1.3 Lonely McMurdo Station rests on black ash and lava rock from 12,450-foot Mount Erebus.

2. Cool air above warmer water coats sea with fog

built a city under the snow, a modern community big enough to house 100 people, a self-contained laboratory with the latest research facilities. It is new Byrd Station, dedicated and occupied just a year ago (page 272). Nearly six miles away, shrouded in a snowy grave, lies old Byrd Station, built for the IGY. Drifts of 15 to 30 feet, piled up by the relentless wind, have crushed its walls, snapped its timbers, extinguished its life (page 274).

City Under the Snow Takes Shape

I will never forget the cold November day in 1960 when we picked the site for new Byrd. Huddled in a Sno-Cat, we lurched and crawled over the sastrugi, the waves of rock-hard snow sculptured by the wind.

The temperature stood at 30° below zero, not uncommon at a place where the warmest days barely pass the freezing point. The wind, bane of comfort in this windiest of continents, whipped powder-fine snow in our faces. The icy air slashed through our parkas, our layers of wool clothing, our waffle-weave thermal underwear, leaving us thoroughly chilled and miserable.

At length we set up a bamboo trail flag amid a cluster of fuel drums to mark the spot we had chosen, upwind from old Byrd and away from its debris.

Three weeks later, when I returned to the spot, I found the Seabees vigorously at work. For temporary shelter, they had erected the first sections of a Jamesway hut that was to lengthen to 510 feet (a Jamesway is a prefabricated insulated tent on a wooden skeleton). They were already assembling the first of two huge Peter Snow Millers, Swiss snowplows used to clear roads in the Alps. These precision machines, which are capable of carving trenches to an accuracy of half an inch, would dig the tunnels for our city under the snow. They had been proved out already in another city-in-the-snow, the Army's Camp Century in Greenland.*

On this occasion I met for the first time a 25-year-old Seabee lieutenant, David C. deVieq, who was to have more to do with the successful completion of new Byrd than any other person. In time, Dave deVieq will probably become an Antarctic legend.

Resourceful, tireless, enthusiastic, this young engineer recognizes no obstacles. If supplies fail to arrive, he creates substitutes. If a man slackens from the 12-hours-a-day,

*See "Nuclear Power for the Polar Regions," by Rear Adm. George J. Dufek, in the NATIONAL GEOGRAPHIC, May, 1962.
