrax and arthritis to sexual intercourse, thromboangiitis obliterans, and worms. Dr. Hyman combines specific treatments with clear explanations of bodily functions and how they get interrupted. I learned more here about acne than I have from any of the dermatologists I've seen. There are occasional diagrams in the alphabetically arranged text, which is written with the sensibility and humor you'd want from your family doctor. The traditional general practitioner is said to be growing scarce in the American scene, but many of the questions you might want to ask him are answered here.

The control of acne requires a joint effort on the part of youngster and parent, usually the mother.

After a review of the nature of the disturbance, as outlined above, the parent will do well to reassure the child that no blame or shame is attached to the condition.

The child should be told that acne is not due to uncleanliness or bad habits of any description; that it is not a disease but more in the nature of a normal feature in the process of growing up. Here is a suggested outline for the home-treatment plan.

Each morning apply a lather of pure soap or a sudsing detergent (Dove) to face, shoulders and chest. Scrub vigorously with a rough towel. Give special attention to skin folds and creases.

Each afternoon or early evening, on return from school or work, repeat the scrubbing. Then, expose affected areas to ultraviolet rays, using direct sunlight, an inexpensive sun lamp (Sperti) or a bulb (RS model) that has the recommendation of the American Medical Association or a testing institute of a reliable magazine. Regulate the distance from the source and the time of exposure so that the skin is tanned but not burned, so that it flakes but does not peel.

At bedtime, apply hot towels to affected skin areas until flushed. Then, with scrubbed hands and blunt fingernails, gently but firmly extract secretions from whiteheads and blackheads and from pores in skin folds, especially those on the nostrils and between nose and cheek.

Twice weekly, shampoo with hand soap or sudsing detergent (Drene). Scrub scalp vigorously with a tough hand brush before drying.

Avoid application of medicated or cosmetic ointments and creams that may tend to plug the channels you're trying to keep open.

Fig. 14 Jackknife positioning for relief of acute back strain.

Crabs

I don't know if you've done this one before, but for your edification, here is a quote from the sheet of A-200 Pyrinat Liquid

Advantages of A-200 Pyrinat

1. A-200 Pyrinat is a liquid...no messy salve.
2. It kills on contact crab, head and body lice and their eggs (nits), also chiggers (red bugs), and dog fleas.
3. Leaves no tell-tale odor.
4. Does not permanently stain clothing. Is easily removed with water—without soap.
5. Destroys eggs or nits, as well as parasites themselves.
6. Its advantages over blue ointment and larkspur lotion are obvious.

It cost \$1 in a very expensive drug store.

IT WORKS! As anyone who has sat up half the night every night crouched over a dying flashlight pursuing the pernicious phthirus pubis knows, that's the only comment that counts.

Jim Huston
Cleveland, Ohio

Treatment of Acute Alcoholism

The best treatment of acute alcoholism is prevention. Not by absolute prohibition, but by judicious indulgence in the pleasures and uses of alcoholic beverages. Here are some hints to the accomplishment of this end:

Never take more than the equivalent of two ounces of hard liquor or of two bottles of beer at any one session. This will assure you of a safe level of blood alcohol (up to 0.05%).

If you exceed the safe limit, don't drive your car.

If your escort exceeds the safe limit, take away car keys.

If neither you nor any other member of your party is in condition to drive the car, get some sober person to drive for you. (See ACCIDENTS.)

Adopt a protective attitude toward the person who, on occasion, takes one (or a few) too many. If docile and amiable, get him (or her) to bed to sleep it off. If possible, resist efforts of well-meaning amateurs who strive to sober the patient up with large quantities of coffee and/or a cold shower.

If you are unable to control an alcoholic, send for a physician who may succeed by giving a large dose of paraldehyde or an injection of apomorphine (vomiting within ten minutes) or a tranquilizer (Librium, Thorazine, etc.).

On awakening after a binge, take warmed fluids (tea; consommé; hot water; citrus fruit juice; clam broth; etc.). Do not add to dehydration by resorting to the conventional saline purge— with or without precedent calomel.

For relief of the hangover headache, don't take the "hair of the dog that bit." Instead, take a dose of aspirin and wash down with 250 cc. heated, charged water. As soon as stomach is tolerant, eat small quantities of warmed soft foods at frequent intervals. Choose poached egg; milk toast; warm milk and soda crackers; puree of soup; mashed potato; etc. Despite craving for cold, carbonated fluids, avoid them, since they are very apt to cause abdominal cramps and distention.

For relief of the "morning-after-the-night-before depression," take a euphoriant such as 5 mg. dextro-amphetamine (Dexedrine), 5 mg. amphetamine (Benzedrine), 25 mg. phenmetrazine (Preludin), 10 mg. methylphenidate (Ritalin); or 2.5 mg. piperadol (Meratran).

THE LORD WORKS IN MYSTERIOUS WAYS

D.R. got up and had breakfast with the family and then lay down on the couch to read the paper while Marcella and Doyle got the kids ready to go to Sunday School. It had been clear the evening before that D.R. wasn't going to feel like going to church with them, and so they left him alone to read and relax while they got dressed and ready. When the family left, the house fell into such profound silence D.R. dozed off almost immediately. But then around eleven the phone rang and woke him up and when it turned out to be God Himself calling to summons D.R. to Kentucky, alertness spread through him like a rush.
